Dental practitioners' formulary May be prescribed as Miconazole and Hydrocortisone Cream or Ointment for max. 7 days.

- EXCEPTIONS TO LEGAL CATEGORY A 15-g tube of hydrocortisone with miconazole cream is on sale to the public for the treatment of athlete's foot and candidal intertrigo.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

Daktacort (Janssen-Cilag Ltd)

Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Daktacort ointment | 30 gram PoM £2.50 DT = £2.50

Craam

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxyanisole, disodium edetate

► Daktacort (McNeil Products Ltd, Janssen-Cilag Ltd)

Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per
1 gram Daktacort 2%/1% cream | 30 gram PoM £2.49 DT = £2.49

Hydrocortisone with oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1339, oxytetracycline p. 618.

INDICATIONS AND DOSE

Mild inflammatory skin disorders such as eczemas

- ► TO THE SKIN
- ► Child 12-17 years: (consult product literature)
- Adult: (consult product literature)

POTENCY

- ► Hydrocortisone 1% with oxytetracycline ointment: mild.
- INTERACTIONS → Appendix 1: corticosteroids · tetracyclines
- PREGNANCY Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child's teeth.
- BREAST FEEDING Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- PATIENT AND CARER ADVICE Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

ointment | 30 gram [PoM] £5.01 DT = £5.01

► Terra-Cortril (Esteve Pharmaceuticals Ltd)

Hydrocortisone 10 mg per 1 gram, Oxytetracycline (as

Oxytetracycline hydrochloride) 30 mg per 1 gram Terra-Cortril

CAUTIONARY AND ADVISORY LABELS 15

CAUTIONARY AND ADVISORY LABELS 15

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Pimecrolimus

20-0ct-2020

INDICATIONS AND DOSE

Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)

- ► TO THE SKIN
- Adult: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated by a specialist)

- ► TO THE SKIN
- Adult: Apply twice daily until symptoms resolve (maximum duration of treatment 4 weeks)
- UNLICENSED USE Pimecrolimus is not licensed for shortterm treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy.
- CONTRA-INDICATIONS Application to malignant or potentially malignant skin lesions · application under occlusion · congenital epidermal barrier defects · contact with eves · contact with mucous membranes · generalised erythroderma · immunodeficiency · infection at treatment site
- CAUTIONS Alcohol consumption (risk of facial flushing and skin irritation) · avoid other topical treatments except emollients at treatment site · UV light (avoid excessive exposure to sunlight and sunlamps)
- INTERACTIONS → Appendix 1: pimecrolimus
- SIDE-EFFECTS
- ► Common or very common Increased risk of infection
- ▶ Rare or very rare Skin discolouration
- ► Frequency not known Skin papilloma
- PREGNANCY Manufacturer advises avoid; toxicity in animal studies following systemic administration.
- BREAST FEEDING Manufacturer advises caution; ensure infant does not come in contact with treated areas.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ► Tacrolimus and pimecrolimus for atopic eczema [for patients with mild atopic eczema or as first-line treatment for atopic eczema of any severity] (August 2004) NICE TA82 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 4, 11, 28 EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol

Elidel (Viatris UK Healthcare Ltd)

Pimecrolimus 10 mg per 1 gram Elidel 1% cream | 30 gram PoM £19.69 DT = £19.69 | 60 gram PoM £37.41 DT = £37.41 | 100 gram PoM £59.07 DT = £59.07

Tacrolimus

02-Dec-2020

DRUG ACTION Tacrolimus is a calcineurin inhibitor.

INDICATIONS AND DOSE

Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (initiated by a specialist)

- ► TO THE SKIN
- Adult: Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or strength of ointment to 0.03% if condition allows continued →

Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (initiated by a specialist)

- ► TO THE SKIN
- Adult: Apply twice weekly, 0.1% ointment to be applied thinly, with an interval of 2-3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated under specialist supervision)

- ► TO THE SKIN
- Adult: Apply twice daily until symptoms resolve, 0.1% ointment to be applied thinly, reduce to once daily or switch to 0.03% ointment if condition allows, maximum duration of treatment 4 weeks
- UNLICENSED USE Short-term treatment of facial, flexural, or genital psoriasis is unlicensed.
- CONTRA-INDICATIONS Application to malignant or potentially malignant skin lesions · application under occlusion · avoid contact with eyes · avoid contact with mucous membranes · congenital epidermal barrier defects · generalised erythroderma · immunodeficiency · infection at treatment site
- CAUTIONS UV light (avoid excessive exposure to sunlight and sunlamps)
- INTERACTIONS → Appendix 1: tacrolimus
- SIDE-EFFECTS
- ► Common or very common Alcohol intolerance increased risk of infection sensation abnormal skin reactions
- ▶ Uncommon Lymphadenopathy
- ► Frequency not known Malignancy neoplasms
- ALLERGY AND CROSS-SENSITIVITY Evgr Contra-indicated if history of hypersensitivity to macrolides.
- PREGNANCY Manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration.
- BREAST FEEDING Avoid—present in breast milk (following systemic administration).
- HEPATIC IMPAIRMENT Manufacturer advises caution in hepatic failure.
- PATIENT AND CARER ADVICE Avoid excessive exposure to UV light including sunlight.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

Bimekizumab

23-Nov-2021

 DRUG ACTION Bimekizumab is a humanised monoclonal antibody that binds with high affinity to interleukin-17A, 17F and 17AF to block the activity of pro-inflammatory cytokines.

• INDICATIONS AND DOSE

Moderate-to-severe plaque psoriasis (under expert supervision)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 320 mg every 4 weeks for 5 doses (at weeks 0, 4, 8, 12 and 16), followed by maintenance 320 mg every 8 weeks, dose given as 2 injections of 160 mg each, consider discontinuing treatment if no response after 16 weeks. Patients weighing ≥ 120 kg who do not achieve completely clear skin after 16 weeks of treatment may be considered for maintenance dosing given every 4 weeks
- CONTRA-INDICATIONS Clinically significant active infection • inflammatory bowel disease
- CAUTIONS Chronic infection · history of recurrent infection

CAUTIONS, FURTHER INFORMATION

 Infection Ever Consider anti-tuberculosis therapy before initiation of bimekizumab in patients with a history of tuberculosis in whom an adequate course of treatment cannot be confirmed.

Consider completing appropriate immunisations according to current guidelines before starting.

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Fatigue headache increased risk of infection skin reactions
- ► Uncommon Conjunctivitis inflammatory bowel disease neutropenia
- ► Frequency not known Hypersensitivity
- CONCEPTION AND CONTRACEPTION Ever Females of childbearing potential should use effective contraception during treatment and for at least 17 weeks after last treatment.
- PREGNANCY EVGr Avoid—no information available.
- BREAST FEEDING EvGr Avoid—no information available.
- PRE-TREATMENT SCREENING EVGT Patients should be evaluated for tuberculosis infection before treatment.
- MONITORING REQUIREMENTS Ever Monitor for signs and symptoms of infection (suspend treatment if infection is clinically significant or unresponsive to treatment).
- DIRECTIONS FOR ADMINISTRATION EVGT Inject into the thigh, abdomen or upper arm and rotate injection site; avoid injecting into areas of the skin that are tender, bruised, or affected by psoriasis. Patients may self-administer Bimzelx *, after appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION
 Bimekizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- HANDLING AND STORAGE EVGT Store in a refrigerator (2–8°C) and protect from light. Once removed from

refrigerator, may be stored at room temperature for 25 days, then discarded.

- PATIENT AND CARER ADVICE Patients and their carers should be advised to seek medical attention if signs or symptoms of infection occur.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

► Bimekizumab for treating moderate to severe plague psoriasis (September 2021) NICE TA723 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Bimekizumab (Bimzelx®) for the treatment of moderate to severe plaque psoriasis in adults who are candidates for systemic therapy (November 2021) SMC No. SMC2410 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Bimzelx (UCB Pharma Ltd)

Bimekizumab 160 mg per 1 ml Bimzelx 160mg/1ml solution for injection pre-filled syringes | 2 pre-filled disposable injection PoM £2,443.00 (Hospital only)

Bimzelx 160mg/1ml solution for injection pre-filled pens | 2 pre-filled disposable injection PoM £2,443.00 (Hospital only)

Brodalumah

03-Nov-2020

 DRUG ACTION Brodalumab is a recombinant human monoclonal antibody that binds with high affinity to interleukin-17RA and blocks the activity of proinflammatory cytokines.

INDICATIONS AND DOSE

Moderate-to-severe plaque psoriasis (under expert supervision)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 210 mg every week for 3 doses, followed by 210 mg every 2 weeks, consider discontinuing treatment if no response after 16 weeks
- CONTRA-INDICATIONS Active Crohn's disease clinically significant active infection
- CAUTIONS Chronic infection history of Crohn's disease (monitor for exacerbations) · history of depressive disorders (discontinue if new or worsening symptoms develop) · history of recurrent infection · history of suicidal ideation or behaviour (discontinue if new or worsening symptoms develop)

CAUTIONS, FURTHER INFORMATION

Infection Manufacturer advises to consider antituberculosis therapy for patients with latent tuberculosis before starting treatment with brodalumab.

Manufacturer advises patients should be brought up-todate with current immunisation schedule before initiating

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Arthralgia · diarrhoea · fatigue · headache · increased risk of infection · myalgia · nausea · oropharyngeal pain
- ► Uncommon Conjunctivitis
- ► Frequency not known Meningitis cryptococcal · suicidal behaviours
- CONCEPTION AND CONTRACEPTION Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 12 weeks after stopping treatment.

- PREGNANCY Manufacturer advises avoid—limited information available.
- BREAST EFFDING Manufacturer advises avoid—no. information available.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration, and to avoid injecting into areas of the skin that are tender, bruised, or affected by psoriasis. Patients may self-administer Kyntheum® after appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION Brodalumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- PATIENT AND CARER ADVICE Manufacturer advises patients and their carers should be given training in subcutaneous injection technique. Manufacturer advises patients and their carers should seek medical advice if new or worsening symptoms of depression, suicidal ideation, or behaviour occur; they should also be advised to report signs and symptoms of infection.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website NICE decisions

► Brodalumab for treating moderate to severe plague psoriasis (March 2018) NICE TA511 Recommended with restrictions Scottish Medicines Consortium (SMC) decisions

- ▶ Brodalumab (Kyntheum®) for the treatment of moderate-tosevere plaque psoriasis in adult patients who are candidates for systemic therapy (May 2018) SMC No. 1283/17 Recommended with restrictions

Brodalumab 140 mg per 1 ml Kyntheum 210mg/1.5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [PoM] £1.280.00

Dupilumab

04-Jan-2022

• DRUG ACTION Dupilumab is a recombinant human monoclonal antibody that inhibits interleukin-4 and interleukin-13 signaling.

INDICATIONS AND DOSE

Moderate-to-severe atopic eczema (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 600 mg, followed by 300 mg every 2 weeks, the initial dose should be administered as two consecutive 300 mg injections at different injection sites, review treatment if no response after 16 weeks

Severe asthma with type 2 inflammation [add-on maintenance therapy] (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 400 mg, followed by 200 mg every 2 weeks, the initial dose should be administered as two consecutive 200 mg injections at different injection sites, review need for treatment yearly

13

Severe asthma with type 2 inflammation [add-on maintenance therapy for patients currently treated with oral corticosteroids or patients with co-morbid moderate-to-severe atopic eczema or patients with comorbid severe chronic rhinosinusitis with nasal polyps1 (initiated by a specialist)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: Initially 600 mg, followed by 300 mg every 2 weeks, the initial dose should be administered as two consecutive 300 mg injections at different injection sites, review need for treatment yearly

Severe chronic rhinosinusitis with nasal polyps (initiated by a specialist)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: Initially 300 mg, followed by 300 mg every 2 weeks, review treatment if no response after 24 weeks
- CAUTIONS Helminth infection
- CAUTIONS, FURTHER INFORMATION
- Risk of infection Dupilumab may influence the immune response to helminth infections. Resolve pre-existing infection before initiating treatment; suspend treatment if resistant infection develops during therapy.

Manufacturer advises patients should be brought up-todate with live and live attenuated vaccines before initiating treatment.

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Eosinophilia eye inflammation eve pruritus · oral herpes
- ► Frequency not known Anaphylactic reaction (discontinue $immediately) \cdot angioedema \cdot arthralgia \cdot pneumonia$ eosinophilic · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) Churg-Strauss syndrome has occurred in patients given dupilumab; the reaction may be associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy in patients with eosinophilia.

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk-limited information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises to inject into the thigh or abdomen (except for the 5 cm around the navel), or upper arm (if not self-administered); rotate injection site and avoid skin that is tender, damaged or scarred. Patients may self-administer Dupixent® after appropriate training in preparation and administration.
- PRESCRIBING AND DISPENSING INFORMATION Dupilumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- When used for Asthma For choice of therapy, see Asthma, acute p. 260 and Asthma, chronic p. 256.
- HANDLING AND STORAGE Store in a refrigerator (2–8°C) and protect from light; may be kept at room temperature (max. 25°C) for max. 14 days.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ► Dupilumab for treating moderate to severe atopic dermatitis (August 2018) NICE TA534 Recommended with restrictions
- Dupilumab for treating severe asthma with type 2 inflammation (December 2021) NICE TA751 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ▶ Dupilumab (*Dupixent*®) for treatment of moderate-to-severe atopic dermatitis (September 2018) SMC No. SMC2011 Recommended with restrictions
- ► Dupilumab (*Dupixent*®) as add-on maintenance treatment in adults and adolescents 12 years and older for severe asthma with type 2 inflammation, who are inadequately controlled with high dose inhaled corticosteroids plus another medicinal product for maintenance treatment (April 2021) SMC No. SMC2317 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates

- Dupixent (Sanofi Genzyme)
- Dupilumab 150 mg per 1 ml Dupixent 300mg/2ml solution for injection pre-filled syringes | 2 pre-filled disposable injection PoM £1.264.89 (Hospital only)
- Dupixent 300mg/2ml solution for injection pre-filled pens | 2 prefilled disposable injection [PoM] £1,264.89 (Hospital only) Dupilumab 175 mg per 1 ml Dupixent 200mg/1.14ml solution for injection pre-filled syringes | 2 pre-filled disposable injection PoM £1,264.89 (Hospital only)
- Dupixent 200mg/1.14ml solution for injection pre-filled pens | 2 prefilled disposable injection [PoM] £1,264.89 (Hospital only)

Guselkumah

10-Sep-2021

- DRUG ACTION Guselkumab is a recombinant human monoclonal antibody that binds selectively to interleukin-23 and blocks the activity of pro-inflammatory cytokines.
 - INDICATIONS AND DOSE

Moderate-to-severe plaque psoriasis (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 100 mg, then 100 mg after 4 weeks, then maintenance 100 mg every 8 weeks, consider discontinuation of treatment if no response after 16 weeks

Psoriatic arthritis (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 100 mg, then 100 mg after 4 weeks, then maintenance 100 mg every 8 weeks, a maintenance dose of 100 mg every 4 weeks may be considered in patients at high risk for joint damage, consider discontinuation of treatment if no response after 24 weeks
- CONTRA-INDICATIONS Clinically significant active infection
- CAUTIONS Risk of infection

CAUTIONS, FURTHER INFORMATION

 Risk of infection Manufacturer advises consider antituberculosis therapy before initiation of guselkumab in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed.

Manufacturer advises consider completion of appropriate immunisations according to current guidelines before initiating treatment (consult product literature for appropriate interval between vaccination and administration of guselkumab).

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Arthralgia · diarrhoea · headache · increased risk of infection
- ► Uncommon Skin reactions
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 12 weeks after treatment.

- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid during treatment and for up to 12 weeks after discontinuing treatment-no information available.
- PRE-TREATMENT SCREENING Manufacturer advises that patients should be evaluated for tuberculosis infection before treatment.
- MONITORING REQUIREMENTS
- ▶ EvGr Monitor for signs and symptoms of active tuberculosis during and after treatment.
- ► When used for psoriatic arthritis EvGr In patients receiving maintenance treatment every 4 weeks, monitor liver enzymes before starting treatment, and as clinically indicated thereafter-interrupt treatment if drug-induced liver injury suspected.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises to avoid injecting into areas of the skin that show psoriasis. Patients may self-administer Tremfya[®], after appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION Guselkumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8°C) and protect from light.
- PATIENT AND CARER ADVICE Manufacturer advises patients and their carers should be advised to seek medical attention if signs or symptoms of infection occur (monitor closely and suspend treatment if infection is clinically significant or unresponsive to treatment). Self-administration Manufacturer advises patients may selfadminister following training in subcutaneous injection technique.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ► Guselkumab for treating moderate to severe plaque psoriasis (June 2018) NICE TA521 Recommended with restrictions
- ► Guselkumab for treating active psoriatic arthritis after inadequate response to DMARDs (June 2021) NICE TA711 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Guselkumab (*Tremfya*®) for the treatment of moderate to severe plaque psoriasis in adults who are candidates for systemic therapy (June 2018) SMC No. 1340/18 Recommended with restrictions
- ► Guselkumab (Tremfya®) for the treatment of active psoriatic arthritis in adults who have had an inadequate response or who have been intolerant to a prior disease-modifying antirheumatic drug therapy, alone or in combination with methotrexate (August 2021) SMC No. SMC2360 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Tremfva (Janssen-Cilag Ltd) ▼ Guselkumab 100 mg per 1 ml Tremfya 100mg/1ml solution for injection pre-filled pens | 1 pre-filled disposable injection PoM £2 250 00

Ixekizumah

31-Aug-2021

 DRUG ACTION Ixekizumab is a human monoclonal antibody that binds to interleukin-17A and inhibits the release of pro-inflammatory cytokines and chemokines.

INDICATIONS AND DOSE

Moderate-to-severe plaque psoriasis (under expert supervision) | Psoriatic arthritis with concomitant moderate-to-severe plaque psoriasis (under expert supervision)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 160 mg for 1 dose, followed by 80 mg after 2 weeks, then 80 mg every 2 weeks for 5 further doses (at weeks 4, 6, 8, 10 and 12), then maintenance 80 mg every 4 weeks, consider discontinuation of treatment if no response after 16-20 weeks

Psoriatic arthritis (under expert supervision) | Ankylosing spondylitis (under expert supervision) | Nonradiographic axial spondyloarthritis (under expert supervision)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 160 mg for 1 dose, then maintenance 80 mg every 4 weeks, consider discontinuation of treatment if no response after 16-20 weeks
- CONTRA-INDICATIONS Active infections (including active tuberculosis) · inflammatory bowel disease (discontinue if signs or symptoms develop, or an exacerbation occurs)
- CAUTIONS Chronic or recurrent infection-monitor carefully and discontinue if serious, unresponsive infection develops

CAUTIONS, FURTHER INFORMATION

- ▶ Latent tuberculosis EvGr Patients with latent tuberculosis should complete anti-tuberculosis therapy before starting ixekizumab. (M)
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- Common or very common Conjunctivitis · increased risk of infection · nausea · oropharyngeal pain
- ▶ Uncommon Angioedema · inflammatory bowel disease · neutropenia · skin reactions · thrombocytopenia
- ▶ Rare or very rare Anaphylactic reaction
- ► Frequency not known Hypersensitivity (occasionally lateonset)
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment and for at least 10 weeks after treatment in women of childbearing potential.
- PREGNANCY Manufacturer advises avoid—limited information available.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- DIRECTIONS FOR ADMINISTRATION FOR Avoid injecting into areas of the skin that show psoriasis: injection sites may be alternated. Patients may self-administer Taltz[®], after appropriate training in subcutaneous injection technique; doses less than 80 mg must be prepared and administered by a healthcare professional.
- PRESCRIBING AND DISPENSING INFORMATION Ixekizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8°C).
- PATIENT AND CARER ADVICE EVGr Patients and their carers should be advised to seek medical attention if symptoms of infection develop during treatment.

Self-administration If appropriate, patients and their carers should be given training in subcutaneous injection technique.

A Patient Leaflet and User Manual should be provided.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Ixekizumab for treating moderate to severe plaque psoriasis
 (April 2017) NICE TA442 Recommended with restrictions
- Ixekizumab for treating active psoriatic arthritis after inadequate response to DMARDs (August 2018) NICE TA537 Recommended with restrictions
- ► Ixekizumab for treating axial spondyloarthritis (July 2021) NICE TA718 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Ixekizumab (Taltz[®]) for moderate to severe plaque psoriasis in adults who are candidates for systemic therapy (April 2017) SMC No. 1223/17 Recommended with restrictions
- Ixekizumab (Taltz®) alone or in combination with methotrexate for the treatment of active psoriatic arthritis in adult patients who have responded inadequately to, or who are intolerant to one or more disease-modifying antirheumatic drug therapies (October 2018) SMC No. SMC2097 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates

► Taltz (Eli Lilly and Company Ltd)

Taltz 80mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £1,125.00 (Hospital only)

Risankizumab

04-May-20

 DRUG ACTION Risankizumab is a humanised monoclonal antibody that binds selectively to interleukin-23 and blocks the activity of pro-inflammatory cytokines.

• INDICATIONS AND DOSE

Moderate-to-severe plaque psoriasis (specialist use only) | Psoriatic arthritis (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 150 mg, then 150 mg after 4 weeks, then maintenance 150 mg every 12 weeks, consider discontinuation if no response after 16 weeks
- CONTRA-INDICATIONS Clinically significant active infection
- CAUTIONS Chronic infection · history of recurrent infection · risk of infection

CAUTIONS, FURTHER INFORMATION

 Risk of infection Manufacturer advises consider antituberculosis therapy before initiation of risankizumab in patients with a history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed.

Manufacturer advises consider completion of immunisations according to current guidelines before initiating treatment (consult product literature for appropriate interval between vaccination and administration of risankizumab).

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Asthenia · headaches · increased risk of infection · pruritus
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 21 weeks after treatment.

- PREGNANCY Manufacturer advises avoid (limited information available).
- BREAST FEEDING Manufacturer advises avoid (no information available).
- PRE-TREATMENT SCREENING Manufacturer advises patients should be evaluated for tuberculosis infection before treatment.
- MONITORING REQUIREMENTS Manufacturer advises monitor for signs and symptoms of active tuberculosis during treatment.
- DIRECTIONS FOR ADMINISTRATION Evgr For prefilled syringe, take carton out of the refrigerator at least 15 minutes before administration. For prefilled pen, take carton out of the refrigerator at least 30 minutes before administration. Inject preparations into the thigh or abdomen; avoid injecting into areas of the skin that are tender, bruised or affected by psoriasis. ♠ Patients may self-administer Skyrizi® after appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION
 Risankizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C) and protect from light.
- PATIENT AND CARER ADVICE Manufacturer advises
 patients and their carers should be advised to seek medical
 attention if signs or symptoms of infection occur.
- NATIONAL FUNDING/ACCESS DECISIONS

Tildrakizumab

16-Nov-2020

 DRUG ACTION Tildrakizumab is a recombinant human monoclonal antibody that specifically binds to interleukin-23 and inhibits the release of pro-inflammatory cytokines and chemokines.

INDICATIONS AND DOSE

Moderate-to-severe plaque psoriasis (under expert supervision)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 100 mg, then 100 mg after 4 weeks, then maintenance 100 mg every 12 weeks, consider discontinuation if no response after 28 weeks, in patients with a high disease burden, or with a body weight ≥ 90kg, a dose of 200 mg may provide greater efficacy
- CONTRA-INDICATIONS Clinically significant active infection
- CAUTIONS Chronic infection · history of recurrent infection · recent serious infection

CAUTIONS, FURTHER INFORMATION

 Risk of infection Manufacturer advises consider antituberculosis therapy before initiation of tildrakizumab in patients with a history of tuberculosis, in whom an adequate course of treatment cannot be confirmed.

Manufacturer advises consider completion of immunisations according to current guidelines before initiating treatment (consult product literature for appropriate interval between vaccination and administration of tildrakizumab).

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ➤ Common or very common Back pain · diarrhoea · headache · increased risk of infection · nausea
- CONCEPTION AND CONTRACEPTION Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 17 weeks after stopping treatment.
- PREGNANCY Manufacturer advises avoid—limited information available.
- BREAST FEEDING Manufacturer advises avoid—limited information available.
- PRE-TREATMENT SCREENING Manufacturer advises patients should be evaluated for tuberculosis infection before treatment.
- MONITORING REQUIREMENTS Manufacturer advises monitor for signs and symptoms of active tuberculosis during and after treatment
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration, and to avoid injecting into areas of the skin that are affected by psoriasis or are tender, bruised, red, hard, thick, or scaly. Patients may self-administer Ilumetri®, after appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION

Tildrakizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

 HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

- PATIENT AND CARER ADVICE Manufacturer advises
 patients and their carers should be advised to seek medical
 advice if signs or symptoms of infection occur.
- NATIONAL FUNDING/ACCESS DECISIONS

Tralokinumab

28-Jan-2022

 DRUG ACTION Tralokinumab is a human monoclonal antibody that inhibits the interleukin-13 pathway.

• INDICATIONS AND DOSE

Moderate-to-severe atopic eczema (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 600 mg, followed by maintenance 300 mg every 2 weeks, patients who achieve clear or almost clear skin after 16 weeks of treatment may be considered for maintenance dosing given every 4 weeks; this may not be appropriate in patients weighing over 100kg. Consider discontinuation of treatment if no response after 16 weeks
- CAUTIONS Helminth infection

CAUTIONS, FURTHER INFORMATION

Patients should be brought up-to-date with live and live attenuated vaccines before initiating treatment.

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Eosinophilia eye inflammation increased risk of infection
- PREGNANCY Evgr Avoid—limited information available.
- BREAST FEEDING EVGr Avoid—no information
- **DIRECTIONS FOR ADMINISTRATION** Evg: Remove syringe from the refrigerator 30 minutes before administration. Inject into the thigh or abdomen (except for the 5cm around the navel), or upper arm (if not self-administered); rotate injection site and avoid skin that is tender, damaged, or scarred. (*) Patients may self-administer $Adtralza^{\circ}$ after appropriate training in preparation and administration.
- PRESCRIBING AND DISPENSING INFORMATION
 Tralokinumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines,

under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

- HANDLING AND STORAGE Store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- PATIENT AND CARER ADVICE

Self-administration If appropriate, patients and their carers should be given training in subcutaneous injection technique.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

 Tralokinumab (Adtralza®) for the treatment of moderate-tosevere atopic dermatitis in adult patients who are candidates for systemic therapy (January 2022) SMC No. SMC2403 Recommended with restrictions

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
 Solution for injection

EXCIPIENTS: May contain Polysorbates

► Adtralza (LEO Pharma) ▼

Tralokinumab 150 mg per 1 ml Adtralza 150mg/1ml solution for injection pre-filled syringes | 4 pre-filled disposable injection PoM £1,070.00 (Hospital only)

IMMUNOSUPPRESSANTS > JAK INHIBITORS

Abrocitinib

22-Nov-2021

 DRUG ACTION Abrocitinib is a selective inhibitor of the Janus-associated tyrosine kinase JAK1.

INDICATIONS AND DOSE

Moderate-to-severe atopic eczema (under expert supervision)

- ► BY MOUTH
- Adult: 200 mg once daily, a reduced initial dose of 100 mg once daily is recommended for patients less likely to tolerate treatment, consider discontinuation of treatment if no response after 12 weeks in all patients, for dose adjustments, interruption or discontinuation due to clinical response or sideeffects—consult product literature; maximum 200 mg per day
- ▶ Elderly: Initially 100 mg once daily, increased to 200 mg once daily if necessary and if tolerated, consider discontinuation of treatment if no response after 12 weeks, for dose adjustments, interruption or discontinuation due to clinical response or sideeffects—consult product literature; maximum 200 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ► [EVGT] Reduce initial dose by half with concurrent use of potent CYP2C19 inhibitors. ♠
- CONTRA-INDICATIONS Absolute lymphocyte count less than 0.5 × 10⁹ cells/litre (do not initiate) absolute neutrophil count less than 1 × 10⁹ cells/litre (do not initiate) clinically significant active infection haemoglobin less than 8 g/dL (do not initiate) platelet count less than 150 × 10⁹ cells/litre (do not initiate)
- CAUTIONS Chronic or recurrent infection · known malignancy · risk factors for deep-vein thrombosis or pulmonary embolism

CAUTIONS, FURTHER INFORMATION

- Tuberculosis Ever Consider anti-tuberculosis therapy prior to initiation of abrocitinib in patients with previously untreated latent tuberculosis.
- Immunisation Ever Patients should receive all recommended vaccinations before starting treatment; live

- vaccines are not recommended immediately before, or during, treatment.
- Deep-vein thrombosis of pulmonary embolism EvGr If deepvein thrombosis or pulmonary embolism occurs during treatment, discontinuation of abrocitinib is recommended. ♠
- INTERACTIONS → Appendix 1: abrocitinib
- SIDE-EFFECTS
- ► Common or very common Abdominal pain upper · acne · dizziness · headache · increased risk of infection · nausea · vomiting
- ► **Uncommon** Dyslipidaemia embolism and thrombosis lymphopenia thrombocytopenia
- ► Frequency not known Herpes virus reactivation
- CONCEPTION AND CONTRACEPTION Every Females of childbearing potential should use effective contraception during treatment and for 1 month after last treatment.
 Female fertility may be temporarily reduced during treatment—studies in animals show that the effects on fertility are reversible 1 month after stopping treatment.
- PREGNANCY Evgr Avoid—toxicity in animal studies.
- BREAST FEEDING EVGT Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT [EVGT] Avoid in severe impairment (no information available).
- RENAL IMPAIRMENT EVG! Caution in moderate and severe impairment.
 Dose adjustments EVG! Reduce dose by half in moderate

impairment.

Reduce initial dose to 50 mg once daily, and increase to maximum 100 mg once daily, in severe impairment.

- PRE-TREATMENT SCREENING Evgr Patients should be evaluated for tuberculosis and viral hepatitis before treatment.
- MONITORING REQUIREMENTS
- Evgr Monitor lipid profile at baseline, 4 weeks after treatment initiation, and then periodically hyperlipidaemia should be managed according to clinical guidelines.
- Monitor for haematological abnormalities at baseline, 4 weeks after treatment initiation, and then periodically; interrupt treatment if absolute neutrophil count less than 1 × 10⁹ cells/litre, absolute lymphocyte count less than 0.5 × 10⁹ cells/litre, or haemoglobin less than 8 g/dL treatment may be restarted when levels return above these values. Discontinue treatment if platelet count less than 50 × 10⁹ cells/litre.
- ► Monitor for viral hepatitis during treatment. ♠
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Cibinqo® has provided a Prescriber Brochure
- PATIENT AND CARER ADVICE Patients and carers should be advised that taking Cibinqo® with food may improve nausea.

Risk minimisation materials A patient card should be provided.

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

RETINOID AND RELATED DRUGS

Acitretin

04-Nov-2021

DRUG ACTION Acitretin is a metabolite of etretinate.

INDICATIONS AND DOSE

Severe extensive psoriasis resistant to other forms of therapy (under expert supervision) | Palmoplantar pustular psoriasis (under expert supervision) | Severe congenital ichthyosis (under expert supervision)

- ► BY MOUTH
- Adult: Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

Severe Darier's disease (keratosis follicularis) (under expert supervision)

- ▶ BY MOUTH
- Adult: Initially 10 mg daily for 2-4 weeks, then adjusted according to response to 25-50 mg daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL RETINOID MEDICINES: REVISED AND SIMPLIFIED PREMANCY PREVENTION EDUCATIONAL MATERIALS FOR HEALTHCARE PROFESSIONALS AND WOMEN (JUNE 2019) New prescriber checklists, patient reminder cards, and pharmacy checklists are available to support the Pregnancy Prevention Programme in women and girls of childbearing potential taking oral acitretin, alitretinoin, or isotretinoin. Healthcare professionals are reminded that the use of oral retinoids is contra-indicated in pregnancy due to a high risk of serious congenital malformations, and any use in females must be within the conditions of the Pregnancy Prevention Programme (see Conception and contraception and Prescribing and dispensing information).

Neuropsychiatric reactions have been reported in patients taking oral retinoids. Healthcare professionals are advised to monitor patients for signs of depression or suicidal ideation and refer for appropriate treatment, if necessary; particular care is needed in those with a history of depression. Patients should be advised to speak to their doctor if they experience any changes in mood or behaviour, and encouraged to ask family and friends to look out for any change in mood.

MHRA/CHM ADVICE: ORAL RETINOID MEDICINES (ISOTRETINOIN, ALITRETINOIN, AND ACITRETIN): TEMPORARY MONITORING ADVICE DURING CORONAVIRUS (COVID-19) PANDEMIC (JULY 2021)

The MHRA has issued temporary guidance about the use of remote consultations for female patients taking acitretin to support adherence to the Pregnancy Prevention Programme (see Conception and contraception and Prescribing and dispensing information) and ensuring continued monitoring for signs of psychiatric reactions (especially depression) and other safety risks during the coronavirus (COVID-19) pandemic. The guidance also includes advice that can be provided to patients to help them understand the monitoring requirements. The temporary guidance is available at: www.gov.uk/guidance/temporary-advice-for-management-of-oral-retinoid-medicines-during-the-covid-19-pandemic.

- CONTRA-INDICATIONS Hyperlipidaemia
- CAUTIONS Avoid excessive exposure to sunlight and unsupervised use of sunlamps · diabetes (can alter glucose tolerance—initial frequent blood glucose checks) · do not donate blood during and for 3 years after stopping therapy (teratogenic risk) · history of depression (risk of

- neuropsychiatric reactions) investigate atypical musculoskeletal symptoms
- INTERACTIONS → Appendix 1: retinoids
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · arthralgia · brittle nails · conjunctivitis · diarrhoea · dry mouth · gastrointestinal disorder · haemorrhage · hair texture abnormal · headache · increased risk of infection · mucosal abnormalities · myalgia · nausea · oral disorders · peripheral oedema · skin reactions · thirst · vomiting · xerophthalmia
- ► Uncommon Dizziness hepatic disorders photosensitivity reaction vision disorders
- ► Rare or very rare Bone pain exostosis idiopathic intracranial hypertension peripheral neuropathy
- ► Frequency not known Angioedema · anxiety · capillary leak syndrome · depression · drowsiness · dysphonia · flushing · glucose tolerance impaired · granuloma · hearing impairment · hyperhidrosis · malaise · mood altered · psychiatric disorder · pyogenic granuloma · retinoic acid syndrome · taste altered · tinnitus

SIDE-EFFECTS, FURTHER INFORMATION Exostosis Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which acitretin is a metabolite) and premature epiphyseal closure in children.

Benign intracranial hypertension Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.

 CONCEPTION AND CONTRACEPTION The MHRA advises that women and girls of childbearing potential being treated with the oral retinoids acitretin, alitretinoin, or isotretinoin must be supported on a Pregnancy Prevention Programme with regular follow-up and pregnancy testing.
 Pregnancy prevention Effective contraception must be used.

In females of childbearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and every 1-3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of childbearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 highly effective method of contraception (i.e. a user-independent form such as an intra-uterine device or implant) or 2 complementary userdependent forms of contraception (e.g. combined oral contraceptives and barrier method). Oral progestogenonly contraceptives are not considered effective. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

- PREGNANCY Manufacturer advises avoid—teratogenic.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment.
- RENAL IMPAIRMENT EVG: Avoid in severe impairment (increased risk of toxicity).
- MONITORING REQUIREMENTS
- ► Monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.
- ► Check liver function at start, then every 2–4 weeks for first 2 months and then every 3 months.
- PRESCRIBING AND DISPENSING INFORMATION
 Prescribing for females of childbearing potential The Pregnancy
 Prevention Programme is supported by the following

materials provided by the manufacturer: *Checklists for prescribers and pharmacists*, and *Patient reminder cards*.

Each prescription for oral acitretin should be limited to a supply of up to 30 days' treatment. Pregnancy testing should ideally be carried out on the same day as prescription issuing and dispensing.

PATIENT AND CARER ADVICE

Risk of neuropsychiatric reactions The MHRA advises patients and carers to seek medical attention if changes in mood or behaviour occur.

Pregnancy Prevention Programme Pharmacists must ensure that female patients have a patient card—see also *Important safety information*.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

04-Nov-2021

• INDICATIONS AND DOSE

Severe chronic hand eczema refractory to potent topical corticosteroids

- ► BY MOUTH
- Adult (prescribed by or under supervision of a consultant dermatologist): 30 mg once daily; reduced if not tolerated to 10 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse DOSE ADJUSTMENTS DUE TO INTERACTIONS
- Manufacturer advises reduce dose to 10 mg once daily with concurrent use of potent inhibitors of CYP3A4, CYP2C8 and moderate inhibitors of CYP2C9.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL RETINOID MEDICINES: REVISED AND SIMPLIFIED PREGMANCY PREVENTION EDUCATIONAL MATERIALS FOR HEALTHCARE PROFESSIONALS AND WOMEN (UME 2019) New prescriber checklists, patient reminder cards, and pharmacy checklists are available to support the Pregnancy Prevention Programme in women and girls of childbearing potential taking oral acitretin, alitretinoin, or isotretinoin. Healthcare professionals are reminded that the use of oral retinoids is contra-indicated in pregnancy due to a high risk of serious congenital malformations, and any use in females must be within the conditions of the Pregnancy Prevention Programme (see Conception and contraception and Prescribing and dispensing information).

Neuropsychiatric reactions have been reported in patients taking oral retinoids. Healthcare professionals are advised to monitor patients for signs of depression or suicidal ideation and refer for appropriate treatment, if necessary; particular care is needed in those with a history of depression. Patients should be advised to speak to their doctor if they experience any changes in mood or behaviour, and encouraged to ask family and friends to look out for any change in mood.

MHRA/CHM ADVICE: ORAL RETINOID MEDICINES (ISOTRETINOIN. ALITRETINOIN, AND ACITRETIN): TEMPORARY MONITORING ADVICE DURING CORONAVIRUS (COVID-19) PANDEMIC (JULY 2021) The MHRA has issued temporary guidance about the use of remote consultations for female patients taking alitretinoin to support adherence to the Pregnancy Prevention Programme (see Conception and contraception and Prescribing and dispensing information) and ensuring continued monitoring for signs of psychiatric reactions (especially depression) and other safety risks during the coronavirus (COVID-19) pandemic. The guidance also includes advice that can be provided to patients to help them understand the monitoring requirements. The temporary guidance is available at: www.gov.uk/guidance/ temporary-advice-for-management-of-oral-retinoidmedicines-during-the-covid-19-pandemic.

- CONTRA-INDICATIONS Hypervitaminosis A uncontrolled hyperlipidaemia uncontrolled hypothyroidism
- CAUTIONS Avoid blood donation during treatment and for at least 1 month after stopping treatment - dry eye syndrome - history of depression (risk of neuropsychiatric reactions)
- INTERACTIONS → Appendix 1: retinoids
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · conjunctivitis · dizziness · dry eye · dry mouth · eye irritation · fatigue · flushing · headache · hypercholesterolaemia · hypertension · hypertriglyceridaemia (risk of pancreatitis if triglycerides above 9 mmol/litre) · joint disorders · myalgia · nausea · oral disorders · skin reactions · tinnitus · vomiting
- ► **Uncommon** Bone disorders cataract dyspepsia epistaxis vision disorders
- Rare or very rare Anxiety · behaviour abnormal · depression · hair texture abnormal · idiopathic intracranial hypertension · mood altered · nail disorder · photosensitivity reaction · psychotic disorder · suicidal behaviours · vasculitis
- ► Frequency not known Inflammatory bowel disease peripheral oedema

SIDE-EFFECTS, FURTHER INFORMATION Dry eyes may respond to lubricating eye ointment or tear replacement therapy.

Discontinue treatment if signs or symptoms of idiopathic intracranial hypertension such as headache, nausea, vomiting, papilloedema, or visual disturbances occur.

Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.

 CONCEPTION AND CONTRACEPTION The MHRA advises that women and girls of childbearing potential being treated with the oral retinoids acitretin, alitretinoin, or isotretinoin must be supported on a Pregnancy Prevention Programme with regular follow-up and pregnancy testing. Pregnancy prevention Effective contraception must be used.

In females of childbearing potential, exclude pregnancy a few days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 1 month after stopping treatment. Females of childbearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. They should be advised to use at least 1 highly effective method of contraception (i.e. a user-independent form such as an intra-uterine device or implant) or 2 complementary user-dependent forms of contraception (e.g. combined oral contraceptives and barrier method). Oral progestogen-only contraceptives are not considered effective. Females

should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

- PREGNANCY Manufacturer advises avoid—teratogenic.
- BREAST FEEDING Manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises avoid limited information available.
- RENAL IMPAIRMENT EVG: Avoid in moderate to severe impairment (no information available).
- MONITORING REQUIREMENTS Monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia.
- PRESCRIBING AND DISPENSING INFORMATION
 Prescribing for females of childbearing potential The Pregnancy
 Prevention Programme is supported by the following
 materials provided by the manufacturer: Checklists for
 prescribers and pharmacists, and Patient reminder cards.

Each prescription for oral alitretinoin should be limited to a supply of up to 30 days' treatment. Pregnancy testing should ideally be carried out on the same day as prescription issuing and dispensing.

• PATIENT AND CARER ADVICE

Risk of neuropsychiatric reactions The MHRA advises patients and carers to seek medical attention if changes in mood or behaviour occur.

UV light Manufacturer advises patients to avoid excessive exposure to UV light (including sunlight, solariums)— sunscreen with a high protection factor should be applied. Pregnancy Prevention Programme Pharmacists must ensure that female patients have a patient card—see also Important safety information.

Tazarotene

14-Feb-2020

INDICATIONS AND DOSE

Mild to moderate plaque psoriasis affecting up to 10% of skin area $\,$

- ► TO THE SKIN
- Adult: Apply once daily usually for up to 12 weeks, apply in the evening
- CAUTIONS Avoid contact with eczematous skin · avoid contact with eyes · avoid contact with face · avoid contact with hair-covered scalp · avoid contact with inflamed skin · avoid contact with intertriginous areas
- INTERACTIONS → Appendix 1: retinoids
- SIDE-EFFECTS
- ► Common or very common Paraesthesia · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Local irritation is more common with higher concentration and may require treatment interruption.

- CONCEPTION AND CONTRACEPTION Effective contraception required (oral progestogen-only contraceptives not considered effective).
- PREGNANCY Avoid.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- PATIENT AND CARER ADVICE Avoid excessive exposure to UV light (including sunlight, solariums, PUVA or UVB treatment). Do not apply emollients or cosmetics within 1 hour of application. Wash hands immediately after use.
- MEDICINAL FORMS No licensed medicines listed.

SALICYLIC ACID AND DERIVATIVES

Salicylic acid with zinc oxide

23-Nov-2020

• INDICATIONS AND DOSE

Hyperkeratotic skin disorders

- ► TO THE SKIN
- Adult: Apply twice daily
- CAUTIONS Avoid broken skin avoid inflamed skin
 CAUTIONS, FURTHER INFORMATION
- Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin.
- SIDE-EFFECTS Skin irritation
- PRESCRIBING AND DISPENSING INFORMATION Zinc and Salicylic Acid Paste BP is also referred to as Lassar's Paste. When prepared extemporaneously, the BP states Zinc and Salicylic Acid Paste, BP (Lassar's Paste) consists of zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.
- MEDICINAL FORMS Forms available from special-order manufacturers include: paste

VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

Calcipotriol

28-Jun-2021

• INDICATIONS AND DOSE

Plaque psoriasis

- ► TO THE SKIN USING OINTMENT
- Adult: Apply 1–2 times a day, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 100 g per week

Scalp psoriasis

- ► TO THE SKIN USING SCALP LOTION
- Adult: Apply twice daily, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 60 mL per week
- CONTRA-INDICATIONS Calcium metabolism disorders
- CAUTIONS Avoid excessive exposure to sunlight and sunlamps · avoid use on face · erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) · generalised pustular psoriasis (enhanced risk of hypercalcaemia)
- INTERACTIONS → Appendix 1: vitamin D substances
- SIDE-EFFECTS
- ► Common or very common Skin reactions
- ▶ Uncommon Hypercalcaemia increased risk of infection

- ► Rare or very rare Hypercalciuria photosensitivity reaction
- PREGNANCY Manufacturers advise avoid unless essential.
- BREAST EFEDING No information available.
- **HEPATIC IMPAIRMENT** Manufacturers advise avoid in severe impairment (no information available).
- RENAL IMPAIRMENT [EVGT] Avoid in severe impairment (no information available).
- PATIENT AND CARER ADVICE

Advice on application Patient information leaflet for *Dovonex*® ointment advises liberal application. However, patients should be advised of maximum recommended weekly dose.

Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

4 Perspiration

4.1 Hyperhidrosis

Hyperhidrosis

16-Jun-2020

Overview

Hyperhidrosis is defined as sweating in excess of normal body temperature regulation. It can be localised (focal) or affect the entire skin area, and can be classified by the absence (primary) or presence (secondary) of an underlying cause.

Ever Patients with primary focal hyperhidrosis affecting axillae, palmar, or plantar areas, should be offered a topical preparation containing 20% aluminium chloride hexahydrate p. 1359. This is a more potent antiperspirant compared to commercially available preparations and is available as a spray, roll-on, or solution.

Ever If the response to treatment is inadequate or not tolerated after 6 weeks, consider referral to a specialist.

Specialist management may also be appropriate in more severe cases of hyperhidrosis. Topical glycopyrronium bromide p. 1359 as a 0.05% solution, may be used in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. Botox ® contains botulinum toxin type A complex p. 440 and is licensed for intradermal use for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment. Oxybutynin hydrochloride p. 841 [unlicensed indication] can cause a reduction in sweat secretion through its effects on muscarinic receptors near the sweat glands; its use is limited due to antimuscarinic adverse effects.

ANTIMUSCARINICS

Pruritus

Topical local antipruritics

Overview

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying causes should be treated. An emollient may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient. Levomenthol **cream** p. 1360 can be used to relieve pruritus: it exerts a cooling effect on the skin. Local antiprurities have a role in the treatment of pruritus in palliative care.

Preparations containing crotamiton p. 1360 are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective.

A topical preparation containing doxepin 5% p. 1360 is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of colestyramine p. 215 is the treatment of

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause hypersensitivity. For insect stings and insect bites, a short course of a topical corticosteroid is appropriate. Short-term treatment with a sedating antihistamine may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

Topical local anaesthetics are indicated for the relief of local pain. Preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than 3 days; not generally suitable for young children and are less suitable for prescribing.

Topical antihistamines should be avoided in eczema and are not recommended for longer than 3 days. They are less suitable for prescribing.

Other drugs used for Pruritus Alimemazine tartrate, p. 305 · Cetirizine hydrochloride, p. 301 · Chlorphenamine maleate, p. 305 · Coal tar with calamine, p. 1346 · Hydroxyzine hydrochloride, p. 307 · Levocetirizine hydrochloride, p. 303

Rosacea and acne

Acne

Description of condition

Acne is a common inflammatory skin condition that leads to lesions which consist of non-inflammatory comedones, and inflammatory papules, pustules, nodules and cysts. In patients with acne, lesions and/or scarring may be seen and severity can range from mild lesions to permanent disfiguration. It can also have a psychological and social impact on the patient.

Acne vulgaris is a common type of acne that primarily affects the face, back, and chest; it is most common in adolescence, but may affect those in any age group. Other types of acne include acne conglobata, a severe form of nodulo-cystic acne with interconnecting sinuses and abscesses; and acne fulminans, a very serious form of acne conglobata that is associated with systemic symptoms (such as fever and arthralgia).

The severity of acne varies along a continuum from mild to moderate to severe, that is characterised by the lesion type (s) and quantity. Patients with mild to moderate acne are those with 1 or more of the following: non-inflammatory lesions (of any number), up to 34 inflammatory lesions, up to 2 nodules. Patients with moderate to severe acne are those who have 35 or more inflammatory lesions and/or 3 or more nodules.

Aims of treatment

Treatment aims to reduce the severity of skin lesions and other complications, and to prevent recurrence and scarring.

Management of acne

Patients with acne fulminans should be urgently referred to hospital for assessment by the dermatology team within 24 hours

Patients with acne conglobata, nodulo-cystic acne, or those with diagnostic uncertainty about their acne, should be referred to a consultant dermatologist-led team.

For patients with acne vulgaris, referral to a consultant dermatologist-led team should be considered if they have scarring or persistent pigmentary changes, or if their acne or acne-related scarring is causing or contributing to persistent psychological distress or a mental health disorder.

Referral to a mental health service should also be considered for patients whose acne is contributing to psychological distress or a mental health disorder (including those who have a current or past history of suicidal ideation or self-harm, body morphic disorder, or a severe depressive or anxiety disorder).

Ever Consider condition-specific management or specialist referral if a medication or medical disorder is contributing to the patient's acne. A Specialist referral should also be considered for individuals with acne and polycystic ovary syndrome (PCOS) with features of hyperandrogenism.

Non-drug treatment

Ever Patients with acne vulgaris should be advised on appropriate skin care such as using a non-alkaline, synthetic detergent cleansing product twice daily on acne-prone areas, removing make up at the end of the day, and avoiding the use of oil-based or comedogenic skincare products, sunscreens, and make-up. They should also be advised to avoid persistent picking or scratching of lesions.

Photodynamic therapy should be considered for patients with moderate to severe acne vulgaris if other treatments are ineffective, contra-indicated, or not tolerated. (A)

Drug treatment

20-Sep-2021

EvGr Patients with mild to moderate and moderate to severe acne vulgaris should be offered a 12-week course of a first line treatment option, taking into account the severity and distribution of their acne, their preferences, and that the risk of scarring increases with acne severity and duration. Any potential use of oral isotretinoin in the future for severe forms of acne will be dependent on the completion of adequate courses of first line treatments including systemic antibacterials and topical therapy, and should also be taken into consideration when deciding on initial treatment options. The use of antibacterial monotherapy or a combination of a topical and oral antibacterial are not recommended. Patients should be informed that the benefits of treatment may take between 6-8 weeks to become noticeable and hence the importance of completing the course.

Females receiving acne treatment who wish to use hormonal contraception could consider using an oral combined hormonal contraceptive, ⓐ as combined hormonal contraceptive use may be associated with improvement of acne.

Evgr When considering treatment options that include known teratogenic drugs or drugs with teratogenic potential (such as topical or oral retinoids, or oral tetracyclines), specific contraception requirements should be taken into consideration and discussed with patients, see individual drug monographs for further information.

First line treatment options for acne vulgaris

- · Acne of any severity:
- EvGr Fixed combination topical adapalene with benzoyl peroxide p. 1365, or
- Fixed combination topical tretinoin with clindamycin p. 1367.
- Mild to moderate acne:
- ► Evgr Fixed combination topical benzoyl peroxide with clindamycin p. 1364. ♠
- Moderate to severe acne:
- ► Ever Fixed combination topical adapalene with benzoyl peroxide with oral lymecycline p. 617 or doxycycline p. 616, or
- Topical azelaic acid p. 1364 with oral lymecycline or doxycycline.
- Alternative antibacterial options if lymecycline or doxycycline unsuitable: [wgr trimethoprim p. 625 [unlicensed] or a macrolide (such as erythromycin p. 587).
- Alternative if first line options are contra-indicated, or the patient wishes to avoid antibacterials or topical retinoids:
 Evor topical benzoyl peroxide p. 1364 monotherapy.

For further information on the management of acne vulgaris, such as the advantages and disadvantages of each treatment option, see NICE guideline: **Acne** (see *Useful resources*).

Reassessment and further treatment

EvGr Review first line treatment after 12 weeks. For patients whose acne has cleared, maintenance options should also be considered (a) (see *Maintenance*).

IEVGI For patients whose treatment included an oral antibacterial and their acne has completely cleared, consider continuing their topical treatment and stopping the oral antibacterial. If their acne has improved but not cleared, consider continuing the course for up to a further 12 weeks. Treatment courses that include an antibacterial should only be continued for more than 6 months in exceptional circumstances, and should be reviewed every 3 months.

For patients with mild to moderate acne who have had an inadequate response to treatment after 12 weeks, offer another first line option. A Consider referral to a consultant dermatologist-led team for those who have mild to moderate acne unresponsive to 2 completed treatment courses.

Evgr For patients with moderate to severe acne who have had an inadequate response to treatment that did not include an oral antibacterial, offer another first line option which includes an oral antibacterial. For those whose treatment included an oral antibacteral, consider referral to a consultant dermatologist-led team.

Evgr For females with PCOS that have not improved following treatment with a first line option, consider adding ethinylestradiol with cyproterone (co-cyprindiol below) and review at 6 months, or an alternative combined oral contraceptive pill [unlicensed]. (A)

For further information on the drug treatment of acne vulgaris, including the use of intralesional corticosteroids and the management of acne-related scarring, see NICE guideline: Acne (see Useful resources).

Isotretinoin

Ever For patients with severe acne (such as acne conglobata or fulminans, nodulo-cystic acne, or acne at risk of permanent scarring) that is resistant to adequate courses of oral antibiotic-containing first line treatments, consider oral isotretinoin p. 1365 (specialist use). Take into account the patient's psychological wellbeing, and refer them to mental health services before starting treatment if appropriate. (A)

Isotretinoin is a powerful teratogen; for females of childbearing potential isotretinoin must only be used if the conditions of the Pregnancy Prevention Programme are met. For further information, see Important safety information, Conception and contraception, and Prescribing and dispensing information in the isotretinoin monograph, and Contraception in patients taking medication with teratogenic potential in Contraceptives, hormonal p. 854.

Ever For acne flares that occur after starting isotretinoin, a course of oral prednisolone p. 747 may be considered. (a) For further information on acne flares, see NICE guideline: Acne (see *Useful resources*).

Relapse

Evgr For acne that responds adequately to a course of first line treatment but then relapses, consider another 12-week course of either the same treatment or an alternative treatment option. For treatment options, see First line treatment options.

Evor If acne relapses after an adequate response to oral isotretinoin and is currently mild to moderate, offer an appropriate first line treatment option. If acne relapses after an adequate response to oral isotretinoin and is currently moderate to severe, offer either a 12-week course of an appropriate first line treatment option or re-referral if the patient is no longer under the care of a consultant dermatologist-led team. For individuals with moderate to severe acne that relapses after a second course of oral isotretinoin, further care should be provided by their dermatology team; offer re-referral if the patient is no longer under the care of the consultant dermatologist-led team.

Maintenance

Every On completion of treatment, the need for maintenance treatment is not always necessary; advise patients that appropriate skin care should be continued. In patients with a

history of frequent relapse, consider maintenance treatment using a fixed combination of topical adapalene with benzoyl peroxide p. 1365. If this is not tolerated or one component of the combination is contra-indicated, consider topical monotherapy with either adapalene p. 1365, azelaic acid p. 1364, or benzoyl peroxide p. 1364. Maintenance treatments should be reviewed after 12 weeks and a decision made about continuation.

Useful Resources

Rosacea

29-Sen-2020

Rosacea

Rosacea is not comedonal (but may exist with acne which may be comedonal). Brimonidine tartrate p. 1368 is licensed for the treatment of facial erythema in rosacea. The pustules and papules of rosacea respond to topical azelaic acid p. 1364, topical ivermectin p. 1368 or to topical metronidazole p. 1322. Alternatively oral administration of oxytetracycline p. 618 or tetracycline p. 619, or erythromycin p. 587, can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline p. 616 can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low daily doses for the treatment of facial rosacea. Camouflagers may be required for the redness.

6.1 Acne

Other drugs used for Acne Minocycline, p. 618 · Oxytetracycline, p. 618

ANTI-ANDROGENS

Co-cyprindiol

25-Oct-2021

• INDICATIONS AND DOSE

Moderate to severe acne vulgaris related to hyperandrogenism caused by polycystic ovary syndrome [adjunct in refractory acne] | Moderately severe hirsutism

- ► BY MOUTH
- Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CYPROTERONE ACETATE: NEW ADVICE TO MINIMISE RISK OF MENINGIOMA (JUNE 2020)

Cyproterone acetate has been associated with an overall rare, but cumulative dose-dependent, increased risk of meningioma (single and multiple), mainly at doses of 25 mg/day and higher. Healthcare professionals are advised to monitor patients for meningiomas, and to permanently discontinue treatment if diagnosed. Use of cyproterone acetate, including co-cyprindiol, for all indications is contra-indicated in those with meningioma or a history of meningioma.

- CONTRA-INDICATIONS Acute porphyrias p. 1150 · current breast cancer · heart disease associated with pulmonary hypertension or risk of embolus · history of stroke (including transient ischaemic attack) · ischaemic heart disease · known thrombogenic mutations (e.g. factor V Leiden, prothrombin mutation, protein S, protein C and antithrombin deficiencies) · medical treatment for varicose veins · migraine with aura · positive antiphospholipid antibodies · presence or history of liver tumours · previous or current venous or arterial thrombosis · severe or multiple risk factors for arterial or venous thromboembolism · systemic lupus erythematosus with antiphospholipid antibodies
- CAUTIONS Cardiac disease cervical cancer cholestasis with previous use of combined oral contraception—seek specialist advice before use · gallbladder disease-seek specialist advice before use • gene mutations associated with breast cancer (e.g. BRCA 1)—seek specialist advice before use · history of breast cancer-seek specialist advice before use · history of cholestasis during pregnancy · history of depression · hyperprolactinaemia-seek specialist advice before use · inflammatory bowel disease including Crohn's disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial thromboembolism · risk factors for venous thromboembolism · sickle-cell disease · systemic lupus erythematosus · undiagnosed breast mass—seek specialist advice before use undiagnosed vaginal bleeding

CAUTIONS, FURTHER INFORMATION

Venous thromboembolism There is an increased risk of

venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5-2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third generation progestogens (desogestrel and gestodene) or drospirenone. Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

For more information about the risk factors for venous thromboembolism, see combined hormonal contraceptive preparations.

- INTERACTIONS → Appendix 1: anti-androgens ethinylestradiol
- SIDE-EFFECTS
- ► Common or very common Abdominal pain breast abnormalities · depression · headaches · mood altered · nausea · weight changes
- ▶ Uncommon Diarrhoea fluid retention sexual dysfunction · skin reactions · vomiting
- ▶ Rare or very rare Contact lens intolerance erythema nodosum · thromboembolism · vaginal discharge
- ► Frequency not known Amenorrhoea (on discontinuation) angioedema aggravated $\boldsymbol{\cdot}$ chorea exacerbated $\boldsymbol{\cdot}$ hepatic function abnormal · hepatic neoplasm · hypertension · hypertriglyceridaemia · inflammatory bowel disease · menstrual cycle irregularities · suicidal behaviours
- CONCEPTION AND CONTRACEPTION EVG Co-cyprindiol contains an anti-androgen and is an effective hormonal contraceptive. However, it should not be used solely for contraception but reserved for women who require treatment for androgen-dependent skin conditions. Patients should not take other hormonal contraceptives while being treated with co-cyprindiol.
- PREGNANCY Avoid—risk of feminisation of male fetus with cyproterone.
- BREAST FEEDING Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.

- HEPATIC IMPAIRMENT Manufacturer advises caution: avoid in severe or active disease
- PRESCRIBING AND DISPENSING INFORMATION A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Isotretinoin

04-Nov-2021

INDICATIONS AND DOSE

Severe acne [(such as nodular or conglobate acne or acne at risk of permanent scarring) resistant to adequate courses of standard therapy with systemic antibacterials and topical therapy] (under expert supervision)

- BY MOUTH
- Adult: Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily and continued until a total cumulative dose of 120–150 mg/kg is reached—treatment may be discontinued sooner if there has been an adequate response and no new lesions for 4–8 weeks, treatment course may be repeated after a period of at least 8 weeks if relapse after first course, consider dose reduction to less than 500 micrograms/kg daily for patients at increased risk of, or experiencing, side-effects: maximum 150 mg/kg per course

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ISOTRETINOIN ($ROACCUTANE^{\otimes}$): RARE REPORTS OF ERECTILE DYSFUNCTION AND DECREASED LIBIDO (OCTOBER 2017)

An EU-wide review has concluded that on rare occasions, oral isotretinoin, indicated for severe acne, may cause sexual side-effects, including erectile dysfunction and decreased libido.

MHRA/CHM ADVICE: ORAL RETINOID MEDICINES: REVISED AND SIMPLIFIED PREGNANCY PREVENTION EDUCATIONAL MATERIALS FOR HEALTHCARE PROFESSIONALS AND WOMEN (JUNE 2019) New prescriber checklists, patient reminder cards, and pharmacy checklists are available to support the Pregnancy Prevention Programme in women and girls of childbearing potential taking oral acitretin, alitretinoin, or isotretinoin. Healthcare professionals are reminded that the use of oral retinoids is contra-indicated in pregnancy due to a high risk of serious congenital malformations, and any use in females must be within the conditions of the Pregnancy Prevention Programme (see Conception and contraception and Prescribing and dispensing information).

Neuropsychiatric reactions have been reported in patients taking oral retinoids. Healthcare professionals are advised to monitor patients for signs of depression or suicidal ideation and refer for appropriate treatment, if necessary; particular care is needed in those with a history of depression. Patients should be advised to speak to their doctor if they experience any changes in mood or behaviour, and encouraged to ask family and friends to look out for any change in mood.

MHRA/CHM ADVICE: ISOTRETINOIN (ROACCUTANE®): REMINDER OF IMPORTANT RISKS AND PRECAUTIONS (AUGUST 2020)

The MHRA reminds healthcare professionals that isotretinoin should only be prescribed for the treatment of severe forms of acne resistant to adequate courses of standard therapy with systemic antibacterials and topical therapy. Isotretinoin should be given under the supervision of physicians with expertise in the use of systemic retinoids, and a complete understanding of the risks of therapy and monitoring requirements (including signs of depression).

Healthcare professionals are also advised to counsel patients on the potential risks of isotretinoin, including neuropsychiatric reactions and sexual dysfunction.

The MHRA further reminds healthcare professionals that isotretinoin is a powerful teratogen associated with a high frequency of severe and life-threatening birth defects if there is exposure in utero; females of childbearing potential must meet the conditions of the Pregnancy Prevention Programme (see Conception and contraception and Prescribing and dispensing information).

MHRA/CHM ADVICE: ORAL RETINOID MEDICINES (ISOTRETINOIN. ALITRETINOIN, AND ACITRETIN): TEMPORARY MONITORING ADVICE DURING CORONAVIRUS (COVID-19) PANDEMIC (JULY 2021) The MHRA has issued temporary guidance about the use of remote consultations for female patients taking isotretinoin to support adherence to the Pregnancy Prevention Programme (see Conception and contraception and Prescribing and dispensing information) and ensuring continued monitoring for signs of psychiatric reactions (especially depression) and other safety risks during the coronavirus (COVID-19) pandemic. The guidance also includes advice that can be provided to patients to help them understand the monitoring requirements. The temporary guidance is available at: www.gov.uk/guidance/ temporary-advice-for-management-of-oral-retinoidmedicines-during-the-covid-19-pandemic.

- CONTRA-INDICATIONS Hyperlipidaemia · hypervitaminosis
- CAUTIONS Avoid blood donation during treatment and for at least 1 month after treatment · diabetes · dry eye syndrome (associated with risk of keratitis) · history of depression (risk of neuropsychiatric reactions)
- INTERACTIONS → Appendix 1: retinoids
- Common or very common Anaemia · arthralgia · back pain · cheilitis · dry eye · eye discomfort · eye inflammation · haemorrhage · headache · increased risk of infection ·

- myalgia · nasal dryness · neutropenia · proteinuria · skin fragility (trauma may cause blistering) · skin reactions · thrombocytopenia · thrombocytosis
- ▶ Rare or very rare Alopecia · anxiety · arthritis · behaviour abnormal · bronchospasm · cataract · corneal opacity · depression · diabetes mellitus · dizziness · drowsiness · dry throat • epiphyses premature fusion (following long-term use of high doses) · exostosis (following long-term use of high doses) · gastrointestinal disorders · glomerulonephritis · hair changes · hearing impairment · hepatitis · hoarseness · hyperhidrosis · hyperuricaemia · idiopathic intracranial hypertension • inflammatory bowel disease · ligament calcification (following long-term use of high doses) · lymphadenopathy · malaise · mood altered · nail dystrophy · nausea · pancreatitis · photosensitivity reaction · psychotic disorder · pyogenic granuloma · seizure · suicidal behaviours · tendinitis · tendon calcification (following long-term use of high doses) · vasculitis · vision disorders
- ► Frequency not known Psychiatric disorder rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · sexual dysfunction · vulvovaginal dryness

SIDE-EFFECTS, FURTHER INFORMATION Risk of pancreatitis if triglycerides above 9 mmol/litre-discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.

Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.

Visual disturbances require expert referral and possible

Psychiatric side-effects could require expert referral.

 CONCEPTION AND CONTRACEPTION The MHRA advises that women and girls of childbearing potential being treated with the oral retinoids acitretin, alitretinoin, or isotretinoin must be supported on a Pregnancy Prevention Programme with regular follow-up and pregnancy testing. Pregnancy prevention Effective contraception must be used. In females of childbearing potential, exclude pregnancy

a few days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 1 month after stopping treatment. Females of childbearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. They should be advised to use at least 1 highly effective method of contraception (i.e. a user-independent form such as an intra-uterine device or implant) or 2 complementary user-dependent forms of contraception (e.g. combined oral contraceptives and barrier method). Oral progestogen-only contraceptives are not considered effective. Females should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

- PREGNANCY Manufacturer advises avoid—teratogenic.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Manufacturer advises avoid limited information available.

Dose adjustments [EvGr] In severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated.

- MONITORING REQUIREMENTS Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).
- PRESCRIBING AND DISPENSING INFORMATION Isotretinoin is an isomer of tretinoin. Prescribing for females of childbearing potential The Pregnancy Prevention Programme is supported by the following materials provided by the manufacturer: Checklists for prescribers and pharmacists, and Patient reminder cards.

Each prescription for oral isotretinoin should be limited to a supply of up to 30 days' treatment. Pregnancy testing should ideally be carried out on the same day as prescription issuing and dispensing.

 PATIENT AND CARER ADVICE Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.

Risk of neuropsychiatric reactions The MHRA advises patients and carers to seek medical attention if changes in mood or behaviour occur.

Pregnancy Prevention Programme Pharmacists must ensure that female patients have a patient card—see also *Important safety information*.

Tretinoin with clindamycin

13-0ct-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, tretinoin p. 1014, clindamycin p. 1363.

• INDICATIONS AND DOSE

Acne vulgaris

- ► TO THE SKIN
- Child 12-17 years: Apply once daily, to be applied thinly at bedtime
- Adult: Apply once daily, to be applied thinly at bedtime
- CONTRA-INDICATIONS Perioral dermatitis personal or familial history of skin cancer rosacea
- CAUTIONS Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid avoid accumulation in angles of the nose avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin avoid exposure to UV light (including sunlight, solariums) avoid use of topical retinoids with keratolytic agents, abrasive cleaners, comedogenic or astringent cosmetics caution in sensitive areas such as the neck severe acne.
- INTERACTIONS → Appendix 1: clindamycin · retinoids
- SIDE-EFFECTS Dry skin (discontinue if severe) eye irritation oedema photosensitivity reaction skin pigmentation change (transient) skin reactions
- CONCEPTION AND CONTRACEPTION Females of childbearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).
- PREGNANCY Contra-indicated in pregnancy.
- BREAST FEEDING Amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas.

 PATIENT AND CARER ADVICE If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

Patients and carers should be warned that some redness and skin peeling can occur initially but settles with time. To reduce the risk of skin irritation, treatment may be started with alternate-day or short-contact application (e.g. washing off after an hour) and progressed to standard application if tolerated. If severe irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Brimonidine tartrate

11-May-2021

 DRUG ACTION Brimonidine, an alpha₂-adrenoceptor agonist, is used to reduce erythema in rosacea by cutaneous vasoconstriction.

INDICATIONS AND DOSE

Facial erythema in rosacea

- ► TO THE SKIN
- Adult: Apply once daily until erythema subsides, apply thinly, divide dose over forehead, chin, nose, and cheeks, max. 1 g of gel per day

DOSE EQUIVALENCE AND CONVERSION

► 1 g of gel contains 5 mg of brimonidine tartrate (equivalent to 3.3 mg of brimonidine).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BRIMONIDINE GEL (MIRVASO®): RISK OF SYSTEMIC CARDIOVASCULAR EFFECTS (JUNE 2017)

Systemic cardiovascular effects including bradycardia, hypotension, and dizziness have been reported after application of brimonidine gel. To minimise the possibility of systemic absorption, it is important to avoid application to irritated or damaged skin, including after laser therapy.

MHRA/CHM ADVICE: BRIMONIDINE GEL (MIRVASO®): RISK OF EXACERBATION OF ROSACEA (NOVEMBER 2016)

Symptom exacerbation has been reported very commonly in patients treated with brimonidine gel. Treatment should be initiated with a small amount of gel (less than the maximum dose) for at least 1 week, then increased gradually, based on tolerability and response. Patients should be counselled on the importance of not exceeding the maximum daily dose, and advised to stop treatment and seek medical advice if symptoms worsen during treatment.

7 Scalp and hair conditions

Scalp and hair conditions

14-Aug-2020

Overview

Dandruff is considered to be a mild form of seborrhoeic dermatitis. Shampoos containing antimicrobial agents such as pyrithione zinc (which are widely available) and selenium p. 1370 may have beneficial effects. Shampoos containing tar extracts may be useful and they are also used in psoriasis. Ketoconazole shampoo p. 1324 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1346 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis p. 1330 that affects the scalp. Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

Cradle cap in infants may be treated with **coconut oil** or **olive oil** applications followed by shampooing.

Hirsutism

Hirsutism may result from hormonal disorders or as a sideeffect of drugs such as minoxidil p. 1370, corticosteroids, anabolic steroids, androgens, danazol, and progestogens.

Weight loss can reduce hirsutism in obese women. Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Eflornithine p. 1370 an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical

eflornithine can be used as an adjunct to laser therapy for facial hirsutism in women.

Co-cyprindiol p. 1362 (cyproterone acetate with ethinylestradiol) may be effective for moderately severe hirsutism. Metformin hydrochloride p. 761 is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen. The MHRA/CHM have released important safety information regarding the use of cyproterone acetate and the risk of meningioma. For further information, see *Important safety information* for co-cyprindiol. The Faculty of Sexual and Reproductive Healthcare have released a statement in response to the MHRA/CHM information (available at: www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-new-advice-from-the-mhra-regarding/).

Androgenetic alopecia

Finasteride p. 850 is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

Other drugs used for Scalp and hair conditions Coal tar, p. 1345 • Coal tar with salicylic acid and precipitated sulfur, p. 1346

ANTISEPTICS AND DISINFECTANTS

UNDECENOATES

Cetrimide with undecenoic acid

• INDICATIONS AND DOSE

Scalp psoriasis | Seborrhoeic dermatitis | Dandruff

Skin cleansers, antiseptics and desloughing agents

Skin cleansers, antiseptics and desloughing agents

Skin cleansers and antiseptics

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 1372 or povidone-iodine p. 1372, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Hydrogen peroxide p. 1374, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers. Hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often

Potassium permanganate solution 1 in 10 000 below, a mild antiseptic with astringent properties, can be used for exudative eczematous areas: treatment should be stopped when the skin becomes dry.

Desloughing agents

Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised. Gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neomycin sulfate p. 1322 or lanolin.

ANTISEPTICS AND DISINFECTANTS

Potassium permanganate

22-Anr-2022

INDICATIONS AND DOSE

Cleansing and deodorising suppurating eczematous reactions and wounds

- ► TO THE SKIN
- Adult: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF DEATH OR SERIOUS HARM FROM ACCIDENTAL INGESTION OF POTASSIUM PERMANGANATE PREPARATIONS (DECEMBER 2014)

Potassium permanganate is for external use only. Oral ingestion can cause fatality due to local inflammatory reactions that block the airways or cause perforations of the gastrointestinal tract, or through toxicity and organ failure. Potassium permanganate is subject to the requirements of Control of Substances Hazardous to Health including: separate storage, additional hazard labelling, and issue only to staff and patients who have been educated to understand its safe use. Accidental ingestion should be treated as a medical emergency.

NHS IMPROVEMENT PATIENT SAFETY ALERT: INADVERTENT ORAL ADMINISTRATION OF POTASSIUM PERMANGANATE (APRIL 2022) A review of reported incidents over a two-year period identified 35 cases of inadvertent ingestion of potassium permanganate. Of these, 15 cases were of healthcare staff administering potassium permanganate orally to patients and 9 cases, one fatal, of patients selfadministering orally. To minimise the risk of harm from potassium permanganate, the British Association of Dermatologists (BAD) has issued advice on formulary management, prescribing, dispensing, storage,

healthcare-professionals/clinical-standards/. The overall use of potassium permanganate should be reviewed locally and protocols for its use should be aligned with all BAD recommendations, including: In primary care:

preparation and use, and waste www.bad.org.uk/

- patients are not on repeat prescriptions for potassium permanganate:
- prescriptions include clear instructions to dilute before use:
- · dispensing label includes the warning 'harmful if swallowed'.

In secondary care:

- remove all stock supply (except for use within outpatient departments) and supply on a named patient basis only:
- potassium permanganate is prescribed as 'potassium permanganate 0.01% topical solution' and the dispensing label must include the warning 'harmful if
- potassium permanganate is not stored with medicines for oral/internal use, including the ward drug trolley; dilution should occur away from the patient, and neither the concentrated form nor the diluted form should be left near the patient.

In all settings:

- prescriptions are only issued by an appropriate prescriber;
- if potassium permanganate is to be used in a patient's home, a risk assessment must be undertaken before prescribing:
- all patients must be supplied with a patient information leaflet.

CAUTIONS Irritant to mucous membranes

- **DIRECTIONS FOR ADMINISTRATION** With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.
- PATIENT AND CARER ADVICE Can stain clothing, skin and nails (especially with prolonged use).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

Tablet for cutaneous solution

- Permitabs (Alliance Pharmaceuticals Ltd)

Pre-operative hand and skin disinfection | General hand and skin disinfection

- TO THE SKIN
- Child: Use as alternative to soap (consult product literature)
- Adult: Use as alternative to soap (consult product literature)

HIBITANE OBSTETRIC®

For use in obstetrics and gynaecology as an antiseptic and lubricant

- ► TO THE SKIN
- Adult: To be applied to skin around vulva and perineum and to hands of midwife or doctor

HIBI® LIQUID HAND RUB+

Hand and skin disinfection

- ► TO THE SKIN
- ▶ Child: To be used undiluted (consult product literature)
- Adult: To be used undiluted (consult product literature)

HYDREX ® SOLUTION

For pre-operative skin disinfection

- ► TO THE SKIN
- ► Child: (consult product literature)
- Adult: (consult product literature)

HYDREX ® SURGICAL SCRUB

For pre-operative hand and skin disinfection | General hand disinfection

- ► TO THE SKIN
- ▶ Child: (consult product literature)
- Adult: (consult product literature)

UNISEPT

For cleansing and disinfecting wounds and burns and swabbing in obstetrics

- ► TO THE SKIN
- Child: (consult product literature)
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CHLORHEXIDINE SOLUTIONS: REMINDER OF THE RISK OF CHEMICAL BURNS IN PREMATURE INFANTS (NOVEMBER 2014)

In premature infants, use sparingly, monitor for skin reactions, and do not allow solution to pool—risk of severe chemical burns.

- CONTRA-INDICATIONS Not for use in body cavities
- CAUTIONS Avoid contact with brain avoid contact with eyes - avoid contact with meninges - avoid contact with middle ear - use prior to diathermy (alcohol containing skin disinfectants)
- SIDE-EFFECTS Skin reactions
- DIRECTIONS FOR ADMINISTRATION

HIBITANE PLUS 5% CONCENTRATE SOLUTION For preoperative skin preparation, dilute 1 in 10 (0.5%) with alcohol 70%. For general skin disinfection, dilute 1 in 100 (0.05%) with water. Alcoholic solutions not suitable for use before diathermy or on neonatal skin.

PRESCRIBING AND DISPENSING INFORMATION
 Chlorhexidine digluconate is a synonym for chlorhexidine

Chlorhexidine digluconate is a synonym for chlorhexidine gluconate.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Cream

► Hibitane Obstetric (Derma UK Ltd)

Chlorhexidine gluconate 10 mg per 1 gram Hibitane Obstetric 1% cream | 50 ml | GSL | £4.80 | 250 ml | GSL | £19.23 DT = £19.23

Liquid

CAUTIONARY AND ADVISORY LABELS $\,$ 15 (For ethanolic solutions (e.g. ChloraPrep $^{\otimes}$ and Hydrex $^{\otimes}$ only)

Hydrogen peroxide

29-Apr-2020

DRUG ACTION Hydrogen peroxide is an oxidising agent.

• INDICATIONS AND DOSE

For skin disinfection, particularly cleansing and deodorising wounds and ulcers

▶ TO THE SKIN

 Adult: Use 3% and 6% solutions (consult product literature)

CRYSTACIDE ®

Superficial bacterial skin infection

► TO THE SKIN

▶ Child: Apply 2-3 times a day for up to 3 weeks

▶ Adult: Apply 2–3 times a day for up to 3 weeks

Localised non-bullous impetigo [in patients who are not systemically unwell or at high risk of complications]

► TO THE SKIN

▶ Child: Apply 2–3 times a day for 5–7 days

▶ Adult: Apply 2-3 times a day for 5-7 days

- UNLICENSED USE Licensed for use in children (age range not specified by manufacturer).
- CONTRA-INDICATIONS Closed body cavities (in adults) deep wounds large wounds use as disinfection agent for
 surgical instruments (in adults) use as enema (in adults) use during surgery (in adults)
- CAUTIONS Avoid on eyes · avoid on healthy skin · incompatible with products containing iodine or potassium permanganate
- PRESCRIBING AND DISPENSING INFORMATION The BP directs that when hydrogen peroxide is prescribed,

hydrogen peroxide solution 6% (20 vols) should be dispensed.

Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions.

CRYSTACIDE For choice of therapy, see Skin infections, antibacterial therapy p. 554.

- HANDLING AND STORAGE Hydrogen peroxide bleaches fabric.

9 Skin disfigurement

Camouflagers

Overview

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances

The preparations marked 'ACBS' can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

Camouflages

CAMOUFLAGES

Covermark classic foundation (Colour Not Specified) 15 ml(ACBS) • NHS indicative price = £11.86

10 Sun protection and photodamage

Sunscreen

15-Sen-2021

Overview

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for skin disorders such as polymorphic light eruption, solar urticaria, and it provokes the various cutaneous porphyrias. It may also trigger or aggravate skin lesions of lupus erythematosus, rosacea, and other dermatoses. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. Solar ultraviolet irradiation may also trigger attacks of recurrent herpes labialis.

The effects of exposure over longer periods include *ageing changes*, and more importantly the initiation of *skin cancer*.

Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) are the main cause of *sunburn*. The long wavelengths (320–400 nm, known as UVA) are responsible for many *photosensitivity reactions* and *photodermatoses*. Both UVA and UVB contribute to long-term *photodamage* and to the changes responsible for *skin cancer* and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are not a substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, most users do not apply sufficient sunscreen product. The amount of sunscreen needed to cover the body of an average adult to achieve the stated SPF is around 35 mL or 6–8 teaspoons of lotion.

The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. [EvGr] Sunscreens should meet the minimum standards for UVA protection and the label should state that it provides good UVA protection (e.g. at least '4-star UVA protection'). They should also provide a SPF of at least 15 for UVB protection. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may cause contact dermatitis as a result of an allergy to one of its ingredients.

For optimum photoprotection, sunscreen preparations should be applied **liberally** and **frequently** as per manufacturer instructions. As maximum protection from sunlight is desirable in patients with photodermatoses, sunscreen with the highest SPF is essential.

Borderline substances

Some sunscreen products (see *About Borderline Substances*) are regarded as drugs when prescribed for skin protection against ultraviolet radiation and/or visible light in abnormal cutaneous photosensitivity causing severe cutaneous reactions in genetic disorders (including xeroderma pigmentosum and porphyrias), severe photodermatoses (both idiopathic and acquired) and in those with increased risk of ultraviolet radiation causing adverse effects due to chronic disease (such as haematological malignancies), medical therapies and/or procedures.

Photodamage

18-Nov-2020

Overview

Ever Patients should be advised on the harms of prolonged sunlight exposure and how to adequately protect their skin from strong sunlight (e.g. use of topical sun protection preparations).

Topical treatments can be used for actinic (solar) keratoses. An emollient can be used as part of the management regimen for dry, sun-damaged elderly skin although the direct effect of emollient treatment is unclear; addition of urea or salicylic acid may provide benefit. Diclofenac sodium p. 1377 gel may be suitable for the treatment of superficial lesions in mild disease. Fluorouracil cream p. 1377 is effective against most types of nonhypertrophic actinic keratosis; a solution containing fluorouracil with salicylic acid p. 1377 can be used for the treatment of low or moderately thick hyperkeratotic actinic keratosis. Imiquimod p. 1381 can be used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac sodium but lesions resolve faster. Photodynamic therapy in combination with methyl-5-aminolevulinate cream (Metvix ®) or 5-aminolaevulinic acid gel (Ameluz ®) is used in specialist centres for treating superficial and confluent, nonhypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple and large-area lesions, cosmetically sensitive sites, lesions located at sites of poor healing, or where pain is likely to be an issue. (A)

Imiquimod and topical fluorouracil are licensed for treating superficial basal cell carcinomas. [vor Patients with skin lesions suspected to be a basal cell carcinoma should be considered for routine referral; a suspected cancer pathway referral should only be considered if there are concerns that delay may have a significant impact (due to factors such as lesion size and site). Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating thin nodular basal cell carcinomas when other treatments are unsuitable. It may also be used for superficial basal cell carcinomas, particularly for multiple and large-area lesions, cosmetically sensitive sites, and lesions located at sites of poor healing.

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Diclofenac sodium

21-Apr-2022

INDICATIONS AND DOSE

SOLARAZE ®

Actinic keratosis

- TO THE SKIN
- Adult: Apply twice daily for 60-90 days, to be applied thinly; maximum 8 g per day
- CAUTIONS Avoid contact with eyes avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)
- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-EFFECTS
- ► Common or very common Conjunctivitis muscle tone increased · oedema · rash (discontinue) · sensation abnormal · skin reactions · skin ulcer
- ► Uncommon Abdominal pain alopecia diarrhoea eye pain · haemorrhage · lacrimation disorder · nausea · seborrhoea
- ► Rare or very rare Acute kidney injury angioedema asthma · hypersensitivity · photosensitivity reaction · rash pustular
- ► Frequency not known Hair colour changes SIDE-EFFECTS, FURTHER INFORMATION Topical application of large amounts of diclofenac can result in systemic
- ALLERGY AND CROSS-SENSITIVITY EVGr Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID-which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- PREGNANCY Patient packs for topical preparations carry a warning to avoid during pregnancy.
- BREAST FEEDING Patient packs for topical preparations carry a warning to avoid during breast-feeding.
- RENAL IMPAIRMENT In general, manufacturers advise caution (deterioration in renal function has also been reported after topical use).
- DIRECTIONS FOR ADMINISTRATION For topical preparations, apply with gentle massage only.
- PATIENT AND CARER ADVICE For topical preparations. patients and their carers should be advised to wash hands immediately after use.
 - Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

EXCIPIENTS: May contain Benzyl alcohol, fragrances, propylene glycol

► Solaraze (Almirall Ltd)

Diclofenac sodium 30 mg per 1 gram Solaraze 3% gel 50 gram PoM £38.30 DT = £38.30 | 100 gram PoM £76.60

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

Fluorouracil

19-Jan-2021

INDICATIONS AND DOSE

Superficial malignant and pre-malignant skin lesions

- ► TO THE SKIN USING CREAM
- ▶ Adult: Apply 1-2 times a day for 3-4 weeks (usual duration of initial therapy), apply thinly to the affected area, maximum area of skin 500 cm² (e.g. 23 cm × 23 cm) treated at one time, alternative regimens may be used in some settings
- CAUTIONS Avoid contact with eyes and mucous membranes · dihydropyrimidine dehydrogenase deficiency · do not apply to bleeding lesions
- INTERACTIONS → Appendix 1: fluorouracil
- SIDE-FFFFCTS
- ► Common or very common Alopecia · diarrhoea · mucositis · nausea · neutropenia · skin reactions · stomatitis · thrombocytopenia · vomiting
- ▶ Uncommon Dizziness · headache
- ▶ Rare or very rare Abdominal pain chills diarrhoea haemorrhagic · fever · leucocytosis · pancytopenia · skin irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions) · skin
- ► Frequency not known Conjunctival irritation excessive tearing · keratitis · taste altered
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturers advise avoid (teratogenic).
- BREAST FEEDING Manufacturers advise avoid.
- HANDLING AND STORAGE Caution in handling—irritant to tissues.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol

- Fluorouracil (Non-proprietary)
 - Fluorouracil 5 mg per 1 gram Carac 0.5% cream | 30 gram PoM S
- Ffudix (Viatris UK Healthcare Ltd)

Fluorouracil 50 mg per 1 gram Efudix 5% cream | 40 gram PoM £32 90 DT = £32 90

Fluorouracil with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorouracil above, salicylic acid p. 1381.

INDICATIONS AND DOSE

Low or moderately thick hyperkeratotic actinic keratosis

- ► TO THE SKIN
- Adult: Apply once daily for up to 12 weeks, reduced to 3 times a week if severe side effects occur and until side-effects improve, to be applied to the affected area, if treating area with thin epidermis, reduce frequency of application and monitor response more often; maximum area of skin treated at one time, 25 cm² (e.g. $5 \, \text{cm} \times 5 \, \text{cm}$
- INTERACTIONS → Appendix 1: fluorouracil

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ANTINEOPLASTIC DRUGS > PROTEIN KINASE INHIBITORS

Tirbanibulin

12-Apr-2022

 DRUG ACTION Tirbanibulin is a tyrosine kinase inhibitor which binds to tubulin thereby inducing death of proliferating cells.

• INDICATIONS AND DOSE

Actinic keratosis on face or scalp

- ► TO THE SKIN
- Adult: Apply once daily for 5 consecutive days, consider other treatment options if treated area does not show complete clearance after about 8 weeks
- CAUTIONS Avoid contact with eyes avoid contact with inside of ears - avoid contact with inside of nostrils - avoid contact with lips - avoid contact with open wounds or broken skin - avoid occlusive dressings on treated area immunocompromised patients
- PREGNANCY EVGr Avoid—toxicity in animal studies.
- BREAST FEEDING Specialist sources indicate use with caution—amount in milk is likely to be low. Do not apply to breast or nipple and avoid contact with infant's skin.
- DIRECTIONS FOR ADMINISTRATION [EvGr] Each sachet is for single use only and for a treatment area of up to 25 cm². Avoid applying on skin which has not healed from any previous treatment. Before applying, wash the treatment area with mild soap and water and dry. Avoid washing or touching the treated area for 8 hours after application; after this time, area may be washed with mild soap and water. ♠>
- PATIENT AND CARER ADVICE Patients and carers should be advised that excessive exposure to direct sunlight, including the use of sunlamps and sunbeds, are to be avoided. If sun exposure is unavoidable, protective clothing should be worn.

Patients and carers should be advised on the application of $\mathit{Klisyri}^{\oplus}$ ointment.

Missed doses If a dose is missed, apply the ointment as soon as remembered and continue with the regular schedule. Avoid applying more than once a day.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

 Tirbanibulin (Klisyri®) for field treatment of nonhyperkeratotic, non-hypertrophic actinic keratosis (Olsen grade 1) of the face or scalp in adults (December 2021) SMC No. 5MC2395 Recommended

All Wales Medicines Strategy Group (AWMSG) decisions

- Tirbanibulin (Klisyri®) for the field treatment of nonhyperkeratotic, non-hypertrophic actinic keratosis (Olsen grade 1) of the face or scalp in adults (February 2022) AWMSG No. 4076 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

PROTEIN KINASE C ACTIVATORS

Ingenol mebutate

09-Mar-2020

INDICATIONS AND DOSE

Actinic keratosis on face and scalp

- ► TO THE SKIN
- Adult: Apply once daily for 3 days, use the 150 microgram/g gel

Actinic keratosis on trunk and extremities

- ► TO THE SKIN
- Adult: Apply once daily for 2 days, use the 500 microgram/g gel

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED FEBRUARY 2020): INGENOL MEBUTATE GEL (*PICATO®*): SUSPENSION OF THE LICENCE DUE TO RISK OF SKIN MALIGNANCY

Clinical studies have shown an increased incidence of benign and malignant skin tumours (such as basal and squamous cell carcinoma, Bowen's disease, and keratoacanthoma) in patients using ingenol mebutate gel; cases of neuroendocrine carcinoma of the skin, and atypical fibroxanthoma have also been reported. Healthcare professionals are advised to stop prescribing ingenol mebutate gel and consider alternative treatment options for actinic keratosis. The licence of ingenol mebutate has been suspended as a precautionary measure while investigations are carried out. Healthcare professionals should advise patients to be vigilant for the development of any new skin lesions within the treatment area and to seek immediate medical advice if any occur.

- CAUTIONS Avoid contact with broken skin · avoid contact with eyes · avoid contact with inside of ears · avoid contact with inside of nostrils · avoid contact with lips · avoid occlusive dressings on treated area
- SIDE-EFFECTS
- ► Common or very common Headache
- ► Frequency not known Neoplasms skin eruption localised
- PREGNANCY Not absorbed from skin, but manufacturer advises avoid.
- BREAST FEEDING Not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application.
- DIRECTIONS FOR ADMINISTRATION One tube covers skin area of 25 cm². Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.
- MEDICINAL FORMS No licensed medicines listed.

12 Warts and calluses

Warts and calluses

12-Feh-2021

Cutaneous warts

Cutaneous warts are caused by infection of keratinocytes with the human papillomavirus (HPV). They can appear on any part of the body but commonly affect the feet (also known as plantar warts or verrucas) and hands. In most cases, warts resolve spontaneously usually within 2 years; sometimes within months. [EvG] Treatment is required only if the warts are painful, unsightly, persistent, or are causing distress and the patient requests treatment.

Treatment choice is dependent on patient preference and response to previous treatments. Patients with facial warts should be referred to a specialist for treatment. Options for non-facial warts include either the topical keratolytic salicylic acid p. 1381 (or salicylic acid with lactic acid p. 1382), or cryotherapy using liquid nitrogen, or a combination of both. A shorter cryotherapy freeze or weaker salicylic acid preparation is recommended for warts on the back of the hands, as scarring is more likely to occur. Cryotherapy is unlikely to help in the treatment of plantar warts as they can be difficult to treat. When indicated, cryotherapy should be provided by an appropriately trained healthcare professional. (A)

Preparations of formaldehyde p. 1380, glutaraldehyde p. 1380, and silver nitrate p. 1380 are also licensed for the treatment of warts on hands and feet.

Salicylic acid with lactic acid p. 1382 is also licensed for the removal of *corns and calluses*.

Anogenital warts

Anogenital warts (condylomata acuminata) are caused by the human papillomavirus. [EvG Patients with anogenital warts should be referred to a sexual health specialist where possible, and treatment should be accompanied by screening for other sexually transmitted infections. Treatment is not always required, as warts may resolve spontaneously, usually within 6 months.

Topical podophyllotoxin p. 1380 (the major active ingredient of podophyllum) may be used to treat soft, non-keratinised external anogenital warts. Topical imiquimod cream p. 1381 may also be used to treat external anogenital warts; it is suitable for both keratinised and non-keratinised lesions. Cryotherapy or other forms of physical ablative therapy (e.g. surgery, laser treatment) may also be considered, particularly for patients with a small number of low-volume warts, irrespective of type. (A)

Camellia sinensis below ointment is licensed for the treatment of external anogenital warts.

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Camellia sinensis

20-Aug-2020

 DRUG ACTION Camellia sinensis is an extract from green tea leaves. The exact mechanism of action is not known; non-clinical studies have shown inhibition of the growth of activated keratinocytes, and anti-oxidative effects at the site of application.

INDICATIONS AND DOSE

Warts (external genital and perianal) in immunocompetent patients

- ► TO THE LESION
- Adult: Apply up to 250 mg 3 times a day until complete clearance of warts (maximum 16 weeks), do not exceed treatment period even if new warts develop; maximum 750 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ 250 mg is equivalent to 0.5 cm of ointment.
- CAUTIONS Avoid broken skin avoid contact with eyes avoid contact with lips - avoid contact with mouth - avoid contact with nostrils - avoid inflamed skin - uncircumcised males (risk of phimosis) - vulvar region

SIDE-EFFECTS

- ▶ **Uncommon** Balanoposthitis increased risk of infection lymphatic abnormalities necrosis painful sexual intercourse phimosis skin reactions urinary disorders
- ► Frequency not known Urinary tract stenosis vaginal discharge
- CONCEPTION AND CONTRACEPTION Manufacturer advises Catephen® may weaken condoms and vaginal diaphragms—alternative methods of contraception should be considered.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises risk to infant cannot be excluded—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (limited information available).
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises apply to each wart, ensuring a thin layer is left on the wart. It is not necessary to wash off the ointment from the area before next application.
- PATIENT AND CARER ADVICE Manufacturer advises the ointment should be washed off before sexual activity. Manufacturer advises female patients using tampons should insert tampon before applying the ointment.
- NATIONAL FUNDING/ACCESS DECISIONS

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Immunoglobulins

19-Jul-2021

Passive immunity

Immunity with protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 1387 and disease-specific immunoglobulins.

Human normal immunoglobulin (HNIG) is prepared from pooled plasma obtained from donors outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult the Department of Health and Social Care's National Demand Management Programme for Immunoglobulin and Clinical Guidelines for Immunoglobulin Use (both available at: igd.mdsas.com).

For further information on the use of immunoglobulins, see Public Health England (PHE) guidance:

Immunoglobulin: when to use (www.gov.uk/government/ publications/immunoglobulin-when-to-use) and Immunisation against Infectious Disease (www.gov.uk/government/ collections/immunisation-against-infectious-disease-the-green-book).

Availability

Human normal immunoglobulin for intramuscular administration is available from the Immunisation, Hepatitis and Blood Safety Department of PHE's Centre for Infectious Disease Surveillance and some regional PHE and NHS laboratories, for the protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal

immunoglobulin may be purchased from the manufacturer (see Index of manufacturers p. 1798).

Various disease-specific immunoglobulins for intramuscular use are available from either the Immunisation, Hepatitis and Blood Safety Department of PHE's Centre for Infectious Disease Surveillance; some regional PHE and NHS laboratories; PHE's Rabies and Immunoglobulin Service; and/or through Bio Products Laboratory (BPL). Tetanus immunoglobulin p. 1390 is available from BPL, hospital pharmacies, or blood transfusion departments. Hepatitis B immunoglobulin p. 1387 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the Scottish National Blood Transfusion Service (SNBTS).

In Wales all immunoglobulins are available from the Welsh Blood Service (WBS).

In Northern Ireland all immunoglobulins are available from the *Northern Ireland Blood Transfusion Service* (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin (containing 10%–18% protein) is administered by *intramuscular injection* for the protection of susceptible contacts against **hepatitis** A virus (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for intravenous administration is used as replacement therapy for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intrausucularly or subcutaneously, but intravenous formulations are normally preferred.

Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For information on the use of intravenous normal immunoglobulin and alternative therapies for certain conditions, see the Department of Health and Social Care guideline: Immunoglobulin Use (www.gov.uk/government/publications/clinical-guidelines-for-immunoglobulin-use-second-edition-update).

Henatitis A

For close contacts (of the index case) who have chronic liver disease (including chronic hepatitis B or C infection), HIV infection (with a CD4 count < 200 cells per microlitre), are

immunosuppressed, or are aged 60 years or over, normal immunoglobulin in addition to the monovalent hepatitis A vaccine p. 1427 is recommended within 14 days of exposure to the index case (up to 28 days in those with chronic liver disease). Normal immunoglobulin and the monovalent hepatitis A vaccine can be given at the same time, but should be given at separate injection sites.

For further information on post-exposure prophylaxis and information on risk assessment, see Hepatitis A vaccine p. 1401.

Measles

Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Patients with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- · non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 1433 for prophylaxis following exposure to measles.

Rubella

Intramuscular immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 1433.

Tetanus

Normal immunoglobulin [unlicensed] can be used an alternative when tetanus immunoglobulin is not available (see Tetanus immunoglobulin in Disease-specific immunoglobulins).

Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see PHE guidance: Immunoglobulin: when to use (www.gov.uk/government/publications/immunoglobulin-when-to-use).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin p. 1387 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as post-exposure prophylaxis.

Hepatitis B immunoglobulin

Hepatitis B immunoglobulin p. 1387 (HBIG) in addition to the hepatitis B vaccine p. 1429 is recommended for postexposure prophylaxis of individuals in certain high-risk groups to provide rapid protection against hepatitis B until the vaccine becomes effective. HBIG is also recommended in some known non-responders to the hepatitis B vaccine. The administration of HBIG at the same time as the vaccine will not inhibit the antibody response, but they should be given at different sites. For further information on high-risk groups and post-exposure management, see Hepatitis B vaccine D. 1402.

An intravenous and subcutaneous preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

Rabies immunoglobulin

Rabies immunoglobulin p. 1389 should be considered following high risk exposure to rabies to give rapid protection until rabies vaccine p. 1434 (administered at a separate site) becomes effective. When indicated for post-exposure treatment, rabies immunoglobulin should be injected around the site of the wound where possible, rather than intramuscularly, as it neutralises rabies virus before the immune system can respond. There is limited benefit of intramuscular administration away from the wound site. For information about dosing and administration, see rabies immunoglobulin.

Rabies immunoglobulin is not recommended if:

- an individual is already partially or previously immunised (unless immunocompromised);
- more than 7 days have passed since the first dose of rabies vaccine or more than 1 day since the second dose of rabies vaccine;
- the rabies exposure was more than 12 months prior. For further information on risk assessment and post-exposure treatment, see Rabies vaccine p. 1411.

Tetanus immunoglobulin

Intravenous tetanus immunoglobulin is no longer available in the UK and the volume of intramuscular tetanus immunoglobulin required to reach a therapeutic dose would be too large in most individuals with tetanus. Therefore, for the management of suspected or confirmed tetanus infection (including localised tetanus), intravenous normal immunoglobulin [unlicensed] is recommended. For further guidance on the management of confirmed and suspected cases of tetanus (including localised tetanus), see Chapter 30, Tetanus, in *Immunisation against infectious disease*- 'The Green Book' (available at: www.gov.uk/government/publications/tetanus-the-green-book-chapter-30) and Public Health England (PHE) guidance: Tetanus (available at: www.gov.uk/government/publications/tetanus-advice-for-health-professionals).

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 1390 should be considered based on an individual's immunisation status and wound category. If tetanus immunoglobulin is not available, normal immunoglobulin [unlicensed] may be used. For further guidance on the management of tetanus-prone wounds, see PHE guidance: Tetanus (available at: www.gov.uk/ government/publications/tetanus-advice-for-healthprofessionals). When indicated for post-exposure prophylaxis, tetanus immunoglobulin should be used in addition to the other preventative measures of thorough wound cleansing and administration of a tetanus-containing vaccine (depending on immunisation status). Antibacterial therapy may also be warranted depending on clinical severity. For further information, see Post-exposure management in Tetanus vaccine p. 1413.

Varicella-zoster immunoglobulin

Varicella infection in immunosuppressed individuals and pregnant women can lead to severe and even lifethreatening varicella disease. Post-exposure prophylaxis is

recommended to attenuate disease and to reduce the risk of complications

Varicella-zoster immunoglobulin p. 1390 (VZIG) is recommended for individuals who have:

- had a significant exposure to varicella (chickenpox) or herpes zoster (shingles)—this depends on the type of varicella-zoster infection in the index case, the timing of the exposure in relation to onset of rash in the index case, and/or closeness and duration of contact; and
- a clinical condition that increases the risk of severe chickenpox; and
- no antibodies to varicella-zoster virus.

Due to a significant shortage of varicella-zoster immunoglobulin, stock has been prioritised for the most vulnerable groups, such as susceptible women exposed in the first 20 weeks of pregnancy. For susceptible pregnant women exposed after 20 weeks (from 21 weeks to delivery), either varicella-zoster immunoglobulin or aciclovir p. 687 [unlicensed] is recommended; valaciclovir p. 690 [unlicensed] may be used as an alternative. Varicella-zoster immunoglobulin may also be considered in susceptible individuals with renal impairment or intestinal malabsorption (such as inflammatory bowel disease).

For susceptible immunosuppressed individuals, an antiviral [unlicensed] is recommended unless there are significant concerns about renal toxicity or malabsorption. Aciclovir [unlicensed] is recommended first-line; valaciclovir [unlicensed] may be used as an alternative. Immunosuppressed individuals on long term aciclovir or valaciclovir prophylaxis, may require their dose to be temporarily increased.

For further information on risk assessment and the use of VZIG or an antiviral for post-exposure prophylaxis, see the PHE guidance: Varicella-zoster immunoglobulin (available at: www.gov.uk/government/publications/varicella-zoster-immunoglobulin). Refer to the British HIV Association for use of VZIG in individuals with HIV infection. See www.bhiva.org/guidelines for further information.

Individuals who develop chickenpox despite postexposure prophylaxis require treatment with an antiviral; there is no evidence that VZIG is effective in the treatment of disease. For information on the treatment of chickenpox or shingles, see *Varicella-zoster infections* in Herpesvirus infections p. 686.

Anti-D (Rho) immunoglobulin

Anti-D (Rh_0) immunoglobulin below is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh_0) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D (Rh₀) immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh₀) immunoglobulin is also given when significant fetomaternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D (Rh₀) immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

Use of routine antenatal anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh₀) immunoglobulin below is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

MMR vaccine

Measles, mumps and rubella vaccine, live p. 1433 may be given in the postpartum period with anti-D (Rh_0) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

Anti-D (Rh_o) immunoglobulin

03-Mar-2020

INDICATIONS AND DOSE

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, following birth of rhesus-positive infant

- ► BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks' gestation

- ► BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of $\mathbf{Rh}_0(\mathbf{D})$ sensitisation, antenatal prophylaxis

- ► BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesuspositive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of $Rh_0(\mbox{\bf D})$ sensitisation, antenatal prophylaxis (alternative NICE recommendation)

- ► BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 1000-1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 30 weeks gestation

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, following $Rh_0(D)$ incompatible blood transfusion

- ► BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders

continued →

RHOPHYL∆C®

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, following birth of rhesus-positive infant

- ► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Females of childbearing potential: 1000–1500 units, dose to administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation

- ► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

To rhesus-negative woman for prevention of $Rh_0(D)$ sensitisation, antenatal prophylaxis

- ► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of $Rh_0(\text{D})$ sensitisation, following $Rh_0(\text{D})$ incompatible blood transfusion

- ► BY INTRAVENOUS INJECTION
- Females of childbearing potential: 50 units per mL of transfused rhesus-positive blood, alternatively 100 units per of mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders
- CAUTIONS Immunoglobulin A deficiency · possible interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION

- MMR vaccine MMR vaccine may be given in the postpartum period with anti-D (Rh₀) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.
- INTERACTIONS → Appendix 1: immunoglobulins
- SIDE-EFFECTS
- ► Uncommon Chills · fever · headache · malaise · skin reactions
- ▶ Rare or very rare Arthralgia · dyspnoea · hypersensitivity · hypotension · nausea · tachycardia · vomiting
- ► Frequency not known Intravascular haemolysis
- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins need
 to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period
 recommended in the product literature.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ➤ D-Gam (Bio Products Laboratory Ltd)

 Anti-D (RHO) immunoglobulin 500 unit D-Gam Anti-D immunoglobulin 500 unit solution for injection vials | 1 vial PoM
 - Anti-D (RHO) immunoglobulin 1500 unit D-Gam Anti-D immunoglobulin 1,500unit solution for injection vials | 1 vial PoM £58.00
- Rhophylac (CSL Behring UK Ltd)
 Anti-D (RHO) immunoglobulin 750 unit per 1 ml Rhophylac
 1,500units/2ml solution for injection pre-filled syringes | 1 pre-filled
 disposable injection [₱oM] £76.50

Cytomegalovirus immunoglobulin

6-Apr-2020

INDICATIONS AND DOSE

Prophylaxis of cytomegalovirus infection in patients taking immunosuppressants, particularly transplant recipients (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Selective IgA deficiency with IgA antibodies
- CAUTIONS Interference with live virus vaccines
 CAUTIONS FURTHER INFORMATION
- Interference with live virus vaccines Cytomegalovirus immunoglobulin may impair the immune response to live virus vaccines; such vaccines should only be given 3 months after CMV immunoglobulin treatment. Patients receiving measles vaccines should have their antibody status checked as impairment of immune response may persist for up to 1 year.
- INTERACTIONS → Appendix 1: immunoglobulins
- SIDE-EFFECTS Arthralgia · back pain · chills · cutaneous lupus erythematosus · dizziness · embolism and thrombosis · fatigue · fever · haemolysis · haemolytic anaemia · headache · hypotension · infusion related reaction · meningitis aseptic · myocardial infarction · nausea · neutropenia · renal impairment · skin reactions · stroke · transfusion related acute lung injury · vomiting
- MONITORING REQUIREMENTS
- Manufacturer advises monitor for signs of infusion-related reactions during and for at least one hour after each infusion in patients receiving cytomegalovirus immunoglobulin for the first time, or following a prolonged period between treatments, or when a different human immunoglobulin has been used previously; monitor all other patients for at least 20 minutes after each infusion—in case of reaction, reduce rate or stop infusion as clinically appropriate.
- Manufacturer advises monitor urine output and serum creatinine.
- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins need
 to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period
 recommended in the product literature.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Cytotect CP Biotest (Biotest (UK) Ltd)

Cytomegalovirus immunoglobulin human 100 unit per

1 ml Cytotect CP Biotest 5,000units/50ml solution for infusion vials | 1 vial PoM £917.70 (Hospital only)

Cytotect CP Biotest 1,000units/10ml solution for infusion vials | 1 vial Pom £183.54 (Hospital only)

Hepatitis B immunoglobulin

17-Mar-2022

• INDICATIONS AND DOSE

Prophylaxis against hepatitis B infection

- **▶** BY INTRAMUSCULAR INJECTION
- Adult: 500 units, dose to be administered as soon as possible after exposure; ideally within 24–48 hours, but no later than 7 days after exposure

Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material

- ► BY INTRAVENOUS INFUSION
- Adult: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)

Prevention of hepatitis B in haemodialysed patients

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

Prophylaxis against re-infection of transplanted liver

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

Prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients

- ► BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 75 kg): 500 units once weekly, increased if necessary up to 1000 units once weekly, dose to be started 2-3 weeks after last dose of intravenous hepatitis B immunoglobulin
- Adult (body-weight 75 kg and above): 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin
- CAUTIONS IgA deficiency · interference with live virus vaccines
- INTERACTIONS → Appendix 1: immunoglobulins
- SIDE-EFFECTS
- ▶ Uncommon Abdominal pain upper headache
- Rare or very rare Cardiac discomfort fatigue hypersensitivity - hypertension - hypotension - muscle spasms - nasopharyngitis - oropharyngeal pain palpitations - skin reactions
- PRESCRIBING AND DISPENSING INFORMATION Vials containing 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.
- HANDLING AND STORAGE Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Hepatitis B immunoglobulin (Non-proprietary)

Hepatitis B immunoglobulin human 200 unit Hepatitis B immunoglobulin human 200unit solution for injection vials | 1 vial PoM £200.00

Hepatitis B immunoglobulin human 500 unit Hepatitis B immunoglobulin human 500 unit solution for injection vials | 1 vial Pom £500.00

➤ Zutectra (Biotest (UK) Ltd)
Zutectra 500units/1ml solution for injection pre-filled syringes |
5 syringe PoM £1,500.00 (Hospital only)

Solution for infusion

Hepatect CP (Biotest (UK) Ltd)

Hepatitis B immunoglobulin human 50 unit per 1 ml Hepatect CP 100units/2ml solution for infusion vials | 1 vial PoM £55.00 (Hospital only)

Hepatect CP 2000units/40ml solution for infusion vials | 1 vial PoM £1,100.00 (Hospital only)

Hepatitis B immunoglobulin human 50 unit per 1 ml Omri-Hep-B 5000units/100ml solution for infusion vials | 1 vial PoM 및 (Hospital only)

Normal immunoglobulin

01-Apr-2022

INDICATIONS AND DOSE

Post-exposure prophylaxis against hepatitis A infection [using Subgam $^{\circledcirc}]$

- ► BY DEEP INTRAMUSCULAR INJECTION
- Adult: 1000 mg for 1 dose

Rubella in pregnancy, prevention of clinical attack

- ► BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 750 mg

Replacement therapy in primary immunodeficiency disorders (specialist use only) | Replacement therapy in secondary immunodeficiency disorders (specialist use only)

- ► BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

Immune-mediated disorders (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: For some indications, subcutaneous infusion may be used for maintenance treatment—consult product information (consult product literature)
- UNLICENSED USE PHE advises normal immunoglobulin (as Subgam®) is used for post-exposure prophylaxis against hepatitis A infection, but it is not licensed for this indication. PHE advises normal immunoglobulin is used for rubella in pregnancy for prevention of clinical attack, but it is not licensed for this indication.
- CONTRA-INDICATIONS Patients with selective IgA deficiency who have known antibodies against IgA CONTRA-INDICATIONS, FURTHER INFORMATION For full details on contra-indications, consult product literature.

CAUTIONS

GENERAL CAUTIONS Agammaglobulinaemia with or without IgA deficiency · hypogammaglobulinaemia with or without IgA deficiency

SPECIFIC CAUTIONS

► With intravenous use Ensure adequate hydration • obesity renal insufficiency • risk factors for arterial or venous thromboembolic events • thrombophilic disorders CAUTIONS, FURTHER INFORMATION For full details on cautions, consult product literature.

- INTERACTIONS → Appendix 1: immunoglobulins
- SIDE-FFFFCTS

GENERAL SIDE-EFFECTS

➤ Common or very common Diarrhoea · dizziness · fatigue · gastrointestinal discomfort · myalgia · nausea · pain · skin reactions

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intravenous use Arthralgia · chills · embolism and thrombosis · feeling hot · fever · haemolysis · headache · hyperaemia · hypersensitivity · hypertension · infusion related reaction · palpitations · sensory disorder · taste altered · vomiting
- With subcutaneous use Drowsiness · headaches · hypotension · local reaction
- ▶ Uncommon
- With intravenous use Hypothermia
- ▶ With subcutaneous use Paraesthesia
- ► Frequency not known
- With intravenous use Acute kidney injury angina pectoris cutaneous lupus erythematosus dyspnoea leucopenia meningitis aseptic neutropenia shock transfusion related acute lung injury

SIDE-EFFECTS, FURTHER INFORMATION Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

- MONITORING REQUIREMENTS Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.
- DIRECTIONS FOR ADMINISTRATION Administration advice (including licensed route of administration, recommended rate of infusion and reconstitution requirements) varies widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; consult product literature.
- PRESCRIBING AND DISPENSING INFORMATION Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.

Ever The brand name and batch number should be recorded after each administration (in case of transmission of infective agents).

Indications, licensed age groups, and excipients differ between preparations. Some manufacturers also provide hyaluronidase to enhance the absorption of normal immunoglobulin. Further information can be found in the product literature for the individual preparations.

- With intramuscular use Available from ImmForm and from some Public Health England and NHS laboratories (for hepatitis A and rubella prophylaxis).
- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins need
 to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period
 recommended in the product literature.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Rabies immunoglobulin

16-Mar-2020

• INDICATIONS AND DOSE

Post-exposure treatment against rabies infection ► BY LOCAL INFILTRATION, OR BY INTRAMUSCULAR INJECTION

- Child: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site). If more than 2 mL to be given by intramuscular injection then give in divided doses at different sites, to be given in combination with rabies vaccine, not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine
- Adult: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site). If more than 5 mL to be given by intramuscular injection then give in divided doses at different sites, to be given in combination with rabies vaccine, not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine
- CAUTIONS IgA deficiency · interference with live virus vaccines
- INTERACTIONS → Appendix 1: immunoglobulins
- SIDE-EFFECTS
- ► Rare or very rare Arthralgia · chills · fatigue · fever · headache · hypersensitivity · hypotension · influenza like illness · malaise · nausea · skin reactions · tachycardia · vomiting
- PRESCRIBING AND DISPENSING INFORMATION The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore

critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose.

Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins need
 to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period
 recommended in the product literature.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Varicella-zoster immunoglobulin

16-0ct-2020

(Antivaricella-zoster Immunoglobulin)

INDICATIONS AND DOSE

Prophylaxis against varicella infection

- **▶** BY INTRAMUSCULAR INJECTION
- Adult: 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose
- CAUTIONS IgA deficiency · interference with live virus vaccines
- INTERACTIONS → Appendix 1: immunoglobulins
- SIDE-EFFECTS Arthralgia · chills · fever · headache · hypersensitivity · hypotension · malaise · nausea · skin reactions · tachycardia · vomiting
- DIRECTIONS FOR ADMINISTRATION Public Health England advises normal immunoglobulin for intravenous use may be used in those unable to receive intramuscular injections

Manufacturer advises if a large volume (>5 mL) is to be given by intramuscular injection then administer in divided doses at different sites.

- PRESCRIBING AND DISPENSING INFORMATION Available from selected Public Health England and NHS laboratories (also from Bio Products Laboratory).
- HANDLING AND STORAGE Care must be taken to store all
 immunological products under the conditions
 recommended in the product literature, otherwise the
 preparation may become ineffective. Refrigerated
 storage is usually necessary; many immunoglobulins need
 to be stored at 2–8°C and not allowed to freeze.
 Immunoglobulins should be protected from light. Opened
 multidose vials must be used within the period

Botulism antitoxin

12-Jan-2021

Overview

Botulism antitoxin (botulinum antitoxin) p. 1391 [unlicensed] is a polyvalent preparation that contains equine-derived immune globulins against multiple Clostridium botulinum serotypes. It is used for the treatment of suspected cases of botulism, such as foodborne (preformed toxins ingested from contaminated food) and wound botulism (associated with parenteral drug abuse). Humanderived botulism immune globulin [unlicensed] is used for the treatment of infant botulism as part of the Infant Botulism Treatment and Prevention Program. In infant botulism, neurotoxins are formed in the large intestine after ingestion of Clostridium botulinum spores, which are harmless to older children and adults.

Botulism is a notifiable disease in the UK, especially foodborne botulism, which is considered a public health emergency as contaminated food may be available to other individuals. For further information on reporting of

suspected cases, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

All cases of suspected botulism should be managed promptly—treatment should not be delayed while awaiting laboratory diagnosis. Supportive care (including artificial ventilation) and symptomatic treatment may also be necessary

For individuals with wound botulism, surgical debridement and antibacterial therapy are recommended in addition to botulism antitoxin, to help reduce the organism load and toxin production.

For further information on the management of infant, foodborne and wound botulism, see Public Health England guidance: Botulism: clinical and public health management (see *Useful resources*).

Recommendations reflect Botulism: clinical and public health management. Public Health England, December 2018. www.gov.uk/government/publications/botulism-clinical-and-public-health-management

IMMUNE SERA AND IMMUNOGLOBULINS >

ANTITOXINS

Bezlotoxumab

18-Aug-2017

 DRUG ACTION Bezlotoxumab is a human monoclonal antitoxin antibody; it binds to Clostridioides difficile toxin B and neutralises its activity, preventing recurrence of Clostridioides difficile infection.

INDICATIONS AND DOSE

Prevention of recurrence of *Clostridioides difficile* infection in patients at high risk of reinfection

- ► BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg for 1 dose, to be administered during the course of antibacterial therapy for Clostridioides difficile infection

SIDE-EFFECTS

- ► Common or very common Fever headache infusion related reaction nausea
- ► Frequency not known Dizziness · dyspnoea · fatigue · hypertension
- PREGNANCY Manufacturer advises avoid unless essential—limited information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intravenous infusion (Zinplava®), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute requisite dose to a concentration of 1–10 mg/mL with infusion fluid; give over 60 minutes via a central venous catheter or peripheral catheter using a low-protein binding filter (0.2–5 micron).
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates ELECTROLYTES: May contain Sodium

Bezlotoxumab 25 mg per 1 ml Zinplava 1g/40ml concentrate for solution for infusion vials | 1 vial Pom £2,470.00 (Hospital only)

Botulism antitoxin

13-May-2021

INDICATIONS AND DOSE

Treatment of botulism [suspected or confirmed]

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- SIDE-EFFECTS Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

- PRE-TREATMENT SCREENING All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).
- PRESCRIBING AND DISPENSING INFORMATION Available from designated centres after discussion with the on-call duty doctor at Colindale, Public Health England (during and outside of working hours) for risk assessment and further advice on treatment (Tel: (020) 8200 4400).
 For non-urgent queries, contact Botulism@phe.gov.uk.
- MEDICINAL FORMS No licensed medicines listed.

Diphtheria antitoxin

03-Jun-2021

(Dip/Ser)

• INDICATIONS AND DOSE

Treatment of diphtheria [suspected or confirmed]

- ► BY INTRAVENOUS INFUSION
- Adult: Dose should be given without waiting for bacteriological confirmation (consult local protocol)

CAUTIONS

- Hypersensitivity Hypersensitivity is common after administration; resuscitation facilities should be available. Diphtheria antitoxin is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis and vaccine.
- SIDE-EFFECTS
- ► Common or very common Hypersensitivity
- PRE-TREATMENT SCREENING Diphtheria antitoxin is derived from horse serum and reactions are common.
 Public Health England advises hypersensitivity testing should be carried out before use in certain individuals (e.g. those who have a positive history of animal allergy, or prior exposure to equine-derived immunoglobulin).
- PRESCRIBING AND DISPENSING INFORMATION Available from designated centres after discussion with the Duty Doctor at Colindale, Public Health England (during and outside of working hours) for risk assessment and further advice on treatment (Tel: (020) 8200 4400). In Northern Ireland, available from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Diphtheria antitoxin (Non-proprietary)

Diphtheria antitoxin 1000 unit per 1 ml Antidiphtheria serum 10,000units/10ml solution for injection ampoules | 1 ampoule [PoM] [됩 (Hospital only)

3 Tuberculosis diagnostic test

DIAGNOSTIC AGENTS

Tuberculin purified protein derivative (Tuberculin PPD)

• INDICATIONS AND DOSE

Mantoux test

- ► BY INTRADERMAL INJECTION
- ► Child: 2 units for one dose
- Adult: 2 units for one dose

Mantoux test (if first test is negative and a further test is considered appropriate)

- ► BY INTRADERMAL INJECTION

 Child: 10 units for 1 dose
- Adult: 10 units for 1 dose

DOSE EQUIVALENCE AND CONVERSION

- ▶ 2 units is equivalent to 0.1 mL of 20 units/mL strength.
- ▶ 10 units is equivalent to 0.1 mL of 100 units/mL

strength. • CAUTIONS

- Mantoux test Response to tuberculin may be suppressed by viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment and the MMR vaccine. If a tuberculin skin test has already been initiated, then the MMR should be delayed until the skin test has been read unless protection earliest mosels is
- test has been read unless protection against measles is required urgently. If a child has had a recent MMR, and requires a tuberculin test, then a 4 week interval should be observed. Apart from tuberculin and MMR, all other live vaccines can be administered at any time before or after tuberculin
- PRESCRIBING AND DISPENSING INFORMATION Available from ImmForm (SSI brand).

The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

4 Vaccination

injection 1.5ml vials | 1 vial S

Vaccination, general principles

09-Feb-2021

Active immunity

Active immunity can be acquired by natural disease or by vaccination. Vaccines induce active immunity and provide immunological memory by stimulating the production of antibodies and cells involved in the immune response. As a result, the immune system is able to recognise and respond

rapidly to natural infection at a later date. Antibodies can be detected in the patient's blood or serum, but even in the absence of detectable antibodies, immunological memory may still be present. Vaccines consist of either:

- a live attenuated form of the virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. Bacillus Calmette-Guérin vaccine):
- inactivated preparations of the virus (e.g. tick-borne encephalitis vaccine) or bacteria (e.g. meningococcal vaccine):
- inactivated toxins (toxoids) produced by a micro-organism (e.g. tetanus and diphtheria vaccines);
- extracts of a micro-organism which may be derived from the organism (e.g. pneumococcal vaccine), or produced by recombinant DNA technology (e.g. hepatitis B vaccine);
- viral vectors of replicating (attenuated or low pathogenicity viruses) or non-replicating viruses (e.g. Oxford/AstraZeneca COVID-19 vaccine), produced using recombinant technology; or
- nucleic acid (DNA or RNA) of an antigen derived from the virus (e.g. Pfizer/BioNTech or Moderna COVID-19 vaccines) or bacteria.

Live attenuated and replicating viral vector vaccines usually promote a full, long-lasting antibody response. In rare cases, a mild form of the disease may occur with some vaccines, such as a rash following a measles-containing vaccine.

Inactivated or non-replicating vaccines (including toxoids) produce an antibody response following a primary course, which may last for months or years. In most cases booster (reinforcing) injections are required for long-term protection. To stimulate the immune system more broadly, some polysaccharide vaccines have been enhanced by conjugation (such as the *Haemophilus influenzae* type B and meningococcal group C vaccines), while some inactivated vaccines contain an adjuvant (such as aluminium hydroxide or aluminium phosphate) to enhance the antibody response. Inactivated vaccines cannot cause the disease that they are designed to prevent.

For further information on how vaccines are made and what they contain, see Chapter 1, Immunity and how vaccines work, in *Immunisation against infectious disease*'The Green Book' (see *Useful resources*).

Passive immunity

Passive immunity is acquired through the transfer of antibodies from immune individuals either across the placenta, or from the transfusion of blood or blood products including immunoglobulins (for further information, see Immunoglobulins p. 1383). Protection provided by the crossplacental transfer of antibodies provides the infant with temporary protection (commonly for a few weeks to months), and is more effective against some infections (e.g. tetanus and measles) than others (e.g. polio and pertussis).

Vaccination during pregnancy

Live vaccines should not be administered routinely to pregnant females due to the theoretical risk of fetal infection; these should generally be delayed until after delivery. The Immunisation Department of Public Health England (PHE) run a UK-wide surveillance programme on the safety of certain vaccines (measles, mumps, rubella, varicella-zoster, COVID-19, and human papillomavirus) given inadvertently during pregnancy or shortly before conception. For advice on the reporting, risk assessment, and management of inadvertent vaccination in pregnancy, see PHE guidance: Vaccination in pregnancy (available at: www.gov.uk/guidance/vaccination-in-pregnancy-vip).

There is no evidence of risk from vaccinating pregnant females with inactivated vaccines; they do not replicate so cannot harm the fetus. Some inactivated vaccines are actively recommended to prevent severe complications during pregnancy or to the new-born infant, such as the

influenza vaccine, and diphtheria with tetanus, pertussis and poliomyelitis vaccine.

For further information on vaccination in pregnancy, see individual vaccine treatment summaries.

Vaccines in immunosuppression and HIV infection

Almost all individuals can be safely vaccinated; in only a few individuals is vaccination either contra-indicated or should be deferred. Specialist advice should be sought when in doubt, if using live vaccines, or if there are queries about an individual's degree of immunosuppression. In some situations, the specialist may decide that the risk of a specific disease outweighs any potential risk from the vaccine. Antibody responses may be lower in immunosuppressed individuals, therefore additional vaccine doses may be required.

Live vaccines can cause severe or fatal infections in some immunosuppressed individuals due to extensive replication of the vaccine strain. Live vaccines are therefore not recommended for individuals with some types of severe primary or acquired immunodeficiency, or for those who are on or have recently received high doses of certain immunosuppressive or biological therapies.

Inactivated vaccines cannot replicate so may be given to immunosuppressed individuals.

Wherever possible, immunisation or additional booster doses for individuals with immunosuppression, should be carried out either before immunosuppression occurs or deferred until an improvement in immunity has been seen. The optimal timing for any vaccination should be based upon a judgement about the relative need for rapid protection and the likely response. For infants born to females taking immunosuppressive biological therapy during pregnancy, live vaccines should be delayed by 6 months; therefore, the infant will not be eligible to receive the rotavirus vaccine, and if indicated, will need to have their Bacillus Calmette-Guérin vaccine deferred.

Most live vaccines used in the UK immunisation schedule can be safely given to close contacts of an immunosuppressed individual. They carry a low risk of transmission (or the risk can be minimised with simple precautions) from a recently vaccinated close contact to an immunosuppressed individual. Close contacts of immunosuppressed individuals should be fully immunised according to the national Immunisation schedule p. 1394 to reduce the risk of exposure to vaccine preventable conditions, and they should also be offered the annual Influenza vaccine p. 1404.

For further information on vaccines in immunosuppresion, see Chapter 6, Contra-indications and special considerations, and Chapter 7, Immunisation of individuals with underlying medical conditions in *Immunisation against infectious disease-* 'The Green Book' (see *Useful resources*).

For further information on vaccines for individuals with HIV infection, see the British HIV Association guideline: Use of vaccines in HIV-positive adults (available at: www.bhiva.org/vaccination-guidelines), or the Children's HIV Association guidelines: Vaccination of HIV infected children and Preparing HIV-infected children and adolescents for travel (available at: www.chiva.org.uk).

Vaccines and asplenia, splenic dysfunction, or complement disorders

The following vaccines are recommended for individuals with asplenia, splenic dysfunction, or complement disorders (including those taking complement inhibitors) depending on the age at which their condition is diagnosed:

- Influenza vaccine p. 1432;
- Meningococcal groups A with C and W135 and Y vaccine p. 1423 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 1422;

 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1424 and/or 23-valent pneumococcal polysaccharide vaccine p. 1424. Patients on complement inhibitor therapy with eculizumab p. 1104 are not at increased risk of pneumococcal disease and do not require 23-valent pneumococcal polysaccharide vaccine or additional doses of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Additional booster doses of other vaccines should be considered depending on the individual's underlying condition—specialist advice may be required. For information on specific indications for immunisation of vulnerable groups, see Chapter 7, Immunisation of individuals with underlying medical conditions, in Immunisation against infectious disease- 'The Green Book' (see Useful resources).

Children first diagnosed or presenting aged under 1 year should be immunised according to the Immunisation schedule p. 1394. During their first year they should also be given 2 doses of meningococcal groups A with C and W135 and Y vaccine at least 4 weeks apart, and a dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1424 (in order to have received a total of 2 doses of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) with an 8 week interval). 8 weeks following their routine 1 year booster vaccines, they should receive a booster dose of meningococcal groups A with C and W135 and Y vaccine. An additional dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 8 weeks after the routine 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) booster scheduled at 1 year. After their second birthday, a dose of 23-valent pneumococcal polysaccharide vaccine p. 1424 should be given at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed). The influenza vaccine should be given annually in children aged 6 months or older.

Children first diagnosed or presenting aged 1 year to under 2 years should be immunised according to the Immunisation schedule p. 1394, including any routine vaccines due at 1 year of age if not yet administered. 8 weeks following the routine 1 year booster vaccines a dose of meningococcal groups A with C and W135 and Y vaccine should be given. An additional dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1424 should be given at least 8 weeks after the 1 year 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) booster dose. After their second birthday, a dose of 23-valent pneumococcal polysaccharide vaccine p. 1424 should be given at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed). The influenza vaccine should be given annually.

Children first diagnosed or presenting aged 2 years to under 10 years should be immunised according to the Immunisation schedule p. 1394. Additionally, they should be given a dose of meningococcal groups A with C and W135 and Y vaccine and 23-valent pneumococcal polysaccharide vaccine p. 1424. For children who have not received the full routine immunisation for meningococcal group B vaccine (rDNA, component, adsorbed), ensure that 2 doses, 8 weeks apart have been given since their first birthday. For children who have not received any 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1424 previously, a single dose should be given, followed by a dose of 23-valent pneumococcal polysaccharide vaccine at least 8 weeks later. The influenza vaccine should be given annually

Individuals first diagnosed aged 10 years and over regardless of previous immunisations, should be given a dose of 23-valent pneumococcal polysaccharide vaccine p. 1424, meningococcal group B vaccine (rDNA, component, adsorbed) and meningococcal groups A with C and W135 and

Y vaccine. After 4 weeks, an additional dose of meningococcal group B vaccine (rDNA, component, adsorbed) should be given. The influenza vaccine should be given annually.

Vaccines and antitoxins availability

For information on availability of vaccines and antitoxins. see individual monographs.

For antivenom, see Poisoning, emergency treatment

Enquiries for vaccines not available commercially can also be made to:

Vaccines and Countermeasures Response Department Public Health England vaccinesupply@phe.gov.uk

In Northern Ireland, enquiries for vaccines not available commercially should be directed to Northern Health and Social Care Trust's Pharmacy Services (www.northerntrust. hscni.net/services/pharmaceutical-services/).

In Scotland, information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales, enquiries for vaccines not available commercially should be directed to the Welsh Medicines Information Centre (www.wmic.wales.nhs.uk/about/contactus/).

Useful Resources

Recommendations reflect advice from Immunisation against infectious disease- 'The Green Book'. Public Health England, 2013. Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-againstinfectious-disease-the-green-book

Immunisation schedule

06-May-2022

Routine immunisations, sources of information

The following recommendations reflect advice from UKHSA. Recommendations specific to each vaccine can be found in Immunisation against infectious disease- 'The Green Book'. UKHSA at: www.gov.uk/government/collections/immunisationagainst-infectious-disease-the-green-book.

The immunisation schedule reflects advice from 'The complete routine immunisation schedule' produced by UKHSA (2022). For the most up to date immunisation schedule, see: www.gov.uk/government/publications/thecomplete-routine-immunisation-schedule.

The Influenza immunisation recommendations reflect advice from the 'National flu immunisation programme plan 2022/2023 produced by UKHSA, Department of Health and Social Care, and NHS England. For the most up to date letter, see: www.gov.uk/government/publications/national-fluimmunisation-programme-plan.

Vaccines for the immunisation schedule should be obtained from ImmForm at: portal.immform.phe.gov.uk.

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for respiratory complications for 48-72 hours after immunisation. If a baby develops appoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring.

Routine immunisation schedule		
When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)	
Neonates at risk only	 Bacillus Calmette-Guérin vaccine p. 1421 (around 4 weeks). Check severe combined immunodeficiency (SCID) screening outcome before giving, see Bacillus Calmette-Guérin vaccine p. 1396. Hepatitis B vaccine p. 1429 (at birth, 4 weeks, and 1 year, see Hepatitis B vaccine p. 1402 	
8 weeks	 ▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1420 (<i>Infanrix hexa</i>® or <i>Vaxelis</i>®). First dose. ▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1422 (<i>Bexsero</i>®). First dose. ▶ Rotavirus vaccine p. 1435 (<i>Rotarix</i>®). Check SCID screening outcome before giving. First dose. 	
12 weeks	 Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine (<i>Infanrix hexa</i>® or <i>Vaxelis</i>®). Second dose. Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1424 (<i>Prevenar 13</i>®). Single dose. Rotavirus vaccine (<i>Rotarix</i>®). Check SCID screening outcome before giving. Second dose. 	
16 weeks	 Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine (<i>Infanrix hexa</i>® or <i>Vaxelis</i>®). Third dose. Meningococcal group B vaccine (rDNA, component, adsorbed) (<i>Bexsero</i>®). Second dose. 	
1 year (on or after first birthday)	 Measles, mumps and rubella vaccine, live p. 1433 (MMR VaxPRO® or Priorix®). First dose. Meningococcal group B vaccine (rDNA, component, adsorbed) (Bexsero®). Single booster dose. Pneumococcal polysaccharide conjugate vaccine (adsorbed) (Prevenar 13®). Single booster dose. Haemophilus influenzae type b with meningococcal group C vaccine p. 1422 (Menitorix®). Single booster dose. 	
2-3 years on 31st August 2022, and all primary school aged children from reception to year 6	▶ Influenza vaccine p. 1432. Each year from September. Note: live attenuated influenza nasal spray is recommended (Fluenz Tetra [®]); if contra-indicated or unsuitable, see Influenza vaccine p. 1404.	

	When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
	3 years and 4 months, or soon after	 ▶ Diphtheria with tetanus, pertussis and poliomyelitis vaccine p. 1419 (Boostrix-IPV®). Single booster dose. ▶ Measles, mumps and rubella vaccine, live (MMR VaxPRO® or Priorix®). Second dose.
	11-14 years. First dose of HPV vaccine will be offered to individuals aged 12-13 years in England, Wales, and Northern Ireland, and those aged 11-13 years in Scotland. For individuals aged 15 years and over, see Human papillomavirus vaccine p. 1403.	▶ Human papillomavirus vaccines p. 1431 (Gardasil® or Gardasil 9®). 2 dose schedule; second dose 6-24 months after first dose. For individuals with immunosuppression or HIV infection, see Human papillomavirus vaccine p. 1403.
	13-15 years	▶ Meningococcal groups A with C and W135 and Y vaccine p. 1423 (Nimenrix [®]). Single booster dose.
	13-18 years	▶ Diphtheria with tetanus and poliomyelitis vaccine p. 1419 (Revaxis®). Single booster dose. Note: Can be given at the same time as the dose of meningococcal groups A with C and W135 and Y vaccine at 13-15 years of age.
	Females of child-bearing age susceptible to rubella	Measles, mumps and rubella vaccine, live. Females of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation, and avoid pregnancy for one month after vaccination.
	Pregnant females	Acellular pertussis-containing vaccine administered as diphtheria with tetanus, pertussis and poliomyelitis vaccine (Boostrix-IPV [®]). 1 dose from the 16th week of pregnancy, preferably after the fetal anomaly scan (weeks 18-20). Influenza vaccine (inactivated). Single dose administered from September, regardless of the stage of pregnancy (see Influenza vaccine p. 1404).

Routine immunisations during a	outine immunisations during adult life			
When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)			
Under 25 years, those entering university who are at risk of meningococcal disease	▶ Meningococcal groups A with C and W135 and Y vaccine (Nimenrix® or Menveo®). Single dose. Note: Should be offered to those aged under 25 years entering university who have not received the meningococcal groups A with C and W135 and Y vaccine over the age of 10 years.			
During adult life, if not previously immunised or 5 dose course is incomplete	▶ Diphtheria with tetanus and poliomyelitis vaccine.			
65 years	▶ Pneumococcal polysaccharide vaccine p. 1424.			
From 65 years	▶ Influenza vaccine (inactivated). Each year from September (see Influenza vaccine p. 1404).			
70-79 years	► Herpes-zoster vaccine, live p. 1431. Note: live attenuated vaccine is recommended (Zostavax®); if contra-indicated or unsuitable, offer herpes-zoster vaccine (recombinant, adjuvanted) p. 1431 (Shingrix®), see Varicella-zoster vaccines p. 1415.			

Individuals with unknown or incomplete immunisation history

For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administered where the routine childhood immunisation schedule has not been completed.

For advice on dosing schedules for missed vaccinations, and the immunisation of individuals coming to the UK. consult Chapter 11. The UK immunisation schedule, in Immunisation against infectious disease- 'The Green Book'. UKHSA, available at: www.gov.uk/government/publications/ immunisation-schedule-the-green-book-chapter-11, and UKHSA guidance: Vaccination of individuals with uncertain or incomplete immunisation status, available at: www.gov.uk/ government/publications/vaccination-of-individuals-withuncertain-or-incomplete-immunisation-status.

Immunisations for healthcare and laboratory staff

Vaccine-preventable diseases that can be transmitted from person to person are a risk for staff and patients in healthcare environments, and staff in laboratory environments. Therefore, all staff must be up-to-date with their routine immunisations. In addition, specific immunisations are recommended for certain staff groups due to the risk of acquiring or passing on infection. For detailed recommendations, consult Chapter 12. Immunisation of healthcare and laboratory staff in

Immunisation against infectious disease- 'The Green Book'. UKHSA, available at: www.gov.uk/government/publications/ immunisation-of-healthcare-and-laboratory-staff-the-green-bookchapter-12.

Anthrax vaccine

04-May-2021

Overview

Anthrax vaccine p. 1420 is made from antigens from inactivated Bacillus anthracis adsorbed onto an adjuvant. Anthrax immunisation is indicated for individuals who handle infected animals or process infected animal products where there is a potential risk of occupational exposure to B. anthracis. It is also recommended for occupations where workers are at risk of one-off high level exposures to anthrax (e.g. following a deliberate or accidental release of spores).

A 4-dose regimen is used for primary immunisation; a single booster dose should be given at 10-year intervals on up to 3 occasions to workers at potential continuous low level risk of exposure to anthrax. In those with potential intermittent high level exposure, a single booster dose should be offered just before entering situations with a specific high exposure risk. If such opportunities do not arise, a single booster dose should be given at 10-year intervals on up to 3 occasions to sustain protection.

In the event of proven or high probability of exposure to anthrax spores, a single booster dose should be given, in

addition to antibacterial prophylaxis, except when a dose has been given in the preceding 12 months.

Advice on the treatment of previously unvaccinated individuals with a proven or high probability of exposure to anthrax spores can be found at: www.gov.uk/government/publications/chemical-biological-radiological-and-nuclear-incidents-recognise-and-respond.

Anthrax is a notifiable disease in the UK. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

Useful Resources

Recommendations reflect Chapter 13, Anthrax, in Immunisation against infectious disease— 'The Green Book'. Public Health England. February 2017.

www.gov.uk/government/publications/anthrax-the-green-book-chapter-13

Bacillus Calmette-Guérin vaccine

08-Oct-2021

Overview

The Bacillus Calmette-Guérin vaccine p. 1421 (BCG vaccine) contains a live attenuated strain derived from *Mycobacterium bovis* and is indicated for the prevention of Tuberculosis p. 630.

BCG immunisation is recommended for the following individuals if immunisation has not previously been carried out and they are tuberculin-negative:

- all neonates and infants (aged 0–12 months) living in areas of the UK where the annual incidence of tuberculosis is 40 cases per 100 000 or greater;
- all neonates and infants (aged 0–12 months) with a parent or grandparent born in a country where the annual incidence of tuberculosis is 40 cases per 100 000 or greater;
- previously unvaccinated children (aged 1–5 years) with a parent or grandparent born in a country where the annual incidence of tuberculosis is 40 cases per 100 000 or greater (tuberculin testing is not usually required);
- previously unvaccinated children (aged 6–15 years) with a parent or grandparent born in a country where the annual incidence of tuberculosis is 40 cases per 100 000 or greater;
- previously unvaccinated children (aged under 16 years) with close contact to cases of sputum smear-positive pulmonary or laryngeal tuberculosis;
- previously unvaccinated children (aged under 16 years) who were born in, or lived for at least 3 months in a country where the annual incidence of tuberculosis is 40 cases per 100 000 or greater;
- previously unvaccinated individuals at occupational risk (irrespective of age). This includes healthcare workers or laboratory staff who have direct contact with patients with tuberculosis or potentially infectious clinical materials, and veterinary and abattoir staff handling animals or animal materials that could be infected with tuberculosis. BCG vaccination can also be considered for staff working with prisoners, homeless people, people with drug and alcohol misuse, and those who work with refugees and asylum seekers.

As part of the neonatal BCG immunisation programme, immunisation is recommended for eligible neonates at 28 days of age (or soon after), to ensure that the result of the severe combined immunodeficiency (SCID) screening is available and checked prior to it being given. Vaccination may be given earlier than 28 days of age, provided that the SCID screening result is available. For further information, see UKHSA guidance: Changing the timing of the neonatal BCG immunisation programme to a 28 day immunisation programme: effective from 1 September 2021 (see *Useful resources*).

Although protection provided by BCG vaccine may decrease with time, there is no evidence that repeat vaccination offers significant additional protection and therefore repeat BCG vaccination is not recommended.

The Bacillus Calmette-Guérin vaccine is contra-indicated in all HIV-infected individuals. For advice on BCG vaccination in immunosuppressed individuals, consult Chapter 32: Tuberculosis - 'The Green Book', Public Health England (see *Useful resources*).

For advice on drug treatment, see Tuberculosis p. 630; for the treatment of infection following vaccination, seek expert advice

Travel

The risk of a traveller acquiring tuberculosis infection depends on several factors including the incidence of tuberculosis in that country, the duration of travel, the degree of contact with the local population, the work setting of the traveller (if any), the reason for travel, and the susceptibility and age of the traveller.

BCG vaccine is recommended for previously unvaccinated, tuberculin-negative individuals aged under 16 years, or for healthcare workers at high risk of exposure to patients with tuberculosis, who intend to travel for 3 months or more in a country where the annual incidence of tuberculosis is 40 cases per 100 000 or greater, or where the risk of multi-drug resistant tuberculosis is high. The risk of tourists acquiring tuberculosis infection is low and BCG vaccine is not required if no other factors are present.

A list of countries where the annual incidence of tuberculosis is 40 cases per 100 000 or greater, is available at www.government/publications/tuberculosis-tb-by-country-rates-per-100000-people.

Tuberculin skin testing

The tuberculin skin test (*Mantoux test*) is used to assess an individual's sensitivity to tuberculin protein when BCG vaccination is being considered or as an aid to diagnosis of tuberculosis. A tuberculin skin test involves administration of tuberculin purified protein derivative p. 1392 by intradermal injection. It is necessary before BCG vaccination for:

- individuals aged 6 years and over;
- children aged under 6 years living in a country for more than 3 months with an annual tuberculosis incidence of 40 cases per 100 000 or greater;
- those who have had close contact with a person with known tuberculosis;
- those who have a family history of tuberculosis within the last 5 years.

BCG vaccination can be given up to three months following a negative tuberculin test.

The BCG vaccine should not be administered to an individual with a positive tuberculin test—it is unnecessary and may cause a more severe local reaction. Those with a *Mantoux test* induration of 5 mm and greater should be referred to a tuberculosis clinic for assessment of the need for further investigation and treatment.

Tuberculosis is a notifiable disease in the UK. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

Useful Resources

Recommendations reflect Chapter 32, Tuberculosis, in *Immunisation against infectious disease*– 'The Green Book'. Public Health England, August 2018.

Cholera vaccine

07-Nov-2018

Overview

Oral cholera vaccine p. 1421 contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for adults and children from 2 years of age who are travelling to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least one week before potential exposure. However, there is no requirement for cholera vaccination for international travel. After a full risk assessment, immunisation can be considered for the following individuals:

- relief or disaster aid workers;
- persons with remote itineraries in areas where cholera epidemics are occurring and there is limited access to medical care.
- travellers to potential cholera risk areas, for whom vaccination is considered potentially beneficial:
- individuals at occupational risk, such as laboratory workers who may be regularly exposed to cholera.

For dosing schedule, see cholera vaccine.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

All suspected cases of cholera must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Contacts

Contacts of patients with cholera should maintain high standards of personal hygiene to avoid becoming infected. Cholera vaccine should not be used in the management of contacts of cases or in controlling the spread of infection.

Useful Resources

Recommendations reflect Chapter 14, Cholera, in *Immunisation against infectious disease*— 'The Green Book'. Public Health England, December 2013.

www.gov.uk/government/publications/cholera-the-green-book-chapter-14

COVID-19 vaccines

05-May-2022

Overview

There are 5 COVID-19 vaccines authorised for use in the UK—the messenger RNA (mRNA) vaccines, Pfizer/BioNTech (Comirnaty®) and Moderna (Spikevax®); the adenovirus vector vaccines, AstraZeneca (Vaxzevria®) and Janssen (Ad26.COV2-S [recombinant]); and the recombinant, adjuvanted protein-based vaccine, Novavax (Nuvaxovid®). The Janssen and Nuvaxovid® vaccines are not currently being supplied routinely in the UK.

There have been reports of a rare condition involving serious thromboembolic events with thrombocytopenia following vaccination with the AstraZeneca and Janssen vaccines. This condition, known as vaccine-induced immune thrombocytopenia and thrombosis (VITT), is a syndrome that develops within 5 to 30 days of receiving vaccination. For further information on blood clotting following COVID-19 vaccination, see UKHSA guidance: Information for healthcare professionals on blood clotting following COVID-19 vaccination (available at: www.gov.uk/government/publications/covid-19-vaccination-blood-clotting-

information-for-healthcare-professionals/information-for-healthcare-professionals-on-blood-clotting-following-covid-19-vaccination), and for guidance on the diagnosis and management of VITT, see NICE rapid guideline: Vaccine-induced immune thrombocytopenia and thrombosis (available at: www.nice.org.uk/guidance/ng200). For guidance on vaccine choice, see *Age specific recommendations for vaccine choice*.

Primary immunisation

The COVID-19 vaccination programme consists of a primary vaccination course followed by a booster dose/s in eligible individuals. The vaccination programme aims to provide protection for individuals who are considered at highest risk of severe illness or death from COVID-19 infection, as well as protecting frontline health and social care staff from exposure. JCVI have provided advice on priority groups for vaccination as part of phase 1 and 2 of the programme according to risk. The risk of poorer outcomes from infection increases with age in both healthy adults and in adults with underlying health conditions. Older adults, particularly those aged over 65 years, are at highest risk.

There is also an increased risk of hospitalisation in males, individuals from certain ethnic minority backgrounds, individuals from socio-economically deprived areas, and those who are obese or morbidly obese. In children, the risk of severe disease or death from COVID-19 infection is very low. However, some children with certain underlying health conditions are at higher risk of severe COVID-19 disease.

Based on JCVI advice, the following groups were eligible for immunisation in *phase* 1:

- residents of, and staff working in care homes for older adults;
- all individuals aged 50 years and over;
- · frontline health and social care workers;
- individuals aged 16 years and over in clinical at-risk groups;
- individuals aged 16 years and over who are eligible for a carer's allowance, or who are the main carer for a clinically vulnerable older or disabled individual:
- individuals aged 16 years and over who are household contacts of immunosuppressed individuals (of any age);
- individuals experiencing homelessness.

Based on JCVI advice, all individuals aged 5 years and over are eligible for immunisation in $\it phase$ 2.

For further information on priority groups in phase 1 and 2 (such as group rankings in order of priority, definition of frontline health and social care workers, and underlying health conditions included in clinical at-risk groups), see Chapter 14a: COVID-19 - SARS-CoV-2, in *Immunisation against infectious disease*- 'The Green Book' (see *Useful resources*).

Most eligible individuals should receive 2 doses of COVID-19 vaccine p. 1425 for their primary course; 3 doses are required for individuals aged 5 years and over who were severely immunosuppressed at the time of their vaccination. For further information on vaccination in individuals with severe immunosuppression (including vaccine choice), see Immunosuppression and HIV. For most individuals, ICVI recommend a minimum 8 week interval between doses for all available vaccines where a multi-dose primary schedule is used, unless rapid immunisation is required in specific circumstances (such as individuals about to receive immunosuppressive treatment). However, for healthy individuals aged under 18 years who are not health and social care workers, carers, or household contacts of immunosuppressed individuals, a minimum 12 week interval between doses is recommended. Vaccine choice is dependent on age and comorbidities, (see Age specific recommendations for vaccine choice).

In individuals with confirmed COVID-19 infection, vaccination should be deferred. For all adults, and children

who are in clinical at-risk groups, are health and social care workers, or household contacts of immunosuppressed individuals, vaccination should ideally be deferred until clinical recovery (approximately 4 weeks after the onset of symptoms, or 4 weeks from the first confirmed positive result in those who are asymptomatic). For healthy individuals aged under 18 years who are not health and social care workers or household contacts of immunosuppressed individuals, vaccination should ideally be deferred for a minimum of 12 weeks from infection onset or sample date.

The same COVID-19 vaccine should ideally be used for the entire course, where possible. If the same vaccine is not available or suitable, or if the first product received is unknown, a suitable available product should be given to complete the primary course. If the course is delayed, it should be resumed, but the 1st dose should not be repeated. Individuals presenting for vaccination who have participated in a COVID-19 vaccine clinical trial should have written advice provided by their clinical trial investigators about vaccination in the routine programme. For further information on the COVID-19 vaccine (such as inadvertent administration errors, delayed administration of the 2nd dose, or exceptional circumstances for administration of a different second vaccine), see UKHSA guidance: COVID-19 vaccination programme (see Useful resources); and for guidance on completing vaccination in individuals who received vaccine doses abroad, see UKHSA: Vaccination of those who received COVID-19 vaccination overseas (available at: www.gov.uk/government/publications/covid-19-vaccinations-received-overseas).

Although there is no data on co-administration of COVID-19 vaccines with other vaccines, interference would likely be minimal. Whilst co-administration may make the attribution of adverse effects more difficult, it is generally better to proceed with vaccination to avoid further delay in protection or risk of the patient not returning for a later appointment. An exception to this is the herpes zoster (shingles) vaccines, where an interval period of 7 days should ideally be observed.

All vaccinated individuals should be advised to continue to follow the advice in place regarding social distancing, regular handwashing, and use of face coverings following immunisation.

COVID-19 vaccines are an area of ongoing research and recommendations may change as more data and other vaccines become available. For further information on the COVID-19 vaccination programme, see the UKHSA collection (available at: www.gov.uk/government/collections/covid-19-vaccination-programme).

Age specific recommendations for vaccine choice Individuals aged under 18 years

Although the Moderna vaccine is authorised for use in children aged 12 years and over, the preferred COVID-19 vaccine p. 1425 for use in children is the Pfizer/BioNTech vaccine due to a lower reported rate of myocarditis. Individuals aged 16-17 years who have already received their 1st dose with the AstraZeneca [unlicensed] vaccine can complete the course with the same vaccine or with an mRNA vaccine.

Individuals aged 18-39 years (not in clinical at-risk groups)
For healthy individuals aged 18-39 years (including health
and social care workers, carers, and household contacts of
immunosuppressed individuals), JCVI advises that it is
preferable to offer an mRNA COVID-19 vaccine rather than
the AstraZeneca vaccine where available. If an mRNA
vaccine is not available, individuals can make an informed
choice to receive the AstraZeneca COVID-19 vaccine
(provided they understand the relative risks and benefits).
Individuals who have already received their 1st dose with the
AstraZeneca vaccine can complete the course with the same
vaccine or with an mRNA vaccine.

Individuals aged 40 years and over (not in clinical at-risk groups) or individuals aged 18 years and over in clinical at-risk groups

For individuals aged 40 years and over, and those aged 18 years and over in clinical at-risk groups, the JCVI, MHRA and the WHO consider the benefits of vaccination to outweigh the risk from rare adverse events seen after vaccination with the AstraZeneca vaccine. All individuals can be offered vaccination with any available COVID-19 vaccine, unless otherwise contra-indicated.

Booster doses

JCVI advise that a booster dose should be offered at least 3 months after completion of primary immunisation (2 or 3 doses) to all individuals aged 16 years and over, and to children aged 12-15 years in clinical at-risk groups or who are household contacts of immunosuppressed individuals.

A further booster dose (spring booster) should be offered around 6 months after the previous booster to individuals aged 75 years and over, residents in care home for older adults, and those aged 12 years and over who are immunosuppressed. For individuals who received their 1st booster dose more recently, the spring booster should also be offered provided it has been at least 3 months since the last dose. For individuals who receive their 1st booster dose during the spring booster campaign, an additional booster dose is not recommended before the autumn (an autumn booster campaign is expected).

For individuals aged 18 years and over, the Pfizer/BioNTech or Moderna COVID-19 vaccine should be offered for the booster dose/s irrespective of the vaccine used for the primary course. For eligible individuals aged under 18 years, the Pfizer/BioNTech vaccine is preferred. For individuals in whom mRNA vaccines are unsuitable and who have received at least one dose of AstraZeneca vaccine previously, the AstraZeneca vaccine may be considered. In exceptional circumstances, individuals aged 40 years and over who have previously received an mRNA vaccine may be offered the AstraZeneca vaccine; this should be on a case-by-case basis.

Individuals who have participated in a COVID-19 vaccine clinical trial should have written advice provided by their clinical trial investigators about vaccination in the routine programme. For further information on booster doses (including dosing intervals for those about to receive immunosuppressive treatment), see Chapter 14a: COVID-19 - SARS-CoV-2, in *Immunisation against infectious disease*- 'The Green Book' (see *Useful resources*); and for guidance in individuals who received vaccine doses abroad, see UKHSA: **Vaccination of those who received COVID-19** vaccination overseas (available at: www.gov.uk/government/publications/covid-19-vaccinations-received-overseas).

Pregnancy

JCVI advise that pregnant females should be offered immunisation against COVID-19 as pregnancy is a clinical risk factor for severe COVID-19 infection. The preferred COVID-19 vaccine for use in pregnant females aged 18 years and over is the Pfizer/BioNTech or Moderna vaccine. The preferred vaccine for use in pregnant females aged under 18 years is the Pfizer/BioNTech vaccine. Females who are planning a pregnancy or are immediately post-partum should also be offered vaccination with a suitable COVID-19 vaccine.

If started prior to, or given inadvertently during early pregnancy, vaccination should be completed during pregnancy at the recommended intervals; pregnant females who have already received a dose of the AstraZeneca vaccine can complete the course with the same vaccine or with an mRNA vaccine. Any inadvertent exposure to the COVID-19 vaccine from the first day of the last menstrual period to any time during pregnancy, should be reported to the

Immunisation Department of PHE who run UK-wide surveillance on the safety of vaccines given in pregnancy. For advice on the reporting of inadvertent vaccination in pregnancy, see PHE guidance: Inadvertent vaccination in pregnancy (VIP)(available at: www.gov.uk/guidance/ vaccination-in-pregnancy-vip). For further information on COVID-19 vaccination and disease in pregnancy, see www.gov.uk/government/publications/safety-of-covid-19-vaccines-when-given-in-pregnancy.

Immunosuppression and HIV

Individuals with immunosuppression and HIV infection (regardless of CD4 count) are considered at-risk and should be vaccinated against COVID-19 in accordance with JCVI recommendations (see Primary immunisation and Booster doses).

Individuals with severe immunosuppression may have an inadequate immune response to a primary course of vaccination and may therefore remain at high risk. JCVI advise that individuals aged 5 years and over who were severely immunosuppressed at the time of receiving their 1st or 2nd dose of COVID-19 vaccine, should be offered a 3rd dose as part of their primary course (ideally at least 8 weeks after the 2nd dose). For vaccine choice, see Age specific recommendations for vaccine choice for the 3rd primary dose; and for further information on 3rd primary dose vaccination (including the definition of severe immunosuppression), see Chapter 14a: COVID-19 - SARS-CoV-2, in Immunisation against infectious disease- 'The Green Book' (see Useful resources). Individuals aged 12 years and over with severe immunosuppression should also be offered booster doses to extend protection from their primary course. For further guidance, see Booster doses.

As there is limited evidence on response to immunisation in individuals with immunosuppression, specialists may advise their patients on optimal timing of vaccine delivery based on the patient's immune status, likely response to vaccination, risk of COVID-19 and of exposure. Postvaccination testing for individuals with severe immunosuppression may be considered by specialists managing their care; advice on whether further precautions are required to reduce their risk can then be given if appropriate.

Refer to the British HIV Association for further information on the use of COVID-19 vaccine in HIV-positive individuals. See www.bhiva.org/SARS-CoV-2-vaccine-advice-foradults-living-with-HIV-update for further information.

Age specific recommendations for vaccine choice for the 3rd primary dose

For individuals aged 5-17 years with severe immunosuppression, the Pfizer/BioNTech COVID-19 vaccine p. 1425 is preferred.

For individuals aged 18 years and over with severe immunosuppression, either the Pfizer/BioNTech or Moderna COVID-19 vaccine are preferred. The AstraZeneca vaccine is an alternative option for individuals who have already received this previously if mRNA vaccines are clinically unsuitable. In exceptional circumstances, individuals aged 40 years and over who have previously received an mRNA vaccine may be offered the AstraZeneca vaccine; this should be on a case-by-case basis.

Post-exposure management

COVID-19 is a notifiable disease in the UK. For further information, see Notifiable diseases in Antibacterials, principles of therapy p. 540.

There is limited evidence on the use of COVID-19 vaccines as post-exposure prophylaxis or to prevent transmission during outbreaks. For vulnerable individuals who require direct protection during prolonged community outbreaks, advice on post-exposure management can be sought from local health protection teams.

For the management of COVID-19 infection and links to other resources, see COVID-19 p. 674.

Diphtheria vaccine

Overview

Diphtheria-containing vaccines are prepared from the toxin of Corynebacterium diphtheriae and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antibody. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years, vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1420 (Infanrix hexa®) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine . Individuals aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

Diphtheria-containing vaccines for children over 10 years and

A low dose of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster agenh

Travel

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low

dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

ontacts

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with *C. diphtheriae* or *C. ulcerans* should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. **Adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine** is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. See advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual.

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Haemophilus influenzae type b conjugate vaccine 25-Nov-2020

Overview

Haemophilus influenzae type b (Hib) containing vaccines are inactivated, and are made from capsular polysaccharide extracted from cultures of Hib bacteria. The polysaccharide is conjugated with a protein (such as tetanus toxoid) to increase immunogenicity, especially in young children. The Hib conjugate vaccine is only available as a combination preparation containing other vaccines.

Hib vaccination is given as a component of the routine childhood immunisation programme to provide protection against invasive Hib disease for children aged under 10 years (see Immunisation schedule p. 1394). If the child's routine immunisation is delayed, children aged under 10 years should be immunised at the earliest opportunity. Hib vaccination may also be given to individuals aged 10 years and over who are considered to be at increased risk of invasive Hib disease.

A primary course consists of 3 doses of the diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1420, given at 4 weekly intervals.

Children aged under 1 year should be given a primary course, followed by a booster dose of the haemophilus influenzae type b with meningococcal group C vaccine p. 1422 at 1 year of age (usually on or after the child's first birthday). This should be given at least 4 weeks after the last dose of Hib-containing vaccine, and where there has been a delay, can be given up until 10 years of age. Early immunisation with a primary course may be considered for children from 6 weeks of age if required in certain

circumstances, such as for travel reasons (immunisation may be given at an interval of 3 weeks for 1 dose only, with the other 2 doses completed at an interval of at least 4 weeks).

If the primary course was commenced with the pentavalent diphtheria with tetanus, pertussis, poliomyelitis and haemophilus influenzae type b vaccine p. 1420, it can be completed with the diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine. If interrupted, the primary course should be resumed but not repeated, allowing a 4 week interval between doses.

Children aged 1 year to under 10 years who have not been immunised against Hib need to only receive 1 dose of the haemophilus influenzae type b with meningococcal group C vaccine. However, children who have not completed a primary course of diphtheria, tetanus, pertussis and polio, should be given 3 doses of the diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine at 4 weekly intervals, in order to be fully protected against diphtheria, tetanus, pertussis and polio.

For further information on vaccination of children with uncertain or incomplete immunisation status, see Chapter 11, The UK immunisation schedule, in *Immunisation against infectious disease-* 'The Green Book'.

For information on immunisation of individuals with neurological conditions, see Chapter 16, *Haemophilus influenzae* type b (Hib), in *Immunisation against infectious disease-* 'The Green Book'.

Children with immunosuppression and HIV infection (regardless of CD4 count) should be given Hib-containing vaccines according to the routine immunisation schedule (see Immunisation schedule p. 1394). Consider reimmunisation after treatment completion—specialist advice may be required. Refer to the British HIV Association and Children's HIV Association for further information on the use of Hib-containing vaccines in individuals with HIV infection. See www.bhiva.org/guidelines and www.chiva.org.uk/ for further information.

Post-exposure management of invasive Haemophilus influenzae type b disease

Acute meningitis caused by Hib is a notifiable disease in England, Northern Ireland and Wales. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

To reduce the risk of secondary invasive Hib disease in the index case and their close contacts (such as contacts in a household, or a pre-school or primary school setting), antibacterial prophylaxis and vaccination may be required. Individual risk is determined by factors such as age, health status, and immunisation history. For information on antibacterial prophylaxis, see *Haemophilus influenzae type b infection: prevention of secondary disease* in Antibacterials, use for prophylaxis p. 542.

Children aged under 10 years who are unimmunised or partially immunised against Hib disease and are either the index case, a household contact of the index case, or a contact of the index case in a pre-school or primary school setting, should complete their primary immunisation. Vaccination of the index case should occur after recovery from invasive Hib infection. For further information on primary immunisation, see *Overview*. Children aged under 10 years who have completed their age-specific primary immunisation, and individuals of any age with asplenia or splenic dysfunction, may need an additional dose of a Hibcontaining vaccine. For further information on vaccination following a case of invasive Hib disease, see Public Health England guidance: *Haemophilus influenzae* type b (see *Useful resources*).

Hepatitis A vaccine

22-Sep-2020

Overview

The hepatitis A vaccine p. 1427 is prepared from different strains of the virus grown in human diploid cells. The inactivated vaccine is available as a monovalent vaccine (different monovalent vaccines can be used interchangeably), or in combination with hepatitis B or typhoid—vaccine choice is dependent on which infection(s) the individual requires protection from. Immunisation with normal immunoglobulin p. 1387 can be used to provide immediate protection against hepatitis A.

Pre-exposure prophylaxis

Immunisation against hepatitis A is recommended for individuals at high risk of hepatitis A exposure, those with certain underlying medical conditions, and those at risk of complications, as listed:

- laboratory staff who may be exposed to the virus;
- staff and residents of homes for those with severe learning difficulties, or where personal hygiene among patients may be poor:
- workers at risk of repeated exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia being treated with plasmaderived clotting factors;
- patients with severe liver disease regardless of the cause (consider for those with chronic hepatitis B or C infection and for patients with milder liver disease);
- individuals travelling to or going to reside in areas of intermediate or high prevalence, see Travel below;
- · individuals who are at risk due to their sexual behaviour (such as men who have sex with men);
- · parenteral drug misusers.

Immunisation may be considered under certain circumstances for:

- food packagers and handlers where a case or outbreak occurs—advice should be sought from the local Health Protection Team:
- staff in day-care facilities where there is a community outbreak-advice should be sought from the local Health Protection Team:
- healthcare workers

Immunisation against hepatitis A infection requires a primary pre-exposure course. The immunisation regimens for monovalent hepatitis A vaccine and hepatitis A with typhoid vaccine p. 1428 consist of a single dose. For immunisation using the combined hepatitis A and B vaccine, the dosing regimen depends on the product used, see hepatitis A and B vaccine p. 1426 for dosing schedules (including accelerated course information).

Individuals with immunosuppression and HIV infection can be given hepatitis A-containing vaccines. Consider reimmunisation—specialist advice may be required. Refer to the British HIV Association or Children's HIV Association for further information on the use of hepatitis A vaccine in HIVpositive individuals. See www.bhiva.org or www.chiva.org.uk for further information.

A booster dose is usually given 6-12 months after the initial dose of hepatitis A-containing vaccine, and ensures immunity beyond 10 years; however, successful boosting can occur even if the second dose is delayed by several years. A further booster dose 25 years after full primary immunisation is only considered necessary if the risk of hepatitis A infection is still present.

Pre-exposure immunisation is recommended for individuals travelling to or going to reside in areas of high or intermediate prevalence. Immunisation should ideally be given 2 weeks prior to departure, but can be given up to the day of departure; the use of normal immunoglobulin for travel prophylaxis is no longer recommended. Care should also be taken to avoid hepatitis A exposure through food and water. Further information on country-specific hepatitis A risk is available from the National Travel Health Network and Centre (travelhealthpro.org.uk/) and Health Protection Scotland (www.travax.nhs.uk).

Post-exposure prophylaxis

Hepatitis A (acute infectious hepatitis) is a notifiable disease in the UK. For further information, see Notifiable diseases in Antibacterials, principles of therapy p. 540.

A risk assessment should be carried out for the index case (particularly if infection occurs in a non-household setting), and the national standard questionnaire also completed for all probable and confirmed cases. Verbal and written guidance on the importance of good hygiene practices (such as hand washing after using the toilet, changing nappies, and before preparing food) should be given to the index case. their family and other close contacts. If sexual transmission is the likely route (particularly between men who have sex with men), advice on prevention of hepatitis A spread during sex should also be given. For further information on the management of index cases and link to the national standard questionnaire, see Public Health England (PHE) guidance: Public Health control and management of hepatitis A

(see Useful resources).

Close contacts of the index case(s) should have a risk assessment as soon as possible within 14 days of exposure. Prophylactic treatment choice for close contacts depends on susceptibility (determined by age and health status) and time since exposure. There should be a low threshold for considering someone a close contact.

Close contacts should be considered immune if they have a documented history of either a completed primary course within the past 10 years, or a single dose of monovalent vaccine within the past year, or if they have previously had laboratory-confirmed hepatitis A.

Post-exposure prophylaxis is **not** required for healthy close contacts aged under 1 year not attending childcare; immunisation should be offered to all those who assist in the child's toileting to prevent tertiary infection. For close contacts aged 2-12 months attending childcare, a dose of monovalent hepatitis A vaccine [unlicensed use] should be given within 14 days of exposure. If the child contact cannot be immunised, appropriate advice should be given on enhanced hygiene in the childcare setting; if enhanced hygiene standards cannot be met, the child should be excluded from childcare for 30 days. If exclusion of the child is not possible, all carers and children aged 2 months and above in the childcare setting should be immunised. In these cases, any child that goes on to require long-term protection against hepatitis A after their first birthday, should be given the full course of 2 doses.

For healthy close contacts aged 1-59 years, a single dose of monovalent hepatitis A vaccine is recommended within

14 days of exposure. A risk assessment is required to determine any continued risk of hepatitis A infection. To ensure long term protection, a second dose should be given after 6–12 months.

For close contacts who have chronic liver disease (including chronic hepatitis B or C infection), HIV infection (with a CD4 count < 200 cells per microlitre), are immunosuppressed, or are aged 60 years or over, normal immunoglobulin in addition to monovalent hepatitis A vaccine is recommended within 14 days of exposure (up to 28 days in those with chronic liver disease). To provide long term protection, a second dose should be given after 6–12 months.

Refer to the British HIV Association or Children's HIV Association for further information on the use of hepatitis A vaccine p. 1427 in HIV-positive individuals. See www.bhiva.org or www.chiva.org.uk for further information.

In households with more than one close contact, all unvaccinated household contacts seen within 8 weeks of jaundice onset in the index case, should be given the monovalent hepatitis A vaccine to prevent tertiary spread within the household.

For further information on the management of susceptible close contacts and for information on outbreaks, see PHE guidance: **Public Health control and management of hepatitis A** (see *Useful resources*); and for further information on normal immunoglobulin, see Immunoglobulins p. 1383.

Hepatitis B vaccine

09-May-2022

Overview

Hepatitis B vaccines contain inactivated hepatitis B surface antigen (HBsAg) prepared from yeast cells using recombinant DNA technology, which are adsorbed onto an adjuvant. The vaccine is available as a monovalent vaccine, a bivalent vaccine in combination with hepatitis A, and a hexavalent vaccine in combination with diphtheria, tetanus, accellular pertussis, inactivated poliomyelitis, and *Haemophilus influenzae* type b (Hib).

Pre-exposure prophylaxis

Hepatitis B vaccination is given as a component of the routine childhood immunisation programme to provide long-term protection against hepatitis B for children aged under 1 year. Children aged under 1 year should be given a primary course consisting of 3 doses of the diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1420, given at 4 weekly intervals (see Immunisation schedule p. 1394). If interrupted, the primary course should be resumed but not repeated, allowing a 4 week interval between doses. Early immunisation with a primary course may be considered for children from 6 weeks of age if required in certain circumstances, such as for travel reasons (immunisation may be given at an interval of 3 weeks for 1 dose only, with the other 2 doses completed at an interval of at least 4 weeks).

If the child's routine immunisation is delayed, children aged under 10 years should be immunised at the earliest opportunity.

If the primary course was commenced with the pentavalent diphtheria with tetanus, pertussis, poliomyelitis and haemophilus influenzae type b vaccine p. 1420, it can be completed with the hexavalent diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine.

Children aged 1 year to under 10 years who have completed a primary course with the pentavalent vaccine but have not received any hepatitis B-containing vaccines, do not require a hepatitis B-containing vaccine unless they are in a high risk group (see below) or are exposed to hepatitis B (see Post-exposure management).

Immunisation against hepatitis B is also recommended for individuals in high risk groups (those at high risk of exposure or those at risk of complications), as listed:

- parenteral drug misusers and their sexual partners, other household and close family contacts;
- non-parenteral drug misusers who are likely to 'progress' to parenteral drug misuse;
- close family, household, or sexual contacts of an individual with chronic hepatitis B infection;
- individuals who change sexual partners frequently (such as commercial sex workers);
- men who have sex with men;
- individuals receiving regular blood transfusions or blood products (such as those with haemophilia), and carers responsible for the administration of such products;
- patients with chronic renal failure who are on haemodialysis or a renal transplantation programme, and those predicted to require these interventions—use vaccines specifically formulated for patients with renal insufficiency. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary;
- patients with severe liver disease regardless of the cause, or those with milder liver disease who may share risk factors for acquiring hepatitis B infection (such as individuals with chronic hepatitis C);
- healthcare workers (including students and trainees) who may have direct contact with patients' blood, bloodstained body fluids or tissues;
- laboratory staff who handle material that may contain the virus:
- other occupational risk groups (such as morticians and embalmers);
- staff and residents of homes for those with learning difficulties (consideration may also be given for those in day care, schools and centres for those with severe learning disability);
- staff and inmates of custodial institutions;
- individuals travelling to or going to reside in areas of high or intermediate prevalence of hepatitis B, see *Travel*
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- some foster carers and their families.

For immunisation of individuals in a high-risk group, the primary course dosing regimen depends on how rapidly protection is required, the likelihood of patient compliance, and the product used. For most individuals, an accelerated schedule should be given (particularly in individuals where compliance with immunisation is difficult). Alternative non-accelerated schedules are available, but should only be used when rapid protection is not required and there is a high likelihood of patient attendance for immunisation. In certain circumstances, a very rapid schedule may be given to individuals who are at immediate risk where a more rapid induction of protection is required. See hepatitis B vaccine p. 1429 and hepatitis A and B vaccine p. 1426 for information on dosing schedules.

During vaccination, advice should be provided on other preventative measures (such as condom use and needle

exchange), and referral to specialist services arranged if

Immunosuppressed individuals with HIV infection have higher rates of developing chronic infection; HIV-positive patients and those at risk of HIV infection should be offered vaccination. Refer to the British HIV Association and Children's HIV Association for further information on the use of hepatitis B-containing vaccines in individuals with HIV infection. See www.bhiva.org/guidelines and www.chiva.org.uk/ for further information.

Boosters

Following a primary course of immunisation, most individuals do not require a reinforcing dose of a hepatitis B-containing vaccine. For healthcare workers (including students and trainees) a single booster dose (once only) should be offered approximately 5 years after primary immunisation. For patients with renal failure and for individuals at the time of a subsequent significant exposure, a booster dose may be required. For further information, see Chapter 18: Hepatitis B, in *Immunisation against infectious disease-* 'The Green Book'.

Travel

Pre-exposure immunisation is recommended for individuals travelling to or going to reside in areas of high or intermediate prevalence of hepatitis B and who, through their behaviour/activities may put themselves at risk while abroad. These include sexual activity, parenteral drug use, undertaking relief aid work, and/or playing contact sports. Travellers are also at risk of acquiring infection as a result of medical or dental procedures carried out in countries where unsafe therapeutic injections (e.g. the re-use of contaminated needles and syringes without sterilisation) are a risk factor for hepatitis B. Individuals at high risk of requiring medical or dental procedures in such countries should therefore be immunised, including:

- those staying for lengthy periods;
- those with chronic medical conditions that may require hospitalisation;
- those travelling for medical or dental procedures. Further information on country-specific hepatitis B risk is available from the National Travel Health Network and Centre (travelhealthpro.org.uk/) and Health Protection Scotland (www.travax.nbs.uk).

Post-exposure prophylaxis

Hepatitis B (acute infectious hepatitis) is a notifiable disease in the UK. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

Post-exposure prophylaxis should be given immediately to neonates born to mothers infected with hepatitis B, see Selective neonatal immunisation programme below for further information. Immediate post-exposure prophylaxis should also be offered to any individual who has potentially been exposed to hepatitis B infected blood or bodily fluids, such as sexual partners/close contacts of an individual with acute hepatitis B or newly diagnosed chronic hepatitis B, or those exposed through a needle stick injury or bites from a known hepatitis B individual. Advice should be sought from the nearest public health laboratory, health protection team, or on-call virologist. The recommended vaccine course (including use of a booster dose) is dependent on the individual's vaccination history, source of exposure, and continued risk. For further information, see Chapter 18: Hepatitis B, in Immunisation against infectious disease- 'The Green Book'.

Hepatitis B immunoglobulin p. 1387 may also be given to individuals at the same time as the hepatitis B vaccine following accidental exposure to hepatitis B-infected blood or bodily fluids through percutaneous inoculation, contamination of mucous membranes or non-intact skin. It is also recommended for use with the vaccine in sexual

partners/contacts of an individual with acute hepatitis B or newly diagnosed chronic hepatitis B, if seen within 1 week. Hepatitis B immunoglobulin is also recommended in some known non-responders to the hepatitis B vaccine. For further information, see UKHSA: **Hepatitis B** immunoglobulin (see *Useful resources*).

Selective neonatal immunisation programme

Neonates born to mothers who have chronic hepatitis B infection or who had acute hepatitis B during pregnancy, should be vaccinated with a dose of the monovalent hepatitis B vaccine p. 1429 as soon as possible (ideally within 24 hours of birth), followed by a second dose at 4 weeks. Routine childhood immunisation with the hexavalent diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1420 should then be given as scheduled (see Immunisation schedule p. 1394), followed by a further dose of the monovalent hepatitis B vaccine and blood test (to exclude infection) at 1 year of age. For further information on the selective immunisation programme, see UKHSA: Hexavalent combination vaccine: information for healthcare practitioners and PHE: Guidance on the hepatitis B antenatal screening and selective neonatal immunisation pathway (see Useful resources)

For neonates with a birth weight below 1.5 kg born to an infected mother, or neonates born to a highly infectious mother, hepatitis B immunoglobulin should be given at the same time as the first dose of monovalent hepatitis B vaccine (administered at different sites) in order to provide rapid protection until the vaccine becomes effective. For further information on the use of hepatitis B immunoglobulin, and which mothers are considered to be highly infectious, see UKHSA guidance: **Hepatitis B immunoglobulin** (see *Useful resources*).

Human papillomavirus vaccine

11-Apr-2022

Overview

The human papillomavirus vaccines p. 1431 (HPV vaccines) consist of virus-like particles prepared from the major protein of the viral capsid and mimic the structure of the native virus, but do not contain any viral DNA. The quadrivalent vaccine (*Gardasil*®) contains HPV types 6, 11, 16 and 18, and the nine-valent vaccine (*Gardasil*9®) contains HPV types 6, 11, 16, 18, 31, 33, 45, 52 and 58. Both are adjuvanted and are used for the prevention of cervical and anal cancers, and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions associated with HPV types 16

and 18. Gardasil® and Gardasil 9® are also effective at preventing genital warts, and may also provide some cross-protection against infection caused by other high-risk HPV types.

During 2022, Gardasil 9 will replace Gardasil as the HPV vaccine supplied for the national HPV vaccination programme. The two vaccines are considered interchangeable by the JCVI, and vaccination should not be delayed while awaiting supply of either vaccine.

As the vaccines do not protect against all strains of HPV, safe sex precautions should always be practiced; and for all females, routine cervical screening should continue at the scheduled age.

Children aged 9 to 14 years

The HPV vaccines are licensed for individuals from 9 years of age, however vaccination of children aged 9 to 10 years is not offered as part of the national vaccination programme. Immunisation is routinely recommended for children aged 11 to 14 years (the eligible age for vaccine administration varies within different countries within the UK, see Immunisation schedule p. 1394 for further guidance).

For guidance on the vaccination schedule to be given (2 dose or 3 dose schedule), see *Vaccination schedule*.

Individuals aged 15 to 25 years

Under the national programme in England, individuals remain eligible to receive the HPV vaccine up to the age of 25 years if they did not receive the vaccine when scheduled (age eligibility differs in different countries in the UK), see Chapter 18a, Human papillomavirus, in *Immunisation against infectious disease-* 'The Green Book' (see *Useful resources*) for further information. Where appropriate, immunisation with the HPV vaccine should also be offered to individuals coming into the UK if they have not been offered protection in their country of origin.

For individuals who started but did not complete their vaccination before reaching the age of 25 years, the vaccination course should be completed where possible.

For guidance on the vaccination schedule to be given (2 dose or 3 dose schedule), see *Vaccination schedule*.

Vaccination of males who have sex with males and other at risk individuals

Males who have sex with other males (MSM), who are aged 15 to 45 years and attend specialist sexual health services or HIV services, are eligible for vaccination if they have not previously been vaccinated. If the course has not been completed before the age of 46 years, it can still be completed provided the first dose was given as part of the pilot or national vaccination programme.

There may be considerable benefit in offering HPV vaccination to other individuals who attend specialist sexual health services or HIV services who are not eligible under the national programme, but are deemed to have a similar risk profile to that seen in males who have sex with males. This includes some transgender individuals, sex workers, and men and women living with HIV infection.

Refer to the British HIV Association for further information on the use of human papillomavirus vaccines in individuals with HIV infection. See www.bhiya.org/guidelines.

For guidance on the vaccination schedule to be given (2 dose or 3 dose schedule), see *Vaccination schedule*.

Vaccination schedule

A 2 dose schedule is now recommended for all children and adults except for those with immunosuppression or HIV infection. For guidance on vaccination scheduling for individuals aged 15 years and over who commenced their course prior to April 2022, see UKHSA: **HPV vaccination:** guidance for healthcare practitioners (see *Useful resources*)

Individuals without immunosuppression or HIV infection
Eligible individuals who do not have immunosuppression or
HIV infection should be offered a 2 dose schedule of human

papillomavirus vaccines, with the second dose given 6-24 months after the first dose.

2 doses given less than 6 months apart for *Gardasil* or less than 5 months apart for *Gardasil* or less than 5 months apart for *Gardasil* or be considered adequate to provide long term protection, therefore the dose that was given early should be discounted and a third dose given once the recommended time period has elapsed and at least 4 weeks after the dose that was given early. If different vaccines have been administered, the minimum recommended time interval between doses should be 6 months.

Individuals with immunosuppression or HIV infection

A 3 dose schedule of human papillomavirus vaccines should be offered to eligible individuals who are known to be immunocompromised at the time of immunisation. Reimmunisation may be considered after treatment is finished and/or recovery has occurred depending on the treatment received—specialist advice may be required.

A 3 dose schedule of human papillomavirus vaccines is also recommended for eligible individuals with HIV infection who attend HIV services, and should be given regardless of CD4 cell count, antiretroviral therapy use, or viral load.

The second dose in the 3 dose schedule should be given at least 1 month after the first dose, followed by a third dose at least 3 months after the second dose; ideally the course should be completed within a 12 month period. In cases where the second dose is given late and there is a high likelihood that the individual will not return, or it is not practical for the third dose to be given after 3 months, then the third dose can be given at least 1 month after the second dose

For eligible individuals of the MSM vaccination program, variable administration intervals are possible in order to align administration of doses with existing clinic appointments, provided that for these individuals the course is completed within 24 months and the minimum interval between doses is followed where possible.

Booster doses

Protection from human papillomavirus vaccines is maintained for at least 10 years, although protection is expected to last longer. There is no recommendation for the need for booster doses.

Influenza vaccine

06-May-2022

Overview

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccines in use target the prevalent strain or strains as recommended each year by the WHO.

The influenza vaccines recommended for immunisation are the adjuvanted egg-grown quadrivalent influenza

vaccine (inactivated), cell-grown quadrivalent influenza vaccine (inactivated), egg-grown quadrivalent influenza vaccine (inactivated), recombinant quadrivalent influenza vaccine, and the live attenuated influenza vaccine. The choice of vaccine is dependent on the person's age and contra-indications.

The ideal time for immunisation is between September and early November.

Immunisation is recommended for individuals at high risk of serious complications from influenza, and to reduce transmission of infection. In the national flu immunisation programme 2022/2023, influenza vaccination is recommended for the following eligible groups:

- Individuals aged 6 months and over in a clinical risk group, such as those with:
- chronic respiratory disease;
- chronic heart disease;
- chronic liver disease;
- chronic kidney disease;
- chronic neurological disease;
- diabetes mellitus;
- splenic dysfunction or asplenia;
- immunosuppression because of disease or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone p. 747: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily], and chemotherapy);
- HIV infection (regardless of immune status);
- morbid obesity (BMI of 40 kg/m² and above);
- learning disability.
- All children aged 2-3 years on 31st August 2022.
- All primary school aged children (from reception to year
 6).
- All pregnant females (including those who become pregnant during the flu season).
- All adults aged 65 years and over (including those who turn 65 by 31st March 2023).
- Residents of long-stay residential homes or other specific long-stay facilities, where rapid spread is likely to follow introduction of infection and cause high morbidity and mortality (this does not include, for instance, prisons, young offender institutions, or university halls of residence).
- Individuals who receive a carer's allowance, or who are the main carer of an older or disabled individual whose welfare may be at risk if the carer falls ill.
- Household contacts of immunocompromised individuals.
- Frontline health and social care workers.

Vaccine choice

Children aged 6 months to less than 2 years who are in a clinical risk group should be offered the egg-grown quadrivalent (inactivated) influenza vaccine p. 1432. For children with an allergy to eggs, the cell-grown quadrivalent (inactivated) influenza vaccine should be offered [unlicensed usel.

Eligible children aged 2-17 years should be offered the live attenuated influenza vaccine, administered as a nasal spray (Fluenz tetra®). The live attenuated vaccine has been shown to be more effective than inactivated vaccines. Where parents decline the live attenuated vaccine for their child due to the porcine gelatine content, and for children in whom the live attenuated influenza vaccine is contraindicated or otherwise unsuitable, the cell-grown quadrivalent (inactivated) influenza vaccine should be offered, with the egg-grown quadrivalent (inactivated) influenza vaccine offered as a second option. Children who have a very severely immunocompromised household contact should also be offered the cell-grown quadrivalent (inactivated) influenza vaccine, or the egg-grown quadrivalent (inactivated) influenza vaccine, instead of the live attenuated influenza vaccine.

Children aged 6 months to less than 9 years in a clinical risk group, and those aged 2 years to less than 9 years who are household contacts of immunocompromised individuals, should be offered 2 doses of the appropriate influenza vaccine (at least 4 weeks apart) if they have never had the influenza vaccine previously.

Adults aged 18 to 64 years in a clinical risk group or other eligible groups, should be offered either the cell-grown quadrivalent (inactivated) influenza vaccine, or the recombinant quadrivalent influenza vaccine. If these options are unavailable, the egg-grown quadrivalent (inactivated) influenza vaccine may be offered.

Pregnant females should be offered either the cell-grown quadrivalent (inactivated) influenza vaccine, or the recombinant quadrivalent influenza vaccine (if aged 18 years and over). If these options are unavailable, the egg-grown quadrivalent (inactivated) influenza vaccine may be offered.

Adults aged 65 years and over (including those who turn 65 by 31st March 2023) should be offered the adjuvanted egg-grown quadrivalent (inactivated) influenza vaccine, or the recombinant quadrivalent influenza vaccine; if unavailable or unsuitable, the cell-grown quadrivalent (inactivated) influenza vaccine is a suitable alternative.

For further information on the annual influenza programme, see UKHSA collection: **Annual flu programme** (available at: www.gov.uk/government/collections/annual-flu-programme).

For the management of influenza, see Influenza p. 716.

Japanese encephalitis vaccine 14-Nov-2018

Overview

Japanese encephalitis is a mosquito-borne viral encephalitis caused by a *Flavivirus*.

Japanese encephalitis vaccine p. 1433 (IXIARO) [®] is an inactivated vaccine adsorbed onto an adjuvant. It is recommended for individuals who are going to reside in an area where Japanese encephalitis is endemic or epidemic. Travellers to South and South-East Asia and the Far East should be immunised if staying for a month or longer in endemic areas during the transmission season. Other travellers with shorter exposure periods should also be immunised if the risk is considered sufficient. Immunisation is also recommended for laboratory staff at risk of exposure to the virus

The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

In adults (aged under 65 years) and children (aged 2 months and over) at ongoing risk (including laboratory staff and long-term travellers), a single booster dose should be given 12 months after the primary immunisation course. A booster dose can be considered in adults aged 65 years and over, but the immune response is lower than in younger adults. For other travellers, a single booster dose should be given within 12–24 months after primary immunisation, before potential re-exposure to the Japanese encephalitis

virus. Travellers aged 18–64 years should be offered a second booster dose at 10 years if they remain at risk.

Cases of Japanese encephalitis should be managed with supportive treatment. $% \label{eq:cases} % A = \{A_{ij}, A_{ij}, A_{ij}$

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre.

Useful Resources

Recommendations reflect Chapter 20, Japanese encephalitis, in *Immunisation against infectious disease*— 'The Green book'. Public Health England, June 2018.

National Travel Health Network and Centre

Measles, Mumps and Rubella vaccine

Overview

Measles vaccine has been replaced by a combined measles, mumps and rubella vaccine, live p. 1433 (MMR vaccine).

Measles, mumps and rubella vaccine, live aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contraindication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children at 1 year of age, on or after their first birthday. A second dose is given before starting school at 3 years and 4 months of age, or soon after (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, measles, mumps and rubella vaccine, live immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of measles, mumps and rubella vaccine, live in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease

Measles, mumps and rubella vaccine, live should be used to protect against rubella in seronegative women of childbearing age (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously unimmunised and seronegative post-partum women (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contact

Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months of age (or soon after) should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin after exposure to measles; routine measles, mumps and rubella vaccine, live immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (see advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

Travel

Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months of age (or soon after) should still be given.

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Meningococcal vaccine

Overview

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. **Meningococcal group C conjugate vaccine** protects only against infection by serogroup C and **Meningococcal group B vaccine** protects only against infection by serogroup B. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the meningococcal groups A, C, W135, and Y conjugate vaccine is likely to

provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

Meningococcal group B vaccines. Bexsero®, and Trumenba® are licensed in the UK against infection caused by Neisseria meningitidis serogroup B. The use of Bexsero [®] is recommended in the Immunisation Schedule. Bexsero contains 3 recombinant Neisseria meningitidis serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against Neisseria meningitidis serogroup B. Trumenba® contains 2 recombinant Neisseria meningitidis serogroup B proteins. The proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

Childhood immunisation

Meningococcal group C conjugate vaccine provides longterm protection against infection by serogroup C of Neisseria meningitidis. Immunisation consists of 1 dose given at 12 months of age (as the haemophilus influenzae type b with meningococcal group C vaccine p. 1422) and a second dose given at 13-15 years of age (as the meningococcal groups A with C and W135 and Y vaccine p. 1423) (see Immunisation

Meningococcal group B vaccine provides protection against infection by serogroup B of Neisseria meningitidis. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see Immunisation Schedule).

Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B vaccine (rDNA, component, adsorbed) p. 1422 followed by a second dose of meningococcal group B vaccine (rDNA, component, adsorbed) two months later. They should then be vaccinated according to the Immunisation Schedule (ensuring at least a two month interval between doses of meningococcal group B vaccines). Unimmunised children aged 12-23 months should be given 2 doses of meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months if they have received less than 2 doses in the first year of life. Unimmunised children aged 2-9 years should be given a single dose of meningococcal group C vaccine (as the haemophilus influenzae type b with meningococcal group C vaccine) followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine at 13-15 years of age.

From 2015, unimmunised individuals aged 10-25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine; a booster dose is not required.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel

Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of

meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.

Proof of vaccination with the tetravalent meningococcal groups A with C and W135 and Y vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts

For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with Neisseria meningitidis should be considered.

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-againstinfectious-disease-the-green-book

Pertussis vaccine

28-May-2020

Overview

Pertussis vaccine is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of Bordetella pertussis. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with a combination vaccine of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1420 (Infanrix

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed. Children aged 1-10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of

Vaccination of pregnant women against pertussis

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine;

Boostrix-IPV® or Repevax®) between 16 and 32 weeks of pregnancy. Public Health England has advised (2016) that the vaccine is probably best offered after the fetal anomaly scan at around 18–20 weeks. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 16–32 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

Contacts

Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

Side-effects

Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity:
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Pneumococcal vaccine

25-Feb-2022

Overview

The pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1424 and the pneumococcal polysaccharide vaccine p. 1424 protect against infection with *Streptococcus pneumoniae* (pneumococcus). Both vaccines contain polysaccharide from capsular pneumococci. The pneumococcal polysaccharide vaccine contains purified polysaccharide from 23 capsular types of pneumococcus, whereas the pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide from 13 capsular types (*Prevenar* 13®). Both vaccines are inactivated.

Prevenar 13[®] is the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) used for childhood immunisation. In January 2020, the routine immunisation schedule was changed from a 3-dose to a 2-dose schedule, given at separate intervals (see Immunisation schedule p. 1394 for further information). Children who present late for vaccination should be immunised according to Children with unknown or incomplete vaccination histories.

For further information on the use of *Prevenar* 13[®] pneumococcal polysaccharide conjugate vaccine (adsorbed) (including guidance on early immunisation, or shortened dosing intervals; and the management of children given the

incorrect pneumococcal vaccine, or if vaccinated overseas), see PHE guidance: **Pneumococcal vaccination: guidance for health professionals** (available from: www.gov.uk/ government/publications/pneumococcal-vaccination-guidance-for-health-professionals).

The 23-valent pneumococcal polysaccharide vaccine is recommended for all adults aged 65 years and over (including those immunised during the influenza season and who turn 65 by the 31st March), and for adults and children aged 2 years and over in the following at-risk groups:

- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac syndrome which could lead to splenic dysfunction);
- chronic respiratory disease (including severe asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- diabetes mellitus requiring insulin or anti-diabetic medication;
- immunosuppression because of disease (e.g. HIV infection, and genetic disorders affecting the immune system) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: adult and child 20 kg and over, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily, and chemotherapy);
- presence of cochlear implant:
- conditions where leakage of cerebrospinal fluid may occur.
 The 23-valent pneumococcal polysaccharide vaccine should also be considered for those at risk of occupational exposure to metal fume (e.g. welders).

Where possible, the vaccine should be given at least 2 weeks (ideally 4–6 weeks) before splenectomy, chemotherapy or radiotherapy; patients should be given advice about the increased risk of pneumococcal infection. If it is not possible to vaccinate at least 2 weeks before splenectomy, chemotherapy or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy, and at least 3 months after completion of chemotherapy or radiotherapy. Vaccination advice for patients with leukaemia or those who have had a bone marrow transplant, and information on patient cards and leaflets for individuals with apslenia, is available in Chapter 25, Pneumococcal, in *Immunisation against infectious disease*- 'The Green Book' (see Useful resources).

Vaccination regimens may differ depending on the individual's age, risk of pneumococcal disease, vaccination history, and immune status. Individuals in at-risk groups may require additional protection.

For information on revaccination with 23-valent pneumococcal polysaccharide vaccine for individuals in whom the antibody concentration is likely to decline rapidly, see *Revaccination*.

Children with unknown or incomplete vaccination histories

Unimmunised or partially immunised children who present late for vaccination and before the age of 1 year should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), followed by a booster dose on or after their first birthday, at least 4 weeks after the 1st dose.

Children aged 1 year to under 2 years who are unimmunised or partially immunised should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

For the management of children who received one or more doses of 10-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) in another country, refer to Chapter 25

(for infants born on or after 1 January 2020), Pneumococcal, in *Immunisation against infectious disease-* 'The Green Book' (see *Useful resources*).

Individuals with an at-risk condition born on or before December 31st 2019

Children diagnosed with at-risk conditions aged under 2 years Children who were aged under 1 year when diagnosed with an at-risk condition, should have received 3 doses of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (1 dose at 8 weeks, then at 16 weeks, and a booster dose at 1 year). Those who presented late for vaccination should have been immunised according to Chapter 25 (for infants born up to and including 31 December 2019), Pneumococcal, in *Immunisation against infectious disease-* 'The Green Book' (see *Useful resources*).

Children aged under 2 years who were severely immunocompromised, or those with asplenia, splenic dysfunction or complement disorders, should have received an additional dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) after the 1 year booster dose.

A single dose of the 23-valent pneumococcal polysaccharide vaccine should then have been given at 2 years of age.

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1392.

Children diagnosed with at-risk conditions aged 2 years to under 10 years $\,$

Children diagnosed or first presenting with an at-risk condition who have completed their routine immunisation schedule should receive a single dose of 23-valent pneumococcal polysaccharide vaccine, at least 2 months after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children previously unvaccinated or partially vaccinated with the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine at least 2 months later.

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1392.

Severely immunocompromised children may have a suboptimal immunological response to the vaccine and should be given an additional dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), even if they are fully vaccinated. This should be followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine, at least 2 months after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed). If the 23-valent pneumococcal polysaccharide vaccine has already been given, the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 6 months after.

Individuals diagnosed with at-risk conditions aged 10 years and over

Individuals diagnosed or first presenting with an at-risk condition should be given a single dose of the 23-valent pneumococcal polysaccharide vaccine; no additional 23-valent pneumococcal polysaccharide vaccine is required at 65 years of age.

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1392.

Severely immunocompromised individuals should be given a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) followed by the 23-valent

pneumococcal polysaccharide vaccine at least 2 months after, irrespective of their previous pneumococcal vaccinations. If the 23-valent pneumococcal polysaccharide vaccine p. 1424 has already been given, the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1424 should be given at least 6 months after.

Individuals with an at-risk condition born on or after January 1st 2020

Children diagnosed with at-risk conditions aged under 1 year Children in an at-risk group (excluding those with asplenia, splenic dysfunction or complement disorder, or who are severely immunocompromised) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) according to the Immunisation schedule p. 1394. Those who present late for vaccination should be immunised according to Children with unknown or incomplete vaccination histories. A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children who are severely immunocompromised, or those with asplenia, splenic dysfunction or complement disorders, should receive 2 doses of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at least 8 weeks apart (commencing no earlier than 6 weeks of age), followed by a single booster dose given on or after their first birthday. An additional dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 8 weeks after the booster dose. A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1392.

Children diagnosed with at-risk conditions aged 1 year to under 2 years

Children in an at-risk group (excluding those with asplenia, splenic dysfunction or complement disorder, or who are severely immunocompromised) should receive their 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) booster dose according to the Immunisation schedule p. 1394. Those who present late for vaccination should be immunised according to Children with unknown or incomplete vaccination histories. A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children who are severely immunocompromised, or those with asplenia, splenic dysfunction or complement disorders, should receive their 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) booster dose according to the Immunisation schedule p. 1394. Those who present late for vaccination should be immunised according to Children with unknown or incomplete vaccination histories. An additional dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 8 weeks after the booster dose. A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1392.

Children diagnosed with at-risk conditions aged 2 years to under 10 years

Children diagnosed or first presenting with an at-risk condition (excluding those severely immunocompromised) who have completed their routine immunisation schedule should receive a single dose of 23-valent pneumococcal polysaccharide vaccine, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children diagnosed or first presenting with an at-risk condition (excluding those severely immunocompromised) who are previously unimmunised or partially immunised with the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine at least 8 weeks later.

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1392.

Severely immunocompromised children should be given a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), regardless of immunisation status. This should be followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Individuals diagnosed with at-risk conditions aged 10 years

Individuals diagnosed or first presenting with an at-risk condition (excluding those who are severely immunocompromised) should be given a single dose of the 23-valent pneumococcal polysaccharide vaccine. The 23-valent pneumococcal polysaccharide vaccine is not required for individuals with asplenia, splenic dysfunction or complement disorders if they have already received a dose within the previous 2 years (due to a theoretical risk of pneumococcal serotype-specific hypo-responsiveness with revaccination).

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1392.

Severely immunocompromised individuals should be given a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine at least 8 weeks after. The 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) or additional 23-valent pneumococcal polysaccharide vaccine are not required if a 23-valent pneumococcal polysaccharide vaccine has already been received within the previous 2 years, due to a theoretical risk of pneumococcal serotype-specific hyporesponsiveness with re-vaccination.

Revaccination

Revaccination is not recommended for any clinical risk groups or age groups, except for individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction, or chronic renal disease), where revaccination is recommended every 5 years.

Management of cases

For the management of cases, contacts and outbreaks, refer to Chapter 25, Pneumococcal, in Immunisation against infectious disease- 'The Green Book' (see Useful resources).

Useful Resources

Recommendations reflect Chapter 25 (for infants born up to and including 31 December 2019), Pneumococcal, in Immunisation against infectious disease- 'The Green Book'. UK Health Security Agency, January 2018.

www.gov.uk/government/publications/pneumococcal-the-greenbook-chapter-25

Chapter 25 (for infants born on or after 1 January 2020), Pneumococcal, in Immunisation against infectious disease-'The Green Book'. UK Health Security Agency, January 2020. www.gov.uk/government/publications/pneumococcal-the-greenbook-chapter-25

Poliomyelitis vaccine

Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. Inactivated poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

Live (oral) poliomyelitis vaccine is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk/ or from the National Travel Health Network and Centre (www.nathnac.org/).

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-againstinfectious-disease-the-green-book

Rabies vaccine

01-Jun-2021

Overview

The rabies vaccine p. 1434 contains inactivated rabies virus cultured in either human diploid cells or purified chick embryo cells; vaccines may be used interchangeably to provide protection for pre-exposure prophylaxis and post-exposure treatment.

Pre-exposure prophylaxis

Immunisation with the rabies vaccine should be offered to those considered to be at risk of exposure to rabies within the UK, as listed:

- laboratory staff who routinely handle the rabies virus;
- workers at Defra-authorised quarantine premises and carriers:
- those who regularly handle bats, including on a voluntary basis:
- veterinary and technical staff who, by reason of their employment, encounter enhanced risk.

Immunisation is also recommended for those considered to be at risk of exposure to rabies travelling outside the UK, including:

- animal control and wildlife workers, veterinary staff or zoologists who regularly work in rabies enzootic (high risk)
- travellers to rabies enzootic areas, especially if:
- post-exposure medical care and rabies biologics at the destination are lacking or in short supply;
- they are undertaking higher risk activities such as cycling or running;
- they are living or staying there for more than 1 month. Immunisation against rabies requires a primary preexposure course of 3 doses administered over 21 or 28 days (preferred schedule if time allows), or an accelerated course of 3 doses over 7 days with an additional dose at 1 year. For dosing schedules, see rabies vaccine.

For further information on pre-exposure prophylaxis in individuals with immunosuppression and/or HIV infection, see *Immunosuppression and HIV infection*.

Boosters

The requirement for booster doses is dependent on an individual's indication for pre-exposure prophylaxis and the likely frequency of ongoing exposures.

For laboratory workers who handle lyssavirus containing material (includes the rabies virus) a single booster dose of rabies vaccine should be given 1 year after the primary course has been completed. Further booster doses should be given based on 6-monthly antibody levels.

For individuals who may have frequent unrecognised exposures to the virus (such as bat handlers) a single booster dose of rabies vaccine should be given 1 year after the primary course has been completed. Further booster doses should then be given every 3–5 years or based on antibody levels.

For individuals at infrequent risk of exposure, but who are likely to have an unrecognised exposure (such as recreational cavers, veterinarians investigating suspect rabies cases and non-compliant imported pets, engineers maintaining rabies laboratory equipment or those entering rabies laboratories), should be given booster doses of rabies vaccine based on antibody levels from at least 1 year after the primary course has been completed.

For further information on antibody testing and booster doses, see PHE guidance: **Guidelines on timing of rabies boosters based on antibody levels** (see *Useful resources*).

Travel

Routine booster doses are not recommended for most travellers. A single booster dose of rabies vaccine can be considered, following a risk assessment, in those who have

completed a primary course over 1 year ago and are travelling again to an enzootic area. Only 1 booster is needed in a traveller's lifetime.

Further information on country-specific rabies travel risk is available from the National Travel Health Network and Centre (travelhealthpro.org.uk/) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Post-exposure management

Rabies is a notifiable disease in the UK. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible. Disinfectant and a simple dressing can be applied, but suturing should be delayed until post-exposure treatment has begun otherwise it may increase the risk of introducing rabies virus into the nerves. Antibacterial therapy may be required for some animal bites, see *Human and animal bites* in Skin infections, antibacterial therapy p. 554 for further guidance. For puncture wounds, tetanus risk should be also be assessed, see Tetanus vaccine p. 1413 for information on the management of tetanus-prone wounds.

A full, rapid post-exposure risk assessment (based on detailed information about the circumstances of the potential exposure) is required so that post-exposure treatment, if indicated, can be started promptly. When post-exposure treatment is indicated, this should always be started without delay, even in the presence of other illness. If the exposure occurred many months or years previously, a full risk assessment should always be done and treatment considered as the incubation period for rabies can be prolonged.

The regimen used for post-exposure management depends on the composite rabies risk (assessed as a green, amber, or red rating using a combination of the country where the incident occurred and the type of animal involved, and the category of exposure), and the individual's past medical history (including immune status). For further information on risk assessment (including composite rabies risk) and the management of potential rabies exposure, see PHE guidance: Guidelines on managing rabies post-exposure (see Useful resources).

For individuals arriving in the UK who started postexposure treatment via the intradermal route, the remaining doses should be given intramuscularly. If the regimen started was different to the UK regimen—seek specialist advice.

For post-exposure management in individuals with immunosuppression, see *Immunosuppression and HIV infection*; and for country-specific specialist contact details in England, Wales, Scotland and Northern Ireland, see Chapter 27: Rabies, in *Immunisation against infectious disease-* 'The Green Book'.

Post-exposure treatment of individuals who are fully immunised

Fully immunised individuals are those who have received at least 3 documented doses of rabies vaccine (on at least two separate days either as a primary pre-exposure prophylaxis course or as part of a previous post-exposure treatment course), or documented rabies virus neutralising antibody (VNA) titres of at least 0.5 IU/ml.

For fully immunised individuals with a green composite rabies risk or who have completed a rabies post-exposure treatment course in the last 3 months, no treatment is required.

For fully immunised individuals with an amber or red composite rabies risk, give 2 doses of rabies vaccine (first dose on day 0 and second dose between days 3–7). Rabies immunoglobulin is not needed for these individuals. If rabies immunoglobulin is inadvertently given, individuals will need

to complete a 4 dose course of rabies vaccine (on days 0, 3, 7 and 21).

Post-exposure treatment of individuals who are partially immunised

Partially immunised individuals are those who have had an incomplete/inadequate primary pre-exposure prophylaxis course or documented rabies virus neutralising antibody titres consistently less than 0.5 IU/mL.

For *partially immunised* individuals with a *green* composite rabies risk, no treatment is required.

For partially immunised individuals with an amber or red composite rabies risk, give 4 doses in total of rabies vaccine p. 1434 (on days 0, 3, 7 and 21). If the 4th dose of rabies vaccine is given before day 21, a 5th dose of vaccine should be administered 2 weeks after the 4th dose. Rabies immunoglobulin is not needed for these individuals.

Post-exposure treatment of individuals who are nonimmunised

Non-immunised individuals are those who have never received rabies pre- or post-exposure immunisation.

For non-immunised individuals with a green composite rabies risk, no treatment is required.

For non-immunised individuals, with an amber or red composite rabies risk, give 4 doses in total of rabies vaccine (on days 0, 3, 7 and 21). If the 4th dose of rabies vaccine is given before day 21, a 5th dose of vaccine should be administered 2 weeks after the 4th dose.

Individuals with a *red* composite rabies risk should also be given rabies immunoglobulin p. 1389. This is not required if more than 7 days has passed since the first dose of rabies vaccine or more than 1 day since the second dose, or if the exposure was more than 12 months ago.

Immunosuppression and HIV infection

Refer to the British HIV Association for further information on the use of *rabies vaccine* and *rabies immunoglobulin* in individuals with HIV infection. See www.bhiva.org/guidelines for further information.

Pre-exposure prophylaxis

Pre-exposure prophylaxis may be given to individuals with immunosuppression and HIV infection (regardless of CD4 count). These individuals may not develop a full antibody response so re-immunisation should be considered upon completion of treatment and recovery has occurred, or in those with HIV when there has been immune recovery following commencement of antiretroviral treatment (such as a CD4 count >200 per mm³).

Individuals who become immunosuppressed after receiving a primary course of immunisation, or having an antibody test or booster should be advised to seek medical advice for review of testing/booster vaccination frequency. They may no longer be able to produce an effective immune response following a rabies virus exposure and should be informed about the potential risks of continuing with activities that might lead to rabies virus exposures.

Post-exposure management

For *immunosuppressed* individuals with a *green* composite rabies risk, no treatment is required.

For *immunosuppressed* individuals with an *amber* or *red* composite rabies risk, give 5 doses in total of rabies vaccine (on days 0, 3, 7, 14, and 28 or 30) and rabies immunoglobulin. Post-exposure treatment response should be confirmed using antibody testing at the same time as the 4th dose (day 14); further antibody tests may be required depending on the results. Rabies immunoglobulin is not indicated if more than 7 days have passed since the first dose of rabies vaccine or more than 1 day since the second dose, or if the exposure was more than 12 months previously.

Rotavirus vaccine

11-Jan-2022

Overview

Rotavirus vaccine p. 1435 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

Prior to vaccination with the rotavirus vaccine, the result of the severe combined immunodeficiency (SCID) screening should be checked. For further information, see PHE guidance: The rotavirus vaccination programme: information for healthcare professionals (see *Useful resources*)

The recommended schedule consists of 2 doses, the first at 8 weeks of age, and the second at 12 weeks of age (see Immunisation schedule p. 1394). The first dose of rotavirus vaccine must be given between 6 weeks and under 15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

Children who inadvertently receive the first dose of rotavirus vaccine at 15 weeks of age or older should still receive a second dose after at least 4 weeks, providing that they will still be under 24 weeks of age at the time.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of children with *immunosuppressed* close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated child should be advised of the need to wash their hands after changing the child's nappies.

Useful Resources

Smallpox vaccine

25-Jun-2020

Overview

The smallpox vaccine is prepared from the live vaccinia virus (a pox virus similar to smallpox, but less harmful). Routine immunisation against smallpox is not indicated, but should be considered for workers in laboratories where pox viruses (such as monkeypox or genetically modified vaccinia) are handled, and for others whose work involves an identifiable risk of exposure to pox viruses. For further information on the need for smallpox immunisation and for information on contra-indications and supply, contact the Public Health England Virus Reference Department (contact details available at: www.gov.uk/government/collections/virus-reference-department-vrd). In Scotland, information can be obtained from Health Protection Scotland (contact details available at: www.hps.scot.nhs.uk/about-us/contact-us/).

Refer to the British HIV Association for information on the use of smallpox vaccine in individuals with HIV. See www.bhiva.org/guidelines for further information.

A 24 hour on-call service for urgent diagnosis of smallpox is available; contact the Colindale Duty Doctor (Tel: 020 8200 4400). Medical practitioners must notify the proper officer at their local council or local health protection team of all suspected cases of smallpox. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

Useful Resources

Recommendations reflect Chapter 29, Smallpox and vaccinia, in Immunisation against infectious disease - 'The Green Book'. Public Health England, March 2013. www.gov.uk/government/publications/smallpox-and-vaccinia-the-green-book-chapter-29

Tetanus vaccine

19-Jul-2021

Overview

Tetanus-containing vaccines are inactivated and are made from a cell-free purified toxin of *Clostridium tetani* adsorbed on aluminium hydroxide or aluminium phosphate to improve immunogenicity. The tetanus vaccine is only available as a combination preparation containing other vaccines.

Prophylaxis

In most circumstances, the recommended vaccination schedule, comprising of a total of 5 doses of tetanus-containing vaccine, is considered sufficient to provide long-term protection against tetanus infection.

Individuals due for their routine tetanus immunisation may not require their routine dose if, they have a history of vaccination (such as for a tetanus-prone wound) with the same tetanus-containing vaccine that is due, and it was administered at an appropriate interval.

Parenteral drug misusers are at a greater risk of tetanus infection—every opportunity should be taken to ensure that they are fully vaccinated against tetanus.

For information on immunisation of individuals with neurological conditions, see Chapter 30, Tetanus, in *Immunisation against infectious disease-* 'The Green Book'.

For information on immunisation in pregnant females, see *Pregnancy*.

Individuals with immunosuppression or HIV infection (regardless of CD4 count) should be given the recommended vaccination schedule of 5 doses of a tetanus-containing vaccine (see *Primary Immunisation* and *Boosters*). Consider re-immunisation after treatment completion—specialist advice may be required. Refer to the British HIV Association and the Children's HIV Association for further information

on the use of tetanus-containing vaccines in individuals with HIV infection. See www.bhiva.org/guidelines or www.chiva.org. uk/ for further information.

Primary immunisation

Tetanus vaccination is given as a component of the routine childhood immunisation programme for children aged under 10 years (see Immunisation schedule p. 1394). If the child's routine immunisation is delayed, children aged under 10 years should be immunised at the earliest opportunity.

Children aged under 10 years, should be given a primary course consisting of 3 doses of the hexavalent diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1420 at intervals of 4 weeks (it is the only suitable vaccine containing high dose tetanus for priming children of this age). If interrupted, the primary course should be resumed but not repeated, allowing a 4 weekly interval between doses. Early immunisation with a primary course may be considered for children from 6 weeks of age if required in certain circumstances, such as for travel reasons (immunisation may be given at an interval of 3 weeks for 1 dose only, with the other 2 doses completed at intervals of at least 4 weeks).

If the primary course was commenced with the pentavalent diphtheria with tetanus, pertussis, poliomyelitis and haemophilus influenzae type b vaccine p. 1420, it can be completed with the hexavalent diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine.

Individuals aged 10 years and over who have not been immunised previously or have an unknown or incomplete history, should be given a primary course consisting of 3 doses of the diphtheria with tetanus and poliomyelitis vaccine p. 1419 at 1 month intervals. If interrupted, the primary course should be resumed but not repeated, allowing an interval of 1 month between doses.

For further information on vaccination of individuals with uncertain or incomplete immunisation status, see Chapter 11, The UK immunisation schedule, in *Immunisation against infectious disease-* 'The Green Book'.

Boosters

Following a primary course, 2 doses of a tetanus-containing booster vaccine should be given. When an individual presents for a booster dose but has a history of being vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, or the vaccine administered was not the same as the vaccine due at the current visit or was not given after an appropriate interval, the scheduled booster should still be given to ensure long-term protection against all antigens.

Children aged under 10 years should be given the diphtheria with tetanus, pertussis and poliomyelitis vaccine p. 1419 for their 1st booster dose. This is usually given 3 years after completing the primary course (before school entry)—see Immunisation schedule p. 1394. However, when primary immunisation has been delayed, it may be given at the scheduled visit provided it has been 1 year since the 3rd dose of their primary course.

Individuals aged 10 years and over should be given the diphtheria with tetanus and poliomyelitis vaccine for their 1st booster dose. This should be at least 5 years after the 3rd dose of their primary course.

All individuals should be given the diphtheria with tetanus and poliomyelitis vaccine for their 2nd booster dose. This is usually given 10 years after the 1st booster, but if previous doses have been delayed, it may be given at the school session or scheduled visit provided there has been at least a 5 year interval since the 1st booster dose.

Parenteral drug misusers should be given booster doses if there is any doubt about their immunisation status.

Travel

All travellers should ensure they are fully immunised (or are up-to-date) with their tetanus vaccination (see *Primary Immunisation* and *Boosters*). Travellers who last received a tetanus booster dose more than 10 years ago and are travelling to areas where medical attention may not be accessible, should be given a booster dose of tetanus-containing vaccine prior to travel, even if they have previously received 5 doses of tetanus-containing vaccines. This is a precautionary measure in case immunoglobulin is not available to the individual in the event of a tetanus-prone injury.

Post-exposure management

Cases

Tetanus is a notifiable disease in the UK. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

Intravenous normal immunoglobulin [unlicensed] is used for the treatment of tetanus (for further information, see Immunoglobulins p. 1383). Antibacterials (such as benzylpenicillin sodium p. 595 and metronidazole p. 590) may also be required—discuss with the microbiology team. Tetanus infection may not result in immunity and vaccination is recommended following recovery (see Prophylaxis). For further guidance on the management of confirmed and suspected cases of tetanus (including localised tetanus), see Chapter 30, Tetanus, in Immunisation against infectious disease—'The Green Book' and Public Health England (PHE) guidance: Tetanus (see Useful resources).

Prophylaxis of tetanus-prone wounds

Any wound can give rise to tetanus. Clean wounds (less than 6 hours old, non-penetrating and have negligible tissue damage) are considered to have a low likelihood of harbouring tetanus spores and of developing conditions that promote spore germination. Tetanus-prone wounds include compound fractures, certain animal bites and scratches, puncture-type injuries acquired in a contaminated environment (these are likely to contain tetanus spores), wounds or burns with systemic sepsis, and wounds containing foreign bodies—this list is not exhaustive. Highrisk tetanus-prone wounds include any tetanus-prone wounds or burns that either show extensive devitalised tissue or require surgical intervention that is delayed more than 6 hours, or wounds that are heavily contaminated with material likely to contain tetanus spores (such as soil or manure).

Post-exposure management of tetanus-prone wounds depends on the individual's immunisation status and wound category (clean, tetanus-prone, or high-risk tetanus-prone). For the risk-assessment of tetanus-prone wounds, an adequate priming course of tetanus vaccine is considered to be at least 3 doses of tetanus-containing vaccine at appropriate intervals.

All wounds should be thoroughly cleaned, and surgical debridement of devitalised tissue in *high-risk tetanus-prone* wounds is essential for the prevention of tetanus infection.

For individuals aged 11 years and over who have received an adequate priming course of tetanus vaccine with the last dose given within 10 years, for children aged 5–10 years whose tetanus immunisation is up to date, and for children aged under 5 years who have received an adequate priming course, no immediate treatment is required regardless of wound category.

For individuals who have received an adequate priming course of tetanus vaccine but the last dose was given more than 10 years ago (includes those born in the UK after 1961 with a history of accepting vaccinations), and for children aged 5–10 years who have received an adequate priming course but no booster, give an immediate booster dose of a suitable tetanus-containing vaccine to individuals with a

wound that is *tetanus-prone* or *high-risk tetanus-prone*. In addition, for a *high-risk tetanus-prone* wound, give a single dose of tetanus immunoglobulin p. 1390 at a different site (or if unavailable, normal immunoglobulin [unlicensed] may be used—for further guidance, see PHE guidance: **Tetanus** (see *Useful resources*)).

For individuals who have not received an adequate priming course of tetanus vaccine (includes those with uncertain immunisation status and/or born before 1961), give an immediate booster dose of a suitable tetanus-containing vaccine regardless of wound category. In addition, for a tetanus-prone or high-risk tetanus-prone wound, give a single dose of tetanus immunoglobulin at a different site (or if unavailable, normal immunoglobulin [unlicensed] may be used—for further guidance, see PHE guidance: Tetanus (see Useful resources)).

Individuals who are severely immunosuppressed may not be adequately protected against tetanus, despite being fully immunised. An additional booster dose of a suitable tetanus-containing vaccine and/or immunoglobulin may be required.

To ensure immunity against future exposure, all individuals who are not completely immunised should be given further doses of a suitable tetanus-containing vaccine as required to complete their recommended schedule (see *Prophylaxis*).

Antibacterial therapy may also be considered for tetanusprone wounds depending on clinical severity, to prevent tetanus. For further guidance on the management of tetanus-prone wounds, see Chapter 30, Tetanus, in Immunisation against infectious disease- 'The Green Book' and PHE guidance: **Tetanus** (see *Useful resources*).

Pregnancy

Routine vaccination of pregnant females with diphtheria with tetanus, pertussis and poliomyelitis vaccine p. 1419 is recommended from week 16 of each pregnancy as part of the maternal pertussis programme (for further guidance, see PHE guidance: Pertussis (whooping cough) vaccination programme for pregnant women, available at: www.gov.uk/government/publications/vaccination-against-pertussis-whooping-cough-for-pregnant-women). For pregnant females who have not been immunised previously or have an unknown or incomplete history, they should be given the diphtheria with tetanus and poliomyelitis vaccine p. 1419 at appropriate intervals as needed to complete a primary course. For information on tetanus-containing booster vaccines following a primary course, see Boosters in Prophylaxis.

Pregnant females may be given tetanus-containing vaccines where protection is needed without delay. For information on the management of cases and prophylaxis of tetanus-prone wounds, see Post-exposure management.

Useful Resources

Recommendations reflect Chapter 30, Tetanus, in *Immunisation against infectious disease-* 'The Green Book'. Public Health England, January 2020. www.gov.uk/government/publications/tetanus-the-green-book-chapter-30

Tetanus: Guidance on the management of suspected cases and on the assessment and management tetanus-prone wounds. Public Health England, July 2019. www.gov.uk/government/publications/tetanus-advice-for-health-professionals

Tick-borne encephalitis vaccine

08-Jul-2020

Overview

The tick-borne encephalitis (TBE) vaccine contains inactivated TBE virus (Neudörfl strain) grown in chick embryo cells. It is recommended for the protection of individuals at high risk of exposure to the TBE virus through their work or travel.

Immunisation with the tick-borne encephalitis vaccine, inactivated p. 1436 is therefore recommended for:

- individuals who travel, particularly in spring and summer, to endemic forested areas where ticks are most prevalent (including those who hike, camp, hunt, and undertake fieldwork);
- individuals who will be residing in an area where TBE is endemic or epidemic, especially those working in forestry, woodcutting, farming, and the military;
- laboratory workers who may be exposed to the TBE virus.

A 3 dose schedule of the tick-borne encephalitis vaccine, inactivated is recommended for children aged 1 year and over, and for adults. Sufficient protection can be expected for the ongoing tick season after the first 2 doses, and for at least 3 years after the 3rd dose. Booster doses are required every 3–5 years for those still at risk of TBE exposure. For dosing schedules, see tick-borne encephalitis vaccine, inactivated.

Refer to the British HIV Association for information on the use of tick-borne encephalitis vaccine, inactivated in individuals with HIV infection. See www.bhiva.org/guidelines for further information.

Further information on preventing or reducing the risk of TBE is available from the National Travel Health Network and Centre (nathnac.net/) and Health Protection Scotland (www.travax.nbs.uk/).

Post-exposure management

Unvaccinated individuals bitten by ticks in endemic areas should seek local medical advice. No specific therapy is available following exposure to tick-borne encephalitis; supportive treatment can significantly reduce morbidity and mortality. If tick-borne encephalitis is suspected, the referring clinician should discuss the case with a clinician at the Public Health England Rare and Imported Pathogens Laboratory (contact details are available at: www.gov.uk/guidance/tick-borne-encephalitis-epidemiology-diagnosis-and-prevention).

Medical practitioners must notify the proper officer at their local council or local health protection team of all suspected cases of acute encephalitis of any cause. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

Useful Resources

Recommendations reflect Chapter 31, Tick-borne encephalitis, in *Immunisation against infectious disease-* 'The Green Book'. Public Health England, April 2013. www.gov.uk/government/publications/tick-borne-encephalitis-the-green-book-chapter-31

Typhoid vaccine

29-Jul-2019

Overview

Typhoid vaccine p. 1425 is available as a Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and a live, attenuated *Salmonella typhi* vaccine for oral use. Typhoid immunisation is advised for:

 travellers to areas where typhoid is endemic and whose planned activities put them at higher risk (country-bycountry information is available from the National Travel Health Network and Centre);

- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely.
- laboratory personnel who, in the course of their work, may be exposed to Salmonella typhi.

Capsular polysaccharide typhoid vaccine is given as a single dose, usually by intramuscular injection. Children under 2 years [unlicensed] may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). A single booster dose should be given at 3-year intervals in adults and children over 2 years of age who remain at risk from typhoid fever.

Oral typhoid vaccine is a live, attenuated vaccine contained in an enteric-coated capsule recommended in individuals aged 5 years and over. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. If travelling from a nonendemic area to an area where typhoid is endemic, a booster consisting of 3 doses is recommended every 3 years. The oral typhoid vaccine should be avoided in immunosuppressed and HIV-infected individuals.

Prevention of typhoid primarily depends on improving sanitation and water supplies in endemic areas and on scrupulous personal, food and water hygiene.

All suspected cases of typhoid fever must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Useful Resources

Recommendations reflect Chapter 33, Typhoid, in *Immunisation against infectious disease*— 'The Green Book'. Public Health England, May 2019.

Varicella-zoster vaccines

27-Sep-2021

Overview

The vaccine preparations Varilrix®, Varivax® and Zostavax® contain live, attenuated virus derived from the Oka strain of varicella-zoster virus, whereas Shingrix® is a recombinant, adjuvanted vaccine that contains varicella-zoster virus glycoprotein E antigen—it does not contain any live virus.

The Varilrix® and Varivax® vaccines provide protection against varicella (chickenpox)—these vaccines have a significantly lower antigen content than the Zostavax® vaccine.

The $Zostavax^{\otimes}$ and $Shingrix^{\otimes}$ vaccines provide protection against herpes zoster (shingles).

Pre-exposure prophylaxis against varicella (chickenpox)

Varicella immunisation aims to protect individuals who are at most risk of serious illness from exposure to the varicellazoster virus, by vaccinating specific individuals who are in regular or close contact with those at risk. Individuals with a definite history of chickenpox or shingles can be considered immune. However, for individuals born and raised overseas, a history of chickenpox is a less reliable predictor of immunity and routine testing should be considered.

Vaccination with the chickenpox varicella-zoster vaccine p. 1437 ($Varilrix^{\otimes}$ or $Varivax^{\otimes}$) is recommended for:

- non-immune laboratory staff who may be exposed to varicella-zoster virus in the course of their work in virology laboratories and clinical infectious disease units;
- non-immune healthy susceptible contacts of immunocompromised patients where continuing close contact is unavoidable.

Children aged 1 year and over and adults, should receive 2 doses of the chickenpox varicella-zoster vaccine at least 4–8 weeks apart. Vaccination should be postponed in acutely unwell individuals until they have fully recovered, unless protection is urgently required. There is no data on interchangeability between the *Varilrix®* or *Varivax®* vaccines, but it is likely that a course can be completed effectively with the different vaccine.

Within 1 month of vaccination, some individuals may develop a localised rash at the injection site or a generalised rash (papular or vesicular). Healthcare workers who develop a post-vaccine rash should consult their occupational health department for assessment before commencing work. The vaccine virus strain can also establish latent infection and reactivate to cause shingles in some individuals (the risk is substantially lower than with wild chickenpox infection)—cases of shingles should be investigated. For further information on vaccine-related cutaneous rashes, see Cautions, further information in varicella-zoster vaccine, and Chapter 34, Varicella, in Immunisation against infectious disease- 'The Green Book' (see Useful resources).

The chickenpox vaccines are not recommended for individuals with immunosuppression—seek specialist advice for those who require protection against chickenpox. Refer to the British HIV Association or Children's HIV Association for guidance in individuals with HIV infection (available at: www.bhiva.org/guidelines and www.chiva.org.uk).

For information on post-exposure management, see Varicella-zoster immunoglobulin in Immunoglobulins p. 1383. Chickenpox is only a notifiable disease in Northern Ireland. For further information, see Notifiable diseases in Antibacterials, principles of therapy p. 540.

Immunisation against herpes zoster (shingles)

The national shingles vaccination programme (launched in September 2013) aims to lower the incidence and severity of shingles in older people, in whom the risk and severity of disease and of subsequent post herpetic neuralgia (PHN) is higher. As part of the national programme, immunisation is only recommended for individuals aged 70–79 years. This is because the burden of shingles disease is generally not as severe in individuals aged 50–69 years, and because of the limited vaccine effectiveness in older individuals. For guidance on the vaccination of individuals who have received vaccination before 70 years of age, see PHE guidance: Shingles vaccination: guidance for healthcare professionals (see *Useful resources*).

The herpes zoster (shingles) vaccines (Zostavax® and Shingrix®) are not recommended for shingles post-exposure prophylaxis or for the treatment of shingles or PHN, but they can be given to those with a previous history of shingles or who experience residual nerve pain that may be permanent. For further information, see Chapter 28a, Shingles (herpes zoster), in Immunisation against infectious disease- 'The Green Book' (see Useful resources).

Non-immunosuppressed individuals

Non-immunosuppressed individuals should be offered a single dose of the herpes-zoster vaccine, live p. 1431 (Zostavax®). The need for a booster dose has not been established. For information on shingles immunisation in individuals with immunosuppression and/or HIV infection, see Immunosuppression and HIV.

Administration of herpes-zoster vaccine, live (*Zostavax*®) should be delayed in individuals who are being treated with oral or intravenous antivirals (such as aciclovir) until 48 hours after cessation of treatment.

There is a theoretical risk that individuals who develop a rash following vaccination with herpes-zoster vaccine, live (Zostavax*) could transmit the attenuated vaccine virus to a susceptible individual. Individuals who develop a vesicular rash or varicella-zoster virus-like rash after vaccination should seek medical attention, be tested, and take precautionary measures. For further guidance, see Chapter 28a, Shingles (herpes zoster), in *Immunisation against infectious disease-* 'The Green Book', and PHE guidance: Shingles vaccination: guidance for healthcare professionals (see *Useful resources*).

For information on post-exposure management, see Varicella-zoster immunoglobulin in Immunoglobulins p. 1383.

Immunosuppression and HIV

The decision on which shingles vaccine to administer to individuals who are immunosuppressed should be based on a full clinical assessment. Seek specialist advice if there are doubts or concerns about an individual's immunosuppressive treatment, degree of immunosuppression, or vaccine suitability. Refer to the British HIV Association for guidance in individuals with HIV infection (available at: www.bhiva.org/guidelines).

Individuals with non-severe immunosuppression aged 70–79 years who are eligible for the shingles immunisation, should be offered herpes-zoster vaccine, live (Zostavax®). Individuals anticipating immunosuppressive therapy should receive the Zostavax® vaccine at the earliest opportunity and at least 14 days before starting immunosuppressive therapy, although leaving 1 month would be preferable if a delay is possible. For guidance on vaccination with the Zostavax® vaccine, see Non-immunosuppressed individuals.

Individuals with severe immunosuppression aged 70–79 years who are eligible for the shingles immunisation, should be offered 2 doses of the herpes-zoster vaccine (recombinant, adjuvanted) p. 1431 (Shingrix®), given 2 months apart. Individuals who have turned 80 years of age following their 1st dose, should be given a 2nd dose to complete the 2 dose schedule. If the course of Shingrix® is interrupted or delayed, it should be resumed but not repeated. The need for a booster dose has not been established

For further information on shingles immunisation in immunosuppressed individuals, including the definition of severe immunosuppression and management if herpeszoster vaccine, live p. 1431 (Zostavax®) is inadvertently administered to an immunosuppressed individual, see Chapter 28a, Shingles (herpes zoster), in *Immunisation against infectious disease*- The Green Book', and PHE guidance: Shingles vaccination: guidance for healthcare professionals (see Useful resources).

For information on post-exposure management, see *Varicella-zoster immunoglobulin* in Immunoglobulins p. 1383.

Pregnancy

The live *Varilrix*®, *Varivax*®, and *Zostavax*® vaccines are not recommended during pregnancy. All exposure to live vaccines from 3 months before conception to any time during pregnancy, should be reported to the Immunisation Department of PHE who run UK-wide surveillance on the safety of vaccines given in pregnancy. Pregnant women should be advised to seek prompt medical advice if they develop a vesicular rash following inadvertent vaccination. For advice on the reporting, risk assessment, and management of inadvertent vaccination in pregnancy, see PHE guidance: **Vaccination in pregnancy** (VIP)(available at: www.gov.uk/guidance/vaccination-in-pregnancy-vip).

There is no evidence of risk from vaccinating pregnant females with inactivated vaccines

Yellow fever vaccine

23-Jan-2020

MHRA/CHM advice: stronger precautions in people with weakened immunity and in those aged 60 years or older

The MHRA and CHM have released important safety information regarding the use of the live yellow fever vaccine in those with weakened immunity, and in those aged 60 years or older. For further information, see *Important safety information* for yellow fever vaccine, live p. 1437.

Overview

Yellow fever vaccine, live is an attenuated preparation of yellow fever virus grown in chick eggs. Yellow fever vaccine, live is recommended for:

- · laboratory workers handling infected material;
- individuals aged 9 months or older who are travelling to, or living in areas or countries with a risk of yellow fever transmission;
- individuals aged 9 months or older who are travelling to, or living in countries that require an International Certificate of Vaccination or Prophylaxis (ICVP) for entry (information about countries at risk of yellow fever is available from the National Travel Health Network and Centre).

Children aged under 9 months are at higher risk of vaccineassociated encephalitis, with the risk being inversely proportional to age. Children aged under 6 months should **not** be vaccinated. Children aged 6–9 months should only be vaccinated following a detailed risk assessment, and vaccination is generally only recommended if the risk of yellow fever transmission is high (such as during epidemics/outbreaks). If travel is unavoidable, seek expert advice on whether to vaccinate.

Yellow fever vaccine, live should be avoided in individuals with primary or acquired immunodeficiency due to a congenital condition or disease process, and in individuals who are immunosuppressed as a result of treatment.

If the yellow fever risk is unavoidable in HIV-infected individuals, consult the British HIV Association (bhiva.org/vaccination-guidelines) or other specialist advice.

For additional guidance on the suitability of immunisation against yellow fever, standardised checklists are available from: National Travel Health Network and Centre (see *Useful resources*) or Health Protection Scotland (www.Travax.nhs.uk).

A single-dose of yellow fever vaccine, live confers life-long immunity against yellow fever disease. Immunisation should be performed at least 10 days before travelling to an endemic area to allow protective immunity to develop and for the ICVP (if required) to become valid.

Reinforcing immunisation is not needed, except for a small subset of individuals at continued risk who may not

have developed long-term protection from their initial yellow fever vaccine, live vaccination—seek expert advice.

All suspected cases of yellow fever must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Useful Resources

Recommendations reflect Chapter 35, Yellow fever, in *Immunisation against infectious disease*- 'The Green Book'. Public Health England, January 2020.

Travel vaccinations and precautions

14-Jul-202

Immunisation for travel

The National Travel Health Network and Centre have issued guidance on how to manage interrupted vaccination schedules which includes general principles for consideration, such as keeping to the recommended schedules, lengthening and shortening schedules, off-label administration and re-starting courses. For further information, see travelhealthpro.org.uk/news/517/interrupted-vaccination-schedules-general-principles-for-travel-health-professionals.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); the tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of **poliomyelitis** should be immunised with the appropriate vaccine; previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine.

Immunisation against **meningococcal meningitis** is recommended for a number of areas of the world.

There is no requirement for cholera vaccination as a condition for entry into any country, but **oral cholera vaccine** should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on **diphtheria** is available from the National Travel Health Network and Centre (see *Useful resources*).

For guidance on immunisation against the following infectious diseases, refer to the individual treatment summaries listed:

- Hepatitis A (see Hepatitis A vaccine p. 1401).
- Hepatitis B (see Hepatitis B vaccine p. 1402).
- Japanese encephalitis (see Japanese encephalitis vaccine p. 1405).
- Rabies (see Rabies vaccine p. 1411).
- Tetanus (see Tetanus vaccine p. 1413).
- Tick-borne encephalitis (see Tick-borne encephalitis vaccine p. 1415).
- Tuberculosis (see Bacillus Calmette-Guérin vaccine p. 1396).
- Typhoid (see Typhoid vaccine p. 1415).
- Yellow fever (see Yellow fever vaccine above).

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country; or the National Travel Health Network and Centre, Health Protection Scotland, the Welsh Government, or the Department of Health Northern Ireland (see *Useful resources*).

Precautions for avoiding infectious disease

In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers' diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

For guidance on malaria precautions, see Malaria, prophylaxis p. 661 and Malaria, treatment p. 667.

Further information on preventing or reducing the risk of infectious diseases when travelling, visiting, working, or living in high risk areas is available from the National Travel Health Network and Centre and Health Protection Scotland (see *Useful resources*).

VACCINES

Vaccines

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED NOVEMBER 2017)

Following reports of death in neonates who received a live attenuated vaccine after exposure to a tumor necrosis factor alpha (TNF-a) inhibitor in utero, the MHRA has issued the following advice:

- any infant who has been exposed to immunosuppressive treatment from the mother either in utero during pregnancy or via breastfeeding should have any live attenuated vaccination deferred for as long as a postnatal influence on the immune status of the infant remains possible;
- in the case of infants who have been exposed to TNF-a inhibitors and other immunosuppressive biological medicines in utero, PHE advise that any live attenuated vaccination (e.g. BCG vaccine) should be deferred until the infant is age 6 months;
- PHE advise if there is any doubt as to whether an infant due to receive a live attenuated vaccine may be immunosuppressed due to the mother's therapy, including exposure through breast-feeding, specialist advice should be sought.

• CONTRA-INDICATIONS

- Impaired immune response Public Health England advises severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).
- CAUTIONS Acute illness minor illnesses

CAUTIONS, FURTHER INFORMATION PHE advises vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.

 Impaired immune response and drugs affecting immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines.

PHE advises:

- specialist advice should be sought for immunosuppressed patients, or those being treated with high doses of corticosteroids (dose equivalents of prednisolone: adults, at least 40 mg daily for more than 1 week or at least 20 mg daily for more than 14 days; children, 2 mg/kg (or more than 40 mg) daily for more than 1 week or 1 mg/kg (or more than 20 mg) daily for more than 14 days) or other immunosuppressive drugs, or those being treated for malignant or non-malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids or non-biological oral immune modulating drugs, and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressive biological therapy).
- Predisposition to neurological problems PHE advises:
- when there is a personal or family history of febrile
 convulsions, there is an increased risk of these occurring
 during fever from any cause including immunisation,
 but this is not a contra-indication to immunisation. In
 children who have had a seizure associated with fever
 without neurological deterioration, immunisation is
 recommended; advice on the management of fever should
 be given before immunisation. When a child has had a
 convulsion not associated with fever, and the
 neurological condition is not deteriorating,
 immunisation is recommended:
- children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule;
- when there is a still evolving neurological problem, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

• SIDE-EFFECTS

- Common or very common Abdominal pain · appetite decreased · arthralgia · diarrhoea · fatigue · fever · headache · lymphadenopathy · malaise · myalgia · nausea · skin reactions · vomiting
- ► Uncommon Hypersensitivity
- ALLERGY AND CROSS-SENSITIVITY PHE advises contraindicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines).
- PREGNANCY Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids.

- BREAST FEEDING Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breastfeeding, with inactivated viral or bacterial vaccines or toxoids.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises if alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

Public Health England advises when 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart. See also Cautions, further information in Bacillus Calmette-Guérin vaccine p. 1421 and in measles, mumps and rubella vaccine, live p. 1433.

Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. Public Health England advises the intramuscular route is usually avoided in patients with bleeding disorders such as haemophilia or thrombocytopenia; vaccines usually given by the intramuscular route can be given by deep subcutaneous injection instead.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

HANDLING AND STORAGE Care must be taken to store all
vaccines under the conditions recommended in the
product literature, otherwise the preparation may become
ineffective. Refrigerated storage is usually necessary;
many vaccines need to be stored at 2–8°C and not allowed
to freeze. Vaccines should be protected from light.
Reconstituted vaccines and opened multidose vials must
be used within the period recommended in the product
literature. Unused vaccines should be disposed of by
incineration at a registered disposal contractor.

Diphtheria with tetanus and poliomyelitis vaccine

05-0ct-2021

• INDICATIONS AND DOSE

Primary immunisation

- ► BY INTRAMUSCULAR INJECTION
- ► Child 10-17 years: 0.5 mL every month for 3 doses
- Adult: 0.5 mL every month for 3 doses

Booster doses

- ► BY INTRAMUSCULAR INJECTION
- Child 10-17 years: 0.5 mL for 1 dose, first booster dose—should be given at least 5 years after primary course, then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed)
- Adult: 0.5 mL for 1 dose, first booster dose—should be given at least 5 years after primary course, then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed)

SIDE-EFFECTS

- ► Common or very common Vertigo
- ► Frequency not known Asthenia · chills · face oedema · influenza like illness · nerve disorders · pallor · seizure · shock · syncope · vaccination reactions
- PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood schedule from health organisations or ImmForm.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

Revaxis (Sanofi Pasteur)

Revaxis vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection | PoM| £7.80 DT = £7.80

F 1418

Diphtheria with tetanus, pertussis and poliomyelitis vaccine 05-0ct-2021

INDICATIONS AND DOSE

First booster dose

- ► BY INTRAMUSCULAR INJECTION
- Child 3-9 years: 0.5 mL, to be given 3 years after primary immunisation

Vaccination of pregnant women against pertussis (using low dose vaccines)

- ► BY INTRAMUSCULAR INJECTION
- Females of childbearing potential: 0.5 mL for 1 dose

SIDE-EFFECTS

- ► Common or very common Irritability (in children)
- ▶ Uncommon Apathy (in children) asthma chills dizziness drowsiness (very common in children) dry throat (in children) extensive swelling of vaccinated limb (very common in children) oral herpes pain paraesthesia sleep disorder (in children)
- ► Frequency not known Angioedema · asthenia · hypotonichyporesponsiveness episode · seizure SIDE-EFFECTS, FURTHER INFORMATION The incidence of

local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis.

Public Health England has advised (2016) that the vaccine should not be withheld from children with a history to a preceding dose of: fever, irrespective of severity; hypotonic-hyporesonsive episodes; persistent crying or screaming for more than 3 hours; severe local reaction, irrespective of extent.

- PREGNANCY Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.
- PRESCRIBING AND DISPENSING INFORMATION Pregnant women should be vaccinated using low dose vaccines (brands may include Boostrix-IPV® or Repevax®).

Available as part of childhood immunisation schedule from health organisations or ImmForm.

Available for vaccination of pregnant women from ImmForm.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

- ► Boostrix-IPV (GlaxoSmithKline UK Ltd)

 Boostrix-IPV suspension for injection 0.5ml pre-filled syringes | 1 prefilled disposable injection PoM £22.74 DT = £20.00

Bacillus Calmette-Guérin vaccine

18-Jan-2022

(BCG Vaccine)

 DRUG ACTION BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from Mycobacterium bovis which stimulates the development of immunity to M. tuberculosis.

• INDICATIONS AND DOSE

Immunisation against tuberculosis

- ► BY INTRADERMAL INJECTION
- Child 1-11 months: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided
- Child 1-17 years: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided
- Adult: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided
- CONTRA-INDICATIONS Children less than 2 years of age in household contact with known or suspected case of active tuberculosis · generalised septic skin conditions · history of active or latent tuberculosis · severe combined immunodeficiency disorder

CONTRA-INDICATIONS, FURTHER INFORMATION

Manufacturer advises using a lesion-free site to administer BCG vaccine to patients with eczema.

- CAUTIONS When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.
- INTERACTIONS → Appendix 1: live vaccines
- SIDE-EFFECTS
- ▶ Uncommon Lymphadenitis suppurative
- ▶ Rare or very rare Osteitis · osteomyelitis
- $\blacktriangleright \ \, \textbf{Frequency not known} \ \, \textbf{Seizure} \cdot \textbf{syncope}$

DIRECTIONS FOR ADMINISTRATION

- PRE-TREATMENT SCREENING Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see tuberculin purified protein derivative p. 1392). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.
- In children PHE advise that the results of the severe combined immunodeficiency (SCID) screening should be checked before administering BCG vaccine.
- Intradermal injection technique Public Health England advises skin is stretched between thumb and forefinger and needle (size 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised

Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb is sign of correct injection; 7 mm bleb \equiv 0.1 mL injection, 3 mm bleb \equiv 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine. Jet injectors and multiple puncture devices should not be used.

- PRESCRIBING AND DISPENSING INFORMATION Available from health organisations or direct from ImmForm portal. immform.phe.gov.uk (SSI brand, multidose vial with diluent).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Cholera vaccine

05-0ct-2021

• INDICATIONS AND DOSE

Immunisation against cholera (for travellers to endemic or epidemic areas on the basis of current recommendations)

- ► BY MOUTH
- Child 2-5 years: 1 dose every 1-6 weeks for 3 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
- Child 6-17 years: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
- Adult: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

Booster

- ► BY MOUTH
- Child 2-5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated
- Child 6-17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated
- Adult: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated
- CONTRA-INDICATIONS Acute gastro-intestinal illness
- INTERACTIONS → Appendix 1: cholera vaccine
- SIDE-EFFECTS
- Uncommon Gastrointestinal discomfort · gastrointestinal disorders
- Rare or very rare Chills · cough · dehydration · dizziness · drowsiness · hyperhidrosis · increased risk of infection · insomnia · pulmonary reaction · syncope · taste altered · throat pain
- ► Frequency not known Angioedema · asthenia · dyspnoea · hypertension · influenza like illness · lymphadenitis · pain · paraesthesia · sputum increased
- DIRECTIONS FOR ADMINISTRATION
 - In children Manufacturer advises dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2–5 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

- In adults Manufacturer advises dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). Add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.
- PATIENT AND CARER ADVICE Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

F 1418

Haemophilus influenzae type b with meningococcal group C vaccine 05-0ct-2021

• INDICATIONS AND DOSE

Booster dose (for infants who have received primary immunisation with a vaccine containing Haemophilus influenzae type b component) and primary immunisation against Neisseria meningitidis

- ► BY INTRAMISCIII AR INJECTION
- ► Child 12-13 months: 0.5 mL for 1 dose

Immunisation against *Neisseria meningitidis* in an unimmunised patient

► BY INTRAMUSCULAR INJECTION

Child 1-9 years: 0.5 mL for 1 dose

Booster dose (for children who have not been immunised against Haemophilus influenza type b) | Booster dose after recovery from Haemophilus influenzae type b disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)

- ► BY INTRAMUSCULAR INJECTION
- ▶ Child 1-9 years: 0.5 mL for 1 dose

Booster dose after recovery from Haemophilus influenzae type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)

- ► BY INTRAMUSCULAR INJECTION
- ▶ Child 1-17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)

- ► BY INTRAMUSCULAR INJECTION
- Child 2-17 years: 0.5 mL for 1 dose, this booster dose should be given after the second birthday, this is the second dose of haemophilus influenzae type B vaccine combined with meningococcal group C conjugate vaccine (the first dose is given during the routine immunisation schedule)

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)

- ► BY INTRAMUSCULAR INJECTION
- Child 2-17 years: 0.5 mL for 1 dose, this booster dose should be followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine (in patients from 11 years of age, this interval can be reduced to one month)

- Adult: 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine
- UNLICENSED USE Not licensed for use in patients over 2 years.
- SIDE-EFFECTS
- ► Common or very common Drowsiness irritability
- ▶ Uncommon Crying
- ▶ Rare or very rare Insomnia
- ► Frequency not known Dizziness · febrile seizure · meningism (but no evidence that vaccine causes meningococcal C meningitis) · muscle tone decreased
- PRESCRIBING AND DISPENSING INFORMATION Available as part of the childhood immunisation schedule from ImmForm.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Meningococcal group B vaccine (rDNA, component, adsorbed) 19-0ct-201

• INDICATIONS AND DOSE

BEXSERO®

Immunisation against *Neisseria meningitidis*, primary immunisation

- ► BY DEEP INTRAMUSCULAR INJECTION
- Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 477.
- Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 477.

Immunisation against *Neisseria meningitidis*, primary immunisation booster dose

- **▶** BY DEEP INTRAMUSCULAR INJECTION
- Child 12-23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

Immunisation against *Neisseria meningitidis*, primary immunisation (in unimmunised patients)

- ► BY DEEP INTRAMUSCULAR INJECTION
- Child 6-11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1-2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- Child 12-23 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12-24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- ► Child 2-10 years: 0.5 mL for 2 doses, separated by an interval of at least 2 months. Injected preferably into deltoid region (or anterolateral thigh in infants)
- Child 11-17 years: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

 Adult: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

TRUMENBA®

Immunisation against *Neisseria meningitidis*, primary immunisation

- ► BY INTRAMUSCULAR INJECTION
- Child 10-17 years: 0.5 mL for 2 doses, separated by an interval of 6 months, alternatively 0.5 mL for 2 doses, separated by an interval of at least 1 month, followed by 0.5 mL as a third dose, given at least 4 months after the second dose, injected preferably into deltoid region, a booster dose should be considered for individuals at continued risk—consult product literature
- Adult: 0.5 mL for 2 doses, separated by an interval of 6 months, alternatively 0.5 mL for 2 doses, separated by an interval of at least 1 month, followed by 0.5 mL as a third dose, given at least 4 months after the second dose, injected preferably into deltoid region, a booster dose should be considered for individuals at continued risk—consult product literature

SIDE-EFFECTS

- ► Common or very common Crying abnormal (in children) · drowsiness (in children) · eating disorder (in children) · irritability (in children)
- Uncommon Seizures (in children) · vascular disorders (in children)
- Frequency not known Extensive swelling of vaccinated limb

 hypotonic-hyporesponsiveness episode (in children) •
 meningism
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Pneumococcal polysaccharide conjugate vaccine (adsorbed)

07-Jan-2022

• INDICATIONS AND DOSE

PREVENAR 13

Primary immunisation against pneumococcal infection first dose

- ► BY INTRAMUSCULAR INJECTION
- Child 12 weeks: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year

Primary immunisation against pneumococcal infection booster dose

- ► BY INTRAMUSCULAR INJECTION
- Child 1 year: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year; deltoid muscle is preferred in older children

Primary immunisation against pneumococcal infection—in those with asplenia, splenic dysfunction, complement disorder or severe immunocompromise

- ► BY INTRAMUSCULAR INJECTION
- Child 6 weeks-11 months: 0.5 mL for 4 doses, the first two doses to be given at least 8 weeks apart, the third dose to be given on or after their first birthday, and the fourth dose to be given at least 8 weeks later.
 Anterolateral thigh is preferred site of injection in infants under 1 year; deltoid muscle is preferred in children
- Child 1-2 years: 0.5 mL for 2 doses, the first dose to be given on or after their first birthday and the second dose to be given at least 8 weeks later. Deltoid muscle is preferred site of injection in children

Immunisation against pneumococcal infection—unimmunised or partially immunised patients

- **▶** BY INTRAMUSCULAR INJECTION
- Child 3-11 months: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose on or after their first birthday, given at least 4 weeks after the first dose. Anterolateral thigh is preferred site of injection in infants under 1 year
- Child 12-23 months: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children

Immunisation against pneumococcal infection unimmunised or partially immunised patients at increased risk [born on or after 1 January 2020]

- ► BY INTRAMUSCULAR INJECTION
- Child 2-9 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children

Immunisation against pneumococcal infection immunised patients with severe immunocompromise [born on or after 1 January 2020]

- ► BY INTRAMUSCULAR INJECTION
- Child 2-17 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children
- Adult: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults

Immunisation against pneumococcal infection immunised patients at increased risk [born on or before 31 December 2019]

- ► BY INTRAMUSCULAR INJECTION
- Child 14 months-17 years: 0.5 mL for 1 dose, given at least 2 months after primary immunisation booster dose, deltoid muscle is preferred site of injection in children
- Adult: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults

Immunisation against pneumococcal infection unimmunised or partially immunised patients at increased risk [born on or before 31 December 2019]

- ► BY INTRAMUSCULAR INJECTION
- Child 1-9 years: 0.5 mL for 1 dose, an additional dose is recommended (at least 2 months later) in those who are severely immunocompromised. Deltoid muscle is preferred site of injection in children
- Child 10-17 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children
- Adult: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults

Typhoid vaccine

05-0ct-2021

 DRUG ACTION Typhoid vaccine protects against typhoid fever caused by Salmonella typhi infection; it is available as an oral live attenuated vaccine and an injectable polysaccharide vaccine.

• INDICATIONS AND DOSE

Immunisation against typhoid fever [in children at high risk of typhoid fever]

- ► BY INTRAMUSCULAR INJECTION
- Child 12-23 months: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection, response may be suboptimal

Immunisation against typhoid fever

- ► BY INTRAMUSCULAR INJECTION
- Child 2-17 years: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
- Adult: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
- ► BY MOUTH
- Child 5-17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5), course should be completed at least 1 week before potential exposure to typhoid infection
- Adult: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5), course should be completed at least 1 week before potential exposure to typhoid infection

Booster

- **▶** BY INTRAMUSCULAR INJECTION
- ▶ Child 2-17 years: 0.5 mL for 1 dose every 3 years
- ▶ Adult: 0.5 mL for 1 dose every 3 years
- ► BY MOUTH
- Child 5-17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5) every 3 years
- Adult: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5) every 3 years

UNLICENSED USE

- With intramuscular use in children Not licensed for use in children under 2 years.
- CONTRA-INDICATIONS
- ▶ With oral use Acute gastro-intestinal illness
- INTERACTIONS → Appendix 1: live vaccines
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS Shock

SPECIFIC SIDE-EFFECTS

- With oral use Abdominal distension · asthenia · back pain · chills · dizziness · flatulence · influenza like illness · paraesthesia
- ▶ With parenteral use Asthma syncope
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

• HANDLING AND STORAGE

- With oral use It is important to store capsules in a refrigerator.
- PATIENT AND CARER ADVICE
- With oral use Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

VACCINES > VIRAL VACCINES

F 1418

COVID-19 vaccine 16-May-2022

• DRUG ACTION COVID-19 vaccines use the spike protein of the SARS-COV-2 virus to act as an intracellular antigen and produce an antibody response, thereby protecting against COVID-19 infection. Pfizer/BioNTech (Comirnaty®) and Moderna (Spikevax®) are nucleosidemodified messenger RNA (mRNA) vaccines that deliver viral RNA into host cells to enable expression of the spike protein. AstraZeneca vaccine (Vaxzevria®) uses a chimpanzee-derived adenovirus vector to incorporate the

The rINN for the Pfizer/BioNTech vaccine (Comirnaty®) is tozinameran

• INDICATIONS AND DOSE

spike protein into host cells.

ASTRAZENECA VACCINE (VAXZEVRIA®)

Immunisation against COVID-19

- ► BY INTRAMUSCULAR INJECTION
- ► Adult: (consult local protocol)

 MODERNA VACCINE (SPIKEVAX ®)

Immunisation against COVID-19

- ► BY INTRAMUSCULAR INJECTION
- ► Adult: (consult local protocol)

PFIZER/BIONTECH VACCINE (COMIRNATY®)

Immunisation against COVID-19

- ► BY INTRAMUSCULAR INJECTION
- ► Adult: (consult local protocol)

CONTRA-INDICATIONS

ASTRAZENECA VACCINE (VAXZEVRIA®) History of capillary leak syndrome • thrombosis with thrombocytopenia syndrome following previous dose • transverse myelitis following previous dose

CAUTIONS

ASTRAZENECA VACCINE (VAXZEVRIA®) History of cerebral venous sinus thrombosis · history of heparin-induced thrombocytopenia with thrombosis · patients under 40 years (higher risk of thrombotic side-effects; Pfizer/BioNTech (Comirnaty®) and Moderna (Spikevax®) vaccines preferred)

CAUTIONS, FURTHER INFORMATION

- Medical conditions predisposing to blood clots The MHRA advises that administration in individuals of any age at higher risk of blood clots because of a medical condition (such as antiphospholipid syndrome) should only be considered if the benefits outweigh the risks.
- SIDE-EFFECTS
- ► Common or very common Axillary lymph node tenderness chills influenza like illness pain in extremity
- ► Uncommon Asthenia · dizziness · drowsiness · insomnia · sweat changes

- ▶ Rare or very rare Angioedema · facial paralysis · Guillain-Barre syndrome (following AstraZeneca vaccine) · myocarditis (following Moderna and Pfizer/BioNTech vaccines) · pericarditis (following Moderna and Pfizer/BioNTech vaccines) · sensation abnormal
- ► Frequency not known Arterial thrombosis (following AstraZeneca vaccine) · capillary leak syndrome (following AstraZeneca vaccine) · cerebral venous sinus thrombosis (following AstraZeneca vaccine) · extensive swelling of vaccinated limb · thrombocytopenia (following AstraZeneca vaccine) · thromboembolism (following AstraZeneca vaccine) · transverse myelitis (following AstraZeneca vaccine) · venous thrombosis (following AstraZeneca vaccine) · visceral venous thrombosis (following AstraZeneca vaccine)
- ALLERGY AND CROSS-SENSITIVITY PHE advises individuals
 with a history of anaphylaxis to food, an identified drug or
 vaccine, or an insect sting can receive any COVID-19
 vaccine, as long as they are not allergic to any of its
 ingredients; consider observation for 15 minutes.
 Individuals who had a non-allergic reaction to a first dose
 of COVID-19 vaccine can receive a second dose, followed
 by an observation period of 15 minutes.

PHE advises individuals with a history of immediate onset anaphylaxis to multiple classes of drugs, or unexplained anaphylaxis, should not be vaccinated with Pfizer/BioNTech (Comirnaty®) or Moderna (Spikevax®) vaccines, except on advice of an allergy specialist. The AstraZeneca (Vazzevria®) vaccine can be used as an alternative (if not otherwise contra-indicated); it should be administered in a setting with full resuscitation facilities, followed by an observation period of 30 minutes.

PHE advises individuals with a localised allergic reaction or with systemic symptoms, but not anaphylaxis, to the first dose of a COVID-19 vaccine can receive further doses with an observation period of 30 minutes. In these individuals, or if the reaction was delayed and selflimiting, or resolved with an oral antihistamine, consider pre-treatment with a non-sedating antihistamine 30 minutes before giving further doses. Seek advice from an allergy specialist if the reaction presented with anaphylaxis or required medical attention. If the anaphylactic reaction was to a previous dose of AstraZeneca (Vaxzevria®) vaccine, complete vaccination with an mRNA vaccine; if the reaction was to an mRNA vaccine, give the same or a different mRNA vaccine in a hospital setting-an observation period of at least 30 minutes is recommended.

- PREGNANCY PHE advises COVID-19 vaccines should be offered—Pfizer/BioNTech (Comirnaty®) and Moderna (Spikevax®) vaccines preferred due to more clinical experience. See also Pregnancy in COVID-19 vaccines p. 1397.
- BREAST FEEDING PHE advises that COVID-19 vaccines are suitable.
- MONITORING REQUIREMENTS
- PHE advises healthcare professionals to monitor platelets 2 to 5 days after vaccination in patients with a history of immune thrombocytopenia.
- ▶ PHE advises healthcare professionals to be alert for signs and symptoms of myocarditis and pericarditis and inform vaccinated patients to seek immediate medical attention if they experience a new onset of chest pain, shortness of breath, palpitations or arrhythmias within 10 days of vaccination.
- Ever For AstraZeneca vaccine (Vaxzevria®): healthcare professionals are advised to be alert for signs and symptoms of Guillain-Barré syndrome.
- For advice on further doses for those who have suspected Guillain-Barré syndrome, myocarditis, or pericarditis after vaccination, see Chapter 14a: COVID-19 - SARS-CoV-2, in Immunisation against infectious disease- "The Green Book".

- DIRECTIONS FOR ADMINISTRATION Public Health England advises that individuals with bleeding disorders may be vaccinated by the intramuscular route, on the advice of a doctor familiar with their bleeding risk. Patients treated with medicines to reduce bleeding (e.g. for haemophilia) are advised to administer their medicine shortly prior to intramuscular vaccination.
- HANDLING AND STORAGE

PFIZER/BIONTECH VACCINE (COMIRNATY ®) Store in a freezer at -90°C to -60°C—consult product literature about thawing and storage after thawing.

MODERNA VACCINE (SPIKEVAX®) Store in a freezer at -25° C to -15°C—consult product literature about thawing and storage after thawing.

PATIENT AND CARER ADVICE

Driving and skilled tasks Healthcare professionals are advised to inform patients not to drive for 15 minutes after vaccination—increased risk of fainting.

ASTRAZENECA VACCINE (VAXZEVRIA ®) Healthcare professionals are advised to inform patients to seek immediate medical advice if symptoms of thromboembolism and/or thrombocytopenia develop 4 days or more after vaccination.

Leaflet for patients The leaflet COVID-19 vaccination and blood clotting is available from PHE (www.gov.uk/government/publications/covid-19-vaccination-and-blood-clotting).

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1427, hepatitis B vaccine p. 1429.

INDICATIONS AND DOSE

AMBIRIX [©]

Immunisation against hepatitis A and hepatitis B infection [primary course]

- ► BY INTRAMUSCULAR INJECTION
- Child 1-15 years: Initially 1 mL for 1 dose, then 1 mL after 6-12 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh may be used in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Post-exposure prophylaxis against hepatitis A infection [for rapid protection]

- ► BY INTRAMUSCULAR INJECTION
- Child 1-15 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh may be used in infants; not to be injected into the buttock (vaccine efficacy reduced),

subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

TWINRIX ® ADULT

Immunisation against hepatitis A and hepatitis B infection [primary course]

- ► BY INTRAMUSCULAR INJECTION
- Child 16-17 years: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
- Adult: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Immunisation against hepatitis A and hepatitis B infection [accelerated schedule for travellers departing within 1 month]

- ► BY INTRAMUSCULAR INJECTION
- ▶ Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
- Adult: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

TWINRIX ® PAEDIATRIC

Immunisation against hepatitis A and hepatitis B infection [primary course]

- ► BY INTRAMUSCULAR INJECTION
- Child 1-15 years: Initially 0.5 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

UNLICENSED USE

AMBIRIX Public Health England advises that *Ambirix* may be used for post-exposure prophylaxis against hepatitis A infection where rapid protection is required, but is not licensed for this indication.

IMPORTANT SAFETY INFORMATION

Ambirix® and Twinrix® are not recommended for postexposure prophylaxis following percutaneous (needlestick), ocular, or mucous membrane exposure to hepatitis B virus.

• PRESCRIBING AND DISPENSING INFORMATION

TWINRIX PAEDIATRIC Primary course should be completed with *Twinrix* (single component vaccines given at appropriate intervals may be used for booster dose).

TWINRIX ADULT Primary course should be completed with *Twinrix* (single component vaccines given at appropriate intervals may be used for booster dose).

AMBIRIX Primary course should be completed with *Ambirix* (single component vaccines given at appropriate intervals may be used for booster dose).

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

Ambirix (GlaxoSmithKline UK Ltd)

- Ambirix vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection PoM £31.18 DT = £31.18
- ► Twinrix (GlaxoSmithKline UK Ltd)

Twinrix Paediatric vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £20.79 DT = £20.79 Twinrix Adult vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £33.31 DT = £31.18 | 10 pre-filled disposable injection [PoM] £333.13

F 1418

Hepatitis A vaccine

INDICATIONS AND DOSE

AVAXIM ®

Immunisation against hepatitis A infection

- ► BY INTRAMUSCULAR INJECTION
- Child 16-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

HAVRIX JUNIOR MONODOSE®

Immunisation against hepatitis A infection

- ► BY INTRAMUSCULAR INJECTION
- Child 1-15 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the gluteal region. The subcutaneous route may be used for patients with bleeding disorders

HAVRIX MONODOSE ®

Immunisation against hepatitis A infection

- ► BY INTRAMUSCULAR INJECTION
- ▶ Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection; not to be injected into the gluteal region. The subcutaneous route may be used for patients with bleeding disorders
- Adult: Initially 1 mL for 1 dose, then 1 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection; not to be injected into the gluteal region. The subcutaneous route may be used for patients with bleeding disorders

continued \rightarrow

VAOTA ® ADULT

Immunisation against hepatitis A infection

- ► BY INTRAMUSCULAR INJECTION
- Adult: Initially 1 mL for 1 dose, then 1 mL after 6-18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

VAQTA® PAEDIATRIC

Immunisation against hepatitis A infection

- ► BY INTRAMUSCULAR INJECTION
- Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)
- SIDE-EFFECTS
- ► Common or very common Asthenia (uncommon in children) pain (uncommon in children)
- ▶ Uncommon Anxiety (in children) · chills (in adults) · cough · crying (in children) · dizziness · ear pain (rare in children) · gastrointestinal disorders (rare in children) · increased risk of infection (in adults) · influenza like illness (rare in children) · muscle weakness (in adults) · musculoskeletal stiffness (rare in children) · nasal complaints · paraesthesia (rare in children) · respiratory disorders (rare in children) · sensation of tightness (rare in children) · temperature sensation altered (rare in children) · vasodilation (rare in children)
- ▶ Rare or very rare Allergic rhinitis (in children) apathy (in adults) asthma (in children) ataxia (in children) burping (in children) chest pain constipation (in children) dehydration (in children) drowsiness (uncommon in children) dry mouth (in adults) eye discomfort gait abnormal (in children) gastrointestinal discomfort infantile spitting up (in children) irritability (very common in children) menstrual disorder (in adults) migraine (in adults) muscle complaints (in adults) oral ulceration (in adults) oropharyngeal pain (in children) photophobia (in adults) screaming (in children) sleep disorders (uncommon in children) sweat changes synovitis (in children) throat oedema (in adults) tremor (in adults) vertigo (in adults) watering eye (in adults)
- ► Frequency not known Guillain-Barre syndrome thrombocytopenia
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

Hepatitis A with typhoid vaccine

05-0ct-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1427, typhoid vaccine p. 1425.

• INDICATIONS AND DOSE

VIATIM

Immunisation against hepatitis A and typhoid infection [primary course]

- **▶** BY INTRAMUSCULAR INJECTION
- Child 16-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose may be given using single or multicomponent vaccines
- Adult: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose may be given using single or multicomponent vaccines

Immunisation against hepatitis A [booster dose for individuals who have received primary immunisation with monovalent hepatitis A vaccine, where protection against typhoid is also required]

- **▶** BY INTRAMUSCULAR INJECTION
- Child 16-17 years: 1 mL for 1 dose, within 36 months (preferably 6-12 months) of primary immunisation, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders
- Adult: 1 mL for 1 dose, within 36 months (preferably 6-12 months) of primary immunisation, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced).
 The subcutaneous route may be used for patients with bleeding disorders

Immunisation against typhoid [booster dose for individuals who have received primary immunisation with hepatitis A and typhoid vaccine, where continued protection against typhoid is required]

- ► BY INTRAMUSCULAR INJECTION
- Child 16-17 years: 1 mL for 1 dose, 36 months after primary immunisation, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders
- Adult: 1 mL for 1 dose, 36 months after primary immunisation, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

ViATIM (Sanofi Pasteur)
 ViATIM vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection Pom £35.76 DT = £35.76

F 1418

Hepatitis B vaccine

• INDICATIONS AND DOSE

ENGERIX B®

Immunisation against hepatitis B infection

- ► BY INTRAMUSCULAR INJECTION
- Child 1 month-15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule for pre- and post-exposure prophylaxis)

- ► BY INTRAMUSCULAR INJECTION
- Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen-positive mothers.
- Child 1 month-15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (alternative accelerated schedule)

- ► BY INTRAMUSCULAR INJECTION
- Child 11-15 years: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months for 1 dose, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (very rapid schedule)

- ► BY INTRAMUSCULAR INJECTION
- Child 16-17 years: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by

- 20 micrograms after 14 days for 1 dose, followed by 20 micrograms for 1 dose, to be given 12 months after the first dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by 20 micrograms after 14 days for 1 dose, followed by 20 micrograms for 1 dose, to be given 12 months after the first dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)

- **▶** BY INTRAMUSCULAR INJECTION
- Child 1 month-15 years: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule for pre- and post-exposure prophylaxis in renal insufficiency, including haemodialysis patients)

- **▶** BY INTRAMUSCULAR INJECTION
- Child 1 month-15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

FENDRIX ®

Immunisation against hepatitis B infection in renal insufficiency (including pre-haemodialysis and haemodialysis patients)

- **▶** BY INTRAMUSCULAR INJECTION
- Child 15-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

continued \rightarrow

HBVAXPRO®

Immunisation against hepatitis B infection

- ► BY INTRAMUSCULAR INJECTION
- Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used in neonates born to hepatitis B surface antigen-positive mothers.
- Child 1 month-15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule for pre- and post-exposure prophylaxis)

- ► BY INTRAMUSCULAR INJECTION
- Neonate: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used in neonates born to hepatitis B surface antigen-positive mothers.
- Child 1 month-15 years: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at

12 months not required if patient is at low risk, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in chronic haemodialysis patients)

- ► BY INTRAMUSCULAR INJECTION
- Child 16-17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

UNLICENSED USE

ENGERIX B PHE advises $Engerix B^{\otimes}$ is used in the doses provided in BNF Publications for immunisation against hepatitis B infection (very rapid schedule) in children aged 16–17 years, but these are considered unlicensed.

- SIDE-EFFECTS
- ► Common or very common Drowsiness gastrointestinal disorder irritability
- ▶ Uncommon Dizziness · influenza like illness
- ► Rare or very rare Sensation abnormal
- Frequency not known Angioedema apnoea arthritis encephalitis encephalopathy hypotension meningitis multiple sclerosis muscle weakness nerve disorders paralysis seizure thrombocytopenia vasculitis
- PRESCRIBING AND DISPENSING INFORMATION PHE advises different hepatitis B vaccine preparations can be used to complete a primary immunisation course, or to administer a booster dose.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

F 1418

Herpes-zoster vaccine, live

11-Jan-2022

 DRUG ACTION Zostavax[®] is a live, attenuated vaccine that protects against herpes zoster (shingles) caused by varicella-zoster virus infection.

• INDICATIONS AND DOSE

ZOSTAVAX®

Immunisation against herpes zoster (shingles)

- ► BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult 70-79 years: 0.65 mL for 1 dose, intramuscular route preferred, to be administered preferably into the deltoid region
- CAUTIONS Post-vaccination close contact with susceptible individuals

CAUTIONS, FURTHER INFORMATION Rarely, the varicella—zoster vaccine virus has been transmitted from individuals vaccinated with live vaccine to susceptible contacts.

Public Health England advises that individuals who develop a vesicular rash following live herpes-zoster vaccination should be tested for wild-type virus and, if in contact with susceptible individuals, also ensure the rash is kept covered until dry and crusted; immunosuppressed persons should avoid contact with susceptible individuals during this time.

- INTERACTIONS → Appendix 1: live vaccines
- SIDE-FFFFCTS
- ▶ Common or very common Pain in extremity
- ▶ Uncommon Lymphatic abnormalities
- ▶ Rare or very rare Increased risk of infection
- CONCEPTION AND CONTRACEPTION FOR Avoid pregnancy for 1 month after vaccination.
- PRESCRIBING AND DISPENSING INFORMATION
 ZOSTAVAX Advice in the BNF may differ from that in product literature.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Human papillomavirus vaccines

13-Apr-2022

INDICATIONS AND DOSE

Immunisation against HPV-related premalignant lesions and cancer (cervical, vulvar, vaginal, and anal) and genital warts [2-dose schedule]

- ► BY INTRAMUSCULAR INJECTION
- Child 9-17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 6-24 months for 1 dose, to be administered preferably into deltoid region or higher anterolateral thigh, if the 2-dose schedule is interrupted, it should be resumed but not repeated, even if more than 24 months have elapsed since the first dose
- Adult: 0.5 mL for 1 dose, followed by 0.5 mL after 6–24 months for 1 dose, to be administered preferably into deltoid region or higher anterolateral thigh, if the 2-dose schedule is interrupted, it should be resumed but not repeated, even if more than 24 months have elapsed since the first dose

Immunisation against HPV-related premalignant lesions and cancer (cervical, vulvar, vaginal, and anal) and genital warts [3-dose schedule for immunocompromised or HIV-positive patients]

- ► BY INTRAMUSCULAR INJECTION
- Child 9-17 years: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, to be administered preferably into deltoid region or higher anterolateral thigh, the 3-dose schedule should be completed within 12 months of the first dose, if the schedule is interrupted, it should be resumed but not repeated, allowing the appropriate interval between the remaining doses
- Adult: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, to be administered preferably into deltoid region or higher anterolateral thigh, the 3-dose schedule should be completed within 12 months of the first dose, if the schedule is interrupted, it should be resumed but not repeated, allowing the appropriate interval between the remaining doses
- UNLICENSED USE EVGT Human papillomavirus vaccines are used in a 2-dose immunisation schedule, but the interval between doses may differ from licensing. EVGT For Gardasil®, the 2-dose immunisation schedule is not licensed for use in individuals aged 14 years and older. For Gardasil 9®, the 2-dose immunisation schedule is not licensed for use in individuals aged 15 years and older.

SIDE-EFFECTS

- ► Common or very common Dizziness gastrointestinal disorder pain in extremity
- ▶ Uncommon Upper respiratory tract infection
- Frequency not known Acute disseminated encephalomyelitis - angioedema - asthenia - bronchospasm - chills - Guillain-Barre syndrome - immune thrombocytopenic purpura - syncope

- PREGNANCY Not known to be harmful, but vaccination should be postponed until completion of pregnancy.
- DIRECTIONS FOR ADMINISTRATION PHE advises that individuals with bleeding disorders may be vaccinated by the intramuscular route, on the advice of a doctor familiar with their bleeding risk. Patients treated with medicines to reduce bleeding (e.g. for haemophilia) are advised to administer their medicine shortly prior to intramuscular vaccination
- . MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ► Gardasil (Merck Sharp & Dohme (UK) Ltd) Gardasil vaccine suspension for injection 0.5ml pre-filled syringes 1 pre-filled disposable injection PoM £86.50 DT = £86.50
- Gardasil 9 (Merck Sharp & Dohme (UK) Ltd) Gardasil 9 vaccine suspension for injection 0.5ml pre-filled syringes 1 pre-filled disposable injection PoM £105.00 DT = £105.00

F 1418

Influenza vaccine

08-0ct-2021

 DRUG ACTION Influenza vaccines protect people at high risk from influenza and reduce transmission of infection: the nasal spray contains live attenuated strains, all other vaccines are inactivated or produced by recombinant DNA technology.

INDICATIONS AND DOSE

Annual immunisation against seasonal influenza

- ► BY INTRAMUSCULAR INJECTION
- Child 6 months-17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose
- ► BY INTRANASAL ADMINISTRATION
- Child 2-17 years: 0.2 mL for 1 dose, to be administered as 0.1 mL into each nostril

Annual immunisation against seasonal influenza (for children in clinical risk groups, or who are household contacts of others in clinical risk groups, and who have not received seasonal influenza vaccine previously)

- ► BY INTRAMUSCULAR INJECTION
- Child 6 months-8 years: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, after at least 4 weeks
- ► BY INTRANASAL ADMINISTRATION
- ▶ Child 2-8 years: 0.2 mL for 1 dose, followed by 0.2 mL for 1 dose, after at least 4 weeks. Dose to be administered as 0.1 mL into each nostril
- UNLICENSED USE The Joint Committee on Vaccination and Immunisation advises offering a second dose of vaccine for annual immunisation against seasonal influenza to children in clinical risk groups only, but this differs from licensed advice.
- CONTRA-INDICATIONS

FLUENZ TETRA® Active wheezing • concomitant use with antiviral therapy for influenza · severe asthma CONTRA-INDICATIONS, FURTHER INFORMATION

- Concomitant use with antiviral therapy for influenza PHE advises avoid immunisation for at least 48 hours after stopping the influenza antiviral agent. Administration of influenza antiviral agents within two weeks of Fluenz Tetra® administration may reduce the effectiveness of the
- INTERACTIONS → Appendix 1: live vaccines
- SIDE-EFFECTS
- Common or very common
- With intramuscular use Chills · hyperhidrosis · induration · local reactions · pain
- With intranasal use Nasal complaints
- ▶ Uncommon
- ▶ With intranasal use Epistaxis · face oedema

► Frequency not known

- With intramuscular use Angioedema · encephalomyelitis · extensive swelling of vaccinated limb · febrile seizure · nerve disorders · nervous system disorder · paraesthesia · presyncope · shock · syncope · thrombocytopenia · vasculitis
- With intranasal use Guillain-Barre syndrome SIDE-EFFECTS, FURTHER INFORMATION Elderly patients might be more susceptible to side-effects.
- ALLERGY AND CROSS-SENSITIVITY PHE advises individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). If an influenza vaccine containing ovalbumin is being considered in those with a history of severe anaphylaxis to egg which has previously required intensive care, these individuals should be referred to a specialist in hospital.
- PREGNANCY EVGr Inactivated vaccines not known to be harmful. (M)

SUPEMTEK [®] **EVGI** Use only if potential benefit outweighs risk-limited information available. M PHE advises that it may be given during pregnancy.

FLUENZ TETRA ® EvGr Avoid—limited information available. (M)

• BREAST FEEDING EVGr Inactivated vaccines not known to be harmful.

SUPEMTEK [®] EvGr Use only if potential benefit outweighs risk-no information available. (N) PHE advises that it may be given during breast-feeding.

FLUENZ TETRA ® EvGr Avoid—limited information available. (M)

- DIRECTIONS FOR ADMINISTRATION PHE advises that individuals with bleeding disorders may be vaccinated by the intramuscular route, on the advice of a doctor familiar with their bleeding risk. Patients treated with medicines to reduce bleeding (e.g. for haemophilia) are advised to administer their medicine shortly prior to intramuscular vaccination.
- PRESCRIBING AND DISPENSING INFORMATION The available preparations are not licensed for use in all agegroups—further information can be found in the product literature for the individual vaccines. For choice of vaccine, see Influenza vaccine p. 1404. Ovalbumin content
- In adults Preparations with ovalbumin content of less than 120 nanograms/mL: Fluenz Tetra® and Quadrivalent influenza vaccine (split virion, inactivated) manufactured by Sanofi Pasteur. Preparations that are egg-free: Flucelvax Tetra® and Supemtek®.
- In children Preparations with ovalbumin content of less than 120 nanograms/mL: Fluenz Tetra® and Quadrivalent influenza vaccine (split virion, inactivated) manufactured by Sanofi Pasteur. Preparations that are egg-free: Flucelvax Tetra®

PATIENT AND CARER ADVICE

FLUENZ TETRA® Avoid close contact with severely immunocompromised patients for 1-2 weeks after vaccination.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates

F 1418

INDICATIONS AND DOSE

22-Feb-2019

Immunisation against Japanese encephalitis

Japanese encephalitis vaccine

- ► BY INTRAMUSCULAR INJECTION
- Child 2-35 months: 0.25 mL every 28 days for 2 doses. alternatively 0.25 mL every 7 days for 2 doses, anterolateral thigh may be used as the injection site in infants; deltoid muscle is preferred site in older children, immunisation should be completed at least 1 week before potential exposure
- ► Child 3-17 years: 0.5 mL every 28 days for 2 doses, alternatively 0.5 mL every 7 days for 2 doses, deltoid muscle is preferred site in older children, immunisation should be completed at least 1 week before potential exposure
- Adult: 0.5 mL every 28 days for 2 doses, alternatively 0.5 mL every 7 days for 2 doses, deltoid muscle is preferred site of injection, immunisation should be completed at least 1 week before potential exposure

First booster

- ► BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.5 mL after 1-2 years, deltoid muscle is preferred site of injection, for those at continued risk, the booster dose should be given 1 year after completing the primary course

▶ Elderly: 0.5 mL after 1 year, for those at continued risk, deltoid muscle is preferred site of injection

Second hooster

- ► BY INTRAMUSCULAR INJECTION
- Adult: 0.5 mL after 10 years, for those at continued risk. deltoid muscle is preferred site of injection

UNLICENSED USE

When used for Immunisation against Japanese encephalitis The rapid schedule administered at days 0 and 7 is not licensed in children or the elderly.

SIDE-EFFECTS

- ► Common or very common Influenza like illness (frequency not known in children)
- ▶ Uncommon Asthenia (in adults) chills (in adults) dizziness (in adults) · hyperhidrosis (in adults) · migraine (in adults) · musculoskeletal stiffness (in adults) · vertigo (in adults)
- ▶ Rare or very rare Dyspnoea (in adults) evelid oedema (in adults) · neuritis (in adults) · pain in extremity (in adults) · palpitations (in adults) · paraesthesia (in adults) · peripheral oedema (in adults) · tachycardia (in adults) · taste altered (in adults) • thrombocytopenia (in adults)
- ▶ Frequency not known Cough (in children) · irritability (in children)
- PREGNANCY Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Measles, mumps and rubella vaccine, live 05-Oct-2021

INDICATIONS AND DOSE

Primary immunisation against measles, mumps, and rubella (first dose)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INTECTION
- Child 12-13 months: 0.5 mL for 1 dose

Primary immunisation against measles, mumps, and rubella (second dose)

- ► BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS
- Child 40 months-5 years: 0.5 mL for 1 dose

Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- Females of childbearing potential: (consult product literature or local protocols) continued →

Children presenting for pre-school booster, who have not received the primary immunisation (first dose) Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course | Control of measles outbreak | Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS
- Child 6 months-17 years: (consult product literature or local protocols)
- Adult: (consult product literature or local protocols)
- UNLICENSED USE Not licensed for use in children under 9 months

IMPORTANT SAFETY INFORMATION

MMR VACCINATION AND BOWEL DISEASE OR AUTISM

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/immunisation.

 CAUTIONS Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion-leave an interval of at least 3 months before MMR immunisation

CAUTIONS, FURTHER INFORMATION

 Administration with other vaccines Public Health England advises MMR and yellow fever vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval; an additional dose of MMR should be considered and re-vaccination with the yellow fever vaccine can also be considered in those at on-going risk.

Public Health England advises MMR and varicella-zoster vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

- INTERACTIONS → Appendix 1: live vaccines
- SIDE-FFFFCTS
- ► Uncommon Increased risk of infection rhinorrhoea
- ► Frequency not known Angioedema · arthritis · ataxia · cough · dizziness · encephalopathy · eye inflammation · irritability · meningitis aseptic · nerve deafness · nerve disorders · oculomotor nerve paralysis · oedema · panniculitis · papillitis · paraesthesia · regional lymphadenopathy · respiratory disorders · seizures · Stevens-Johnson syndrome · subacute sclerosing panencephalitis · syncope · throat pain · thrombocytopenia vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Malaise, fever, or a rash can occur after the first dose of MMR vaccine-most commonly about a week after vaccination and lasting about 2 to 3 days.

Febrile seizures occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection).

Idiopathic thrombocytopenic purpura Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of

the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. Samples should be sent to the Virus Reference Laboratory of the Health Protection Agency.

Frequency of side effects Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

- ALLERGY AND CROSS-SENSITIVITY PHE advises MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination.
- CONCEPTION AND CONTRACEPTION Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.
- PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood immunisation schedule from health organisations or ImmForm portal.immform.phe.gov.uk.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Rabies vaccine

05-0ct-2021

INDICATIONS AND DOSE Primary pre-exposure immunisation against rabies

infection

- ► BY INTRAMUSCULAR INJECTION
- Child: 1 mL for 3 doses (on days 0, 7, and 28), to be administered into deltoid region; in infants anterolateral thigh is recommended, final dose may be given from day 21 if insufficient time before travel
- Adult: 1 mL for 3 doses (on days 0, 7, and 28), to be administered into deltoid region, final dose may be given from day 21 if insufficient time before travel

Primary pre-exposure immunisation against rabies infection [accelerated course]

- **▶** BY INTRAMUSCULAR INJECTION
- ▶ Child: 1 mL for 3 doses (on days 0, 3, and 7), followed by 1 mL for 1 dose at 1 year if continued travel to high-risk areas, to be administered into deltoid region; in infants anterolateral thigh is recommended
- Adult: 1 mL for 3 doses (on days 0, 3, and 7), followed by 1 mL for 1 dose at 1 year if continued travel to highrisk areas, to be administered into deltoid region

Pre-exposure immunisation booster dose [patients at frequent risk of exposure e.g. laboratory workers who handle lyssavirus-containing material]

- ► BY INTRAMUSCULAR INJECTION
- ► Child: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL, repeated if necessary, based on six-monthly antibody levels. To be administered into deltoid region; in infants anterolateral thigh is recommended

 Adult: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL, repeated if necessary, based on six-monthly antibody levels. To be administered into deltoid region

Pre-exposure immunisation booster dose [patients who may have frequent, unrecognised exposures e.g. bat handlers]

- ► BY INTRAMUSCULAR INJECTION
- Child: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered into deltoid region; in infants anterolateral thigh is recommended, the frequency of booster doses may alternatively be based on antibody levels
- Adult: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3-5 years, repeated if necessary, to be administered into deltoid region, the frequency of booster doses may alternatively be based on antibody levels

Pre-exposure immunisation booster dose [patients at infrequent risk of exposure]

- **▶** BY INTRAMUSCULAR INJECTION
- Child: 1 mL for 1 dose, to be given at least 1 year after primary course is completed based on antibody levels, to be administered into deltoid region; in infants anterolateral thigh is recommended
- Adult: 1 mL for 1 dose, to be given at least 1 year after primary course is completed based on antibody levels, to be administered into deltoid region

Post-exposure treatment [fully immunised patients with amber or red composite rabies risk] (administered on expert advice)

- **▶** BY INTRAMUSCULAR INJECTION
- Child: 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered into deltoid region; in infants anterolateral thigh is recommened, rabies immunoglobulin is not necessary
- Adult: 1 mL for 1 dose, followed by 1 mL after 3-7 days for 1 dose, to be administered into deltoid region, rabies immunoglobulin is not necessary

Post-exposure treatment [partially immunised patients with amber or red composite rabies risk] (administered on expert advice)

- **▶** BY INTRAMUSCULAR INJECTION
- Child: 1 mL for 4 doses (on days 0, 3, 7, and 21), to be administered into deltoid region; in infants anterolateral thigh is recommended, rabies immunoglobulin is not necessary
- Adult: 1 mL for 4 doses (on days 0, 3, 7, and 21), to be administered into deltoid region, rabies immunoglobulin is not necessary

Post-exposure treatment [non-immunised patients with amber or red composite rabies risk] (administered on expert advice)

- ► BY INTRAMUSCULAR INJECTION
- Child: 1 mL for 4 doses (on days 0, 3, 7, and 21), to be administered into deltoid region; in infants anterolateral thigh is recommended, rabies immunoglobulin also to be given to patients with red composite rabies risk (but is not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine)
- Adult: 1 mL for 4 doses (on days 0, 3, 7, and 21), to be administered into deltoid region, rabies immunoglobulin also to be given to patients with red composite rabies risk (but is not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine)

Post-exposure treatment [immunosuppressed patients with amber or red composite rabies risk, regardless of immunisation status] (administered on expert advice)

- ► BY INTRAMUSCULAR INJECTION
- Child: 1 mL for 5 doses (on days 0, 3, 7, 14, and 28 or 30), to be administered into deltoid region; in infants anterolateral thigh is recommended, rabies immunoglobulin also to be given (but is not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine)
- Adult: 1 mL for 5 doses (on days 0, 3, 7, 14, and 28 or 30), to be administered into deltoid region, rabies immunoglobulin also to be given (but is not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine)
- UNLICENSED USE Public Health England advises rabies vaccine may be used as detailed below, although these situations are considered unlicensed:
- dosing regimens for post-exposure treatment.
- INTERACTIONS \rightarrow Appendix 1: rabies vaccine
- SIDE-EFFECTS
- ➤ Common or very common Abdominal discomfort asthenia • dizziness
- ▶ Rare or very rare Angioedema · chills · encephalitis · Guillain-Barre syndrome · hyperhidrosis · paraesthesia · syncope · vertigo
- PREGNANCY Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to postexposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

F 1418

Rotavirus vaccine

11-Jan-2022

 DRUG ACTION Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

• INDICATIONS AND DOSE

Immunisation against gastro-enteritis caused by rotavirus

- ► BY MOUTH
- Child 6-23 weeks: 1.5 mL for 2 doses separated by an interval of at least 4 weeks, first dose must be given between 6-14 weeks of age; course should be

continued \rightarrow

completed before 24 weeks of age (preferably before 16 weeks)

IMPORTANT SAFETY INFORMATION

PUBLIC HEALTH ENGLAND: UPDATE TO GREEN BOOK (OCTOBER 2017)

Public Health England advises that immunisation with live vaccines should be delayed until 6 months of age in children born to mothers who received immunosuppressive biological therapy during pregnancy. In practice, this means that children born to mothers who were on immunosuppressive biological therapy during pregnancy will not be eligible to receive rotavirus vaccine.

CONTRA-INDICATIONS History of intussusception · predisposition to intussusception · severe combined immunodeficiency disorder

CONTRA-INDICATIONS, FURTHER INFORMATION

- Immunosuppression With the exception of severe combined immunodeficiency disorder (and children born to mothers who received immunosuppressive biological therapy during pregnancy, see *Important safety information*), rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, Public Health England recommends seek specialist advice.
- CAUTIONS Diarrhoea (postpone vaccination) immunosuppressed close contacts · vomiting (postpone vaccination)

CAUTIONS, FURTHER INFORMATION The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, Public Health England advises vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus

- INTERACTIONS → Appendix 1: live vaccines
- SIDE-EFFECTS
- ▶ Common or very common Irritability
- ► Uncommon Gastrointestinal disorders
- ▶ Frequency not known Apnoea · haematochezia
- PRE-TREATMENT SCREENING PHE advise that the results of the severe combined immunodeficiency (SCID) screening should be checked before administering rotavirus vaccine.
- PATIENT AND CARER ADVICE The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

F 1418

Tick-borne encephalitis vaccine, inactivated

05-0ct-2021

• INDICATIONS AND DOSE

Initial immunisation against tick-borne encephalitis

- ► BY INTRAMUSCULAR INJECTION
- Child 1-15 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1-3 months for 1 dose, then 0.25 mL after further 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region or

- anterolateral thigh in infants, in immunocompromised patients (including those receiving
- immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- Child 16-17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1-3 months for 1 dose, then 0.5 mL after further 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved.
- Adult: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- Elderly: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

Immunisation against tick-borne encephalitis, booster doses

- ► BY INTRAMUSCULAR INJECTION
- Child 1-17 years: First dose to be given within 3 years after initial course completed and then every 3-5 years, dose to be administered in deltoid region or anterolateral thigh in infants (consult product literature)
- Adult: First dose to be given within 3 years after initial course completed and then every 3–5 years, dose to be administered in deltoid region (consult product literature)

SIDE-EFFECTS

- ► Common or very common Restlessness (in children) sleep disorder (in children)
- ▶ Rare or very rare Asthenia · autoimmune disorder (in adults) · chills (uncommon in children) · demyelination (in adults) · dizziness · drowsiness (in adults) · dyspepsia (in children) · dyspnoea · eye pain · gait abnormal · hyperhidrosis · increased risk of infection · influenza like illness · joint swelling (in adults) · meningism · meningitis aseptic (in adults) · motor dysfunction · musculoskeletal stiffness · nerve disorders · oedema · pain · seizures · sensory disorder · tachycardia (in adults) · tinnitus · vertigo · vision disorders
- ALLERGY AND CROSS-SENSITIVITY PHE advises individuals
 with evidence of previous anaphylactic reaction to egg
 should not be given tick-borne encephalitis vaccine.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

F 1418

Varicella-zoster vaccine

11-Jan-2022

 DRUG ACTION Varilrix® and Varivax® are live attenuated vaccines that protect against varicella (chickenpox) caused by varicella-zoster virus infection.

• INDICATIONS AND DOSE

VARILRIX ®

Prevention of varicella infection (chickenpox)

- ► BY SUBCUTANEOUS INJECTION
- Child 1-17 years: 0.5 mL every 4-6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh
- Adult: 0.5 mL every 4–6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh

VARIVAX ®

Prevention of varicella infection (chickenpox)

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Child 1-12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
- Child 13-17 years: 0.5 mL for 2 doses, interval of 4-8 weeks between each dose, to be administered preferably into the deltoid region
- ► Adult: 0.5 mL for 2 doses, interval of 4–8 weeks between each dose, to be administered preferably into the deltoid region

Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Child 1-12 years: 0.5 mL for 2 doses, interval of 12 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
- CAUTIONS Post-vaccination close contact with susceptible individuals

CAUTIONS, FURTHER INFORMATION Rarely, the varicellazoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, manufacturer advises contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- · varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Public Health England advises healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

- Administration with MMR vaccine Public Health England advises varicella-zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.
- INTERACTIONS → Appendix 1: live vaccines

SIDE-EFFECTS

- ▶ Uncommon Cough drowsiness increased risk of infection • irritability
- ▶ Rare or very rare Conjunctivitis Kawasaki disease seizure stroke thrombocytopenia vasculitis

- CONCEPTION AND CONTRACEPTION Manufacturer advises avoid pregnancy for 1 month after vaccination.
- PRESCRIBING AND DISPENSING INFORMATION

VARIVAX ®

 In children Advice in BNF Publications may differ from that in product literature.

VARILRIX ®

- In children Advice in BNF Publications may differ from that in product literature.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

Yellow fever vaccine, live

21-Apr-2022

• INDICATIONS AND DOSE

Immunisation against yellow fever

- ► BY DEEP SUBCUTANEOUS INJECTION
- Child 6-8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
- ▶ Child 9 months-17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED NOVEMBER 2019): YELLOW FEVER VACCINE: STRONGER PRECAUTIONS IN PEOPLE WITH WEAKENED IMMUNITY AND IN THOSE AGED 60 YEARS OR OLDER

The yellow fever vaccine (Stamaril®) has been associated with the very rare, life-threatening reactions viscerotropic disease (YEL-AVD) and neurotropic disease (YEL-AND), which both resemble yellow fever infection. It must not be given to patients who have had a thymectomy, who are taking immunosuppressive or immunomodulating biological drugs, or who have a firstdegree family history of YEL-AVD or YEL-AND following vaccination that was unrelated to a known medical risk factor. In patients aged 60 years and older, the vaccine should only be administered when there is a significant and unavoidable risk of acquiring yellow fever infection. It must only be administered by healthcare professionals specifically trained in the benefit-risk evaluation of yellow fever vaccine. Healthcare professionals must inform patients and carers about the early signs and symptoms of YEL-AVD and YEL-AND, and advise them to seek urgent medical attention if they occur; the manufacturer's patient information leaflet should also be provided. Healthcare professionals administering vaccines should consult information in the YF Vaccine Centre code of practice and strengthen protocols and checklists to avoid inappropriate administration.

MHRA/CHM ADVICE: YELLOW FEVER VACCINE (STAMARIL $^{\odot}$): NEW PRE-VACCINATION CHECKLIST (NOVEMBER 2021)

A standardised pre-vaccination checklist has been introduced to ensure the yellow fever vaccine is indicated for the intended travel destination and to enable vaccinators to identify existing contraindications or precautions in individuals before vaccination. Healthcare professionals are reminded to adhere to the contra-indications (for example, in people

with immunosuppression or thymus dysfunction or thymectomy) and precautions (in infants aged 6 months to 9 months, in people aged 60 years or older, and pregnant or breast-feeding women) as this is essential to reduce the risk of very rare but potentially fatal adverse reactions. The new checklist should be used in vaccination consultations to ensure systematic evaluation of benefits and risks for individual travellers. this however is not a replacement for the full travel health risk assessment by a qualified practitioner and additional checklists or materials that may also be used prior to vaccination, depending on clinical guidance. Patients and carers should be provided with the patient information leaflet and advised to seek emergency medical attention if they develop signs or symptoms of a severe reaction following vaccination.

- CONTRA-INDICATIONS Children under 6 months · history of thymus dysfunction · thymectomy
- CAUTIONS Individuals over 60 years—greater risk of vaccine-associated adverse effects

CAUTIONS, FURTHER INFORMATION

- Administration with MMR vaccine Public Health England advises yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval; an additional dose of MMR should be considered and re-vaccination with the yellow fever vaccine can also be considered in those at on-going risk.
- INTERACTIONS → Appendix 1: live vaccines
- SIDE-EFFECTS
- ► Common or very common Asthenia · crying (in children) · drowsiness (in children) · irritability (in children)
- ► Uncommon Dizziness
- ▶ Rare or very rare Rhinitis · yellow fever vaccine-associated neurotropic disease · yellow fever vaccine-associated viscerotropic disease
- ► Frequency not known Angioedema · influenza like illness · paraesthesia
 - SIDE-EFFECTS, FURTHER INFORMATION Very rare vaccine-associated adverse effects may occur, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multiorgan failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity. Increased risk of fatal reactions reported in patients aged 60 years and older and those who are immunosuppressed.
- ALLERGY AND CROSS-SENSITIVITY [EVG] In individuals with a history of confirmed anaphylactic reaction to eggs and who are currently avoiding eggs due to ongoing hypersensitivity reactions, yellow fever vaccine should only be considered under the guidance of an allergy specialist. (£)
- PREGNANCY Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.
- BREAST FEEDING Avoid; seek specialist advice if exposure to virus cannot be avoided.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

General anaesthesia

Anaesthesia (general)

Overview

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using 'rapid sequence induction'); lower doses may be required in premedicated patients.

Total intravenous anaesthesia

This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to

predicted plasma-drug concentrations in ventilated adult patients.

Drugs used for intravenous anaesthesia

Propofol p. 1441, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures and sedation in adults in intensive

Thiopental sodium p. 369 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate p. 1441 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 1458 is used rarely. Ketamine causes less hypotension than thiopental sodium and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazenam p. 375 or midazolam p. 371.

Inhalational anaesthetics

Inhalational anaesthetics include gases and volatile liquids. *Gaseous anaesthetics* require suitable equipment for storage and administration. *Volatile liquid anaesthetics* are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 1444 is being administered.

Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isoflurane p. 1443 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 1443 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 1444 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics.

Nitrous oxide

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox ®, Equanox ®) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 1448 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene sodium p. 1460 is used in the treatment of malignant hyperthermia.

Sedation, anaesthesia, and resuscitation in dental practice

Overview

Sedation for dental procedures should be limited to conscious sedation. Diazepam p. 375 and temazepam p. 520 are effective anxiolytics for dental treatment in adults.

For details of sedation, anaesthesia, and resuscitation in dental practice see A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in Standards for Conscious Sedation in the Provision of Dental Care; report of an Intercollegiate Advisory Committee for Sedation in Dentistry, 2020 www.rcseng.ac.uk/dental-faculties/fds/publications-guidelines/standards-for-conscious-sedation-in-the-provision-of-dental-care-and-accreditation/.

Surgery and long-term medication

26-Mar-2021

Overview

The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about **all** drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids). For further information, see *Glucocorticoid replacement during stress* in Adrenal insufficiency p. 738.

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. See general advice on surgery in diabetic patients in Diabetes, surgery and medical illness p. 758.

Patients taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 1.47 or low molecular weight heparin therapy. [Ever] In patients with stable angina, perioperative aspirin p. 133 should be only continued where there is a high thrombotic risk (e.g. patients with a recent acute coronary syndrome, coronary artery stents, or an ischaemic stroke).

Drugs that should be stopped before surgery include combined hormonal contraceptives, see Contraceptives, hormonal p. 854; for advice on hormone replacement therapy, see Sex hormones p. 808. MAOIs can have important interactions with some drugs used during surgery, such as pethidine hydrochloride p. 502. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but

the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassiumsparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

ANAESTHETICS, GENERAL > INTRAVENOUS **ANAESTHETICS**

Etomidate

04-Sen-2020

INDICATIONS AND DOSE

Induction of anaesthesia

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: 150-300 micrograms/kg (max. per dose 60 mg). to be administered over 30-60 seconds (60 seconds in patients in whom hypotension might be hazardous)
- ► Elderly: 150-200 micrograms/kg (max. per dose 60 mg), to be administered over 30-60 seconds (60 seconds in patients in whom hypotension might be hazardous)

IMPORTANT SAFETY INFORMATION

Etomidate should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

• CAUTIONS Acute circulatory failure (shock) • adrenal insufficiency · avoid in Acute porphyrias p. 1150 · cardiovascular disease · elderly · fixed cardiac output · hypovolaemia

CAUTIONS, FURTHER INFORMATION

- Adrenal insufficiency Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.
- INTERACTIONS → Appendix 1: etomidate
- ► Common or very common Apnoea · hypotension · movement disorders · nausea · respiratory disorders · skin reactions · vascular pain · vomiting
- ▶ Uncommon Arrhythmias cough hiccups hypersalivation · hypertension · muscle rigidity · neuromuscular dysfunction · nystagmus · procedural complications
- ► Frequency not known Adrenal insufficiency atrioventricular block · cardiac arrest · embolism and thrombosis · seizures · shock · Stevens-Johnson syndrome ·

SIDE-EFFECTS, FURTHER INFORMATION Pain on injection Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.

Extraneous muscle movements Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose in liver cirrhosis

• DIRECTIONS FOR ADMINISTRATION Manufacturer advises give over 30-60 seconds (60 seconds in patients in whom hypotension might be hazardous).

PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Propylene glycol

 Hypnomidate (Piramal Critical Care Ltd) Etomidate 2 mg per 1 ml Hypnomidate 20mg/10ml solution for injection ampoules | 5 ampoule Pom £12.00

Emulsion for injection

 Etomidate-Lipuro (B.Braun Medical Ltd) Etomidate 2 mg per 1 ml Etomidate-Lipuro 20mg/10ml emulsion for injection ampoules | 10 ampoule Pom £17,57 (Hospital only)

Propofol

13-Aug-2020

INDICATIONS AND DOSE

Induction of anaesthesia using 0.5% or 1% injection

- ► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS
- Adult 18-54 years: Usual dose 1.5-2.5 mg/kg, to be administered at a rate of 20-40 mg every 10 seconds until response, for debilitated patients use dose for 55 years and over
- ▶ Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

Induction of anaesthesia using 2% injection

- **▶** BY INTRAVENOUS INFUSION
- Adult 18-54 years: Usual dose 1.5-2.5 mg/kg, to be administered at a rate of 20-40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over
- ▶ Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

Maintenance of anaesthesia using 1% injection

- ► INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Usual dose 4-12 mg/kg/hour, alternatively (by slow intravenous injection) 25-50 mg, dose may be repeated according to response, for debilitated patients use dose for elderly
- ► Elderly: Usual dose 3–6 mg/kg/hour, alternatively (by slow intravenous injection) 25-50 mg, dose may be repeated according to response

Maintenance of anaesthesia using 2% injection

- ► BY INTRAVENOUS INFUSION
- Adult: Usual dose 4–12 mg/kg/hour, for debilitated patients use dose for elderly
- Elderly: Usual dose 3-6 mg/kg/hour

Sedation of ventilated patients in intensive care using 1% or 2% injection

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: Usual dose 0.3-4 mg/kg/hour, adjusted according to response continued →

Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: Initially 0.5-1 mg/kg, to be administered over 1-5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection

- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 1.5-4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10-20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

Maintenance of sedation for surgical and diagnostic procedures using 1% injection

- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

Maintenance of sedation for surgical and diagnostic procedures using 2% injection

- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 1.5-4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10-20 mg, using 0.5% or 1% injection (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

IMPORTANT SAFETY INFORMATION

Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CAUTIONS Acute circulatory failure (shock) · cardiac impairment · cardiovascular disease · elderly · epilepsy · fixed cardiac output · hypotension · hypovolaemia · raised intracranial pressure · respiratory impairment
- INTERACTIONS → Appendix 1: propofol
- SIDE-EFFECTS
- ► Common or very common Apnoea · arrhythmias · headache · hypotension · localised pain · nausea · vomiting
- ▶ Uncommon Thrombosis
- Rare or very rare Epileptiform seizure (may be delayed) pancreatitis - post procedural complications - pulmonary oedema - sexual disinhibition - soft tissue necrosis - urine discolouration
- ► Frequency not known Drug use disorders · dyskinesia · euphoric mood · heart failure · hepatomegaly · hyperkalaemia · hyperlipidaemia · metabolic acidosis · renal failure · respiratory depression · rhabdomyolysis SIDE-EFFECTS, FURTHER INFORMATION Bradycardia Bradycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.

Pain on injection Pain on injection can be reduced by intravenous lidocaine.

Propofol infusion syndrome Prolonged infusion of propofol doses exceeding 4mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis,

- hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.
- PREGNANCY May depress neonatal respiration if used during delivery.
- **Dose adjustments** Max. dose for maintenance of anaesthesia 6 mg/kg/hour.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
- RENAL IMPAIRMENT Use with caution.
- MONITORING REQUIREMENTS Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%. 0.5% emulsion for injection or intermittent infusion; manufacturer advises may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL. 1% emulsion for injection or infusion; manufacturer advises may be administered undiluted, or diluted with Glucose 5% (Diprivan ®) or (Propofol-Lipuro®) or Sodium chloride 0.9% (Propofol-Lipuro® only); dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation. 2% emulsion for infusion; manufacturer advises do not dilute.

PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ANAESTHETICS, GENERAL > VOLATILE LIQUID ANAESTHETICS

Volatile halogenated anaesthetics

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CONTRA-INDICATIONS Susceptibility to malignant hyperthermia
- CAUTIONS Can trigger malignant hyperthermia · raised intracranial pressure (can increase cerebrospinal pressure)
- SIDE-EFFECTS
- Common or very common Agitation · apnoea · arrhythmias · chills · cough · dizziness · headache · hypersalivation · hypertension · hypotension · nausea · respiratory disorders · vomiting
- ▶ Uncommon Hypoxia
- Frequency not known Breath holding · cardiac arrest · haemorrhage · hepatic disorders · hyperkalaemia · malignant hyperthermia · QT interval prolongation · rhabdomyolysis · seizure
- ALLERGY AND CROSS-SENSITIVITY Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.
- DIRECTIONS FOR ADMINISTRATION Volatile liquid anaesthetics are administered using calibrated vaporisers, using oxygen, oxygen-enriched air, or nitrous oxideoxygen mixtures as the carrier gas (consult product literature).
- PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

Desflurane

• INDICATIONS AND DOSE

Induction of anaesthesia (but not recommended)

- ► BY INHALATION
- Adult: 4-11%, to be inhaled through specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide-oxygen)

- ► BY INHALATION
- Adult: 2-6%, to be inhaled through a specifically calibrated vaporiser

Maintenance of anaesthesia (in oxygen or oxygenenriched air)

- ► BY INHALATION
- Adult: 2.5–8.5 %, to be inhaled through a specifically calibrated vaporiser

- INTERACTIONS → Appendix 1: volatile halogenated anaesthetics
- SIDE-FFFFCTS
- ► Common or very common Coagulation disorder -
- ► Uncommon Myalgia · myocardial infarction · myocardial ischaemia · vasodilation
- Frequency not known Abdominal pain · asthenia · heart failure · hypokalaemia · malaise · metabolic acidosis · pancreatitis acute · shock · skin reactions · ventricular dysfunction · visual acuity decreased
- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

Desflurane (Non-proprietary)

Desflurane 1 ml per 1 ml Desflurane volatile liquid | 240 ml $\boxed{\text{PoM}}$ $\boxed{\textbf{S}}$ (Hospital only)

► above

12-Dec-2019

Isoflurane

INDICATIONS AND DOSE

Induction of anaesthesia (in oxygen or nitrous oxideoxygen)

- ► BY INHALATION
- Adult: Initially 0.5 %, increased to 3 %, adjusted according to response, administered using specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide-oxygen)

- ► BY INHALATION
- Adult: 1-2.5%, to be administered using specifically calibrated vaporiser; an additional 0.5-1% may be required when given with oxygen alone

Maintenance of anaesthesia in caesarean section (in nitrous oxide-oxygen)

- ► BY INHALATION
- Adult: 0.5-0.75 %, to be administered using specifically calibrated vaporiser
- INTERACTIONS → Appendix 1: volatile halogenated anaesthetics
- SIDE-EFFECTS Carboxyhaemoglobinaemia · chest discomfort · cognitive impairment · delirium · dyspnoea · ileus · mood altered (that can last several days) · mvoglobinuria · skin reactions
- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

- ► Isoflurane (Non-proprietary)

Nitrous oxide

12-Aug-2020

INDICATIONS AND DOSE

Maintenance of anaesthesia in conjunction with other anaesthetic agents

- ► BY INHALATION
- ▶ Adult: 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen

Analgesia

- ► BY INHALATION
- Adult: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient's needs

IMPORTANT SAFETY INFORMATION

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

• CAUTIONS Entrapped air following recent underwater dive • pneumothorax • presence of intracranial air after head injury · recent intra-ocular gas injection

CAUTIONS, FURTHER INFORMATION Nitrous oxide may have a deleterious effect if used in patients with an aircontaining closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

- INTERACTIONS → Appendix 1: nitrous oxide
- SIDE-EFFECTS Abdominal distension addiction agranulocytosis · disorientation · dizziness · euphoric mood · megaloblastic anaemia · middle ear damage · myeloneuropathy · nausea · paraesthesia · sedation · subacute combined cord degeneration • tympanic membrane perforation · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B₁₂; neurological toxic effects can occur without preceding overt haematological changes. Depression of white cell formation may also occur.

- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- MONITORING REQUIREMENTS
- ► Assessment of plasma-vitamin B₁₂ concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia.
- ▶ Nitrous oxide should **not** be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.
- DIRECTIONS FOR ADMINISTRATION For analgesia (without) loss of consciousness), manufacturer advises a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®) is used.
- HANDLING AND STORAGE Exposure of theatre staff to nitrous oxide should be minimised (risk of serious sideeffects).

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Sevoflurane

INDICATIONS AND DOSE

Induction of anaesthesia (in oxygen or nitrous oxideoxygen)

- ► BY INHALATION
- ▶ Adult: Initially 0.5–1 %, then increased to up to 8 %. increased gradually, according to response, to be administered using specifically calibrated vaporiser

Maintenance of anaesthesia (in oxygen or nitrous oxideoxygen)

- ► RY INHAL ATION
- ▶ Adult: 0.5–3 %, adjusted according to response, to be administered using specifically calibrated vaporiser
- CAUTIONS Susceptibility to QT-interval prolongation
- INTERACTIONS → Appendix 1: volatile halogenated anaesthetics
- SIDE-EFFECTS
- ► Common or very common Drowsiness · fever · hypothermia
- ▶ Uncommon Asthma atrioventricular block confusion
- ► Frequency not known Dystonia · intracranial pressure increased · muscle rigidity · nephritis tubulointerstitial · oedema · pancreatitis
- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- RENAL IMPAIRMENT Use with caution.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Anaesthesia adjuvants 1

Pre-medication and peri-operative drugs 01-Sep-2020

Drugs that affect gastric pH

Regurgitation and aspiration of gastric contents (Mendelson's syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastrooesophageal reflux disease and in circumstances where gastric emptying may be delayed.

An H₂-receptor antagonist can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂receptor antagonist can be given 1-2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; 'clear' (non-

particulate) antacids such as sodium citrate p. 851 are preferred.

Antimuscarinic drugs

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 1218 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol p. 1441 and suxamethonium chloride p. 1448.

Atropine sulfate below is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. Atropine sulfate may have a role in acute arrhythmias after myocardial infarction.

Hyoscine hydrobromide p. 470 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyrronium bromide p. 1446 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs.

Phenothiazines do not effectively reduce secretions when used alone

Sedative drugs

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a benzodiazepine. Premedication may also augment the action of anaesthetics and provide some degree of preoperative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures.

Premedicants can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation. Flumazenil p. 1482 is used to antagonise the effects of benzodiazepines.

Diazepam p. 375 is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

Temazepam p. 520 is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam p. 369 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Midazolam p. 371 is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

Other drugs for sedation

Dexmedetomidine p. 1459 and clonidine hydrochloride p. 161 are alpha₂-adrenergic agonists with sedative properties. Dexmedetomidine is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine hydrochloride [unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.

Analgesia

For guidance on the use of analgesics before, during, or after surgery, see Peri-operative analgesia p. 1452.

Antagonists for central and respiratory depression

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone hydrochloride p. 1484. Naloxone hydrochloride will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone hydrochloride; however, naloxone hydrochloride will also antagonise the analgesic effect.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resedated.

Doxapram hydrochloride p. 323 is a central and respiratory stimulant but is of limited value in anaesthesia.

ANTIMUSCARINICS

F 839

Atropine sulfate

22-Jan-2021

INDICATIONS AND DOSE

Symptomatic bradycardia due to acute overdosage of beta-blockers

- ► BY INTRAVENOUS INJECTION
- Child: 0.02 mg/kg (max. per dose 1.2 mg), repeat doses may be necessary
- ▶ Adult: 0.5–1.2 mg, repeat doses may be necessary

Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)

- ► BY INTRAVENOUS INJECTION
- Child: 20 micrograms/kg every 5-10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning
- Adult: 2 mg every 5-10 minutes until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- ▶ BY MOUTH
- Adult: 0.6–1.2 mg daily, dose to be taken at night

continued →

Premedication

- ► BY INTRAVENOUS INJECTION
- Child 12-17 years: 300-600 micrograms, to be administered immediately before induction of anaesthesia
- Adult: 300-600 micrograms, to be administered immediately before induction of anaesthesia
- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Child 12-17 years: 300-600 micrograms, to be administered 30-60 minutes before induction of anaesthesia
- Adult: 300-600 micrograms, to be administered 30-60 minutes before induction of anaesthesia

Intra-operative bradycardia

- ► BY INTRAVENOUS INJECTION
- Child 12-17 years: 300-600 micrograms, larger doses may be used in emergencies
- Adult: 300-600 micrograms, larger doses may be used in emergencies

Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block

► BY INTRAVENOUS INJECTION

▶ Child 12-17 years: 0.6-1.2 mg

▶ Adult: 0.6-1.2 mg

Excessive bradycardia associated with beta-blocker use

- ► BY INTRAVENOUS INJECTION
- Adult: 0.6-2.4 mg in divided doses (max. per dose 600 micrograms)

Bradycardia following myocardial infarction (particularly if complicated by hypotension)

- ► BY INTRAVENOUS INJECTION
- Adult: 500 micrograms every 3-5 minutes; maximum 3 mg per course

UNLICENSED USE

With intravenous use TOXBASE advises atropine sulfate is used in the doses provided for the treatment of symptomatic bradycardia due to acute overdosage of betablockers, but these may vary from those licensed.

IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their

- INTERACTIONS → Appendix 1: atropine
- SIDE-EFFECTS
- ► Common or very common
- With intravenous use Abdominal distension anhidrosis anxiety arrhythmias bronchial secretion decreased dysphagia gastrointestinal disorders hallucination hyperthermia movement disorders mydriasis speech disorder taste loss thirst
- ► Uncommon
- With intravenous use Psychotic disorder
- ▶ Rare or very rare
- With intravenous use Angina pectoris · hypertensive crisis · seizure
- ► Frequency not known
- With intravenous use Insomnia
- With oral use Angle closure glaucoma · arrhythmias · bronchial secretion altered · chest pain · dysphagia · fever · gastrointestinal disorders · mydriasis · staggering · thirst
- PREGNANCY Not known to be harmful; manufacturer advises caution.
- BREAST FEEDING May suppress lactation; small amount present in milk—manufacturer advises caution.

MONITORING REQUIREMENTS

 Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block. Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.

• LESS SUITABLE FOR PRESCRIBING

With oral use Atropine tablets less suitable for prescribing.
 Any clinical benefit as a gastro-intestinal antispasmodic is outweighed by atropinic side-effects.

EXCEPTIONS TO LEGAL CATEGORY

- With intramuscular use or intravenous use or subcutaneous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, solution for infusion

1.1 Neuromuscular blockade

Neuromuscular blockade

Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 1218. Non-depolarising neuromuscular blocking drugs can be divided into the aminosteroid group, comprising pancuronium bromide p. 1450, rocuronium bromide p. 1450, and vecuronium bromide p. 1450, and the

benzylisoquinolinium group, comprising atracurium besilate p. 1448, cisatracurium p. 1449, and mivacurium p. 1449.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride p. 1448. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as

atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vecuronium bromide p. 1450, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

Depolarising neuromuscular blocking drugs

Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in **dual block**, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium chloride

but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

NEUROMUSCULAR BLOCKING DRUGS > DEPOLARISING

Suxamethonium chloride

02-Dec-2020

(Succinylcholine chloride)

 DRUG ACTION Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

INDICATIONS AND DOSE

Neuromuscular blockade (short duration) during surgery and intubation

- ► BY INTRAVENOUS INJECTION
- ► Adult: 1–1.5 mg/kg
- UNLICENSED USE Doses of suxamethonium in BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- CONTRA-INDICATIONS Hyperkalaemia · low plasmacholinesterase activity (including severe liver disease) · major trauma · neurological disease involving acute wasting of major muscle · personal or family history of congenital myotonic disease · personal or family history of malignant hyperthermia · prolonged immobilisation (risk of hyperkalaemia) · severe burns · skeletal muscle myopathies (e.g. Duchenne muscular dystrophy)
- CAUTIONS Cardiac disease neuromuscular disease raised intra-ocular pressure (avoid in penetrating eye injury) • respiratory disease • severe sepsis (risk of hyperkalaemia)
- INTERACTIONS → Appendix 1: suxamethonium
- SIDE-EFFECTS
- Common or very common Arrhythmias · bradycardia (may occur with repeated doses) · flushing · muscle contractions involuntary · myoglobinaemia · myoglobinuria · post procedural muscle pain · rash
- ▶ Rare or very rare Apnoea · cardiac arrest · hypersensitivity malignant hyperthermia · respiratory disorders · trismus SIDE-EFFECTS, FURTHER INFORMATION Premedication with attropine reduces bradycardia associated with suxamethonium use.
- ALLERGY AND CROSS-SENSITIVITY Evg: Allergic crossreactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.
- PREGNANCY Mildly prolonged maternal neuromuscular blockade may occur.
- BREAST FEEDING Unlikely to be present in breast milk in significant amounts (ionised at physiological pH). Breastfeeding may be resumed once the mother recovered from neuromuscular block.
- HEPATIC IMPAIRMENT Manufacturer advises caution, particularly in end stage hepatic failure (increased risk of prolonged apnoea due to reduced hepatic synthesis of plasma cholinesterase).

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- ➤ Suxamethonium chloride (Non-proprietary)

 Suxamethonium chloride 50 mg per 1 ml Suxamethonium chloride

NEUROMUSCULAR BLOCKING DRUGS > NON-

DEPOLARISING

Non-depolarising neuromuscular blocking drugs

IMPORTANT SAFETY INFORMATION

Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- CAUTIONS Burns (resistance can develop, increased doses
 may be required) · cardiovascular disease (reduce rate of
 administration) · electrolyte disturbances (response
 unpredictable) · fluid disturbances (response
 unpredictable) · hypothermia (activity prolonged, lower
 doses required) · myasthenia gravis (activity prolonged,
 lower doses required) · neuromuscular disorders (response
 unpredictable)
- SIDE-EFFECTS
- ► Common or very common Flushing hypotension
- ► **Uncommon** Bronchospasm hypersensitivity skin reactions tachycardia
- ► Rare or very rare Circulatory collapse muscle weakness (after prolonged use in intensive care) myopathy (after prolonged use in intensive care) shock
- ALLERGY AND CROSS-SENSITIVITY Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.
- PREGNANCY Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts
- BREAST FEEDING Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts.
 Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

Atracurium besilate

(Atracurium besylate)

INDICATIONS AND DOSE

Neuromuscular blockade (short to intermediate duration) for surgery and intubation

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg as required, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour

Neuromuscular blockade during intensive care

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 300–600 micrograms/kg, initial dose is optional, then (by intravenous infusion) 270–1770 micrograms/kg/hour; (by intravenous infusion) usual dose 650–780 micrograms/kg/hour

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
- INTERACTIONS → Appendix 1: neuromuscular blocking drugs, non-depolarising
- SIDE-EFFECTS
- ► Rare or very rare Cardiac arrest
- ► Frequency not known Seizure

SIDE-EFFECTS, FURTHER INFORMATION Hypotension, skin flushing, and bronchospasm is associated with histamine release. Manufacturer advises minimising effects of histamine release by administering over 1 minute in patients with cardiovascular disease or sensitivity to hypotension.

- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Tracrium®, Atracurium besilate injection, Hospira; Atracurium injection/infusion, Genus), give continuously in Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Neuromuscular blockade (intermediate duration) during surgery and intubation

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 150 micrograms/kg, then (by intravenous injection) maintenance 30 micrograms/kg every 20 minutes, alternatively (by intravenous infusion) initially 180 micrograms/kg/hour, then (by intravenous infusion) maintenance 60–120 micrograms/kg/hour, maintenance dose administered after stabilisation

Neuromuscular blockade (intermediate duration) during intensive care

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 150 micrograms/kg, initial dose is optional, then (by intravenous infusion) 180 micrograms/kg/hour, adjusted according to response; (by intravenous infusion) usual dose 30–600 micrograms/kg/hour

DOSES AT EXTREMES OF BODY-WEIGHT

- ► To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
- INTERACTIONS → Appendix 1: neuromuscular blocking drugs, non-depolarising
- SIDE-EFFECTS
- ► Common or very common Bradycardia
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Nimbex®, Nimbex Forte®), manufacturer advises give continuously in Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

F 1448

Mivacurium

10-May-2021

INDICATIONS AND DOSE

Neuromuscular blockade (short duration) during surgery and intubation

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: 70-250 micrograms/kg; (by intravenous injection) maintenance 100 micrograms/kg every 15 minutes, alternatively (by intravenous infusion) maintenance 8-10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 6-7 micrograms/kg/minute

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
- CAUTIONS Burns (low plasma cholinesterase activity; dose titration required) • elderly
- INTERACTIONS → Appendix 1: neuromuscular blocking drugs, non-depolarising
- HEPATIC IMPAIRMENT Manufacturer advises caution in hepatic failure (increased duration of action).
 Dose adjustments Manufacturer advises dose reduction in hepatic failure.
- RENAL IMPAIRMENT EVGT Use with caution. (N)

 Dose adjustments EvGT Reduce dose according to response in end-stage renal disease (clinical effect prolonged). (N)
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 500 micrograms/mL; may also be given undiluted. Doses up to 150 micrograms/kg may be given over 5–15 seconds,

higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Mivacron (Aspen Pharma Trading Ltd)

Mivacurium (as Mivacurium chloride) 2 mg per 1 ml Mivacron 10mg/5ml solution for injection ampoules | 5 ampoule PoM £13.95 (Hospital only)

Mivacron 20mg/10ml solution for injection ampoules | 5 ampoule | FOM | £22.57 (Hospital only)

F 1448

Pancuronium bromide

10-May-2021

• INDICATIONS AND DOSE

Neuromuscular blockade (long duration) during surgery and intubation

- ► BY INTRAVENOUS INJECTION
- Adult: Initially 100 micrograms/kg, then 20 micrograms/kg as required

Neuromuscular blockade (long duration) during intensive care

- ► BY INTRAVENOUS INJECTION
- Adult: Initially 100 micrograms/kg, initial dose is optional, then 60 micrograms/kg every 60–90 minutes

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
- INTERACTIONS → Appendix 1: neuromuscular blocking drugs, non-depolarising
- SIDE-EFFECTS Apnoea · arrhythmia · hypersalivation · increased cardiac output · miosis

SIDE-EFFECTS, FURTHER INFORMATION Pancuronium lacks histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia.

- HEPATIC IMPAIRMENT Manufacturer advises caution (possibly slower onset and higher dose requirements due to resistance to neuromuscular blocking action which may lead to a prolonged recovery time).
- RENAL IMPAIRMENT Ever Use with caution (may prolong duration of block).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Pancuronium bromide (Non-proprietary)

Pancuronium bromide 2 mg per 1 ml Pancuronium bromide 4mg/2ml solution for injection ampoules | 10 ampoule PoM £50.00 (Hospital only)

Rocuronium bromide 10 mg per 1 ml Esmeron 50mg/5ml solution for injection vials | 10 vial PoM £28.92 (Hospital only)

F 1448

Vecuronium bromide • INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery and intubation

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: 80–100 micrograms/kg; (by intravenous injection) maintenance 20–30 micrograms/kg, adjusted according to response, max. 100 micrograms/kg in caesarean section, alternatively (by intravenous infusion) maintenance 0.8–1.4 micrograms/kg/minute, adjusted according to response

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
- INTERACTIONS → Appendix 1: neuromuscular blocking drugs, non-depolarising
- SIDE-EFFECTS
- ▶ Uncommon Procedural complications
- ▶ Rare or very rare Angioedema face oedema paralysis
- HEPATIC IMPAIRMENT Manufacturer advises caution in significant impairment.
- RENAL IMPAIRMENT EVGT Use with caution.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises reconstitute each vial with 5 mL Water for Injections to

give 2 mg/mL solution; alternatively reconstitute with up to 10 mL Glucose 5% or Sodium Chloride 0.9% or Water for Injections—unsuitable for further dilution if not reconstituted with Water for Injections. For continuous intravenous infusion, manufacturer advises dilute reconstituted solution to a concentration up to 40 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; reconstituted solution can also be given via drip tubing.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

1.2 Neuromuscular blockade reversal

Neuromuscular blockade reversal

Neuromuscular blockade reversal

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide p. 1450 but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride p. 1448.

Neostigmine p. 1218 is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium bromide p. 1446 or alternatively atropine sulfate p. 1445, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

Other drugs for reversal of neuromuscular blockade Sugammadex below is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium bromide p. 1450 or vecuronium bromide p. 1450. In practice, sugammadex is used mainly for

rapid reversal of neuromuscular blockade in an emergency.

ANTICHOLINESTERASES

Neostigmine with glycopyrronium bromide

17-Jul-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, neostigmine p. 1218, glycopyrronium bromide p. 1446.

INDICATIONS AND DOSE

Reversal of non-depolarising neuromuscular blockade

- ► BY INTRAVENOUS INJECTION
- Adult: 1-2 mL, repeated if necessary, alternatively 0.02 mL/kilogram, repeated if necessary; maximum 2 mL per course
- INTERACTIONS → Appendix 1: glycopyrronium · neostigmine
- DIRECTIONS FOR ADMINISTRATION For intravenous injection, manufacturer advises give over 10–30 seconds.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

➤ Neostigmine with glycopyrronium bromide (Non-proprietary) Glycopyrronium bromide 500 microgram per 1 ml, Neostigmine metilsulfate 2.5 mg per 1 ml Neostigmine 2.5mg/1ml / Glycopyrronium bromide 500micrograms/1ml solution for injection ampoules | 10 ampoule PoM £11.50

ANTIDOTES AND CHELATORS

Sugammadex

10-Aug-2021

INDICATIONS AND DOSE

Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium

- ► BY INTRAVENOUS INJECTION
- Adult: Initially 2-4 mg/kg, then 4 mg/kg if required, administered if recurrence of neuromuscular blockade occurs; consult product literature for further details

Immediate reversal of neuromuscular blockade induced by rocuronium

- ► BY INTRAVENOUS INJECTION
- Adult: 16 mg/kg (consult product literature)

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- CAUTIONS Cardiovascular disease (recovery may be delayed) - elderly (recovery may be delayed) - pre-existing coagulation disorders - recurrence of neuromuscular blockade—monitor respiratory function until fully recovered - use of anticoagulants (unrelated to surgery) wait 24 hours before re-administering rocuronium · wait 24 hours before re-administering vecuronium
- INTERACTIONS → Appendix 1: sugammadex
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · arrhythmias · cough · dizziness · headache · nausea · procedural complications · skin reactions · taste altered · vomiting
- ► Uncommon Hypersensitivity
- ► Frequency not known Bronchospasm
- PREGNANCY Use with caution—no information available.
- RENAL IMPAIRMENT [EVGT] Avoid if creatinine clearance less than 30 mL/minute. (**) See p. 21.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Sugammadex (Bridion®) for the routine reversal of neuromuscular blockade induced by rocuronium or vecuronium in adults and rocuronium in paediatric patients (March 2013) SMC No. 527/09 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

1.3 Peri-operative analgesia

Peri-operative analgesia

01-Sep-2020

Overview

Ever Postoperative pain management options should be discussed with patients prior to surgery. Take into account the patient's clinical features and the type of surgery, and discuss the patient's pain history, preferences and expectations, likely impact of the procedure on their pain, potential benefits and risks of treatment, and discharge plan. A multimodal approach using a combination of analgesics from different classes to manage postoperative pain should be offered.

Consider prescribing pre-emptive analgesia to ensure that the patient's pain is managed when the effects of local anaesthesia wears off.

Non-opioid analgesics

[EvGr] Oral paracetamol p. 477 should be offered before and after surgery irrespective of pain severity, with intravenous paracetamol reserved for patients unable to take oral medication.

Offer oral ibuprofen p. 1232 to manage immediate postoperative pain (pain during the first 24 hours after surgery) of all severities, except for patients who have had surgery for a hip fracture—see NICE guideline: Hip fractures: management for guidance, available at: www.nice.org.uk/guidance/cg124. Intravenous NSAIDs should be reserved for patients unable to take oral medication; if offering intravenous NSAIDs, choose a traditional NSAID rather than a COX-2 (cyclo-oxygenase-2) inhibitor.

Intramuscular injections of diclofenac sodium p. 1227 and ketoprofen p. 1236 are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketorolac trometamol p. 1455 is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection. Suppositories of diclofenac sodium and ketoprofen may be effective alternatives to the parenteral use of these drugs.

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain.

Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Preoperative use of opioid analgesics is generally limited to those patients who require control of existing pain.

Evos An oral opioid should only be offered if immediate postoperative pain is expected to be moderate to severe. It should be given as soon as the patient can eat and drink after surgery, and the dose adjusted to help achieve functional recovery (such as coughing and mobilising) as soon as possible. Patients unable to take oral opioids should be offered either a patient-controlled analgesia (PCA) or continuous epidural. The benefit of a continuous epidural should be taken into consideration for patients who are having major or complex open-torso surgery, are expected to have severe pain, or those who have cognitive impairment. If opioids are used, see NICE guideline: Controlled drugs: safe use and management (available at: www.nice.org.uk/guidance/ng46) for information on prescribing controlled drugs.

For guidance on the management of opioid-induced respiratory depression, see Pre-medication and perioperative drugs p. 1444.

Intra-operative analgesia

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil p. 1456, fentanyl p. 490, and remifentanil p. 1457 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil

Evgr A single dose of intravenous ketamine p. 1458 [unlicensed] should be considered either during or immediately after surgery to supplement other types of pain relief if, the patient's pain is expected to be moderate to severe and an intravenous opioid alone does not provide adequate pain relief, or the patient has opioid sensitivity.

Useful resources

Perioperative care in adults. National Institute for Health and Care Excellence. NICE guideline 180. August 2020. www.nice.org.uk/guidance/ng180

ANAESTHETICS, GENERAL > NMDA RECEPTOR ANTAGONISTS

Esketamine

10-May-2022

 DRUG ACTION Esketamine is an isomer of ketamine that blocks N-methyl-D-aspartate (NMDA) receptors and interrupts the association pathways of the brain, resulting in dissociative anaesthesia and analgesia and in restoration of neural pathways regulating mood and emotional behaviour.

INDICATIONS AND DOSE

Induction and maintenance of anaesthesia (specialist use only)

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: 0.5-1 mg/kg, then maintenance 0.25-0.5 mg/kg every 10-15 minutes, adjusted according to response
- ► BY INTRAMUSCULAR INJECTION
- ► Adult: 2–4 mg/kg, then maintenance 1–2 mg/kg every 10–15 minutes, adjusted according to response
- ► BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: 0.5-3 mg/kg/hour, adjusted according to response

Analgesic supplementation of regional and local anaesthesia (specialist use only)

- ► BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: 0.125-0.25 mg/kg/hour, adjusted according to response

Analgesia in emergency medicine (specialist use only)

- **▶** BY INTRAMUSCULAR INJECTION
- Adult: 0.25-0.5 mg/kg, adjusted according to response
- **▶** BY SLOW INTRAVENOUS INJECTION
- Adult: 0.125-0.25 mg/kg, adjusted according to response

Major depressive disorder (specialist use only)

- ► BY INTRANASAL ADMINISTRATION
- Adult: Initially 56 mg on day 1, then 56-84 mg twice weekly for weeks 1-4, then 56-84 mg once weekly for weeks 5-8, then 56-84 mg every 1-2 weeks from week 9 onwards, review continued treatment periodically. treatment is recommended for at least 6 months after depressive symptoms improve, all dose adjustments to be made in 28 mg increments
- ► BY INTRANASAL ADMINISTRATION
- Elderly: Initially 28 mg on day 1, then 28-84 mg twice weekly for weeks 1-4, then 28-84 mg once weekly for weeks 5-8, then 28-84 mg every 1-2 weeks from week 9 onwards, review continued treatment periodically, treatment is recommended for at least 6 months after depressive symptoms improve, all dose adjustments to be made in 28 mg increments

Major depressive disorder (patients of Japanese origin) (specialist use only)

- ► BY INTRANASAL ADMINISTRATION
- ▶ Adult: Initially 28 mg on day 1, then 28-84 mg twice weekly for weeks 1-4, then 28-84 mg once weekly for weeks 5-8, then 28-84 mg every 1-2 weeks from week 9 onwards, review continued treatment periodically, treatment is recommended for at least 6 months after depressive symptoms improve, all dose adjustments to be made in 28 mg increments

DOSE FOULVALENCE AND CONVERSION

- With intranasal use
- 28 mg equivalent to 2 sprays (1 spray administered into each nostril).

IMPORTANT SAFETY INFORMATION

Esketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 1150 · patients in whom hypertension or raised intracranial pressure forms a serious risk

SPECIFIC CONTRA-INDICATIONS

- When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Eclampsia · ischaemic cardiac disorders (when used as sole anaesthetic agent) . pre-eclampsia
- When used for Major depressive disorder Aneurysmal vascular disease · cardiovascular events, including myocardial infarction (within 6 weeks) · intracerebral haemorrhage

GENERAL CAUTIONS History of drug abuse · hypertension · raised intracranial pressure · thyroid dysfunction SPECIFIC CAUTIONS

· When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Chronic or acute alcohol consumption · decompensated cardiac failure · increased cerebrospinal fluid pressure · patients with multiple injuries or in poor condition-consult product literature · prolapsed umbilical cord · raised intra-ocular pressure ·

- severe psychotic disorders · unstable angina pectoris · uterine rupture
- ▶ When used for Major depressive disorder Bipolar disorder (active or previous history) · cardiovascular conditions (clinically significant or unstable) · mania (active or previous history) · psychosis (active or previous history) · respiratory conditions (clinically significant or unstable) CAUTIONS, FURTHER INFORMATION

- History of drug abuse
- ▶ When used for Major depressive disorder EvGr Patients should be assessed for the risk of drug abuse prior to starting treatment, and monitored for signs of this during therapy.
- Cardiovascular or respiratory conditions
- When used for Major depressive disorder Esketamine should be administered where appropriately trained staff and resuscitation facilities are available.
- INTERACTIONS → Appendix 1: esketamine
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

► Common or very common Anxiety · dizziness · nausea · vomiting

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intranasal use Drowsiness · dry mouth · dysarthria · feeling abnormal · feeling of body temperature change · hallucinations · headache · hyperacusia · hyperhidrosis · hypertension · mood altered · nasal complaints · oral disorders · perception altered · psychiatric disorders · sensation abnormal · tachycardia · taste altered · tinnitus · tremor · urinary disorders · vertigo · vision blurred
- ▶ With parenteral use Arrhythmias hypersalivation movement disorders · respiratory disorders · respiratory secretion increased · sleep disorders · vision disorders
- ▶ Uncommon
- With parenteral use Muscle tone increased nystagmus skin reactions
- ► Rare or very rare
- With parenteral use Hypotension
- ► Frequency not known
- With intranasal use Cystitis
- With parenteral use Disorientation · drug-induced liver injury · dysphoria · hallucination

PREGNANCY

- When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Manufacturer advises use only if potential benefit outweighs risk-may depress neonatal respiration if used during delivery.
- When used for Major depressive disorder Manufacturer advises avoid-no information available.

BREAST FEEDING

- When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Manufacturer advises present in milk—not thought to be harmful at therapeutic doses.
- When used for Major depressive disorder Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT
- When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Manufacturer advises caution (risk of prolonged action).
- When used for Major depressive disorder Manufacturer advises caution in moderate impairment when using maximum dose (84 mg); avoid in severe impairment—no information available.

Dose adjustments > When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Manufacturer advises consider dose reduction.

MONITORING REQUIREMENTS

When used for Major depressive disorder Manufacturer advises monitor blood pressure at baseline, approximately 40 minutes after treatment, and as clinically indicated thereafter. Manufacturer advises monitor for urinary tract and bladder symptoms during treatment and refer to an appropriate healthcare provider if symptoms persist.

DIRECTIONS FOR ADMINISTRATION

- With intramuscular use or intravenous use Manufacturer advises solution can be diluted with Glucose 5% or Sodium Chloride 0.9%.
- With intranasal use Manufacturer advises dose is administered via a single-use device delivering 28 mg as 2 sprays (1 spray per nostril). A second device is required for a 56 mg dose, and a third device is required for an 84 mg dose. Allow a break of 5 minutes between use of each device.

• PRESCRIBING AND DISPENSING INFORMATION

• When used for Major depressive disorder The manufacturer of Spravato® has provided the following materials: Guide for Healthcare Professionals, Checklist for Healthcare Professionals and Patient Guide. Patients must be enrolled onto the Spravato® Register and Alert System (available at: spravatoregister.clinpal.com) before first prescription or within 24 hours of the first administration for new patients, or before the next prescription for existing patients.

PATIENT AND CARER ADVICE

- When used for Major depressive disorder Manufacturer advises patients should be informed not to eat for at least 2 hours before and not to drink liquids for at least 30 minutes before treatment. Manufacturer advises patients who require a nasal corticosteroid or nasal decongestant on a dosing day should be informed not to administer these within 1 hour prior to treatment. Manufacturer advises patients and carers should seek immediate medical advice if symptoms worsen, or if suicidal behaviour or thoughts and unusual changes in behaviour occur.
- When used for Major depressive disorder A patient guide should be provided.

Missed doses > When used for Major depressive disorder Manufacturer advises if more than 2 treatment sessions are missed, adjustment of the dose or frequency of treatment may be clinically appropriate.

Driving and skilled tasks

- When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised. For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine which has similar pharmacokinetic properties to esketamine, see *Drugs and driving* under Guidance on prescribing p. 1.
- When used for Major depressive disorder Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of somnolence, sedation, dissociative symptoms, perception disturbances, dizziness, vertigo and anxiety. For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine which has similar pharmacokinetic properties to esketamine, see *Drugs and driving* under Guidance on prescribing p. 1.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Esketamine nasal spray (Spravato®) in combination with a selective serotonin reuptake inhibitor (SSRI) or serotoninnorepinephrine reuptake inhibitor (SNRI), for adults with treatment-resistant Major Depressive Disorder, who have not responded to at least two different treatments with antidepressants in the current moderate to severe depressive episode (September 2020) SMC No. SMC2258 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

• INDICATIONS AND DOSE

During labour (once epidural block established)

- ► BY CONTINUOUS LUMBAR EPIDURAL INFUSION
- Adult: 10-18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 16-30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours

Postoperative pain (once epidural block established)

- ► BY CONTINUOUS EPIDURAL INFUSION
- Adult: 4–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 8–30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours, to be administered by thoracic, upper abdominal or lower abdominal epidural infusion
- INTERACTIONS → Appendix 1: anaesthetics, local · opioids
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Solution for infusion

Bufyl (Sintetica Ltd)

Fentanyl 2 microgram per 1 ml, Bupivacaine hydrochloride 1 mg per 1 ml Bufyl 1mg/ml and 2micrograms/ml 500ml infusion bags | 5 bag PoM £46.00 (Hospital only) CD2 Bufyl 1mg/ml and 2micrograms/ml 250ml infusion bags | 5 bag PoM £42.50 (Hospital only) CD2|

Fentanyl (as Fentanyl citrate) 2 microgram per 1 ml, Bupivacaine hydrochloride 1.25 mg per 1 ml Bufyl 1.25mg/ml and 2micrograms/ml 250ml infusion bags | 5 bag PoM £45.25 (Hospital only) [CD2]

Bufyl 1.25mg/ml and 2micrograms/ml 500ml infusion bags | 5 bag PoM £46.00 (Hospital only) CD2

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Ketorolac trometamol

24-Nov-2021

INDICATIONS AND DOSE

Short-term management of moderate to severe acute postoperative pain only

- ► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Adult (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
- Adult (body-weight 50 kg and above): Initially 10 mg, then 10-30 mg every 4-6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
- Elderly: Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
- CONTRA-INDICATIONS Active or history of gastrointestinal bleeding · active or history of gastro-intestinal ulceration · coagulation disorders · complete or partial syndrome of nasal polyps · confirmed or suspected cerebrovascular bleeding · dehydration · following operations with high risk of haemorrhage or incomplete haemostasis · haemorrhagic diatheses · history of gastrointestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · hypovolaemia · severe heart failure
- CAUTIONS Allergic disorders cardiac impairment (NSAIDs may impair renal function) cerebrovascular disease connective-tissue disorders elderly (risk of serious side-effects and fatalities) heart failure history of gastro-intestinal disorders (e.g. ulcerative colitis, Crohn's disease) ischaemic heart disease may mask symptoms of infection peripheral arterial disease risk factors for cardiovascular events uncontrolled hypertension
- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-EFFECTS Agranulocytosis · angioedema · anxiety · aplastic anaemia · appetite decreased · asthenia · asthma · azotaemia · bradycardia · burping · chest pain · concentration impaired · confusion · constipation · Crohn's disease aggravated · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · euphoric mood · fever · flank pain · fluid retention · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · hearing loss · heart failure · hepatic disorders · hyperhidrosis · hyperkinesia · hypersensitivity · hypertension · hypotension · infertility female · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · musculoskeletal disorder · myalgia · myocardial infarction · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral disorders · pallor · palpitations · pancreatitis · paraesthesia perforation · photosensitivity reaction · platelet

aggregation inhibition • psychotic disorder • pulmonary oedema • renal impairment • respiratory disorders • seizure • severe cutaneous adverse reactions (SCARs) • skin reactions • sleep disorders • stroke • taste altered • thinking abnormal • thirst • thrombocytopenia • tinnitus • ulcer • urinary disorders • vertigo • visual impairment • vomiting • weight increased • wound haemorrhage

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1222

- ALLERGY AND CROSS-SENSITIVITY Evgr Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING Amount too small to be harmful.
- HEPATIC IMPAIRMENT Manufacturer advises caution—may increase risk of renal impairment; avoid in hepatic failure.
- RENAL IMPAIRMENT In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure). Evgr For ketorolac, avoid if serum creatinine greater than 160 micromol/litre.

Dose adjustments EvGr Max. 60 mg daily if serum creatinine 160 micromol/litre or less.

- DIRECTIONS FOR ADMINISTRATION For intravenous injection, manufacturer advises give over at least 15 seconds
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ► Ketorolac trometamol (Non-proprietary)

 Ketorolac trometamol 30 mg per 1 ml Ketorolac 30 mg/1ml solution for injection ampoules | 5 ampoule PoM £1.10 DT = £5.36 (Hospital
- ► Toradol (Atnahs Pharma UK Ltd)

Ketorolac trometamol 30 mg per 1 ml Toradol 30 mg/1ml solution for injection ampoules | 5 ampoule PoM £5.36 DT = £5.36 (Hospital only)

Parecoxib

22-Nov-2021

- DRUG ACTION Parecoxib is a selective inhibitor of cyclooxygenase-2.
 - INDICATIONS AND DOSE

Short-term management of acute postoperative pain

- ► BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ► Adult: Initially 40 mg, then 20–40 mg every 6–12 hours as required for up to 3 days; maximum 80 mg per day
- Elderly (body-weight up to 50 kg): Initially 20 mg; maximum 40 mg per day
- CONTRA-INDICATIONS Active gastro-intestinal bleeding active gastro-intestinal ulceration cerebrovascular disease following coronary artery bypass graft surgery inflammatory bowel disease ischaemic heart disease mild to severe heart failure peripheral arterial disease

- CAUTIONS Allergic disorders cardiac impairment (NSAIDs may impair renal function) coagulation defects connective-tissue disorders dehydration (risk of renal impairment) elderly (risk of serious side-effects and fatalities) history of cardiac failure history of gastrointestinal disorders hypertension may mask symptoms of infection oedema risk factors for cardiovascular events.
- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-EFFECTS
- Common or very common Agitation · back pain · constipation · dizziness · gastrointestinal discomfort · gastrointestinal discorders · hyperhidrosis · hypertension · hypokalaemia · hypotension · increased risk of infection · insomnia · nausea · numbness · peripheral oedema · post procedural complications · renal impairment · respiratory disorders · skin reactions · vomiting
- ▶ Uncommon Appetite decreased · arrhythmias · arthralgia · asthenia · cerebrovascular insufficiency · dry mouth · ear pain · embolism and thrombosis · hyperglycaemia · myocardial infarction · thrombocytopenia
- ► Rare or very rare Hypersensitivity pancreatitis perioral swelling
- Frequency not known Angioedema · cardiovascular event · circulatory collapse · congestive heart failure · dyspnoea · fluid retention · hepatitis · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs)
 - SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Nonsteroidal anti-inflammatory drugs. p. 1222
- ALLERGY AND CROSS-SENSITIVITY Evg: Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. Contraindicated in patients with a history of allergic drug reactions including sulfonamide hypersensitivity.
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING Avoid—present in milk.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).
 Dose adjustments Manufacturer advises dose reduction to half the usual recommended dose in moderate impairment; maximum 40 mg daily.
- RENAL IMPAIRMENT In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure).

 Dose adjustments [EvGr] Reduce initial dose to 20 mg if creatinine clearance less than 30 mL/minute. ♠ See p. 21.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

 Parecoxib (Dynastat®) for the short-term treatment of postoperative pain (January 2003) SMC No. 27/02 Not recommended MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

Dynastat (Pfizer Ltd)

Parecoxib (as Parecoxib sodium) 40 mg Dynastat 40mg powder and solvent for solution for injection vials | 5 vial PoM £28.34 DT = £28.34

Powder for solution for injection

► Parecoxib (Non-proprietary)

Parecoxib (as Parecoxib sodium) 40 mg Parecoxib 40mg powder for solution for injection vials | 10 vial PoM £49.60 DT = £49.60 (Hospital only)

Dvnastat (Pfizer Ltd)

Parecoxib (as Parecoxib sodium) 40 mg Dynastat 40mg powder for solution for injection vials | 10 vial [PoM] £49.60 DT = £49.60

ANALGESICS > OPIOIDS

F 479

Alfentanil

10-May-2021

• INDICATIONS AND DOSE

Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures

- ► BY INTRAVENOUS INJECTION
- Adult: Initially up to 500 micrograms, dose to be administered over 30 seconds; supplemental doses 250 micrograms

Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures

- **▶** BY INTRAVENOUS INJECTION
- Adult: Initially 30-50 micrograms/kg, supplemental doses 15 micrograms/kg

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 50–100 micrograms/kg, dose to be administered over 10 minutes or as a bolus, followed by maintenance 30–60 micrograms/kg/hour

Assisted ventilation: analgesia and suppression of respiratory activity during intensive care for up to 4 days

- **▶** BY INTRAVENOUS INFUSION
- Adult: Initially 2 mg/hour, adjusted according to response; usual dose 0.5–10 mg/hour, alternatively initially 5 mg in divided doses, to be administered over 10 minutes; dose used for more rapid initial control, reduce rate of administration if hypotension or bradycardia occur; additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

DOSES AT EXTREMES OF BODY-WEIGHT

 To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

CAUTIONS

- Repeated intra-operative doses EvGr Repeated intraoperative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.
- INTERACTIONS → Appendix 1: opioids
- SIDE-EFFECTS
- ► Common or very common Apnoea · chills · fatigue · hypertension · hypotension · movement disorders · muscle rigidity · procedural complications · visual impairment
- ► Uncommon Coma · hiccups · hypercapnia · pain · post procedural complications · respiratory disorders
- ▶ Rare or very rare Agitation · crying · epistaxis · vascular pain

► Frequency not known Cardiac arrest · cough · fever · loss of consciousness · seizure

SIDE-EFFECTS, FURTHER INFORMATION Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking

- BREAST FEEDING Present in milk—withhold breastfeeding for 24 hours.
- HEPATIC IMPAIRMENT Manufacturer advises caution. Dose adjustments Manufacturer advises dose reduction and cautious titration.
- RENAL IMPAIRMENT [EVGr] Use with caution and titrate carefully (risk of increased and prolonged effects). Dose adjustments [EvGr] Dose reduction may be required in renal failure.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises 5 mg/mL injection should be diluted in Glucose 5% or Sodium Chloride 0.9% before use.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

► Alfentanil (Non-proprietary)

Remifentanil

F 479 12-May-2021

• INDICATIONS AND DOSE

Analgesia and enhancement of anaesthesia at induction (initial bolus injection)

- ► BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 0.25-1 microgram/kg, dose to be administered over at least 30 seconds, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose

- ► BY INTRAVENOUS INFUSION
- ▶ Adult: 30–60 micrograms/kg/hour, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)

- ► BY INTRAVENOUS INJECTION
- Adult: Initially 0.25-1 microgram/kg, dose to be administered over at least 30 seconds

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial holus dose

- ► BY INTRAVENOUS INFUSION
- Adult: 3-120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, in light anaesthesia additional doses can be given by intravenous injection every 2-5 minutes during the intravenous infusion

Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5-6 micrograms/kg/hour

Assisted ventilation: analgesia and sedation in intensivecare patients (for max 3 days)

- ► BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 6–9 micrograms/kg/hour, then adjusted in steps of 1.5 micrograms/kg/hour, allow at least 5 minutes between dose adjustments; usual dose 0.36-44.4 micrograms/kg/hour, if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details)

Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients

- ► BY INTRAVENOUS INFUSION
- Adult: Usual dose 15-45 micrograms/kg/hour, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2-5 minutes according to requirements

Cardiac surgery

Adult: (consult product literature)

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
- UNLICENSED USE Remifentanil doses in BNF may differ from those in product literature.
- CONTRA-INDICATIONS Analgesia in conscious patients
- INTERACTIONS → Appendix 1: opioids
- SIDE-EFFECTS
- ► Common or very common Apnoea · hypotension · muscle rigidity · post procedural complications
- ▶ Uncommon Hypoxia
- ▶ Rare or very rare Cardiac arrest
- ► Frequency not known Agitation atrioventricular block hypertension · seizure

SIDE-EFFECTS, FURTHER INFORMATION In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by plasma esterases; it has short duration of action which is independent of dose and duration of infusion.

Muscle rigidity Remifentanil can cause muscle rigidity that can be managed by the use of neuromuscular blocking drugs.

- PREGNANCY No information available.
- BREAST FEEDING Avoid breast-feeding for 24 hours after administration—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (limited information available).
- RENAL IMPAIRMENT

Dose adjustments [EvGr] No dose adjustment necessary in renal impairment.

- DIRECTIONS FOR ADMINISTRATION
- With intravenous use For intravenous infusion (Ultiva®), manufacturer advises give continuously in Glucose 5% or

Sodium Chloride 0.9% or Water for Injections; reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of

20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device).

PRESCRIBING AND DISPENSING INFORMATION

Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► Remifentanil (Non-proprietary)

Remifentanil (as Remifentanyl hydrochloride) 1 mg Remifentanil 1mg powder for concentrate for solution for injection vials | 5 vial | PoM | £25.60-£33.70 (Hospital only) | CD2 |

Remifentanil (as Remifentanyl hydrochloride) 2 mg Remifentanil 2mg powder for concentrate for solution for injection vials | 5 vial PoM £51.13-£67.40 (Hospital only) CD2

Remifentanil (as Remifentanyl hydrochloride) 5 mg Remifentanil 5mg powder for concentrate for solution for injection vials | 5 vial PoM £127.90-£168.45 (Hospital only) CD2

Remifentanil (as Remifentanyl hydrochloride) 5 mg Ultiva 5mg powder for solution for injection vials | 5 vial PoM £127.88 (Hospital only) [CD2]

1.4 Peri-operative sedation

Conscious sedation for clinical procedures

Overview

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be *monitored carefully*; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

ANAESTHETICS, GENERAL > NMDA RECEPTOR ANTAGONISTS

Ketamine

04-Dec-2019

• INDICATIONS AND DOSE

Induction and maintenance of anaesthesia for short procedures

- **▶** BY INTRAMUSCULAR INJECTION
- Adult: Initially 6.5–13 mg/kg, adjusted according to response, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia
- ► BY INTRAVENOUS INJECTION
- Adult: Initially 1–4.5 mg/kg, adjusted according to response, to be administered over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia

Diagnostic manoeuvres and procedures not involving intense pain

- ► BY INTRAMUSCULAR INJECTION
- Adult: Initially 4 mg/kg

Induction and maintenance of anaesthesia for long procedures

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 0.5–2 mg/kg, using an infusion solution containing 1 mg/ml; maintenance 10–45 micrograms/kg/minute, adjusted according to response

IMPORTANT SAFETY INFORMATION

Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CONTRA-INDICATIONS Acute porphyrias p. 1150 eclampsia head trauma hypertension pre-eclampsia raised intracranial pressure severe cardiac disease stroke
- CAUTIONS Acute circulatory failure (shock) · cardiovascular disease · dehydration · elderly · fixed cardiac output · hallucinations · head injury · hypertension · hypovolaemia · increased cerebrospinal fluid pressure · intracranial mass lesions · nightmares · predisposition to seizures · psychotic disorders · raised intra-ocular pressure · respiratory tract infection · thyroid dysfunction
- INTERACTIONS → Appendix 1: ketamine
- SIDE-EFFECTS
- Common or very common Anxiety · behaviour abnormal · confusion · diplopia · hallucination · muscle tone increased · nausea · nystagmus · skin reactions · sleep disorders · tonic clonic movements · vomiting
- ► **Uncommon** Appetite decreased arrhythmias hypotension respiratory disorders
- ► Rare or very rare Apnoea · cystitis · cystitis haemorrhagic · delirium · dysphoria · flashback · hypersalivation
- Frequency not known Drug-induced liver injury
 SIDE-EFFECTS, FURTHER INFORMATION Incidence of hallucinations can be reduced by premedication with a benzodiazepine (such as midazolam).
- PREGNANCY May depress neonatal respiration if used during delivery.
- BREAST FEEDING Avoid for at least 12 hours after last dose.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of prolonged duration of action).
 Dose adjustments Manufacturer advises consider dose reduction
- DIRECTIONS FOR ADMINISTRATION For continuous intravenous infusion, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia. For intravenous injection, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9% or Water for Injections.

PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see *Drugs and driving* under Guidance on prescribing p. 1.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

F 373

Remimazolam

03-Sep-2021

INDICATIONS AND DOSE

Conscious sedation for procedures

- ► BY INTRAVENOUS INJECTION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

CAUTIONS Cardiac disease

CAUTIONS, FURTHER INFORMATION

- Recovery when used for sedation Remimazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with severe hepatic impairment, or with body weight less than 50 kg.
- INTERACTIONS → Appendix 1: benzodiazepines
- SIDE-EFFECTS
- ► Common or very common Arrhythmias · dyspnoea · gas exchange abnormal · respiratory disorders · vomiting
- ▶ Uncommon Chills feeling cold hiccups
- PREGNANCY Evgr Avoid—limited information available.
- BREAST FEEDING EvGr Avoid breast feeding for 24 hours after administration—present in milk in animal studies.
- HEPATIC IMPAIRMENT EVGr Caution in severe impairment (more pronounced and prolonged effects). Dose adjustments **EvGr** Titrate doses with caution in severe impairment.
- PATIENT AND CARER ADVICE Patients should be advised to avoid alcohol intake for 24 hours before the procedure. Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours

after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

HYPNOTICS, SEDATIVES AND ANXIOLYTICS >

NON-BENZODIAZEPINE HYPNOTICS AND **SEDATIVES**

Dexmedetomidine

07-Aug-2020

INDICATIONS AND DOSE

Maintenance of sedation during intensive care

- ► BY INTRAVENOUS INFUSION
- Adult: 0.7 microgram/kg/hour, adjusted according to response; usual dose 0.2-1.4 micrograms/kg/hour

IMPORTANT SAFETY INFORMATION

Dexmedetomidine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management.

- CONTRA-INDICATIONS Acute cerebrovascular disorders second- or third-degree AV block (unless pacemaker fitted) · uncontrolled hypotension
- CAUTIONS Abrupt withdrawal after prolonged use bradycardia • elderly (risk of hypotension) • ischaemic heart disease (especially at higher doses) · malignant hyperthermia · severe cerebrovascular disease (especially at higher doses) · severe neurological disorders · spinal cord injury
- INTERACTIONS → Appendix 1: dexmedetomidine
- ► Common or very common Agitation arrhythmias dry mouth · hyperglycaemia · hypertension · hyperthermia · hypoglycaemia · hypotension · myocardial infarction · myocardial ischaemia · nausea · respiratory depression · vomiting
- ▶ Uncommon Abdominal distension apnoea atrioventricular block · dyspnoea · hallucination · hypoalbuminaemia · metabolic acidosis · thirst
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution (increased risk of toxicity due to decreased clearance). Dose adjustments Manufacturer advises consider dose reduction
- MONITORING REQUIREMENTS
- ► Monitor cardiac function.
- ▶ Monitor respiratory function in non-intubated patients.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises to be diluted before use. For intravenous infusion given continuously in Glucose 5% or Sodium Chloride 0.9%, dilute to a concentration of 4 micrograms/mL.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Dexdor 40omicrograms/4ml concentrate for solution for infusion vials | 4 vial [Poml £125.28 (Hospital only)

Dexdor 200micrograms/2ml concentrate for solution for infusion ampoules | 5 ampoule PoM £78.30 (Hospital only)

2 Malignant hyperthermia

MUSCLE RELAXANTS > DIRECTLY ACTING

Dantrolene sodium

08-Mar-2021

 DRUG ACTION Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

• INDICATIONS AND DOSE

Malignant hyperthermia

- ► BY RAPID INTRAVENOUS INJECTION
- Adult: Initially 2-3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course

Chronic severe spasticity of voluntary muscle

- BY MOUTH
- Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals; usual dose 75 mg 3 times a day

Muscle cramps in motor neurone disease (specialist use only)

- ▶ BY MOUTH
- Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals

• UNLICENSED USE

 With oral use Ever Dantrolene sodium is used for the treatment of muscle cramps in motor neurone disease, but is not licensed for this indication.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

CONTRA-INDICATIONS

 With oral use Acute muscle spasm · avoid when spasticity is useful, for example, locomotion

CAUTIONS

- With intravenous use Avoid extravasation (risk of tissue necrosis)
- With oral use Females (hepatotoxicity) history of liver disorders (hepatotoxicity) - if doses greater than 400 mg daily (hepatotoxicity) - impaired cardiac function impaired pulmonary function - patients over 30 years

(hepatotoxicity) · therapeutic effect may take a few weeks to develop— discontinue if no response within 6–8 weeks

- INTERACTIONS → Appendix 1: dantrolene
- SIDE-EFFECTS

GENERAL SIDE-FEEECTS

- ► Common or very common Abdominal pain hepatic disorders nausea respiratory disorders skin reactions speech disorder vomiting
- ► Uncommon Crystalluria hyperhidrosis
- ► Frequency not known Arrhythmias dizziness drowsiness SPECIFIC SIDE-EFFECTS
- ► Common or very common
- With oral use Appetite decreased · chills · confusion · depression · eosinophilia · fever · headache · insomnia · nervousness · pericarditis · visual impairment
- Uncommon
- With oral use Constipation · dysphagia · haemorrhage · heart failure aggravated · urinary disorders
- ▶ Frequency not known
- With intravenous use Gastrointestinal haemorrhage · heart failure · localised pain · pulmonary oedema · seizure · thrombophlebitis
- With oral use Asthenia · diarrhoea · dyspnoea · hypertension · malaise

PREGNANCY

- With intravenous use Use only if potential benefit outweighs risk.
- With oral use Although teratological studies in animals have proved satisfactory, dantrolene sodium does cross the placenta, therefore manufacturer advises avoid.

BREAST FEEDING

- With intravenous use Present in milk—use only if potential benefit outweighs risk.
- With oral use Present in milk—manufacturer advises avoid.
- HEPATIC IMPAIRMENT
- With oral use Manufacturer advises avoid in hepatic impairment.
- MONITORING REQUIREMENTS
- With oral use Test liver function before and at intervals during therapy.
- PATIENT AND CARER ADVICE

Hepatotoxicity > With oral use Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

Driving and skilled tasks • With oral use Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Powder for solution for injection

Dantrium (Forum Health Products Ltd)
Dantrolene sodium 20 mg Dantrium Intravenous 20mg powder for solution for injection vials | 12 vial PoM £612.00 (Hospital only) | 36 vial PoM £1,836.00 (Hospital only)

Local anaesthesia

Anaesthesia (local)

Local anaesthetic drugs

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier's block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 1462 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Levobupivacaine p. 1465, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 1466 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 241) is about 90 minutes.

Prilocaine hydrochloride p. 1470 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride. A hyperbaric solution of prilocaine hydrochloride (containing glucose) may be used for spinal anaesthesia.

Ropivacaine hydrochloride p. 1471 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 1472, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

Administration by injection

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient's age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

NHS Improvement has advised (September 2016) that. prior to administration, all injectable medicines must be drawn directly from their original ampoule or container into a syringe and should never be decanted into gallipots or open containers. This is to avoid the risk of medicines being confused with other substances, e.g. skin disinfectants, and to reduce the risk of contamination.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidural anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential.

Vasoconstrictors in combination with local anaesthetics

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline/epinephrine, and it is **not** advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products.

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline/epinephrine should be used.

Dental anaesthesia

Lidocaine hydrochloride is widely used in dental procedures: it is most often used in combination with adrenaline/epinephrine, Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine.

The amide-type local anaesthetics articaine and mepivacaine hydrochloride p. 1469 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

Toxicity induced by local anaesthesia

For management of toxicity see Severe local anaestheticinduced cardiovascular toxicity below.

Severe local anaesthetic-induced cardiovascular toxicity

Overview

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed. In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as Intralipid [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion. Further advice on ongoing treatment should be obtained from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.orgor can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity – Accompanying notes.

ANAESTHETICS, LOCAL

Adrenaline with articaine hydrochloride

19-Dec-2019

(Carticaine hydrochloride with epinephrine)

• INDICATIONS AND DOSE

Infiltration anaesthesia in dentistry

- ► BY REGIONAL ADMINISTRATION
- ► Adult: Consult expert dental sources

DOSES AT EXTREMES OF BODY-WEIGHT

 To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

 CONTRA-INDICATIONS Injection into infected tissues injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block

CONTRA-INDICATIONS, FURTHER INFORMATION

- Injection site Manufacturer advises the local anaesthetic effect may be reduced when injected into an inflamed or infected area, due to altered local pH. Increased absorption into the blood also increases the possibility of systemic side-effects.
- CAUTIONS Arrhythmias · arteriosclerosis · cardiovascular disease · cerebrovascular disease · cor pulmonale · debilitated patients (consider dose reduction) · diabetes mellitus · elderly (consider dose reduction) · epilepsy · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · hypovolaemia · impaired cardiac conduction · impaired respiratory function · ischaemic heart disease · myasthenia gravis · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders ·

 $psychoneurosis \cdot severe\ angina \cdot shock \cdot susceptibility\ to\ angle-closure\ glaucoma$

CAUTIONS, FURTHER INFORMATION

- Use of vasoconstrictors In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.
- INTERACTIONS → Appendix 1: articaine · sympathomimetics, vasoconstrictor
- SIDE-EFFECTS Face oedema gingivitis headache nausea sensation abnormal

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The toxicity mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

• ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Use only if potential benefit outweighs risk no information available.
- BREAST FEEDING Avoid breast-feeding for 48 hours after administration.
- HEPATIC IMPAIRMENT Manufacturer advises caution (increased risk of toxicity in severe impairment).
- RENAL IMPAIRMENT Manufacturers advise use with caution in severe impairment.
- MONITORING REQUIREMENTS Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfites

► Septanest (Septodont Ltd)

Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 ml, Articaine hydrochloride 40 mg per 1 ml Septanest 1 in 100,000 solution for injection cartridges | 50 cartridge PoM £24.95 (Hospital only)

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Articaine hydrochloride 40 mg per 1 ml Septanest 1 in 200,000 solution for injection cartridges | 50 cartridge PoM £24.95 (Hospital only)

Bupivacaine hydrochloride

09-Dec-2019

• INDICATIONS AND DOSE

Surgical anaesthesia, lumbar epidural block

- ► BY REGIONAL ADMINISTRATION
- Adult: 75–150 mg, dose administered using a 5 mg/mL (0.5%) solution

Surgical anaesthesia, field block

- ► BY REGIONAL ADMINISTRATION
- Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, thoracic epidural block

- **▶** BY THORACIC EPIDURAL
- Adult: 12.5-50 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, caudal epidural block

- ► BY REGIONAL ADMINISTRATION
- Adult: 50-150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, major nerve block

- ► BY REGIONAL ADMINISTRATION
- Adult: 50–175 mg, dose administered using 5 mg/mL (0.5%) solution

Acute pain, intra-articular block

- ► BY INTRA-ARTICULAR INJECTION
- Adult: Up to 100 mg, dose administered using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivacaine by another route, total max. 150 mg

Acute pain, thoracic epidural block

- ► BY CONTINUOUS EPIDURAL INFUSION
- Adult: 6.3–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute pain, labour

- ► BY CONTINUOUS EPIDURAL INFUSION
- Adult: 6.25–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

Acute pain, lumbar epidural block

- ► INITIALLY BY LUMBAR EPIDURAL
- Adult: 15–37.5 mg, then (by lumbar epidural) 15–37.5 mg, repeated when required at intervals of at least 30 minutes, dose administered by intermittent injection using a 2.5 mg/mL (0.25%) solution, alternatively (by continuous epidural infusion) 12.5–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute pain, field block

- ► BY REGIONAL ADMINISTRATION
- Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

DOSES AT EXTREMES OF BODY-WEIGHT

 To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

MARCAIN HEAVY®

Intrathecal anaesthesia for surgery

- ► BY INTRATHECAL INJECTION
- ▶ Adult: 10-20 mg

IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS Avoid injection into infected tissues

 avoid injection into inflamed tissues • intravenous regional anaesthesia (Bier's block) • preparations containing preservatives should not be used for caudal, epidural, or spinal block

CONTRA-INDICATIONS, FURTHER INFORMATION

- Injection site Manufacturer advises local anaesthetics should not be injected into inflamed or infected tissues.
 Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- CAUTIONS Cardiovascular disease · cerebral atheroma · complete heart block · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy ·

hypertension · hypotension · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · myocardial depression may be more severe and more resistant to treatment · shock

- INTERACTIONS → Appendix 1: anaesthetics, local
- SIDE-EFFECTS
- ► Common or very common Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · urinary retention · vomiting
- ► Uncommon Neurotoxicity
- ▶ Rare or very rare Arachnoiditis · cardiac arrest · diplopia · nerve disorders · paraplegia · paresis · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.
 Dose adjustments Use lower doses for intrathecal use

during late pregnancy.

- BREAST FEEDING Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in advanced liver dysfunction.
- RENAL IMPAIRMENT Use with caution in severe impairment.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

Chloroprocaine hydrochloride

07-Nov-2021

 DRUG ACTION Chloroprocaine is an ester-type local anaesthetic that blocks the generation and conduction of nerve impulses.

INDICATIONS AND DOSE

Spinal anaesthesia for surgical procedures lasting 40 minutes or less (using 10 mg/ml solution) (specialist use only)

- ► BY SLOW INTRATHECAL INJECTION
- Adult: 40-50 mg (max. per dose 50 mg), dose depends on desired length of block

Surgical anaesthesia for procedures lasting 60 minutes or less, peripheral nerve block (using 20 mg/ml solution) (specialist use only)

► BY REGIONAL ADMINISTRATION

19-Dec-2019

Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

• CONTRA-INDICATIONS Avoid injection into infected tissues • avoid injection into inflamed tissues • hypovolaemia • impaired cardiac conduction • intravenous regional anaesthesia (Bier's block) • severe anaemia

CONTRA-INDICATIONS, FURTHER INFORMATION

- Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- CAUTIONS Acute porphyrias p. 1150 · cardiovascular disease · complete heart block · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · low plasma-cholinesterase activity (including severe liver disease) · neurological disorders · neuromuscular disorders · partial heart block
- INTERACTIONS → Appendix 1: chloroprocaine
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Anxiety · dizziness · hypotension · nausea · vomiting
- Uncommon Arrhythmias · hearing impairment · hypertension · loss of consciousness · neurotoxicity · oral disorders · seizure · speech disorder · tinnitus · tremor · vision disorders
- Rare or very rare Cardiac arrest · drowsiness · faecal incontinence · myocardial contractility decreased · nerve disorders · neurological injury · perineal numbness · sexual dysfunction · urinary incontinence

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intrathecal use Sensation abnormal
- When used by regional administration Anaesthetic complication • paraesthesia
- ▶ Uncommon
- ▶ With intrathecal use Headache pain
- ► Rare or very rare
- With intrathecal use Motor dysfunction · respiratory disorders · spinal block
- When used by regional administration Dyspnoea · respiratory arrest

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

- ALLERGY AND CROSS-SENSITIVITY
- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local

anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Crosssensitivity reactions may be avoided by using the alternative chemical type.

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk (limited information available); this does not preclude use at term for obstetrical anaesthesia.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.
- RENAL IMPAIRMENT Manufacturer advises use with
 caution
- HANDLING AND STORAGE Manufacturer advises protect from light.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Chloroprocaine hydrochloride (Ampres®) for spinal anaesthesia in adults where the planned surgical procedure should not exceed 40 minutes (October 2021) SMC No. SMC2373 Recommended with restrictions

Levobupivacaine

08-Sep-2020

• INDICATIONS AND DOSE

Acute postoperative pain

- ► BY CONTINUOUS EPIDURAL INFUSION
- Adult: 12.5–18.75 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute labour pain

- ► BY LUMBAR EPIDURAL
- Adult: 15–25 mg, repeated at intervals of at least 15 minutes, dose administered using a 2.5 mg/mL (0.25%) solution; maximum 400 mg per day
- **▶** BY CONTINUOUS EPIDURAL INFUSION
- Adult: 5-12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

Surgical anaesthesia, peripheral nerve block

- ► BY REGIONAL ADMINISTRATION
- Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, peribulbular nerve block

- ► BY REGIONAL ADMINISTRATION
- Adult: 37.5-112.5 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia for caesarean section

► BY LUMBAR EPIDURAL

 Adult: 75-150 mg, to be given over 15 -20 minutes, dose administered using a 5 mg/mL (0.5%) solution

Surgical anaesthesia

- ► BY LUMBAR EPIDURAL
- Adult: 50-150 mg, to be given over 5 minutes, dose administered using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution

- ► BY INTRATHECAL INJECTION
- Adult: 15 mg, dose administered using a 5 mg/mL (0.5%) solution
- ► BY LOCAL INFILTRATION
- Adult: 2.5-150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

DOSES AT EXTREMES OF BODY-WEIGHT

 To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS Avoid injection into infected tissues

 avoid injection into inflamed tissues · intravenous
 regional anaesthesia (Bier's block) · preparations
 containing preservatives should not be used for caudal,
 epidural, or spinal block

CONTRA-INDICATIONS, FURTHER INFORMATION

- Injection site Manufacturer advises local anaesthetics should not be injected into inflamed or infected tissues.
 Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- CAUTIONS Cardiovascular disease · complete heart block · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock
- INTERACTIONS → Appendix 1: anaesthetics, local

SIDE-EFFECTS

- ► Common or very common Anaemia · back pain · dizziness · fever · headache · hypotension · nausea · procedural pain · vomiting
- ► Frequency not known Angioedema · apnoea · arrhythmias · asthenia · atrioventricular block · bladder disorder · cardiac arrest · drowsiness · eye disorders · faecal incontinence · flushing · loss of consciousness · muscle twitching · muscle weakness · nerve disorders · neurological injury · oral hypoaesthesia · paralysis · priapism · respiratory disorders · seizure · sensation abnormal · skin reactions · sneezing · sweat changes · syncope · vision blurred

SIDE-EFFECTS, FURTHER INFORMATION The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. Systemic toxicity can occur due to inadvertent intravascular injection. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid if possible in the first trimester—toxicity in animal studies. May cause fetal distress syndrome. Do not use for paracervical block in obstetrics. Do not use 7.5 mg/mL strength in obstetrics.

- BREAST FEEDING. Amount too small to be harmful.
- HEPATIC IMPAIRMENT Manufacturer advises caution in impairment or patients with reduced hepatic blood flow (no information available).
- PRESCRIBING AND DISPENSING INFORMATION Levobupivacaine is an isomer of bupivacaine.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Levobupivacaine (Non-proprietary)

Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml Levobupivacaine 25mg/10ml solution for injection ampoules 5 ampoule PoM £9.45-£10.30 (Hospital only)

Levobupivacaine (as Levobupivacaine hydrochloride) 5 mg per 1 ml Levobupivacaine 50mg/10ml solution for injection ampoules | 5 ampoule PoM £11.85-£16.15 (Hospital only)

Levobupivacaine (as Levobupivacaine hydrochloride) 7.5 mg per 1 ml Levobupivacaine 75mg/10ml solution for injection ampoules | 5 ampoule PoM £16.20-£17.70 (Hospital only)

► Chirocaine (AbbVie Ltd)

Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml Chirocaine 25mg/10ml solution for injection ampoules 10 ampoule PoM £14.11 (Hospital only)

Levobupivacaine (as Levobupivacaine hydrochloride) 5 mg per 1 ml Chirocaine 50mg/10ml solution for injection ampoules 10 ampoule PoM £16.15 (Hospital only)

Levobupivacaine (as Levobupivacaine hydrochloride) 7.5 mg per 1 ml Chirocaine 75mg/10ml solution for injection ampoules 10 ampoule PoM £24.23 (Hospital only)

► Levobupivacaine (Non-proprietary)

Levobupiyacaine (as Levobupiyacaine hydrochloride).625 mg per 1 ml Levobupivacaine 62.5mg/100ml infusion bags | 5 bag PoM £45.15 (Hospital only)

Levobupivacaine 125mg/200ml infusion bags | 5 bag PoM £68.80 (Hospital only)

Levobupivacaine (as Levobupivacaine hydrochloride) 1.25 mg per 1 ml Levobupivacaine 125mg/100ml infusion bags | 5 bag PoM £50.55-£174.22 (Hospital only)

Levobupivacaine 250mg/200ml infusion bags | 12 bag Pom £145.18 (Hospital only)

► Chirocaine (AbbVie Ltd)

Levobupivacaine (as Levobupivacaine hydrochloride) 1.25 mg per 1 ml Chirocaine 125mg/100ml infusion bags | 24 bag PoM £174.22 (Hospital only)

Chirocaine 250mg/200ml infusion bags | 12 bag PoM £124.44 (Hospital only)

Lidocaine hydrochloride

10-Nov-2020

(Lignocaine hydrochloride)

INDICATIONS AND DOSE Infiltration anaesthesia

- ► BY LOCAL INFILTRATION
- Adult: Dose to be given according to patient's weight and nature of procedure; max. 200 mg, maximum dose 500 mg if given in solutions containing adrenaline

DOSES AT EXTREMES OF BODY-WEIGHT

▶ When used by local infiltration To avoid excessive dosage in obese patients, weight-based doses for non-emergency indications may need to be calculated on the basis of ideal body-weight.

Intravenous regional anaesthesia and nerve block

- ► BY REGIONAL ADMINISTRATION
- Adult: Seek expert advice

Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis) Lubricant in cystoscopy | Lubricant in proctoscopy

- ► TO THE SKIN USING OINTMENT
- ▶ Adult: Apply 1-2 mL as required, avoid long-term use

Sore nipples from breast-feeding

- ► TO THE SKIN USING OINTMENT
- Adult: Apply using gauze and wash off immediately before next feed

Anaesthesia before venous cannulation or venepuncture

- ► Child 1-2 months: Apply up to 1 g, apply thick layer to small area (2.5 cm \times 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes
- Child 3-11 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
- Child 1-17 years: Apply 1–2.5 g, apply thick layer to small area (2.5 cm \times 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes
- ▶ Adult: Apply 1–2.5 g, apply thick layer to small area $(2.5 \, \text{cm} \times 2.5 \, \text{cm})$ of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

VERSATIS ®

Postherpetic neuralgia ► TO THE SKIN

Adult: Apply once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks, to be applied to intact, dry, non-hairy, non-irritated skin, up to 3 plasters may be used to cover large areas; plasters may be cut

During delivery in obstetrics

► TO THE SKIN

Adult: Up to 20 doses

IMPORTANT SAFFTY INFORMATION

When used by local infiltration

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS

- When used by regional administration Avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block)
- With topical use Application to the middle ear (can cause ototoxicity) · should not be applied to damaged skin CONTRA-INDICATIONS, FURTHER INFORMATION
- With topical use or when used by regional administration Manufacturer advises local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects,

and the local anaesthetic effect may also be reduced by altered local pH.

CAUTIONS

- When used by regional administration Acute porphyrias p. 1150 (consider infusion with glucose for its antiporphyrinogenic effects) · congestive cardiac failure (consider lower dose) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · post cardiac surgery (consider lower dose) · shock
- INTERACTIONS → Appendix 1: antiarrhythmics
- ▶ With parenteral use Anxiety arrhythmias atrioventricular block · cardiac arrest · circulatory collapse · confusion · dizziness · drowsiness · euphoric mood · headache · hypotension (may lead to cardiac arrest) · loss of consciousness · methaemoglobinaemia · muscle twitching · myocardial contractility decreased · nausea · neurological effects · nystagmus · pain · psychosis · respiratory disorders · seizure · sensation abnormal · temperature sensation altered · tinnitus · tremor · vision blurred · vomiting SIDE-EFFECTS, FURTHER INFORMATION Toxic effects The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

Methaemoglobinaemia Methylthioninium chloride is licensed for the acute symptomatic treatment of druginduced methaemoglobinaemia.

- ALLERGY AND CROSS-SENSITIVITY
- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.
- BREAST FEEDING Present in milk but amount too small to he harmful
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure).
- RENAL IMPAIRMENT Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- MONITORING REQUIREMENTS
- ▶ With systemic use Monitor ECG and have resuscitation facilities available.
- NATIONAL FUNDING/ACCESS DECISIONS

VERSATIS [®] For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ► Lidocaine hydrochloride (Versatis®) for the treatment of neuropathic pain associated with previous herpes zoster infection (post-herpetic neuralgia, PHN) (August 2008) SMC No. 334/06 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, ointment

Solution for injection

Lidocaine hydrochloride (Non-proprietary)

Lidocaine hydrochloride 5 mg per 1 ml Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule PoM £10.00 DT

Lidocaine hydrochloride 10 mg per 1 ml Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule PoM £13.80 | 100 ampoule PoM £61.26

Lidocaine 100mg/10ml (1%) solution for injection ampoules 10 ampoule [PoM] £5.00-£6.55 DT = £5.00 | 20 ampoule [PoM] £192.20 (Hospital only)

Lidocaine 200mg/20ml (1%) solution for injection vials | 10 vial PoM £22.00-£26.40 DT = £26.40

Lidocaine 200mg/20ml (1%) solution for injection ampoules 1 ampoule PoM £20.97 (Hospital only) | 10 ampoule PoM £10.00-£14.00 DT = £14.00 | 20 ampoule PoM £419.40 (Hospital only) Lidocaine 50mg/5ml (1%) solution for injection ampoules 1 ampoule PoM £6.55 (Hospital only) | 10 ampoule PoM £3.00-£4.00 DT = £3.00 | 20 ampoule PoM £131.00 (Hospital only) Lidocaine 200mg/20ml (1%) solution for injection Mini-Plasco ampoules | 100 ampoule Pom 🖫

Lidocaine 20mg/2ml (1%) solution for injection ampoules 10 ampoule PoM £3.50 DT = £2.50

Lidocaine 50mg/5ml (1%) solution for injection Mini-Plasco ampoules 20 ampoule PoM £8.05

Medicated plaster

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol

Versatis (Grunenthal Ltd)

Lidocaine 50 mg per 1 gram Versatis 700mg medicated plasters 30 plaster PoM £72.40 DT = £72.40

Cream

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

 LMX 4 (Ferndale Pharmaceuticals Ltd) Lidocaine 40 mg per 1 gram LMX 4 cream | 5 gram P £2.98 DT = £2.98 | 30 gram P £14.90 DT = £14.90

Ointment

Lidocaine hydrochloride (Non-proprietary)

Lidocaine hydrochloride 50 mg per 1 gram Lidocaine 5% ointment 15 gram P £9.00 DT = £8.28

Spray

 Xylocaine 10mg/dose spray (Aspen Pharma Trading Ltd) Lidocaine 10 mg per 1 actuation | 50 ml P £6.29 DT = £6.29

Lidocaine with adrenaline

19-Dec-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1466, adrenaline/epinephrine p. 241.

INDICATIONS AND DOSE

Local anaesthesia

- ► BY LOCAL INFILTRATION
- Adult: Dosed according to the type of nerve block required (consult product literature)
- INTERACTIONS → Appendix 1: antiarrhythmics sympathomimetics, vasoconstrictor
- PROFESSION SPECIFIC INFORMATION

Dental information A variety of lidocaine injections with adrenaline is available in dental cartridges.

Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

EXCIPIENTS: May contain Sulfites

► Lignospan Special (Septodont Ltd)

Lignospan Special 20mg/ml / 12.5micrograms/ml solution for injection 1.8ml cartridges | 50 cartridge PoM £21.95 DT = £21.95

Rexocaine (Henry Schein Ltd)

Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Rexocaine 2% injection 2.2ml cartridges | 50 cartridge | PoM | £23.29 DT = £21.95

➤ Xylocaine with Adrenaline (Aspen Pharma Trading Ltd)
Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml,
Lidocaine hydrochloride 10 mg per 1 ml Xylocaine 1% with
Adrenaline 100micrograms/20ml (1 in 200,000) solution for injection
vials | 5 vial PoM | 59.66 DT = £9.66

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Xylocaine 2% with Adrenaline 100micrograms/20ml (1 in 200,000) solution for injection vials | 5 vial [PoM] £8.85 DT = £8.85 (Hospital only)

Lidocaine with cetrimide

27-Anr-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1466.

INDICATIONS AND DOSE

Anaesthesia and disinfection in dental practice

- ► TO MUCOUS MEMBRANES USING OROMUCOSAL SPRAY
- Adult: 10-20 mg, no more than 30 mg should be applied to the same quadrant of the buccal cavity consult product literature, dose expressed as lidocaine

Anaesthesia in dental practice

- ► TO MUCOUS MEMBRANES USING DENTAL GEL
- Adult: Apply 100-500 mg, use cotton pellet for application to dried mucosa, dose expressed as weight of gel

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 metered dose of Xylonor[®] spray is equivalent to 10 mg of lidocaine.
- ► 2 millimetres of *Xylonor*® gel is approximately equivalent to 100 mg of gel (approximately equivalent to 5 mg of lidocaine).
- CAUTIONS Sepsis (risk of rapid systemic absorption) traumatised mucosa (risk of rapid systemic absorption)
- INTERACTIONS → Appendix 1: antiarrhythmics
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oromucosal gel

➤ Xylonor (Septodont Ltd)

Cetrimide 1.5 mg per 1 gram, Lidocaine 50 mg per 1 gram Xylonor 50mg/g / 1.5mg/g gel sugar-free | 15 gram PoM £4.00

Spray

Xylonor (Septodont Ltd)

Cetrimide 100 microgram per 1 gram, Lidocaine 10 mg per 1 gram Xylonor 150mg/g / 1.5mg/g oromucosal spray sugar-free | 36 gram PoM £20.15

Lidocaine with phenylephrine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1466, phenylephrine hydrochloride p. 205.

INDICATIONS AND DOSE

Anaesthesia before nasal surgery, endoscopy, larvngoscopy, or removal of foreign bodies from the nose

- ► BY INTRANASAL ADMINISTRATION
- Adult: Up to 8 sprays
- INTERACTIONS → Appendix 1: antiarrhythmics · sympathomimetics, vasoconstrictor
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Sprav

➤ Lidocaine with phenylephrine (Non-proprietary)
Phenylephrine hydrochloride 5 mg per 1 ml, Lidocaine
hydrochloride 50 mg per 1 ml Lidocaine 5% / Phenylephrine 0.5%
nasal spray | 2.5 ml [PoM] £16.39 DT = £16.39

Lidocaine with prilocaine

10-Nov-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1466, prilocaine hydrochloride p. 1470.

INDICATIONS AND DOSE

Anaesthesia before minor skin procedures including venepuncture

- ► TO THE SKIN
- Child 1-2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day
- Child 3-11 months: Apply up to 2 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- Child 1-11 years: Apply 1-5 hours before procedure, a
 thick layer should be applied under occlusive dressing,
 shorter application time of 15-30 minutes is
 recommended for children with atopic dermatitis
 (30 minutes before removal of mollusca); maximum
 2 doses per day
- Child 12-17 years: Apply 1-5 hours before procedure (2-5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)
- Adult: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing

Anaesthesia on genital skin before injection of local anaesthetics

- ► TO THE SKIN
- Adult: Apply under occlusive dressing for 15 minutes (males) or 60 minutes (females) before procedure

Anaesthesia before surgical treatment of lesions on genital mucosa

- ► TO THE SKIN
- Adult: Apply up to 10 g, to be applied 5–10 minutes before procedure

Anaesthesia before cervical curettage

- ► TO THE SKIN
- Adult: Apply 10 g in lateral vaginal fornices for 10 minutes

Anaesthesia before mechanical cleansing or debridement of leg ulcer

- ► TO THE SKIN
- Adult: Apply up to 10 g for 30-60 minutes, to be applied under occlusive dressing

FORTACIN®

Primary premature ejaculation

- ► TO THE SKIN
- Adult: 3 sprays every 4 hours as required, to be applied to cover the glans penis (excess spray should be removed after 5 minutes and before intercourse); maximum 9 sprays per day

DOSE EQUIVALENCE AND CONVERSION

- ► For Fortacin[®]: each dose of 3 sprays is equivalent to lidocaine 22.5 mg and prilocaine 7.5 mg.
- CONTRA-INDICATIONS Use in child less than 37 weeks corrected gestational age
- CAUTIONS

- INTERACTIONS → Appendix 1: anaesthetics, local antiarrhythmics
- SIDE-EFFECTS
- ► Common or very common Sexual dysfunction (in adults)
- ► Uncommon Fever (in adults) headache (in adults) penis disorder (in adults)
- Rare or very rare Methaemoglobinaemia · skin reactions SIDE-EFFECTS, FURTHER INFORMATION When applied to the glans penis, side-effects for sexual partners should be considered. Side-effects reported in female partners include vaginal candidiasis and dysuria.

CONCEPTION AND CONTRACEPTION

FORTACIN Deterioration of polyurethane-based female and male condoms has been observed. Manufacturer advises avoid in patients planning to conceive, or if it is essential to achieve penetration, then the glans penis should be washed thoroughly 5 minutes after application but before intercourse.

PREGNANCY

FORTACIN Manufacturer advises preferably avoid unless an effective male barrier contraceptive is used—limited information available.

• HEPATIC IMPAIRMENT

FORTACIN [®] Manufacturer advises caution in severe impairment (no information available).

• DIRECTIONS FOR ADMINISTRATION

FORTACIN Manufacturer advises when using the spray for the first time, shake and prime the unit with 3 sprays, and before each subsequent use, shake and prime the unit with 1 spray.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: EMLA cream for local anaesthesia www.medicinesforchildren.org.uk/medicines/emla-cream-for-local-anaesthesia/

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Cream

- ► Denela (Teva UK Ltd)
 - Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram Denela 5% cream | 5 gram P £3.29 | 25 gram P £12.99 | 30 gram P £14.75 DT = £12.30
- ► Emla (Aspen Pharma Trading Ltd)

Lidocaine 25 mg per 1 gram. Prilocaine 25 mg per 1 gram. Emla 5% cream | 5 gram. P. £2.25-£2.99 | 25 gram. P. £11.70 | 30 gram. P. £12.30 DT = £12.30

Nulbia (Glenmark Pharmaceuticals Europe Ltd)

Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram Nulbia 5% cream | 5 gram P £1.58 | 25 gram P £7.88 | 30 gram P £8.61 DT = £12.30

Cutaneous spray solution

► Fortacin (Recordati Pharmaceuticals Ltd)

Prilocaine 50 mg per 1 ml, Lidocaine 150 mg per 1 ml Fortacin 150mg/ml / 50mg/ml cutaneous spray | 5 ml PoM £59.99 DT = £59.99

Mepivacaine hydrochloride

04-Dec-2019

INDICATIONS AND DOSE

Infiltration anaesthesia and nerve block in dentistry

- Child 3-17 years: Consult expert dental sources
- ► Adult: Consult expert dental sources

 DOSES AT EXTREMES OF BODY-WEIGHT
- ► To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- CONTRA-INDICATIONS Avoid injection into infected tissues
 avoid injection into inflamed tissues intravenous
 regional anaesthesia (Bier's block) preparations
 containing preservatives should not be used for caudal,
 epidural, or spinal block severe atrio-ventricular
 conduction disorders not controlled by a pacemaker
 CONTRA-INDICATIONS, FURTHER INFORMATION
- Injection site Manufacturer advises the local anaesthetic effect may be reduced when injected into an inflamed or infected area, due to altered local pH. Increased absorption into the blood also increases the possibility of systemic side-effects.
- CAUTIONS Cardiovascular disease · children (consider dose reduction) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock
- INTERACTIONS → Appendix 1: anaesthetics, local
- SIDE-EFFECTS
- ► Common or very common Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · vomiting
- ► Uncommon Neurotoxicity
- Rare or very rare Arachnoiditis · cardiac arrest · diplopia · nerve disorders · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be

unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

- ALLERGY AND CROSS-SENSITIVITY
- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bujuacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Use with caution in early pregnancy.
- BREAST FEEDING Use with caution.
- HEPATIC IMPAIRMENT Manufacturer advises caution; increased risk of toxic plasma concentrations in severe impairment.
- RENAL IMPAIRMENT Use with caution; increased risk of side-effects.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Scandonest plain (Septodont Ltd)

Mepivacaine hydrochloride 30 mg per 1 ml Scandonest plain 3% solution for injection 2.2ml cartridges | 50 cartridge | PoM £21.95

Mepivacaine with adrenaline 19-Dec-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride p. 1469, adrenaline/epinephrine p. 241.

INDICATIONS AND DOSE

Infiltration anaesthesia and nerve block in dentistry

- ► BY LOCAL INFILTRATION
- ▶ Adult: (consult product literature)
- INTERACTIONS → Appendix 1: anaesthetics, local sympathomimetics, vasoconstrictor
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfites

Scandonest special (Septodont Ltd)

Adrenaline 10 microgram per 1 ml, Mepivacaine hydrochloride 20 mg per 1 ml Scandonest special 2% solution for injection 2.2ml cartridges | 50 cartridge Pom £21.95

Prilocaine hydrochloride

12-Nov-2020

• INDICATIONS AND DOSE

CITANEST 1% ®

Infiltration anaesthesia | Nerve block

- ► BY REGIONAL ADMINISTRATION
- Adult: 100-200 mg/minute, alternatively may be given in incremental doses; dose adjusted according to site of administration and response, and in elderly and debilitated patients (smaller doses may be required); maximum 400 mg per course

PRILOTEKAL ®

Spinal anaesthesia

- ▶ BY INTRATHECAL INJECTION
- Adult: Usual dose 40-60 mg (max. per dose 80 mg), dose may need to be reduced in elderly or debilitated patients, or in late pregnancy

DOSES AT EXTREMES OF BODY-WEIGHT

 To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acquired methaemoglobinaemia - anaemia - avoid injection into infected tissues - avoid injection into inflamed tissues - congenital methaemoglobinaemia - preparations containing preservatives should not be used for caudal, epidural, or spinal block

SPECIFIC CONTRA-INDICATIONS

- With intrathecal use Serious cardiac conduction disorders CONTRA-INDICATIONS, FURTHER INFORMATION
 - Injection site Manufacturer advises local anaesthetics should not be injected into inflamed or infected tissues.
 Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- CAUTIONS Cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · severe or untreated hypertension · shock
- INTERACTIONS → Appendix 1: anaesthetics, local
- SIDE-EFFECTS
- ► Common or very common Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · vomiting
- ► Uncommon Neurotoxicity
- Rare or very rare Cardiac arrest · methaemoglobinaemia · nerve disorders
- ► Frequency not known Diplopia · respiratory depression SIDE-EFFECTS, FURTHER INFORMATION Toxic effects
 Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

Methaemoglobinaemia Methaemoglobinaemia can be treated with an intravenous injection of methylthioninium chloride

ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinaemia reported).
 - **Dose adjustments** Use lower doses for intrathecal use during late pregnancy.
- BREAST FEEDING Present in milk but not known to be harmful

- HEPATIC IMPAIRMENT Manufacturer advises caution.
 Dose adjustments With intrathecal use Manufacturer advises consider dose reduction.
- RENAL IMPAIRMENT Use with caution.
 Dose adjustments Lower doses may be required for intrathecal anaesthesia.
- NATIONAL FUNDING/ACCESS DECISIONS

• INDICATIONS AND DOSE

Acute pain, peripheral nerve block

- ► BY REGIONAL ADMINISTRATION
- Adult: 10-20 mg/hour, dose administered as a continuous infusion or by intermittent injection using a 2 mg/mL (0.2%) solution

Acute pain, field block

- ► BY REGIONAL ADMINISTRATION
- Adult: 2-200 mg, dose administered using a 2 mg/mL (0.2%) solution

Acute pain, lumbar epidural block

- ► BY LUMBAR EPIDURAL
- Adult: 20–40 mg, followed by 20–30 mg at least every 30 minutes, dose administered using a 2 mg/mL (0.2%) solution

Acute labour pain

- ► BY CONTINUOUS EPIDURAL INFUSION
- Adult: 12-20 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Acute postoperative pain

- ► BY CONTINUOUS EPIDURAL INFUSION
- Adult: Up to 28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Postoperative pain, thoracic epidural block

- ► BY CONTINUOUS EPIDURAL INFUSION
- Adult: 12-28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Surgical anaesthesia, field block

- ► BY REGIONAL ADMINISTRATION
 - Adult: 7.5–225 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, major nerve block (brachial plexus block)

- ► BY REGIONAL ADMINISTRATION
- Adult: 225–300 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, thoracic epidural block (to establish block for postoperative pain)

- ► BY THORACIC EPIDURAL
- Adult: 38–113 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia for caesarean section

- ► BY LUMBAR EPIDURAL
 - Adult: 113–150 mg, to be administered in incremental doses using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, lumbar epidural block

- ► BY LUMBAR EPIDURAL
- Adult: 113–200 mg, dose administered using a 7.5 mg/mL (0.75%) or 10 mg/mL (1%) solution

DOSES AT EXTREMES OF BODY-WEIGHT

 To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

Poisoning, emergency treatment

11-Jan-2022

Overview

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either **TOXBASE** or the **UK National Poisons Information Service** be consulted when there is doubt about the degree of risk or about management.

Hospital admission

Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin p. 133, iron, paracetamol p. 477, tricyclic antidepressants, and cophenotrope (diphenoxylate with atropine, Lomotil®) p. 68; the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number: Tel: 0344 892 0111.

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours).

Storage of specialist antidotes

Due to the risk of unintended administration, NHS England advises emergency departments and pharmacies to ensure that 'specialist antidotes' are stored either in automatic dispensing cabinets/systems, or in a separate area specifically designated for antidotes. Those requiring refrigeration should be separated from other medicines in the medication fridge and clearly identified as antidotes. If 'specialist antidotes' are kept in the emergency/out-of-hours

medicine cupboards, they should be separated from other medicines and clearly identified as antidotes.

'Specialist antidotes' are defined as those on the Royal College of Emergency Medicine/ UK National Poisons Information Service list (available at www.npis.org/ Publications.html) and only used in emergency departments as a specific antidote.

General care

It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Blood pressure

Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal

tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 1131 or a colloid. Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amfetamines, phencyclidine, and cocaine.

Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

Body temperature

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require **urgent** hospitalisation for assessment and supportive treatment.

Convulsions during poisoning

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 369 or diazepam p. 375 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 371 [unlicensed use in adults and children under 3 months] can be given by the buccal route or diazepam p. 375 can be administered as a rectal solution.

Methaemoglobinaemia

Drug- or chemical-induced methaemoglobinaemia should be treated with methylthioninium chloride p. 1486 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthioninium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylthioninium chloride can itself cause methaemoglobinaemia.

Poison removal and elimination

Prevention of absorption

Given by mouth, charcoal, activated p. 1481 can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The **sooner** it is given the **more effective** it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

Active elimination techniques

Repeated doses of charcoal, activated by mouth *enhance the elimination* of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Ouinine
- Theophylline

If vomiting occurs after dosing it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should **not** be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- · alkalinisation of the urine for salicylates.

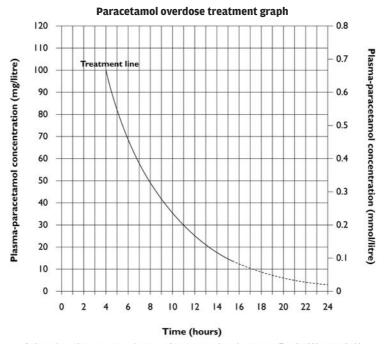

Removal from the gastro-intestinal tract

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of emesis (e.g. with ipecacuanha) is not recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract ('body-packing'). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

Alcohol, acute intoxication

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

Patients whose plasma-paracetamol concentrations are on or above the treatment line should be treated with acetylcysteine by intravenous infusion

The prognostic accuracy after 15 hours is uncertain, but a plasma-paracetamol concentration on or above the treatment line should be regarded as carrying a serious risk of liver damage.

Graph reproduced courtesy of Medicines and Healthcare products Regulatory Agency

Aspirin poisoning

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly. and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5-8.5).

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis

Opioid poisoning

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 1484 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone.

Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required. Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate p. 1128 or magnesium sulfate p. 1142, or both. Arrhythmias may occur for up to 12 hours.

Paracetamol poisoning

In all cases of intravenous paracetamol poisoning clinicians are encouraged to contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol p. 477 may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the early features of poisoning, usually settle within 24 hours. The recurrence of nausea and vomiting after 2–3 days, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol p. 477 overdose and may lead to liver failure, encephalopathy, coma, and death.

The following guidance provides only an overview of the management of paracetamol overdosage from the *National Poisons Information Service TOXBASE* database.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese patients who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 1485 prevents or reduces the severity of liver damage if given up to, and possibly beyond (in patients at risk of severe liver disease) 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of paracetamol ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth [unlicensed] is an alternative if intravenous access is not possible (for further information, see Acetylcysteine—oral doses, available from TOXBASE).

Acute overdose

Acute overdose involves ingestion of a potentially toxic dose of paracetamol in 1 hour or less.

For adults and children aged 6 years and over, serious toxicity is unlikely to occur from a single ingestion of less than 75 mg/kg of paracetamol taken in less than 1 hour. Refer patients to hospital for medical assessment if they meet any of the following criteria:

- · have ingested paracetamol in the context of self-harm,
- · are symptomatic,
- have ingested 75 mg/kg or more of paracetamol in 1 hour or less, or
- where the time of ingestion is uncertain but the dose ingested is 75 mg/kg or more.

For **children aged under 6 years**, serious toxicity is unlikely to occur from a single ingestion of less than 150 mg/kg of paracetamol taken in less than 1 hour. Refer children to hospital for medical assessment if they meet any of the following criteria:

- · are symptomatic,
- have ingested 150 mg/kg or more of paracetamol in 1 hour or less, or
- where there is uncertainty about the dose ingested or circumstance of ingestion.

Although the benefit of gastric decontamination is uncertain, charcoal, activated p. 1481 should be considered if the patient presents within 1 hour of ingesting paracetamol in excess of 150 mg/kg.

Patients at risk of liver damage and therefore requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples cannot be interpreted. The concentration is plotted on a paracetamol treatment graph, with a reference line ('treatment line') joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours, see *Paracetamol overdose treatment graph*.

Acetylcysteine treatment should commence in patients:

- whose plasma-paracetamol concentration falls on or above the treatment line on the paracetamol treatment graph;
- who present within 8 hours of ingestion of more than 150 mg/kg of paracetamol if there is going to be a delay of 8 hours or more in obtaining the paracetamol concentration after the overdose;

- who present 8–24 hours after ingestion of an acute overdose of more than 150 mg/kg of paracetamol even if the plasma-paracetamol concentration is not yet available;
- who present more than 24 hours after ingestion of an overdose if they are clearly jaundiced or have hepatic tenderness, their ALT is above the upper limit of normal (patients with chronically elevated ALT should be discussed with the National Poisons Information Service), their INR is greater than 1.3 (in the absence of another cause), or the paracetamol concentration is detectable.

Consider acetylcysteine treatment in patients who present within 24 hours of an overdose if biochemical tests suggest acute liver injury, even if the plasma paracetamol concentration is below the treatment line on the paracetamol treatment graph.

If the patient is not at risk of liver toxicity (i.e. the paracetamol concentration is below the treatment line or undetectable; the INR and ALT are normal; and the patient is asymptomatic) no treatment with an antidote is indicated; acetylcysteine may be discontinued if it has been started.

Where the time of ingestion is unknown, patients should be managed as a *staggered overdose*.

Therapeutic excess or staggered overdose

Patients who have ingested more than 150 mg/kg of paracetamol in any 24-hour period are at risk of serious toxicity. Toxicity rarely occurs with paracetamol doses between 75–150 mg/kg in any 24-hour period. Doses consistently less than 75 mg/kg in any 24-hour period are very unlikely to be toxic; however risk may be increased if this dose is repeatedly ingested over 2 or more days. Ingestion of a licensed dose of paracetamol is not considered an overdose.

Therapeutic excess is the ingestion of a potentially toxic dose of paracetamol with intent to treat pain or fever and without self-harm intent during its clinical use. All patients should be referred to hospital for medical assessment if they meet any of the following criteria:

- are symptomatic,
- have ingested more than a licensed dose and more than or equal to 75 mg/kg in any 24-hour period, or
- have ingested more than the licensed dose but less than 75 mg/kg/24 hours on each of the preceding 2 or more days.

Patients with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. For other patients, management is determined by the maximum dose of paracetamol ingested in any 24-hour period.

When there is uncertainty about whether the presentation was due to therapeutic excess, the patient should be managed as a *staggered overdose*.

A **staggered overdose** involves ingestion of a potentially toxic dose of paracetamol over more than 1 hour, with the possible intention of causing self-harm. All patients who have taken a staggered overdose should be referred to hospital for medical assessment. The MHRA advises that all patients who have ingested a staggered overdose should be treated with acetylcysteine without delay.

Clinically significant hepatotoxicity is unlikely and the patient is not considered to be at risk if, there has been at least 4 hours or more since the last paracetamol ingestion, the patient has no symptoms suggesting liver damage, the paracetamol concentration is less than 10 mg/L, their ALT is within the normal range, and their INR is 1.3 or less. Acetylcysteine can be discontinued in patients not considered to be at risk of clinically significant liver damage. If there is uncertainty about a patient's risk of toxicity after paracetamol overdose, advice should be sought from the National Poisons Information Service.

Acetylcysteine dose and administration

For paracetamol overdosage, there are two intravenous acetylcysteine p. 1485 regimens: the standard 21-hour regimen and the modified 12-hour regimen (also known as the Scottish and Newcastle Acetylcysteine Protocol (SNAP)). The SNAP regimen [unlicensed] is not endorsed by the MHRA, and its efficacy with regard to preventing liver toxicity is not fully established in all patterns of paracetamol overdose—it should only be used after discussion with a senior clinician. For further information, see Acetylcysteine SNAP Doses—Adult and Acetylcysteine SNAP Doses—Children, available from TOXBASE.

For the standard 21-hour regimen, acetylcysteine is given in a total dose that is divided into 3 consecutive intravenous infusions over a total of 21 hours. The tables below include the dose of acetylcysteine for adults and children of bodyweight 40 kg and over, in terms of the volume of acetylcysteine Concentrate for Intravenous Infusion required for each of the 3 infusions. The requisite dose of acetylcysteine is added to glucose 5% p. 1132 or sodium chloride 0.9% Intravenous Infusion p. 1131. For information on dosing/administration for adults and children who weigh less than 40 kg, see Acetylcysteine Doses—Children, available from TOXBASE.

First infusion	
Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare first infusion
40-49 kg	34 mL
50-59 kg	42 mL
60-69 kg	49 mL
70-79 kg	57 mL
80-89 kg	64 mL
90-99 kg	72 mL
100-109 kg	79 mL
≥110 kg	83 mL (max. dose)

First infusion (based on an acetylcysteine dose of approx. 150 mg/kg)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 200 mL Glucose 5% or sodium chloride 0.9% Intravenous Infusion; infuse over 1 hour.

Second infus	econd infusion		
Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare second infusion		
40-49 kg	12 mL		
50-59 kg	14 mL		
60-69 kg	17 mL		
70-79 kg	19 mL		
80-89 kg	22 mL		
90-99 kg	24 mL		
100-109 kg	27 mL		
≥110 kg	28 mL (max. dose)		

Second infusion (based on an acetylcysteine dose of approx. 50 mg/kg; start immediately after completion of first infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 500 mL Glucose 5% or sodium chloride 0.9% Intravenous Infusion; infuse over 4 hours.

Third infusion	1
Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare third infusion
40-49 kg	23 mL
50-59 kg	28 mL
60-69 kg	33 mL
70-79 kg	38 mL
80-89 kg	43 mL
90-99 kg	48 mL
100-109 kg	53 mL
≥110 kg	55 mL (max. dose)

Third infusion (based on an acetylcysteine dose of approx. 100 mg/kg; start immediately after completion of second infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 1 litre Glucose 5% or sodium chloride 0.9% Intravenous Infusion; infuse over 16 hours

Antidepressant poisoning

Tricyclic and related antidepressants

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

Selective serotonin re-uptake inhibitors (SSRIs)

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or midazolam oromucosal solution [unlicensed use in adults and children under 3 months] (see Convulsions). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

Antimalarial poisoning

Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include

arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Antipsychotic poisoning

Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 444 or diazepam p. 375 (emulsion preferred).

Second-generation antipsychotic drugs

Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 1481 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

Benzodiazepine poisoning

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 1482 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

Beta-blockers poisoning

Overdosages with beta-blockers may cause cardiac effects such as bradycardia, hypotension, syncope, conduction abnormalities, and heart failure. Bradycardia is the most common arrhythmia, but some beta-blockers may induce ventricular tachyarrhythmias secondary to prolongation of QT interval (e.g. sotalol) or QRS duration (e.g. propranolol). Although the predominant effects of beta-blocker overdose are on the heart, other features may also occur, such as central nervous system effects (including drowsiness, confusion, convulsions, hallucinations, and in severe cases coma), respiratory depression, and bronchospasm. The effects of overdosage can vary from one beta-blocker to another; propranolol overdosage in particular may cause coma and convulsions.

The following guidance provides only an overview of the management of beta-blocker overdosage from the *National Poisons Information Service TOXBASE database*.

All patients who have been exposed to beta-blockers as a result of self-harm should be referred for assessment. Medical assessment is recommended for all patients who are symptomatic or have ingested more than a toxic dose; and in those who are treatment naive or have taken more than their therapeutic dose, and have a significant cardiac history, asthma, chronic obstructive pulmonary disease, or are elderly. All patients who have exceeded their prescribed daily dose of 2 or more cardiotoxic agents should also be referred for medical assessment irrespective of the dose

ingested. Hospital clinicians are encouraged to discuss all serious cases with the UK National Poisons Information Service

For patients presenting with overdose, maintain a clear airway and adequate ventilation. Although the benefit of gastric decontamination is uncertain, charcoal, activated p. 1481 can be considered if the patient presents within 1 hour of ingestion of more than a potentially toxic dose.

For the management of hypotension, ensure adequate fluid resuscitation; in an emergency, vasopressors and inotropes can be initiated under the advice of an experienced physician. Intravenous glucagon p. 793 [unlicensed] is a treatment option for severe hypotension, heart failure, or cardiogenic shock. In severe cases, an insulin and glucose infusion can improve myocardial contractility and systemic perfusion, especially in the presence of acidosis. Consider intravenous sodium bicarbonate p. 1128 for correction of metabolic acidosis that persists despite correction of hypoxia and adequate fluid resuscitation—rapid correction is particularly important if QRS duration is prolonged. For symptomatic bradycardia, give intravenous atropine sulfate p. 1445; dobutamine p. 240 [unlicensed] or isoprenaline [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may be considered if bradycardia is associated with hypotension. A temporary cardiac pacemaker can be used to increase the heart rate.

Treat bronchospasm with nebulised bronchodilators and corticosteroids.

If convulsions occur give oxygen, and correct acid-base and metabolic disturbances as required. Prolonged or frequent convulsions should be controlled with intravenous diazepam p. 375, lorazepam p. 369, or midazolam p. 371. If convulsions are unresponsive to treatment, the patient should be referred urgently to critical care.

Calcium-channel blockers poisoning

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 1138 or calcium gluconate p. 1139 is given by injection; atropine sulfate is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Iron salts poisoning

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 1116, which chelates iron. The serum-iron concentration is measured as an emergency and

intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

Lithium poisoning

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient's depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4-1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within 1 hour of ingesting significant quantities of lithium. Wholebowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

Stimulant-drug poisoning

Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam or lorazepam; advice should be sought from the National Poisons Information Service on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine

Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see Body temperature); hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy

Ecstasy (methylenedioxymethamfetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use.

Treatment of methylenedioxymethamfetamine poisoning is supportive, with diazepam p. 375 to control severe

agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

'Liquid ecstasy' is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

Theophylline poisoning

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 466 may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 1149 and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam p. 369 or diazepam (see Convulsions). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a shortacting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

Cyanide poisoning

Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 1481 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should not be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 1481 followed by sodium thiosulfate p. 1482 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 1114 (*Cyanokit* — no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

Ethylene glycol and methanol poisoning

Fomepizole (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metal poisoning

Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases poisoning

Carbon monoxide

Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow oxygen 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 248. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, and ammonia

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS Spray poisoning

CS spray, which is used for riot control, irritates the eyes (hence 'tear gas') and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Pesticide poisoning

Organophosphorus insecticides

Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent

removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 1445 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride p. 1482, a cholinesterase reactivator, is used as an adjunct to atropine sulfate p. 1445 in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

Snake bites and animal stings

Snake bites

Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (*Vipera berus*). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with intramuscular adrenaline/epinephrine p. 241, see Antihistamines, allergen immunotherapy and allergic emergencies p. 299 for further guidance on anaphylaxis management. Indications for european viper snake venom antiserum p. 1487 treatment include systemic envenoming. especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those patients who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the european viper snake venom antiserum is recommended; if symptoms of systemic envenoming persist contact the National Poisons Information Service. Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the european viper snake venom antiserum.

Antivenom is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service.

Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

Insect stings

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular adrenaline/epinephrine; self-administered intramuscular adrenaline/epinephrine is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator may also be considered for patients with persisting respiratory problems, see Antihistamines.

allergen immunotherapy and allergic emergencies p. 299 for further guidance on anaphylaxis management. A short course of an **oral antihistamine** or a **topical corticosteroid** may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

Marine stings

The severe pain of weeverfish (*Trachinus vipera*) and Portuguese man-o'-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45° C). People stung by jellyfish and Portuguese man-o'-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should **not** be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

Other poisons

Consult either the National Poisons Information Service day and night or TOXBASE.

The National Poisons Information Service (Tel: 0344 892 0111) will provide specialist advice on all aspects of poisoning day and night.

1 Active elimination from the gastro-intestinal tract

ANTIDOTES AND CHELATORS > INTESTINAL ADSORBENTS

Charcoal, activated

23-Jul-2020

• INDICATIONS AND DOSE

Reduction of absorption of poisons in the gastro-intestinal system

- ► BY MOUTH
- ▶ Neonate: 1 g/kg.
- ► Child 1 month-11 years: 1 g/kg (max. per dose 50 g)
- ► Child 12-17 years: 50 g
- Adult: 50 g

Active elimination of poisons

- ► BY MOUTH
- Neonate: 1 g/kg every 4 hours, dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy.
- Child 1 month-11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy
- Child 12-17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy
- Adult: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy

Accelerated elimination of teriflunomide

- ► BY MOUTH USING GRANULES
- Adult: 50 g every 12 hours for 11 days

Accelerated elimination of leflunomide (washout procedure)

- ► BY MOUTH USING GRANULES
- Adult: 50 g 4 times a day for 11 days

UNLICENSED USE

- In adults Activated charcoal doses in BNF may differ from those in product literature.
- CAUTIONS Comatose patient (risk of aspiration—ensure airway is protected) · drowsy patient (risk of aspiration ensure airway protected) · reduced gastrointestinal motility (risk of obstruction)
- SIDE-EFFECTS Bezoar · constipation · diarrhoea · gastrointestinal disorders
- DIRECTIONS FOR ADMINISTRATION TOXBASE advises suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

► Charcodote (Teva UK Ltd)

Activated charcoal 200 mg per 1 ml Charcodote 200mg/ml oral suspension sugar-free | 250 ml | P| £11.88 DT = £11.88

Granule

Carbomix (Kent Pharma (UK) Ltd)

Activated charcoal 813 mg per 1 gram Carbomix 81.3% granules sugar-free | 50 gram P £11.90 DT = £11.90

2 Chemical toxicity

2.1 Cyanide toxicity

ANTIDOTES AND CHELATORS

Dicobalt edetate

• INDICATIONS AND DOSE

Severe poisoning with cyanides

- ► BY INTRAVENOUS INJECTION
- Child: Consult the National Poisons Information Service
- Adult: 300 mg, to be given over 1 minute (or 5 minutes if condition less serious), dose to be followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity
- CAUTIONS Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness
- SIDE-EFFECTS Reflex tachycardia · vomiting
- EXCEPTIONS TO LEGAL CATEGORY Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- MEDICINAL FORMS No licensed medicines listed.

Sodium nitrite

05-May-2021

07-0ct-2021

INDICATIONS AND DOSE

Poisoning with cyanides (used in conjunction with sodium thiosulfate)

- ► BY INTRAVENOUS INJECTION
- ► Child: Consult the National Poisons Information Service continued →

Adult: 300 mg

IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF DEATH FROM UNINTENDED ADMINISTRATION OF SODIUM NITRITE (AUGUST 2020)

Cases of unintended administration of sodium nitrite have been reported, including 2 fatalities. Sodium nitrite can cause significant side-effects such as methaemoglobinaemia and nitric oxide-induced vasodilation.

Acute trusts are advised to check all clinical areas to ensure that sodium nitrite injection has not been inadvertently supplied, and to only retain stock in emergency departments. Unlicensed sodium nitrite ampoules in emergency departments should also be destroyed appropriately and replaced with licensed vials.

For information on the storage of 'specialist antidotes', see Poisoning, emergency treatment p. 1473.

- SIDE-EFFECTS Arrhythmias · dizziness · headache · hypotension · methaemoglobinaemia · palpitations
- EXCEPTIONS TO LEGAL CATEGORY Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Sodium nitrite (Non-proprietary)

Sodium nitrite 30 mg per 1 ml Sodium nitrite 300mg/10ml solution for injection vials | 1 vial PoM ► (Hospital only)

Sodium thiosulfate

16-Mar-2018

INDICATIONS AND DOSE

Poisoning with cvanides

- ► BY INTRAVENOUS INJECTION
- Child: Consult the National Poisons Information Service
- Adult: 12.5 g, to be given over 10 minutes, dose may be repeated in severe cyanide poisoning

DOSE EQUIVALENCE AND CONVERSION

- ▶ 12.5 g equates to 50 mL of a 25% solution or 25 mL of a 50% solution.
- EXCEPTIONS TO LEGAL CATEGORY Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

➤ Sodium thiosulfate (Non-proprietary)

Sodium thiosulfate 250 mg per 1 ml Sodium thiosulfate 12.5g/50ml solution for injection vials | 1 vial PoM
(Hospital only)

2.2 Organophosphorus toxicity

Other drugs used for Organophosphorus toxicity Atropine sulfate, p. 1445

ANTIDOTES AND CHELATORS

Pralidoxime chloride

31-Jan-2022

• INDICATIONS AND DOSE

Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

- ► BY INTRAVENOUS INFUSION
- Child: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day
- Adult: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day
- UNLICENSED USE Pralidoxime chloride doses may differ from those in product literature.
- In children Licensed for use in children (age range not specified by manufacturer).
- CONTRA-INDICATIONS Poisoning with carbamates poisoning with organophosphorus compounds without anticholinesterase activity
- CAUTIONS Myasthenia gravis
- SIDE-EFFECTS Dizziness · drowsiness · headache · hyperventilation · muscle weakness · nausea · tachycardia · vision disorders
- RENAL IMPAIRMENT EVGr Use with caution.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises the loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.
- In children For intravenous infusion, manufacturer advises reconstitute each vial with 20 mL Water for Injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.
- PRESCRIBING AND DISPENSING INFORMATION Available from designated centres for organophosphorus insecticide poisoning—see TOXBASE for list of holding centres.
- EXCEPTIONS TO LEGAL CATEGORY Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Pralidoxime chloride (Non-proprietary)
Pralidoxime chloride 1 gram Protopam Chloride 1g powder for solution for injection vials | 6 vial PoM S (Hospital only)

3 Drug toxicity

3.1 Benzodiazepine toxicity

ANTIDOTES AND CHELATORS >

BENZODIAZEPINE ANTAGONISTS

Flumazenil

24-Jul-2020

• INDICATIONS AND DOSE

Reversal of sedative effects of benzodiazepines in anaesthesia and clinical procedures

- ► BY INTRAVENOUS INJECTION
- Adult: 200 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; usual dose 300–600 micrograms; maximum 1 mg per course

Reversal of sedative effects of benzodiazepines in intensive care

- ► BY INTRAVENOUS INJECTION
- Adult: 300 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; maximum 2 mg per course

Reversal of sedative effects of benzodiazepines in intensive care (if drowsiness recurs after injection)

- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: 100–400 micrograms/hour, adjusted according to response, alternatively (by intravenous injection)
 300 micrograms, adjusted according to response

IMPORTANT SAFETY INFORMATION

Flumazenil should only be administered by, or under the direct supervision of, personnel experienced in its use.

- CONTRA-INDICATIONS Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines
- CAUTIONS Avoid rapid injection following major surgery avoid rapid injection in high-risk or anxious patients benzodiazepine dependence (may precipitate withdrawal symptoms) elderly ensure neuromuscular blockade cleared before giving head injury (rapid reversal of benzodiazepine sedation may cause convulsions) history of panic disorders (risk of recurrence) prolonged benzodiazepine therapy for epilepsy (risk of convulsions) short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours)

SIDE-FFFFCTS

- ➤ Common or very common Anxiety · diplopia · dry mouth · eye disorders · flushing · headache · hiccups · hyperhidrosis · hyperventilation · hypotension · insomnia · nausea · palpitations · paraesthesia · speech disorder · tremor · vertigo · vomiting
- ► Uncommon Abnormal hearing arrhythmias chest pain chills cough dyspnoea nasal congestion seizure (more common in patients with epilepsy)
- ► Frequency not known Withdrawal syndrome
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Avoid breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased half-life).

Dose adjustments Manufacturer advises cautious dose titration.

- DIRECTIONS FOR ADMINISTRATION For continuous intravenous infusion, manufacturer advises dilute with Glucose 5% or Sodium Chloride 0.9%.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Flumazenil (Non-proprietary)

Flumazenil 100 microgram per 1 ml Flumazenil 500micrograms/5ml solution for injection ampoules | 5 ampoule [PoM] £65.50-£72.46 (Hospital only) | 10 ampoule [PoM] £140.00 (Hospital only)

3.2 Digoxin toxicity

ANTIDOTES AND CHELATORS > ANTIBODIES

Digoxin-specific antibody

20-Jul-2020

INDICATIONS AND DOSE

Treatment of known or strongly suspected lifethreatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary

- ► BY INTRAVENOUS INFUSION
- Child: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)
- Adult: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

• DIRECTIONS FOR ADMINISTRATION

- In adults For intravenous infusion (DigiFab[®]), manufacturer advises give intermittently in Sodium chloride 0.9%. Reconstitute with water for injections (4 mL/vial), then dilute with infusion fluid and give over 30 minutes.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ DigiFab (Protherics Medicines Development Ltd)
Digoxin-specific antibody fragments 40 mg DigiFab 40mg powder for solution for infusion vials | 1 vial PoM £750.00 (Hospital only)

3.3 Heparin toxicity

ANTIDOTES AND CHELATORS

Protamine sulfate

02-Dec-2020

• INDICATIONS AND DOSE

Overdosage with intravenous injection of unfractionated heparin

- ► BY INTRAVENOUS INJECTION
- Adult: Dose to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 80–100 units heparin when given within 15 minutes; if longer than 15 minute since heparin, less protamine required (consult product literature for details) as heparin rapidly excreted; maximum 50 mg

Overdosage with intravenous infusion of unfractionated henarin

- ► BY INTRAVENOUS INJECTION
- Adult: 25-50 mg, to be administered once heparin infusion stopped at a rate not exceeding 5 mg/minute

Overdosage with subcutaneous injection of unfractionated heparin

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 25–50 mg, to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 100 units heparin, then (by intravenous infusion), any remaining dose to be administered over 8–16 hours; maximum 50 mg per course continued →

Overdosage with subcutaneous injection of low molecular weight heparin

- ► BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: Dose to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); maximum 50 mg
- CAUTIONS Excessive doses can have an anticoagulant effect
- SIDE-FFFFCTS
- ▶ Rare or very rare Pulmonary oedema non-cardiogenic
- Frequency not known Acute pulmonary vasoconstriction back pain - bradycardia - circulatory collapse - dyspnoea fatigue - feeling hot - flushing - hypertension - hypotension - nausea - pulmonary hypertension - vomiting
- ALLERGY AND CROSS-SENSITIVITY EVGT Caution if
 increased risk of allergic reaction to protamine (includes
 previous treatment with protamine or protamine insulin,
 allergy to fish, men who are infertile or who have had a
 vasectomy and who may have antibodies to protamine).
- MONITORING REQUIREMENTS Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.
- PRESCRIBING AND DISPENSING INFORMATION The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Protamine sulfate (Non-proprietary)
Protamine sulfate 10 mg per 1 ml Protamine sulfate 50mg/5ml solution for injection ampoules | 10 ampoule PoM £49.55

3.4 Opioid toxicity

OPIOID RECEPTOR ANTAGONISTS

Naloxone hydrochloride

16-Jun-2021

• INDICATIONS AND DOSE

Acute opioid overdose-high-dose regimen [when rapid titration with naloxone is necessary to reverse potentially life-threatening effects]

- ► BY INTRAVENOUS INJECTION
- Child 1 month-11 years: Initially 100 micrograms/kg (max. per dose 2 mg), if no response, repeat at intervals of 1 minute to a total max. of 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates following initial response, intravenous administration has more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible
- Child 12-17 years: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates following initial response, intravenous administration has more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible

- Adult: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates following initial response, intravenous administration has more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible
- ► BY CONTINUOUS INTRAVENOUS INFUSION
- Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory respiratory effort for at least 15 minutes
- Adult: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory respiratory effort for at least 15 minutes

Opioid overdose-low-dose regimen [when there is risk of acute withdrawal, or when a continued therapeutic effect is required (e.g. postoperative use, palliative care)]

- ► BY INTRAVENOUS INJECTION
- ▶ Child 1 month-11 years: Initially 1–10 micrograms/kg (max. per dose 200 micrograms), if no response, repeat at intervals of 1 minute up to 5 times, if no response then give a single dose of 100 micrograms/kg (max. dose 2 mg) then review diagnosis if still no response, further doses may be required if respiratory function deteriorates following initial response, intravenous administration has a more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible
- Child 12-17 years: Initially 100-200 micrograms, then 100 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, continue titrating up to a max. of 2 mg until adequate response achieved. If still no response, give a further 2 mg dose (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates following initial response, intravenous administration has a more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible
- Adult: Initially 100–200 micrograms, then 100 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, continue titrating up to a max. of 2 mg until adequate response achieved. If still no response, give a further 2 mg dose (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates following initial response, intravenous administration has a more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible

Opioid overdose in non-medical and medical settings

- ► BY INTRANASAL ADMINISTRATION
- Child 14-17 years: 1.8 mg, administered into one nostril, if no response, give a second dose after 2-3 minutes. If the patient responds to the first dose then relapses into respiratory depression, give the second dose immediately. Further doses should be administered into alternate nostrils
- Adult: 1.8 mg, administered into one nostril, if no response, give a second dose after 2–3 minutes. If the patient responds to the first dose then relapses into

respiratory depression, give the second dose immediately. Further doses should be administered into alternate nostrils

Opioid overdose in a non-medical setting

- ► BY INTRAMUSCULAR INJECTION
- Adult: 400 micrograms every 2–3 minutes, each dose given in subsequent resuscitation cycles if patient not breathing normally, continue until consciousness regained, breathing normally, medical assistance available, or contents of syringe used up; to be injected into deltoid region or anterolateral thigh

DOSE EQUIVALENCE AND CONVERSION

- With intranasal use
- ▶ 1 spray equivalent to 1.8 mg.

PHARMACOKINETICS

- Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.
- UNLICENSED USE TOXBASE advises naloxone is used in both high- and low-dose regimens for the management of opioid overdose, but these may differ from those licensed.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Doses used in acute opioid overdose may not be appropriate when there is risk of acute withdrawal (e.g. chronic opioid use), or when a continued therapeutic effect is required (e.g. postoperative use, palliative care).

 CAUTIONS Cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported) · chronic opioid use (risk of acute withdrawal) · maternal chronic opioid use (risk of acute withdrawal in newborn) · palliative care (risk of returning pain and acute withdrawal) · postoperative use (risk of returning pain)

CAUTIONS, FURTHER INFORMATION

 Titration of dose Ever In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Arrhythmias · dizziness · headache · hypertension · hypotension · nausea · vomiting
 ► Uncommon Diarrhoea · dry mouth · hyperhidrosis ·
- hyperventilation tremor
- ▶ Rare or very rare Cardiac arrest erythema multiforme pulmonary oedema

SPECIFIC SIDE-EFFECTS

- ▶ Uncommon
- With parenteral use Inflammation localised pain vascular irritation
- ► Rare or very rare
- ▶ With parenteral use Anxiety seizure
- ► Frequency not known
- With parenteral use Analgesia reversed asthenia chills death dyspnoea fever irritability nasal complaints piloerection yawning
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Not orally bioavailable.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use in children For continuous intravenous infusion, dilute to a concentration of up to 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%
- With intravenous use in adults For intravenous infusion (Minijet® Naloxone Hydrochloride), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute to a

concentration of up to 200 micrograms/mL and administer via an infusion pump.

- PRESCRIBING AND DISPENSING INFORMATION
- With intranasal use The manufacturer has provided a Healthcare Professional Guidance Document.
- PATIENT AND CARER ADVICE
- With intranasal use Patients and carers should be given advice on how to administer naloxone nasal spray.
 Patient training and information cards should be provided.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Spra

3.5 Paracetamol toxicity

ANTIDOTES AND CHELATORS

Acetylcysteine

05-0ct-2020

INDICATIONS AND DOSE

Paracetamol overdosage

- ► BY INTRAVENOUS INFUSION
- Child (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%
- Child (body-weight 20-39 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%
- Child (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL glucose 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL glucose 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre glucose 5%
- Adult (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL glucose 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL glucose 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre glucose 5% continued →

DOSES AT EXTREMES OF BODY-WEIGHT

▶ To avoid excessive dosage in obese patients, a ceiling weight of 110 kg should be used when calculating the dose for paracetamol overdosage.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: INTRAVENOUS ACETYLCYSTEINE FOR PARACETAMOL OVERDOSE: REMINDER OF AUTHORISED DOSE REGIMEN; POSSIBLE NEED FOR CONTINUED TREATMENT (JANUARY 2017)

The authorised dose regimen for acetylcysteine in paracetamol overdose is 3 consecutive intravenous infusions given over a total of 21 hours.

Continued treatment (given at the dose and rate as used in the third infusion) may be necessary depending on the clinical evaluation of the individual patient.

- CAUTIONS Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) · atopy · may slightly increase INR · may slightly increase prothrombin time
- INTERACTIONS → Appendix 1: acetylcysteine
- SIDE-EFFECTS
- ► Frequency not known Acidosis anaphylactoid reaction angioedema · anxiety · arrhythmias · cardiac arrest · chest discomfort · cough · cyanosis · eye pain · eye swelling · generalised seizure · hyperhidrosis · hypertension · hypotension · joint disorders · malaise · nausea · pain facial respiratory disorders - skin reactions - syncope thrombocytopenia · vasodilation · vision blurred · vomiting SIDE-EFFECTS, FURTHER INFORMATION Anaphylactoid reactions can be managed by suspending treatment and initiating appropriate management. Treatment may then be restarted at lower rate.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion, manufacturer advises Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if Glucose 5% unsuitable.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion Solution for infusion

Methaemoglobinaemia

ANTIDOTES AND CHELATORS

Methylthioninium chloride (Methylene blue)

11-Feb-2022

• INDICATIONS AND DOSE

Drug- or chemical-induced methaemoglobinaemia

- **▶** BY SLOW INTRAVENOUS INJECTION
- ▶ Child 3 months-17 years: Initially 1-2 mg/kg, then 1-2 mg/kg after 30-60 minutes if required, to be given over 5 minutes, seek advice from National Poisons

- Information Service if further repeat doses are required; maximum 7 mg/kg per course
- ▶ Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30-60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg

Aniline- or dapsone-induced methaemoglobinaemia

- ► BY SLOW INTRAVENOUS INJECTION
- ► Child 3 months-17 years: Initially 1-2 mg/kg, then 1-2 mg/kg after 30-60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course
- Adult: Initially 1-2 mg/kg, then 1-2 mg/kg after 30-60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg
- CAUTIONS Chlorate poisoning (reduces efficacy of methylthioninium) • G6PD deficiency (seek advice from National Poisons Information Service) · methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service) • pulse oximetry may give false estimation of oxygen saturation
- INTERACTIONS → Appendix 1: methylthioninium chloride
- SIDE-EFFECTS
- ► Common or very common Abdominal pain anxiety chest pain · dizziness · headache · hyperhidrosis · nausea · pain in extremity · paraesthesia · skin reactions · taste altered · urine discolouration · vomiting
- ► Frequency not known Aphasia arrhythmias confusion faeces discoloured · fever · haemolytic anaemia · hyperbilirubinaemia (in infants) · hypertension · hypotension · injection site necrosis · mydriasis · tremor
- PREGNANCY No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.
- BREAST FEEDING Manufacturer advises avoid breastfeeding for up to 6 days after administration-no information available.
- RENAL IMPAIRMENT National Poisons Information Service advises caution in severe impairment.

Dose adjustments Manufacturer advises lower doses may be required (consult product literature).

- DIRECTIONS FOR ADMINISTRATION
- In children For intravenous injection, manufacturer advises may be diluted with Glucose 5% to minimise injection-site pain; not compatible with Sodium Chloride 0.9%.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Methylthioninium chloride (Non-proprietary)

Methylthioninium chloride 5 mg per 1 ml Methylthioninium chloride Proveblue 50mg/10ml solution for injection ampoules 5 ampoule PoM £196.89 (Hospital only)

5 Snake bites

IMMUNE SERA AND IMMUNOGLOBULINS > ANTITOXINS

European viper snake venom antiserum

05-Feb-2021

INDICATIONS AND DOSE

VIPERATAB®

Envenoming from *Vipera berus* bites (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Child: Initially 8 mL for 1 dose, then 8 mL if required, the second and subsequent doses should only be given if signs and symptoms of envenomation persist or recur, if signs and symptoms of envenoming progress or persist contact the National Poisons Information Service
- Adult: Initially 8 mL for 1 dose, then 8 mL if required, the second and subsequent doses should only be given if signs and symptoms of envenomation persist or recur, if signs and symptoms of envenoming progress or persist contact the National Poisons Information Service

DIRECTIONS FOR ADMINISTRATION

VIPERATAB [®] Evgr For intravenous infusion, dilute with 100 mL of Sodium Chloride 0.9%; give over 30 minutes.

- PRESCRIBING AND DISPENSING INFORMATION To order, email immform@dh.gsi.gov.uk.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion.

Appendix 1Interactions

Two or more drugs given at the same time can exert their effects independently or they can interact. Interactions may be beneficial and exploited therapeutically; this type of interaction is not within the scope of this appendix. Many interactions are harmless, and even those that are potentially harmful can often be managed, allowing the drugs to be used safely together. Nevertheless, adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse reactions to drugs p. 10), as for other adverse drug reactions.

Potentially harmful drug interactions may occur in only a small number of patients, but the true incidence is often hard to establish. Furthermore the severity of a harmful interaction is likely to vary from one patient to another. Patients at increased risk from drug interactions include the elderly and those with impaired renal or hepatic function.

Interactions can result in the potentiation or antagonism of one drug by another, or result in another effect, such as renal impairment. Drug interactions may develop either through pharmacokinetic or pharmacodynamic mechanisms.

Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They might be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs.

Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or decreasing the amount of drug available to produce its pharmacological effects. Pharmacokinetic interactions occurring with one drug do not necessarily occur uniformly across a group of related drugs.

Affecting absorption The rate of absorption and the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless a rapid effect is required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, can result in ineffective therapy.

Affecting distribution *Due to changes in protein binding*: To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing the proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug will usually be eliminated.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides but these interactions become clinically relevant mainly because warfarin metabolism is also inhibited.

Induction or inhibition of drug transporter proteins: Drug transporter proteins, such as P-glycoprotein, actively transport drugs across biological membranes. Transporters can be induced or inhibited, resulting in changes in the concentrations of drugs that are substrates for the transporter. For example, rifampicin induces P-glycoprotein, particularly in the gut wall, resulting in decreased plasma concentrations of digoxin, a P-glycoprotein substrate.

Affecting metabolism Many drugs are metabolised in the liver. Drugs are either metabolised by phase I reactions (oxidation, reduction, or hydrolysis) or by phase II reactions (e.g., glucoronidation).

Phase I reactions are mainly carried out by the cytochrome P450 family of isoenzymes, of which CYP3A4 is the most important isoenzyme involved in the metabolism of drugs. Induction of cytochrome P450 isoenzymes by one drug can increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducing drug, plasma concentrations increase and toxicity can occur.

Conversely when one drug inhibits cytochrome P450 isoenzymes, it can decrease the metabolism of another, leading to higher plasma concentrations, resulting in an increased effect with a risk of toxicity.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. With knowledge of which isoenzymes are involved in a drug's metabolism, it is possible to predict whether certain pharmacokinetic interactions will occur. For example, carbamazepine is a potent inducer of CYP3A4, ketoconazole is potent inhibitor of CYP3A4, and midazolam is a substrate of CYP3A4. Carbamazepine reduces midazolam concentrations, and it is therefore likely that other drugs that are potent inducers of CYP3A4 will interact similarly with midazolam. Ketoconazole, however, increases midazolam concentrations, and it can be predicted that other drugs that are potent inhibitors of CYP3A4 will interact similarly.

Less is known about the enzymes involved in phase II reactions. These include UDP-glucuronyltransferases which, for example, might be induced by rifampicin, resulting in decreased metabolism of mycophenolate (a substrate for this enzyme) to its active form, mycophenolic acid.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible. Changes in urinary pH can also affect the reabsorption of a small number of drugs, including methenamine.

Relative importance of interactions

Levels of severity: Most interactions have been assigned a severity; this describes the likely effect of an unmanaged interaction on the patient.

Severe—the result may be a life-threatening event or have a permanent detrimental effect.

Moderate—the result could cause considerable distress or partially incapacitate a patient; they are unlikely to be lifethreatening or result in long-term effects.

Mild—the result is unlikely to cause concern or incapacitate the majority of patients.

Unknown—used for those interactions that are predicted, but there is insufficient evidence to hazard a guess at the outcome

Levels of evidence: Most interactions have been assigned a rating to indicate the weight of evidence behind the interaction.

Study—for interactions where the information is based on formal study including those for other drugs with same mechanism (e.g. known inducers, inhibitors, or substrates of cytochrome P450 isoenzymes or P-glycoprotein).

Anecdotal—interactions based on either a single case report or a limited number of case reports.

Theoretical—interactions that are predicted based on sound theoretical considerations. The information may have been derived from *in vitro* studies or based on the way other members in the same class act.

Action messages: Each interaction describes the effect that occurs, and the action to be taken, either based on manufacturer's advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g timing of doses) are recommended. Pharmacodynamic interactions, with the exception of interactions with drugs that may prolong the QT interval, do not have an action message included as these will depend on individual patient circumstances.

Appendix 1 structure

O Drugs

Drugs are listed alphabetically. If a drug is a member of a drug class, all interactions for that drug will be listed under the drug class entry; in this case the drug entry provides direction to the relevant drug class where its interactions can be found.

Within a drug or drug class entry, interactions are listed alphabetically by the interacting drug or drug class. The interactions describe the effect that occurs, and the action to be taken, either based on manufacturer's advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. If two drugs have a pharmacodynamic effect in addition to a pharmacokinetic interaction, a cross-reference to the relevant pharmacodynamic effect table is included at the end of the pharmacokinetic message.

O Drug classes

The drugs that are members of a drug class are listed underneath the drug class entry in a blue box. Interactions for the class are then listed alphabetically by the interacting drug or drug class. If the interaction only applies to certain drugs in the class, these drugs will be shown in brackets after the drug class name.

3 Supplementary information

If a drug has additional important information to be considered, this is shown in a blue box underneath the drug or drug class entry. This information might be food and lifestyle advice (including smoking and alcohol consumption), relate to the pharmacology of the drug or applicability of interactions to certain routes of administration, or it might be advice about separating administration times.

Pharmacodynamic effects

Tables at the beginning of Appendix 1 cover pharmacodynamic effects. If a drug is included in one or more of these tables, this will be indicated at the top of the

O Drug entry

- Details of interaction between drug entry and another drug or drug class. Action statement. Severity Evidence
- ▶ Details of interaction between drug entry and another drug or drug class. Action statement. Severity Evidence → Also see TABLE 1

Drug Drug

list of interactions for the drug or drug class. In addition to the list of interactions for a drug or drug class, these tables should always be consulted.

Each table describes the relevant pharmacodynamic effect and lists those drugs that are commonly associated with the effect. Concurrent use of two or more drugs from the same table is expected to increase the risk of the pharmacodynamic effect occurring. Please note these tables are not exhaustive.

A1

TABLE 1

Drugs that cause hepatotoxicity

The following is a list of some drugs that cause hepatotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

alcohol dantrolene alectinib demeclocycline asparaginase doxycycline atorvastatin flucloxacillin bedaquiline fluconazole carbamazepine fluvastatin clavulanate isoniazid crisantaspase itraconazole dactinomycin leflunomide	lenalidomide lomitapide lymecycline mercaptopurine methotrexate micafungin minocycline neratinib oxytetracycline	paracetamol pegaspargase pravastatin rosuvastatin simvastatin sotorasib streptozocin sulfasalazine teriflunomide	tetracycline tigecycline trabectedin valproate vincristine
--	--	--	--

TABLE 2

Drugs that cause nephrotoxicity

The following is a list of some drugs that cause nephrotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

aceciotenac	ceroxitin	diciotenac	metnotrexate	tacrolimus
aciclovir	cefradine	etodolac	nabumetone	tenofovir disoproxil
adefovir	ceftaroline	etoricoxib	naproxen	tenoxicam
amikacin	ceftazidime	flurbiprofen	neomycin	tiaprofenic acid
amphotericin B	ceftobiprole	foscarnet	oxaliplatin	tobramycin
bacitracin	ceftolozane	ganciclovir	parecoxib	tolfenamic acid
capreomycin	ceftriaxone	gentamicin	pemetrexed	trimethoprim
carboplatin	cefuroxime	ibuprofen	penicillamine	valaciclovir
cefaclor	celecoxib	ifosfamide	pentamidine	valganciclovir
cefadroxil	ciclosporin	indometacin	phenazone	vancomycin
cefalexin	cidofovir	inotersen	piroxicam	zidovudine
cefazolin	cisplatin	ketoprofen	polymyxin b	zoledronate
cefepime	colistemethate (particularly	ketorolac	streptomycin	
cefixime	intravenous)	mefenamic acid	streptozocin	
cefotaxime	dexketoprofen	meloxicam	sulindac	

TABLE 3

Drugs with anticoagulant effects

The following is a list of drugs that have anticoagulant effects. Concurrent use of two or more drugs from this list might increase the risk of bleeding; concurrent use of drugs with antiplatelet effects (see table of drugs with antiplatelet effects) might also increase this risk.

acenocoumarol	bivalirudin	enoxaparin	phenindione	tirofiban
alteplase	dabigatran	eptifibatide	rivaroxaban	urokinase
apixaban	dalteparin	fondaparinux	streptokinase	warfarin
argatroban	danaparoid	heparin	tenecteplase	
bemiparin	edoxaban	nicotinic acid	tinzaparin	

TABLE 4

acalabrutinib

Drugs with antiplatelet effects

clonidogral

The following is a list of drugs that have antiplatelet effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of bleeding; concurrent use of drugs with anticoagulant effects (see table of drugs with anticoagulant effects) might also increase this risk.

culindae

flurhinrofon

dCdIdDI ULIIIID	ciopidogrei	nurbiproien	паргохен	Sullilude
aceclofenac	dapoxetine	fluvoxamine	nintedanib	sunitinib
alprostadil	dasatinib	ibrutinib	omega-3-acid ethyl esters	tenoxicam
anagrelide	dexketoprofen	ibuprofen	parecoxib	tiaprofenic acid
aspirin	diclofenac	iloprost	paroxetine	ticagrelor
axitinib	dipyridamole	imatinib	pazopanib	tolfenamic acid
benzydamine	duloxetine	indometacin	phenazone	treprostinil
bosutinib	eicosapentaenoic acid	ketoprofen	piroxicam	venlafaxine
bromfenac	epoprostenol	ketorolac	ponatinib	vortioxetine
cangrelor	escitalopram	lenvatinib	prasugrel	
celecoxib	etodolac	mefenamic acid	regorafenib	
cilostazol	etoricoxib	meloxicam	sertraline	
citalopram	fluoxetine	nabumetone	sorafenib	

TABLE 5

Drugs that cause thromboembolism

The following is a list of some drugs that cause thromboembolism (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

bleomycin	epoetin zeta	methoxy polyethylene	strontium	tretinoin
cyclophosphamide	fluorouracil	glycol-epoetin beta	tamoxifen	vinblastine
darbepoetin alfa	fulvestrant	mitomycin	thalidomide	vincristine
doxorubicin	lenalidomide	pentostatin	tibolone	vindesine
epoetin alfa	methotrexate	pomalidomide	toremifene	vinflunine
epoetin beta		raloxifene	tranexamic acid	vinorelbine

TABLE 6

Drugs that cause bradycardia

The following is a list of drugs that cause bradycardia (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

acebutolol	carvedilol	fentanyl	neostigmine	rivastigmine	
alectinib	celiprolol	fingolimod	ozanimod	selegiline	
alfentanil	ceritinib	flecainide	pasireotide	siponimod	
amiodarone	clonidine	galantamine	pindolol	sotalol	
apraclonidine	crizotinib	ivabradine	ponesimod	suxamethonium	
atenolol	digoxin	labetalol	propafenone	thalidomide	
betaxolol	diltiazem	levobunolol	propofol	ticagrelor	
bisoprolol	donepezil	metoprolol	propranolol	timolol	
brigatinib	dronedarone	nadolol	pyridostigmine	tizanidine	
brimonidine	esmolol	nebivolol	remifentanil	verapamil	

TABLE 7

Drugs that cause first dose hypotension

The following is a list of some drugs that can cause first-dose hypotension (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

alfuzosin	eprosartan	isosorbide dinitrate	prazosin	trandolapril
azilsartan	fosinopril	isosorbide mononitrate	quinapril	valsartan
candesartan	glyceryl trinitrate	lisinopril	ramipril	
captopril	imidapril	losartan	tamsulosin	
doxazosin	indoramin	olmesartan	telmisartan	
enalapril	irbesartan	perindopril	terazosin	

TABLE 8

Drugs that cause hypotension

The following is a list of some drugs that cause hypotension (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

acebutolol alcohol alrososin aliskiren alprostadil amantadine amitriptyline amlodipine apomorphine apraclonidine aripiprazole asenapine atenolol avanafil azilsartan baclofen bendroflumethiazide benperidol betaxolol bisoprolol bortezomib brimonidine bromocriptine bumetanide cabergoline canagliflozin candesartan captopril cariprazine carvedilol celiprolol	chlorothiazide chlorpromazine chlortalidone clomipramine clonidine clozapine dapagliflozin desflurane diazoxide diltiazem dipyridamole dosulepin doxazosin doxepin droperidol empagliflozin enalapril eplerenone epoprostenol eprosartan ertugliflozin esketamine esmolol etomidate felodipine flupentixol fosinopril furosemide glyceryl trinitrate guanfacine haloperidol	hydralazine hydrochlorothiazide hydrochlorothiazide iloprost imidapril imipramine indapamide indoramin irbesartan isocarboxazid isoflurane isosorbide dinitrate isosorbide mononitrate ketamine labetalol lacidipine lercanidipine lercanidipine levobunolol levodopa levomepromazine lisinopril lofepramine lofexidine losartan loxapine urasidone methoxyflurane methyldopa metolazone metoprolol minoxidil	moxisylyte moxonidine nadolol nebivolol nicardipine nicorandil nifedipine nimodipine nitroprusside nitrous oxide nortriptyline olanzapine olmesartan paliperidone pericyazine perindopril phenelzine pimozide pimozide pimozide pimozide pimozide prazosin prochlorperazine promazine propofol quetiapine quinagolide quinapril ramipril riociguat risperidone	ropinirole rotigotine sacubitril sapropterin selegiline sevoflurane sildenafil sodium oxybate sotalol spironolactone sulpiride tadalafil tamsulosin telmisartan terazosin thiopental timolol tizanidine torasemide trandolapril tranylcypromine treprostinil trifluoperazine trimipramine valsartan vardenafil verapamil vericiguat vernakalant xipamide zuclopenthixol
---	---	---	--	---

TABLE 9

Drugs that prolong the QT interval

The following is a list of some drugs that prolong the QT-interval (note that this list is not exhaustive). In general, manufacturers advise that the use of two or more drugs that are associated with QT prolongation should be avoided. Increasing age, female sex, cardiac disease, and some metabolic disturbances (notably hypokalaemia) predispose to QT prolongation—concurrent use of drugs that reduce serum potassium might further increase this risk (see table of drugs that reduce serum potassium).

Drugs that are not known to prolong the QT interval but are predicted (by the manufacturer) to increase the risk of QT prolongation include: domperidone, fingolimod, granisetron, ivabradine, mefloquine, mizolastine, ozanimod, palonosetron, intravenous pentamidine, and siponimod. Most manufacturers advise avoiding concurrent use with drugs that prolong the QT interval.

amifampridine	clomipramine	glasdegib	osimertinib	sunitinib
amiodarone	crizotinib	haloperidol	paliperidone	tetrabenazine
amisulpride	dasatinib	hydroxychloroquine	panobinostat	tizanidine
anagrelide	delamanid	hydroxyzine	pasireotide	tolterodine
apalutamide	desflurane	inotuzumab ozogamicin	pazopanib	toremifene
apomorphine	disopyramide	isoflurane	pimozide	vandetanib
arsenic trioxide	dronedarone	lapatinib	quinine	vardenafil
artemether	droperidol	lenvatinib	ranolazine	vemurafenib
artenimol	efavirenz	levomepromazine	ribociclib	venlafaxine
bedaquiline	encorafenib	lithium	risperidone	vernakalant
bosutinib	entrectinib	lofexidine	selpercatinib	vinflunine
cabozantinib	eribulin	methadone	sevoflurane	voriconazole
ceritinib	erythromycin	moxifloxacin	sildenafil	zuclopenthixol
chlorpromazine	escitalopram	nilotinib	sorafenib	
citalopram	flecainide	ondansetron	sotalol	
clarithromycin	fluconazole	osilodrostat	sulpiride	

TABLE 10

Drugs with antimuscarinic effects

The following is a list of some drugs that have antimuscarinic effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of these effects occurring.

aclidinium amantadine amitriptyline atropine baclofen chlorphenamine chlorpromazine clemastine clomipramine	cyclopentolate cyproheptadine darifenacin dicycloverine dimenhydrinate disopyramide dosulepin doxepin fesoterodine	haloperidol homatropine hydroxyzine hyoscine imipramine ipratropium levomepromazine lofepramine loxapine	orphenadrine oxybutynin pimozide pridinol prochlorperazine procyclidine promethazine propafenone propantheline	tiotropium tolterodine trifluoperazine trihexyphenidyl trimipramine tropicamide trospium umeclidinium
clomipramine	fesoterodine	loxapine	propantheline	
clozapine	flavoxate	nefopam	propiverine	
cyclizine	glycopyrronium	nortriptyline	solifenacin	

TABLE 11

Drugs with CNS depressant effects

clomactino

The following is a list of some drugs with CNS depressant effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of CNS depressant effects, such as drowsiness, which might affect the ability to perform skilled tasks (see 'Drugs and Driving' in Guidance on Prescribing p. 1).

midazolam

quetianine

agomeratme	cieniastine	guaniacine	IIIIUdZUIdIII	quetiapine
alcohol	clobazam	haloperidol	mirtazapine	remifentanil
alfentanil	clomethiazole	hydromorphone	morphine	remimazolam
alimemazine	clomipramine	hydroxyzine	moxonidine	risperidone
alprazolam	clonazepam	imipramine	nabilone	ropivacaine
amisulpride	clonidine	isoflurane	nitrazepam	sevoflurane
amitriptyline	clozapine	ketamine	nitrous oxide	sodium oxybate
apraclonidine	codeine	ketotifen	nortriptyline	sulpiride
aripiprazole	cyclizine	lamotrigine	olanzapine	tapentadol
articaine	cyproheptadine	levetiracetam	oxazepam	temazepam
asenapine	desflurane	levomepromazine	oxycodone	tetrabenazine
baclofen	dexmedetomidine	lidocaine	paliperidone	tetracaine
benperidol	diamorphine	lofepramine	pentazocine	thalidomide
brimonidine	diazepam	lofexidine	perampanel	thiopental
buclizine	dihydrocodeine	loprazolam	pericyazine	tizanidine
bupivacaine	dipipanone	lorazepam	pethidine	tramadol
buprenorphine	dosulepin	lormetazepam	phenobarbital	trazodone
cannabidiol	doxepin	loxapine	pimozide	trifluoperazine
cariprazine	dronabinol	lurasidone	pizotifen	trimipramine
cenobamate	droperidol	melatonin	pregabalin	venlafaxine
chloral hydrate	esketamine	mepivacaine	prilocaine	zolpidem
chlordiazepoxide	etomidate	meptazinol	primidone	zopiclone
chloroprocaine	fentanyl	methadone	prochlorperazine	zuclopenthixol
chlorphenamine	flupentixol	methocarbamol	promazine	
chlorpromazine	flurazepam	methoxyflurane	promethazine	
cinnarizine	gabapentin	mianserin	propofol	

TABLE 12

Drugs that cause peripheral neuropathy

The following is a list of some drugs that cause peripheral neuropathy (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amiodarone	disulfiram	lamivudine	thalidomide	vinorelbine
bortezomib	docetaxel	metronidazole	vinblastine	
brentuximab vedotin	eribulin	nitrofurantoin	vincristine	
cabazitaxel	fosphenytoin	paclitaxel	vindesine	
cisplatin	isoniazid	phenytoin	vinflunine	

TABLE 13

Drugs that cause serotonin syndrome

The following is a list of some drugs that cause serotonin syndrome (note that this list is not exhaustive). See 'Serotonin Syndrome' and 'Monoamine-Oxidase Inhibitors' under Antidepressant drugs p. 390 for more information and for specific advice on avoiding monoamine-oxidase inhibitors during and after administration of other serotonergic drugs.

almotriptan	fentanyl	lithium	pentazocine	sumatriptan
citalopram	fluoxetine	methadone	pethidine	tramadol
clomipramine	fluvoxamine	methylthioninium chloride	phenelzine	tranylcypromine
dapoxetine	frovatriptan	mirtazapine	rasagiline	trazodone
dexamfetamine	granisetron	moclobemide	rizatriptan	tryptophan
duloxetine	imipramine	naratriptan	safinamide	venlafaxine
eletriptan	isocarboxazid	ondansetron	selegiline	vortioxetine
escitalopram	linezolid	palonosetron	sertraline	zolmitriptan
fenfluramine	lisdexamfetamine	paroxetine	St John's wort	

TABLE 14

Antidiabetic drugs

The following is a list of antidiabetic drugs (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase the risk of hypoglycaemia.

acarbose	empagliflozin	glimepiride	lixisenatide	semaglutide
alogliptin	ertugliflozin	glipizide	metformin	sitagliptin
canagliflozin	exenatide	insulin	pioglitazone	tolbutamide
dapagliflozin	glibenclamide	linagliptin	repaglinide	vildagliptin
dulaglutide	gliclazide	liraglutide	sayaglintin	

TABLE 15

Drugs that cause myelosuppression

The following is a list of some drugs that cause myelosuppression (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

adalimumab aldesleukin alemtuzumab amsacrine arsenic trioxide asparaginase axitinib azacitidine azathioprine belatacept bendamustine bevacizumab bexarotene bleomycin blinatumomab bortezomib bosutinib brentuximab vedotin busulfan cabazitaxel cabozantinib canakinumab	carmustine ceritinib certolizumab pegol chlorambucil cisplatin cladribine clofarabine crisantaspase cyclophosphamide cytarabine dacarbazine dacatnomycin daratumumab dasatinib daunorubicin decitabine dexrazoxane dinutuximab docetaxel doxorubicin epirubicin eribulin	fluorouracil ganciclovir gemcitabine gemtuzumab ozogamicin golimumab hydroxycarbamide ibrutinib idarubicin ifosfamide imatinib infliximab inotuzumab ozogamicin ipilimumab irinotecan leflunomide lenalidomide lomustine melphalan mercaptopurine methotrexate mifamurtide mitomycin	nelarabine nilotinib niraparib nivolumab obinutuzumab olaparib oxaliplatin paclitaxel palbociclib panobinostat pegaspargase peginterferon alfa pembrolizumab pemetrexed pentostatin pixantrone pomalidomide procarbazine raltitrexed ramucirumab regorafenib ribociclib	ruxolitinib sorafenib streptozocin sulfasalazine sunitinib talazoparib tegafur temozolomide temsirolimus thalidomide thiotepa tioguanine topotecan trastuzumab deruxtecan trastuzumab deruxtecan trastuzumab emtansine treosulfan valganciclovir vinblastine vincristine vindesine
cabozantinib	epirubicin	mifamurtide	regorafenib	vincristine
capecitabine carboplatin carfilzomib	estramustine etoposide fludarabine	mitotane mitoxantrone mogamulizumab	rituximab ropeginterferon alfa rucaparib	vinflunine vinorelbine

A1

TABLE 16

Drugs that increase serum potassium

The following is a list of some drugs that increase serum potassium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyperkalaemia (hyperkalaemia is particularly notable when ACE inhibitors or angiotensin-II receptor antagonists are given with spironolactone or eplerenone).

aceclofenac	diclofenac	heparin	naproxen	sulindac
aliskiren	drospirenone	ibuprofen	olmesartan	tacrolimus
amiloride	enalapril	imidapril	parecoxib	telmisartan
azilsartan	enoxaparin	indometacin	perindopril	tenoxicam
bemiparin	eplerenone	irbesartan	phenazone	tiaprofenic acid
candesartan	epoetin alfa	ketoprofen	piroxicam	tinzaparin
captopril	epoetin beta	ketorolac	potassium aminobenzoate	tolfenamic acid
celecoxib	epoetin zeta	lisinopril	potassium canrenoate	tolvaptan
ciclosporin	eprosartan	losartan	potassium chloride	trandolapril
dalteparin	etodolac	mefenamic acid	quinapril	triamterene
darbepoetin alfa	etoricoxib	meloxicam	ramipril	trimethoprim
dexketoprofen	flurbiprofen	nabumetone	spironolactone	valsartan

TABLE 17

Drugs that reduce serum potassium

The following is a list of some drugs that reduce serum potassium concentrations (note that this list is not exhaustive and that other drugs can cause hypokalaemia in overdose). Concurrent use of two or more drugs from this list might increase the risk of hypokalaemia. Hypokalaemia can increase the risk of torsade de pointes, which might be additive with the effects of drugs that prolong the QT interval (see table of drugs that prolong the QT interval).

aminophylline	bumetanide	furosemide	metolazone	torasemide
amphotericin B	chlorothiazide	hydrochlorothiazide	olodaterol	triamcinolone
bambuterol	chlortalidone	hydrocortisone	prednisolone	vilanterol
beclometasone	deflazacort	hydroflumethiazide	salbutamol	xipamide
bendroflumethiazide	dexamethasone	indacaterol	salmeterol	
betamethasone	fludrocortisone	indapamide	terbutaline	
budesonide	formoterol	methylprednisolone	theophylline	

TABLE 18

Drugs that cause hyponatraemia

The following is a list of some drugs that reduce sodium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyponatraemia.

aceclofenac	desmopressin	fluvoxamine	meloxicam	sulindac
amiloride	dexketoprofen	furosemide	metolazone	tenoxicam
amitriptyline	diclofenac	gabapentin	nabumetone	tiaprofenic acid
bendroflumethiazide	dosulepin	hydrochlorothiazide	naproxen	tolfenamic acid
bumetanide	doxepin	hydroflumethiazide	nortriptyline	torasemide
carbamazepine	duloxetine	ibuprofen	parecoxib	triamterene
celecoxib	eplerenone	imipramine	paroxetine	trimethoprim
chlorothiazide	escitalopram	indapamide	phenazone	trimipramine
chlortalidone	etodolac	indometacin	piroxicam	xipamide
citalopram	etoricoxib	ketoprofen	sertraline	
clomipramine	fluoxetine	ketorolac	sodium picosulfate	
dapoxetine	flurbiprofen	mefenamic acid	spironolactone	

TABLE 19

Drugs that cause ototoxicity

The following is a list of some drugs that cause ototoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amikacin	cisplatin	oxaliplatin	vancomycin	vinflunine
bumetanide	furosemide	streptomycin	vinblastine	vinorelbine
capreomycin	gentamicin	tobramycin	vincristine	
carboplatin	neomycin	torasemide	vindesine	

TARLE 20

Drugs with neuromuscular blocking effects

The following is a list of some drugs with neuromuscular blocking effects (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amikacin	cisatracurium	neomycin	streptomycin
atracurium	colistimethate	pancuronium	suxamethonium
botulinum toxin type A	gentamicin	polymyxin b	tobramycin
botulinum toxin type B	mivacurium	rocuronium	vecuronium

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

5-HT3-receptor antagonists → see TABLE 13 p. 1493 (serotonin syndrome), TABLE 9 p. 1492 (QT-interval prolongation)

granisetron · ondansetron · palonosetron

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ondansetron. Moderate Study → Also see TABLE 9 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ondansetron. [Moderate] Study
- Dopamine receptor agonists (apomorphine) increase the risk of severe hypotension when given with ondansetron. Avoid. [Severe] Study → Also see TABLE 9 p. 1492
- ➤ Dopamine receptor agonists (apomorphine) are predicted to increase the risk of severe hypotension when given with 5-HT3-receptor antagonists (granisetron, palonosetron). Severe Theoretical
- Mitotane is predicted to decrease the exposure to ondansetron.
 [Moderate] Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to ondansetron. Moderate Study

Abacavir → see NRTIs

Abatacept

- Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. [Severe] Theoretical
- ► Filgotinib is predicted to increase the risk of immunosuppression when given with abatacept. Avoid. [Severe] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Monoclonal antibodies (certolizumab pegol) are predicted to increase the risk of generalised infection (possibly lifethreatening) when given with abatacept. Avoid. Severe Theoretical
- Abatacept is predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies (golimumab). Avoid. [Severe] Theoretical

Abemaciclib

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to abemaciclib. Avoid. Severe
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to abemaciclib. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to abemaciclib. Avoid. [Severe] Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to abemaciclib.

 Moderate Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1042. [Severe] Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to abemaciclib. Moderate Study
- ➤ Cobicistat is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1042. [Severe] Study
- Crizotinib is predicted to increase the exposure to abemaciclib.
 Moderate Study
- Grapefruit juice is predicted to increase the exposure to abemaciclib. Avoid. Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1042.
 Severe Study
- ► Idelalisib is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1042. [Severe] Study

- ► Imatinib is predicted to increase the exposure to abemaciclib. Moderate Study
- Letermovir is predicted to increase the exposure to abemaciclib. [Moderate] Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1042. [Severe] Study
- ► Macrolides (erythromycin) are predicted to increase the exposure to abemaciclib. Moderate Study
- Mitotane is predicted to markedly decrease the exposure to abemaciclib. Avoid. Severe Study
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to abemaciclib. Moderate
- Nilotinib is predicted to increase the exposure to abemaciclib.
 Moderate Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of abemaciclib. Avoid or adjust abemaciclib dose, p. 1042. Severel Theoretical
- ► Rifamycins (rifampicin) are predicted to markedly decrease the exposure to abemaciclib. Avoid. Severe Study
- St John's wort is predicted to decrease the exposure to abemaciclib. Avoid. Severe Study

Abiraterone → see anti-androgens

Abrocitinib

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to abrocitinib. Avoid. [Moderate] Study
 - Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to abrocitinib. Avoid. [Moderate] Theoretical
 - Antifungals, azoles (fluconazole) are predicted to increase the exposure to abrocitinib. Adjust abrocitinib dose, p. 1354. Severe Study
 - ► Abrocitinib might increase the exposure to ciclosporin.

 [Moderate] Theoretical
 - Abrocitinib might increase the exposure to digoxin. Moderate
 Theoretical
 - Abrocitinib might increase the exposure to everolimus.
 Moderate Theoretical
 - ► Abrocitinib might increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Moderate Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abrocitinib. Avoid. Severel Theoretical
- NNRTIs (efavirenz) are predicted to decrease the exposure to abrocitinib. Avoid. Moderate Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to abrocitinib. Avoid. [Moderate] Study
- Abrocitinib might increase the exposure to sirolimus. [Moderate]
 Theoretical
 SSRIs (fluoxetine, fluvoxamine) are predicted to increase the
- SSRs (fluoxetine, fluoxamine) are predicted to increase the exposure to abrocitinib. Adjust abrocitinib dose, p. 1354. <u>Severel</u> Study
- Abrocitinib slightly increases the exposure to thrombin inhibitors (dabigatran). [Moderate] Study

Acalabrutinib → see TABLE 4 p. 1490 (antiplatelet effects)

- Oral antacids are predicted to decrease the exposure to oral acalabrutinib. Separate administration by at least 2 hours.
 Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to acalabrutinib. Avoid. Severe Study
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to acalabrutinib. Avoid or monitor. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to acalabrutinib. Avoid. Severe Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to acalabrutinib. Avoid or monitor. (Severe) Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to acalabrutinib. Avoid.

 | Severe | Study |
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to acalabrutinib. Avoid or monitor.

 Severe Study

Acalabrutinib (continued)

- Oral calcium salts (calcium carbonate) -containing antacids modestly decrease the exposure to oral acalabrutinib. Separate administration by at least 2 hours. [Moderate] Study
- ► Cobicistat is predicted to increase the exposure to acalabrutinib. Avoid. Severe Study
- ► Crizotinib is predicted to increase the exposure to acalabrutinib. Avoid or monitor. Severe Study
- Dabrafenib is predicted to decrease the exposure to acalabrutinib. Severe Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to acalabrutinib. Severe Study
- H₂ receptor antagonists are predicted to decrease the exposure to acalabrutinib. Acalabrutinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate] Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to acalabrutinib. Avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to acalabrutinib. Avoid. Severe Study
- ► Imatinib is predicted to increase the exposure to acalabrutinib. Avoid or monitor. Severe Study → Also see TABLE 4 p. 1490
- Letermovir is predicted to increase the exposure to acalabrutinib. Avoid or monitor. Severe Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to acalabrutinib. Avoid. Severe Study
- ► Macrolides (erythromycin) are predicted to increase the
- exposure to acalabrutinib. Avoid or monitor. Severe Study

 Mitotane is predicted to decrease the exposure to
 acalabrutinib. Avoid. Severe Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to acalabrutinib. Avoid or monitor. Severe Study
- Nilotinib is predicted to increase the exposure to acalabrutinib.
 Avoid or monitor. Severe Study
- ► NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to acalabrutinib. Severe | Study
- Proton pump inhibitors are predicted to decrease the exposure to acalabrutinib. Avoid. [Moderate] Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to acalabrutinib. Avoid. [Severe] Study
- to acaidorutinib. Avoid. <u>[Severe]</u> Study

 Oral sodium bicarbonate -containing antacids are predicted to decrease the exposure to oral acalabrutinib. Separate
- administration by at least 2 hours. Moderate Study

 ► St John's wort is predicted to decrease the exposure to acalabrutinib. Avoid. Severe Study

Acarbose → see TABLE 14 p. 1493 (antidiabetic drugs)

- ► Acarbose decreases the concentration of digoxin. Moderate
- ► Fenfluramine might decrease blood glucose concentrations when given with acarbose. Moderate Theoretical
- ▶ Pancreatin is predicted to decrease the effects of acarbose. Avoid. Moderate Theoretical

ACE inhibitors → see TABLE 7 p. 1491 (first-dose hypotension),
TABLE 8 p. 1491 (hypotension), TABLE 16 p. 1494 (increased serum potassium)

captopril • enalapril • fosinopril • imidapril • lisinopril • perindopril • quinapril • ramipril • trandolapril

- ACE inhibitors increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients, p. 195. Severe Study → Also see TABLE 8 p. 1491 → Also see TABLE 16 p. 1494
- ► ACE inhibitors are predicted to increase the risk of hypersensitivity and haematological reactions when given with allopurinol. [Severe] Anecdotal
- ► ACE inhibitors are predicted to increase the risk of anaemia and/or leucopenia when given with azathioprine. Severe
- ► Everolimus potentially increases the risk of angioedema when given with ACE inhibitors. Severe Anecdotal
- ACE inhibitors are predicted to decrease the efficacy of icatibant and icatibant is predicted to decrease the efficacy of ACE inhibitors. Avoid. [Moderate] Theoretical
- ► ACE inhibitors are predicted to increase the concentration of lithium. Monitor and adjust dose. [Severe] Anecdotal

- ACE inhibitors are predicted to increase the risk of angioedema when given with temsirolimus. [Moderate] Theoretical
- ► Oral quinapril (magnesium carbonate-containing forms) might decrease the absorption of oral tetracyclines. Avoid.

 Moderate Study

Acebutolol → see beta blockers, selective

Aceclofenac → see NSAIDs

Acenocoumarol → see coumarins

Acetazolamide

- Acetazolamide potentially increases the risk of toxicity when given with antiepileptics (valproate). [Severe] Study
- Acetazolamide potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide).
 Avoid in children. [Severe] Theoretical
- ► Acetazolamide increases the risk of severe toxic reaction when given with aspirin (high-dose). [Severe] Study
- Acetazolamide alters the concentration of lithium. Severel Anecdotal
- Acetazolamide is predicted to decrease the efficacy of methenamine. Avoid. Moderate Theoretical
- Acetazolamide increases the urinary excretion of methotrexate. [Moderate] Study

Acetylcysteine

► Acetylcysteine might increase the vasodilatory effects of nitrates (glyceryl trinitrate). Moderate Theoretical

Aciclovir → see TABLE 2 p. 1490 (nephrotoxicity)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ► Aciclovir increases the exposure to aminophylline. Monitor and adjust dose. Severe Anecdotal
- Aciclovir is predicted to decrease the efficacy of live vaccines (herpes-zoster vaccine, live). [Moderate] Theoretical
- Mycophenolate is predicted to increase the risk of haematological toxicity when given with aciclovir. [Moderate]
 Theoretical
- Aciclovir is predicted to increase the exposure to theophylline.
 Monitor and adjust dose. Severe Theoretical

Acipimox

- Acipimox is predicted to increase the risk of rhabdomyolysis when given with fibrates. Severe Theoretical
- Acipimox is predicted to increase the risk of rhabdomyolysis when given with statins. Severe Theoretical

Acitretin → see retinoids

Aclidinium → see TABLE 10 p. 1492 (antimuscarinics)

➤ Antipsychotics, second generation (clozapine) can cause constipation, as can aclidinium; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492

Acrivastine → see antihistamines, non-sedating

Adalimumab → see monoclonal antibodies

Adapalene → see retinoids

Adefovir → see TABLE 2 p. 1490 (nephrotoxicity)

- ► Leflunomide is predicted to increase the exposure to adefovir.

 Moderate Theoretical
- ► Nitisinone is predicted to increase the exposure to adefovir. Moderate Study
- ► Teriflunomide is predicted to increase the exposure to adefovir. Moderate Study

Adenosine → see antiarrhythmics

Adrenaline/epinephrine → see sympathomimetics, vasoconstrictor Afatinih

- ► Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to afatinib. [Moderate] Study
- Antiepileptics (carbamazepine) are predicted to decrease the exposure to afatinib. [Moderate] Study
- Antiepileptics (phenobarbital, phenytoin) are predicted to decrease the exposure to afatinib. Moderate Theoretical
- ► Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to afatinib. Moderate Study
- Calcium channel blockers (verapamil) are predicted to increase the exposure to afatinib. Moderate Study
- Ciclosporin is predicted to increase the exposure to afatinib.
 Moderate Study

- ► HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to afatinib. Moderate Study
- ► Ivacaftor is predicted to increase the exposure to afatinib.

 [Moderate] Study
- ► Lapatinib is predicted to increase the exposure to afatinib.

 Moderate | Study
- Macrolides are predicted to increase the exposure to afatinib.
 Moderate Study
- Neratinib is predicted to increase the exposure to afatinib.
 Moderate Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of afatinib. Moderate Theoretical
- Ranolazine is predicted to increase the exposure to afatinib.
 Moderate Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to afatinib. [Moderate] Study
- Rucaparib is predicted to increase the exposure to afatinib.
 Moderate Study
- St John's wort is predicted to decrease the exposure to afatinib.
 Moderate Study
- ► Tacrolimus is predicted to increase the exposure to afatinib.

 Moderate Theoretical
- Vandetanib is predicted to increase the exposure to afatinib.
 Moderate Study
- ➤ Vemurafenib is predicted to increase the exposure to afatinib.

 Moderate | Study

Aflibercept

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use unless specified.

Agalsidase alfa

- ➤ Aminoglycosides are predicted to decrease the effects of agalsidase alfa. Avoid. Moderate Theoretical
- ► Antiarrhythmics (amiodarone) are predicted to decrease the effects of agalsidase alfa. Avoid. Moderate Theoretical
- Antimalarials (chloroquine) are predicted to decrease the effects of agalsidase alfa. Avoid. Moderate Theoretical
- Hydroxychloroquine is predicted to decrease the effects of agalsidase alfa. [Moderate] Theoretical

Agalsidase beta

- Aminoglycosides are predicted to decrease the effects of agalsidase beta. Avoid. [Moderate] Theoretical
- Antiarrhythmics (amiodarone) are predicted to decrease the effects of agalsidase beta. Avoid. Moderate Theoretical
- ► Antimalarials (chloroquine) are predicted to decrease the effects of agalsidase beta. Avoid. Moderate Theoretical
- Hydroxychloroquine is predicted to decrease the exposure to agalsidase beta. Moderate Theoretical

Agomelatine → see TABLE 11 p. 1492 (CNS depressant effects)

- Dose adjustment might be necessary if smoking started or stopped during treatment.
- Caution with concomitant use of drugs associated with hepatic injury.
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- Axitinib is predicted to increase the exposure to agomelatine.
 Moderate Theoretical
- ► Combined hormonal contraceptives is predicted to increase the exposure to agomelatine. Moderate Study
- Givosiran is predicted to increase the exposure to agomelatine.
 Use with caution and adjust dose. [Moderate] Study
- HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to agomelatine. Moderate Theoretical
- ► Leflunomide is predicted to decrease the exposure to agomelatine. Moderate Theoretical
- Mexiletine is predicted to increase the exposure to agomelatine. [Moderate] Study
- Osilodrostat is predicted to increase the exposure to agomelatine. [Moderate] Study
- Quinolones (ciprofloxacin) are predicted to increase the exposure to agomelatine. Moderate Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- Rucaparib is predicted to increase the exposure to agomelatine. [Moderate] Study

- ► SSRIs (fluvoxamine) very markedly increase the exposure to agomelatine. Avoid. [Severe] Study
- ► Teriflunomide is predicted to decrease the exposure to agomelatine. Moderate Theoretical
- ▶ Vemurafenib is predicted to increase the exposure to agomelatine. Moderate Study

Albendazole

- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of albendazole. [Moderate] Study
- H₂ receptor antagonists (cimetidine) decrease the clearance of albendazole. [Moderate] Study
- ► HIV-protease inhibitors (ritonavir) decrease the exposure to albendazole. [Moderate] Study
- Albendazole slightly decreases the exposure to levamisole and levamisole moderately decreases the exposure to albendazole.
 Moderatel Study
- Alcohol → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects)
 ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to alcohol used for topical action unless specified.
- Alcohol potentially increases the risk of visual disturbances when given with antiepileptics (retigabine). [Moderate] Study
- Alcohol potentially causes a disulfiram-like reaction when given with antifungals, azoles (ketoconazole). Avoid. [Moderate]
 Anecdotal
- ► Alcohol causes serious, potentially fatal, CNS depression when given with clomethiazole. Avoid. Severe Study → Also see TABLE 11 p. 1492
- Alcohol (in those who drink heavily) potentially decreases the anticoagulant effect of coumarins. Severe Study
- Alcohol (excessive consumption) potentially increases the risk of gastrointestinal adverse effects when given with dimethyl fumarate. Avoid. [Moderate] Theoretical
- ► Alcohol causes an extremely unpleasant systemic reaction when given with disulfiram. Avoid for at least 24 hours before and up to 14 days after stopping treatment. Severe Study
- ► Alcohol potentially causes a disulfiram-like reaction when given with griseofulvin. [Moderate] Anecdotal
- ► Alcohol potentially causes a disulfiram-like reaction when given with levamisole. Moderate Study
- Alcohol (excessive consumption) potentially increases the risk of lactic acidosis when given with metformin. Avoid excessive alcohol consumption. [Moderate] Theoretical
- Alcohol might increase the concentration of methylphenidate.
 Avoid. Moderate Study
- ► Alcohol potentially causes a disulfiram-like reaction when given with metronidazole. Avoid for at least 48 hours after stopping treatment. [Moderate] Study
- ► Alcohol causes rapid release of opioids (hydromorphone, morphine) from extended-release preparations. Avoid. Severe Study → Also see TABLE 11 p. 1492
- ► Alcohol (in those who drink heavily) causes severe liver damage when given with paracetamol. Severe Study → Also see TABLE 1 p. 1490
- ► Alcohol increases the risk of facial flushing and skin irritation when given with topical pimecrolimus. [Moderate] Study
- ► Alcohol potentially causes a disulfiram-like reaction when given with procarbazine. [Moderate] Anecdotal
- ➤ Alcohol potentially increases the concentration of retinoids (acitretin). Avoid and for 2 months after stopping acitretin. Moderate Study
- Alcohol increases the risk of facial flushing and skin irritation when given with topical tacrolimus. [Moderate] Study

Aldesleukin → see TABLE 15 p. 1493 (myelosuppression)

Aldosterone antagonists → see TABLE 18 p. 1494 (hyponatraemia),
TABLE 8 p. 1491 (hypotension), TABLE 16 p. 1494 (increased serum
potassium)

eplerenone · spironolactone

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to eplerenone. Avoid. Moderate

 Theoretical
- ➤ Spironolactone is predicted to oppose the effects of antiandrogens (abiraterone). Avoid. Severe Theoretical

Aldosterone antagonists (continued)

- Antiarrhythmics (amiodarone) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 210. Severe Theoretical
- ➤ Antiarrhythmics (dronedarone) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 210. Severe Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical → Also see TABLE 18 n. 1494
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 210. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to eplerenone.
 Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 210. Severe Study → Also see TABLE 8 p. 1491
- Cenobamate is predicted to decrease the exposure to eplerenone. Adjust dose. Moderate Theoretical
- Cobicistat is predicted to markedly increase the exposure to eplerenone. Avoid. Severe Study
- ► Crizotinib is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 210. Severe Study
- ► Eplerenone very slightly increases the exposure to digoxin.

 Mild Study
- ► Spironolactone increases the concentration of digoxin.
- Monitor and adjust dose. Moderate Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to eplerenone. Avoid. Severe Study
- Idelalisib is predicted to markedly increase the exposure to eplerenone. Avoid. Severe Study
 Imatinib is predicted to increase the exposure to eplerenone.
- Adjust eplerenone dose, p. 210. Severe Study

 Letermovir is predicted to increase the exposure to eplerenone.
- Adjust eplerenone dose, p. 210. Severe Study
- Eplerenone potentially increases the concentration of lithium.
 Avoid. [Moderate] Theoretical
- ► Spironolactone potentially increases the concentration of lithium. [Moderate] Study
 ► Macrolides (clarithromycin) are predicted to markedly increase
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to eplerenone. Avoid. Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 210. Severe Study
- Mitotane is predicted to decrease the exposure to eplerenone.
 Avoid. Moderate Theoretical
- ➤ Spironolactone is predicted to decrease the effects of mitotane. Avoid. Severe Anecdotal
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 210. [Severe] Study
- Nilotinib is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 210. Severe Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical
- St John's wort is predicted to slightly decrease the exposure to eplerenone. Avoid. [Moderate] Study

Alectinib → see TABLE 6 p. 1491 (bradycardia), TABLE 1 p. 1490 (hepatotoxicity)

Alemtuzumab → see monoclonal antibodies

Alendronate → see bisphosphonates

Alfacalcidol → see vitamin D substances

Alfentanil → see opioids

Alfuzosin → see alpha blockers

Alimemazine → see antihistamines, sedating

Aliskiren → see TABLE 8 p. 1491 (hypotension), TABLE 16 p. 1494 (increased serum potassium)

FOOD AND LIFESTYLE Avoid apple juice and orange juice as they greatly decrease aliskiren concentrations and plasma renin activity.

► ACE inhibitors increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in

- selected patients, p. 195. Severe Study \rightarrow Also see TABLE 8 p. 1491 \rightarrow Also see TABLE 16 p. 1494
- Angiotensin-II receptor antagonists increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients, p. 195. Severe Study → Also see TABLE 8 p. 1491 → Also see TABLE 16 p. 1494
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to aliskiren. Severe Study
- Antiepileptics (carbamazepine) decrease the exposure to aliskiren. [Moderate] Study
- Antifungals, azoles (itraconazole) markedly increase the exposure to aliskiren. Avoid. [Severe] Study
- ► Antifungals, azoles (ketoconazole) moderately increase the exposure to aliskiren. Moderate Study
- Berotralstat is predicted to increase the concentration of aliskiren. Monitor and adjust dose. Moderate Study
- ► Calcium channel blockers (verapamil) moderately increase the exposure to aliskiren. Moderatel Study → Also see TABLE 8 p. 1491
- ► Ceritinib is predicted to increase the exposure to aliskiren.

 Moderate Theoretical
- ► Ciclosporin markedly increases the exposure to aliskiren. Avoid. Severe Study → Also see TABLE 16 p. 1494
- ► Eliglustat is predicted to increase the exposure to aliskiren.

 Adjust dose. Moderate Study
- Grapefruit juice moderately decreases the exposure to aliskiren. Avoid. Severel Study
- ► HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to aliskiren. (Moderate) Theoretical
- ► Ibrutinib is predicted to increase the exposure to aliskiren. Separate administration by at least 6 hours. Moderate Theoretical
- ► Ivacaftor is predicted to increase the exposure to aliskiren.

 [Moderate] Study
- ► Lapatinib is predicted to increase the exposure to aliskiren.

 Moderate Theoretical
- Aliskiren slightly decreases the exposure to loop diuretics (furosemide). Moderate Study → Also see TABLE 8 p. 1491
- Lorlatinib is predicted to decrease the exposure to aliskiren.
 Moderate Study
- Macrolides (azithromycin) are predicted to increase the exposure to aliskiren. Moderate Theoretical
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to aliskiren. Moderate Study
- ► Mirabegron is predicted to increase the exposure to aliskiren.

 [Mild] Theoretical
- Neratinib is predicted to increase the exposure to aliskiren.
 [Moderate] Study
- ► Olaparib might increase the exposure to aliskiren. Moderate
 Theoretical
- ► Osimertinib is predicted to increase the exposure to aliskiren.

 Moderate Study
- Pibrentasvir with glecaprevir is predicted to increase the exposure to aliskiren. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to aliskiren.
 Mild Theoretical
- Ranolazine is predicted to increase the exposure to aliskiren.
 Moderate Theoretical
- Rifamycins (rifampicin) decrease the exposure to aliskiren.
 Moderate Study
- ► Sotorasib is predicted to increase the exposure to aliskiren.

 Avoid or adjust dose. Moderate Study
- ► St John's wort decreases the exposure to aliskiren. Moderate Study
- Statins (atorvastatin) slightly to moderately increase the exposure to aliskiren. [Moderate] Study
- ► Tepotinib is predicted to increase the concentration of aliskiren. [Severe] Study
- ► Tucatinib is predicted to increase the exposure to aliskiren. Use with caution and adjust dose. [Moderate] Theoretical
- Vandetanib is predicted to increase the exposure to aliskiren.
 Moderate Study
- ► Velpatasvir is predicted to increase the exposure to aliskiren.

 Severe Theoretical
- ▶ Vemurafenib is predicted to increase the exposure to aliskiren. Use with caution and adjust dose. [Moderate] Theoretical

Alitretinoin → see retinoids

Alkylating agents → see TABLE 15 p. 1493 (myelosuppression), TABLE 2 p. 1490 (nephrotoxicity), TABLE 5 p. 1491 (thromboembolism)

bendamustine • busulfan • carmustine • chlorambucil • cyclophosphamide • dacarbazine • estramustine • ifosfamide • lomustine • melphalan • temozolomide • thiotepa • treosulfan

- Oral antacids are predicted to decrease the absorption of oral estramustine. Avoid. Moderate Study
- Antifungals, azoles (isavuconazole) are predicted to increase the exposure to cyclophosphamide. [Moderate] Study
- ► Antifungals, azoles (itraconazole) increase the risk of busulfan toxicity when given with busulfan. Monitor and adjust dose.

 [Moderate] Study
- ► Antifungals, azoles (miconazole) are predicted to increase the concentration of busulfan. Use with caution and adjust dose. Moderate Theoretical
- ► Oral calcium salts decrease the absorption of estramustine.

 Severel Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylating agents. UKHSA advises avoid (refer to Green Book).
 Severej Theoretical
- Metronidazole increases the risk of toxicity when given with busulfan. [Severe] Study
- Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant) are predicted to increase the exposure to ifosfamide. Severe Theoretical
- Neurokinin-1 receptor antagonists (netupitant) very slightly increase the exposure to cyclophosphamide. [Moderate] Study
- Neurokinin-1 receptor antagonists (netupitant) are predicted to increase the exposure to ifosfamide. Moderate Study
- Paracetamol is predicted to decrease the clearance of busulfan.
 Moderate Theoretical
- Pemigatinib might increase the exposure to the active metabolite of cyclophosphamide. [Moderate] Theoretical
- Pemigatinib might decrease the exposure to ifosfamide.
 Moderate Theoretical
- ► Cyclophosphamide (high-dose) increases the risk of toxicity when given with pentostatin. Avoid. Severe Anecdotal → Also see TABLE 15 p. 1493 → Also see TABLE 5 p. 1491
- Cyclophosphamide increases the risk of prolonged neuromuscular blockade when given with suxamethonium.
 Moderate Study

Allopurinol

- ► ACE inhibitors are predicted to increase the risk of hypersensitivity and haematological reactions when given with allopurinol. Severel Anecdotal
- Allopurinol potentially increases the risk of haematological toxicity when given with azathioprine. Adjust azathioprine dose, p. 902. (Severe) Study
- Allopurinol is predicted to decrease the effects of capecitabine.
 Avoid. Severel Study
- Allopurinol potentially increases the risk of haematological toxicity when given with mercaptopurine. Adjust mercaptopurine dose, p. 986. Severe Study
- Allopurinol increases the risk of skin rash when given with penicillins (amoxicillin, ampicillin). [Moderate] Study
- Allopurinol is predicted to increase the risk of hyperuricaemia when given with pyrazinamide. Moderate Theoretical
- ► Thiazide diuretics are predicted to increase the risk of hypersensitivity reactions when given with allopurinol. Severe Theoretical

Almotriptan → see triptans

Alogliptin → see dipeptidylpeptidase-4 inhibitors **Alpelisib**

- Alpelisib is predicted to decrease the efficacy of bupropion.
 Mild Theoretical
- ► Ciclosporin is predicted to increase the exposure to alpelisib.

 Moderate Theoretical
- ► Alpelisib is predicted to decrease the efficacy of coumarins (warfarin). [Moderate] Theoretical
- ► Eltrombopag is predicted to increase the exposure to alpelisib.

 Moderate Theoretical

- Lapatinib is predicted to increase the exposure to alpelisib.
 Moderate Theoretical
- ► Leflunomide is predicted to increase the exposure to alpelisib.

 Moderate Theoretical
- ► Proton pump inhibitors (pantoprazole) are predicted to increase the exposure to alpelisib. Moderate Theoretical
- ► Teriflunomide is predicted to increase the exposure to alpelisib. Moderate Theoretical

Alpha blockers → see TABLE 7 p. 1491 (first-dose hypotension), TABLE 8 p. 1491 (hypotension)

alfuzosin • doxazosin • indoramin • prazosin • tamsulosin • terazosin

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to tamsulosin. Moderate Theoretical
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tamsulosin. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to doxazosin. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tamsulosin. Moderate Theoretical → Also see TABLE 8 p. 1491
- Cobicistat is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- Cobicistat is predicted to increase the exposure to doxazosin.
 Moderate Study
- ► Crizotinib is predicted to increase the exposure to tamsulosin.

 Moderate Theoretical
- ► HIV-protease inhibitors are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to doxazosin. [Moderate] Study
- ► Idelalisib is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- ► Idelalisib is predicted to increase the exposure to doxazosin.

 Moderate Study
- Imatinib is predicted to increase the exposure to tamsulosin.
 Moderate Theoretical
- ► Letermovir is predicted to increase the exposure to tamsulosin.

 Moderate Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to doxazosin. [Moderate] Study
- ► Macrolides (erythromycin) are predicted to increase the exposure to tamsulosin. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin).
 Use with caution or avoid. [Moderate] Study
- MAOIs, irreversible are predicted to increase the effects of indoramin. Avoid. Severe Theoretical → Also see TABLE 8 p. 1491
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to tamsulosin. Moderate Theoretical
- ► Nilotinib is predicted to increase the exposure to tamsulosin.

 [Moderate] Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of alfuzosin. Avoid. [Severe] Theoretical
- Alpha blockers cause significant hypotensive effects when given with phosphodiesterase type-5 inhibitors. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. Severe Study → Also see TABLE 8 p. 1491
- ► Ribociclib (high-dose) is predicted to increase the exposure to alfuzosin. Avoid. [Moderate] Theoretical

Alprazolam → see benzodiazepines

Alprostadil → see TABLE 8 p. 1491 (hypotension), TABLE 4 p. 1490 (antiplatelet effects)

Alteplase → see TABLE 3 p. 1490 (anticoagulant effects)

Aluminium hydroxide

- SEPARATION OF ADMINISTRATION Aluminium-containing antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Aluminium-containing antacids might damage enteric coatings designed to prevent dissolution in the stomach.
- ➤ Oral aluminium hydroxide might decrease the concentration of the active metabolite of oral baloxavir marboxil. Severe Theoretical
- Oral aluminium hydroxide decreases the absorption of chenodeoxycholic acid. [Moderate] Study
- ► Aluminium hydroxide increases the risk of blocked enteral or nasogastric tubes when given with enteral feeds. Moderate Study
- Aluminium hydroxide is predicted to decrease the exposure to iron chelators (deferasirox). Avoid. [Moderate] Theoretical
- Aluminium hydroxide is predicted to decrease the absorption of iron chelators (deferiprone). Avoid, Moderate Theoretical
- Aluminium hydroxide might decrease the exposure to roxadustat. Roxadustat should be taken at least 1 hour after aluminium hydroxide. [Moderate] Theoretical

Amantadine → see dopamine receptor agonists

Ambrisentan → see endothelin receptor antagonists

Amfetamines → see TABLE 13 p. 1493 (serotonin syndrome)

dexamfetamine · lisdexamfetamine

- Amfetamines are predicted to decrease the effects of apraclonidine. Avoid. Severe Theoretical
- Amfetamines are predicted to increase the risk of adverse effects when given with atomoxetine. [Severe] Theoretical
- ► HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to amfetamines. [Severe] Theoretical
- ► MAO-B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with amfetamines. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1493
- ► MAO-B inhibitors (safinamide) are predicted to increase the risk of severe hypertension when given with amfetamines. Severe

 Theoretical → Also see TABLE 13 p. 1493
- ➤ Amfetamines are predicted to increase the risk of a hypertensive crisis when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Anecdotal → Also see TABLE 13 p. 1493
- ➤ Amfetamines are predicted to increase the risk of a hypertensive crisis when given with moclobemide. Avoid. Severe | Theoretical → Also see TABLE 13 p. 1493
- ► Nabilone is predicted to increase the risk of cardiovascular adverse effects when given with amfetamines. Severe Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of amfetamines. Severe Theoretical
- Phenothiazines are predicted to decrease the effects of amfetamines and amfetamines are predicted to decrease the effects of phenothiazines. Moderatel Study
- ➤ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to amfetamines. Severe Theoretical → Also see TABLE 13 p. 1493

Amifampridine → see TABLE 9 p. 1492 (QT-interval prolongation) **Amikacin** → see aminoglycosides

Amiloride → see potassium-sparing diuretics

Aminoglycosides → see TABLE 2 p. 1490 (nephrotoxicity), TABLE 19 p. 1494 (ototoxicity), TABLE 20 p. 1494 (neuromuscular blocking effects)

amikacin • gentamicin • streptomycin • tobramycin

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions with topical **gentamicin** and **tobramycin** should be borne in mind.

- Aminoglycosides are predicted to decrease the effects of agalsidase alfa. Avoid. Moderate Theoretical
- Aminoglycosides are predicted to decrease the effects of agalsidase beta. Avoid. [Moderate] Theoretical
- Antifungals, azoles (miconazole) potentially decrease the exposure to tobramycin. [Moderate] Anecdotal

- ► Ataluren is predicted to increase the risk of nephrotoxicity when given with intravenous aminoglycosides. Avoid. Severe
- ► Aminoglycosides increase the risk of hypocalcaemia when given with bisphosphonates. Moderate Anecdotal → Also see TABLE 2 p. 1490
- ► Aminoglycosides potentially increase the concentration of digoxin. Monitor and adjust dose. [Mild] Study
- ► Loop diuretics increase the risk of nephrotoxicity when given with aminoglycosides. Avoid. Moderate Study → Also see TABLE 19 p. 1494
- Aminoglycosides are predicted to decrease the effects of neostigmine. [Moderate] Theoretical
- Aminoglycosides are predicted to decrease the effects of pyridostigmine. Moderate Theoretical
- Gentamicin is predicted to increase the exposure to relugolix.
 Avoid or take relugolix first and separate administration by at least 6 hours. [Moderate] Theoretical

Aminophylline → see TABLE 17 p. 1494 (reduced serum potassium)

FOOD AND LIFESTYLE Smoking can increase aminophylline clearance and increased doses of aminophylline are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.

- Aciclovir increases the exposure to aminophylline. Monitor and adjust dose. Severe Anecdotal
- ► Aminophylline is predicted to decrease the efficacy of antiarrhythmics (adenosine). Separate administration by 24 hours. [Mild] Theoretical
- Antiepileptics (fosphenytoin) are predicted to decrease the exposure to aminophylline. Adjust dose. Moderate Study
- Antiepileptics (phenobarbital) are predicted to decrease the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Antiepileptics (phenytoin) decrease the exposure to aminophylline. Adjust dose. Moderate Study
- Antiepileptics (primidone) are predicted to increase the clearance of aminophylline. Adjust dose. Moderate Theoretical
- Antiepileptics (stiripentol) are predicted to increase the exposure to aminophylline. Avoid. Moderate Theoretical
- Axitinib is predicted to increase the exposure to aminophylline.
 Moderate Theoretical
- ▶ Beta blockers, non-selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. Severe Theoretical
- ▶ Beta blockers, selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. Severe Theoretical
- Combined hormonal contraceptives is predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Aminophylline increases the risk of agitation when given with doxapram. Moderate Study
- ► Esketamine is predicted to increase the risk of seizures when given with aminophylline. Avoid. Severe Theoretical
- ► H₂ receptor antagonists (cimetidine) increase the concentration of aminophylline. Adjust dose. Severe Study
- HIV-protease inhibitors (ritonavir) decrease the exposure to aminophylline. Adjust dose. Moderate Study
- ► Interferons are predicted to slightly increase the exposure to aminophylline. Adjust dose. Moderate Theoretical
- ► Iron chelators (deferasirox) are predicted to increase the exposure to aminophylline. Avoid. Moderate Theoretical
- ► Isoniazid is predicted to affect the clearance of aminophylline.

 | Severe | Theoretical |
- Leflunomide decreases the exposure to aminophylline. Adjust dose. Moderate Study
- ► Aminophylline is predicted to decrease the concentration of lithium. Moderate Theoretical
- Macrolides (azithromycin) are predicted to increase the exposure to aminophylline. [Moderate] Theoretical
- ► Macrolides (clarithromycin) are predicted to increase the exposure to aminophylline. Adjust dose. Moderate Theoretical
- Aminophylline is predicted to decrease the exposure to macrolides (erythromycin). Adjust dose. [Severe] Study
- Methotrexate is predicted to decrease the clearance of aminophylline. Moderate Theoretical

- Metreleptin might alter the exposure to aminophylline. Severe
 Theoretical
- Mexiletine is predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Monoclonal antibodies (blinatumomab) are predicted to transiently increase the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
- Monoclonal antibodies (sarilumab) potentially affect the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to aminophylline. Monitor and adjust dose. Moderate Theoretical
- ► Nirmatrelvir boosted with ritonavir is predicted to decrease the concentration of aminophylline. Adjust dose. [Moderate]

 Theoretical
- Osilodrostat is predicted to increase the exposure to aminophylline. Adjust dose. Moderate Theoretical
- Pentoxifylline is predicted to increase the concentration of aminophylline. Use with caution or avoid. Severe Theoretical
- Aminophylline is predicted to slightly increase the exposure to phosphodiesterase type-4 inhibitors (roflumilast). Avoid.
 Moderate Theoretical
- Quinolones (ciprofloxacin) are predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Rifamycins (rifampicin) decrease the exposure to aminophylline.
 Adjust dose. Moderate Study
- Rucaparib is predicted to increase the exposure to aminophylline. Adjust dose. Moderate Theoretical
- ► SSRIs (fluvoxamine) moderately to markedly increase the exposure to aminophylline. Avoid. Severe Study
- St John's wort is predicted to decrease the concentration of aminophylline. [Severe] Theoretical
- ➤ Sympathomimetics, vasoconstrictor (ephedrine) increase the risk of adverse effects when given with aminophylline. Avoid in children. Moderate Study
- ► Teriflunomide decreases the exposure to aminophylline. Adjust dose. [Moderate] Study
- ► Valaciclovir is predicted to increase the exposure to aminophylline. [Severe] Anecdotal
- ▶ Vemurafenib is predicted to increase the exposure to aminophylline. Adjust dose. Moderate Theoretical

Aminosalicylic acid

- Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. Severe Theoretical
- Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severe Theoretical

Amiodarone → see antiarrhythmics

Amisulpride → see antipsychotics, second generation **Amitriptyline** → see tricyclic antidepressants

Amlodipine → see calcium channel blockers

Amoxicillin → see penicillins
Amphotericin B → see TABLE 2 p. 1490 (nephrotoxicity), TABLE 17
p. 1494 (reduced serum potassium)

- ► Amphotericin B increases the risk of toxicity when given with flucytosine. [Severe] Study
- Micafungin slightly increases the exposure to amphotericin B. Avoid or monitor toxicity. Moderate Study

Ampicillin → see penicillins

Amsacrine → see TABLE 15 p. 1493 (myelosuppression)

 Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. UKHSA advises avoid (refer to Green Book). <u>Severe</u> Theoretical

Anaesthetics, local → see TABLE 11 p. 1492 (CNS depressant effects)

bupivacaine • levobupivacaine • mepivacaine • oxybuprocaine • prilocaine • proxymetacaine • ropivacaine • tetracaine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ➤ Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Severe Theoretical
- ► Anaesthetics, local are predicted to increase the risk of cardiodepression when given with antiarrhythmics. [Severe]
 Theoretical → Also see TABLE 11 p. 1492
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Severe Theoretical → Also see TABLE 11 p. 1492
- ► Antiepileptics (phenytoin) are predicted to decrease the exposure to ropivacaine. Moderate Theoretical
- Antimalarials (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Severe Theoretical
- ► Axitinib is predicted to increase the exposure to ropivacaine.

 Moderate Theoretical
- ► Combined hormonal contraceptives is predicted to increase the exposure to ropivacaine. Moderate Theoretical
- ▶ Dapsone is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. (Severe) Theoretical
- ► HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to ropivacaine. Moderate Theoretical
- ▶ Leflunomide is predicted to decrease the exposure to ropivacaine. Moderate Theoretical
- Metoclopramide is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine.
 Avoid. Severe Theoretical
- Mexiletine is predicted to increase the exposure to ropivacaine.
 Moderate Theoretical
- Nitrates are predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine.
 Avoid. [Severe] Theoretical
- ► Nitrofurantoin is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. [Severe] Theoretical
- Nitroprusside is predicted to increase the risk of methaemoglobinaemia when given with prilocaine. [Severe] Theoretical
- Osilodrostat is predicted to increase the exposure to ropivacaine. Moderate Theoretical
- Paracetamol is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine.
 Use with caution or avoid. (Severe) Theoretical
- Quinolones (ciprofloxacin) are predicted to increase the exposure to ropivacaine. Moderate Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to ropivacaine. Moderate Theoretical
- Rucaparib is predicted to increase the exposure to ropivacaine.
 Moderate Theoretical
- ► SSRIs (fluvoxamine) decrease the clearance of ropivacaine. Avoid prolonged use. Moderate Study
- Sulfonamides potentially increase the risk of methaemoglobinaemia when given with topical prilocaine.
 Use with caution or avoid. [Severe] Anecdotal
- ► Teriflunomide is predicted to decrease the exposure to ropivacaine. Moderate Theoretical
- ► Vemurafenib is predicted to increase the exposure to ropivacaine. [Moderate] Theoretical

Anagrelide → see TABLE 9 p. 1492 (QT-interval prolongation), TABLE 4 p. 1490 (antiplatelet effects)

- Combined hormonal contraceptives is predicted to increase the exposure to anagrelide. [Moderate] Theoretical
- Mexiletine is predicted to increase the exposure to anagrelide.
 Moderate Theoretical
- ► Osilodrostat is predicted to increase the exposure to
- anagrelide. [Moderate] Theoretical → Also see TABLE 9 p. 1492

 → Quinolones (ciprofloxacin) are predicted to increase the
- exposure to anagrelide. Moderate Theoretical

 Rucaparib is predicted to increase the exposure to anagrelide.
- | Moderate | Theoretical |
 | SSRIs (fluvoxamine) are predicted to increase the exposure to anagrelide. | Moderate | Theoretical → Also see TABLE 4 p. 1490

Anagrelide (continued)

 Vemurafenib is predicted to increase the exposure to anagrelide. [Moderate] Theoretical → Also see TABLE 9 p. 1492

Anakinra

- Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. [Severe] Theoretical
- Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Avoid. Severe Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with anakinra. Avoid. Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anakinra. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Monoclonal antibodies (certolizumab pegol) are predicted to increase the risk of generalised infection (possibly lifethreatening) when given with anakinra. Avoid. Severe Theoretical
- ► Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies (golimumab). Avoid. [Severe] Theoretical

Andexanet alfa

- Andexanet alfa has been reported to affect the anticoagulant effect of heparin. Avoid. [Severe] Anecdotal
- Andexanet alfa is predicted to affect the anticoagulant effect of low molecular-weight heparins. Avoid. Severe Theoretical
- Angiotensin-II receptor antagonists → see TABLE 7 p. 1491 (first-dose hypotension), TABLE 8 p. 1491 (hypotension), TABLE 16 p. 1494 (increased serum potassium)

azilsartan • candesartan • eprosartan • irbesartan • losartan • olmesartan • telmisartan • valsartan

- Angiotensin-II receptor antagonists increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients, p. 195. <u>Severe</u> Study → Also see TABLE 8 p. 1491 → Also see TABLE 16 p. 1494
- Angiotensin-II receptor antagonists potentially increase the concentration of lithium. Monitor concentration and adjust dose. [Severe] Anecdotal
- ➤ Taxanes (cabazitaxel) are predicted to affect the exposure to valsartan. Manufacturer advises take 12 hours before or 3 hours after cabazitaxel. [Moderate] Theoretical

Antacids

- SEPARATION OF ADMINISTRATION Aluminium- and magnesium-containing antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Aluminium- and magnesium-containing antacids might damage enteric coatings designed to prevent dissolution in the stomach.
- ➤ Oral antacids are predicted to decrease the exposure to oral acalabrutinib. Separate administration by at least 2 hours.

 Moderate Study
- ➤ Oral antacids are predicted to decrease the absorption of oral alkylating agents (estramustine). Avoid. [Moderate] Study
- Oral antacids decrease the absorption of oral antiepileptics (gabapentin). Gabapentin should be taken 2 hours after antacids. [Moderate] Study
- ➤ Oral antacids decrease the absorption of oral antifungals, azoles (itraconazole) capsules. Itraconazole should be taken 2 hours before or 1 hour after antacids. [Moderate] Study
- Oral antacids decrease the absorption of oral antifungals, azoles (ketoconazole). Separate administration by at least 2 hours. [Moderate] Study
- ➤ Oral antacids decrease the absorption of oral antihistamines, non-sedating (fexofenadine). Separate administration by 2 hours. [Mild] Study
- Oral antacids are predicted to decrease the absorption of oral antimalarials (chloroquine). Separate administration by at least 4 hours. [Moderate] Theoretical
- ➤ Oral antacids are predicted to decrease the absorption of oral antimalarials (proguanil). Separate administration by at least 2 hours. [Moderate] Study

- Oral antacids decrease the absorption of oral aspirin (high-dose). [Moderate] Study
- Oral antacids might decrease the concentration of the active metabolite of oral baloxavir marboxil. Avoid. [Severe] Theoretical
- Oral antacids decrease the exposure to oral bictegravir.
 Separate administration by at least 2 hours. Moderate Study
- ➤ Oral antacids decrease the absorption of oral bisphosphonates (alendronate). Alendronate should be taken at least 30 minutes before antacids. Moderate Study
- ➤ Oral antacids decrease the absorption of oral bisphosphonates (clodronate). Avoid antacids for 2 hours before or 1 hour after clodronate. [Moderate] Study
- ➤ Oral antacids are predicted to decrease the absorption of oral bisphosphonates (ibandronate). Avoid antacids for at least 6 hours before or 1 hour after ibandronate. [Moderate] Theoretical
- ► Oral antacids decrease the absorption of oral bisphosphonates (risedronate). Separate administration by at least 2 hours.

 Moderate Study
- ➤ Oral antacids are predicted to decrease the absorption of oral bosutinib. Bosutinib should be taken at least 12 hours before antacids. Moderate Theoretical
- ➤ Oral antacids are predicted to decrease the concentration of oral cabotegravir. Cabotegravir should be taken 4 hours before or 2 hours after antacids. Moderate Theoretical
- ➤ Oral antacids are predicted to decrease the absorption of oral ceritinib. Separate administration by 2 hours. Moderate

 Theoretical
- Oral antacids are predicted to decrease the absorption of oral cholic acid. Separate administration by 5 hours. Mild Theoretical
- ➤ Oral antacids are predicted to decrease the absorption of oral corticosteroids (deflazacort). Separate administration by 2 hours. [Moderate] Theoretical
- ► Oral antacids decrease the absorption of oral corticosteroids (dexamethasone). [Moderate] Study
- Oral antacids decrease the absorption of oral dasatinib.
 Separate administration by at least 2 hours. Moderate Study
- ► Oral **antacids** decrease the absorption of oral **digoxin**. Separate administration by 2 hours. Mild Study
- Oral antacids are predicted to decrease the absorption of oral dipyridamole (immediate release tablets). Moderate Theoretical
- Oral antacids decrease the exposure to oral dolutegravir.
 Dolutegravir should be taken 2 hours before or 6 hours after antacids. [Moderate] Study
- Oral antacids decrease the absorption of oral eltrombopag.
 Eltrombopag should be taken 2 hours before or 4 hours after antacids. Severel Study
- Oral antacids decrease the exposure to oral elvitegravir.
 Separate administration by at least 4 hours. [Moderate] Study
- Oral antacids are predicted to decrease the absorption of oral erlotinib. Erlotinib should be taken 2 hours before or 4 hours after antacids. [Moderate] Theoretical
- Oral antacids decrease the exposure to oral fibrates (gemfibrozil). [Moderate] Study
- ► Oral antacids are predicted to decrease the exposure to oral gefitinib. [Moderate] Theoretical
- ➤ Oral antacids are predicted to decrease the absorption of oral HIV-protease inhibitors (atazanavir). Atazanavir should be taken 2 hours before or 1 hour after antacids. [Severe] Theoretical
- ➤ Oral antacids are predicted to decrease the absorption of oral HIV-protease inhibitors (tipranavir). Separate administration by 2 hours. [Moderate] Study
- ➤ Oral antacids are predicted to decrease the absorption of oral hydroxychloroquine. Separate administration by at least 4 hours. [Moderate] Theoretical
- ➤ Oral antacids decrease the absorption of oral iron.

 Manufacturer advises iron should be taken 1 hour before or
 2 hours after antacids. [Moderate] Study
- ► Oral antacids is predicted to decrease the absorption of oral lapatinib. Avoid. [Moderate] Theoretical
- Oral antacids are predicted to decrease the exposure to oral ledipasvir. Separate administration by 4 hours. [Moderate]
- Oral antacids decrease the exposure to oral mycophenolate.
 Moderate Study

- Oral antacids are predicted to decrease the exposure to oral neratinib. Separate administration by at least 3 hours. Mild
- ► Oral **antacids** might affect the absorption of oral **nilotinib**. Separate administration by at least 2 hours. Moderate
 Theoretical
- ➤ Oral antacids are predicted to decrease the exposure to oral NNRTIS (rilpivirine). Rilpivirine should be taken 4 hours before or 2 hours after antacids. [Severe] Theoretical
- Oral antacids are predicted to decrease the absorption of oral pazopanib. Pazopanib should be taken 1 hour before or 2 hours after antacids. [Moderate] Theoretical
- ➤ Oral antacids decrease the absorption of oral penicillamine. Separate administration by 2 hours. [Mild] Study
- ▶ Oral antacids decrease the absorption of oral phenothiazines.
- Moderate Anecdotal

 ➤ Oral antacids increase the risk of metabolic alkalosis when given with oral polystyrene sulfonate. Severe Anecdotal
- ➤ Oral antacids decrease the absorption of oral quinolones. Quinolones should be taken 2 hours before or 4 hours after antacids. [Moderate] Study
- Oral antacids decrease the exposure to oral raltegravir. Avoid.
 [Moderate] Study
- Oral antacids decrease the absorption of oral rifamycins (rifampicin). Rifampicin should be taken 1 hour before antacids. Moderate Study
- Oral antacids decrease the exposure to oral riociguat. Riociguat should be taken 1 hour before or 2 hours after antacids. Mild Study
- Antacids might decrease the exposure to roxadustat.
 Roxadustat should be taken at least 1 hour after antacids.
 Moderate Theoretical
- Antacids are predicted to decrease the exposure to selpercatinib. [Moderate] Theoretical
- Oral antacids are predicted to decrease the exposure to oral sotorasib. Sotorasib should be taken 4 hours before or 10 hours after antacids. [Moderate] Theoretical
- ► Oral antacids decrease the absorption of oral statins (rosuvastatin). Separate administration by 2 hours. [Moderate]
- ➤ Oral antacids decrease the absorption of oral strontium. Separate administration by 2 hours. [Moderate] Study
- Oral antacids decrease the absorption of oral sulpiride.
 Separate administration by 2 hours. Moderate Study
- Oral antacids greatly decrease the absorption of oral tetracyclines. Separate administration by 2 to 3 hours.
 Moderate Study
- ➤ Oral antacids are predicted to decrease the absorption of oral thyroid hormones (levothyroxine). Separate administration by at least 4 hours. [Moderate] Anecdotal
- ➤ Oral antacids are predicted to decrease the absorption of oral ursodeoxycholic acid. Separate administration by 2 hours. Moderate Theoretical
- Oral antacids are predicted to decrease the concentration of oral velpatasvir. Separate administration by 4 hours. [Moderate] Theoretical

Antazoline → see antihistamines, sedating

Anthracyclines → see TABLE 15 p. 1493 (myelosuppression), TABLE 5 p. 1491 (thromboembolism)

daunorubicin • doxorubicin • epirubicin • idarubicin • mitoxantrone • pixantrone

GENERAL INFORMATION Caution is necessary with concurrent use of **anthracyclines** with cardiotoxic drugs, or drugs that reduce cardiac contractility.

- Calcium channel blockers (verapamil) moderately increase the exposure to doxorubicin. Moderate Study
- ► Ciclosporin increases the concentration of anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone). [Severe] Study
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to epirubicin. Avoid. [Moderate] Study
- ► Leflunomide is predicted to increase the exposure to anthracyclines (daunorubicin, doxorubicin, mitoxantrone).

 [Moderate] Theoretical → Also see TABLE 15 p. 1493

- ► Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anthracyclines. UKHSA advises avoid (refer to Green Book). |Severe| Theoretical
- Anthracyclines are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (trastuzumab, trastuzumab emtansine). Avoid. Severe Theoretical → Also see TABLE 15 p. 1493
- Anthracyclines are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (trastuzumab deruxtecan). Severe Theoretical → Also see TABLE 15 n. 1493
- ► Teriflunomide is predicted to increase the exposure to anthracyclines (daunorubicin, doxorubicin, mitoxantrone).
 Moderate Theoretical

Anti-androgens → see TABLE 9 p. 1492 (QT-interval prolongation)

abiraterone • apalutamide • bicalutamide • cyproterone • darolutamide • enzalutamide • flutamide

GENERAL INFORMATION Caution with concurrent chemotherapy—safety and efficacy with abiraterone and enzaluatmide not established.

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to 5-HT3-receptor antagonists (ondansetron). Moderate Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to abemaciclib. Avoid. Severe Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to abrocitinib. Avoid. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to acalabrutinib. Avoid. [Severe] Study
- ► Aldosterone antagonists (spironolactone) are predicted to
- oppose the effects of abiraterone. Avoid. [Severe] Theoretical
 ➤ Anti-androgens (apalutamide, enzalutamide) are predicted to
 decrease the exposure to aldosterone antagonists (eplerenone).
- Avoid. Moderate Theoretical

 ➤ Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to anti-androgens (abiraterone). Avoid.
- Severe Study
 ➤ Anti-androgens (apalutamide) are predicted to decrease the exposure to anti-androgens (darolutamide). Avoid. Moderate
- Anti-androgens (enzalutamide) are predicted to decrease the exposure to anti-androgens (darolutamide). Avoid. [Moderate] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Study → Also see TABLE 9 p. 1492
- ➤ Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the efficacy of antiarrhythmics (propafenone). Moderate Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil). [Mild] Study
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of cyproterone with ethinylestradiol (cocyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. | Severe| Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abiraterone. Avoid. Severe Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to darolutamide. Avoid. Moderate Study
- ► Enzalutamide is predicted to slightly decrease the exposure to antiepileptics (brivaracetam). Moderate Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. [Moderate] Study
- Apalutamide potentially decreases the exposure to antiepileptics (valproate). [Mild] Theoretical

Anti-androgens (continued)

- Antifungals, azoles (itraconazole) slightly increase the exposure to darolutamide. Monitor and adjust dose. [Moderate] Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to apalutamide. Mild Study → Also see TABLE 9 p. 1492
- ➤ Antifungals, azoles (ketoconazole) are predicted to increase the exposure to darolutamide. Monitor and adjust dose. [Moderate] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to antifungals, azoles (isavuconazole).
 Avoid. [Severe] Study
- Apalutamide slightly decreases the exposure to antihistamines, non-sedating (fexofenadine). [Mild] Study
- Darolutamide is predicted to increase the concentration of antihistamines, non-sedating (fexofenadine). [Moderate] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to antimalarials (artemether) with lumefantrine. Avoid. [Severe] Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of antimalarials (piperaquine).
 Avoid. Moderate Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to antipsychotics, second generation (aripiprazole). Adjust aripiprazole dose, p. 427.
 Moderatel Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to antipsychotics, second generation (cariprazine). Avoid. Severe Theoretical
- Enzalutamide is predicted to decrease the exposure to antipsychotics, second generation (clozapine). [Moderate] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to antipsychotics, second generation (lurasidone). Avoid. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to antipsychotics, second generation (paliperidone). Monitor and adjust dose. Severe Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to antipsychotics, second generation (quetiapine). [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to antipsychotics, second generation (risperidone). Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to avapritinib. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to avatrombopag. Adjust avatrombopag dose with moderate CYP2C9 inducers in chronic immune thrombocytopenia, p. 1120. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to axitinib. Avoid or adjust dose.
 Moderatel Study
- Anti-androgens (apalutamide, enzalutamide) decrease the exposure to bedaquiline. Avoid. Severe Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to benzodiazepines (alprazolam). Adjust dose. [Moderate] Theoretical
- Apalutamide is predicted to decrease the exposure to benzodiazepines (diazepam). Avoid or monitor. Mild Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to benzodiazepines (midazolam).
 Monitor and adjust dose. Moderate Study
- Abiraterone is predicted to increase the exposure to beta blockers, selective (metoprolol). Moderate Study
- Apalutamide is predicted to decrease the exposure to beta₂ agonists (salmeterol). Avoid or monitor. Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) slightly decrease the exposure to bortezomib. Avoid. Severe Study

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to very markedly decrease the exposure to bosutinib. Avoid.

 [Severe] Study → Also see TABLE 9 p. 1492
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to brigatinib. Avoid. [Severe] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to buspirone. Use with caution and adjust dose. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) moderately decrease the exposure to cabozantinib. Avoid. Moderate Study → Also see TABLE 9 p. 1492
- Enzalutamide is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Apalutamide is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to cannabidiol. Adjust dose. [Moderate] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ceritinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) decrease the concentration of ciclosporin. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to alter the effects of cilostazol. [Moderate] Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to cinacalcet. Monitor and adjust dose.

 Moderate Study
- ► Anti-androgens (apalutamide, enzalutamide) decrease the exposure to clomethiazole. Monitor and adjust dose. Moderate Study
- Clopidogrel is predicted to increase the exposure to apalutamide and apalutamide is predicted to increase the exposure to the active metabolite of clopidogrel. Avoid or monitor. [Moderate] Study
- Clopidogrel moderately increases the exposure to enzalutamide. Avoid or adjust enzalutamide dose, p. 1023.
 Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to cobicistat. Avoid. Severe Study
- Cobicistat is predicted to increase the exposure to apalutamide. Mild Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to cobimetinib. Avoid. Severe Theoretical
- ► Apalutamide is predicted to decrease the exposure to colchicine. Mild Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. [Moderate] Study
- ➤ Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to corticosteroids (fluticasone). Unknown Theoretical
- Apalutamide is predicted to decrease the exposure to coumarins. Avoid or monitor. Mild Study
- Enzalutamide potentially decreases the exposure to coumarins.
 Avoid or adjust dose and monitor INR. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to crizotinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to dabrafenib. Avoid. [Moderate]

 Theoretical
- Dabrafenib is predicted to decrease the exposure to darolutamide. Avoid. [Moderate] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to darifenacin. [Moderate] Theoretical

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to dasatinib. Avoid. Severe Study → Also see TABLE 9 D. 1492
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to slightly decrease the exposure to delamanid. Avoid. Moderate Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to dienogest. [Severe] Study
- Apalutamide is predicted to decrease the exposure to digoxin.
 Mild Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to dipeptidylpeptidase-4 inhibitors (linagliptin). Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to dolutegravir. Severe Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to dronabinol. Avoid or adjust dose.
 Mild Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to elbasvir. Avoid. Severe Study
- Anti-androgens (apalutamide, enzalutamide) is predicted to decrease the exposure to elexacaftor. Avoid. Severel Theoretical
- ➤ Abiraterone is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to eliglustat. Avoid. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to encorafenib. Severe Theoretical → Also see TABLE 9 p. 1492
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the efficacy of cyproterone with ethinylestradiol (cocyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. [Severe] Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to darolutamide. Avoid. Moderate Theoretical
- Anti-androgens (apalutamide, enzalutamide) affect the exposure to endothelin receptor antagonists (bosentan). Avoid. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to endothelin receptor antagonists (macitentan). Avoid. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to entrectinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 1057. [Severe] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to esketamine. Adjust dose. Moderate Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. Severe Study
- Anti-androgens (apalutamide, enzalutamide) moderately decrease the exposure to exemestane. Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to factor XA inhibitors (apixaban).
 Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to factor XA inhibitors (rivaroxaban).
 Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to fedratinib. Avoid. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study

- ► Fibrates (gemfibrozil) slightly increase the exposure to apalutamide. Mild Study
- ► Fibrates (gemfibrozil) moderately increase the exposure to enzalutamide. Avoid or adjust enzalutamide dose, p. 1023.

 [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to fostamatinib. Avoid. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to the active metabolite of fostemsavir.
 Avoid. [Severe] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to glasdegib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- Enzalutamide is predicted to greatly decrease the concentration of glecaprevir. Avoid. Severe Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to grazoprevir. Avoid. Severe Study
- Griseofulvin is predicted to decrease the efficacy of cyproterone with ethinylestradiol (co-cyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) decrease the concentration of haloperidol. Adjust dose. Moderate Study → Also see TABLE 9 p. 1492
- HIV-protease inhibitors are predicted to increase the exposure to apalutamide. [Mild] Study
- ► HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to darolutamide. Monitor and adjust dose. [Moderate] Theoretical
- ► HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of cyproterone with ethinylestradiol (co-cyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ibrutinib. Avoid or monitor. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to idelalisib. Avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to apalutamide.
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to irinotecan. Avoid. Severe Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ivabradine. Adjust dose. Moderate Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ivacaftor. Avoid. Severe Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ixazomib. Avoid. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to lapatinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to larotrectinib. Avoid.

 Moderatel Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to lomitapide. Monitor and adjust dose.
 Moderate Theoretical
- ► Bicalutamide is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to lorlatinib. Avoid. Severe Study
- Macrolides (clarithromycin) are predicted to increase the exposure to apalutamide. [Mild] Study → Also see TABLE 9 p. 1492

Anti-androgens (continued)

- ► Macrolides (clarithromycin) are predicted to increase the exposure to darolutamide. Monitor and adjust dose. [Moderate]

 Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study
- Darolutamide is predicted to increase the concentration of meglitinides (repaglinide). [Moderate] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to meglitinides (repaglinide). Monitor blood glucose and adjust dose. [Moderate] Study
- Apalutamide is predicted to decrease the exposure to methotrexate. Mild Study
- Darolutamide is predicted to increase the concentration of methotrexate. [Moderate] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to mifepristone. Severe Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study
- Mitotane is predicted to decrease the exposure to abiraterone.
 Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to darolutamide. Avoid. Moderate Study
- Apalutamide is predicted to decrease the exposure to moclobemide. Avoid or monitor. Mild Study
- Modafinii is predicted to decrease the efficacy of cyproterone with ethinylestradiol (co-cyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to monoclonal antibodies (polatuzumab vedotin). [Moderate] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to montelukast. [Mild] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to naldemedine. Avoid. Severe Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to neratinib. Avoid. Severe Study
- Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant) are predicted to decrease the efficacy of cyproterone with ethinylestradiol (co-cyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to neurokinin-1 receptor antagonists (aprepitant). Avoid. Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to neurokinin-1 receptor antagonists (fosaprepitant). Avoid. [Moderate] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to neurokinin-1 receptor antagonists (netupitant). Avoid. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to nilotinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to nirmatrelvir boosted with ritonavir. Avoid. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to nitisinone. Adjust dose. Moderate Theoretical
- ➤ NNRTIs (efavirenz, nevirapine) are predicted to decrease the efficacy of cyproterone with ethinylestradiol (co-cyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. Severel Study
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to darolutamide. Avoid. [Moderate] Theoretical

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to NNRTIs (doravirine). Avoid. Severe
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to NNRTIS (etravirine). Avoid. Severe Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to NNRTIs (nevirapine). Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) markedly decrease the exposure to NNRTIs (rilpivirine). Avoid. Severe Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to olaparib. Avoid. Moderate Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to opioids (alfentanil, fentanyl).

 Moderatel Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. Moderate Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) decrease the exposure to opioids (methadone). Monitor and adjust dose.

 [Severe] Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to opioids (oxycodone). Monitor and adjust dose. [Moderate] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to osilodrostat. Moderate Theoretical → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to osimertinib. Avoid. Moderate Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to ospemifene. Moderate Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to palbociclib. Avoid. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 1492
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to pazopanib. Avoid. Severe

 Theoretical → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to pemigatinib. Avoid. Severe Study
- Anti-androgens (apalutamide, enzalutamide) moderately decrease the exposure to phosphodiesterase type-4 inhibitors (apremilast). Avoid. Severel Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to phosphodiesterase type-4 inhibitors (roflumilast). Avoid. Moderate Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil). Avoid. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafii, vardenafii). Moderate Theoretical → Also see TABLE 9
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately to markedly decrease the exposure to pibrentasvir.
 Avoid. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to pitolisant. [Moderate] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to
- decrease the exposure to ponatinib. Avoid. Moderate Theoretical

 ► Anti-androgens (apalutamide, enzalutamide) might decrease the
 exposure to ponesimod. Moderate Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to praziquantel. Avoid.
 [Moderate] Study
- Apalutamide is predicted to decrease the exposure to proton pump inhibitors (lansoprazole, rabeprazole). Avoid or monitor.
- Apalutamide markedly decreases the exposure to proton pump inhibitors (omeprazole). Avoid or monitor. [Moderate] Study

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ranolazine. Avoid. Severe Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to reboxetine. Moderate Anecdotal
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to regorafenib. Avoid. Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to relugolix. Avoid. [Moderate] Study
- ► Anti-androgens (apalutamide, enzalutamide) might decrease the exposure to remdesivir. Avoid. Moderate Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to ribociclib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- Rifamycins (rifampicin) are predicted to decrease the exposure to abiraterone. Avoid. Severe Study
- Rifamycins are predicted to decrease the efficacy of cyproterone with ethinylestradiol (co-cyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. [Severe] Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to darolutamide. Avoid. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose.
 Moderate | Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to selpercatinib. Avoid. Moderate
 Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to selumetinib. Avoid. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to siponimod. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of sirolimus. Avoid. (Severe) Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to solifenacin. [Moderate] Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to sorafenib. Moderate Theoretical → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to sotorasib. Avoid. [Severe] Study
- ► Apalutamide is predicted to decrease the exposure to SSRIs (citalopram). Avoid or monitor. [Mild] Study → Also see TABLE 9 p. 1492
- St John's wort is predicted to decrease the exposure to darolutamide. Avoid. Moderate Theoretical
- Apalutamide is predicted to decrease the exposure to statins (atorvastatin). Moderate Study
- Darolutamide is predicted to increase the exposure to statins (atorvastatin, fluvastatin, rosuvastatin). Avoid. Severe
- ► Enzalutamide is predicted to decrease the exposure to statins (atorvastatin, simvastatin). [Moderate] Study
- Darolutamide is predicted to increase the concentration of statins (pravastatin, simvastatin). [Moderate] Theoretical
- ► Apalutamide slightly decreases the exposure to statins (rosuvastatin). Mild Study
- ► Apalutamide is predicted to decrease the exposure to statins (simvastatin). Avoid or monitor. Moderate Study

 ► Paralutamide is predicted to increase the exposure to
- Darolutamide is predicted to increase the exposure to sulfasalazine. Avoid. [Severe] Theoretical
- Darolutamide is predicted to increase the concentration of sulfonylureas (glibenclamide). Moderate Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 1080. [Moderate] Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) decrease the concentration of tacrolimus. Monitor and adjust dose. Severe Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to taxanes (cabazitaxel). Avoid.
 Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to taxanes (docetaxel). [Severe] Theoretical

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to taxanes (paclitaxel). Avoid. Severe
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of temsirolimus. Avoid. Severe Study
- Anti-androgens (apalutamide, enzalutamide) might decrease the exposure to tepotinib. Avoid. Severe Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to tezacaftor. Avoid. Severe Theoretical
- ► Apalutamide is predicted to decrease the exposure to thrombin inhibitors (dabigatran). Mild Study
- ► Apalutamide potentially decreases the exposure to thyroid hormones (levothyroxine). [Mild] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to ticagrelor. Avoid. Severe
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to tivozanib. Severe Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to tofacitinib. Avoid. Severe Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to tolvaptan. Use with caution or avoid depending on indication. Severe Study
- Darolutamide is predicted to increase the exposure to topotecan. Avoid. [Severe] Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to toremifene. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to trabectedin. Avoid. [Severe] Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to tucatinib. Avoid. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the efficacy of ulipristal. Avoid and for 4 weeks after stopping ulipristal. Severel Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to upadacitinib. [Moderate] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to vandetanib. Avoid. Moderate Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to velpatasvir. Avoid.
 Severel Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to vemurafenib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to venetoclax. Avoid. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). Severe Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid.

 | Severe | Theoretical → Also see TABLE 9 p. 1492
- ➤ Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to vinca alkaloids (vinorelbine). Use with caution or avoid. Severe Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to vismodegib. Avoid. Moderate
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to zopiclone. Adjust dose. Moderate Study

Anti-D (Rh₀) immunoglobulin → see immunoglobulins
Antiarrhythmics → see TABLE 6 p. 1491 (bradycardia), TABLE 8
p. 1491 (hypotension), TABLE 12 p. 1493 (peripheral neuropathy),
TABLE 9 p. 1492 (QT⁻interval prolongation), TABLE 11 p. 1492 (CNS depressant effects), TABLE 10 p. 1492 (antimuscarinics)

Antiarrhythmics (continued)

adenosine • amiodarone • disopyramide • dronedarone • flecainide • lidocaine • propafenone • vernakalant

- ► Amiodarone has a long half-life; there is potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped.
- Since systemic absorption can follow topical application of lidocaine, the possibility of interactions should be borne in mind
- Avoid intravenous class I and class III antiarrhythmics for 4 hours before and after vernakalant.
- Dronedarone is predicted to increase the exposure to abemaciclib. [Moderate] Study
- Dronedarone is predicted to increase the exposure to acalabrutinib. Avoid or monitor. Severe Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to afatinib. (Moderate) Study
- ► Amiodarone is predicted to decrease the effects of agalsidase alfa. Avoid. Moderate Theoretical
- Amiodarone is predicted to decrease the effects of agalsidase beta. Avoid. [Moderate] Theoretical
- Amiodarone is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 210. [Severe] Theoretical
- ▶ Dronedarone is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 210. Severe Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to aliskiren. [Severe] Study
- Dronedarone is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
- ➤ Aminophylline is predicted to decrease the efficacy of adenosine. Separate administration by 24 hours. [Mild] Theoretical
- ► Anaesthetics, local are predicted to increase the risk of cardiodepression when given with antiarrhythmics. Severe Theoretical → Also see TABLE 11 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the efficacy of propafenone. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Study → Also see TABLE 9 p. 1492
- Antiarrhythmics (propafenone) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (amiodarone). Monitor and adjust dose. Severe Theoretical → Also see TABLE 6 p. 1491
- Antiarrhythmics (amiodarone) increase the concentration of antiarrhythmics (flecainide). Adjust flecainide dose and monitor adverse effects. [Severe] Study → Also see TABLE 6 p. 1491 → Also see TABLE 9 p. 1492
- Antiarrhythmics (propafenone) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (lidocaine). [Moderate] Study
- ➤ Antiarrhythmics (dronedarone) are predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 1491
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of propafenone. [Moderate] Study
- ► Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to lidocaine. [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. Severe Study
- ► Amiodarone is predicted to slightly increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. Severe Study → Also see TABLE 12 p. 1493
- ► Antifungals, azoles (fluconazole) are predicted to increase the exposure to dronedarone. Severe Theoretical → Also see TABLE 9 p. 1492
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to propafenone.
 Monitor and adjust dose. Moderate Study

- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to disopyramide. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very markedly increase the exposure to dronedarone. Avoid.

 | Severe | Study → Also see TABLE 9 p. 1492|
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (miconazole) are predicted to increase the exposure to disopyramide. Use with caution and adjust dose.
 [Severe] Theoretical
- Antifungals, azoles (posaconazole) are predicted to increase the exposure to antiarrhythmics (disopyramide, dronedarone).
 Avoid. [Severe] Theoretical
- ▶ Dronedarone is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine, mizolastine). [Severe] Theoretical
- Dronedarone is predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. Moderate Study
- Dronedarone is predicted to increase the concentration of antimalarials (piperaquine). Severe Theoretical
- Dronedarone is predicted to increase the exposure to antipsychotics, second generation (cariprazine). Avoid. [Severe] Study
- ► Antipsychotics, second generation (clozapine) can cause constipation, as can antiarrhythmics (disopyramide, propafenone); concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Dronedarone is predicted to increase the exposure to antipsychotics, second generation (lurasidone). Adjust lurasidone dose. [Moderate] Study
- ▶ Dronedarone is predicted to increase the exposure to antipsychotics, second generation (quetiapine). Avoid. Moderate Study
- Dronedarone is predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. [Moderate]
 Study
- Amiodarone is predicted to increase the exposure to avatrombopag. Adjust avatrombopag dose with moderate CYP2C9 inhibitors in chronic immune thrombocytopenia, p. 1120. [Moderate] Study
- Dronedarone is predicted to increase the exposure to axitinib.
 Moderate Study
- Dronedarone is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical → Also see TABLE 9 p. 1492
- Dronedarone is predicted to increase the exposure to benzodiazepines (alprazolam). Severe Study
- ➤ Dronedarone is predicted to increase the exposure to benzodiazepines (midazolam). Monitor adverse effects and adjust dose. Severe Study
- ► Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to berotralstat. Severe Study
- ► Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular adverse effects when given with beta blockers, non-selective. Use with caution or avoid. Severe Study → Also see TABLE 6 p. 1491 → Also see TABLE 9 p. 1492
- ➤ Propafenone is predicted to increase the risk of cardiovascular adverse effects when given with beta blockers, non-selective (labetalol, levobunolol, nadolol, pindolol, sotalol). Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 1491
- Propafenone increases the risk of cardiovascular adverse effects when given with beta blockers, non-selective (propranolol). Use with caution or avoid. Severe Study → Also see
 TABLE 6 p. 1491
- ► Propafenone is predicted to increase the exposure to beta blockers, non-selective (timolol) and beta blockers, non-selective (timolol) are predicted to increase the risk of cardiodepression when given with propafenone. Severe Anecdotal → Also see TABLE 6 p. 1491
- Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of

- cardiovascular adverse effects when given with beta blockers, selective. Use with caution or avoid. Severe Study → Also see TABLE 6 p. 1491
- Propafenone is predicted to increase the risk of cardiovascular adverse effects when given with beta blockers, selective (acebutolol, atenolol, betaxolol, bisoprolol, celiprolol, esmolol).
 Use with caution or avoid. [Severe] Study -> Also see TABLE 6 p. 1491
- ► Propafenone is predicted to increase the exposure to beta blockers, selective (metoprolol). [Moderate] Study → Also see TABLE 6 p. 1491
- ► Propafenone is predicted to increase the exposure to beta blockers, selective (nebivolol) and beta blockers, selective (nebivolol) are predicted to increase the risk of cardiodepression when given with propafenone. Avoid. Severe Theoretical → Also see TABLE 6 p. 1491
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical
- ▶ Dronedarone is predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study → Also see TABLE 9 p. 1492
- ▶ Dronedarone is predicted to increase the exposure to brigatinib. Moderate Study → Also see TABLE 6 p. 1491
- Dronedarone is predicted to increase the exposure to buspirone. Use with caution and adjust dose. Moderate Study
- Dronedarone is predicted to increase the exposure to cabozantinib. Moderate Study → Also see TABLE 9 p. 1492
- ► Caffeine citrate decreases the efficacy of adenosine. Separate administration by 24 hours. Mild Study
- Calcium channel blockers (diltiazem, verapamil) increase the exposure to dronedarone and dronedarone increases the exposure to calcium channel blockers (diltiazem, verapamil).
 Moderatel Study → Also see TABLE 6 p. 1491
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Study → Also see TABLE 6 p. 1491
- ► Calcium channel blockers (verapamil) increase the risk of cardiodepression when given with flecainide. Severe

 Anecdotal → Also see TABLE 6 p. 1491
- Dronedarone is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Amiodarone is predicted to increase the risk of cardiodepression when given with calcium channel blockers (diltiazem, verapamil). Avoid. Severe Theoretical → Also see TABLE 6 p. 1491
- ➤ Disopyramide is predicted to increase the risk of cardiodepression when given with calcium channel blockers (verapamil). Severe | Theoretical
- ► Dronedarone is predicted to increase the exposure to ceritinib.
 Moderate Study → Also see TABLE 6 p. 1491 → Also see TABLE 9
 p. 1492
- Chloroprocaine is predicted to increase the risk of cardiovascular adverse effects when given with antiarrhythmics (amiodarone, dronedarone, vernakalant). [Severe] Theoretical
- Amiodarone increases the concentration of ciclosporin.
 Monitor concentration and adjust dose. Severe Study
- Dronedarone is predicted to increase the concentration of ciclosporin. Severe Study
- Cobicistat potentially increases the concentration of antiarrhythmics (amiodarone, disopyramide, flecainide, lidocaine). Severe Theoretical
- ➤ Cobicistat very markedly increases the exposure to dronedarone. Avoid. Severe Study
- Cobicistat is predicted to increase the exposure to propafenone. Monitor and adjust dose. Severe Study
- Dronedarone is predicted to increase the exposure to cobimetinib. Severe Study
- ➤ Amiodarone is predicted to increase the exposure to colchicine. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1212. Severe Theoretical
- ► Dronedarone is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212. [Severe] Study

- ▶ Dronedarone is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. Moderate Study
- ► Amiodarone increases the anticoagulant effect of coumarins.

 Severe Study
- ▶ Propafenone increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. Moderate Study
 - ► Dronedarone is predicted to increase the exposure to crizotinib. [Moderate] Study → Also see TABLE 6 p. 1491 → Also see TABLE 9 p. 1492
 - ► Crizotinib is predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Study → Also see TABLE 6 p. 1491
- Dronedarone is predicted to increase the exposure to dabrafenib. [Moderate] Study
- Dronedarone is predicted to increase the exposure to darifenacin. [Moderate] Study
- ▶ Darifenacin is predicted to increase the concentration of flecainide. [Moderate] Theoretical
- ► Dronedarone is predicted to increase the exposure to dasatinib. Severe Study → Also see TABLE 9 p. 1492
- ▶ Dronedarone is predicted to slightly increase the exposure to dienogest. Moderate Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust digoxin dose, p. 117. [Severe] Study → Also see TABLE 6 p. 1491
- ➤ Propafenone increases the concentration of digoxin. Monitor and adjust dose. Severe Study → Also see TABLE 6 p. 1491
- Dronedarone is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Mild] Study
- Dipyridamole increases the exposure to adenosine. Avoid or adjust dose. Severe Study
- Dronedarone is predicted to increase the exposure to domperidone. Avoid. Severe Study
- Dronedarone is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). Severe Theoretical
- Dronedarone is predicted to increase the concentration of dopamine receptor agonists (cabergoline). Severe Anecdotal
- Dronedarone is predicted to moderately increase the exposure to dutasteride. [Mild] Study
- ➤ Dronedarone is predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. Severe Theoretical
- Antiarrhythmics (dronedarone, propafenone) are predicted to increase the exposure to eligiustat. Avoid or adjust dose consult product literature. [Severe] Study
- ▶ Dronedarone is predicted to moderately increase the exposure to encorafenib. Moderate Study → Also see TABLE 9 p. 1492
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to dronedarone. Severe Theoretical
- Dronedarone is predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. Severe Theoretical → Also see TABLE 9 p. 1492
- ► Dronedarone is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
- Dronedarone is predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- Amiodarone is predicted to increase the exposure to erlotinib.
 Moderate Theoretical
- Dronedarone is predicted to increase the exposure to erlotinib.
 [Moderate] Study
- Dronedarone is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to factor XA inhibitors (apixaban).
 Moderate Theoretical
- Amiodarone slightly increases the exposure to factor XA inhibitors (edoxaban). Severe Study
- Dronedarone slightly increases the exposure to factor XA inhibitors (edoxaban). Adjust edoxaban dose, p. 138. Severel Study
- ► Amiodarone might increase the exposure to factor XA inhibitors (rivaroxaban). [Moderate] Study
- ► Dronedarone might increase the exposure to factor XA inhibitors (rivaroxaban). Avoid. Moderate Study

Antiarrhythmics (continued)

- Dronedarone is predicted to increase the exposure to fedratinib. Monitor and adjust dose. Moderate Study
- ➤ Dronedarone is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Mild] Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to fidaxomicin. Avoid. Moderate Study
- Dronedarone is predicted to increase the exposure to gefitinib.
 Moderate Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to gilteritinib. Moderate Theoretical
- Dronedarone potentially increases the exposure to glecaprevir.
 Moderate Theoretical
- Grapefruit juice increases the exposure to amiodarone. Avoid.
 Moderate Study
- Grapefruit juice moderately increases the exposure to dronedarone. Avoid. Severel Study
- ► Grapefruit juice increases the exposure to propafenone.

 Monitor and adjust dose. [Moderate] Study
- Monitor and adjust dose. Moderate Study
 ► Dronedarone is predicted to increase the concentration of
- guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Theoretical

 ► H₂ receptor antagonists (cimetidine) increase the exposure to
 amiodarone. [Moderate] Study
- ► H₂ receptor antagonists (cimetidine) slightly increase the exposure to flecainide. Monitor and adjust dose. Mild Study
- ► H₂ receptor antagonists (cimetidine) increase the exposure to lidocaine. Monitor and adjust dose. Moderate Study
- H₂ receptor antagonists (cimetidine) are predicted to increase the exposure to propafenone. Monitor and adjust dose.
 Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to amiodarone. Avoid. Severe Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to disopyramide. [Severe] Theoretical
- ► HIV-protease inhibitors very markedly increase the exposure to dronedarone. Avoid. (Severe) Study
- ► HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to flecainide. Avoid or monitor adverse effects.

 [Severe] Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to lidocaine. Avoid. [Severe] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Severe] Study
- ➤ Amiodarone is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose, p. 1062. [Severe] Theoretical
- Dronedarone is predicted to increase the exposure to ibrutinib.
 Adjust ibrutinib dose with moderate CYP3A4 inhibitors,
 p. 1062. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to amiodarone. Avoid. Moderate Theoretical
- ► Idelalisib very markedly increases the exposure to dronedarone. Avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to propafenone. Monitor and adjust dose. Severe Study
- ► Imatinib is predicted to increase the exposure to dronedarone. Severe Theoretical
- ► Imatinib is predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Study
- ▶ Dronedarone is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 231. Severe Theoretical → Also see TABLE 6 p. 1491
- Dronedarone is predicted to increase the exposure to ivacaftor.
 Adjust dose with moderate CYPSA4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- ► Dronedarone is predicted to increase the exposure to lapatinib.

 Moderate Study → Also see TABLE 9 p. 1492
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to larotrectinib. [Mild] Theoretical
- ► Ledipasvir increases the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. [Severe] Anecdotal
- Letermovir is predicted to increase the concentration of amiodarone. Moderate Theoretical

- Letermovir is predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Study
- ► Amiodarone is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- ► Dronedarone is predicted to increase the exposure to lomitapide. Avoid. Moderate Theoretical
- Dronedarone is predicted to increase the exposure to loperamide. Severe Theoretical
- Macrolides (clarithromycin) very markedly increase the exposure to dronedarone. Avoid. Severe Study → Also see TABLE 9 n. 1492
- ► Macrolides (clarithromycin) are predicted to increase the exposure to propafenone. Monitor and adjust dose. Severe
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to lidocaine. Moderate Theoretical
- ► Macrolides (erythromycin) are predicted to moderately increase the exposure to dronedarone. Avoid. Severe Theoretical → Also see TABLE 9 p. 1492
- ► Macrolides (erythromycin) are predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Study
- Mexiletine is predicted to increase the risk of torsade de pointes when given with antiarrhythmics. Avoid. Severe Theoretical
- Dronedarone is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- Mitotane is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. Severel Study
- ► Mitotane is predicted to decrease the efficacy of propafenone.

 Moderatel Study
- ▶ Dronedarone increases the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. [Severe] Theoretical
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to naldemedine. [Moderate] Study
- Dronedarone is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor adverse effects, p. 67. [Moderate] Study
- Dronedarone is predicted to increase the exposure to neratinib. Avoid moderate CYP3A4 inhibitors or adjust neratinib dose and monitor for gastrointestinal adverse effects, p. 1069. [Severe] Study
- Neurokinin-1 receptor antagonists (aprepitant) increase the exposure to dronedarone. Severel Theoretical
- ➤ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Study
- Nilotinib is predicted to increase the exposure to propafenone.
 Monitor and adjust dose. Moderate Study
- ► Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to nintedanib. [Moderate] Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of antiarrhythmics (amiodarone, dronedarone, flecainide, propafenone). Avoid. [Severe] Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of lidocaine. Severe Theoretical
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to dronedarone. Severe Theoretical → Also see TABLE 9
- ► NSAIDs (celecoxib) are predicted to increase the exposure to antiarrhythmics (flecainide, propafenone). Monitor and adjust dose. Moderate Theoretical
- ▶ Dronedarone is predicted to increase the exposure to olaparib. Avoid moderate CYP3A4 inhibitors or adjust olaparib dose, p. 1088. Moderate Theoretical
- Dronedarone is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. Moderate Study → Also see TABLE 6 p. 1491
- ► Amiodarone is predicted to increase the concentration of opioids (fentanyl). Moderate Theoretical → Also see TABLE 6 p. 1491
- Dronedarone is predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical → Also see TABLE 9 p. 1492

- ► Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 1492
- ▶ Dronedarone is predicted to increase the exposure to pazopanib. Moderate Study → Also see TABLE 9 p. 1492
- Dronedarone is predicted to increase the exposure to pemigatinib. [Severe] Study
- Propafenone is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. Moderate Theoretical
- Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 878. [Moderate] Theoretical
- Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate CYP3A4 inhibitors, p. 879.
 Moderate] Study → Also see TABLE 9 p. 1492
- Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical
- ▶ Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. Severe Theoretical → Also see TABLE 9 p. 1492
- Amiodarone is predicted to increase the exposure to pibrentasvir. [Moderate] Theoretical
- Dronedarone potentially increases the exposure to pibrentasvir. [Moderate] Theoretical
- ▶ Dronedarone is predicted to increase the exposure to pimozide. Avoid. Severe Theoretical → Also see TABLE 9 p. 1492
- Dronedarone is predicted to increase the exposure to ponatinib. Moderate Study
- Quinolones (ciprofloxacin) slightly increase the exposure to lidocaine. [Mild] Study
- ► Dronedarone is predicted to increase the exposure to ranolazine. Severe Study → Also see TABLE 9 p. 1492
- ► Dronedarone is predicted to increase the exposure to regorafenib. [Moderate] Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to relugolix. Avoid or take relugolix first and separate administration by at least 6 hours. [Moderate] Study
- ► Propafenone is predicted to increase the exposure to relugolix. Avoid or take relugolix first and separate administration by at least 6 hours. [Moderate] Theoretical
- ► Amiodarone is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1356. Moderate
- ► Ribociclib (high-dose) is predicted to increase the exposure to amiodarone. Avoid. Moderate Theoretical → Also see TABLE 9 p. 1492
- ► Dronedarone is predicted to increase the exposure to ribociclib. [Moderate] Study → Also see TABLE 9 p. 1492
- Rifamycins (rifampicin) are predicted to decrease the efficacy of propafenone. [Moderate] Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. Severe
- Dronedarone is predicted to increase the exposure to ruxolitinib. Moderate Study
- ▶ Dronedarone is predicted to increase the exposure to selpercatinib. [Moderate] Study → Also see TABLE 9 p. 1492
- Dronedarone is predicted to increase the exposure to selumetinib. Avoid or adjust dose—consult product literature.
 Severe Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to siponimod. Avoid depending on other drugs taken—consult product literature. Severe Study → Also see TABLE 6 p. 1491
- Amiodarone is predicted to increase the concentration of sirolimus. [Severe] Anecdotal
- Dronedarone increases the concentration of sirolimus. Monitor and adjust dose. Moderate Study
- ➤ Sofosbuvir is predicted to increase the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. (Severe) Anecdotal
- SSRIs (fluvoxamine) are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study

- ► Dronedarone is predicted to increase the exposure to SSRIs (citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline). [Severe] Theoretical → Also see TABLE 9 p. 1492
- Dronedarone is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate CYP3A4 inhibitors, p. 887. Moderate Theoretical
- ► St John's wort is predicted to decrease the exposure to dronedarone. Avoid. Severe Theoretical
- Amiodarone is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. Moderate Theoretical
- ► Dronedarone slightly increases the exposure to statins (atorvastatin). Monitor and adjust dose. Severe Study
- ► Amiodarone is predicted to increase the exposure to statins (fluvastatin). [Moderate] Study
- Dronedarone slightly increases the exposure to statins (rosuvastatin). Adjust dose. Severe Study
- Amiodarone increases the exposure to statins (simvastatin).
 Adjust simvastatin dose, p. 222. Severe Study
- ▶ Dronedarone moderately increases the exposure to statins (simvastatin). Monitor and adjust dose. Severe Study
- ► Amiodarone is predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. Moderate Study
- ► Dronedarone is predicted to increase the exposure to sunitinib.
 Moderate Study → Also see TABLE 9 p. 1492
- Lidocaine is predicted to increase the effects of suxamethonium. [Moderate] Study
- Amiodarone is predicted to increase the concentration of tacrolimus. (Severe) Anecdotal
- Dronedarone is predicted to increase the concentration of tacrolimus. [Severe] Study
- ► Antiarrhythmics (amiodarone, dronedarone) are predicted to slightly increase the exposure to talazoparib. Avoid or adjust talazoparib dose, p. 1091. [Severe] Study
- Propafenone is predicted to increase the exposure to talazoparib. Avoid or adjust talazoparib dose, p. 1091. Moderate Theoretical
- ► Dronedarone is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical
- ▶ Dronedarone is predicted to increase the exposure to taxanes (docetaxel). [Severe] Study
- Amiodarone is predicted to increase the exposure to taxanes (docetaxel, paclitaxel) (oral). Unknown Theoretical → Also see
 TABLE 12 p. 1493
- Dronedarone is predicted to increase the exposure to taxanes (paclitaxel). [Moderate] Anecdotal
- Dronedarone is predicted to increase the concentration of temsirolimus. Use with caution or avoid. Moderate Theoretical
- Dronedarone is predicted to increase the exposure to tezacaftor. Adjust dose with moderate CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320. [Severe] Study
- ► Theophylline decreases the efficacy of adenosine. Separate administration by 24 hours. Mild Study
- ► Amiodarone increases the exposure to thrombin inhibitors (dabigatran). Monitor and adjust dose. [Severe] Study
- ► Dronedarone moderately increases the exposure to thrombin inhibitors (dabigatran). Avoid. [Severe] Study
- Amiodarone is predicted to increase the risk of thyroid dysfunction when given with thyroid hormones. Avoid. Moderate Study
- ► Amiodarone is predicted to increase the exposure to ticagrelor. Use with caution or avoid. Severe Study → Also see TABLE 6 p. 1491
- ► Antiarrhythmics (amiodarone, dronedarone) might increase the exposure to tigecycline. [Mild] Anecdotal
- ➤ Dronedarone given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. Moderate Study
- Dronedarone is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate CYP3A4 inhibitors, p. 724. [Moderate] Study
- ► Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to topotecan. Severe Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the concentration of trametinib. [Moderate] Theoretical

Antiarrhythmics (continued)

- Dronedarone is predicted to increase the exposure to trazodone. [Moderate] Theoretical
- ► Dronedarone is predicted to increase the exposure to tricyclic antidepressants. Avoid. Severe Theoretical → Also see TABLE 9 p. 1492
- Propafenone is predicted to increase the concentration of tricyclic antidepressants. Moderate Theoretical → Also see TABLE 10 p. 1492
- Dronedarone is predicted to increase the exposure to ulipristal.
 Avoid if used for uterine fibroids. Moderate Study
- ► Amiodarone is predicted to increase the concentration of velpatasvir. Avoid or monitor. [Moderate] Theoretical
- ▶ Dronedarone is predicted to increase the exposure to vemurafenib. Severe Theoretical → Also see TABLE 9 p. 1492
- Amiodarone is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. Severe Theoretical
- Dronedarone is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature.
 Severe Study
- ► Amiodarone might increase the exposure to vinca alkaloids.

 Severe Theoretical → Also see TABLE 12 p. 1493 → Also see TABLE 9
 p. 1492
- ▶ Dronedarone is predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 9 p. 1492
- ► Dronedarone is predicted to increase the exposure to zopiclone. Adjust dose. Moderate Study

Anticholinesterases, centrally acting → see TABLE 6 p. 1491 (bradycardia)

$done pezil \bullet galantamine \bullet rivastigmine$

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to donepezil. [Mild] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to donepezil. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- Bupropion is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- Cinacalcet is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- Cobicistat is predicted to increase the exposure to galantamine. Monitor and adjust dose. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to galantamine. Monitor and adjust dose. Moderate Study
- Idelalisib is predicted to increase the exposure to galantamine.
 Monitor and adjust dose. Moderate Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to galantamine. Monitor and adjust dose. Moderate
- Mitotane is predicted to decrease the exposure to donepezil.
 [Mild] Study
- Anticholinesterases, centrally acting are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising.
 Moderatel Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to donepezil. Mild Study
- ➤ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to galantamine. Monitor and adjust dose. Moderate Study
- Anticholinesterases, centrally acting increase the effects of suxamethonium. [Moderate] Theoretical → Also see TABLE 6 p. 1491
- ► Terbinafine is predicted to increase the exposure to galantamine. Monitor and adjust dose. Moderate Study

Antiepileptics → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 18 p. 1494 (hyponatraemia), TABLE 12 p. 1493 (peripheral neuropathy), TABLE 11 p. 1492 (CNS depressant effects)

brivaracetam · carbamazepine · eslicarbazepine · ethosuximide · fosphenytoin · gabapentin · lacosamide · lamotrigine · levetiracetam · oxcarbazepine · paraldehyde · perampanel · phenobarbital · phenytoin · pregabalin · primidone · retigabine · rufinamide · stiripentol · tiagabine · topiramate · valproate · vigabatrin · zonisamide

- Manufacturer advises caution on concurrent use of eslicarbazepine with drugs that prolong the PR interval
- Avoid taking milk, dairy products, carbonated drinks, fruit juices, or caffeine-containing food and drinks at the same time as stiripentol.
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to 5-HT3-receptor antagonists (ondansetron). [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to abemaciclib. Avoid. Severe Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to abrocitinib. Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to acalabrutinib. Avoid. [Severe] Study
- Acetazolamide potentially increases the risk of toxicity when given with valproate. [Severe] Study
 Acetazolamide potentially increases the risk of overheating.
- Acetazolamide potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical
- ► Antiepileptics (phenobarbital, phenytoin) are predicted to decrease the exposure to afatinib. [Moderate] Theoretical
- ► Carbamazepine is predicted to decrease the exposure to afatinib. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of albendazole. Moderate Study
- ► Alcohol potentially increases the risk of visual disturbances when given with retigabine. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to aldosterone antagonists (eplerenone). Avoid. [Moderate] Theoretical > Also see TABLE 18 p. 1494
- ► Carbamazepine decreases the exposure to aliskiren. [Moderate] Study
- Fosphenytoin is predicted to decrease the exposure to aminophylline. Adjust dose. Moderate Study
- Phenobarbital is predicted to decrease the exposure to aminophylline. Adjust dose. Moderate Theoretical
- Phenytoin decreases the exposure to aminophylline. Adjust dose. [Moderate] Study
- Primidone is predicted to increase the clearance of aminophylline. Adjust dose. Moderate Theoretical
- Stiripentol is predicted to increase the exposure to aminophylline. Avoid. [Moderate] Theoretical
- ➤ Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. Severe

 Theoretical → Also see TABLE 11 p. 1492
- Phenytoin is predicted to decrease the exposure to anaesthetics, local (ropivacaine). Moderate Theoretical
- ► Oral antacids decrease the absorption of oral gabapentin.

 Gabapentin should be taken 2 hours after antacids. Moderate

 Study
- Anti-androgens (apalutamide) potentially decrease the exposure to valproate. Mild Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to perampanel. Monitor and adjust dose. [Moderate] Study
- ► Anti-androgens (enzalutamide) are predicted to slightly decrease the exposure to brivaracetam. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to anti-androgens (abiraterone). Avoid. [Severe] Study
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of anti-androgens (cyproterone) with ethinylestradiol (co-cyprindiol). Use alternative methods

- during treatment with, and for 28 days after, the enzyme inducing drug is stopped. Severe Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to anti-androgens (darolutamide). Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Study
- Antiarrhythmics (amiodarone) are predicted to slightly increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Severe] Study → Also see TABLE 12 p. 1493
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to antiarrhythmics (lidocaine). Severel Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of antiarrhythmics (propafenone). [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil). [Miid] Study
- Antiepileptics (carbamazepine) decrease the concentration of antiepileptics (brivaracetam). [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (brivaracetam). [Moderate] Study
- Antiepileptics (lamotrigine) potentially increase the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) decrease the concentration of antiepileptics (lamotrigine). Adjust lamotrigine dose and monitor carbamazepine concentration, p. 346, p. 336. [Woderate]
- Antiepileptics (phenobarbital) affect the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) increase the concentration of antiepileptics (phenobarbital). Adjust dose. [Woderate] Study
- Antiepileptics (topiramate) increase the risk of carbamazepine toxicity when given with antiepileptics (carbamazepine).
 Moderate Study
- ► Antiepileptics (stiripentol) increase the concentration of antiepileptics (carbamazepine, phenobarbital). Avoid in Dravet syndrome. [Severe] Study
- Antiepileptics (carbamazepine) slightly decrease the exposure to antiepileptics (eslicarbazepine, oxcarbazepine). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (oxcarbazepine) are predicted to increase the concentration of antiepileptics (fosphenytoin). Monitor concentration and adjust dose. Moderate Study
- Antiepileptics (stiripentol) are predicted to increase the concentration of antiepileptics (fosphenytoin). (Severe) Study
- Antiepileptics (carbamazepine) affect the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. Severe Study
- Antiepileptics (eslicarbazepine) increase the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the exposure to antiepileptics (eslicarbazepine). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (valproate) affect the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (valproate). [Severe] study
- Antiepileptics (vigabatrin) decrease the concentration of antiepileptics (fosphenytoin, phenytoin). [Mild] Study
- Antiepileptics (fosphenytoin) decrease the concentration of antiepileptics (lamotrigine). Monitor and adjust lamotrigine dose, p. 346. Moderate Study
- Antiepileptics (phenobarbital, phenytoin, primidone) decrease the concentration of antiepileptics (lamotrigine). Monitor and adjust lamotrigine dose, p. 346. Moderate Study → Also see TABLE 11 p. 1492
- ► Antiepileptics (valproate) increase the exposure to antiepileptics (lamotrigine). Adjust lamotrigine dose and monitor rash, p. 346. Severe | Study

- ➤ Antiepileptics (lamotrigine) are predicted to increase the concentration of antiepileptics (oxcarbazepine) and antiepileptics (oxcarbazepine) are predicted to decrease the concentration of antiepileptics (lamotrigine). Monitor adverse effects and adjust dose. [Moderate] Study
- ► Antiepileptics (carbamazepine, fosphenytoin) are predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (oxcarbazepine) decrease the concentration of antiepileptics (perampanel) and antiepileptics (perampanel) increase the concentration of antiepileptics (oxcarbazepine).
 Monitor and adjust dose, [Moderate] Study
- Antiepileptics (phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1492
- Antiepileptics (phenytoin) increase the concentration of antiepileptics (phenobarbital) and antiepileptics (phenobarbital) affect the concentration of antiepileptics (phenytoin). [Moderate]
 Study
- Antiepileptics (fosphenytoin) increase the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) affect the concentration of antiepileptics (fosphenytoin). [Moderate] Study
- Antiepileptics (oxcarbazepine) are predicted to increase the concentration of antiepileptics (phenytoin). Monitor concentration and adjust dose. Moderate Study
- Antiepileptics (stiripentol) are predicted to increase the concentration of antiepileptics (phenytoin). Avoid in Dravet syndrome. [Severe] Study
- Antiepileptics (carbamazepine) potentially decrease the concentration of antiepileptics (primidone) and antiepileptics (primidone) potentially decrease the concentration of antiepileptics (carbamazepine). Adjust dose. [Moderate] Anecdotal
- Antiepileptics (phenytoin) increase the concentration of antiepileptics (primidone) and antiepileptics (primidone) affect the concentration of antiepileptics (phenytoin). [Moderate] Study
- Antiepileptics (stiripentol) are predicted to increase the concentration of antiepileptics (primidone). [Severe] Theoretical
- Antiepileptics (valproate) affect the concentration of antiepileptics (primidone). Monitor and adjust dose. Severe Study
- Antiepileptics (carbamazepine) slightly increase the clearance of antiepileptics (retigabine). [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to slightly increase the clearance of antiepileptics (retigabine). Moderate Study
- Antiepileptics (valproate) increase the exposure to antiepileptics (rufinamide). Adjust rufinamide dose, p. 355. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to antiepileptics (tiagabine). Monitor and adjust tiagabine dose, p. 361. [Moderate]
- Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (topiramate) and antiepileptics (topiramate) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. Moderate Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antiepileptics (topiramate). Mild Study
- Antiepileptics (phenobarbital) decrease the concentration of antiepileptics (valproate) and antiepileptics (valproate) increase the concentration of antiepileptics (phenobarbital). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (topiramate) increase the risk of toxicity when given with antiepileptics (valproate). Severe Study
- Antiepileptics (carbamazepine) slightly to moderately decrease the concentration of antiepileptics (zonisamide) and antiepileptics (zonisamide) affect the concentration of antiepileptics (carbamazepine). Monitor and adjust dose.
 Moderatel Study
- ► Antiepileptics (fosphenytoin, phenytoin) slightly to moderately decrease the concentration of antiepileptics (zonisamide). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antiepileptics (zonisamide).
 Monitor and adjust dose. Moderate Study
- Antiepileptics (topiramate) potentially increase the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to very slightly increase the exposure to perampanel. [Mild] Study
- ► Antifungals, azoles (miconazole) increase the risk of carbamazepine toxicity when given with carbamazepine. Monitor and adjust dose. (Severe) Anecdotal
- Antifungals, azoles (miconazole) increase the risk of phenytoin toxicity when given with fosphenytoin. Monitor and adjust dose. [Severe] Anecdotal
- Antifungals, azoles (miconazole) increase the risk of phenytoin toxicity when given with phenytoin. Monitor and adjust dose.

 Severel Anecdotal
- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (fluconazole) and antifungals, azoles (fluconazole) increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly, p. 336. [Severe] Theoretical → Also see TABLE 1 p. 1490
- Antifungals, azoles (fluconazole) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Study
- Fosphenytoin very markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid and for 14 days after stopping fosphenytoin. Moderate Study
- Phenobarbital decreases the concentration of antifungals, azoles (itraconazole). Avoid and for 14 days after stopping phenobarbital. [Moderate] Study
- Phenytoin very markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid and for 14 days after stopping phenytoin. [Moderate] Study
- ➤ Primidone is predicted to decrease the concentration of antifungals, azoles (itraconazole). Moderate Theoretical
- ► Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (itraconazole, voriconazole) and antifungals, azoles (itraconazole, voriconazole) increase the concentration of carbamazepine. Avoid or adjust dose. Moderate Theoretical → Also see TABLE 1 p. 1490
- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (ketoconazole) and antifungals, azoles (ketoconazole) slightly increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly, p. 336. [Moderate]
 Study
- Phenobarbital is predicted to decrease the concentration of antifungals, azoles (ketoconazole). Avoid. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) decrease the exposure to antifungals, azoles (ketoconazole). Avoid. [Moderate] Study
- Primidone is predicted to decrease the concentration of antifungals, azoles (ketoconazole, posaconazole). Avoid.
 Moderate Study
- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (posaconazole) and antifungals, azoles (posaconazole) increase the concentration of carbamazepine.
 Avoid. [Moderate] Theoretical
- Phenobarbital is predicted to decrease the concentration of antifungals, azoles (posaconazole). Avoid. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to antifungals, azoles (posaconazole).
 Avoid. Moderatel Study
- Fosphenytoin decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to fosphenytoin. Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 654. [Moderate]

- Phenytoin decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to phenytoin. Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 654, p. 351. [Moderate] Study
- ➤ Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antifungals, azoles (voriconazole). Avoid. [Moderate] Theoretical
- ➤ Antihistamines, sedating (hydroxyzine) potentially increase the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antimalarials (artemether) with lumefantrine. Avoid. [Severe]
- ► Antimalarials (pyrimethamine) increase the risk of haematological toxicity when given with antiepileptics (fosphenytoin, phenytoin). [Severe] Study
- ► Antimalarials (pyrimethamine) are predicted to increase the risk of haematological toxicity when given with antiepileptics (phenobarbital, primidone). [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of antimalarials (piperaquine). Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, phenobarbital, primidone) potentially increase the risk of toxicity when given with antimalarials (quinine). [Unknown] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to antipsychotics, second generation (aripiprazole). Adjust aripiprazole dose, p. 427. [Moderate] Study → Also see TABLE 11 p. 1492
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antipsychotics, second generation (cariprazine). Avoid. [Severe] Theoretical → Also see TABLE 11 p. 1492
- ► Carbamazepine is predicted to increase the risk of myelosuppression when given with antipsychotics, second generation (clozapine). Avoid. [Severe] Anecdotal
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antipsychotics, second generation (clozapine). [Moderate] Anecdotal -> Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antipsychotics, second generation (lurasidone). Avoid.
 Moderate) Study -> Also see TABLE 11 p. 1492
- Carbamazepine potentially decreases the exposure to antipsychotics, second generation (olanzapine). Monitor and adjust dose. Moderate Study
- Phenytoin is predicted to decrease the exposure to antipsychotics, second generation (olanzapine). Monitor and adjust dose. [Moderate] Study
- Valproate increases the risk of adverse effects when given with antipsychotics, second generation (olanzapine). Severe Study
- Valproate slightly increases the exposure to antipsychotics, second generation (paliperidone). Adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antipsychotics, second generation (paliperidone). Monitor and adjust dose. (Severe) Study -> Also see TABLE 11 p. 1492
- Valproate potentially increases the risk of neutropenia when given with antipsychotics, second generation (quetiapine).
 Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antipsychotics, second generation (quetiapine). Moderate Study -> Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antipsychotics, second generation (risperidone). Adjust dose. Moderate) Study -> Also see TABLE 11 p. 1492

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to avapritinib. Avoid. Severe Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to bedaquiline. Avoid. [Severe] Study → Also see TABLE 1 p. 1490
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to benzodiazepines (alprazolam). Adjust dose. [Moderate]
 Theoretical → Also see TABLE 11 p. 1492
- Stiripentol increases the concentration of benzodiazepines (clobazam). Severe Study
- ▶ Benzodiazepines (chlordiazepoxide) affect the concentration of antiepileptics (fosphenytoin, phenytoin). Severe Study
- ▶ Benzodiazepines (clobazam, clonazepam) potentially affect the concentration of antiepileptics (fosphenytoin, phenytoin).
 [Severe] Anecdotal
- Benzodiazepines (diazepam) potentially affect the concentration of antiepileptics (fosphenytoin, phenytoin).
 Monitor concentration and adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to benzodiazepines (midazolam). Monitor and adjust dose.
 Moderate) Study → Also see TABLE 11 p. 1492
- Carbamazepine is predicted to decrease the concentration of berotralstat. Avoid. [Severe] Theoretical
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (carvedilol, labetalol). [Moderate] Theoretical
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (propranolol). [Moderate] Study
- ➤ Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, selective (acebutolol, bisoprolol, metoprolol, nebivolol). [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Study
- Oxcarbazepine is predicted to decrease the exposure to bictegravir. Avoid. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) slightly decrease the exposure to bortezomib. Avoid. Severe Study → Also see TABLE 12 p. 1493
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to brigatinib. Avoid. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to bupropion. [Severe] Study
- ► Valproate increases the exposure to bupropion. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to buspirone. Use with caution and adjust dose. Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) might decrease the concentration of cabotegravir. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to cabozantinib. Avoid. Moderatel Study
- ➤ Antiepileptics (fosphenytoin, phenytoin) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study
- Calcium channel blockers (diltiazem) increase the concentration of carbamazepine and carbamazepine is predicted to decrease the exposure to calcium channel blockers (diltiazem). Monitor concentration and adjust dose. [Severe] Anecdotal

- Calcium channel blockers (verapamil) increase the concentration
 of carbamazepine and carbamazepine is predicted to decrease
 the exposure to calcium channel blockers (verapamil). Severe
 Aperdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) potentially increase the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- Valproate increases the exposure to calcium channel blockers (nimodipine). Adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cannabidiol. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1492
- Cannabidiol increases the risk of increased ALT concentrations when given with valproate. Avoid or adjust dose. [Severe] Study
- Capecitabine increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal
- ► Carbapenems decrease the concentration of valproate. Avoid.

 Severe Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the concentration of caspofungin. Adjust caspofungin dose, p. 646. Moderate Theoretical
- ► Cenobamate might increase the exposure to antiepileptics (fosphenytoin, primidone). Moderate Theoretical → Also see TABLE 11 p. 1492
- ► Cenobamate slightly increases the exposure to antiepileptics (phenobarbital, phenytoin). Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1492
- ➤ Cenobamate is predicted to decrease the concentration of lamotrigine and lamotrigine might affect the efficacy of cenobamate. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ceritinib. Avoid. [Severe] Study
- Antiepileptics (phenobarbital, primidone) are predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose.
 Moderate Theoretical
- Antiepileptics (phenobarbital, primidone) decrease the concentration of chloramphenicol. Moderate Study
- Intravenous chloramphenicol increases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) affect the concentration of intravenous chloramphenicol. Monitor concentration and adjust dose. [Severe] Study
- Phenobarbital decreases the effects of cholic acid. Avoid.
 Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of ciclosporin. Severe Study
- Oxcarbazepine decreases the concentration of ciclosporin.
 Severel Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the effects of cilostazol. Moderate Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. [Moderate] Study
- Carbamazepine is predicted to increase the risk of haematological toxicity when given with oral cladribine.
 Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to clomethiazole. Monitor and adjust dose. Moderate Study → Also see TABLE 11 p. 1492

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobicistat. Avoid. [Severe] Study
- ► Antiepileptics (eslicarbazepine, oxcarbazepine) are predicted to decrease the concentration of cobicistat. Severe Theoretical
- ➤ Cobicistat is predicted to very slightly increase the exposure to perampanel. Mild Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobimetinib. Avoid. (Severe) Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Study
- ► Combined hormonal contraceptives alter the exposure to lamotrigine and lamotrigine might decrease the efficacy of combined hormonal contraceptives. Adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose.
 Moderatel Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (fluticasone). Unknown Theoretical
- Antiepileptics (fosphenytoin, phenytoin) are predicted to alter the anticoagulant effect of coumarins. Moderate Anecdotal
- Antiepileptics (phenobarbital, primidone) decrease the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate] Study
- Carbamazepine decreases the effects of coumarins. Monitor and adjust dose. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to crizotinib. Avoid. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severe Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- exposure to delamanid. Avoid. Moderate Study

 Lamotrigine is predicted to increase the risk of hyponatraemia when given with desmopressin. [Severe Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives. interactions p. 859. [Severe] Theoretical
- ▶ Desogestrel is predicted to increase the exposure to lamotrigine. Moderate Study
- Diazoxide decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. [Moderate] Anecdotal
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dienogest. [Severe] Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. [Moderate] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dipeptidylpeptidase-4 inhibitors (linagliptin). Moderate) Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Moderate] Study
- ▶ Disulfiram increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 12 p. 1493
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dolutegravir. Adjust dolutegravir dose, p. 696. [Severe] Study
- ► Carbamazepine decreases the exposure to dolutegravir. Adjust dolutegravir dose, p. 696. [Severe] Study
- ► Oxcarbazepine is predicted to decrease the exposure to dolutegravir. Adjust dolutegravir dose, p. 696. Severe Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dronabinol. Avoid or adjust dose. Mild Study → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to elbasvir. Avoid. [Severe] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) is predicted to decrease the exposure to elexacaftor. Avoid. [Severe] Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to eliglustat. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to encorafenib. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) affect the exposure to endothelin receptor antagonists (bosentan). Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to endothelin receptor antagonists (macitentan). Avoid. Severel Study
- Enteral feeds decrease the absorption of phenytoin. Severe Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to entrectinib. Avoid. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 1057. [Severe] Study
- Eslicarbazepine is predicted to decrease the exposure to erlotinib. Severel Theoretical
- ► Oxcarbazepine decreases the exposure to erlotinib. Severe Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to esketamine. Adjust dose. Moderate Theoretical → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of estradiol. [Moderate] Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of etoposide. [Moderate] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study

- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to exemestane. [Moderate] Study
- ► Phenobarbital is predicted to decrease the exposure to factor XA inhibitors (apixaban). Use with caution or avoid. Severe Anecdotal
- ➤ Antiepileptics (carbamazepine, phenytoin) are predicted to decrease the exposure to factor XA inhibitors (apixaban). Use with caution or avoid. [Severe] Study
- Antiepileptics (fosphenytoin, primidone) are predicted to decrease the exposure to factor XA inhibitors (apixaban). (Severe) Study
- ► Carbamazepine is predicted to decrease the exposure to factor XA inhibitors (edoxaban). [Moderate] Study
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to factor XA inhibitors (edoxaban). Severel Theoretical
- Fosphenytoin is predicted to decrease the exposure to factor XA inhibitors (rivaroxaban). Avoid unless patient can be monitored for signs of thrombosis. Severe Theoretical
- ► Oxcarbazepine is predicted to decrease the exposure to factor XA inhibitors (rivaroxaban). Severe Study
- Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to factor XA inhibitors (rivaroxaban). Avoid unless patient can be monitored for signs of thrombosis. [Severe] study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fedratinib. Avoid. [Moderate] Study
- Carbamazepine is predicted to decrease the concentration of fenfluramine. Adjust dose. Severe Theoretical
- ► Stiripentol (given with clobazam, and with or without valproate) modestly increases the exposure to fenfluramine. Adjust fenfluramine dose, p. 341. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fesoterodine. Avoid. Moderate Study
- ► Fluorouracil increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. Severel Anecdotal
- Folates are predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Monitor concentration and adjust dose. [Severe]
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fostamatinib. Avoid. [Severe] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to the active metabolite of fostemsavir. Avoid. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- Eslicarbazepine is predicted to decrease the exposure to gefitinib. [Moderate] Theoretical
- Oxcarbazepine decreases the exposure to gefitinib. [Severe] Study
 Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the exposure to gilteritinib. Avoid. [Severe] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to glasdegib. Avoid. [Severe] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to glecaprevir. Avoid. Severe Study
- Antiepileptics (eslicarbazepine, oxcarbazepine) potentially decrease the exposure to glecaprevir. Avoid. [Severe] Theoretical
- Valproate potentially opposes the effects of glycerol phenylbutyrate. [Moderate] Theoretical
- Grapefruit juice slightly increases the exposure to carbamazepine. Monitor and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study

- ► Antiepileptics (phenobarbital, primidone) decrease the effects of griseofulvin. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Study -> Also see TABLE 11 p. 1492
- Oxcarbazepine is predicted to decrease the concentration of guanfacine. Monitor and adjust guanfacine dose, p. 384.
 Moderate Theoretical
- Guanfacine increases the concentration of valproate. Monitor and adjust dose. Moderate Study
- ► H₂ receptor antagonists (cimetidine) transiently increase the concentration of carbamazepine. Monitor concentration and adjust dose. [Moderate] Study
- ► H₂ receptor antagonists (cimetidine) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of haloperidol. Adjust dose. Moderate Study → Also see TABLE 11 p. 1492
- ► Haloperidol potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children.

 [Severe] Theoretical
- ► HIV-protease inhibitors are predicted to affect the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of HIV-protease inhibitors. Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to carbamazepine and carbamazepine is predicted to decrease the exposure to HIV-protease inhibitors. Monitor and adjust dose. [Severe] Theoretical
- ► HIV-protease inhibitors (ritonavir) slightly decrease the exposure to lamotrigine. Severe Study
- HIV-protease inhibitors (ritonavir) are predicted to decrease the concentration of valproate. (Severe) Anecdotal
- HIV-protease inhibitors are predicted to affect the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of HIVprotease inhibitors. [Severe] Theoretical
- ► HIV-protease inhibitors are predicted to very slightly increase the exposure to perampanel. Mild Study
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the effects of hormone replacement therapy. [Noderate] Anecdotal
- ► Hormone replacement therapy is predicted to alter the exposure to lamotrigine. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ibrutinib. Avoid or monitor. Severe Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study
- ► Idelalisib is predicted to very slightly increase the exposure to perampanel. Mild Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to imatinib. Avoid. Moderate Study
- Eslicarbazepine is predicted to decrease the exposure to imatinib. [Moderate] Theoretical
- ➤ Topiramate is predicted to decrease the exposure to imatinib. Moderate Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. [Moderate] Theoretical
- ► Iron chelators (dexrazoxane) might decrease the absorption of antiepileptics (fosphenytoin, phenytoin). Avoid. Severe Theoretical

- ► Isoniazid increases the concentration of antiepileptics (fosphenytoin, phenytoin). Moderate Study → Also see TABLE 12 p. 1493
- ► Isoniazid markedly increases the concentration of carbamazepine and carbamazepine increases the risk of hepatotoxicity when given with isoniazid. Monitor concentration and adjust dose. Severe Study → Also see TABLE 1 p. 1490
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivacaftor. Avoid. Severel Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ixazomib. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lapatinib. Avoid. Severel Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to larotrectinib. Avoid. Moderate Study
- Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ledipasvir. Avoid. Severe Theoretical
- ► Carbamazepine is predicted to decrease the exposure to ledipasvir. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, phenobarbital, primidone) are predicted to decrease the concentration of letermovir.
 Moderate Theoretical
- Letermovir is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of levodopa. Moderate Study
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- Antiepileptics (carbamazepine, oxcarbazepine) are predicted to increase the risk of neurotoxicity when given with lithium.
 Severel Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lomitapide. Monitor and adjust dose. Moderate Theoretical → Also see TABLE 1 p. 1490
- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of loop diuretics (furosemide). [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lorlatinib. Avoid. [Severe] Study
- ► Lumacaftor is predicted to decrease the exposure to antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. Severe Theoretical
- Macrolides (clarithromycin) slightly increase the concentration of carbamazepine. Monitor concentration and adjust dose.
 Severe Study
- Macrolides (clarithromycin) are predicted to very slightly increase the exposure to perampanel. [Mild] Study
- Macrolides (erythromycin) markedly increase the concentration of carbamazepine. Monitor concentration and adjust dose.
 Severe | Study
- Antiepileptics (phenobarbital, primidone) are predicted to increase the effects of MAOIs, irreversible. [Severe] Theoretical
- Carbamazepine is predicted to increase the risk of severe toxic reaction when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to meglitinides (repaglinide). Monitor blood glucose and adjust dose. [Moderate] Study
- Phenytoin is predicted to decrease the exposure to melatonin.
 Moderate | Theoretical
- ▶ Levetiracetam decreases the clearance of methotrexate. Severel Anecdotal
- Carbamazepine might decrease the concentration of methylphenidate. [Moderate] Anecdotal
- ▶ Valproate might enhance the effects of methylphenidate. Severel Anecdotal
- ► Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to metronidazole. Moderate Study
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of metyrapone. Avoid. [Moderate] Study
- Phenytoin is predicted to increase the clearance of mexiletine.
 Monitor and adjust dose. Moderate Study
- ► Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to mianserin. [Moderate] Study → Also see TABLE 11 p. 1492
- Carbamazepine markedly decreases the exposure to mianserin.
 Adjust dose. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mifepristone. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mirtazapine. Adjust dose. Moderate Study → Also see TABLE 11 p. 1492
- Mitotane is predicted to decrease the exposure to perampanel.
 Monitor and adjust dose. Moderate Study
- Antiepileptics (carbamazepine, phenobarbital, primidone) are predicted to decrease the exposure to modafinil. Mild Theoretical
- ➤ Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to modafinil and modafinil is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Theoretical
- Carbamazepine is predicted to decrease the effects of monoclonal antibodies (brentuximab vedotin). [Severe] Theoretical
- ► Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to antiepileptics (fosphenytoin, phenytoin).

 Monitor and adjust dose. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to monoclonal antibodies (polatuzumab vedotin). Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to montelukast. [Mild] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to naldemedine. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to neratinib. Avoid. [Severe] Study → Also see TABLE 1 p. 1490
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to neurokinin-1 receptor antagonists (aprepitant).
 Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to neurokinin-1 receptor antagonists (fosaprepitant). Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure

- to neurokinin-1 receptor antagonists (netupitant). Avoid. Severe Study
- Carbamazepine is predicted to decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium). Monitor and adjust dose. [Moderate]
- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium). (Moderate) Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study
- Antiepileptics (phenobarbital, phenytoin) are predicted to decrease the exposure to nintedanib. Severe Theoretical
- Carbamazepine is predicted to decrease the exposure to nintedanib. [Moderate] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to nirmatrelvir boosted with ritonavir. Avoid. [Severe] Study
- Nirmatrelvir boosted with ritonavir is predicted to decrease the concentration of antiepileptics (lamotrigine, valproate).
 [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to nitisinone. Adjust dose. Moderate Theoretical
- NNRTIs (efavirenz) are predicted to affect the efficacy of primidone and primidone is predicted to slightly decrease the exposure to NNRTIs (efavirenz). [Severe] Theoretical
- NNRTIs (nevirapine) are predicted to decrease the concentration of antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) and antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of NNRTIs (nevirapine). Severe Study
- Oxcarbazepine is predicted to decrease the exposure to NNRTIS (doravirine). Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to NNRTIs (doravirine). Avoid. [Severe] Study
- ► Carbamazepine slightly decreases the exposure to NNRTIS (efavirenz) and NNRTIS (efavirenz) slightly decrease the exposure to carbamazepine. [Severe] Study
- Phenobarbital is predicted to decrease the exposure to NNRTIs (efavirenz) and NNRTIs (efavirenz) affect the concentration of phenobarbital. [Severe] Theoretical
- Antiepileptics (fosphenytoin, phenytoin) slightly decrease the exposure to NNRTIs (efavirenz) and NNRTIs (efavirenz) affect the concentration of antiepileptics (fosphenytoin, phenytoin).
 Severel Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to NNRTIs (etravirine). Avoid. Severe Theoretical
- ► Oxcarbazepine is predicted to decrease the concentration of NNRTIS (rilpivirine). Avoid. Severe Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to NNRTIs (rilpivirine). Avoid. [Severe] Study
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to NRTIs (abacavir). [Moderate] Theoretical
- Valproate slightly increases the exposure to NRTIs (zidovudine).
 Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to olaparib. Avoid. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure

- to opioids (alfentanil, fentanyl). Moderate Study → Also see TABLE 11 p. 1492
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 1492
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to opioids (methadone). Monitor and adjust dose. Severe Study → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (oxycodone). Monitor and adjust dose. [Moderate]
 Study -> Also see TABLE 11 p. 1492
- ► Carbamazepine decreases the concentration of opioids (tramadol). Adjust dose. Severe Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to osilodrostat. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to ospemifene. [Moderate] Study
- ➤ Oxybutynin potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children.

 | Severe | Theoretical |
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to paracetamol.
 Moderate) Study → Also see TABLE 1 p. 1490
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to pazopanib. Avoid. Severe Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to pemigatinib. Avoid. (Severe) Study
- ► Valproate increases the risk of adverse effects when given with penicillins (pivmecillinam). Avoid. [Severe] Anecdotal
- Phenothiazines (chlorpromazine) decrease the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) decrease the concentration of phenothiazines (chlorpromazine). Moderate Study → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to phosphodiesterase type-4 inhibitors (apremilast). Avoid. (Severe)
 Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-4 inhibitors (roflumilast). Avoid. Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil). Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil).
 Moderatel Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately to markedly decrease the exposure to pibrentasvir. Avoid. Severe Study
- Antiepileptics (eslicarbazepine, oxcarbazepine) potentially decrease the exposure to pibrentasvir. Avoid. Severe Theoretical
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to pirfenidone. Moderate Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, **phenytoin, primidone)** are predicted to moderately decrease the exposure to pitolisant. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ponatinib. Avoid. Moderate Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) might decrease the exposure to ponesimod. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to praziquantel. Avoid. Moderate Study
- Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone) are predicted to increase the risk of hypersensitivity reactions when given with procarbazine. Severe Anecdotal
- Fosphenytoin is predicted to increase the risk of hypersensitivity when given with procarbazine. Severe
- ▶ Valproate potentially increases the concentration of propofol. Adjust dose. Severe Theoretical
- Quinolones (ciprofloxacin) affect the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. Severe Study
- ► Antiepileptics (fosphenytoin, phenobarbital, phenytoin, **primidone**) are predicted to affect the exposure to raltegravir. Use with caution or avoid. [Moderate] Theoretical
- Carbamazepine is predicted to affect the exposure to raltegravir. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ranolazine. Avoid. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to reboxetine. Moderate Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to regorafenib. Avoid. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital. phenytoin, primidone) are predicted to decrease the exposure to relugolix. Avoid. Moderate Study
- ▶ Antiepileptics (oxcarbazepine, topiramate) are predicted to decrease the exposure to relugolix. Avoid. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) might decrease the exposure to remdesivir. Avoid. Moderate Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ribociclib. Avoid. Severe Study
- ▶ Rifamycins (rifampicin) slightly decrease the exposure to brivaracetam. Adjust dose. Moderate Study
- ▶ Rifamycins (rifampicin) markedly increase the clearance of lamotrigine. Adjust lamotrigine dose, p. 346. Moderate Study
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to perampanel. Monitor and adjust dose. Moderate Study
- ▶ Rifamycins (rifampicin) decrease the concentration of antiepileptics (fosphenytoin, phenytoin). Use with caution and adjust dose. Moderate Study
- ▶ Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to rifamycins (rifampicin) and rifamycins (rifampicin) are predicted to decrease the exposure to antiepileptics (phenobarbital, primidone). Use with caution and adjust dose. Moderate Study
- Rucaparib is predicted to increase the exposure to phenytoin. Monitor and adjust dose. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the exposure to the active component of sacituzumab govitecan. Severe Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the exposure to the active metabolite of selexipag. Adjust dose. Moderate Study

- ▶ Valproate is predicted to increase the exposure to selexipag. Unknown Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to selpercatinib. Avoid. Moderate Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to selumetinib. Avoid. Severe Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to siponimod. Severe Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of sirolimus. Avoid. Severe Study
- ▶ Phenytoin is predicted to decrease the exposure to SNRIS (duloxetine). Moderate Theoretical
- ▶ Phenytoin might decrease the exposure to sodium glucose cotransporter 2 inhibitors (empagliflozin). Avoid or monitor diabetic control. Moderate Theoretical
- ▶ Valproate increases the exposure to sodium oxybate. Adjust sodium oxybate dose, p. 524. Moderate Study
- ▶ Valproate potentially decreases the effects of sodium phenylbutyrate. [Moderate] Anecdotal
- ► Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Avoid. Severe Theoretical
- ▶ Carbamazepine is predicted to decrease the exposure to sofosbuvir. Avoid. Severe Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to solifenacin. [Moderate] Theoretical
- ► Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sorafenib. Moderate Theoretical
- ▶ Oxcarbazepine is predicted to decrease the exposure to sorafenib. Moderate Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sotorasib. Avoid. Severe Study → Also see TABLE 1 p. 1490
- ► SSRIs (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. Severe Anecdotal
- ► SSRIs (sertraline) potentially increase the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. Severe Anecdotal
- ► Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of SSRIs (paroxetine). [Moderate] Study
- ▶ St John's wort is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. Severe Theoretical
- ▶ St John's wort is predicted to decrease the exposure to brivaracetam. Moderate Theoretical
- ► St John's wort is predicted to decrease the concentration of carbamazepine. Monitor and adjust dose. Moderate Theoretical
- ▶ St John's wort is predicted to decrease the exposure to perampanel. Monitor and adjust dose. Moderate Theoretical
- ▶ St John's wort is predicted to decrease the exposure to tiagabine. Avoid. Mild Theoretical
- ► Carbamazepine is predicted to decrease the exposure to statins (atorvastatin). Monitor and adjust dose. Moderate Study → Also see TABLE 1 p. 1490
- ► Eslicarbazepine is predicted to decrease the exposure to statins (atorvastatin). Monitor and adjust dose. Moderate Theoretical
- ▶ Phenytoin moderately decreases the exposure to statins (atorvastatin). Moderate Study
- ► Oxcarbazepine is predicted to decrease the exposure to statins (atorvastatin, simvastatin). Moderate Theoretical
- ► Antiepileptics (fosphenytoin, phenobarbital, primidone) are predicted to decrease the exposure to statins (atorvastatin, simvastatin). Moderate Study
- ► Eslicarbazepine decreases the exposure to statins (rosuvastatin). Moderate Study
- ▶ Phenytoin is predicted to decrease the exposure to statins (simvastatin). [Moderate] Study

- ► Antiepileptics (carbamazepine, eslicarbazepine) moderately decrease the exposure to statins (simvastatin). Monitor and adjust dose. [Moderate] Study → Also see TABLE 1 p. 1490
- ➤ Sulfonamides (sulfadiazine) are predicted to increase the concentration of fosphenytoin. Monitor and adjust dose.

 [Moderate] Study
- Sulfonamides (sulfadiazine) increase the concentration of phenytoin. Monitor and adjust dose. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 1080. Moderate
- ► Antiepileptics (fosphenytoin, phenytoin) increase the effects of suxamethonium. [Moderate] Study
- Carbamazepine increases the risk of prolonged neuromuscular blockade when given with suxamethonium. [Moderate] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- ➤ Tamoxifen (high-dose) might increase the concentration of fosphenytoin and fosphenytoin might decrease the concentration of tamoxifen (high-dose). [Severe] Theoretical
- Tamoxifen (high-dose) might increase the concentration of phenytoin and phenytoin might decrease the concentration of tamoxifen (high-dose). [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to taxanes (cabazitaxel). Avoid. [Moderate] Study → Also see TABLE 12 p. 1493
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to taxanes (docetaxel). Severe Theoretical → Also see TABLE 12 p. 1493
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to taxanes (paclitaxel). Avoid. Severe Study → Also see TABLE 12 p. 1493
- Tegafur potentially increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. Severe Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tenofovir alafenamide. Avoid. [Moderate]

 Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) might decrease the exposure to tepotinib. Avoid. [Severe] Theoretical
- Fosphenytoin is predicted to decrease the concentration of tetracyclines (doxycycline). Adjust dose. Moderate Theoretical
- ► Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone) decrease the concentration of tetracyclines (doxycycline). Adjust dose. [Moderate] Study → Also see TABLE 1
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tezacaftor. Avoid. [Severe] Theoretical
- ► Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to theophylline. Adjust dose. Moderate Study
- ➤ Antiepileptics (phenobarbital, primidone) are predicted to increase the clearance of theophylline. Adjust dose. Moderate Theoretical
- Carbamazepine potentially increases the clearance of theophylline and theophylline decreases the exposure to carbamazepine. Adjust dose. Moderate Anecdotal
- ► Stiripentol is predicted to increase the exposure to theophylline. Avoid. Moderate Theoretical
- ► Carbamazepine is predicted to decrease the exposure to thrombin inhibitors (dabigatran). Avoid. Severe Study
- Phenytoin is predicted to decrease the exposure to thrombin inhibitors (dabigatran). Avoid. [Severe] Theoretical

- Antiepileptics (fosphenytoin, phenytoin) are predicted to increase the risk of hypothyroidism when given with thyroid hormones. Moderate Study
- ► Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of thyroid hormones. [Moderate] Theoretical
- ► Carbamazepine is predicted to increase the risk of hypothyroidism when given with thyroid hormones. Monitor and adjust dose. Moderate Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ticagrelor. Avoid. Severe Study
- ► Carbamazepine might decrease the exposure to tigecycline.

 [Mild] Theoretical → Also see TABLE 1 p. 1490
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tivozanib. Severe Study
- Antiepileptics (fosphenytoin, phenytoin) moderately decrease the exposure to tizanidine. [Mild] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tofacitinib. Avoid. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tolvaptan. Use with caution or avoid depending on indication. [Severe] Study
- Antiepileptics (fosphenytoin, phenytoin) increase the clearance of topotecan. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to toremifene. Adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to trabectedin. Avoid. Severe Theoretical → Also see TABLE 1 p. 1490
- ► Carbamazepine decreases the concentration of trazodone.

 Adjust dose. [Moderate] Anecdotal
- Antiepileptics (carbamazepine, phenobarbital, phenytoin) are predicted to decrease the exposure to treprostinil. Adjust dose.
 Mild Theoretical
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to tricyclic antidepressants. [Moderate] Study → Also see TABLE 11 p. 1492
- ► Carbamazepine decreases the exposure to tricyclic antidepressants. Adjust dose. Moderate Study → Also see TABLE 18 n. 1494
- Tricyclic antidepressants (clomipramine, imipramine) potentially increase the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical
- Valproate increases the concentration of tricyclic antidepressants (nortriptyline). Severe Study
- ► Trimethoprim increases the concentration of antiepileptics (fosphenytoin, phenytoin). Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tucatinib. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) decrease the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to upadacitinib. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to velpatasvir. Avoid. Severel Study
- Oxcarbazepine is predicted to decrease the exposure to velpatasvir. Avoid. Severe Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). [Severe] Theoretical → Also see TABLE 1 p. 1490 → Also see TABLE 1 p. 1493
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. Severe Theoretical → Also see TABLE 12 p. 1493
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinca alkaloids (vinorelbine). Use with caution or avoid.
 [Severe] Theoretical -> Also see TABLE 12 p. 1493
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of vitamin D substances. [Moderate] Study
- ► Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of vitamin D substances. Moderate
- ► Carbamazepine is predicted to decrease the effects of vitamin D substances. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) potentially increase the risk of nephrotoxicity when given with volatile halogenated anaesthetics (methoxyflurane). Avoid. Severe Theoretical → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Study
- Oxcarbazepine is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- Carbamazepine moderately decreases the exposure to zolpidem. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to zopiclone. Adjust dose. Moderate Study → Also see TABLE 11 p. 1492

Antifungals, azoles → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 9 p. 1492 (QT-interval prolongation)

clotrimazole • fluconazole • isavuconazole • itraconazole • ketoconazole • miconazole • posaconazole • voriconazole

- Since systemic absorption can follow topical application, the possibility of interactions with topical clotrimazole and ketoconazole should be borne in mind.
- In general, fluconazole interactions relate to multiple-dose treatment.
- ➤ The use of carbonated drinks, such as cola, improves itraconazole, ketoconazole, and posaconazole bioavailability.
- Interactions of miconazole apply to the oral gel formulation, as a sufficient quantity can be absorbed to cause systemic effects. Systemic absorption from intravaginal and topical formulations might also occur.
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to abemaciclib.
 [Moderate] Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1042. [Severe] Study
- Fluconazole is predicted to increase the exposure to abrocitinib. Adjust abrocitinib dose, p. 1354. Severe Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to acalabrutinib. Avoid or monitor. (Severe) Study

- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to acalabrutinib. Avoid.

 | Severe | Study |
- ► Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to afatinib. [Moderate] Study
- Alcohol potentially causes a disulfiram-like reaction when given with ketoconazole. Avoid. [Moderate] Anecdotal
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 210. [Severe]
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. [Severe] Study
- ► Itraconazole markedly increases the exposure to aliskiren.

 Avoid. [Severe] Study
- Ketoconazole moderately increases the exposure to aliskiren.
 Moderate Study
- ► Itraconazole increases the risk of busulfan toxicity when given with alkylating agents (busulfan). Monitor and adjust dose.

 Moderate] Study
- ► Miconazole is predicted to increase the concentration of alkylating agents (busulfan). Use with caution and adjust dose. Moderate] Theoretical
- ► Isavuconazole is predicted to increase the exposure to alkylating agents (cyclophosphamide). [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to alpha blockers (doxazosin). Moderate Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
- Miconazole potentially decreases the exposure to aminoglycosides (tobramycin). Moderatel Anecdotal
- Oral antacids decrease the absorption of oral itraconazole capsules. Itraconazole should be taken 2 hours before or 1 hour after antacids. [Moderate] Study
- ▶ Oral antacids decrease the absorption of oral ketoconazole.
- Separate administration by at least 2 hours. Moderate Study

 Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to isavuconazole. Avoid. Severe Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to anti-androgens (apalutamide). [Mild] Study → Also see TABLE 9 p. 1492
- Itraconazole slightly increases the exposure to anti-androgens (darolutamide). Monitor and adjust dose. Moderate Study
- Ketoconazole is predicted to increase the exposure to antiandrogens (darolutamide). Monitor and adjust dose. Moderate Theoretical
- Miconazole is predicted to increase the exposure to antiarrhythmics (disopyramide). Use with caution and adjust dose. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antiarrhythmics (disopyramide). Avoid. Severe Theoretical → Also see TABLE 9 p. 1492
- ➤ Posaconazole is predicted to increase the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. Severe Theoretical
- ► Fluconazole is predicted to increase the exposure to antiarrhythmics (dronedarone). Severe Theoretical → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very markedly increase the exposure to antiarrhythmics (dronedarone). Avoid. [Severe] Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Severe] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose.
 Moderatel Study
- Antiepileptics (carbamazepine) are predicted to decrease the efficacy of fluconazole and fluconazole increases the concentration of antiepileptics (carbamazepine). Avoid or monitor carbamazepine concentration and adjust dose accordingly, p. 336. [Severe] Theoretical → Also see TABLE 1 p. 1490
- Antiepileptics (carbamazepine) are predicted to decrease the efficacy of ketoconazole and ketoconazole slightly increases the concentration of antiepileptics (carbamazepine). Avoid or monitor carbamazepine concentration and adjust dose accordingly, p. 336. [Moderate] Study
- Antiepileptics (carbamazepine) are predicted to decrease the efficacy of posaconazole and posaconazole increases the concentration of antiepileptics (carbamazepine). Avoid. [Moderate] Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to isavuconazole. Avoid. Severe Study
- ➤ Antiepileptics (fosphenytoin) very markedly decrease the exposure to itraconazole. Avoid and for 14 days after stopping fosphenytoin. [Moderate] Study
- Antiepileptics (fosphenytoin) decrease the exposure to voriconazole and voriconazole increases the exposure to antiepileptics (fosphenytoin). Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 654. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) decrease the exposure to ketoconazole. Avoid. Moderate Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to posaconazole. Avoid. [Moderate] Study
- Antiepileptics (phenobarbital) decrease the concentration of itraconazole. Avoid and for 14 days after stopping phenobarbital. [Moderate] Study
- Antiepileptics (phenobarbital) are predicted to decrease the concentration of ketoconazole. Avoid. Moderate Study
- ► Antiepileptics (phenobarbital) are predicted to decrease the concentration of posaconazole. Avoid. Moderate Study
- ► Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of voriconazole. Avoid. Moderate Theoretical
- Antiepileptics (phenytoin) very markedly decrease the exposure to itraconazole. Avoid and for 14 days after stopping phenytoin. [Moderate] Study
- Antiepileptics (phenytoin) decrease the exposure to voriconazole and voriconazole increases the exposure to antiepileptics (phenytoin). Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 654, p. 351. [Moderate] Study
- ► Antiepileptics (primidone) are predicted to decrease the concentration of itraconazole. Moderate Theoretical
- ► Miconazole increases the risk of carbamazepine toxicity when given with antiepileptics (carbamazepine). Monitor and adjust dose. |Severe| Anecdotal
- Miconazole increases the risk of phenytoin toxicity when given with antiepileptics (fosphenytoin). Monitor and adjust dose.
 Severe Anecdotal
- ► Fluconazole increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine) are predicted to decrease the efficacy of antifungals, azoles (itraconazole, voriconazole) and antifungals, azoles (itraconazole, voriconazole) increase the concentration of antiepileptics (carbamazepine). Avoid or adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 1490
- Antiepileptics (primidone) are predicted to decrease the concentration of antifungals, azoles (ketoconazole, posaconazole). Avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to very slightly increase the exposure to antiepileptics (perampanel). Mild Study
- Miconazole increases the risk of phenytoin toxicity when given with antiepileptics (phenytoin). Monitor and adjust dose. Severel Anecdotal

- ► Antifungals, azoles (fluconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor adverse effects. [Severe] Study
- ► Antifungals, azoles (posaconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Moderate

 Theoretical
- Miconazole is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. Moderate
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, nonsedating (mizolastine). Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. [Moderate] Study
- Ketoconazole increases the exposure to antimalarials (mefloquine). [Moderate] Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole, voriconazole) are predicted to increase the exposure to antimalarials (mefloquine). Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the concentration of antimalarials (piperaquine).
 [Severe] Theoretical
- Antifungals, azoles (tiraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to antipsychotics, second generation (aripiprazole). Adjust aripiprazole dose, p. 427. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antipsychotics, second generation (cariprazine). Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to antipsychotics, second generation (cariprazine). Avoid. Severe
 Study
- Posaconazole moderately increases the exposure to antipsychotics, second generation (lurasidone). Avoid. Severel Study
- Antifungals, azoles (fluconazole, isavuconazole) are predicted to increase the exposure to antipsychotics, second generation (lurasidone). Adjust lurasidone dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid. Severe Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antipsychotics, second generation (quetiapine). Avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antipsychotics, second generation (risperidone). Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to avapritinib. Avoid.

 Moderate Study
- Antifungals, azoles (fluconazole, miconazole) are predicted to increase the exposure to avatrombopag. Adjust avatrombopag dose with moderate CYP2C9 inhibitors in chronic immune thrombocytopenia, p. 1120. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to axitinib. Moderate Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bedaquiline. Avoid

- Antifungals, azoles (continued)

 prolonged use. Mild Theoretical → Also see TABLE 1 p. 1490 → Also
 see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Study → Also see TABLE 1 p. 1490 → Also see TABLE 9 p. 1492
- Miconazole is predicted to increase the exposure to benzodiazepines (alprazolam). Use with caution and adjust dose. [Moderate] Theoretical
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to benzodiazepines (alprazolam). Severe Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) moderately increase the exposure to benzodiazepines (alprazolam). Avoid. [Moderate] Study
- ► Antifungals, azoles (fluconazole, voriconazole) potentially increase the exposure to benzodiazepines (clobazam). Adjust dose. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, voriconazole) moderately increase the exposure to benzodiazepines (diazepam). Monitor and adjust dose. [Moderate] Study
- Miconazole is predicted to increase the exposure to intravenous benzodiazepines (midazolam). Use with caution and adjust dose. [Moderate] Theoretical
- Miconazole is predicted to increase the exposure to oral benzodiazepines (midazolam). Avoid. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to benzodiazepines (midazolam). Monitor adverse effects and adjust dose. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to benzodiazepines (midazolam). Avoid or adjust dose. Severe Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to berotralstat. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to beta blockers, non-selective (nadolol).
 Moderate| Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to beta₂ agonists (salmeterol). Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical
- Posaconazole is predicted to increase the exposure to bictegravir. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) slightly increase the exposure to bortezomib. Moderate Study
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to bosutinib. Avoid or adjust dose.
 [Severe] Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to brigatinib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1048. Severe Study
- ► Isavuconazole slightly increases the exposure to bupropion.

 Adjust dose. Moderate Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 373. [Severe] Study
- Miconazole is predicted to increase the concentration of buspirone. Use with caution and adjust dose. Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to cabozantinib. [Moderate] Study → Also see TABLE 9 p. 1492

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to isavuconazole. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose.
 Moderatel Study
- Miconazole is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil).
 Use with caution and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Miconazole is predicted to increase the exposure to calcium channel blockers (diltiazem). [Moderate] Theoretical
- Fluconazole (high-dose) is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate]
 Theoretical
- ► Posaconazole is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe| Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. Severe Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cannabidiol. Avoid or adjust dose. [Mild] Study
- Fluconazole is predicted to increase the exposure to cannabidiol. [Moderate] Theoretical
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ceritinib. [Moderate] Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 1050. Severe Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of ciclosporin.

 Severe Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the concentration of ciclosporin. [Severe] Study
- Miconazole increases the concentration of ciclosporin. Monitor and adjust dose. [Severe] Anecdotal
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cilostazol.
 Adjust rijostazol (korea p. 352 (Moderate) ktudy
- Adjust cilostazol dose, p. 252. Moderate Study
 ➤ Fluconazole is predicted to increase the exposure to cilostazol.
 Adjust cilostazol dose, p. 252. Moderate Theoretical
- Miconazole is predicted to increase the exposure to cilostazol.
 Use with caution and adjust dose. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cinacalcet.
 Adjust dose. [Moderate] Study
- Fluconazole is predicted to decrease the efficacy of clopidogrel.
 Avoid. [Severe] Theoretical
- Voriconazole is predicted to decrease the efficacy of clopidogrel. Avoid. Moderate Study
- Cobicistat is predicted to increase the exposure to antifungals, azoles (fluconazole, posaconazole). Moderate Theoretical
- ➤ Cobicistat is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole). Adjust dose. Moderate Theoretical
- ► Cobicistat is predicted to increase the exposure to
- isavuconazole. Avoid or monitor adverse effects. [Severe] Study

 ► Cobicistat is predicted to affect the exposure to voriconazole.
- Avoid. Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to cobimetinib. Severe Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. Severe Study

- Miconazole is predicted to increase the exposure to cobimetinib. Severe Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212.
 [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to colchicine. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1212. Severe Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects. [Severe] Study
- Miconazole is predicted to increase the concentration of corticosteroids (methylprednisolone). Monitor and adjust dose.
 Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study
- ► Fluconazole increases the anticoagulant effect of coumarins.

 Monitor INR and adjust dose. Severe Study
- Itraconazole potentially increases the anticoagulant effect of coumarins. Severe Anecdotal
- Ketoconazole potentially increases the anticoagulant effect of coumarins (warfarin). Monitor INR and adjust dose. Severe Anecdotal
- ➤ Miconazole greatly increases the anticoagulant effect of coumarins. MHRA advises avoid unless INR can be monitored closely; monitor for signs of bleeding. [Severe] Study
- ► Voriconazole increases the anticoagulant effect of coumarins.

 Monitor INR and adjust dose. Moderate Study
- Antifungals, azoles (fluconazole, isavuconazole) are predicted to increase the exposure to crizotinib. Moderate Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to crizotinib. Avoid. Moderate Study → Also see TABLE 9 p. 1492
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dabrafenib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- Dabrafenib is predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Theoretical
- Antifungals, azoles (isavuconazole, posaconazole) are predicted to increase the exposure to darifenacin. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
- Fluconazole slightly increases the exposure to darifenacin.
 Moderate Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dasatinib. Severe
 Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. Severe Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole)
 very slightly increase the exposure to delamanid. Severe
 Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to slightly increase the exposure to dienogest.
 Moderate Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to dienogest.

 Moderate Study

- ► Isavuconazole slightly increases the exposure to digoxin.

 Monitor and adjust dose. [Moderate] Study
- ► Itraconazole is predicted to markedly increase the concentration of digoxin. Monitor and adjust dose. Severe Study
- Ketoconazole is predicted to markedly increase the concentration of digoxin. Severe Study
- Posaconazole is predicted to increase the concentration of digoxin. Severe Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Moderate] Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to domperidone. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine). Severe Theoretical
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to dopamine receptor agonists (bromocriptine). Severel Study
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the concentration of dopamine receptor agonists (cabergoline). [Moderate] Anecdotal
- Isavuconazole is predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose.
 Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dronabinol. Adjust dose.
 Mildl Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to drospirenone. Severe
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dutasteride. Monitor adverse effects and adjust dose. Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with potent CYP3A4 inhibitors. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to eliglustat. Avoid or adjust dose consult product literature. [Severe] Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to encorafenib. Moderate Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to encorafenib. Avoid or monitor. Severe Study → Also see TABLE 9 p. 1492
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to isavuconazole. Avoid. Severe Theoretical
- ► Fluconazole is predicted to increase the exposure to endothelin receptor antagonists (bosentan). Avoid. Severe Study
 ► Itraconazole is predicted to increase the exposure to endothelin
- receptor antagonists (bosentan). Moderate Theoretical

 Ketoconazole moderately increases the exposure to endothelin
- receptor antagonists (bosentan). Moderate Study
- ► Voriconazole is predicted to increase the exposure to endothelin receptor antagonists (bosentan). Avoid. Severe Theoretical

Antifungals, azoles (continued)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to endothelin receptor antagonists (macitentan). [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056.
 [Severe] Theoretical -> Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to entrectinib. Avoid potent CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. [Severe] Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergometrine. Severe Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. Severe Theoretical
- Miconazole is predicted to increase the exposure to ergometrine. Avoid. Moderate Theoretical
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- ► Miconazole is predicted to increase the exposure to ergotamine. Avoid. Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to erlotinib. Moderate Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to erlotinib. Use with caution and adjust dose. [Severe] Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to esketamine. Adjust dose. Moderatel Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of subdermal etonogestrel. [Moderate] Theoretical
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of everolimus.

 Avoid or adjust dose. [Moderate] Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to everolimus. Avoid. |Severe| Study
- Fluconazole might increase the risk of bleeding when given with factor XA inhibitors (apixaban). [Moderate] Study
- Antifungals, azoles (posaconazole, voriconazole) are predicted to increase the exposure to factor XA inhibitors (apixaban). Avoid.
 Moderate Theoretical
- ► Itraconazole is predicted to increase the exposure to factor XA inhibitors (apixaban, rivaroxaban). Avoid. (Severe) Theoretical
- Ketoconazole moderately increases the exposure to factor XA inhibitors (apixaban, rivaroxaban). Avoid. Severe Study
- Itraconazole is predicted to increase the exposure to factor XA inhibitors (edoxaban). Severe Theoretical
- ► Ketoconazole slightly increases the exposure to factor XA inhibitors (edoxaban). Adjust edoxaban dose, p. 138. Severe Study
- ➤ Antifungals, azoles (posaconazole, voriconazole) are predicted to increase the exposure to factor XA inhibitors (rivaroxaban).

 Avoid. [Severe] Theoretical
- Antifungals, azoles (isavuconazole, posaconazole) are predicted to increase the exposure to fedratinib. Monitor and adjust dose. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fedratinib. Adjust fedratinib dose, but avoid depending on other drugs taken consult product literature, p. 1060. [Moderate] Study
- Fluconazole is predicted to increase the exposure to fedratinib.
 Avoid. Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Miid] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to fesoterodine.
 Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 840. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to fidaxomicin. Avoid. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose. [Moderate] Study
- Posaconazole is predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose.
 Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to gefitinib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to gefitinib. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to gilteritinib. [Moderate]
 Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to glasdegib. Use with caution or avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Posaconazole is predicted to increase the exposure to glasdegib. Use with caution or avoid. Severe Theoretical
- Antifungals, azoles (itraconazole, ketoconazole) potentially increase the exposure to glecaprevir. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of guanfacine.
 Adjust guanfacine dose, p. 384. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 384. Moderate Study
- H₂ receptor antagonists are predicted to decrease the absorption of itraconazole. Administer itraconazole capsules with an acidic beverage. Moderate Study
- ► H₂ receptor antagonists are predicted to decrease the absorption of ketoconazole. Administer ketoconazole with an acidic beverage. [Moderate] Study
- ► H₂ receptor antagonists are predicted to decrease the exposure to posaconazole. Avoid use of posaconazole oral suspension. Moderate Study
- Itraconazole increases the concentration of haloperidol.
 Moderate Study
- Fluconazole slightly increases the exposure to HIV-protease inhibitors (tipranavir). Avoid or adjust dose. [Moderate] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to isavuconazole. Avoid or monitor adverse effects. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to itraconazole. Use with caution and adjust dose. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to ketoconazole. Use with caution and adjust dose. Moderate Study
- Miconazole is predicted to increase the concentration of HIVprotease inhibitors. Use with caution and adjust dose.
 Moderate Theoretical
- Posaconazole is predicted to increase the exposure to HIVprotease inhibitors. Moderate Study
- ► HIV-protease inhibitors are predicted to affect the exposure to voriconazole and voriconazole potentially affects the exposure to HIV-protease inhibitors. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062.
 [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ibrutinib. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1062. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to isavuconazole. Avoid or monitor adverse effects. Severe Study

- Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to imatinib. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to imatinib. [Moderate] Study
- Imatinib is predicted to increase the exposure to isavuconazole. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 231. Severe Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivabradine. Avoid.
 [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivacaftor. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivacaftor. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 317, lumacaftor with ivacaftor p. 318, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Severe] Study
- ► Lanthanum is predicted to decrease the absorption of ketoconazole. Separate administration by at least 2 hours. Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lapatinib. Moderate Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lapatinib. Avoid. Moderate Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to larotrectinib. Avoid or adjust larotrectinib dose, p. 1065. Moderate Study
- Letermovir slightly decreases the exposure to voriconazole.
 Moderate Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lomitapide. Avoid. Moderate Theoretical → Also see TABLE 1 p. 1490
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to lomitapide. Avoid. Severe Study → Also see TABLE 1 p. 1490
- ► Clotrimazole is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lorlatinib. Avoid or adjust lorlatinib dose, p. 1067. Severel Study
- ► Lumacaftor is predicted to decrease the exposure to antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole). Avoid or monitor efficacy. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to isavuconazole. Avoid or monitor adverse effects.
 Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to isavuconazole. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to maraviroc.
 Adjust dose. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of intramuscular medroxyprogesterone. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to meglitinides (repaglinide).
 Moderatel Study
- Metoclopramide potentially decreases the absorption of posaconazole oral suspension. [Moderate] Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to midostaurin.

 Moderate Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to midostaurin. Avoid or monitor for toxicity. Severe Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mifepristone. Moderate study.
- ► Posaconazole is predicted to increase the exposure to mifepristone. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 843.
 Moderatel Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirtazapine. Moderate Study
- Mitotane is predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to modafinil. Mild Theoretical
- Antifungals, azoles (itraconazole, ketoconazole) increase the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to monoclonal antibodies (polatuzumab vedotin). [Moderate] Theoretical
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical
- ► Isavuconazole increases the exposure to mycophenolate.

 [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to naldemedine.
 Moderatel Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to naldemedine. Avoid or monitor. [Moderate] Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor adverse effects, p. 67. [Moderate]
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to naloxegol.
 Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to neratinib. Avoid moderate CYP3A4 inhibitors or adjust neratinib dose and monitor for gastrointestinal adverse effects, p. 1069. [Severe] Study -> Also see TABLE 1 p. 1490
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to neratinib. Avoid potent CYP3A4 inhibitors or adjust neratinib dose, p. 1069. Severe Study -> Also see TABLE 1 p. 1490
- Neurokinin-1 receptor antagonists (aprepitant) are predicted to increase the exposure to isavuconazole. Moderate Theoretical
- Neurokinin-1 receptor antagonists (netupitant) are predicted to decrease the exposure to isavuconazole. Moderate Theoretical
- ► Fluconazole is predicted to increase the exposure to neurokinin-1 receptor antagonists (aprepitant). Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to neurokinin-1 receptor antagonists (aprepitant). Moderate Study
- Posaconazole is predicted to increase the exposure to neurokinin-1 receptor antagonists (aprepitant, fosaprepitant).
 Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to neurokinin-1 receptor antagonists (fosaprepitant). Moderatel Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to neurokinin-1 receptor antagonists (netupitant). [Moderate] Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to nilotinib. [Moderate] Study → Also see TABLE 9 p. 1492

Antifungals, azoles (continued)

- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nilotinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to nintedanib. Moderate Study
- Voriconazole is predicted to increase the exposure to nintedanib. [Moderate] Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of isavuconazole. [Severe] Theoretical
- ► Nirmatrelvir boosted with ritonavir increases the exposure to itraconazole. Severe Study
- ► Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of ketoconazole. Adjust dose. Moderate

 Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to decrease the concentration of voriconazole. Avoid. Severe Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nitisinone. Adjust dose.
 Moderate Theoretical
- NNRTIs (efavirenz) slightly decrease the exposure to itraconazole. Avoid and for 14 days after stopping efavirenz. Moderate Study
- ► NNRTIs (efavirenz) moderately decrease the exposure to ketoconazole. [Severe] Study
- NNRTIs (efavirenz) slightly decrease the exposure to posaconazole. Avoid. [Moderate] Study
- NNRTIs (efavirenz) moderately decrease the exposure to voriconazole and voriconazole slightly increases the exposure to NNRTIs (efavirenz). Adjust dose. [Severe] Study → Also see TABLE 9 p. 1492
- ► NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to isavuconazole. Avoid. (Severe) Theoretical
- NNRTIs (nevirapine) moderately decrease the exposure to itraconazole. Avoid and for 14 days after stopping nevirapine. Moderatel Study
- ► NNRTIs (nevirapine) moderately decrease the exposure to ketoconazole. Avoid. [Severe] Study
- NNRTIs (nevirapine) are predicted to decrease the exposure to voriconazole and voriconazole increases the exposure to NNRTIs (nevirapine). Monitor and adjust dose. Severe Theoretical
- Fluconazole slightly to moderately increases the exposure to NNRTIs (nevirapine). Moderate Study
- ► Fluconazole slightly increases the exposure to NRTIS (zidovudine). [Moderate] Study
- Fluconazole moderately increases the exposure to NSAIDs (celecoxib). Adjust celecoxib dose, p. 1225. [Moderate] Study
- Voriconazole slightly increases the exposure to NSAIDs (diclofenac). Monitor and adjust dose. Moderate Study
- Voriconazole moderately increases the exposure to NSAIDs (ibuprofen). Adjust dose. Moderate Study
- ► Fluconazole increases the exposure to NSAIDs (parecoxib).

 Monitor and adjust dose. Moderate Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to olaparib. Avoid moderate CYP3A4 inhibitors or adjust olaparib dose, p. 1088.
 Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to olaparib. Avoid potent CYP3A4 inhibitors or adjust olaparib dose, p. 1088. Moderate Study
- ► Miconazole is predicted to increase the exposure to opioids (alfentanil). Use with caution and adjust dose. [Moderate]

 Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose.
 [Severe] Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to opioids (methadone).

 Moderate Theoretical → Also see TABLE 9 p. 1492

- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to opioids (methadone). Adjust dose. Severe Theoretical → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to osilodrostat. Moderate Theoretical → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ospemifene. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
- ► Fluconazole increases the exposure to ospemifene. Use with caution or avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxybutynin. Mild Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 1072. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 1009.
 Moderatej Study → Also see TABLE 9 p. 1492
- ► Posaconazole is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to pazopanib. [Moderate] Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 1073. [Moderate] Study → Also see TABLE 9 n. 1492
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to pemigatinib. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pemigatinib. Avoid or adjust pemigatinib dose, p. 1074. [Severe] Study
- Miconazole greatly increases the anticoagulant effect of phenindione. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 878. [Moderate]
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. Severe Study

 Also see
 TABLE 9 n. 1492
- Miconazole is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Use with caution and adjust dose. Severe Theoretical
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate CYP3A4 inhibitors, p. 879. [Moderate] Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent CYP3A4 inhibitors or adjust sildenafil dose, p. 879. [Severe] Study → Also see TABLE 9 p. 1492
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to pibrentasvir. Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to pimozide. Avoid.
 Severe Theoretical → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pimozide. Avoid. Severe Study → Also see TABLE 9 p. 1492

- Miconazole is predicted to increase the exposure to pimozide.
 Avoid. Moderate Theoretical
- ► Pioglitazone potentially decreases the exposure to isavuconazole. Use with caution or avoid. Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ponatinib. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to ponatinib.
 Monitor and adjust ponatinib dose, p. 1075. [Moderate] Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to praziquantel. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) given with carbimazole are predicted to increase the exposure to propiverine. Adjust starting dose. [Moderate] Theoretical
- Proton pump inhibitors decrease the absorption of itraconazole. Administer itraconazole capsules with an acidic beverage. [Moderate] Study
- ▶ Proton pump inhibitors decrease the absorption of ketoconazole. Administer ketoconazole with an acidic beverage. [Moderate] Study
- Proton pump inhibitors decrease the absorption of posaconazole oral suspension. Avoid. Moderate Study
- ➤ Voriconazole increases the exposure to proton pump inhibitors (esomeprazole, omeprazole). Adjust dose. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ranolazine. Severe Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ranolazine. Avoid. Severe Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to reboxetine. Avoid.
 Moderate Study
- ► Miconazole is predicted to increase the concentration of reboxetine. Use with caution and adjust dose. Moderate
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to regorafenib.
 Moderate) Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to regorafenib. Avoid.

 Moderate Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to relugolix. Avoid or take relugolix first and separate administration by at least 6 hours. [Moderate] Study
- Antifungals, azoles (fluconazole, itraconazole, ketoconazole, miconazole, voriconazole) are predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1356. [Moderate] Theoretical
- Posaconazole is predicted to increase the risk of tretinoin toxicity when given with retinoids (tretinoin). Monitor and adjust dose. Severel Theoretical
- Antifungals, azoles (fluconazole, ketoconazole, voriconazole) are predicted to increase the risk of tretinoin toxicity when given with retinoids (tretinoin). Moderate) Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ribociclib. Moderate Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 1077. Moderate Study → Also see TABLE 9 p. 1492
- ► Rifamycins (rifabutin) are predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Theoretical
- Rifamycins (rifabutin) decrease the concentration of voriconazole and voriconazole increases the concentration of rifamycins (rifabutin). Avoid or adjust voriconazole dose, p. 654.
 Severe) Study
- ▶ Rifamycins (rifampicin) slightly decrease the exposure to fluconazole. Adjust dose. [Moderate] Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to isavuconazole. Avoid. Severe Study

- ► Rifamycins (rifampicin) markedly decrease the exposure to itraconazole. Avoid and for 14 days after stopping rifampicin.

 Moderate Study
- Rifamycins (rifampicin) markedly decrease the exposure to ketoconazole and ketoconazole potentially decreases the exposure to rifamycins (rifampicin). Avoid. Moderate Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to posaconazole. Avoid. Moderate Anecdotal
- ► Rifamycins (rifampicin) very markedly decrease the exposure to voriconazole. Avoid. [Moderate] Study
- ► Fluconazole increases the risk of uveitis when given with rifamycins (rifabutin). Adjust dose. [Severe] Study
- Ketoconazole is predicted to increase the concentration of rifamycins (rifabutin) and rifamycins (rifabutin) are predicted to decrease the concentration of ketoconazole. Avoid. Severe

 Theoretical
- Miconazole is predicted to increase the concentration of rifamycins (rifabutin). Use with caution and adjust dose.

 Moderate Theoretical
- Antifungals, azoles (itraconazole, posaconazole) increase the concentration of rifamycins (rifabutin) and rifamycins (rifabutin) decrease the concentration of antifungals, azoles (itraconazole, posaconazole). Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, posaconazole) are predicted to increase the exposure to riociguat. Adjust riociguat dose and monitor blood pressure, p. 200. [Moderate] Theoretical
- Ketoconazole moderately increases the exposure to riociguat.
 Adjust riociguat dose and monitor blood pressure, p. 200.
 Moderatel Study
- Antifungals, azoles (isavuconazole, posaconazole) are predicted to increase the exposure to ruxolitinib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor adverse effects. [Moderate] Study
- Fluconazole is predicted to increase the exposure to ruxolitinib. Avoid or adjust dose. [Moderate] Theoretical
- ► **Ketoconazole** is predicted to increase the exposure to the active component of **sacituzumab govitecan**. [Severe] Theoretical
- Fluconazole is predicted to increase the exposure to selexipag.

 [Unknown] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole) are predicted to increase the exposure to selpercatinib. Moderate Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to selpercatinib. Adjust selpercatinib dose, p. 1079. [Moderate]
 Study -> Also see TABLE 9 p. 1492
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to selumetinib. Avoid or adjust dose consult product literature. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, miconazole, posaconazole) are predicted to increase the exposure to siponimod. Avoid depending on other drugs taken—consult product literature. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to siponimod. Avoid depending on other drugs taken—consult product literature. Severel Theoretical
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) increase the concentration of sirolimus. Monitor and adjust dose. Moderate Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of sirolimus. Avoid.

 [Severe] Study
- Miconazole is predicted to increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to SNRIs (venlafaxine).
 Moderate Study → Also see TABLE 9 p. 1492
- Oral sodium bicarbonate decreases the absorption of ketoconazole. [Moderate] Study
- ► Sodium zirconium cyclosilicate is predicted to decrease the exposure to antifungals, azoles. Separate administration by at least 2 hours. [Moderate] Theoretical

Antifungals, azoles (continued)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to solifenacin. Adjust solifenacin p. 842 or tamsulosin with solifenacin p. 848 dose; avoid in hepatic and renal impairment. [Severe] Study
- Voriconazole is predicted to increase the exposure to SSRIs (citalopram). Severe Theoretical → Also see TABLE 9 p. 1492
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to SSRIs (dapoxetine).
 Adjust dapoxetine dose with moderate CYP3A4 inhibitors, p. 887. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid potent CYP3A4 inhibitors or adjust dapoxetine dose, p. 887. [Severe] Study
- ► Antifungals, azoles (fluconazole, voriconazole) are predicted to increase the exposure to SSRIs (escitalopram). Use with caution and adjust dose. Severe Study → Also see TABLE 9 p. 1492
- ► St John's wort is predicted to decrease the exposure to isavuconazole. Avoid. Severe Theoretical
- ► St John's wort moderately decreases the exposure to voriconazole. Avoid. Moderate Study
- Isavuconazole slightly increases the exposure to statins (atorvastatin). [Moderate] Study
- Miconazole (including the oral gel) might increase the exposure to statins (atorvastatin). [Moderate] Theoretical
- Posaconazole is predicted to increase the exposure to statins (atorvastatin). Avoid. Severe Anecdotal
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to statins (atorvastatin).
 Avoid or adjust dose and monitor rhabdomyolysis. Severe Study -> Also see TABLE 1 p. 1490
- ► Fluconazole is predicted to increase the exposure to statins (atorvastatin, simvastatin). Monitor and adjust dose. Severe

 Anecdotal → Also see TABLE 1 p. 1490
- Antifungals, azoles (fluconazole, miconazole) are predicted to increase the exposure to statins (fluvastatin). Moderate Study → Also see TABLE 1 p. 1490
- Isavuconazole is predicted to increase the exposure to statins (fluvastatin, rosuvastatin). Moderate Theoretical
- Isavuconazole is predicted to increase the exposure to statins (simvastatin). Monitor and adjust dose. [Severe] Theoretical
- Miconazole (including the oral gel) is predicted to increase the exposure to statins (simvastatin). Avoid. Severe Anecdotal
- Posaconazole markedly to very markedly increases the exposure to statins (simvastatin). Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to statins (simvastatin).
 Avoid. Severe Study → Also see TABLE 1 p. 1490
- Isavuconazole is predicted to increase the exposure to sulfasalazine. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, miconazole) are predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. [Moderate] Study
- Voriconazole is predicted to increase the concentration of sulfonylureas. Use with caution and adjust dose. Moderate Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to sunitinib. [Moderate] Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 1080. Moderate Study → Also see TABLE 9 p. 1492
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of tacrolimus. |Severe| Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- ► Miconazole is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. Severe Theoretical
- ➤ Antifungals, azoles (itraconazole, ketoconazole) are predicted to slightly increase the exposure to talazoparib. Avoid or adjust talazoparib dose, p. 1091. [Severe] Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to taxanes (cabazitaxel).
 Moderate Theoretical
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to taxanes (cabazitaxel).

 Avoid or monitor—consult product literature. [Severe] Study
- Miconazole is predicted to increase the concentration of taxanes (docetaxel). Use with caution and adjust dose.
 Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to taxanes (docetaxel).
 Severel Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to taxanes (paclitaxel). [Moderate] Anecdotal
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of temsirolimus.
 Use with caution or avoid. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of temsirolimus.
 Avoid. [Severe] Theoretical
- ► Antifungals, azoles (itraconazole, ketoconazole) might increase the exposure to tepotinib. Avoid. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tezacaffor. Adjust dose with moderate CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tezacaftor. Adjust dose with potent CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320.
 Severel Study
- ▶ Isavuconazole is predicted to increase the exposure to thrombin inhibitors (dabigatran). Monitor and adjust dose. Moderate Study
- Antifungals, azoles (fluconazole, posaconazole, voriconazole) are predicted to increase the exposure to thrombin inhibitors (dabigatran). [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to thrombin inhibitors (dabigatran).
 Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to ticagrelor.
 Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole) might increase the exposure to tigecycline. Mild Anecdotal → Also see TABLE 1
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. Moderate Study
- Fluconazole increases the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. Moderate Study
- ► Isavuconazole given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. Moderate Study
- Posaconazole given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolterodine. Avoid. | Severe| Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tolvaptan.
 Manufacturer advises caution or adjust tolvaptan dose with moderate CYP3A4 inhibitors, p. 724. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent CYP3A4 inhibitors, p. 724. [Severe] study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to topotecan. Severe Study

- Isavuconazole is predicted to increase the exposure to topotecan. [Moderate] Theoretical
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to toremifene. Moderate Theoretical → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 1 p. 1490
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the concentration of trametinib. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to trazodone. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to trazodone.
 Avoid or adjust dose. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to triptans (almotriptan). [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to triptans (eletriptan). Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to upadacitinib. Use with caution or avoid. [Severe] Study
- Posaconazole is predicted to increase the exposure to upadacitinib. Use with caution or avoid. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to vemurafenib. Severe Theoretical → Also see TABLE 9 p. 1492
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to venetoclax. Avoid or adjust dose consult product literature. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 1 p. 1490 → Also see TABLE 9 p. 1492
- ➤ Miconazole is predicted to increase the concentration of vinca alkaloids. Use with caution and adjust dose. Moderate

 Theoretical
- ➤ Antifungals, azoles (clotrimazole, ketoconazole) are predicted to decrease the exposure to vitamin D substances (colecalciferol). Moderate] Theoretical
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to zopiclone. Adjust dose.
 Moderate Theoretical
- Antihistamines, non-sedating → see TABLE 9 p. 1492 (QT-interval prolongation)

acrivastine • azelastine • bilastine • cetirizine • desloratadine • fexofenadine • levocetirizine • loratadine • mizolastine • rupatadine

- Since systemic absorption can follow topical application, the possibility of interactions with topical azelastine should be borne in mind.
- Apple juice and orange juice decrease the exposure to fexofenadine.
- ► Oral antacids decrease the absorption of oral fexofenadine. Separate administration by 2 hours. [Mild] Study
- Anti-androgens (apalutamide) slightly decrease the exposure to fexofenadine. Mild Study
- ► Anti-androgens (darolutamide) are predicted to increase the concentration of fexofenadine. [Moderate] Theoretical

- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to antihistamines, non-sedating (fexofenadine, mizolastine). [Severe] Theoretical
- ► Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to mizolastine. Severe

 Theoretical
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. Avoid. |Severe| Study
- Antifungals, azoles (miconazole) are predicted to increase the exposure to mizolastine. Avoid. Moderate Theoretical
- ► Berotralstat is predicted to increase the concentration of fexofenadine. Monitor and adjust dose. Moderate Study
- ► Antihistamines, non-sedating are predicted to decrease the effects of betahistine. [Moderate] Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to mizolastine. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- Ceritinib is predicted to increase the exposure to fexofenadine.
 Moderate Theoretical
- ► Cobicistat is predicted to increase the exposure to mizolastine.

 Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to rupatadine.
 Avoid. Moderate Study
 Crizotinib is predicted to increase the exposure to mizolastine.
- Severe Theoretical
 ► Crizotinib is predicted to increase the exposure to rupatadine.
- Avoid. Moderate Study
- ► Elexacaftor is predicted to increase the exposure to fexofenadine. Moderate Theoretical
- ► Eliglustat is predicted to increase the exposure to fexofenadine. Adjust dose. Moderate Study
- Grapefruit juice slightly decreases the exposure to bilastine.
 Bilastine should be taken 1 hour before or 2 hours after grapefruit. Moderate Study
- Grapefruit juice increases the exposure to rupatadine. Avoid.
 Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to mizolastine. Avoid. Severe Study
- HIV-protease inhibitors are predicted to increase the exposure to rupatadine. Avoid. Moderate Study
- ► Ibrutinib is predicted to increase the exposure to fexofenadine.

 Separate administration by at least 6 hours. Moderate

 Theoretical
- Idelalisib is predicted to increase the exposure to mizolastine.
 Avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to rupatadine. Avoid. Moderate Study
- ► Imatinib is predicted to increase the exposure to mizolastine. Severe | Theoretical
- ► Imatinib is predicted to increase the exposure to rupatadine. Avoid. Moderate Study
- Ivacaftor is predicted to increase the exposure to fexofenadine.
 [Moderate] Study
- ► Lapatinib is predicted to increase the exposure to fexofenadine. [Moderate] Theoretical
- ► Leflunomide is predicted to increase the exposure to fexofenadine. Moderate Study
- Letermovir is predicted to increase the concentration of fexofenadine. [Moderate] Theoretical
- ► Letermovir is predicted to increase the exposure to mizolastine. Severe Theoretical
- ► Letermovir is predicted to increase the exposure to rupatadine.

 Avoid. Moderatel Study
- ► Lorlatinib decreases the exposure to fexofenadine. Moderate Study
- Macrolides (clarithromycin) are predicted to increase the exposure to mizolastine. Avoid. [Severe] Study

Antihistamines, non-sedating (continued)

- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- ► Macrolides (erythromycin) are predicted to increase the exposure to mizolastine. Severe Theoretical
- MAOIs, irreversible are predicted to increase the risk of antimuscarinic adverse effects when given with antihistamines, non-sedating. Avoid. Severe Theoretical
- Mirabegron is predicted to increase the exposure to fexofenadine. [Mild] Theoretical
- ► Neratinib is predicted to increase the exposure to fexofenadine. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to mizolastine. Severe Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to rupatadine. Avoid.
 Moderate Study
- Nilotinib is predicted to increase the exposure to mizolastine.
 Severe | Theoretical
- Nilotinib is predicted to increase the exposure to rupatadine.
 Avoid. [Moderate] Study
- Olaparib might increase the exposure to fexofenadine.
 Moderate Theoretical
- Osimertinib is predicted to increase the exposure to fexofenadine. Moderate Study
- Pibrentasvir with glecaprevir is predicted to increase the exposure to fexofenadine. Moderate Study
- Pitolisant is predicted to decrease the exposure to fexofenadine. [Mild] Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to bilastine. Moderate Theoretical
- Rifamycins (rifampicin) increase the clearance of fexofenadine.
 Moderate Study
- Roxadustat is predicted to increase the exposure to fexofenadine. Monitor adverse effects and adjust dose.

 Moderate | Study
- Sotorasib is predicted to increase the exposure to fexofenadine. Avoid or adjust dose. Moderate Study
- ➤ Taxanes (cabazitaxel) are predicted to affect the exposure to fexofenadine. Manufacturer advises take 12 hours before or 3 hours after cabazitaxel. [Moderate] Theoretical
- ► Tepotinib is predicted to increase the concentration of fexofenadine. Severe Study
- Teriflunomide is predicted to increase the exposure to fexofenadine. Moderate Study
- ➤ Tucatinib is predicted to increase the exposure to fexofenadine. Use with caution and adjust dose. [Moderate] Theoretical
- Vandetanib is predicted to increase the exposure to fexofenadine. [Moderate] Study
- Velpatasvir is predicted to increase the exposure to fexofenadine. [Severe] Theoretical
- ▶ Vemurafenib is predicted to increase the exposure to fexofenadine. Use with caution and adjust dose. Severe Theoretical
- Venetoclax is predicted to increase the exposure to fexofenadine. [Moderate] Theoretical

Antihistamines, sedating → see TABLE 9 p. 1492 (QT-interval prolongation), TABLE 11 p. 1492 (CNS depressant effects), TABLE 10 p. 1492 (antimuscarinics)

alimemazine \cdot antazoline \cdot buclizine \cdot chlorphenamine \cdot cinnarizine \cdot clemastine \cdot cyclizine \cdot cyproheptadine \cdot doxylamine \cdot hydroxyzine \cdot ketotifen \cdot pizotifen \cdot promethazine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **ketotifen**, the possibility of interactions should be borne in mind.

- Hydroxyzine potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
- Antipsychotics, second generation (clozapine) can cause constipation, as can antihistamines, sedating (chlorphenamine, clemastine, cyclizine, cyproheptadine, hydroxyzine, promethazine); concurrent use might increase the risk of

- developing intestinal obstruction. <u>Severe</u> Theoretical → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- Antihistamines, sedating are predicted to decrease the effects of betahistine. [Moderate] Theoretical
- ► Cyproheptadine might decrease the efficacy of fenfluramine.

 Severe | Theoretical
- MAOIs, irreversible are predicted to increase the risk of antimuscarinic adverse effects when given with antihistamines, sedating. Avoid. [Severe] Theoretical
- Cyproheptadine decreases the effects of metyrapone. Avoid.
 Moderate Study
- Antihistamines, sedating are predicted to decrease the efficacy of pitolisant. [Moderate] Theoretical
- Cyproheptadine potentially decreases the effects of SSRIs.
 Moderate Anecdotal

Antimalarials → see TABLE 9 p. 1492 (QT-interval prolongation)

artemether • artenimol • atovaquone • chloroquine • lumefantrine • mefloquine • piperaquine • primaquine • proguanil • pyrimethamine • quinine •

PHARMACOLOGY Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped.

- ► Chloroquine is predicted to decrease the effects of agalsidase alfa. Avoid. Moderate Theoretical
- Chloroquine is predicted to decrease the effects of agalsidase beta. Avoid. Moderate Theoretical
- Antimalarials (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Theoretical
- ➤ Oral antacids are predicted to decrease the absorption of oral chloroquine. Separate administration by at least 4 hours. Moderate Theoretical
- ➤ Oral antacids are predicted to decrease the absorption of oral proguanil. Separate administration by at least 2 hours.

 Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to artemether with lumefantrine. Avoid. [Severe] Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of piperaquine. Avoid. Moderate Theoretical
- ► Antiarrhythmics (dronedarone) are predicted to increase the concentration of piperaquine. [Severe] Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to artemether with lumefantrine. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of piperaquine. Avoid. Moderate Theoretical
- ➤ Antiepileptics (carbamazepine, phenobarbital, primidone) potentially increase the risk of toxicity when given with quinine. Unknown Study
- Pyrimethamine increases the risk of haematological toxicity when given with antiepileptics (fosphenytoin, phenytoin). Severe
- Pyrimethamine is predicted to increase the risk of haematological toxicity when given with antiepileptics (phenobarbital, primidone). (Severe) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the concentration of piperaguine. (Severe) Theoretical
- Antifungals, azoles (fluconazole, itraconazole, posaconazole, voriconazole) are predicted to increase the exposure to mefloquine. [Moderate] Theoretical
- ► Antifungals, azoles (ketoconazole) increase the exposure to mefloquine. Moderate Study
- Antimalarials (proguanil) are predicted to increase the risk of adverse effects when given with antimalarials (pyrimethamine).
 Severel Theoretical
- Mefloquine is predicted to increase the risk of bradycardia when given with beta blockers, non-selective. [Severe] Theoretical
- Mefloquine is predicted to increase the risk of bradycardia when given with beta blockers, selective. Severe Theoretical

- Mefloquine is predicted to increase the risk of bradycardia when given with calcium channel blockers. Severe Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of piperaquine. Severe Theoretical
- Calcium salts (calcium carbonate) might decrease the absorption of chloroquine. Separate administration by at least 4 hours. [Moderate] Study
- ► Calcium salts (calcium carbonate) are predicted to decrease the absorption of proguanil. Separate administration by at least 2 hours. [Moderate] Study
- ► Chloroquine decreases the efficacy of oral cholera vaccine.

 [Moderate] Study
- Cobicistat is predicted to increase the concentration of piperaquine. Severe Theoretical
- Crizotinib is predicted to increase the concentration of piperaquine. Severe Theoretical
- Antimalarials (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severe Theoretical
- Mefloquine is predicted to increase the risk of bradycardia when given with digoxin. Severe Theoretical
- Quinine increases the concentration of digoxin. Monitor and adjust digoxin dose, p. 117. [Severe] Anecdotal
- ► Grapefruit juice increases the exposure to artemether.

 Unknown Study
- Grapefruit juice is predicted to increase the concentration of piperaquine. Avoid. [Severe] Theoretical
- H₂ receptor antagonists (cimetidine) decrease the clearance of chloroquine. [Moderate] Study
- ► H₂ receptor antagonists (cimetidine) slightly increase the exposure to quinine. Moderate Study
- HIV-protease inhibitors decrease the exposure to atovaquone.
 Avoid if boosted with ritonavir. [Moderate] Study
- ► HIV-protease inhibitors are predicted to increase the concentration of piperaquine. [Severe] Theoretical
- ► HIV-protease inhibitors are predicted to decrease the exposure to proguanil. Avoid. Moderate Study
- HIV-protease inhibitors are predicted to affect the exposure to quinine. Severe Study
- ► Idelalisib is predicted to increase the concentration of piperaquine. Severe Theoretical
- Imatinib is predicted to increase the concentration of piperaquine. Severe Theoretical
- Oral kaolin decreases the absorption of oral chloroquine.
 Separate administration by at least 4 hours. [Moderate] Study
- ▶ Lanthanum is predicted to decrease the absorption of chloroquine. Separate administration by at least 2 hours. Moderatel Theoretical
- ► Chloroquine is predicted to decrease the exposure to laronidase. Avoid simultaneous administration. Severe
- Letermovir is predicted to increase the concentration of piperaquine. Severe Theoretical
- Macrolides might increase the risk of serious cardiovascular adverse effects when given with chloroquine. Severe Theoretical
- Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of piperaquine. Severe Theoretical
- ► Oral magnesium trisilicate decreases the absorption of oral chloroquine. Separate administration by at least 4 hours.

 Moderate | Study
- Mepacrine is predicted to increase the concentration of primaquine. Avoid. Moderate Theoretical
- Pyrimethamine is predicted to increase the risk of adverse effects when given with methotrexate. [Severe] Theoretical
- ► Metoclopramide decreases the concentration of atovaquone. Avoid. Moderate Study
- Mitotane is predicted to decrease the exposure to artemether with lumefantrine. Avoid. Severe Study
- Mitotane is predicted to decrease the concentration of piperaquine. Avoid. [Moderate] Theoretical
- ▶ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the concentration of piperaquine. Severe Theoretical
- Nilotinib is predicted to increase the concentration of piperaquine. [Severe] Theoretical

- ► Nirmatrelvir boosted with ritonavir is predicted to decrease the concentration of atovaquone. [Moderate] Theoretical
- NNRTIs (efavirenz) decrease the concentration of artemether.

 Severel Study → Also see TABLE 9 p. 1492
- NNRTIs (efavirenz) moderately decrease the exposure to atovaquone. Avoid. Moderate Study
- NNRTIS (efavirenz) affect the exposure to proguanil. Avoid.
 Moderate Study
- NNRTIs (etravirine) decrease the exposure to artemether.
 Moderate Study
- Pyrimethamine is predicted to increase the risk of adverse effects when given with NRTIs (zidovudine). [Severe] Theoretical
- ► Pyrimethamine is predicted to increase the risk of adverse effects when given with pemetrexed. Severe Theoretical
- Chloroquine is predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. [Severe] Theoretical
- Chloroquine moderately decreases the exposure to praziquantel. Use with caution and adjust dose. Moderate Study
- ► Chloroquine decreases the efficacy of rabies vaccine (intradermal). Avoid. Moderate Study
- Chloroquine might decrease the effects of remdesivir. Avoid.
 Moderate Theoretical
- Rifamycins (rifabutin) slightly decrease the exposure to atovaquone. Avoid. [Moderate] Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to artemether with lumefantrine. Avoid. Severe Study
- Rifamycins (rifampicin) moderately decrease the exposure to atovaquone and atovaquone slightly increases the exposure to rifamycins (rifampicin). Avoid. [Moderate] Study
- Rifamycins (rifampicin) moderately decrease the exposure to mefloquine. [Severe] Study
- Rifamycins (rifampicin) are predicted to decrease the concentration of piperaquine. Avoid. [Moderate] Theoretical
- ► Rifamycins (rifampicin) decrease the exposure to quinine.

 Severe Study
- ➤ St John's wort is predicted to decrease the concentration of piperaquine. Avoid. Moderate Theoretical
- Pyrimethamine increases the risk of adverse effects when given with sulfonamides. Severel Study
- Tetracyclines (tetracycline) decrease the concentration of atovaquone. Moderate Study
- Pyrimethamine increases the risk of adverse effects when given with trimethoprim. [Severe] Study

Antipsychotics, second generation → see TABLE 8 p. 1491 (hypotension), TABLE 9 p. 1492 (QT-interval prolongation), TABLE 11 p. 1492 (CNS depressant effects), TABLE 10 p. 1492 (antimuscarinics)

 $amisulpride \cdot aripiprazole \cdot asenapine \cdot cariprazine \cdot clozapine \cdot lurasidone \cdot olanzapine \cdot paliperidone \cdot quetiapine \cdot risperidone$

- ► Clozapine and olanzapine dose adjustment might be necessary if smoking started or stopped during treatment.
- Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis or a substantial potential to depress bone marrow function.
- ► Clozapine can cause constipation, as can aclidinium; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 427. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to cariprazine. Avoid. [Severe] Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to lurasidone. Avoid. Moderate Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to paliperidone. Monitor and adjust dose. |Severe| Study → Also see TABLE 9 p. 1492
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to quetiapine. [Moderate] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1492

Antipsychotics, second generation (continued)

- Anti-androgens (enzalutamide) are predicted to decrease the exposure to clozapine. Moderate Theoretical
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to cariprazine. Avoid. Severe Study
- ➤ Antiarrhythmics (dronedarone) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 430. Moderate Study
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
- Clozapine can cause constipation, as can antiarrhythmics (disopyramide, propafenone); concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical -> Also see TABLE 10 p. 1492
- Antiepileptics (carbamazepine) are predicted to increase the risk of myelosuppression when given with clozapine. Avoid. [Severe] Anecdotal
- Antiepileptics (carbamazepine) potentially decrease the exposure to olanzapine. Monitor and adjust dose. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 427.
 Moderatel Study → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cariprazine. Avoid. Severe Theoretical → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lurasidone. Avoid. Moderate Study → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paliperidone. Monitor and adjust dose. Severel Study → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to quetiapine. Moderate Study → Also see TABLE 11 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1492
- ► Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to clozapine. Moderate Anecdotal → Also see TABLE 11 p. 1492
- Antiepileptics (phenytoin) are predicted to decrease the exposure to olanzapine. Monitor and adjust dose. [Moderate] Study
- Antiepileptics (valproate) increase the risk of adverse effects when given with olanzapine. [Severe] Study
- Antiepileptics (valproate) slightly increase the exposure to paliperidone. Adjust dose. Moderate Study
- Antiepileptics (valproate) potentially increase the risk of neutropenia when given with quetiapine. Moderate Study
- Antifungals, azoles (fluconazole, isavuconazole) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 430. [Moderate] Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to cariprazine. Avoid. [Severe] Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to quetiapine. Avoid.

 Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to aripiprazole.
 Adjust aripiprazole dose, p. 427. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cariprazine.
 Avoid. [Severe] Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to risperidone. Adjust dose. Moderate | Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (posaconazole) moderately increase the exposure to lurasidone. Avoid. Severe Study

- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid. [Severe] Study
- ➤ Clozapine can cause constipation, as can antihistamines, sedating (chlorphenamine, clemastine, cyclizine, cyproheptadine, hydroxyzine, promethazine); concurrent use might increase the risk of developing intestinal obstruction.

 [Severe] Theoretical → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- Antipsychotics, second generation (clozapine) can cause constipation, as can antipsychotics, second generation (olanzapine, quetiapine); concurrent use might increase the risk of developing intestinal obstruction. Severe Anecdotal → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492
- ➤ Clozapine can cause constipation, as can atropine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Axitinib is predicted to increase the exposure to antipsychotics, second generation (clozapine, olanzapine). [Moderate] Theoretical
- Clozapine can cause constipation, as can baclofen; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- Bupropion is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 427. [Moderate] Study
- Bupropion is predicted to increase the exposure to risperidone.
 Adjust dose. Moderate Study
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cariprazine. Avoid. Severe Study → Also see TABLE 8 p. 1491
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 430. [Moderate] Study → Also see TABLE 8 p. 1491
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study → Also see TABLE 8 p. 1491
- ► Cenobamate is predicted to decrease the exposure to antipsychotics, second generation (lurasidone, quetiapine). Adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 1492
- Cinacalcet is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 427. Moderate Study
- ► Cinacalcet is predicted to increase the exposure to risperidone.

 Adjust dose. [Moderate] Study
- ➤ Cobicistat is predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid.

 [Severe] Study
- Cobicistat is predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 427. [Moderate] Study
- Cobicistat is predicted to moderately increase the exposure to cariprazine. Avoid. Severe Study
- Cobicistat is predicted to increase the exposure to risperidone.
 Adjust dose. Moderate Study
- ► Combined hormonal contraceptives increases the concentration of clozapine. Monitor adverse effects and adjust dose. Severel Study
- ► Combined hormonal contraceptives is predicted to increase the exposure to olanzapine. Adjust dose. Moderate Anecdotal
- ► Crizotinib is predicted to increase the exposure to cariprazine.

 Avoid. Severe Study
- Crizotinib is predicted to increase the exposure to lurasidone.
 Adjust lurasidone dose, p. 430. [Moderate] Study
- Crizotinib is predicted to increase the exposure to quetiapine.
 Avoid. Moderate Study
- Clozapine can cause constipation, as can cyclopentolate; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10
- ► Dabrafenib is predicted to decrease the exposure to cariprazine. Avoid. [Severe] Theoretical

p. 1492

- ▶ Dabrafenib is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. Moderate Theoretical
- Dabrafenib is predicted to decrease the exposure to quetiapine.
 Moderate Study
- Clozapine can cause constipation, as can darifenacin; concurrent use might increase the risk of developing

- intestinal obstruction. Severe Theoretical → Also see TABLE 10 n. 1492
- Clozapine can cause constipation, as can dicycloverine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 n. 1492
- Clozapine can cause constipation, as can dimenhydrinate; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Antipsychotics, second generation (amisulpride, olanzapine, paliperidone, quetiapine, risperidone) are predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 9 p. 1492
- Antipsychotics, second generation (aripiprazole, clozapine) are predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see TABLE 8 p. 1491 → Also see
 TABLE 10 p. 1492
- ► Asenapine is predicted to decrease the effects of dopamine receptor agonists. Adjust dose. Moderate Theoretical → Also see TABLE 8 p. 1491
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to cariprazine. Avoid. Severe Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to lurasidone. Monitor and adjust dose.

 Moderate Theoretical
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to quetiapine. [Moderate] Study
- Clozapine can cause constipation, as can fesoterodine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- ➤ Clozapine can cause constipation, as can flavoxate; concurrent use might increase the risk of developing intestinal obstruction. Severel Theoretical → Also see TABLE 10 p. 1492
- Clozapine can cause constipation, as can flupentixol; concurrent use might increase the risk of developing intestinal obstruction. Severe! Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492
- Clozapine can cause constipation, as can glycopyrronium; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p.1492
- Grapefruit juice is predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid.
 Severe Theoretical
- Grapefruit juice is predicted to increase the exposure to cariprazine. Avoid. Moderate Study
- ➤ Clozapine can cause constipation, as can haloperidol; concurrent use might increase the risk of developing intestinal obstruction. Severe! Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- ► HIV-protease inhibitors are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 427.

 Moderate Study
- ► HIV-protease inhibitors are predicted to moderately increase the exposure to cariprazine. Avoid. Severe Study
- ► HIV-protease inhibitors (ritonavir) are predicted to affect the exposure to clozapine. Avoid. [Severe] Theoretical
- ► HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to olanzapine. Monitor and adjust dose. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Clozapine can cause constipation, as can homatropine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- ► Clozapine can cause constipation, as can hyoscine; concurrent use might increase the risk of developing intestinal obstruction. (Severe | Theoretical → Also see TABLE 10 p. 1492

- ► Idelalisib is predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid. Severel Study
- ► Idelalisib is predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 427. [Moderate] Study
- ► Idelalisib is predicted to moderately increase the exposure to cariprazine. Avoid. Severe Study
- Idelalisib is predicted to increase the exposure to risperidone.
 Adjust dose. Moderate Study
- Imatinib is predicted to increase the exposure to cariprazine.
 Avoid. Severe Study
- ► Imatinib is predicted to increase the exposure to Iurasidone.

 Adjust Iurasidone dose, p. 430. [Moderate] Study
- Imatinib is predicted to increase the exposure to quetiapine.
 Avoid. Moderate Study
- ► Interferons (ropeginterferon alfa) are predicted to increase the exposure to risperidone. [Moderate] Theoretical
- Clozapine can cause constipation, as can ipratropium; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Clozapine can cause constipation, as can iron; concurrent use might increase the risk of developing intestinal obstruction.
 Severe Anecdotal
- ► Iron chelators (deferasirox) are predicted to increase the exposure to clozapine. Avoid. Moderate Theoretical
- Leflunomide is predicted to decrease the exposure to clozapine.
 Moderate Theoretical
- ► Leflunomide is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. Moderate Study
- Letermovir is predicted to increase the exposure to cariprazine.
 Avoid. [Severe] Study
- ► Letermovir is predicted to increase the exposure to quetiapine.

 Avoid. [Moderate] Study
- Amisulpride is predicted to decrease the effects of levodopa.
 Avoid. [Severe] Theoretical
 Antipsychotics, second generation (aripiprazole, clozapine,
- lurasidone, paliperidone) are predicted to decrease the effects of levodopa. Severe Theoretical → Also see TABLE 8 p. 1491
- Asenapine is predicted to decrease the effects of levodopa. Adjust dose. Severe Theoretical → Also see TABLE 8 p. 1491
- Olanzapine decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. Severe Anecdotal → Also see TABLE 8 p. 1491
- ► Quetiapine decreases the effects of levodopa. Severe

 Anecdotal → Also see TABLE 8 p. 1491
- Risperidone is predicted to decrease the effects of levodopa. Avoid or adjust dose. Severe Anecdotal → Also see TABLE 8 p. 1491
- ► Antipsychotics, second generation (quetiapine, risperidone) potentially increase the risk of neurotoxicity when given with lithium. Severe Anecdotal → Also see TABLE 9 p. 1492
- Clozapine can cause constipation, as can loperamide; concurrent use might increase the risk of developing intestinal obstruction. Severe Anecdotal
- Clozapine can cause constipation, as can loxapine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- Macrolides (clarithromycin) are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 427.
 Moderatel Study
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to cariprazine. Avoid. Severe Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to risperidone. Adjust dose. Moderate Study → Also see TABLE 9 p. 1492
- Macrolides (erythromycin) are predicted to increase the exposure to cariprazine. Avoid. (Severe) Study
- Macrolides (erythromycin) potentially increase the risk of toxicity when given with clozapine. Severe Anecdotal
- ► Macrolides (erythromycin) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 430. Moderate Study
- Macrolides (erythromycin) are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study

Antipsychotics, second generation (continued)

- Macrolides (clarithromycin) are predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid. [Severe] Study
- Methylphenidate might increase the risk of dyskinesias when given with paliperidone. [Severe] Theoretical
- Methylphenidate increases the risk of dyskinesias when given with risperidone. [Severe] Anecdotal
- Mexiletine increases the concentration of clozapine. Monitor adverse effects and adjust dose. Severe Study
- ► Mexiletine is predicted to increase the exposure to olanzapine. Adjust dose. Moderatel Anecdotal
- ► Mitotane is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 427. [Moderate] Study
- ► Mitotane is predicted to decrease the exposure to cariprazine. Avoid. Severe Theoretical
- Mitotane is predicted to decrease the exposure to lurasidone.
 Avoid. Moderate Study
- Mitotane is predicted to decrease the exposure to paliperidone.
 Monitor and adjust dose. Severe Study
- Mitotane is predicted to decrease the exposure to quetiapine.
 Moderate Study
- Mitotane is predicted to decrease the exposure to risperidone.
 Adjust dose. [Moderate] Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to cariprazine. Avoid. |Severe| Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 430. Moderate Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to quetiapine. Avoid.
 Moderatel Study
- Nilotinib is predicted to increase the exposure to cariprazine.
 Avoid. Severe Study
- Nilotinib is predicted to increase the exposure to lurasidone.
 Adjust lurasidone dose, p. 430. Moderate Study
- Nilotinib is predicted to increase the exposure to quetiapine.
 Avoid. Moderate Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of antipsychotics, second generation (clozapine, lurasidone, quetiapine). Avoid. Severe Theoretical
- ► Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of risperidone. Severe Theoretical
- NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to cariprazine. Avoid. Severe Theoretical
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to quetiapine. Moderate Study
- ► Olaparib might alter the exposure to quetiapine. Moderate

 Theoretical
- ➤ Clozapine can cause constipation, as can opioids; concurrent use might increase the risk of developing intestinal obstruction. |Severe| Anecdotal → Also see TABLE 11 p. 1492
- Clozapine can cause constipation, as can orphenadrine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Osilodrostat increases the concentration of clozapine. Monitor adverse effects and adjust dose. Severe Study
- Osilodrostat is predicted to increase the exposure to olanzapine. Adjust dose. [Moderate] Anecdotal
- Clozapine can cause constipation, as can oxybutynin; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- ➤ Clozapine can cause constipation, as can phenothiazines; concurrent use might increase the risk of developing intestinal obstruction. [Severe] Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- ► Clozapine can cause constipation, as can pimozide; concurrent use might increase the risk of developing intestinal

- obstruction. Severe Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- ► Clozapine can cause constipation, as can pridinol; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Clozapine can cause constipation, as can procyclidine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Clozapine can cause constipation, as can propantheline; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Clozapine can cause constipation, as can propiverine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Quinolones (ciprofloxacin) increase the concentration of clozapine. Monitor adverse effects and adjust dose. Severe Study
- Quinolones (ciprofloxacin) are predicted to increase the exposure to olanzapine. Adjust dose. Moderate Anecdotal
- Ribociclib (high-dose) is predicted to increase the exposure to quetiapine. Avoid. Moderate Theoretical
- ► Rifamycins (rifampicin) are predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 427.

 Moderatel Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to cariprazine. Avoid. [Severe] Theoretical
- Rifamycins (rifampicin) decrease the exposure to clozapine.
 Severe Anecdotal
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to olanzapine. Monitor and adjust dose. Moderate Study
- ➤ Rifamycins (rifampicin) are predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to quetiapine. [Moderate] Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to risperidone. Adjust dose. [Moderate] Study
- ➤ Rucaparib increases the concentration of clozapine. Monitor adverse effects and adjust dose. Severe Study
- Rucaparib is predicted to increase the exposure to olanzapine.

 Adjust dose. Moderate Anecdotal
- Clozapine can cause constipation, as can solifenacin; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 n. 1492
- ► SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 427. [Moderate] Study
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- SSRIs (fluvoxamine) increase the exposure to asenapine.
 Moderate Study
- SSRIs (fluvoxamine) increase the concentration of clozapine.
 Monitor adverse effects and adjust dose. Severe Study
- ► SSRIs (fluvoxamine) moderately increase the exposure to olanzapine. Adjust dose. Severe Anecdotal
- SSRIs (paroxetine) moderately increase the exposure to asenapine. [Moderate] Study
- ► St John's wort is predicted to decrease the exposure to cariprazine. Avoid. Severe Theoretical
- St John's wort is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. Moderate Theoretical
- ► St John's wort is predicted to decrease the exposure to paliperidone. Severe Theoretical
- ► St John's wort is predicted to decrease the exposure to quetiapine. [Moderate] Study
- ► Terbinafine is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 427. Moderate Study
- ► Terbinafine is predicted to increase the exposure to risperidone. Adjust dose. Moderate Study

- Teriflunomide is predicted to decrease the exposure to clozapine. Moderate Theoretical
- ► Teriflunomide is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. Moderate Study
- Clozapine can cause constipation, as can tiotropium; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Clozapine can cause constipation, as can tolterodine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10
- Clozapine can cause constipation, as can tricyclic antidepressants; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- Clozapine can cause constipation, as can trihexyphenidyl; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Clozapine can cause constipation, as can tropicamide; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- ➤ Clozapine can cause constipation, as can trospium; concurrent use might increase the risk of developing intestinal obstruction. Severel Theoretical → Also see TABLE 10 p. 1492
- Clozapine can cause constipation, as can umeclidinium; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Vemurafenib increases the concentration of clozapine. Monitor adverse effects and adjust dose. Severe Study
- Vemurafenib is predicted to increase the exposure to olanzapine. Adjust dose. Moderate Anecdotal
- ➤ Clozapine can cause constipation, as can zuclopenthixol; concurrent use might increase the risk of developing intestinal obstruction. Severe! Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492

Antithymocyte immunoglobulin (rabbit) → see immunoglobulins Apalutamide → see anti-androgens

Apixaban → see factor XA inhibitors

Apomorphine → see dopamine receptor agonists

Apraclonidine -> see TABLE 6 p. 1491 (bradycardia), TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects)

- Amfetamines are predicted to decrease the effects of apraclonidine. Avoid. Severel Theoretical
- Methylphenidate is predicted to decrease the effects of apraclonidine. Avoid. <u>Severel</u> Theoretical
- ► Sympathomimetics, inotropic are predicted to decrease the effects of apraclonidine. Avoid. Severe Theoretical
- ► Sympathomimetics, vasoconstrictor are predicted to decrease the effects of apraclonidine. Avoid. [Severe] Theoretical

Apremilast → see phosphodiesterase type-4 inhibitors

Aprepitant → see neurokinin-1 receptor antagonists

Argatroban → see thrombin inhibitors

Aripiprazole → see antipsychotics, second generation

Arsenic trioxide → see TABLE 15 p. 1493 (myelosuppression), TABLE 9 p. 1492 (QT-interval prolongation)

Artemether → see antimalarials

Artenimol → see antimalarials

Articaine → see TABLE 11 p. 1492 (CNS depressant effects)
Ascorbic acid

- Ascorbic acid is predicted to increase the risk of cardiovascular adverse effects when given with iron chelators (deferiprone).
 Severe Theoretical
- Ascorbic acid might increase the risk of cardiovascular adverse
 effects when given with iron chelators (desferrioxamine).
 Manufacturer advises caution or adjust ascorbic acid dose;
 monitor cardiac function and avoid concurrent use in those
 with cardiac failure. (Severe) Theoretical

Asenapine → see antipsychotics, second generation
Asparaginase → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 15
p. 1493 (myelosuppression)

- ► Asparaginase is predicted to increase the risk of hepatotoxicity when given with imatinib. Severe Theoretical → Also see TABLE 15 p. 1493
- ► Asparaginase affects the efficacy of methotrexate. Severe

 Anecdotal → Also see TABLE 1 p. 1490 → Also see TABLE 15 p. 1493
- Asparaginase potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before asparaginase. Severe Anecdotal → Also see TABLE 1 p. 1490 → Also see TABLE 15 p. 1493

Aspirin → see TABLE 4 p. 1490 (antiplatelet effects)

- ► Acetazolamide increases the risk of severe toxic reaction when given with aspirin (high-dose). Severe Study
- Oral antacids decrease the absorption of oral aspirin (high-dose). Moderate Study
- ▶ Bismuth subsalicylate is predicted to increase the risk of adverse effects when given with aspirin. Avoid. Moderate Theoretical
- ➤ Aspirin (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronate, ibandronate). Moderate Study
- ➤ Aspirin (high-dose) is predicted to increase the risk of renal impairment when given with bisphosphonates (clodronate).
 Severel Theoretical
- Corticosteroids are predicted to decrease the concentration of aspirin (high-dose) and aspirin (high-dose) increases the risk of gastrointestinal bleeding when given with corticosteroids. [Moderate] Study
- Aspirin (high-dose) increases the risk of renal impairment when given with daptomycin. Moderate Theoretical
- Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with aspirin (high-dose). Severe Theoretical
- Aspirin (high-dose) increases the exposure to factor XA inhibitors (edoxaban). Avoid. Severe Study
- ➤ Aspirin (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with iron chelators (deferasirox). Severe Theoretical
- Aspirin (high-dose) is predicted to increase the risk of toxicity when given with methotrexate. Severe Study
- Aspirin is predicted to increase the risk of gastrointestinal perforation when given with nicorandil. [Severe] Theoretical
- NRTIs (zidovudine) increase the risk of haematological toxicity when given with aspirin (high-dose). Severe Study
- Aspirin (high-dose) potentially increases the exposure to pemetrexed. Use with caution or avoid. [Severe] Theoretical
- Selumetinib might increase the risk of bleeding when given with aspirin. Severe Theoretical
- ► Aspirin (high-dose) increases the risk of acute renal failure when given with thiazide diuretics. Severe Theoretical

Ataluren

- ► Ataluren is predicted to increase the risk of nephrotoxicity when given with intravenous aminoglycosides. Avoid. Severe
- ► Rifamycins (rifampicin) decrease the exposure to ataluren.

 Moderate Study

Atazanavir → see HIV-protease inhibitors

Atenolol → see beta blockers, selective

Atezolizumab → see monoclonal antibodies

Atomoxetine

- ► Amfetamines are predicted to increase the risk of adverse effects when given with atomoxetine. Severe Theoretical
- ► Berotralstat is predicted to increase the exposure to atomoxetine. Adjust dose. [Moderate] Study
- Atomoxetine is predicted to increase the risk of cardiovascular adverse effects when given with beta₂ agonists (high-dose).
 Moderate Study
- ▶ Bupropion is predicted to markedly increase the exposure to atomoxetine. Adjust dose. Severe Study
- Cinacalcet is predicted to markedly increase the exposure to atomoxetine. Adjust dose. Severe Study
- ▶ Dacomitinib is predicted to markedly increase the exposure to atomoxetine. Avoid or adjust dose. Severe Study
- ► Eliglustat is predicted to increase the exposure to atomoxetine.

 Adjust dose. Moderate Theoretical

Atomoxetine (continued)

- Fedratinib is predicted to increase the exposure to atomoxetine. Monitor and adjust dose. Moderate Theoretical
- ► Givosiran is predicted to increase the exposure to atomoxetine.

 Use with caution and adjust dose. [Moderate] Study
- ► Interferons (ropeginterferon alfa) are predicted to increase the exposure to atomoxetine. Moderate Theoretical
- ► MAOIs, irreversible are predicted to increase the risk of adverse effects when given with atomoxetine. Avoid and for 2 weeks after stopping the MAOI. Severe Theoretical
- ▶ Panobinostat is predicted to increase the exposure to atomoxetine. Monitor and adjust dose. Severe Theoretical
- ➤ SSRIs (fluoxetine, paroxetine) are predicted to markedly increase the exposure to atomoxetine. Adjust dose. Severe Study
- ► Terbinafine is predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study

Atorvastatin → see statins

Atovaquone → see antimalarials

Atracurium → see neuromuscular blocking drugs, non-depolarising **Atropine** → see TABLE 10 p. 1492 (antimuscarinics)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **atropine**, the possibility of interactions should be borne in mind.

- ➤ Antipsychotics, second generation (clozapine) can cause constipation, as can atropine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- ➤ Atropine increases the risk of severe hypertension when given with sympathomimetics, vasoconstrictor (phenylephrine). Severe Study

Avanafil → see phosphodiesterase type-5 inhibitors Avapritinib

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to avapritinib. Avoid. Severe Study
- ➤ Antiarrhythmics (dronedarone) are predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. [Moderate] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to avapritinib. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to avapritinib. Avoid.
 Moderatel Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. [Moderate] Study
- Cobicistat is predicted to increase the exposure to avapritinib.
 Avoid. [Moderate] Study
- ► Corticosteroids (dexamethasone) are predicted to decrease the exposure to avapritinib. Avoid. [Severe] Theoretical
- ► Crizotinib is predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. Moderate Study
- Dabrafenib is predicted to decrease the exposure to avapritinib. Avoid. Severe Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to avapritinib. Avoid. [Severe] Study
- ► Grapefruit juice is predicted to increase the exposure to avapritinib. Avoid. [Moderate] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to avapritinib. Avoid. [Moderate] Study
- Idelalisib is predicted to increase the exposure to avapritinib.
 Avoid. Moderate Study
- ► Imatinib is predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. Moderate Study
- Letermovir is predicted to increase the exposure to avapritinib.
 Avoid or adjust avapritinib dose, p. 1045. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to avapritinib. Avoid. Moderate Study
- ► Macrolides (erythromycin) are predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. [Moderate] Study

- ► Mitotane is predicted to decrease the exposure to avapritinib. Avoid. Severe Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. [Moderate] Study
- Nilotinib is predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. Moderate Study
- NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to avapritinib. Avoid. (Severe) Study
- NNRTIS (etravirine) are predicted to decrease the exposure to avapritinib. Avoid. Severe Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to avapritinib. Avoid. [Severe] Study
- ► St John's wort is predicted to decrease the exposure to avapritinib. Avoid. [Severe] Study

Avatrombopag

- Anti-androgens (enzalutamide) are predicted to decrease the exposure to avatrombopag. Adjust avatrombopag dose with moderate CYP2C9 inducers in chronic immune thrombocytopenia, p. 1120. [Moderate] Study
- Antiarrhythmics (amiodarone) are predicted to increase the exposure to avatrombopag. Adjust avatrombopag dose with moderate CYP2C9 inhibitors in chronic immune thrombocytopenia, p. 1120. [Moderate] Study
- Antifungals, azoles (fluconazole, miconazole) are predicted to increase the exposure to avatrombopag. Adjust avatrombopag dose with moderate CYP2C9 inhibitors in chronic immune thrombocytopenia, p. 1120. [Moderate] Study
- Mifepristone is predicted to increase the exposure to avatrombopag. [Moderate] Theoretical
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to avatrombopag. Adjust avatrombopag dose with moderate CYP2C9 inducers in chronic immune thrombocytopenia, p. 1120. [Moderate] Study

Avelumab → see monoclonal antibodies

Axitinib → see TABLE 15 p. 1493 (myelosuppression), TABLE 4 p. 1490 (antiplatelet effects)

- Axitinib is predicted to increase the exposure to agomelatine.
 Moderate Theoretical
- Axitinib is predicted to increase the exposure to aminophylline.
 Moderate Theoretical
- Axitinib is predicted to increase the exposure to anaesthetics, local (ropivacaine). Moderate Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to axitinib. Avoid or adjust dose.

 Moderate Study
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to axitinib. Moderate Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to axitinib. (Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- ► Axitinib is predicted to increase the exposure to antipsychotics,
- second generation (clozapine, olanzapine). Moderate Theoretical

 ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to axitinib. Moderate Study
- ➤ Cobicistat is predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Crizotinib is predicted to increase the exposure to axitinib.
 [Moderate] Study
- Dabrafenib is predicted to decrease the exposure to axitinib.
 [Moderate] Study
- Axitinib is predicted to increase the exposure to dopamine receptor agonists (ropinirole). [Moderate] Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to axitinib. Moderate Study
- ► Grapefruit juice is predicted to increase the exposure to axitinib. Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

- Idelalisib is predicted to increase the exposure to axitinib.
 Avoid or adjust dose. [Moderate] Study
- ► Imatinib is predicted to increase the exposure to axitinib.

 Moderate

 Study → Also see TABLE 15 p. 1493 → Also see TABLE 4

 p. 1490
- ► Letermovir is predicted to increase the exposure to axitinib.

 [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to axitinib. Avoid or adjust dose. Moderate Study
- Macrolides (erythromycin) are predicted to increase the exposure to axitinib. Moderate Study
- Axitinib is predicted to increase the exposure to MAO-B inhibitors (rasagiline). [Moderate] Theoretical
- Axitinib is predicted to increase the exposure to melatonin.
 Moderate Theoretical
- Mitotane is predicted to decrease the exposure to axitinib. Avoid or adjust dose. Moderate Study → Also see TABLE 15 p. 1493
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to axitinib. Moderate Study
- Nilotinib is predicted to increase the exposure to axitinib.
 Moderate Study → Also see TABLE 15 p. 1493
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to axitinib. [Moderate] Study
- Axitinib is predicted to increase the exposure to pirfenidone.
 Moderate Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Axitinib is predicted to increase the exposure to SNRIS (duloxetine). [Moderate] Theoretical → Also see TABLE 4 p. 1490
- ► St John's wort is predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Axitinib is predicted to increase the exposure to theophylline.
 Moderate Theoretical
- ► Axitinib is predicted to increase the exposure to tizanidine.

 Moderate Theoretical

Azacitidine → see TABLE 15 p. 1493 (myelosuppression) **Azathioprine** → see TABLE 15 p. 1493 (myelosuppression)

- ► ACE inhibitors are predicted to increase the risk of anaemia and/or leucopenia when given with azathioprine. [Severe]
- Allopurinol potentially increases the risk of haematological toxicity when given with azathioprine. Adjust azathioprine dose, p. 902. [Severe] Study
- Baricitinib is predicted to enhance the risk of immunosuppression when given with azathioprine. Severe Theoretical
- Azathioprine decreases the anticoagulant effect of coumarins.
 Moderate Study
- ► Febuxostat is predicted to increase the exposure to azathioprine. Avoid. Severe Theoretical
- ► Filgotinib is predicted to increase the risk of immunosuppression when given with azathioprine. Avoid. Severel Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with azathioprine (high-dose). UKHSA advises avoid (refer to Green Book). [Severe] Theoretical
- Trimethoprim might increase the risk of haematological toxicity when given with azathioprine in renal transplant patients. [Severe] Anecdotal

Azelastine → see antihistamines, non-sedating

Azilsartan → see angiotensin-II receptor antagonists

Azithromycin → see macrolides

Bacillus Calmette-Guérin vaccine → see live vaccines

Bacitracin → see TABLE 2 p. 1490 (nephrotoxicity)

Baclofen → see TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects), TABLE 10 p. 1492 (antimuscarinics)

- ► Antipsychotics, second generation (clozapine) can cause constipation, as can baclofen; concurrent use might increase the risk of developing intestinal obstruction. [Severe]
 Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- ► Baclofen is predicted to increase the risk of adverse effects when given with levodopa. Severe Anecdotal → Also see TABLE 8 p. 1491

Baloxavir marboxil

- ► Oral aluminium hydroxide might decrease the concentration of the active metabolite of oral baloxavir marboxil. Severe

 Theoretical
- Oral antacids might decrease the concentration of the active metabolite of oral baloxavir marboxil. Avoid. Severe Theoretical
- ➤ Oral calcium salts might decrease the concentration of the active metabolite of oral baloxavir marboxil. Avoid. Severe Theoretical
- Oral docusates might decrease the concentration of the active metabolite of oral baloxavir marboxil. Severe Theoretical
- Oral iron might decrease the concentration of the active metabolite of oral baloxavir marboxil. Avoid. [Severe] Theoretical
- ➤ Oral magnesium might decrease the concentration of the active metabolite of oral baloxavir marboxil. Avoid. Severe Theoretical
- Oral selenium might decrease the concentration of the active metabolite of oral baloxavir marboxil. Avoid. [Severe] Theoretical
- ➤ Oral sodium picosulfate might decrease the concentration of the active metabolite of oral baloxavir marboxil. Severe Theoretical
- ➤ Oral zinc might decrease the concentration of the active metabolite of oral baloxavir marboxil. Avoid. Severe Theoretical

alsalazide

 Balsalazide is predicted to decrease the concentration of digoxin. Moderate Theoretical

Bambuterol → see beta₂ agonists

Baricitinib

- Baricitinib is predicted to enhance the risk of immunosuppression when given with azathioprine. [Severe] Theoretical
- Baricitinib is predicted to enhance the risk of immunosuppression when given with ciclosporin.
 Manufacturer advises caution or avoid—consult product literature. [Severe] Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with baricitinib. Avoid.
 Severel Theoretical
- ► Leflunomide is predicted to increase the exposure to baricitinib. Moderate Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with baricitinib. Avoid. [Severe] Theoretical
- Baricitinib is predicted to enhance the risk of immunosuppression when given with methotrexate. Severe Study
- ► Baricitinib is predicted to enhance the risk of immunosuppression when given with tacrolimus. Severe Theoretical
- ► Teriflunomide is predicted to increase the exposure to baricitinib. Moderate Study

Basiliximab → see monoclonal antibodies

Bazedoxifene

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical

Beclometasone → see corticosteroids

Bedaquiline → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 9 p. 1492 (OT-interval prolongation)

- ► Anti-androgens (apalutamide, enzalutamide) decrease the exposure to bedaquiline. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical → Also see TABLE 9 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to bedaquiline. Avoid. [Severe] Study → Also see TABLE 1 p. 1490
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 1 p. 1490 → Also see TABLE 9 p. 1492

Interactions | Appendix 1

Bedaquiline (continued)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Study → Also see TABLE 1 p. 1490 → Also see **TABLE 9 p. 1492**
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical
- ► Clofazimine potentially increases the risk of QT-prolongation when given with bedaquiline. Severe Study
- ► Cobicistat is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Study
- Crizotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical → Also see TABLE 9 p. 1492
- ▶ Dabrafenib is predicted to decrease the exposure to bedaquiline. Avoid. Severe Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to bedaquiline. Avoid. Severe Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Study
- ► Idelalisib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Study
- Imatinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical
- ► Letermovir is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical
- ► Macrolides (clarithromycin) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Study → Also see TABLE 9 p. 1492
- ► Macrolides (erythromycin) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical → Also see TABLE 9 p. 1492
- ► Mitotane decreases the exposure to bedaquiline. Avoid. Severe
- ▶ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical
- Nilotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical → Also see TABLE 9 p. 1492
- ▶ Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of bedaquiline. Avoid or monitor. Moderate
- ▶ NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to bedaquiline. Avoid. Severe Study → Also see TABLE 9
- ► NNRTIs (etravirine) are predicted to decrease the exposure to bedaquiline. Avoid. Severe Theoretical
- ▶ Rifamycins (rifampicin) decrease the exposure to bedaquiline. Avoid. Severe Study
- ► St John's wort is predicted to decrease the exposure to bedaquiline. Avoid. Severe Study

Bee venom extract

Theoretical

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

Belatacept → see TABLE 15 p. 1493 (myelosuppression)

▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belatacept. UKHSA advises avoid (refer to Green Book). Severe

Belimumab → see monoclonal antibodies

Bemiparin → see low molecular-weight heparins Bempedoic acid

- ▶ Bempedoic acid increases the exposure to statins (pravastatin). Moderate Study
- Bempedoic acid increases the exposure to statins (simvastatin). Adjust simvastatin dose, p. 222. Moderate Study

Bendamustine → see alkylating agents

Bendroflumethiazide → see thiazide diuretics

Benperidol → see TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects)

▶ Benperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. Moderate Theoretical → Also see TABLE 8 p. 1491

▶ Benperidol is predicted to decrease the effects of levodopa. Severe Study → Also see TABLE 8 p. 1491

Benzathine benzylpenicillin → see penicillins

Benzodiazepines → see TABLE 11 p. 1492 (CNS depressant effects) alprazolam • chlordiazepoxide • clobazam • clonazepam • diazepam •

flurazepam · loprazolam · lorazepam · lormetazepam · midazolam · nitrazepam · oxazepam · remimazolam · temazepam

- ► Anti-androgens (apalutamide) are predicted to decrease the exposure to diazepam. Avoid or monitor. [Mild] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to alprazolam. Adjust dose. Moderate
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. Moderate Study
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to alprazolam. Severe Study
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to midazolam. Monitor adverse effects and adjust dose. Severe Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to alprazolam. Adjust dose. Moderate Theoretical → Also see TARIF 11 n 1492
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. Moderate Study → Also see TABLE 11 p. 1492
- ► Antiepileptics (stiripentol) increase the concentration of clobazam. Severe Study
- Chlordiazepoxide affects the concentration of antiepileptics (fosphenytoin, phenytoin). Severe Study
- ▶ Diazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. Severe Study
- ▶ Benzodiazepines (clobazam, clonazepam) potentially affect the concentration of antiepileptics (fosphenytoin, phenytoin). Severe Anecdotal
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to alprazolam. Severe
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to midazolam. Monitor adverse effects and adjust dose. Severe Study
- ► Antifungals, azoles (fluconazole, voriconazole) potentially increase the exposure to **clobazam**. Adjust dose. [Moderate] Theoretical
- ► Antifungals, azoles (fluconazole, voriconazole) moderately increase the exposure to diazepam. Monitor and adjust dose. Moderate Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) moderately increase the exposure to alprazolam. Avoid. Moderate Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. Severe Study
- ▶ Antifungals, azoles (miconazole) are predicted to increase the exposure to alprazolam. Use with caution and adjust dose. Moderate Theoretical
- ► Antifungals, azoles (miconazole) are predicted to increase the exposure to intravenous midazolam. Use with caution and adjust dose. Moderate Theoretical
- ► Antifungals, azoles (miconazole) are predicted to increase the exposure to oral midazolam. Avoid. Moderate Theoretical
- ▶ Berotralstat moderately increases the exposure to midazolam. Monitor and adjust dose. Moderate Study
- ▶ Cabozantinib is predicted to increase the exposure to midazolam. Moderate Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to alprazolam. Severe Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to midazolam. Monitor adverse effects and adjust dose. Severe Study
- ▶ Cannabidiol increases the exposure to the active metabolite of clobazam and clobazam increases the exposure to the active

- metabolite of cannabidiol. Adjust dose. Moderate Study → Also see TABLE 11 p. 1492
- ► Cenobamate might increase the concentration of clobazam.

 Monitor and adjust dose. Moderate Theoretical → Also see

 TABLE 11 p. 1492
- ► Cenobamate moderately decreases the exposure to midazolam.

 Adjust dose. Moderatel Study → Also see TABLE 11 p. 1492
- Cobicistat moderately increases the exposure to alprazolam.
 Avoid. Moderate Study
- Cobicistat is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. Severel Study
- ► Crizotinib is predicted to increase the exposure to alprazolam.

 Severe Study
- ► Crizotinib is predicted to increase the exposure to midazolam.

 Monitor adverse effects and adjust dose. [Severe] Study
- Dabrafenib decreases the exposure to midazolam. Monitor and adjust dose. Moderate Study
- Endothelin receptor antagonists (bosentan) are predicted to decrease the concentration of midazolam. Monitor and adjust dose. [Moderate] Theoretical
- ► Entrectinib slightly increases the exposure to midazolam. [Mild] Study
- Fedratinib moderately increases the exposure to midazolam.
 Monitor and adjust dose. [Moderate] Study
- ► HIV-protease inhibitors moderately increase the exposure to alprazolam. Avoid. Moderate Study
- ► HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to benzodiazepines (diazepam, flurazepam). Avoid. Moderate] Theoretical
- HIV-protease inhibitors are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. Severe Study
- Idelalisib moderately increases the exposure to alprazolam.
 Avoid. Moderate Study
- Idelalisib is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. Severe Study
- ► Imatinib is predicted to increase the exposure to alprazolam.

 Severe Study
- ► Imatinib is predicted to increase the exposure to midazolam. Monitor adverse effects and adjust dose. Severe Study
- ► Larotrectinib slightly increases the exposure to midazolam.

 Use with caution and adjust dose. [Mild] Study
- ► Letermovir is predicted to increase the exposure to alprazolam.

 Severe Study
- ► Letermovir is predicted to increase the exposure to midazolam.

 Monitor adverse effects and adjust dose. [Severe] Study
- ➤ Alprazolam is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- ► Lorlatinib moderately decreases the exposure to midazolam. Avoid. Moderate Study
- Lumacaftor is predicted to decrease the exposure to midazolam. Avoid. [Severe] Theoretical
- Macrolides (clarithromycin) moderately increase the exposure to alprazolam. Avoid. Moderate Study
- ► Macrolides (clarithromycin) are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to alprazolam. Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to midazolam. Monitor adverse effects and adjust dose. Severel Study
- ► Mitotane is predicted to decrease the exposure to alprazolam. Adjust dose. Moderate Theoretical
- Mitotane is predicted to decrease the exposure to midazolam.
 Monitor and adjust dose. Moderate Study
- Moclobemide potentially increases the exposure to clobazam.
 Adjust dose. Moderate Theoretical
- Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to benzodiazepines (alprazolam, diazepam, midazolam). Monitor and adjust dose. [Moderate] Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to alprazolam. Severe Study

- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to midazolam. Monitor adverse effects and adjust dose. Severe Study
- ➤ Neurokinin-1 receptor antagonists (fosaprepitant) are predicted to increase the exposure to alprazolam. [Moderate] Study
- Neurokinin-1 receptor antagonists (fosaprepitant) slightly increase the exposure to midazolam. [Moderate] Study
- Nilotinib is predicted to increase the exposure to alprazolam.
 Severel Study
- Nilotinib is predicted to increase the exposure to midazolam.
 Monitor adverse effects and adjust dose. Severe Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of alprazolam. Moderate Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of benzodiazepines (clonazepam, diazepam, flurazepam). Avoid. [Severe] Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of midazolam. Avoid or adjust dose. Severe Theoretical
- NNRTIs (efavirenz) are predicted to alter the effects of midazolam. Avoid. [Moderate] Theoretical
- ► NNRTIS (efavirenz, nevirapine) are predicted to decrease the concentration of alprazolam. [Moderate] Theoretical
- NNRTIs (etravirine) have been reported to increase the concentration of clobazam. [Moderate] Anecdotal
- ► NNRTIs (etravirine) are predicted to increase the exposure to diazepam. Avoid. [Severe] Theoretical
- NNRTIs (nevirapine) are predicted to decrease the concentration of clonazepam and clonazepam is predicted to decrease the concentration of NNRTIs (nevirapine). Moderate Theoretical
- NNRTIs (nevirapine) decrease the concentration of midazolam.
 Monitor and adjust dose. [Moderate] Study
- Palbociclib increases the exposure to midazolam. Moderate Study
- ► Proton pump inhibitors (esomeprazole, omeprazole) potentially increase the exposure to clobazam. Adjust dose. Moderate

 Theoretical
- Ribociclib moderately increases the exposure to midazolam. Avoid. [Moderate] Study
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to alprazolam. Adjust dose. [Moderate] Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to chlordiazepoxide. [Moderate] Theoretical
- ► Rifamycins (rifampicin) moderately decrease the exposure to diazepam. Avoid. [Moderate] Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. Moderate Study
- ► Rifamycins (rifampicin) increase the clearance of benzodiazepines (lorazepam, nitrazepam). [Moderate] Study
- ► Rucaparib slightly increases the exposure to midazolam. Monitor and adjust dose. Severe Study
- Sotorasib moderately decreases the exposure to midazolam.
 Moderatel Study
- SSRIs (fluoxetine, fluvoxamine) potentially increase the exposure to clobazam. Adjust dose. [Moderate] Theoretical
- ► SSRIs (fluvoxamine) moderately increase the exposure to alprazolam. Adjust dose. [Moderate] Study
- SSRIs (fluvoxamine) moderately increase the exposure to
- diazepam. [Moderate] Study

 ► St John's wort moderately decreases the exposure to alprazolam. [Moderate] Study
- ► St John's wort moderately decreases the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
- ► Telotristat ethyl decreases the exposure to midazolam.

 Moderatel Study
- ► Tucatinib markedly increases the exposure to midazolam. Avoid or adjust dose. Moderate Study
- Vemurafenib slightly to moderately decreases the exposure to midazolam. Moderatel Study

Benzydamine → see NSAIDs **Benzylpenicillin** → see penicillins

Berotralstat

▶ Berotralstat is predicted to increase the concentration of aliskiren. Monitor and adjust dose. Moderate Study

Berotralstat (continued)

- ► Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to berotralstat. Severe Study
- ► Antiepileptics (carbamazepine) are predicted to decrease the concentration of berotralstat. Avoid. Severe Theoretical
- ► Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to berotralstat. Severe Study
- Berotralstat is predicted to increase the concentration of antihistamines, non-sedating (fexofenadine). Monitor and adjust dose. [Moderate] Study
- ▶ Berotralstat is predicted to increase the exposure to atomoxetine. Adjust dose. Moderate Study
- Berotralstat moderately increases the exposure to benzodiazepines (midazolam). Monitor and adjust dose.
 Moderate Study
- ► Berotralstat is predicted to increase the exposure to beta blockers, selective (nebivolol). Adjust dose. Moderate Study
- Calcium channel blockers (verapamil) are predicted to increase the exposure to berotralstat. Severe Study
- Ciclosporin is predicted to increase the exposure to berotralstat. Severe Study
- ► Berotralstat is predicted to increase the concentration of colchicine. Monitor and adjust dose. Moderate Study
- Berotralstat might decrease the efficacy of desogestrelcontaining contraceptives. Use alternatives to desogestrelonly contraceptives. Severe Theoretical
- Berotralstat is predicted to increase the concentration of digoxin. Monitor and adjust dose. Moderate Study
- Berotralstat is predicted to increase the exposure to eliglustat.
 Adjust dose. Moderate Study
- Eltrombopag is predicted to increase the exposure to berotralstat. Severe Theoretical
- ▶ Berotralstat is predicted to increase the exposure to ergotamine. Moderate Study
- Berotralstat is predicted to increase the concentration of everolimus. Monitor and adjust dose. Moderate Study
- ➤ Berotralstat is predicted to increase the concentration of factor XA inhibitors (edoxaban, rivaroxaban). Monitor and adjust dose. Moderate Study
- ► Grapefruit juice is predicted to increase the exposure to berotralstat. Moderate Theoretical
- ► HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to berotralstat. Severe Study
- ► Ivacaftor is predicted to increase the exposure to berotralstat.

 Severe | Study
- ► Lapatinib is predicted to increase the exposure to berotralstat.

 Severe Study
- ► Leflunomide is predicted to increase the exposure to berotralstat. Severe Theoretical
- ► Berotralstat is predicted to increase the concentration of loperamide. Monitor and adjust dose. [Moderate] Study
- Macrolides are predicted to increase the exposure to berotralstat. <u>Severe</u> Study
- ► Neratinib is predicted to increase the exposure to berotralstat. Severe Study
- ► Berotralstat is predicted to increase the exposure to opioids (alfentanil, fentanyl). Monitor and adjust dose. Moderate Study
- Berotralstat is predicted to increase the exposure to pimozide.
 Avoid. Moderate Study
- Ranolazine is predicted to increase the exposure to berotralstat. Severe Study
- Rifamycins (rifampicin) are predicted to decrease the concentration of berotralstat. Avoid. [Severe] Theoretical
- Rucaparib is predicted to increase the exposure to berotralstat.
 Severel Study
- ▶ Berotralstat is predicted to increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- St John's wort is predicted to decrease the concentration of berotralstat. Avoid. Severe Theoretical
- Berotralstat is predicted to increase the exposure to tacrolimus. Moderate Study
- Berotralstat is predicted to increase the concentration of talazoparib. Monitor and adjust dose. [Moderate] Study

- ► Berotralstat is predicted to increase the concentration of taxanes (docetaxel, paclitaxel). Monitor and adjust dose.

 Moderate | Study |
- ► Berotralstat is predicted to increase the exposure to temsirolimus. Use with caution or avoid. [Moderate] Study
- ➤ Teriflunomide is predicted to increase the exposure to berotralstat. Severe Theoretical
- ▶ Berotralstat is predicted to increase the concentration of thrombin inhibitors (dabigatran). Monitor and adjust dose. Moderate Study
- ► Berotralstat is predicted to increase the concentration of topotecan. Monitor and adjust dose. Moderate Study
- ► Vandetanib is predicted to increase the exposure to berotralstat. [Severe] Study
- ► Vemurafenib is predicted to increase the exposure to berotralstat. Severe Study
- Beta blockers, non-selective → see TABLE 6 p. 1491 (bradycardia),
 TABLE 8 p. 1491 (hypotension), TABLE 9 p. 1492 (QT-interval
 prolongation)

carvedilol • labetalol • levobunolol • nadolol • pindolol • propranolol • sotalol • timolol

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **levobunolol** and **timolol**, the possibility of interactions should be borne in mind.

- ► Beta blockers, non-selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid.

 [Severe] Theoretical
- Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular adverse effects when given with beta blockers, non-selective. Use with caution or avoid. <u>Severe</u> Study → Also see TABLE 6 p. 1491 → Also see TABLE 9 p. 1492
- Antiarrhythmics (propafenone) increase the risk of cardiovascular adverse effects when given with propranolol. Use with caution or avoid. Severe Study → Also see TABLE 6 p. 1491
- Antiarrhythmics (propafenone) are predicted to increase the exposure to timolol and timolol is predicted to increase the risk of cardiodepression when given with antiarrhythmics (propafenone). Severe Anecdotal → Also see TABLE 6 p. 1491
- Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular adverse effects when given with beta blockers, non-selective (labetalol, levobunolol, nadolol, pindolol, sotalol). Use with caution or avoid. Severe Study → Also see TABLE 6 p. 1491
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to propranolol. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (carvedilol, labetalol). [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to nadolol. Moderate Study
- ► Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with beta blockers, non-selective.

 [Severe] Theoretical
- ► Calcium channel blockers (diltiazem) are predicted to increase the risk of cardiodepression when given with beta blockers, non-selective. Severe Study → Also see TABLE 6 p. 1491 → Also see TABLE 8 p. 1491
- Calcium channel blockers (verapamil) increase the risk of cardiovascular adverse effects when given with beta blockers, non-selective. Avoid intravenous verapamil. Severe Study → Also see TABLE 6 p. 1491 → Also see TABLE 8 p. 1491
- Chloroprocaine is predicted to increase the risk of cardiovascular adverse effects when given with sotalol. Severe Theoretical
- Ciclosporin is predicted to increase the exposure to nadolol.
 [Moderate] Study
- Dacomitinib is predicted to markedly increase the exposure to propranolol. Avoid. Severe Study
- ► Eliglustat is predicted to increase the exposure to propranolol.

 Adjust dose. [Moderate] Study
- ▶ Beta blockers, non-selective are predicted to increase the risk of peripheral vasoconstriction when given with ergometrine. Severe Study

- Beta blockers, non-selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine.
 Severel Study
- ► HIV-protease inhibitors (Iopinavir, ritonavir) are predicted to increase the exposure to nadolol. [Moderate] Study
- Beta blockers, non-selective are predicted to increase the risk of bradycardia when given with lanreotide. [Moderate] Theoretical
- Lapatinib is predicted to increase the exposure to nadolol.
 Moderate Study
- Macrolides are predicted to increase the exposure to nadolol.
 [Moderate] Study
- Mexiletine potentially increases the risk of cardiovascular adverse effects when given with beta blockers, non-selective.
 Avoid or monitor. [Severe] Theoretical
- Omega-3-acid ethyl esters might enhance the blood pressurelowering effects of beta blockers, non-selective. Moderate Study
- Ranolazine is predicted to increase the exposure to nadolol.
 Moderate Study
- ► Carvedilol is predicted to increase the exposure to relugolix. Avoid or take relugolix first and separate administration by at least 6 hours. [Moderate] Theoretical
- Rifamycins (rifampicin) moderately decrease the exposure to carvedilol. [Moderate] Study
- Rifamycins (rifampicin) decrease the exposure to propranolol.
 Monitor and adjust dose. [Moderate] Study
- SSRIs (fluvoxamine) moderately increase the concentration of propranolol. [Moderate] Study
- Beta blockers, non-selective increase the risk of hypertension and bradycardia when given with sympathomimetics, inotropic (dobutamine). Severe Theoretical
- Beta blockers, non-selective are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Severe] Study
- ► Carvedilol causes a small increase in the bioavailability of talazoparib. Avoid or adjust talazoparib dose, p. 1091. [Moderate] Study
- ► Beta blockers, non-selective are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. Severe Theoretical
- ➤ Propranolol slightly to moderately increases the exposure to triptans (rizatriptan). Adjust rizatriptan dose and separate administration by at least 2 hours, p. 513. [Moderate] Study
- Vemurafenib is predicted to increase the exposure to nadolol.
 Moderate Study
- Beta blockers, selective → see TABLE 6 p. 1491 (bradycardia), TABLE 8 p. 1491 (hypotension)

acebutolol • atenolol • betaxolol • bisoprolol • celiprolol • esmolol • metoprolol • nebivolol

- Since systemic absorption can follow topical application of betaxolol, the possibility of interactions should be borne in mind.
- ▶ Orange juice greatly decreases the exposure to **celiprolol**.
- ▶ Beta blockers, selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. Severe Theoretical
- Anti-androgens (abiraterone) are predicted to increase the exposure to metoprolol. [Moderate] Study
- ► Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular adverse effects when given with beta blockers, selective. Use with caution or avoid. Severe Study → Also see TABLE 6 p. 1491
- ► Antiarrhythmics (propafenone) are predicted to increase the exposure to metoprolol. [Moderate] Study → Also see TABLE 6 p. 1491
- ► Antiarrhythmics (propafenone) are predicted to increase the exposure to nebivolol and nebivolol is predicted to increase the risk of cardiodepression when given with antiarrhythmics (propafenone). Avoid. [Severe] Theoretical → Also see TABLE 6 p. 1491
- Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular adverse effects when given with beta blockers, selective (acebutolol, atenolol, betaxolol, bisoprolol, celiprolol, esmolol). Use with caution or avoid. Severe Study → Also see TABLE 6 p. 1491

- ► Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, selective (acebutolol, bisoprolol, metoprolol, nebivolol). [Moderate] Study
- ► Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with beta blockers, selective. Severe

 Theoretical
- ▶ Berotralstat is predicted to increase the exposure to nebivolol. Adjust dose. Moderate Study
- Bupropion is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study
- Calcium channel blockers (diltiazem) are predicted to increase the risk of cardiodepression when given with beta blockers, selective. [Severe] Study → Also see TABLE 6 p. 1491 → Also see
 TABLE 8 p. 1491
- ► Calcium channel blockers (verapamil) increase the risk of cardiovascular adverse effects when given with beta blockers, selective. Avoid intravenous verapamil. Severe Study → Also see TABLE 6 p. 1491 → Also see TABLE 8 p. 1491
- Cinacalcet is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study
- ▶ Dacomitinib is predicted to markedly increase the exposure to beta blockers, selective (metoprolol, nebivolol). Avoid. Severe Study
- ► Eliglustat is predicted to increase the exposure to metoprolol.

 Adjust dose. [Moderate] Study
- ► Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergometrine.

 | Severe | Study |
- Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine.
 Severel Study
- Fedratinib moderately increases the exposure to metoprolol.
 Monitor and adjust dose. [Moderate] Study
- Fedratinib is predicted to increase the exposure to nebivolol.
 Monitor and adjust dose. Moderate Theoretical
- Givosiran is predicted to increase the exposure to nebivolol.
 Use with caution and adjust dose. [Moderate] Study
- ► Grapefruit juice greatly decreases the exposure to celiprolol.

 [Moderate] Study
- ► HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to metoprolol. Moderate Study
- Interferons (ropeginterferon alfa) are predicted to increase the exposure to nebivolol. [Moderate] Theoretical
- Beta blockers, selective are predicted to increase the risk of bradycardia when given with lanreotide. Moderate Theoretical
- Mexiletine potentially increases the risk of cardiovascular adverse effects when given with beta blockers, selective. Avoid or monitor. Severel Theoretical
- ► Mirabegron is predicted to increase the exposure to metoprolol. Moderate Study
- Omega-3-acid ethyl esters might enhance the blood pressurelowering effects of beta blockers, selective. [Moderate] Study
- ► Panobinostat is predicted to increase the exposure to metoprolol. Monitor and adjust dose. Moderate Theoretical
- ► Panobinostat is predicted to increase the exposure to nebivolol. Monitor and adjust dose. [Mild] Theoretical
- ► Rifamycins (rifampicin) moderately decrease the exposure to celiprolol. Moderate Study
- ▶ Rifamycins (rifampicin) slightly decrease the exposure to beta blockers, selective (bisoprolol, metoprolol). [Mild] Study
- ► SNRIs (duloxetine) are predicted to increase the exposure to metoprolol. Moderate Study
- ➤ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol).

 [Moderate] Study
- Beta blockers, selective increase the risk of hypertension and bradycardia when given with sympathomimetics, inotropic (dobutamine). [Moderate] Theoretical
- Beta blockers, selective are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/pinephrine, noradrenaline/norepinephrine). [Severe] Study
- ► Terbinafine is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study

Beta blockers, selective (continued)

- Beta blockers, selective are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. Severe Theoretical
- Vaborbactam is predicted to increase the concentration of metoprolol. <u>Unknown</u> Theoretical

Beta₂ agonists → see TABLE 17 p. 1494 (reduced serum potassium)

bambuterol • formoterol • indacaterol • olodaterol • salbutamol • salmeterol • terbutaline • vilanterol

- Anti-androgens (apalutamide) are predicted to decrease the exposure to salmeterol. Avoid or monitor. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to salmeterol. Avoid.

 [Severel Study
- Atomoxetine is predicted to increase the risk of cardiovascular adverse effects when given with beta₂ agonists (high-dose).
 Moderate Study
- Cenobamate is predicted to decrease the exposure to salmeterol. Adjust dose. Moderate Theoretical
- Cobicistat is predicted to increase the exposure to salmeterol.
 Avoid. | Severe | Study
- ► HIV-protease inhibitors are predicted to increase the exposure to salmeterol. Avoid. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to salmeterol. Avoid. [Severe] Study
- ▶ Beta₂ agonists are predicted to increase the risk of glaucoma when given with ipratropium. Moderate Anecdotal
- ▶ Beta₂ agonists are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. Severe Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to salmeterol. Avoid. [Severe] Study
- MAO-B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with beta₂ agonists. Avoid. (Severe) Theoretical
- MAO-B inhibitors (safinamide) are predicted to increase the risk of severe hypertension when given with beta₂ agonists. Severe Theoretical
- MAOIs, irreversible are predicted to increase the risk of cardiovascular adverse effects when given with beta₂ agonists.
 Moderate Anecdotal
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to salmeterol. [Moderate]
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of salmeterol. Avoid. (Severe) Theoretical

Betahistine

- ► Antihistamines, non-sedating are predicted to decrease the effects of betahistine. [Moderate] Theoretical
- ► Antihistamines, sedating are predicted to decrease the effects of betahistine. [Moderate] Theoretical

Betamethasone → see corticosteroids

Betaxolol → see beta blockers, selective

Bevacizumab → see monoclonal antibodies

Bexarotene → see retinoids

Bezafibrate → see fibrates

Bicalutamide → see anti-androgens

Bictegravir

- Oral antacids decrease the exposure to oral bictegravir.
 Separate administration by at least 2 hours. Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Study
- Antiepileptics (oxcarbazepine) are predicted to decrease the exposure to bictegravir. Avoid. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical
- Antifungals, azoles (posaconazole) are predicted to increase the exposure to bictegravir. [Moderate] Theoretical

- ► Calcium channel blockers (verapamil) are predicted to increase the exposure to bictegravir. Use with caution or avoid.

 Moderate Theoretical
- ► Ciclosporin is predicted to increase the exposure to bictegravir.

 Use with caution or avoid. Moderate Theoretical
- ► HIV-protease inhibitors (atazanavir) moderately increase the exposure to bictegravir. Avoid. Severe Study
- ► HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to bictegravir. Use with caution or avoid. Moderate Theoretical
- ➤ Oral iron decreases the exposure to oral bictegravir.

 Manufacturer advises bictegravir should be taken 2 hours before iron. Moderate Study
- ► Ivacaftor is predicted to increase the exposure to bictegravir.

 Use with caution or avoid. Moderate Theoretical
- ► Lapatinib is predicted to increase the exposure to bictegravir.

 Use with caution or avoid. Moderate Theoretical
- ► Macrolides are predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical
- ► Bictegravir slightly increases the exposure to metformin.

 [Moderate] Study
- ► Mitotane is predicted to decrease the exposure to bictegravir. Avoid. Moderate Study
- ► Neratinib is predicted to increase the exposure to bictegravir.

 Use with caution or avoid. [Moderate] Theoretical
- Bictegravir is predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical
- ► Ranolazine is predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical
- ► Rifamycins (rifabutin) slightly decrease the exposure to bictegravir. Avoid. [Moderate] Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to bictegravir. Avoid. Moderate Study
- ► Rucaparib is predicted to increase the exposure to bictegravir.

 Use with caution or avoid. [Moderate] Theoretical
- St John's wort is predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Theoretical
- Sucralfate is predicted to decrease the exposure to bictegravir.
 Avoid. Moderate Theoretical
- Vandetanib is predicted to increase the exposure to bictegravir. Use with caution or avoid. Moderate Theoretical
- Vemurafenib is predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical

Bilastine → see antihistamines, non-sedating **Bimekizumab** → see monoclonal antibodies

Bismuth

- ▶ Bismuth subsalicylate is predicted to increase the risk of adverse effects when given with aspirin. Avoid. Moderate Theoretical
- ► Bismuth subsalicylate is predicted to increase the risk of bleeding events when given with drugs with anticoagulant effects (see TABLE 3 p. 1490). [Moderate] Theoretical
- ► Bismuth greatly decreases the efficacy of tetracyclines. Separate administration by 2 hours. [Moderate] Study

Bisoprolol → see beta blockers, selective

Bisphosphonates → see TABLE 2 p. 1490 (nephrotoxicity)

alendronate • clodronate • ibandronate • pamidronate • risedronate • zoledronate

- ► Aminoglycosides increase the risk of hypocalcaemia when given with bisphosphonates. Moderate Anecdotal → Also see TABLE 2 p. 1490
- ➤ Oral antacids decrease the absorption of oral alendronate. Alendronate should be taken at least 30 minutes before antacids. [Moderate] Study
- ➤ Oral antacids decrease the absorption of oral clodronate. Avoid antacids for 2 hours before or 1 hour after clodronate. Moderate Study
- ➤ Oral antacids are predicted to decrease the absorption of oral ibandronate. Avoid antacids for at least 6 hours before or 1 hour after ibandronate. [Moderate] Theoretical
- Oral antacids decrease the absorption of oral risedronate.
 Separate administration by at least 2 hours. Moderate Study
- ► Aspirin (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronate, ibandronate). [Moderate] Study

- Aspirin (high-dose) is predicted to increase the risk of renal impairment when given with clodronate. Severe Theoretical
- ➤ Oral calcium salts decrease the absorption of alendronate.

 Alendronate should be taken at least 30 minutes before calcium salts. Moderate Study
- ➤ Oral calcium salts decrease the absorption of clodronate. Avoid calcium salts for 2 hours before or 1 hour after clodronate.

 Moderate Study
- ➤ Oral calcium salts are predicted to decrease the absorption of oral ibandronate. Avoid calcium salts for at least 6 hours before or 1 hour after ibandronate. [Moderate] Theoretical
- Oral calcium salts decrease the absorption of risedronate.
 Separate administration by at least 2 hours. [Moderate] Study
- ➤ Oral iron decreases the absorption of oral clodronate.
 Clodronate should be taken 1 hour before or 2 hours after iron.
 Moderate Study
- ➤ Oral iron is predicted to decrease the absorption of oral ibandronate. Ibandronate should be taken 1 hour before or 6 hours after iron. [Moderate] Theoretical
- Oral iron decreases the absorption of oral risedronate.
 Separate administration by at least 2 hours. Moderate Study
- Bisphosphonates are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). [Severe] Theoretical
- ➤ Oral magnesium decreases the absorption of oral alendronate.

 Alendronate should be taken at least 30 minutes before magnesium. [Moderate] Study
- Oral magnesium decreases the absorption of oral clodronate.
 Avoid magnesium for 2 hours before or 1 hour after clodronate. [Moderate] Study
- Oral magnesium is predicted to decrease the absorption of oral ibandronate. Avoid for at least 6 hours before or 1 hour after ibandronate. Moderate Theoretical
- Oral magnesium decreases the absorption of oral risedronate.
 Separate administration by at least 2 hours. Moderate Study
- ► NSAIDs are predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronate, ibandronate). [Moderate] Study
- NSAIDs are predicted to increase the risk of renal impairment when given with clodronate. Moderate Study
- Bisphosphonates are predicted to decrease the effects of parathyroid hormone. Avoid. Moderate Study
- ➤ Oral zinc decreases the absorption of oral alendronate.

 Alendronate should be taken at least 30 minutes before zinc.

 Moderate | Study
- Oral zinc decreases the absorption of oral clodronate. Avoid zinc for 2 hours before or 1 hour after clodronate. [Moderate]
- ➤ Oral zinc is predicted to decrease the absorption of oral ibandronate. Avoid zinc for at least 6 hours before or 1 hour after ibandronate. Moderate Theoretical
- Oral zinc decreases the absorption of oral risedronate.
 Separate administration by at least 2 hours. [Moderate] Study

Bivalirudin → see thrombin inhibitors

Bleomycin → see TABLE 15 p. 1493 (myelosuppression), TABLE 5 p. 1491 (thromboembolism)

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with bleomycin. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ► Monoclonal antibodies (brentuximab vedotin) increase the risk of pulmonary toxicity when given with bleomycin. Avoid. Severe

 Study → Also see TABLE 15 p. 1493
- ► Platinum compounds (cisplatin) increase the risk of pulmonary toxicity when given with bleomycin. Severe Study → Also see TABLE 15 p. 1493

Blinatumomab → see monoclonal antibodies

Bortezomib → see TABLE 8 p. 1491 (hypotension), TABLE 15 p. 1493 (myelosuppression), TABLE 12 p. 1493 (peripheral neuropathy)

- ► Anti-androgens (apalutamide, enzalutamide) slightly decrease the exposure to bortezomib. Avoid. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) slightly decrease the exposure to bortezomib. Avoid. Severe| Study → Also see TABLE 12 p. 1493

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole)
 slightly increase the exposure to bortezomib. [Moderate] Study
- ► Cobicistat slightly increases the exposure to bortezomib.

 [Moderate] Study
- ► HIV-protease inhibitors slightly increase the exposure to bortezomib. [Moderate] Study
- Idelalisib slightly increases the exposure to bortezomib.
 Moderate Study
- Macrolides (clarithromycin) slightly increase the exposure to bortezomib. [Moderate] Study
- Mitotane slightly decreases the exposure to bortezomib. Avoid. Severe Study → Also see TABLE 15 p. 1493
- Rifamycins (rifampicin) slightly decrease the exposure to bortezomib. Avoid. Severe Study

Bosentan → see endothelin receptor antagonists

Bosutinib → see TABLE 15 p. 1493 (myelosuppression), TABLE 9 p. 1492 (QT-interval prolongation), TABLE 4 p. 1490 (antiplatelet effects)

- ➤ Oral antacids are predicted to decrease the absorption of oral bosutinib. Bosutinib should be taken at least 12 hours before antacids. [Moderate] Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to very markedly decrease the exposure to bosutinib. Avoid.

 [Severe] Study → Also see TABLE 9 p. 1492
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study → Also see TABLE 9 p. 1492
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study
- ► Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to bosutinib. Avoid or adjust dose.
 Severe Study → Also see TABLE 9 p. 1492
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bosutinib. Avoid or adjust dose.
 [Severe] Study
- Oral calcium salts (calcium carbonate) -containing antacids are predicted to decrease the absorption of oral bosutinib.
 Bosutinib should be taken at least 12 hours before antacids.
 Moderate] Theoretical
- ► Cenobamate is predicted to decrease the exposure to bosutinib. Adjust dose. [Moderate] Theoretical
- ➤ Cobicistat is predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study
- ► Crizotinib is predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study → Also see TABLE 9 p. 1492
- Dabrafenib is predicted to decrease the exposure to bosutinib.
 Avoid. Severe Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to bosutinib. Avoid. Severe Study
- ► Grapefruit juice is predicted to increase the exposure to bosutinib. Avoid. Moderate Theoretical
- H₂ receptor antagonists are predicted to decrease the absorption of bosutinib. Moderate Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study
- ► Idelalisib is predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study
- ► Imatinib is predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study → Also see TABLE 15 p. 1493 → Also see TABLE 4 p. 1490
- ► Letermovir is predicted to increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Study
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to bosutinib. Avoid or adjust dose.

 [Severe] Study → Also see TABLE 9 p. 1492
- Mitotane is predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study → Also see TABLE 15 p. 1493
- Modafinil is predicted to decrease the exposure to bosutinib.
 Avoid. Severe Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study

Bosutinib (continued)

- ► Neurokinin-1 receptor antagonists (fosaprepitant) are predicted to increase the exposure to bosutinib. [Severe] Theoretical
- ► Nilotinib is predicted to increase the exposure to bosutinib.

 Avoid or adjust dose. Severe Study → Also see TABLE 15 p. 1493 →

 Also see TABLE 9 p. 1492
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to bosutinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► NNRTIs (etravirine) are predicted to decrease the exposure to bosutinib. Avoid. Severe Theoretical
- ▶ Pitolisant is predicted to decrease the exposure to bosutinib. Avoid. Severe Theoretical
- Proton pump inhibitors are predicted to decrease the absorption of bosutinib. Moderate Study
- ► Rifamycins (rifampicin) are predicted to very markedly decrease the exposure to bosutinib. Avoid. Severe Study
- Oral sodium bicarbonate-containing antacids are predicted to decrease the absorption of oral bosutinib. Bosutinib should be taken at least 12 hours before antacids. [Moderate] Theoretical
- ► St John's wort is predicted to decrease the exposure to bosutinib. Avoid. Severe Study

Botulinum toxin type A → see botulinum toxins **Botulinum toxin type B** → see botulinum toxins

Botulinum toxins → see TABLE 20 p. 1494 (neuromuscular blocking effects)

botulinum toxin type A · botulinum toxin type B

Bowel cleansing preparations

SEPARATION OF ADMINISTRATION Other oral drugs should not be taken 1 hour before, or after, administration of bowel cleansing preparations because absorption might be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

Brentuximab vedotin → see monoclonal antibodies **Brigatinib** → see TABLE 6 p. 1491 (bradycardia)

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to brigatinib. Avoid. Severe Study
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to brigatinib. Moderate Study → Also see TABLE 6 p. 1491
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to brigatinib. Avoid. [Severe] Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to brigatinib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1048. [Severe] Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to brigatinib. Moderate Study → Also see TABLE 6 p. 1491
- ► Cobicistat is predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1048. Severe Study
- Brigatinib is predicted to decrease the exposure to combined hormonal contraceptives. Use additional contraceptive precautions. [Severe] Theoretical
- ► Crizotinib is predicted to increase the exposure to brigatinib. Moderate Study → Also see TABLE 6 p. 1491
- Dabrafenib is predicted to decrease the exposure to brigatinib.
 Avoid. Moderate Study
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to brigatinib. Avoid. Moderate Study
- ▶ Grapefruit juice is predicted to increase the concentration of brigatinib. Avoid. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1048. Severe Study
- Idelalisib is predicted to increase the exposure to brigatinib.
 Avoid or adjust brigatinib dose, p. 1048. Severe Study
- ► Imatinib is predicted to increase the exposure to brigatinib.

 Moderate Study

- ► Letermovir is predicted to increase the exposure to brigatinib.

 [Moderate] Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1048. Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to brigatinib. Moderate Study
- Mitotane is predicted to decrease the exposure to brigatinib.
 Avoid. Severe Study
- ➤ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to brigatinib. Moderate Study
- ► Nilotinib is predicted to increase the exposure to brigatinib. Moderate Study
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to brigatinib. Avoid. [Moderate] Study
- ► Brigatinib potentially decreases the concentration of opioids (alfentanil, fentanyl). Avoid. Moderate Theoretical → Also see
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to brigatinib. Avoid. [Severe] Study
- ► Brigatinib potentially decreases the concentration of sirolimus. Avoid. Moderate Theoretical
- ► St John's wort is predicted to decrease the exposure to brigatinib. Avoid. [Moderate] Study
- ▶ Brigatinib potentially decreases the concentration of tacrolimus. Avoid. Moderate Theoretical

Brimonidine → see TABLE 6 p. 1491 (bradycardia), TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects)
Brinzolamide

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **brinzolamide**, the possibility of interactions should be borne in mind.

Brivaracetam → see antiepileptics

Brodalumab → see monoclonal antibodies

Bromfenac → see NSAIDs

Bromocriptine → see dopamine receptor agonists **Buclizine** → see antihistamines, sedating

Bucilzine -> see antinistamines, sedatin

Budesonide → see corticosteroids **Bumetanide** → see loop diuretics

Bupivacaine → see anaesthetics, local

Buprenorphine → see opioids

Bupropion

- ► Alpelisib is predicted to decrease the efficacy of bupropion. Mild Theoretical
- Bupropion is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to bupropion. Severe Study
- Antiepileptics (valproate) increase the exposure to bupropion.
 Severe Study
- ► Antifungals, azoles (isavuconazole) slightly increase the exposure to bupropion. Adjust dose, Moderate Study
- Bupropion is predicted to moderately increase the exposure to antipsychotics, second generation (aripiprazole). Adjust aripiprazole dose, p. 427. [Moderate] Study
- Bupropion is predicted to increase the exposure to antipsychotics, second generation (risperidone). Adjust dose.
 Moderate Study
- Bupropion is predicted to markedly increase the exposure to atomoxetine. Adjust dose. Severe Study
- ▶ Bupropion is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study
- Bupropion is predicted to slightly increase the exposure to darifenacin. [Mild] Study
- Bupropion increases the risk of adverse effects when given with dopamine receptor agonists (amantadine). [Moderate] Study
- ► Bupropion might enhance the risk of serotonin syndrome when given with drugs that cause serotonin syndrome (see TABLE 13 p. 1493). Severe Anecdotal
- Bupropion is predicted to increase the exposure to eliglustat.
 Avoid or adjust dose—consult product literature. Severe Study

- ► Bupropion is predicted to increase the exposure to fesoterodine. Use with caution and adjust dose. Mild Theoretical
- Bupropion is predicted to increase the exposure to gefitinib.
 Moderate Theoretical
- ► HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to bupropion. [Moderate] Study
- Bupropion increases the risk of adverse effects when given with levodopa. [Moderate] Study
- Bupropion is predicted to increase the risk of intraoperative hypertension when given with linezolid. Severe Anecdotal
- Lumacaftor is predicted to decrease the exposure to bupropion. Adjust dose. [Moderate] Theoretical
- Bupropion is predicted to increase the risk of severe hypertension when given with MAO-B inhibitors. Avoid.
 Moderate Theoretical
- ► Bupropion is predicted to increase the risk of severe hypertension when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- Methylthioninium chloride is predicted to increase the risk of severe hypertension when given with bupropion. Avoid.
 Severe Theoretical
- Bupropion is predicted to increase the exposure to mexiletine.
 Moderate Study
- Midostaurin moderately decreases the exposure to the active metabolite of bupropion. Moderate Study
- ► Bupropion is predicted to increase the risk of severe hypertension when given with moclobemide. Avoid. [Severe] Theoretical
- ► Nirmatrelvir boosted with ritonavir is predicted to decrease the concentration of bupropion. Moderate Theoretical
- NNRTIS (efavirenz) are predicted to decrease the exposure to bupropion. Moderate Study
- Bupropion is predicted to decrease the efficacy of opioids (codeine). [Moderate] Theoretical
- Bupropion is predicted to decrease the efficacy of opioids (tramadol). Severel study
- Bupropion is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. Moderate Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to bupropion. Moderate Study
- Bupropion is predicted to increase the exposure to SSRIs (dapoxetine). [Moderate] Theoretical
- ► Bupropion is predicted to decrease the efficacy of tamoxifen.

 Avoid. Severe Study
- Bupropion is predicted to increase the exposure to the active metabolite of tetrabenazine. [Moderate] Study
- Bupropion is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. Severe Study
- Vemurafenib is predicted to decrease the concentration of bupropion. [Moderate] Theoretical
- Bupropion is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. Moderate Study

Buspirone

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to buspirone. Use with caution and adjust dose. Severe Study
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to buspirone. Use with caution and adjust dose.

 Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to buspirone. Use with caution and adjust dose. Severe Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 373. [Severe] Study
- Antifungals, azoles (miconazole) are predicted to increase the concentration of buspirone. Use with caution and adjust dose.
 Moderatel Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study

- ► Cenobamate is predicted to decrease the exposure to buspirone. Adjust dose. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to buspirone.
 Adjust buspirone dose, p. 373. Severe Study
- Crizotinib is predicted to increase the exposure to buspirone.
 Use with caution and adjust dose. [Moderate] Study
- Grapefruit juice increases the exposure to buspirone. Avoid.
 Mild Study
- HIV-protease inhibitors are predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 373. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 373. Severe Study
- ► Imatinib is predicted to increase the exposure to buspirone.

 Use with caution and adjust dose. [Moderate] Study
- Letermovir is predicted to increase the exposure to buspirone.
 Use with caution and adjust dose. [Moderate] Study
- Buspirone is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. Severe Theoretical
- ► Macrolides (clarithromycin) are predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 373. Severe Study
- ► Macrolides (erythromycin) are predicted to increase the exposure to buspirone. Use with caution and adjust dose.

 [Moderate] Study
- ➤ Buspirone is predicted to increase the risk of elevated blood pressure when given with MAOIs, irreversible. Avoid. Severe
- ► Mitotane is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. Severe Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. Moderate Study
- Nilotinib is predicted to increase the exposure to buspirone.
 Use with caution and adjust dose. [Moderate] Study
- Use with caution and adjust dose. Moderate Study

 ► Nirmatrelvir boosted with ritonavir is predicted to increase the
- concentration of **buspirone**. <u>Moderate</u> Theoretical

 ➤ Rifamycins (rifampicin) are predicted to decrease the exposure to **buspirone**. Use with caution and adjust dose. <u>Severe</u> Study
- ► Tucatinib is predicted to increase the exposure to buspirone. Avoid or adjust dose. Moderate Theoretical

Busulfan → see alkylating agents

Cabazitaxel → see taxanes

Cabergoline → see dopamine receptor agonists Cabotegravir

- ➤ Oral antacids are predicted to decrease the concentration of oral cabotegravir. Cabotegravir should be taken 4 hours before or 2 hours after antacids. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) might decrease the concentration of cabotegravir. Avoid. Severe Theoretical
- ▶ Rifamycins (rifabutin) have been reported to cause a small decrease in the exposure to cabotegravir. Avoid intramuscular cabotegravir, p. 696. Moderate Study
- Rifamycins (rifampicin) modestly decrease the exposure to cabotegravir. Avoid. Severe Study

Cabozantinib → see TABLE 15 p. 1493 (myelosuppression), TABLE 9 p. 1492 (QT-interval prolongation)

- ► Anti-androgens (apalutamide, enzalutamide) moderately decrease the exposure to cabozantinib. Avoid. Moderate Study → Also see TABLE 9 p. 1492
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to cabozantinib. Moderate Study → Also see TABLE 9 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to cabozantinib. Avoid. [Moderate] Study
- ► Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to cabozantinib. [Moderate] Study → Also see TABLE 9 p. 1492
- ► Cabozantinib is predicted to increase the exposure to benzodiazepines (midazolam). [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cabozantinib. [Moderate] Study

Cabozantinib (continued)

- Cobicistat is predicted to increase the exposure to cabozantinib. [Moderate] Study
- ► Cabozantinib might affect the effects of combined hormonal contraceptives. Use additional contraceptive precautions.

 [Severe] Theoretical
- ► Crizotinib is predicted to increase the exposure to cabozantinib. Moderate Study → Also see TABLE 9 p. 1492
- Dabrafenib is predicted to decrease the exposure to cabozantinib. Moderate Study
- ► Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can cabozantinib; concurrent use might increase the risk of developing this effect. Severe Theoretical
- ▶ Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can cabozantinib; concurrent use might increase the risk of developing this effect. [Severe] Theoretical
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to cabozantinib. Moderate Study
- ► Grapefruit juice is predicted to increase the exposure to cabozantinib. Moderate Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to cabozantinib. Moderate Study
- Idelalisib is predicted to increase the exposure to cabozantinib.
 Moderate Study
- ► Imatinib is predicted to increase the exposure to cabozantinib.
 Moderate Study → Also see TABLE 15 p. 1493
- ► Letermovir is predicted to increase the exposure to cabozantinib. Moderate Study
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to cabozantinib. Moderate Study → Also see TABLE 9 p. 1492
- Mitotane moderately decreases the exposure to cabozantinib. Avoid. Moderate Study → Also see TABLE 15 p. 1493
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to cabozantinib. [Moderate]
 Study
- Nilotinib is predicted to increase the exposure to cabozantinib.
 Moderate Study → Also see TABLE 15 p. 1493 → Also see TABLE 9
 p. 1492
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to cabozantinib. Moderate Study → Also see TABLE 9 p. 1492
- ► Rifamycins (rifampicin) moderately decrease the exposure to cabozantinib. Avoid. [Moderate] Study
- St John's wort is predicted to decrease the exposure to cabozantinib. Moderate Study

Caffeine citrate

- ► Caffeine citrate decreases the efficacy of antiarrhythmics (adenosine). Separate administration by 24 hours. [Mild] Study
- ➤ Antiepileptics (fosphenytoin, phenytoin) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study
- ► HIV-protease inhibitors (ritonavir) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. Moderate Study
- Leflunomide is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. Moderate Study
- ► Rifamycins (rifampicin) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose.

 Moderate Study
- ► SSRIs (fluvoxamine) markedly decrease the clearance of caffeine citrate. Monitor and adjust dose. Severe Study
- ➤ Teriflunomide is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose.

 Moderate

 Study
- Caffeine citrate decreases the clearance of theophylline.
 Moderate Study

Calcipotriol → see vitamin D substances

Calcitonins

Calcitonins decrease the concentration of lithium. Adjust dose.
 Moderate Study

Calcitriol → see vitamin D substances **Calcium acetate** → see calcium salts **Calcium carbonate** → see calcium salts

Calcium channel blockers → see TABLE 6 p. 1491 (bradycardia), TABLE 8 p. 1491 (hypotension)

amlodipine • diltiazem • felodipine • lacidipine • lercanidipine • nicardipine • nifedipine • nimodipine • verapamil

- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to abemaciclib. Moderate Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to acalabrutinib. Avoid or monitor.
 Severel Study
- Verapamil is predicted to increase the exposure to afatinib.
 Moderate Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to aldosterone antagonists (eplerenone).
 Adjust eplerenone dose, p. 210. Severe Study → Also see TABLE 8 p. 1491
- ► Verapamil moderately increases the exposure to aliskiren.
 Moderate Study → Also see TABLE 8 p. 1491
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical → Also see TABLE 8 p. 1491
- Verapamil moderately increases the exposure to anthracyclines (doxorubicin). Moderate Study
- Anti-androgens (enzalutamide) are predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Anti-androgens (apalutamide) are predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- ► Anti-androgens (enzalutamide) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- ► Antiarrhythmics (disopyramide) are predicted to increase the risk of cardiodepression when given with verapamil. Severe Theoretical
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Antiarrhythmics (amiodarone) are predicted to increase the risk of cardiodepression when given with calcium channel blockers (diltiazem, verapamil). Avoid. Severel Theoretical → Also see
 TABLE 6 p. 1491
- Calcium channel blockers (diltiazem, verapamil) increase the exposure to antiarrhythmics (dronedarone) and antiarrhythmics (dronedarone) increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Study → Also see TABLE 6 p. 1491
- ► Verapamil increases the risk of cardiodepression when given with antiarrhythmics (flecainide). Severe Anecdotal → Also see TABLE 6 p. 1491
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antiarrhythmics (propafenone).
 Monitor and adjust dose. Moderate Study → Also see TABLE 6 p. 1491
- Antiepileptics (valproate) increase the exposure to nimodipine.
 Adjust dose. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Diltiazem increases the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) are predicted to decrease the exposure to diltiazem. Monitor concentration and adjust dose. [Severe] Anecdotal
- Verapamil increases the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) are predicted to decrease the exposure to verapamil. Severe Anerdotal
- ► Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study

- Calcium channel blockers (diltiazem, verapamil) potentially increase the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to lercanidipine. Avoid. [Severe] Study
- Antifungals, azoles (miconazole) are predicted to increase the exposure to diltiazem. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose.
- ➤ Antifungals, azoles (miconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, leacranidipine, nicardipine, nifedipine, nimodipine, verapamil). Use with caution and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- ➤ Antifungals, azoles (fluconazole) (high-dose) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- Antifungals, azoles (posaconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil).
 Moderate Theoretical
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Moderate] Theoretical
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Severe Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. [Moderate] Study
- ► Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with calcium channel blockers. Severe Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of antimalarials (piperaquine).
 Severel Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antipsychotics, second generation (cariprazine). Avoid. | Severe | Study → Also see TABLE 8 p. 1491
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antipsychotics, second generation (lurasidone). Adjust lurasidone dose. [Moderate] Study → Also see TABLE 8 p. 1491
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antipsychotics, second generation (quetiapine). Avoid. [Moderate] Study → Also see TABLE 8 p. 1491
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. Moderatel Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to axitinib. [Moderate]
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bedaquiline. Avoid prolonged use.
 Mildl Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to benzodiazepines (alprazolam). Severe Study
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to benzodiazepines (midazolam). Monitor adverse effects and adjust dose. [Severe] Study
- Verapamil is predicted to increase the exposure to berotralstat.
 Severel Study

- ► Diltiazem is predicted to increase the risk of cardiodepression when given with beta blockers, non-selective. Severe Study → Also see TABLE 6 p. 1491 → Also see TABLE 8 p. 1491
- ► Verapamil increases the risk of cardiovascular adverse effects when given with beta blockers, non-selective. Avoid intravenous verapamil, p. 180. Severe Study → Also see TABLE 6 p. 1491 → Also see TABLE 8 p. 1491
- ▶ Diltiazem is predicted to increase the risk of cardiodepression when given with beta blockers, selective. Severe Study → Also see TABLE 6 p. 1491 → Also see TABLE 8 p. 1491
- ► Verapamil increases the risk of cardiovascular adverse effects when given with beta blockers, selective. Avoid intravenous verapamil, p. 180. Severe Study → Also see TABLE 6 p. 1491 → Also see TABLE 8 p. 1491
- ► Verapamil is predicted to increase the exposure to bictegravir.

 Use with caution or avoid. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bosutinib. Avoid or adjust dose.
 [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to brigatinib. Moderate Study → Also see TABLE 6 p. 1491
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. Moderate Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cabozantinib. [Moderate] Study
- ➤ Calcium channel blockers (diltiazem) are predicted to increase the exposure to calcium channel blockers (amlodipine). Monitor and adjust dose. [Moderate] Study → Also see TABLE 8 p. 1491
- Calcium channel blockers (verapamil) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study → Also see TABLE 8 p. 1491
- Calcium channel blockers (diltiazem) are predicted to increase the exposure to calcium channel blockers (felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study → Also see TABLE 8 p. 1491
- Cenobamate is predicted to decrease the exposure to calcium channel blockers (felodipine, lercanidipine). Adjust dose.
 Moderate Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ceritinib. Moderate Study → Also see TABLE 6 p. 1491
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of ciclosporin. Severe Study
- Ciclosporin moderately increases the exposure to lercanidipine.
 Use with caution or avoid. [Severe] Study
- Nicardipine increases the concentration of ciclosporin. Severe Study
- ► Calcium channel blockers (nifedipine, nimodipine) might increase the exposure to cladribine. Avoid or adjust dose. Moderate Theoretical
- Cobicistat is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate]
 Study
- ➤ Cobicistat is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). Severe Study
- ► Cobicistat is predicted to markedly increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cobimetinib. Severe Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212. Severe Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to corticosteroids (methylprednisolone).
 Monitor and adjust dose. [Moderate] Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to crizotinib. Avoid. [Moderate] Study → Also see TABLE 6 p. 1491
- Crizotinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine,

Calcium channel blockers (continued)

- **lercanidipine, nicardipine, nifedipine, nimodipine).** Monitor and adjust dose. Moderate Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dabrafenib. [Moderate] Study
- Dabrafenib is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- Dabrafenib is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- Intravenous dantrolene potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with calcium channel blockers (diltiazem, verapamil). Avoid. [Severe]
 Anecdotal
- Diltiazem is predicted to increase the exposure to darifenacin.
 Moderate Study
- Verapamil is predicted to increase the exposure to darifenacin.
 Avoid. Moderate Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dasatinib. Severe Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to slightly increase the exposure to dienogest. Moderate Study
- ► Calcium channel blockers (diltiazem, verapamil) increase the concentration of digoxin. Monitor and adjust dose. Severe Study → Also see TABLE 6 p. 1491
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). Mild Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to domperidone. Avoid. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine). Severe Theoretical → Also see TABLE 8 p. 1491
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of dopamine receptor agonists (cabergoline). [Moderate] Anecdotal → Also see TABLE 8 p. 1491
- Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to elexacaftor. Adjust texacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to eliglustat. Avoid or adjust dose consult product literature. Severel Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to encorafenib. Moderate
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. [Severe] Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergometrine.

 [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergotamine.
 [Severe] Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to erlotinib. Moderate Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- Verapamil is predicted to increase the exposure to factor XA inhibitors (apixaban). [Moderate] Theoretical
- ► Verapamil slightly increases the exposure to factor XA inhibitors (edoxaban). [Severe | Study

- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fedratinib. Monitor and adjust dose.

 Moderatel Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Miiā] Study
- Verapamil is predicted to increase the exposure to fidaxomicin.
 Avoid. Moderate Study
- Diltiazem is predicted to increase the exposure to fostamatinib.
 Monitor adverse effects and adjust dose. Moderate Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to gefitinib. [Moderate] Study
- ▶ Verapamil is predicted to increase the exposure to gilteritinib.
 [Moderate] Theoretical
- ► Grapefruit juice very slightly increases the exposure to amlodipine. Avoid. [Mild] Study
- Grapefruit juice increases the exposure to calcium channel blockers (nifedipine, verapamil). Avoid. [Mild] Study
- Grapefruit juice increases the exposure to felodipine. Avoid.
 Moderate Study
- Grapefruit juice is predicted to increase the exposure to lercanidipine. Avoid. Moderate Theoretical
- Grapefruit juice increases the exposure to nicardipine. Mild Study
- Grazoprevir is predicted to increase the concentration of calcium channel blockers. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. Moderate Theoretical → Also see TABLE 8 p. 1491
- H₂ receptor antagonists (cimetidine) (high-dose) are predicted to increase the exposure to lercanidipine. [Moderate] Theoretical
- ► H₂ receptor antagonists (cimetidine) moderately increase the exposure to nifedipine. Monitor and adjust dose. (Severe) Study
- ► H₂ receptor antagonists (cimetidine) increase the exposure to verapamil. [Moderate] Study
- ► H₂ receptor antagonists (cimetidine) slightly increase the exposure to calcium channel blockers (diltiazem, nimodipine). Monitor and adjust dose. Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose.
 Moderatel Study
- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to lercanidipine. Avoid. Severe Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062. Severe Study
- Idelalisib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. Moderate
- ► Idelalisib is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- ► Idelalisib is predicted to markedly increase the exposure to lercanidipine. Avoid. Severe Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to imatinib. [Moderate] Theoretical
- Imatinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivabradine. Avoid. [Moderate] Study → Also see TABLE 6 p. 1491
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivacaftor. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lapatinib. [Moderate] Study

- Verapamil is predicted to increase the exposure to larotrectinib. Mild Theoretical
- Letermovir is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of neurotoxicity when given with lithium.
 Severel Anecdotal
- Calcium channel blockers (amlodipine, lacidipine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lomitapide. Avoid. Moderate Theoretical
- ► Macrolides (clarithromycin) are predicted to markedly increase the exposure to lercanidipine. Avoid. Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to diltiazem. Severe Theoretical
- Macrolides (erythromycin) are predicted to increase the exposure to verapamil. Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil).

 Severel Study
- Intravenous magnesium potentially increases the risk of hypotension when given with calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil) in pregnant women. Severel Anerdotal
- Mexiletine increases the risk of cardiovascular adverse effects when given with diltiazem. Avoid or monitor. Severe Theoretical
- Mexiletine potentially increases the risk of cardiovascular adverse effects when given with verapamil. Avoid or monitor.
 Severe Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- Mitotane is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Mitotane is predicted to decrease the exposure to diltiazem.
 Severe Study
- ► Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to calcium channel blockers. Monitor and adjust dose. Moderate Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to naldemedine. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor adverse effects, p. 67. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to neratinib. Avoid moderate CYP3A4 inhibitors or adjust neratinib dose and monitor for gastrointestinal adverse effects, p. 1069. [Severe] Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. Moderate Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to neurokinin-1 receptor antagonists (aprepitant) and neurokinin-1 receptor antagonists (aprepitant) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). Moderatel Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to nilotinib. Moderate Theoretical
- Nilotinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine,

- **lercanidipine, nicardipine, nifedipine, nimodipine).** Monitor and adjust dose. [Moderate] Study
- Verapamil is predicted to increase the exposure to nintedanib.
 Moderate Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of calcium channel blockers. Severe Theoretical
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to calcium channel blockers (ambdipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil).
 Moderate Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to olaparib. Avoid moderate CYP3A4 inhibitors or adjust olaparib dose, p. 1088. Moderate Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate]
 Study -> Also see TABLE 6 p. 1491
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical
- Verapamil is predicted to increase the exposure to panobinostat. Adjust dose. Moderate Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pazopanib. Moderate Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pemigatinib. Severe Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 878. [Moderate] Theoretical → Also see TABLE 8 p. 1491
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate CYP3A4 inhibitors, p. 879. [Moderate] Study → Also see TABLE 8 p. 1491
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical → Also see TABLE 8 p. 1491
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. Severe Theoretical → Also see TABLE 8 p. 1401
- Verapamil is predicted to increase the exposure to pibrentasvir. [Moderate] Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pimozide. Avoid. Severe Theoretical → Also see TABLE 8 p. 1491
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ponatinib. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ranolazine. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to regorafenib. [Moderate] Study
- ➤ Verapamil is predicted to increase the exposure to relugolix. Avoid or take relugolix first and separate administration by at least 6 hours. Moderate Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ribociclib. [Moderate] Study
- Rifamycins (rifampicin) moderately decrease the exposure to nifedipine. Avoid. Severe Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercandipine, nicardipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Rifamycins (rifampicin) greatly decrease the exposure to calcium channel blockers (diltiazem, verapamil). Severe Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ruxolitinib. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to selpercatinib. [Moderate] Study

Calcium channel blockers (continued)

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to selumetinib. Avoid or adjust dose consult product literature. Severel Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to siponimod. Avoid depending on other drugs taken—consult product literature. Severe Study → Also see TABLE 6 p. 1491
- Calcium channel blockers (diltiazem, verapamil) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate]
 Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate CYP3A4 inhibitors, p. 887. [Moderate]
 Theoretical
- St John's wort is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- St John's wort is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- ➤ Diltiazem slightly increases the exposure to statins (atorvastatin). Monitor and adjust dose. Severe Study
- Verapamil is predicted to slightly to moderately increase the exposure to statins (atorvastatin). Monitor and adjust dose.
 Severe Theoretical
- Amlodipine slightly increases the exposure to statins (simvastatin). Adjust simvastatin dose, p. 222. [Mild] Study
- Calcium channel blockers (diltiazem, verapamil) moderately increase the exposure to statins (simvastatin). Monitor and adjust dose. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to sunitinib. Moderate Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of tacrolimus. [Severe] Study
- Nicardipine potentially increases the concentration of tacrolimus. Monitor concentration and adjust dose. Severe Anecdotal
- Calcium channel blockers (diltiazem, felodipine) very slightly increase the exposure to talazoparib. [Moderate] Study
- Verapamil is predicted to slightly increase the exposure to talazoparib. Avoid or adjust talazoparib dose, p. 1091. Severe Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to taxanes (cabazitaxel). Moderate Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to taxanes (docetaxel). [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to taxanes (paclitaxel). [Moderate] Anecdotal
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of and the risk of angioedema when given with temsirolimus. Use with caution or avoid.
 Moderatel Theoretical
- Temsirolimus is predicted to increase the risk of angioedema when given with calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Moderatel Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tezacaftor. Adjust dose with moderate CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320.
 Severe Study
- Verapamil increases the exposure to thrombin inhibitors (dabigatran). Monitor and adjust dose. Severe Study
- Verapamil might increase the exposure to tigecycline. Mild Anecdotal
- Calcium channel blockers (diltiazem, verapamil) given with a
 potent CYP2C19 inhibitor are predicted to increase the
 exposure to tofacitinib. Adjust tofacitinib dose, p. 1200.
 Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate CYP3A4 inhibitors, p. 724. [Moderate] Study

- Verapamil is predicted to increase the exposure to topotecan.
 Severel Study
- Verapamil is predicted to increase the concentration of trametinib. Moderate Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to trazodone. Moderate Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to vemurafenib. [Severe] Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. Severe Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to vinca alkaloids. Severe Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to zopiclone. Adjust dose. Moderate Study

Calcium chloride → see calcium salts **Calcium gluconate** → see calcium salts

Calcium lactate → see calcium salts

Calcium phosphate → see calcium salts

Calcium salts

calcium acetate • calcium carbonate • calcium chloride • calcium gluconate • calcium lactate • calcium phosphate

SEPARATION OF ADMINISTRATION Calcium carbonatecontaining antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- Oral calcium carbonate -containing antacids modestly decreases the exposure to oral acalabrutinib. Separate administration by at least 2 hours. [Moderate] Study
- ► Oral calcium salts decrease the absorption of alkylating agents (estramustine). (Severe) Study
- Calcium carbonate might decrease the absorption of antimalarials (chloroquine). Separate administration by at least 4 hours. [Moderate] Study
- Calcium carbonate is predicted to decrease the absorption of antimalarials (proguanil). Separate administration by at least 2 hours. [Moderate] Study
- ► Oral calcium salts might decrease the concentration of the active metabolite of oral baloxavir marboxil. Avoid. Severe
- ➤ Oral calcium salts decrease the absorption of bisphosphonates (alendronate). Alendronate should be taken at least 30 minutes before calcium salts. [Moderate] Study
- ➤ Oral calcium salts decrease the absorption of bisphosphonates (clodronate). Avoid calcium salts for 2 hours before or 1 hour after clodronate. [Moderate] Study
- ➤ Oral calcium salts are predicted to decrease the absorption of oral bisphosphonates (ibandronate). Avoid calcium salts for at least 6 hours before or 1 hour after ibandronate. Moderate
- ➤ Oral calcium salts decrease the absorption of bisphosphonates (risedronate). Separate administration by at least 2 hours.

 Moderate Study
- Oral calcium carbonate-containing antacids are predicted to decrease the absorption of oral bosutinib. Bosutinib should be taken at least 12 hours before antacids. [Moderate] Theoretical
- Cephalosporins (ceftriaxone) increase the risk of cardiorespiratory arrest when given with calcium chloride. Avoid.
 Severel Anecdotal
- Cephalosporins (ceftriaxone) increase the risk of cardiorespiratory arrest when given with intravenous calcium gluconate. Avoid. Severe Anecdotal
- Oral calcium carbonate -containing antacids are predicted to decrease the exposure to oral dasatinib. Separate administration by at least 2 hours. Moderate Study
- ► Intravenous calcium salts increase the effects of digoxin. Avoid. [Moderate] Anecdotal
- ➤ Oral calcium salts decrease the absorption of dolutegravir.

 Dolutegravir should be taken 2 hours before or 6 hours after calcium salts. [Moderate] Study

- ➤ Oral calcium salts decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after calcium salts. Severe Study
- Oral calcium carbonate-containing antacids are predicted to decrease the absorption of oral erlotinib. Erlotinib should be taken 2 hours before or 4 hours after antacids. Moderate
- Oral calcium carbonate -containing antacids are predicted to decrease the exposure to oral gefitinib. [Moderate] Theoretical
- Calcium carbonate is predicted to decrease the absorption of hydroxychloroquine. Moderate Theoretical
- ➤ Oral calcium carbonate decreases the absorption of oral iron. Calcium carbonate should be taken 1 hour before or 2 hours after iron. [Moderate] Study
- ➤ Oral calcium carbonate-containing antacids are predicted to decrease the absorption of oral lapatinib. Avoid. Moderate Theoretical
- ► Calcium carbonate is predicted to decrease the exposure to ledipasvir. Separate administration by 4 hours. Moderate
- ➤ Oral calcium carbonate -containing antacids are predicted to decrease the exposure to oral neratinib. Separate administration by at least 3 hours. [Mild] Theoretical
- ➤ Oral calcium carbonate -containing antacids might affect the exposure to oral nilotinib. Separate administration by at least 2 hours. Moderate Study
- Oral calcium carbonate -containing antacids are predicted to decrease the exposure to oral NNRTIs (rilpivirine). Rilpivirine should be taken 4 hours before or 2 hours after antacids.
 Severel Theoretical
- Oral calcium carbonate -containing antacids might decrease the absorption of oral pazopanib. Pazopanib should be taken 1 hour before or 2 hours after antacids. [Moderate] Theoretical
- ► Calcium carbonate decreases the absorption of quinolones (ciprofloxacin). Separate administration by 2 hours. [Moderate] Study
- ► Calcium carbonate greatly decreases the exposure to raltegravir (high-dose). Avoid. Severe Study
- Calcium acetate minimally decreases the exposure to roxadustat. Roxadustat should be taken at least 1 hour after calcium acetate. Moderate Study
- Oral calcium carbonate is predicted to decrease the exposure to oral sotorasib. Sotorasib should be taken 4 hours before or 10 hours after antacids. Moderate Theoretical
- Oral calcium salts decrease the exposure to strontium.
 Separate administration by 2 hours. [Moderate] Study
- Calcium carbonate is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours.
 Moderate Theoretical
- ► Thiazide diuretics increase the risk of hypercalcaemia when given with calcium salts. [Severe] Anecdotal
- ➤ Oral calcium salts are predicted to decrease the absorption of thyroid hormones (levothyroxine). Separate administration by at least 4 hours. [Moderate] Anecdotal
- Calcium carbonate is predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. Moderate Anecdotal
- ▶ Oral calcium salts decrease the absorption of zinc. Moderate Study

Canagliflozin → see sodium glucose co-transporter 2 inhibitors **Canakinumab** → see monoclonal antibodies

Candesartan → see angiotensin-II receptor antagonists

Cangrelor → see TABLE 4 p. 1490 (antiplatelet effects)

► Selumetinib might increase the risk of bleeding when given with cangrelor. Severe Theoretical

Cannabidiol → see TABLE 11 p. 1492 (CNS depressant effects)

Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to cannabidiol. Adjust dose. [Moderate Study]

 Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cannabidiol. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1492

- Cannabidiol increases the risk of increased ALT concentrations when given with antiepileptics (valproate). Avoid or adjust dose. Severe Study
- Antifungals, azoles (fluconazole) are predicted to increase the exposure to cannabidiol. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cannabidiol. Avoid or adjust dose. [Mild] Study
- Cannabidiol increases the exposure to the active metabolite of benzodiazepines (clobazam) and benzodiazepines (clobazam) increase the exposure to the active metabolite of cannabidiol. Adjust dose. [Moderate] Study -> Also see TABLE 11 p. 1492
- Cobicistat is predicted to increase the exposure to cannabidiol.
 Avoid or adjust dose. Mild Study
- HIV-protease inhibitors are predicted to increase the exposure to cannabidiol. Avoid or adjust dose. Mild Study
- ► Idelalisib is predicted to increase the exposure to cannabidiol. Avoid or adjust dose. [Mild] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to cannabidiol. Avoid or adjust dose. Mild Study
- Mitotane is predicted to decrease the exposure to cannabidiol.
 Adjust dose. [Moderate] Study
- Moclobemide is predicted to increase the exposure to cannabidiol. [Moderate] Theoretical
- ► Proton pump inhibitors (esomeprazole) are predicted to increase the exposure to cannabidiol. Moderate Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to cannabidiol. Adjust dose. Moderate Study
- SSRIs (fluoxetine, fluoxamine) are predicted to increase the exposure to cannabidiol. [Moderate] Theoretical
- St John's wort is predicted to decrease the exposure to cannabidiol. Adjust dose. [Mild] Study

Capecitabine → see TABLE 15 p. 1493 (myelosuppression)

- Allopurinol is predicted to decrease the effects of capecitabine.
 Avoid. Severe Study
- Capecitabine increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal
- Capecitabine increases the effects of coumarins. Monitor INR and adjust dose. Moderate Anecdotal
- ► Folates are predicted to increase the risk of toxicity when given with capecitabine. Severe Anecdotal
- H
 ₂ receptor antagonists (cimetidine) are predicted to slightly increase the exposure to capecitabine. Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with capecitabine. UKHSA advises avoid (refer to Green Book).
 Severel Theoretical
- ► Metronidazole is predicted to increase the risk of capecitabine toxicity when given with capecitabine. [Severe] Theoretical

Caplacizumab

- ➤ Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can caplacizumab; concurrent use might increase the risk of developing this effect. (Severe Theoretical
- ➤ Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can caplacizumab; concurrent use might increase the risk of developing this effect. [Severe] Theoretical

Capreomycin → see TABLE 2 p. 1490 (nephrotoxicity), TABLE 19 p. 1494 (ototoxicity)

Captopril → see ACE inhibitors

Carbamazepine → see antiepileptics

Carbapenems

ertapenem · imipenem · meropenem

- Carbapenems decrease the concentration of antiepileptics (valproate). Avoid. Severe Anecdotal
- ► Ganciclovir is predicted to increase the risk of seizures when given with imipenem. Avoid. Severe Anecdotal
- Valganciclovir is predicted to increase the risk of seizures when given with imipenem. Avoid. Severe Anecdotal

Carbidopa

 Oral iron is predicted to decrease the exposure to oral carbidopa. Moderate Theoretical

arhimazolo

 Carbimazole affects the concentration of digoxin. Monitor and adjust dose. Moderate Theoretical

Carbimazole (continued)

- Carbimazole decreases the effects of metyrapone. Avoid.
 Moderate Theoretical
- ► Carbimazole given with a potent CYP3A4 inhibitor is predicted to increase the exposure to propiverine. Adjust starting dose.
 Moderate Theoretical

Carboplatin → see platinum compounds

Carfilzomib → see TABLE 15 p. 1493 (myelosuppression)

 Carfilzomib potentially decreases the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. Severe Theoretical

Cariprazine → see antipsychotics, second generation

Carmustine → see alkylating agents

Carvedilol → see beta blockers, non-selective

Caspofungin

- Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the concentration of caspofungin. Adjust caspofungin dose, p. 646. [Moderate] Theoretical
- Ciclosporin slightly increases the exposure to caspofungin.
 Severe Study
- ➤ Corticosteroids (dexamethasone) are predicted to decrease the concentration of caspofungin. Adjust caspofungin dose, p. 646.

 Moderate] Theoretical
- NNRTIs (efavirenz) are predicted to decrease the concentration of caspofungin. Adjust dose. [Moderate] Study
- NNRTIS (nevirapine) are predicted to decrease the
- concentration of caspofungin. Adjust dose. Moderate Theoretical
- Rifamycins (rifampicin) decrease the concentration of caspofungin. Adjust caspofungin dose, p. 646. Moderate Study

Cefaclor → see cephalosporins

Cefadroxil → see cephalosporins **Cefalexin** → see cephalosporins

Cefazolin → see cephalosporins

Cefepime → see cephalosporins

Cefiderocol → see cephalosporins

Cefixime → see cephalosporins **Cefotaxime** → see cephalosporins

Cefoxitin → see cephalosporins

Cefradine → see cephalosporins

Ceftaroline → see cephalosporins

Ceftazidime → see cephalosporins **Ceftobiprole** → see cephalosporins

Ceftolozane → see cephalosporins

Ceftriaxone → see cephalosporins

Cefuroxime → see cephalosporins

Celecoxib → see NSAIDs

Celiprolol → see beta blockers, selective

Cemiplimab → see monoclonal antibodies

Cenobamate → see TABLE 11 p. 1492 (CNS depressant effects) ► **Cenobamate** is predicted to decrease the exposure to

- aldosterone antagonists (eplerenone). Adjust dose. [Moderate]
 Theoretical
- ► Cenobamate might increase the exposure to antiepileptics (fosphenytoin, primidone). Moderate Theoretical → Also see TABLE 11 p. 1492
- Cenobamate is predicted to decrease the concentration of antiepileptics (lamotrigine) and antiepileptics (lamotrigine) might affect the efficacy of cenobamate. Adjust dose. Moderate Study -> Also see TABLE 11 p. 1492
- ► Cenobamate slightly increases the exposure to antiepileptics (phenobarbital, phenytoin). Monitor and adjust dose. [Moderate]
 Study → Also see TABLE 11 p. 1492
- ► Cenobamate is predicted to decrease the exposure to antipsychotics, second generation (lurasidone, quetiapine). Adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 1492
- ➤ Cenobamate might increase the concentration of benzodiazepines (clobazam). Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 1492
- Cenobamate moderately decreases the exposure to benzodiazepines (midazolam). Adjust dose. Moderate Study → Also see TABLE 11 p. 1492
- Cenobamate is predicted to decrease the exposure to beta₂ agonists (salmeterol). Adjust dose. Moderate Theoretical
- Cenobamate is predicted to decrease the exposure to bosutinib. Adjust dose. [Moderate] Theoretical

- Cenobamate is predicted to decrease the exposure to buspirone. Adjust dose. Moderate Theoretical
- ► Cenobamate is predicted to decrease the exposure to calcium channel blockers (felodipine, lercanidipine). Adjust dose. Moderate Theoretical
- ► Cenobamate is predicted to decrease the exposure to cobimetinib. Adjust dose. Moderate Theoretical
- ➤ Cenobamate might decrease the efficacy of oral combined hormonal contraceptives. Use additional contraceptive precautions. Severe Theoretical
- Cenobamate is predicted to decrease the exposure to oral corticosteroids (budesonide). Adjust dose. [Moderate] Theoretical
- Cenobamate is predicted to decrease the exposure to corticosteroids (fluticasone). Adjust dose. Moderate Theoretical
- ► Cenobamate is predicted to decrease the exposure to darifenacin. Adjust dose. [Moderate] Theoretical
- Cenobamate is predicted to decrease the exposure to dasatinib.
 Adjust dose. Moderate Theoretical
- ► Cenobamate is predicted to decrease the exposure to everolimus. Adjust dose. [Moderate] Theoretical
- ► Cenobamate is predicted to decrease the exposure to ibrutinib.

 Adjust dose. Moderate Theoretical
- Cenobamate is predicted to decrease the exposure to ivacaftor.
 Adjust dose. [Moderate] Theoretical
- ► Cenobamate is predicted to decrease the exposure to lomitapide. Adjust dose. Moderate Theoretical
- ► Cenobamate is predicted to decrease the exposure to maraviroc. Adjust dose. Moderate Theoretical
- Cenobamate is predicted to decrease the exposure to naloxegol. Adjust dose. Moderate Theoretical
- Cenobamate is predicted to decrease the exposure to opioids (alfentanil). Adjust dose. Moderate Theoretical → Also see TABLE 11 p. 1492
- Cenobamate is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, sildenafil, vardenafil). Adjust dose. [Moderate] Theoretical
- ► Cenobamate moderately increases the exposure to proton pump inhibitors (omeprazole). Adjust dose. Moderatel Study
- Cenobamate is predicted to decrease the exposure to sirolimus.
 Adjust dose. [Moderate] Theoretical
- ► Cenobamate is predicted to decrease the exposure to statins (simvastatin). Adjust dose. [Moderate] Theoretical
- Cenobamate is predicted to decrease the exposure to oral temsirolimus. Adjust dose. [Moderate] Theoretical
- ► Cenobamate is predicted to decrease the exposure to ticagrelor. Adjust dose. Moderate Theoretical
- Cenobamate is predicted to decrease the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical
- Cenobamate is predicted to decrease the exposure to triptans (eletriptan). Adjust dose. Moderate Theoretical

Cephalosporins → see TABLE 2 p. 1490 (nephrotoxicity)

cefaclor · cefadroxil · cefalexin · cefazolin · cefepime · cefiderocol · cefixime · cefotaxime · cefoxitin · cefradine · ceftaroline · ceftazidime · ceftobjprole · ceftolozane · ceftriaxone · cefuroxime

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use of **cefuroxime** unless specified.

- ► Ceftriaxone increases the risk of cardio-respiratory arrest when given with calcium salts (calcium chloride). Avoid. Severe
- ► Ceftriaxone increases the risk of cardio-respiratory arrest when given with intravenous calcium salts (calcium gluconate).

 Avoid. [Severe] Anecdotal
- ► Cephalosporins (cefazolin, ceftriaxone) potentially increase the risk of bleeding events when given with coumarins. Severe
- ► **Ceftobiprole** is predicted to increase the exposure to endothelin receptor antagonists (**bosentan**). [Moderate] Theoretical
- Leflunomide is predicted to increase the exposure to cefaclor.
 Moderate Theoretical
- Nitisinone is predicted to increase the exposure to cefaclor.
 Moderate Study
- ► Cephalosporins (cefazolin, ceftriaxone) potentially increase the risk of bleeding events when given with phenindione. Severe

 Anecdotal

A1

- Ceftobiprole is predicted to increase the concentration of statins. Moderate Theoretical
- Ceftobiprole is predicted to increase the concentration of sulfonylureas (glibenclamide). Moderate Theoretical
- ► Teriflunomide is predicted to increase the exposure to cefaclor. Moderate Study
- Ceritinib → see TABLE 6 p. 1491 (bradycardia), TABLE 15 p. 1493 (myelosuppression), TABLE 9 p. 1492 (QT-interval prolongation)
- ► Ceritinib is predicted to increase the exposure to aliskiren.

 [Moderate] Theoretical
- ➤ Oral antacids are predicted to decrease the absorption of oral ceritinib. Separate administration by 2 hours. [Moderate] Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ceritinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to Certitinib. (Moderate) Study → Also see TABLE 6 p. 1491 → Also see TABLE 7 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ceritinib. [Moderate] Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 1050. Severe Study → Also see TABLE 9 p. 1492
- ► Ceritinib is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). Moderate Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ceritinib. [Moderate] Study → Also see TABLE 6 p. 1491
- ► Ceritinib is predicted to increase the exposure to ciclosporin.

 Avoid. Severe Theoretical
- ➤ Cobicistat is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 1050. Severe Study
- Ceritinib is predicted to increase the exposure to colchicine.
 Moderate Theoretical
- Ceritinib is predicted to increase the exposure to coumarins (acenocoumarol). [Severe] Theoretical
- ► Ceritinib is predicted to increase the exposure to coumarins (warfarin). Avoid. Severe Theoretical
- ► Crizotinib is predicted to increase the exposure to ceritinib. Moderate Study → Also see TABLE 6 p. 1491 → Also see TABLE 9 p. 1492
- Dabrafenib is predicted to decrease the exposure to ceritinib.
 Severe Study
- Ceritinib is predicted to increase the risk of bradycardia when given with digoxin. Avoid. Severe Theoretical → Also see TABLE 6
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to ceritinib. Severe Study
- Ceritinib is predicted to increase the exposure to ergotamine.
 Avoid. Severe Theoretical
- Ceritinib is predicted to increase the exposure to everolimus.
 Moderate Theoretical
 Ceritinib is predicted to increase the exposure to factor XA
- inhibitors (edoxaban). Moderate Theoretical

 ► Grapefruit juice is predicted to increase the exposure to
- ceritinib. Avoid. Severe Theoretical
- ► H₂ receptor antagonists are predicted to decrease the absorption of ceritinib. Moderate Theoretical
 ► HIV-protease inhibitors are predicted to increase the exposure
- to ceritinib. Avoid or adjust ceritinib dose, p. 1050. Severe Study

 Idelalisib is predicted to increase the exposure to ceritinib.
- Avoid or adjust ceritinib dose, p. 1050. Severe Study
- ► Imatinib is predicted to increase the exposure to ceritinib.
 Moderate Study → Also see TABLE 15 p. 1493
- ► Lapatinib is predicted to increase the exposure to ceritinib.
 Moderate Theoretical → Also see TABLE 9 p. 1492
- Letermovir is predicted to increase the exposure to ceritinib.
 Moderate Study
- Ceritinib is predicted to increase the exposure to loperamide.
 Moderate Theoretical

- ► Macrolides (clarithromycin) are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 1050. [Severe] Study → Also see TABLE 9 p. 1492
- Macrolides (erythromycin) are predicted to increase the exposure to ceritinib. Moderate Study → Also see TABLE 9 p. 1492
- Mitotane is predicted to decrease the exposure to ceritinib. Avoid. Severe Study → Also see TABLE 15 p. 1493
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to ceritinib. Moderate Study
- ► Neurokinin-1 receptor antagonists (fosaprepitant) are predicted to increase the exposure to ceritinib. Severe Theoretical
- Nilotinib is predicted to increase the exposure to ceritinib.
 Moderate Study → Also see TABLE 15 p. 1493 → Also see TABLE 9
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of ceritinib. Avoid or adjust ceritinib dose, p. 1050. [Severe] Theoretical
- NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to ceritinib. Severe Study → Also see TABLE 9 p. 1492
- Ceritinib is predicted to increase the exposure to NSAIDs (celecoxib, diclofenac). Adjust dose. Moderate Theoretical
- ► Ceritinib is predicted to increase the exposure to opioids (alfentanil, fentanyl). Avoid. Severe Theoretical → Also see TABLE 6 n. 1491
- ► Ceritinib is predicted to increase the exposure to phenindione.

 Severe Theoretical
- ► Ceritinib is predicted to increase the exposure to pimozide. Avoid. Severe Theoretical → Also see TABLE 9 p. 1492
- Proton pump inhibitors are predicted to decrease the absorption of ceritinib. Moderate Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to ceritinib. Avoid. Severe Study
- ► Ceritinib is predicted to increase the exposure to sirolimus.

 Avoid. [Severe] Theoretical
- ► St John's wort is predicted to decrease the exposure to ceritinib. Avoid. Severe Theoretical
- ► Ceritinib is predicted to increase the exposure to sulfonylureas (glimepiride). Adjust dose. [Moderate] Theoretical
- Ceritinib is predicted to increase the exposure to tacrolimus.
 Avoid. [Severe] Theoretical
- ► Ceritinib is predicted to increase the exposure to taxanes
- (paclitaxel). Moderate Theoretical → Also see TABLE 15 p. 1493
 Ceritinib is predicted to increase the exposure to thrombin inhibitors (dabigatran). Moderate Theoretical
- ► Ceritinib is predicted to increase the exposure to topotecan.

 Moderate Theoretical → Also see TABLE 15 p. 1493

Certolizumab pegol → see monoclonal antibodies

Cetirizine → see antihistamines, non-sedating

Cetuximab → see monoclonal antibodies

Chenodeoxycholic acid

- Oral aluminium hydroxide decreases the absorption of chenodeoxycholic acid. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose.
 Moderate Theoretical
- ► Ciclosporin is predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. Moderate Theoretical
- Oral combined hormonal contraceptives potentially decrease the efficacy of oral chenodeoxycholic acid. Avoid. Moderate
- ➤ Sirolimus is predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. Moderate Theoretical

Chloral hydrate → see TABLE 11 p. 1492 (CNS depressant effects)

► Intravenous loop diuretics (furosemide) potentially increase the risk of sweating, variable blood pressure, and tachycardia when given after chloral hydrate. [Moderate] Anecdotal

Chlorambucil → see alkylating agents

Chloramphenicol

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

 Antiepileptics (phenobarbital, primidone) decrease the concentration of chloramphenicol. [Moderate] Study

Chloramphenicol (continued)

- Intravenous chloramphenicol increases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) affect the concentration of intravenous chloramphenicol. Monitor concentration and adjust dose. [Severe] Study
- ► Chloramphenicol potentially increases the anticoagulant effect of coumarins. [Moderate] Anecdotal
- ► Chloramphenicol is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Theoretical
- ► Chloramphenicol decreases the efficacy of iron. Moderate

 Anecdotal
- Rifamycins (rifampicin) decrease the concentration of chloramphenicol. [Moderate] Study
- Chloramphenicol is predicted to increase the exposure to sulfonylureas. Severe Study
- Chloramphenicol increases the concentration of tacrolimus.
 Severe Study

Chlordiazepoxide → see benzodiazepines

Chlormethine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Chloroprocaine → see TABLE 11 p. 1492 (CNS depressant effects)

- ► Chloroprocaine is predicted to increase the risk of cardiovascular adverse effects when given with antiarrhythmics (amiodarone, dronedarone, vernakalant). Severe Theoretical
- Chloroprocaine is predicted to increase the risk of cardiovascular adverse effects when given with beta blockers, non-selective (sotalol). [Severe] Theoretical
- Chloroprocaine is predicted to decrease the effects of sulfonamides. Avoid. Severe Theoretical

Chloroquine → see antimalarials

Chlorothiazide → see thiazide diuretics

Chlorphenamine → see antihistamines, sedating

Chlorpromazine → see phenothiazines

Chlortalidone → see thiazide diuretics

Cholera vaccine

- ► Antimalarials (chloroquine) decrease the efficacy of oral cholera vaccine. [Moderate] Study
- Hydroxychloroquine is predicted to decrease the efficacy of oral cholera vaccine. [Moderate] Theoretical

Cholic acid

- ➤ Oral antacids are predicted to decrease the absorption of oral cholic acid. Separate administration by 5 hours. Mild Theoretical
- Antiepileptics (phenobarbital) decrease the effects of cholic acid.
 Avoid. Moderate Study
- Ciclosporin affects the concentration of cholic acid. Avoid.
 Moderate Study

Choline salicylate

► Corticosteroids are predicted to decrease the concentration of choline salicylate. Moderate Study

Ciclesonide → see corticosteroids

Ciclosporin → see TABLE 2 p. 1490 (nephrotoxicity), TABLE 16 p. 1494 (increased serum potassium)

- Pomelo juice is predicted to increase ciclosporin exposure, and purple grape juice is predicted to decrease ciclosporin exposure.
- Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
- ► Abrocitinib might increase the exposure to ciclosporin.

 Moderate Theoretical
- ► Ciclosporin is predicted to increase the exposure to afatinib.

 [Moderate] Study
- ► Ciclosporin markedly increases the exposure to aliskiren. Avoid. Severe Study → Also see TABLE 16 p. 1494
- Ciclosporin is predicted to increase the exposure to alpelisib.
 Moderate Theoretical
- ► Ciclosporin increases the concentration of anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone). (Severe) Study
- Anti-androgens (apalutamide, enzalutamide) decrease the concentration of ciclosporin. Severe Study

- ► Antiarrhythmics (amiodarone) increase the concentration of ciclosporin. Monitor concentration and adjust dose. Severe Study
- ► Antiarrhythmics (dronedarone) are predicted to increase the concentration of ciclosporin. Severe Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of ciclosporin. Severe Study
- Antiepileptics (oxcarbazepine) decrease the concentration of ciclosporin. Severe Anecdotal
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of ciclosporin.

 [Severe] Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the concentration of ciclosporin. [Severe] Study
- ► Antifungals, azoles (miconazole) increase the concentration of ciclosporin. Monitor and adjust dose. [Severe] Anecdotal
- Baricitinib is predicted to enhance the risk of immunosuppression when given with ciclosporin.
 Manufacturer advises caution or avoid—consult product literature. [Severe] Theoretical
- ► Ciclosporin is predicted to increase the exposure to berotralstat. [Severe] Study
- ► Ciclosporin is predicted to increase the exposure to beta blockers, non-selective (nadolol). Moderate Study
- Ciclosporin is predicted to increase the exposure to bictegravir.
 Use with caution or avoid. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of ciclosporin. Severe Study
- ► Calcium channel blockers (nicardipine) increase the concentration of ciclosporin. [Severe] Study
- ► Ciclosporin moderately increases the exposure to calcium channel blockers (lercanidipine). Use with caution or avoid.

 | Severe | Study |
- Ciclosporin slightly increases the exposure to caspofungin.
 Severe Study
- Ceritinib is predicted to increase the exposure to ciclosporin.
 Avoid. | Severe | Theoretical
- Ciclosporin is predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. Moderate Theoretical
- ► Ciclosporin affects the concentration of cholic acid. Avoid.

 Moderate Study
- Ciclosporin is predicted to increase the exposure to cladribine.
 Avoid or adjust dose. [Moderate] Theoretical
- ► Cobicistat increases the concentration of ciclosporin. Severe Study
- Ciclosporin increases the exposure to colchicine. Avoid Pglycoprotein inhibitors or adjust colchicine dose, p. 1212. [Severe] Study
- Crizotinib is predicted to increase the concentration of ciclosporin. (Severe) Study
- ► Ciclosporin is predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical
- ► Ciclosporin is predicted to increase the exposure to darifenacin. Avoid. [Moderate] Theoretical
- ► Ciclosporin increases the concentration of digoxin. Monitor and adjust dose. Severe Theoretical
- ► Ciclosporin causes a small decrease in the exposure to eltrombopag. Monitor platelet count and adjust dose.

 Moderate | Study
- Endothelin receptor antagonists (bosentan) moderately decrease the exposure to ciclosporin and ciclosporin moderately increases the exposure to endothelin receptor antagonists (bosentan). Avoid. [Severe] Study
- Ciclosporin moderately increases the exposure to endothelin receptor antagonists (ambrisentan). Adjust ambrisentan dose, p. 199. [Moderate] Study
- ► Entrectinib is predicted to increase the exposure to ciclosporin.

 Mild Theoretical
- Ciclosporin is predicted to increase the exposure to erlotinib.
 [Moderate] Theoretical
- Ciclosporin increases the exposure to etoposide. Monitor and adjust dose. Severe Study

- Ciclosporin moderately increases the exposure to everolimus.
 Avoid or adjust dose. Severe Study
- ► Ciclosporin moderately increases the exposure to ezetimibe and ezetimibe slightly increases the exposure to ciclosporin.

 Moderatel Study
- Ciclosporin is predicted to increase the exposure to factor XA inhibitors (apixaban). [Moderate] Theoretical
- Ciclosporin slightly increases the exposure to factor XA inhibitors (edoxaban). Adjust edoxaban dose, p. 138. Severe Study
- ► Ciclosporin slightly increases the exposure to factor XA
- inhibitors (rivaroxaban). Moderate Study

 ► Fibrates (bezafibrate) are predicted to increase the risk of nephrotoxicity when given with ciclosporin. Severe Theoretical
- ► Fibrates (fenofibrate) increase the risk of nephrotoxicity when given with ciclosporin. Severe Study
- Ciclosporin is predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Filgotinib is predicted to increase the risk of immunosuppression when given with ciclosporin. Avoid.
 Severel Theoretical
- Ciclosporin is predicted to increase the exposure to gilteritinib.
 [Moderate] Theoretical
- Ciclosporin increases the exposure to glecaprevir. Avoid or monitor. Severe Study
- Grapefruit juice increases the concentration of ciclosporin.
 Avoid. Severe Study
- Ciclosporin greatly increases the exposure to grazoprevir.
 Avoid. [Severe] Study
- H₂ receptor antagonists (cimetidine) increase the concentration of ciclosporin. [Mild] Study
- HIV-protease inhibitors increase the concentration of ciclosporin. Severe Study
- ► Idelalisib increases the concentration of ciclosporin. Severe Study
- Imatinib is predicted to increase the concentration of ciclosporin. Severe Study
- ► Iron chelators (dexrazoxane) might increase the risk of immunosuppression when given with ciclosporin. [Severe] Theoretical
- Ivacaftor is predicted to increase the exposure to ciclosporin.
 Moderate Theoretical
- ► Lanreotide is predicted to decrease the absorption of oral ciclosporin. Adjust dose. Severe Theoretical
- ► Ciclosporin might increase the concentration of lapatinib.

 Severe Theoretical
- ► Ciclosporin is predicted to increase the exposure to larotrectinib. Mild Study
- ► Letermovir increases the exposure to ciclosporin and ciclosporin increases the exposure to letermovir. Monitor and adjust letermovir dose, p. 693. Severe Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with ciclosporin. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Ciclosporin is predicted to increase the exposure to lomitapide.
 Separate administration by 12 hours. [Moderate] Theoretical
- ► Lorlatinib is predicted to decrease the exposure to ciclosporin.

 Avoid. Moderatel Theoretical
- ► Lumacaftor is predicted to decrease the exposure to ciclosporin. Avoid. Severe Theoretical
- Macrolides (clarithromycin) increase the concentration of ciclosporin. [Severe] Study
- ► Macrolides (erythromycin) greatly increase the exposure to ciclosporin. Avoid or monitor. Severe Study
- Ciclosporin moderately increases the exposure to meglitinides (repaglinide). [Moderate] Study
- Metreleptin might alter the exposure to ciclosporin. Monitor concentration and adjust dose. Severe Theoretical
- ► Midostaurin might increase the concentration of ciclosporin.

 Severel Anecdotal
- Ciclosporin is predicted to decrease the efficacy of mifamurtide. Avoid. [Severe] Theoretical
- ► Mitotane decreases the concentration of ciclosporin. Severe

- ► Monoclonal antibodies (blinatumomab) are predicted to transiently increase the exposure to ciclosporin. Monitor and adjust dose. [Moderate] Theoretical
- ➤ Monoclonal antibodies (sarilumab) potentially affect the exposure to ciclosporin. Monitor and adjust dose. Moderate Theoretical
- ► Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to ciclosporin. Monitor and adjust dose. Moderate Theoretical
- ► Ciclosporin is predicted to increase the exposure to naldemedine. Moderate Study
- ➤ Ciclosporin is predicted to increase the exposure to neratinib.

 Avoid or adjust neratinib dose and monitor for gastrointestinal adverse effects, p. 1069. [Severe] Theoretical
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the concentration of ciclosporin. Severe
- Nilotinib is predicted to increase the concentration of ciclosporin. [Severe] Study
- ► Ciclosporin is predicted to increase the exposure to nintedanib.

 Moderate Study
- ► Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of ciclosporin. Severe Theoretical
- ► NNRTIs (efavirenz) decrease the concentration of ciclosporin.

 Monitor concentration and adjust dose. [Moderate] Study
- NNRTIs (nevirapine) are predicted to decrease the concentration of ciclosporin. [Moderate] Study
- ► Ciclosporin increases the concentration of NSAIDs (diclofenac).
- Severe Study → Also see TABLE 2 p. 1490 → Also see TABLE 16 p. 1494

 Cotreotide decreases the absorption of oral ciclosporin. Adjust ciclosporin dose, p. 904. Severe Anecdotal
- ► Olaparib might alter the exposure to ciclosporin. Moderate
- ► Ciclosporin is predicted to increase the exposure to the active metabolites of ozanimod. Avoid. Moderate Study
- ▶ Palbociclib is predicted to increase the exposure to ciclosporin. Adjust dose. Moderate Theoretical
- Ciclosporin is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical
- Pasireotide is predicted to decrease the absorption of oral ciclosporin. Adjust dose. Severe Theoretical
- Pitolisant is predicted to decrease the exposure to ciclosporin.
 Avoid. [Severe] Theoretical
- Ciclosporin is predicted to increase the concentration of ranolazine and ranolazine is predicted to increase the concentration of ciclosporin. Moderate Theoretical
- Ciclosporin is predicted to increase the exposure to relugolix.
 Avoid or take relugolix first and separate administration by at least 6 hours. Moderate Study
- ► Ribociclib is predicted to increase the exposure to ciclosporin. Use with caution and adjust dose. Moderate Theoretical
- Rifamycins (rifampicin) decrease the concentration of ciclosporin. Severe Study
- Ciclosporin very markedly increases the exposure to rifaximin.
 Severe Study
- Ciclosporin is predicted to increase the exposure to riociguat.
 Moderate Theoretical
- Rucaparib is predicted to increase the exposure to ciclosporin.
 Monitor and adjust dose. Moderate Study
- Ciclosporin moderately increases the exposure to sirolimus.
 Separate administration by 4 hours. |Severe| Study
- ► St John's wort decreases the concentration of ciclosporin.

 Avoid. [Moderate] Study
- Ciclosporin markedly to very markedly increases the exposure to statins (atorvastatin). Avoid or adjust atorvastatin dose, p. 220. [Severe] Study
- Ciclosporin moderately increases the exposure to statins (fluvastatin). [Severe] Study
- Ciclosporin markedly to very markedly increases the exposure to statins (pravastatin). Adjust dose. Severe Study
- ► Ciclosporin markedly increases the exposure to statins (rosuvastatin). Avoid. Severe Study
- ► Ciclosporin markedly to very markedly increases the exposure to statins (simvastatin). Avoid. Severe Study

Ciclosporin (continued)

- ► Ciclosporin increases the concentration of tacrolimus. Avoid.

 Severe Study → Also see TABLE 2 p. 1490 → Also see TABLE 16 p. 1494
- ► Ciclosporin is predicted to slightly increase the exposure to talazoparib. Avoid or adjust talazoparib dose, p. 1091. Severe Study
- Ciclosporin increases the concentration of taxanes (docetaxel, paclitaxel) (oral). [Unknown] Study
- ► Ciclosporin is predicted to increase the exposure to tenofovir alafenamide. [Moderate] Theoretical
- ► Ciclosporin is predicted to increase the exposure to tenofovir disoproxil. [Moderate] Theoretical → Also see TABLE 2 p. 1490
- Tetracyclines (doxycycline) are predicted to increase the concentration of ciclosporin. [Severe] Theoretical
- Ciclosporin is predicted to increase the exposure to thrombin inhibitors (dabigatran). Avoid. Severe Study
- ► Ciclosporin is predicted to increase the exposure to ticagrelor. Use with caution or avoid. Severe Study
- Ciclosporin might increase the exposure to tigecycline and tigecycline has been reported to increase the concentration of ciclosporin. Severe Anecdotal
- ► Ciclosporin increases the exposure to tofacitinib. Avoid. Severe Study
- Ciclosporin is predicted to increase the exposure to topotecan.
 Severe Study
- Ciclosporin is predicted to increase the concentration of trametinib. [Moderate] Theoretical
- ► **Ursodeoxycholic acid** affects the concentration of **ciclosporin**. Use with caution and adjust dose. Severe Anecdotal
- ► Ciclosporin might affect the exposure to vemurafenib. Severe Theoretical
- Ciclosporin is predicted to increase the exposure to venetoclax.
 Avoid or monitor for toxicity. Severe Theoretical
- Ciclosporin might increase the exposure to vinca alkaloids.
 Severe Theoretical
- Vitamin E substances affect the exposure to ciclosporin.
 Moderate Study
- Ciclosporin increases the concentration of voxilaprevir. Avoid.
 Severe Study

Cidofovir → see TABLE 2 p. 1490 (nephrotoxicity)
Cilostazol → see TABLE 4 p. 1490 (antiplatelet effects)

GENERAL INFORMATION Concurrent use with 2 or more antiplatelets or anticoagulants is contra-indicated.

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to alter the effects of cilostazol. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the effects of cilostazol. [Moderate] Theoretical
- ► Antifungals, azoles (fluconazole) are predicted to increase the exposure to cilostazol. Adjust cilostazol dose, p. 252. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cilostazol.
 Adjust cilostazol dose, p. 252. Moderate Study
- ➤ Antifungals, azoles (miconazole) are predicted to increase the exposure to cilostazol. Use with caution and adjust dose. [Moderate] Theoretical
- Cilostazol might increases the exposure to cladribine. Avoid or adjust dose. Moderate Theoretical
- ► Cobicistat is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 252. [Moderate] Study
- HIV-protease inhibitors are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 252.

 Moderatel Study
- ► Idelalisib is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 252. Moderate Study
- Cilostazol is predicted to increase the exposure to lomitapide.
 Separate administration by 12 hours. Moderate Theoretical
- ► Macrolides (clarithromycin) are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 252. Moderate Study
- ► Macrolides (erythromycin) slightly increase the exposure to cilostazol. Adjust cilostazol dose, p. 252. [Moderate] Study
- Mitotane is predicted to alter the effects of cilostazol. Moderate
 Theoretical

- ► Moclobemide is predicted to increase the exposure to cilostazol. [Moderate] Theoretical
- Proton pump inhibitors (esomeprazole) are predicted to increase the exposure to cilostazol. [Moderate] Theoretical
- ► Proton pump inhibitors (omeprazole) are predicted to increase the exposure to cilostazol. Adjust cilostazol dose, p. 252.

 Moderate | Study
- ► Rifamycins (rifampicin) are predicted to alter the effects of cilostazol. Moderate Theoretical
- Selumetinib might increase the risk of bleeding when given with cilostazol. Severe Theoretical
- ➤ SSRIs (fluoxetine, fluvoxamine) are predicted to increase the exposure to cilostazol. Adjust cilostazol dose, p. 252. Moderate
 Theoretical → Also see TABLE 4 p. 1490
- St John's wort is predicted to alter the effects of cilostazol.
 Moderate Theoretical
- Cilostazol is predicted to increase the exposure to statins (atorvastatin). [Moderate] Theoretical
- Cilostazol slightly increases the exposure to statins (simvastatin). [Moderate] Study

Cimetidine → see H₂ receptor antagonists

Cinacalcet

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment.

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to cinacalcet. Monitor and adjust dose.

 Moderate Study
- ► Cinacalcet is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cinacalcet.
 Adjust dose. [Moderate] Study
- Cinacalcet is predicted to moderately increase the exposure to antipsychotics, second generation (aripiprazole). Adjust aripiprazole dose, p. 427. [Moderate] Study
- Cinacalcet is predicted to increase the exposure to antipsychotics, second generation (risperidone). Adjust dose.
 Moderate Study
- ► Cinacalcet is predicted to markedly increase the exposure to atomoxetine. Adjust dose. Severe Study
- ► Cinacalcet is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study
- ► Cobicistat is predicted to moderately increase the exposure to cinacalcet. Adjust dose. Moderate Study
- Cinacalcet is predicted to slightly increase the exposure to darifenacin. [Mild] Study
- ► Cinacalcet might increase the risk of hypocalcaemia when given with denosumab. Severe Theoretical
- Cinacalcet is predicted to increase the exposure to eliglustat.
 Avoid or adjust dose—consult product literature. Severe Study
- ► Cinacalcet increases the risk of hypocalcaemia when given with etelcalcetide. Avoid. Severe Theoretical
- ► Cinacalcet is predicted to increase the exposure to
- fesoterodine. Use with caution and adjust dose. Mild Theoretical

 ► Cinacalcet is predicted to increase the exposure to gefitinib.
- Moderate Theoretical
- ► HIV-protease inhibitors are predicted to moderately increase the exposure to cinacalcet. Adjust dose. [Moderate] Study
- ► Idelalisib is predicted to moderately increase the exposure to cinacalcet. Adjust dose. Moderate Study
- ► Macrolides (clarithromycin) are predicted to moderately increase the exposure to cinacalcet. Adjust dose. Moderate Study
- Cinacalcet is predicted to increase the exposure to mexiletine.
 Moderate Study
- Mitotane is predicted to decrease the exposure to cinacalcet.
 Monitor and adjust dose. [Moderate] Study
- Cinacalcet is predicted to decrease the efficacy of opioids (codeine). [Moderate] Theoretical
- Cinacalcet is predicted to decrease the efficacy of opioids (tramadol). [Severe] Study

- Cinacalcet is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. Moderate Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. Moderate Study
- ► SSRIs (fluvoxamine) are predicted to increase the exposure to cinacalcet. Adjust dose. Moderate Theoretical
- Cinacalcet is predicted to increase the exposure to SSRIs (dapoxetine). [Moderate] Theoretical
- Cinacalcet is predicted to decrease the efficacy of tamoxifen.
 Avoid. Severel Study
- Cinacalcet is predicted to increase the exposure to the active metabolite of tetrabenazine. [Moderate] Study
- ► Cinacalcet is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. Severe
- Cinacalcet is predicted to increase the exposure to vortioxetine.
 Monitor and adjust dose. [Moderate] Study

Cinnarizine → see antihistamines, sedating

Ciprofibrate → see fibrates

Ciprofloxacin → see quinolones

Cisatracurium → see neuromuscular blocking drugs, non-depolarising

Cisplatin → see platinum compounds

Citalopram → see SSRIs

Cladribine → see TABLE 15 p. 1493 (myelosuppression)

SEPARATION OF ADMINISTRATION Oral cladribine might affect the absorption of concurrently administered drugs—consider separating administration by at least 3 hours.

- Antiepileptics (carbamazepine) are predicted to increase the risk of haematological toxicity when given with oral cladribine.
 Moderate Theoretical
- ➤ Calcium channel blockers (nifedipine, nimodipine) might increase the exposure to cladribine. Avoid or adjust dose. Moderate Theoretical
- ► Ciclosporin is predicted to increase the exposure to cladribine. Avoid or adjust dose. Moderate Theoretical
- Cilostazol might increases the exposure to cladribine. Avoid or adjust dose. [Moderate] Theoretical
- Dipyridamole might increases the exposure to cladribine.
 Moderate Theoretical
- ► Eltrombopag is predicted to increase the exposure to cladribine. Avoid or adjust dose. Moderate Theoretical
- ► HIV-protease inhibitors (ritonavir) might increase the exposure to cladribine. Moderate Theoretical
- ► Leflunomide is predicted to increase the exposure to cladribine. Avoid or adjust dose. Moderate Theoretical → Also see TABLE 15 p. 1493
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ► NSAIDs (sulindac) might increase the exposure to cladribine. Avoid or adjust dose. Moderate Theoretical
- ► Teriflunomide is predicted to increase the exposure to cladribine. Avoid or adjust dose. Moderate Theoretical

Clarithromycin → see macrolides

Clavulanate → see TABLE 1 p. 1490 (hepatotoxicity)

Clemastine → see antihistamines, sedating

Clindamycin

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **clindamycin**, the possibility of interactions should be borne in mind.

- ► Clindamycin increases the effects of neuromuscular blocking drugs, non-depolarising. Severe Anecdotal
- Clindamycin increases the effects of suxamethonium. Severe
 Anecdotal

Clobazam → see benzodiazepines

Clodronate → see bisphosphonates

Clofarabine → see TABLE 15 p. 1493 (myelosuppression)

 Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with clofarabine. UKHSA advises avoid (refer to Green Book).
 [Severe] Theoretical

Clofazimine

► Clofazimine potentially increases the risk of QT-prolongation when given with bedaquiline. Severe Study

Clomethiazole → see TABLE 11 p. 1492 (CNS depressant effects)

- ► Alcohol causes serious, potentially fatal, CNS depression when given with clomethiazole. Avoid. Severe Study → Also see TABLE 11 p. 1492
- ► Anti-androgens (apalutamide, enzalutamide) decrease the exposure to clomethiazole. Monitor and adjust dose. [Moderate] Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to clomethiazole. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 n. 1492
- ► Mitotane decreases the exposure to clomethiazole. Monitor and adjust dose. Moderate Study
- ► Rifamycins (rifampicin) decrease the exposure to clomethiazole. Monitor and adjust dose. Moderate Study

Clomipramine → see tricyclic antidepressants

Clonazepam → see benzodiazepines

Clonidine → see TABLE 6 p. 1491 (bradycardia), TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects)

- ► Tricyclic antidepressants decrease the antihypertensive effects of clonidine. Monitor and adjust dose. [Moderate] Anecdotal → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492
- Clopidogrel → see TABLE 4 p. 1490 (antiplatelet effects)
- Clopidogrel is predicted to increase the exposure to antiandrogens (apalutamide) and anti-androgens (apalutamide) are predicted to increase the exposure to the active metabolite of clopidogrel. Avoid or monitor. [Moderate] Study
- Clopidogrel moderately increases the exposure to antiandrogens (enzalutamide). Avoid or adjust enzalutamide dose, p. 1023. [Severe] Study
- ► Antifungals, azoles (fluconazole) are predicted to decrease the efficacy of clopidogrel. Avoid. [Severe] Theoretical
- Antifungals, azoles (voriconazole) are predicted to decrease the efficacy of clopidogrel. Avoid. Moderate Study
- Cobicistat is predicted to decrease the concentration of the active metabolite of clopidogrel. Avoid. Severe Theoretical
- Clopidogrel is predicted to increase the exposure to dabrafenib. Moderate Theoretical
- Grapefruit juice markedly decreases the exposure to clopidogrel. [Severe] Study
- HIV-protease inhibitors (ritonavir) might decrease the efficacy of clopidogrel. Avoid. Moderate Theoretical
- Clopidogrel increases the exposure to meglitinides (repaglinide).
 Avoid. | Severe | Study
- ► Moclobemide is predicted to decrease the efficacy of clopidogrel. Avoid. [Moderate] Study
- Clopidogrel is predicted to moderately increase the exposure to montelukast. Moderate Study
- ► Clopidogrel is predicted to increase the exposure to the active metabolites of ozanimod. [Moderate] Study
- ► Clopidogrel increases the exposure to pioglitazone. Monitor blood glucose and adjust dose. (Severe) Study
- Proton pump inhibitors (esomeprazole, omeprazole) are predicted to decrease the efficacy of clopidogrel. Avoid.
 [Moderate] Study
- ► Clopidogrel is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1356. Moderate

 Theoretical
- Rifamycins (rifampicin) moderately increase the exposure to the active metabolite of clopidogrel. Avoid. [Moderate] Study
- ► Clopidogrel is predicted to increase the exposure to selexipag.

 Adjust selexipag dose, p. 198. Moderate Study
- Selumetinib might increase the risk of bleeding when given with clopidogrel. Severe Theoretical
- ► SSRIs (fluoxetine, fluvoxamine) are predicted to decrease the efficacy of clopidogrel. Avoid. Severe Theoretical → Also see TABLE 4 p. 1490
- ► Clopidogrel increases the exposure to statins (rosuvastatin).

 Adjust rosuvastatin dose, p. 221. Moderate Study
- Clopidogrel is predicted to increase the concentration of taxanes (paclitaxel). [Severe] Anecdotal

Clopidogrel (continued)

- ► Clopidogrel is predicted to increase the exposure to treprostinil. Adjust dose. Moderate Theoretical → Also see TABLE 4 p. 1490
- ➤ Clopidogrel is predicted to increase the exposure to tucatinib. Avoid or adjust tucatinib dose, p. 1085. [Severe] Study

Clotrimazole → see antifungals, azoles

Clozapine → see antipsychotics, second generation **Cobicistat**

- Cobicistat is predicted to increase the exposure to abemaciclib.
 Avoid or adjust abemaciclib dose, p. 1042. Severe Study
- ► Cobicistat is predicted to increase the exposure to acalabrutinib. Avoid. Severe Study
- ► Cobicistat is predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. [Severe] Study
- Cobicistat is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- Cobicistat is predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to cobicistat. Avoid. Severel Study
- Cobicistat is predicted to increase the exposure to antiandrogens (apalutamide). Mild Study
- Cobicistat potentially increases the concentration of antiarrhythmics (amiodarone, disopyramide, flecainide, lidocaine). [Severe] Theoretical
- Cobicistat very markedly increases the exposure to antiarrhythmics (dronedarone). Avoid. Severe Study
- Cobicistat is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. Severe Study
- Cobicistat is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobicistat. Avoid. [Severe] Study
- ► Antiepileptics (eslicarbazepine, oxcarbazepine) are predicted to decrease the concentration of cobicistat. [Severe] Theoretical
- Cobicistat is predicted to very slightly increase the exposure to antiepileptics (perampanel). Mild Study
- Cobicistat is predicted to increase the exposure to antifungals, azoles (fluconazole, posaconazole). Moderate Theoretical
- Cobicistat is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor adverse effects.
- ► Cobicistat is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole). Adjust dose. Moderate

 Theoretical
- Cobicistat is predicted to affect the exposure to antifungals, azoles (voriconazole). Avoid. Moderate Theoretical
- Cobicistat is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. [Moderate] Study
- Cobicistat is predicted to increase the concentration of antimalarials (piperaquine). Severel Theoretical
- Cobicistat is predicted to slightly increase the exposure to antipsychotics, second generation (aripiprazole). Adjust aripiprazole dose. p. 427. [Moderate] Study
- Cobicistat is predicted to moderately increase the exposure to antipsychotics, second generation (cariprazine). Avoid. Severel
- Cobicistat is predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid.
 Severe Study
- Cobicistat is predicted to increase the exposure to antipsychotics, second generation (risperidone). Adjust dose.
 Moderate Study
- ► Cobicistat is predicted to increase the exposure to avapritinib.

 Avoid. Moderate Study
- ► Cobicistat is predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

- Cobicistat is predicted to increase the exposure to bedaquiline.
 Avoid prolonged use. Mild Study
- ► Cobicistat moderately increases the exposure to benzodiazepines (alprazolam). Avoid. [Moderate] Study
- ► Cobicistat is predicted to markedly to very markedly increase the exposure to benzodiazepines (midazolam). Avoid or adjust dose. [Severe] Study
- Cobicistat is predicted to increase the exposure to beta₂ agonists (salmeterol). Avoid. Severe Study
- Cobicistat slightly increases the exposure to bortezomib.
 Moderate Study
- Cobicistat is predicted to increase the exposure to bosutinib.
 Avoid or adjust dose. Severe Study
- ► Cobicistat is predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1048. Severe Study
- Cobicistat is predicted to increase the exposure to buspirone.
 Adjust buspirone dose, p. 373. Severe Study
- Cobicistat is predicted to increase the exposure to cabozantinib. [Moderate] Study
- Cobicistat is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate]
 Study
- Cobicistat is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- Cobicistat is predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. Severe Study
- Cobicistat is predicted to increase the exposure to cannabidiol.
 Avoid or adjust dose. Mild Study
- Cobicistat is predicted to increase the exposure to ceritinib.
 Avoid or adjust ceritinib dose, p. 1050. Severe Study
- Cobicistat increases the concentration of ciclosporin. Severe Study
- ► Cobicistat is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 252. [Moderate] Study
- ➤ Cobicistat is predicted to moderately increase the exposure to cinacalcet. Adjust dose. Moderate Study
- Cobicistat is predicted to decrease the concentration of the active metabolite of clopidogrel. Avoid. [Severe] Theoretical
- ► Cobicistat is predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. Severe Study
- ► Cobicistat is predicted to increase the exposure to colchicine. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1212. [Severe] Study
- Cobicistat is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. (Severe) Study
- Cobicistat is predicted to increase the exposure to corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate]
 Theoretical
- Cobicistat is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects.

 Severe) Study
- Cobicistat is predicted to affect the exposure to coumarins (warfarin). [Moderate] Theoretical
- ➤ Cobicistat is predicted to increase the exposure to crizotinib. Avoid. Moderate Study
- ► Dabrafenib is predicted to decrease the exposure to cobicistat. Avoid. <a>[Severe] Theoretical
- ► Cobicistat is predicted to increase the exposure to dabrafenib.

 Use with caution or avoid. [Moderate] Study
- Cobicistat is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to dasatinib.
 Avoid or adjust dose—consult product literature. [Severe] Study
- ► Cobicistat very slightly increases the exposure to delamanid.

 Severe Study
- Cobicistat is predicted to moderately increase the exposure to dienogest. [Moderate] Study
- ► Cobicistat is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Moderate] Study

- Cobicistat is predicted to increase the exposure to domperidone. Avoid. Severe Study
- Cobicistat increases the exposure to dopamine receptor agonists (bromocriptine). [Severe] Study
- Cobicistat is predicted to increase the concentration of dopamine receptor agonists (cabergoline). [Moderate] Anecdotal
- Cobicistat is predicted to increase the exposure to dronabinol.
 Adjust dose. Mild Study
- Cobicistat is predicted to increase the exposure to drospirenone. [Severe] Study
- Cobicistat is predicted to increase the exposure to dutasteride.
 Monitor adverse effects and adjust dose. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to elexacaftor.
 Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with potent CYP3A4 inhibitors. [Severe] Study
- Cobicistat is predicted to increase the exposure to eliglustat.
 Avoid or adjust dose—consult product literature. [Severe] Study
- ► Cobicistat is predicted to increase the exposure to encorafenib.

 Avoid or monitor. Severe Study
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- Cobicistat is predicted to increase the exposure to endothelin receptor antagonists (macitentan). [Moderate] Study
- ➤ Cobicistat is predicted to increase the exposure to entrectinib. Avoid potent CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. [Severe] Study
- Cobicistat is predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- ► Cobicistat is predicted to increase the risk of ergotism when given with ergotamine. Avoid. Severe Theoretical
- Cobicistat is predicted to increase the exposure to erlotinib.
 Use with caution and adjust dose. Severe Study
- Cobicistat is predicted to increase the exposure to esketamine.
 Adjust dose. Moderate Study
- Cobicistat is predicted to increase the concentration of subdermal etonogestrel. [Moderate] Theoretical
- ► Cobicistat is predicted to increase the exposure to everolimus.

 Avoid. Severe Study
- Cobicistat is predicted to increase the exposure to factor XA inhibitors (apixaban, edoxaban, rivaroxaban). Avoid. Severe
- ➤ Cobicistat is predicted to increase the exposure to fedratinib.

 Adjust fedratinib dose, but avoid depending on other drugs taken—consult product literature, p. 1060. [Moderate] Study
- ➤ Cobicistat is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 840. [Severe] Study
- Cobicistat is predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose.
 Moderate Study
- ► Cobicistat is predicted to increase the exposure to gefitinib.

 Severel Study
- Cobicistat is predicted to increase the exposure to gilteritinib.
 Moderate Study
- ► Cobicistat is predicted to increase the exposure to glasdegib.

 Use with caution or avoid. Severe Study
- Cobicistat potentially increases the exposure to glecaprevir.
 Moderate Theoretical
- Cobicistat is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. Severe Study
- ► Cobicistat is predicted to increase the exposure to guanfacine.

 Adjust guanfacine dose, p. 384. Moderate Study
- Cobicistat is predicted to increase the exposure to ibrutinib.
 Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose,
 p. 1062. [Severe] Study
- Cobicistat is predicted to increase the exposure to imatinib.
 Moderate Study
- Cobicistat is predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study
- ► Cobicistat is predicted to increase the exposure to ivabradine.

 Avoid. Severe Study
- ► Cobicistat is predicted to increase the exposure to ivacaftor. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 317, lumacaftor with ivacaftor p. 318, tezacaftor with

- ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. Severe Study
- Cobicistat is predicted to increase the exposure to lapatinib.
 Avoid. Moderate Study
- ► Cobicistat is predicted to moderately increase the exposure to larotrectinib. Avoid or adjust larotrectinib dose, p. 1065.

 Moderate | Study
- ► Cobicistat is predicted to markedly increase the exposure to lomitapide. Avoid. Severe Study
- Cobicistat is predicted to increase the exposure to lorlatinib.
 Avoid or adjust lorlatinib dose, p. 1067. Severe Study
- Cobicistat is predicted to increase the concentration of macrolides (erythromycin). [Moderate] Theoretical
- Cobicistat markedly increases the exposure to maraviroc. Refer to specialist literature. Severe Study
- Cobicistat is predicted to increase the concentration of intramuscular medroxyprogesterone. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to meglitinides (repaglinide). [Moderate] Study
- Cobicistat potentially increases the exposure to mexiletine.
 Severe Theoretical
- Cobicistat is predicted to increase the exposure to midostaurin.
 Avoid or monitor for toxicity. (Severe) Study
- Cobicistat is predicted to increase the exposure to mifepristone. Moderate Study
- ➤ Cobicistat is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 843. [Moderate] Study
- Cobicistat is predicted to increase the exposure to mirtazapine.
 Moderate Study
- Mitotane is predicted to decrease the exposure to cobicistat.
 Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to modafinil.
 [Mild] Theoretical
- Cobicistat is predicted to increase the exposure to monoclonal antibodies (polatuzumab vedotin). [Moderate] Theoretical
- ► Cobicistat is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical
- Cobicistat is predicted to increase the exposure to naldemedine. Avoid or monitor. Moderate Study
- ► Cobicistat is predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
- ► Cobicistat is predicted to increase the exposure to neratinib. Avoid potent CYP3A4 inhibitors or adjust neratinib dose, p. 1069. [Severe] Study
- Cobicistat is predicted to markedly increase the exposure to neurokinin-1 receptor antagonists (aprepitant). [Moderate] Study
- ► Cobicistat is predicted to increase the exposure to neurokinin-1
- receptor antagonists (fosaprepitant). Moderate Theoretical

 ➤ Cobicistat is predicted to increase the exposure to neurokinin-1 receptor antagonists (netupitant). [Moderate] Study
- ► Cobicistat is predicted to increase the exposure to nilotinib.

 Avoid. | Severe | Study |
- Cobicistat is predicted to increase the exposure to nintedanib.
 Moderate Theoretical
- Cobicistat is predicted to increase the exposure to nitisinone.
 Adjust dose. Moderate Theoretical
- NNRTIS (defavirenz, nevirapine) are predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- Cobicistat is predicted to increase the exposure to olaparib.
 Avoid potent CYP3A4 inhibitors or adjust olaparib dose,
 p. 1088. Moderate Study
- Cobicistat is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Severe] Study
- Cobicistat is predicted to increase the exposure to osilodrostat.
 Moderate Theoretical
- Cobicistat is predicted to increase the exposure to ospemifene.
 Avoid in poor CYP2C9 metabolisers. [Moderate] Study
- Cobicistat is predicted to increase the exposure to oxybutynin.
 Mild Study
- ► Cobicistat is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 1072. [Severe] Study

Cobicistat (continued)

- ► Cobicistat is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 1009. Moderate Study
- Cobicistat is predicted to increase the exposure to pazopanib.
 Avoid or adjust pazopanib dose, p. 1073. [Moderate] Study
- Cobicistat is predicted to increase the exposure to pemigatinib.
 Avoid or adjust pemigatinib dose, p. 1074. Severe Study
- Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent CYP3A4 inhibitors or adjust sildenafil dose, p. 879. [Severe] Study
- Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. Severe Study
- Cobicistat is predicted to increase the exposure to pimozide.
 Avoid. [Severe] Study
- Cobicistat is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 1075. Moderate Study
- Cobicistat is predicted to moderately increase the exposure to praziquantel. Mild Study
- Cobicistat given with carbimazole is predicted to increase the exposure to propiverine. Adjust starting dose. Moderate Theoretical
- ► Cobicistat is predicted to increase the exposure to ranolazine.

 Avoid. Severe Study
- Cobicistat is predicted to increase the exposure to reboxetine.
 Avoid. Moderate Study
- ► Cobicistat is predicted to increase the exposure to regorafenib.

 Avoid. Moderate Study
- ➤ Cobicistat is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1356. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to ribociclib.
 Avoid or adjust ribociclib dose, p. 1077. [Moderate] Study
- Rifamycins (rifabutin) decrease the concentration of cobicistat and cobicistat increases the exposure to rifamycins (rifabutin).
 Avoid or adjust dose. Severel Study
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to cobicistat. Avoid. [Severe] Study
- ➤ Cobicistat is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor adverse effects. [Moderate] Study
- Cobicistat is predicted to increase the exposure to selpercatinib. Adjust selpercatinib dose, p. 1079. [Moderate] Study
- ► Cobicistat is predicted to increase the exposure to selumetinib.

 Avoid or adjust dose—consult product literature. [Severe] Study
- ➤ Cobicistat is predicted to increase the exposure to siponimod. Avoid depending on other drugs taken—consult product literature. [Severe] Theoretical
- ► Cobicistat is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- ► Cobicistat is predicted to increase the exposure to SNRIs (venlafaxine). Moderate Study
- Cobicistat is predicted to increase the exposure to solifenacin.
 Adjust solifenacin p. 842 or tamsulosin with solifenacin p. 848 dose; avoid in hepatic and renal impairment. Severe Study
- Cobicistat is predicted to increase the exposure to SSRIs (citalopram, escitalopram, fluoxetine, fluoxamine, paroxetine, sertraline). Monitor and adjust dose. [Moderate] Theoretical
- ► Cobicistat is predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid potent CYP3A4 inhibitors or adjust dapoxetine dose, p. 887. [Severe] Study
- St John's wort is predicted to decrease the exposure to cobicistat. Avoid. Severe Theoretical
- Cobicistat is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. Severe) Study
- ► Cobicistat is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to sunitinib.
 Avoid or adjust sunitinib dose, p. 1080. [Moderate] Study

- ► Cobicistat is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. Severe Study
- ► Cobicistat is predicted to increase the exposure to talazoparib.

 Avoid or adjust talazoparib dose, p. 1091. [Moderate] Theoretical
- ➤ Cobicistat is predicted to increase the exposure to taxanes (cabazitaxel). Avoid or monitor—consult product literature.

 [Severe] Study
- ► Cobicistat is predicted to increase the exposure to taxanes (docetaxel). Avoid or adjust dose. Severe Study
- Cobicistat is predicted to increase the exposure to taxanes (paclitaxel). Moderate Anecdotal
- Cobicistat is predicted to increase the concentration of temsirolimus. Avoid. Severe Theoretical
- Cobicistat is predicted to increase the exposure to tezacaftor. Adjust dose with potent CYPSA4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320. [Severe] Study
- Cobicistat moderately increases the exposure to thrombin inhibitors (dabigatran). Avoid. [Severe] Study
- ➤ Cobicistat is predicted to markedly increase the exposure to ticagrelor. Avoid. Severe Study
- ► Cobicistat is predicted to increase the exposure to tofacitinib.

 Adjust tofacitinib dose, p. 1200. [Moderate] Study
- Adjust toractining dose, p. 1200. [Moderate] Study
 Cobicistat is predicted to increase the exposure to tolterodine.
 Avoid. [Severe] Study
- ➤ Cobicistat is predicted to increase the exposure to tolvaptan.

 Manufacturer advises caution or adjust tolvaptan dose with potent CYP3A4 inhibitors, p. 724. [Severe] Study
- Cobicistat is predicted to increase the exposure to toremifene.
 Moderate | Theoretical
- Cobicistat is predicted to increase the exposure to trabectedin.
 Avoid or adjust dose. Severe Theoretical
- ► Cobicistat is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. [Moderate] Study
- Cobicistat is predicted to slightly increase the exposure to tricyclic antidepressants. Mild Study
- Cobicistat increases the exposure to triptans (almotriptan). [Mild]
 Study
- ► Cobicistat is predicted to markedly increase the exposure to triptans (eletriptan). Avoid. [Severe] Study
- ► Cobicistat is predicted to increase the exposure to ulipristal.

 Avoid if used for uterine fibroids. Severe Study
- ► Cobicistat is predicted to increase the exposure to upadacitinib. Use with caution or avoid. Severe Study
- ► Cobicistat is predicted to increase the exposure to vemurafenib. Severe Theoretical
- Cobicistat is predicted to increase the exposure to venetoclax.
 Avoid or adjust dose—consult product literature. Severel Study
- Cobicistat is predicted to increase the exposure to vinca alkaloids. Severel Theoretical
- ► Cobicistat is predicted to increase the exposure to vitamin D substances (paricalcitol). Moderate Study
- Cobicistat is predicted to increase the exposure to zopiclone.
 Adjust dose. Moderate Theoretical

obimetinib

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to cobimetinib. Avoid. Severe Theoretical
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to cobimetinib. (Severe) Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobimetinib. Avoid. Severe Theoretical
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to cobimetinib. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. Severe Study
- ► Antifungals, azoles (miconazole) are predicted to increase the exposure to cobimetinib. Severe Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cobimetinib. [Severe] Study
- ► Cenobamate is predicted to decrease the exposure to cobimetinib. Adjust dose. Moderate Theoretical

- ➤ Cobicistat is predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. Severe Study
- ► Crizotinib is predicted to increase the exposure to cobimetinib.

 Severe Study
- ▶ Dabrafenib is predicted to decrease the exposure to cobimetinib. Avoid. Severe Theoretical
- ▶ Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can cobimetinib; concurrent use might increase the risk of developing this effect. [Severe] Theoretical
- Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can cobimetinib; concurrent use might increase the risk of developing this effect. [Severe] Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to cobimetinib. Avoid. Severe Theoretical
- ► Grapefruit juice is predicted to increase the exposure to cobimetinib. Avoid. Severe Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. Severe Study
- ► Idelalisib is predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. Severe Study
- ► Imatinib is predicted to increase the exposure to cobimetinib. Severe Study
- ► Letermovir is predicted to increase the exposure to cobimetinib. Severe Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to cobimetinib. Severe Study
- Mitotane is predicted to decrease the exposure to cobimetinib.
 Avoid. Severe Theoretical
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to cobimetinib. [Severe] Study
- ► Nilotinib is predicted to increase the exposure to cobimetinib.

 Severe Study
- NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to cobimetinib. Avoid. Severel Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- St John's wort is predicted to decrease the exposure to cobimetinib. Avoid. Severe Theoretical

Codeine → see opioids

Colchicine

- Anti-androgens (apalutamide) are predicted to decrease the exposure to colchicine. [Mild] Study
- Antiarrhythmics (amiodarone) are predicted to increase the exposure to colchicine. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1212. [Severe] Theoretical
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212. Severel Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212.
 Severe Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to colchicine. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1212. Severe study.
- Berotralstat is predicted to increase the concentration of colchicine. Monitor and adjust dose. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212. Severe Study
- ► Ceritinib is predicted to increase the exposure to colchicine.

 [Moderate] Theoretical
- ► Ciclosporin increases the exposure to colchicine. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1212. Severe Study
- ➤ Cobicistat is predicted to increase the exposure to colchicine. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1212. Severe Study
- ► Crizotinib is predicted to increase the exposure to colchicine.
 Adjust colchicine dose with moderate CYP3A4 inhibitors,
 p. 1212. [Severe] Study

- ► Eliglustat is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1212. Severe Theoretical
- ► Colchicine increases the risk of rhabdomyolysis when given with fibrates. Severe Anecdotal
- HIV-protease inhibitors are predicted to increase the exposure to colchicine. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1212. [Severe] Study
- ► Ibrutinib is predicted to increase the exposure to colchicine. Separate administration by at least 6 hours. [Moderate] Theoretical
- ► Idelalisib is predicted to increase the exposure to colchicine. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1212. [Severe] Study
- ► Imatinib is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212. [Severe] Study
- Ivacaftor is predicted to increase the exposure to colchicine.
 Moderate Study
- ► Lapatinib is predicted to increase the exposure to colchicine. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1212. [Moderate] Theoretical
- ► Letermovir is predicted to increase the exposure to colchicine.

 Adjust colchicine dose with moderate CYP3A4 inhibitors,
 p. 1212. [Severe] Study
- Lorlatinib is predicted to decrease the exposure to colchicine.
 Moderatel Study
- Macrolides (azithromycin) are predicted to increase the exposure to colchicine. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1212. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to colchicine. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1212. Severe Study
- ► Macrolides (erythromycin) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212. [Severe] Study
- Mirabegron is predicted to increase the exposure to colchicine.
 Mild | Theoretical
- Neratinib is predicted to increase the exposure to colchicine.
 Moderate Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212.
 Severel Study
- ➤ Nilotinib is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212. [Severe] Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of colchicine. Avoid. Severe Theoretical
 Olaparib might increase the exposure to colchicine. [Moderate]
- Theoretical
- Osimertinib is predicted to increase the exposure to colchicine.
 Moderate Study
- ► Pemigatinib might increase the exposure to colchicine. Separate administration by at least 6 hours. Moderate Theoretical
- ► Pibrentasvir with glecaprevir is predicted to increase the exposure to colchicine. Moderate Study
- Pitolisant is predicted to decrease the exposure to colchicine.
 Mild Theoretical
- ► Ranolazine is predicted to increase the exposure to colchicine. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1212. [Severe] Theoretical
- ► Sotorasib is predicted to increase the exposure to colchicine. Avoid or adjust dose. [Moderate] Study
- Colchicine has been reported to cause rhabdomyolysis when given with statins. Severe Anecdotal
- Tepotinib is predicted to increase the concentration of colchicine. Severe Study
- ► Tucatinib is predicted to increase the exposure to colchicine. Use with caution and adjust dose. Moderate Theoretical
- ► Vandetanib is predicted to increase the exposure to colchicine.

 [Moderate] Study
- ► Velpatasvir is predicted to increase the exposure to colchicine.

 Severe| Theoretical

Colchicine (continued)

- Vemurafenib is predicted to increase the exposure to colchicine. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1212. Severe Theoretical
- ► Venetoclax is predicted to increase the exposure to colchicine.

 Avoid or adjust dose. Severe Study

Colecalciferol → see vitamin D substances

Colesevelam

SEPARATION OF ADMINISTRATION Manufacturer advises take 4 hours before, or after, other drugs.

Colestipol

SEPARATION OF ADMINISTRATION Manufacturer advises take other drugs at least 1 hour before, or 4 hours after, colestipol.

Colestyramine

SEPARATION OF ADMINISTRATION Manufacturer advises take other drugs at least 1 hour before, or 4–6 hours after, colestyramine.

Colistimethate → see TABLE 2 p. 1490 (nephrotoxicity), TABLE 20 p. 1494 (neuromuscular blocking effects)

Combined hormonal contraceptives

- Combined hormonal contraceptives is predicted to increase the exposure to agomelatine. [Moderate] Study
- Combined hormonal contraceptives is predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Combined hormonal contraceptives is predicted to increase the exposure to anaesthetics, local (ropivacaine). [Moderate]
 Theoretical
- ► Combined hormonal contraceptives is predicted to increase the exposure to anagrelide. [Moderate] Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Study
- Combined hormonal contraceptives alter the exposure to antiepileptics (lamotrigine) and antiepileptics (lamotrigine) might decrease the efficacy of combined hormonal contraceptives.
 Adjust dose. [Moderate] Study
- ► Combined hormonal contraceptives increases the concentration of antipsychotics, second generation (clozapine). Monitor adverse effects and adjust dose. [Severe] Study
- Combined hormonal contraceptives is predicted to increase the exposure to antipsychotics, second generation (olanzapine).
 Adjust dose. [Moderate] Anecdotal
- Brigatinib is predicted to decrease the exposure to combined hormonal contraceptives. Use additional contraceptive precautions. Severe Theoretical
- ► Cabozantinib might affect the effects of combined hormonal contraceptives. Use additional contraceptive precautions.

 [Severe] Theoretical
- ► Carfilzomib potentially decreases the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. Severe Theoretical
- ► Cenobamate might decrease the efficacy of oral combined hormonal contraceptives. Use additional contraceptive precautions. [Severe] Theoretical
- ➤ Oral combined hormonal contraceptives potentially decrease the efficacy of oral chenodeoxycholic acid. Avoid. [Moderate] Theoretical
- Cobicistat is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Study
- Dabrafenib is predicted to decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. Severel Theoretical
- Combined hormonal contraceptives is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. [Moderate] Study
- ► Encorafenib is predicted to affect the exposure to combined hormonal contraceptives. Severe Theoretical
- Endothelin receptor antagonists (bosentan) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. Severel Study

- ► Combined hormonal contraceptives are predicted to increases the exposure to erlotinib. Monitor adverse effects and adjust dose. [Moderate Study
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with glecaprevir. Avoid. [Severe] Study
- ► Griseofulvin potentially decreases the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Anecdotal
- ► HIV-protease inhibitors (atazanavir) affect the exposure to combined hormonal contraceptives. Adjust dose. Severe Study
- ► HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Study
- ► Larotrectinib potentially decreases the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. Severe Theoretical
- ► Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with lenalidomide. Avoid. Severe Theoretical
- ➤ Oral combined hormonal contraceptives slightly increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- ► Lorlatinib is predicted to decrease the exposure to combined hormonal contraceptives. Avoid. [Moderate] Theoretical
- ► Combined hormonal contraceptives is predicted to increase the exposure to loxapine. Avoid. Unknown Theoretical
- ► Lumacaftor is predicted to decrease the exposure to combined hormonal contraceptives. Use additional contraceptive precautions. [Severe] Theoretical
- Combined hormonal contraceptives slightly increases the exposure to MAO-B inhibitors (rasagiline). [Moderate] Study
- ► Combined hormonal contraceptives increase the exposure to MAO-B inhibitors (selegiline). Avoid. Severe Study
- Combined hormonal contraceptives is predicted to increase the exposure to melatonin. Moderate Theoretical
- ► Metreleptin might decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions.

 [Severe] Theoretical
- Combined hormonal contraceptives decrease the effects of metyrapone. Avoid. [Moderate] Theoretical
- ➤ Modafinil is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Study
- Monoclonal antibodies (sarilumab) potentially decrease the exposure to combined hormonal contraceptives. Severe Theoretical
- ➤ Neratinib might affect the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions.

 [Severe] Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Study
- Nirmatrelvir boosted with ritonavir is predicted to decrease the concentration of combined hormonal contraceptives (containing ethinylestradiol). Use additional contraceptive precautions. [Moderate] Theoretical
- ► NNRTIs (efavirenz, nevirapine) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Study
- ► NSAIDs (etoricoxib) increase the exposure to combined hormonal contraceptives. [Moderate] Study
- ► Olaparib potentially affects the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions.

 Moderate | Theoretical
- ► Combined hormonal contraceptives potentially oppose the effects of ospemifene. Avoid. Severe Theoretical
- Combined hormonal contraceptives is predicted to increase the exposure to phenothiazines (chlorpromazine). Moderate Theoretical
- Combined hormonal contraceptives is predicted to increase the exposure to phosphodiesterase type-4 inhibitors (roflumilast).
 Moderate Theoretical

- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with pibrentasvir. Avoid. [Severe] Study
- ► Combined hormonal contraceptives is predicted to increase the exposure to pirfenidone. Use with caution and adjust dose.

 Moderate Study
- ► Pitolisant is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical
- Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with pomalidomide. Avoid. [Severe] Theoretical
- ► Ponatinib might affect the effects of combined hormonal contraceptives. Avoid or use additional contraceptive precautions. Severe Theoretical
- Combined hormonal contraceptives potentially oppose the effects of raloxifene. Avoid. Severe Theoretical
- ▶ Rifamycins are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Study
- Combined hormonal contraceptives is predicted to increase the exposure to riluzole. [Moderate] Theoretical
- St John's wort decreases the efficacy of combined hormonal contraceptives. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 859. Severel Anecdotal
- ➤ Sugammadex is predicted to decrease the exposure to combined hormonal contraceptives. Refer to patient information leaflet for missed pill advice. Severe Theoretical
- Combined hormonal contraceptives might exacerbate skin pigmentation when given with tetracyclines (minocycline).
 Moderate Anecdotal
- Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with thalidomide. Avoid. Severe Study
- ► Combined hormonal contraceptives is predicted to increase the exposure to theophylline. Monitor and adjust dose. Moderate

 Theoretical
- ► Combined hormonal contraceptives increases the exposure to tizanidine. Avoid. Moderate Study
- ➤ Combined hormonal contraceptives is predicted to increase the exposure to triptans (zolmitriptan). Adjust zolmitriptan dose, p. 515. [Moderate] Theoretical
- Combined hormonal contraceptives might decrease the efficacy
 of ulipristal and ulipristal might decrease the efficacy of
 combined hormonal contraceptives. Avoid or use additional
 contraceptive precautions. [Severe] Theoretical
- ▶ Vemurafenib might decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. Severe Theoretical
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with voxilaprevir with sofosbuvir and velpatasvir. Avoid. [Severe] Study

Corticosteroids → see TABLE 17 p. 1494 (reduced serum potassium)

beclometasone · betamethasone · budesonide · ciclesonide · deflazacort · dexamethasone · fludrocortisone · fluticasone · hydrocortisone · methylprednisolone · mometasone · prednisolone · triamcinolone

- ▶ With intravitreal use of **dexamethasone** in adults: caution with concurrent administration of anticoagulant or antiplatelet drugs—increased risk of haemorrhagic events.
- Interactions do not generally apply to corticosteroids (except budesonide and fluticasone) used for topical action (including inhalation) unless specified. However, as systemic absorption might occur with hydrocortisone eye drops, the possibility of interactions should be borne in mind
- ► Oral antacids are predicted to decrease the absorption of oral deflazacort. Separate administration by 2 hours. [Moderate]

 Theoretical
- Oral antacids decrease the absorption of oral dexamethasone.
 Moderate Study

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to fluticasone. Unknown Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. [Moderate] Study
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose.

 Moderate Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fluticasone. Unknown Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose.
 Moderatel Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to methylprednisolone.
 Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- Antifungals, azoles (miconazole) are predicted to increase the concentration of methylprednisolone. Monitor and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects. [Severe] Study
- Corticosteroids are predicted to decrease the concentration of aspirin (high-dose) and aspirin (high-dose) increases the risk of gastrointestinal bleeding when given with corticosteroids. [Moderate] Study
- ► Dexamethasone is predicted to decrease the exposure to avapritinib. Avoid. Severe Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study
- ➤ Dexamethasone is predicted to decrease the concentration of caspofungin. Adjust caspofungin dose, p. 646. Moderate Theoretical
- ► Cenobamate is predicted to decrease the exposure to oral budesonide. Adjust dose. [Moderate] Theoretical
- ► Cenobamate is predicted to decrease the exposure to fluticasone. Adjust dose. [Moderate] Theoretical
- ► Corticosteroids are predicted to decrease the concentration of choline salicylate. Moderate Study
- ➤ Cobicistat is predicted to increase the exposure to beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). Moderate Theoretical
- Cobicistat is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects.
 [Severe] Study
- Corticosteroids are predicted to increase the effects of coumarins. [Moderate] Study
- ▶ Crizotinib is predicted to increase the exposure to
- methylprednisolone. Monitor and adjust dose. Moderate Study
 ► Erlotinib is predicted to increase the risk of gastrointestinal
- perforation when given with corticosteroids. Severe Theoretical
- Corticosteroids potentially oppose the effects of glycerol phenylbutyrate. [Moderate] Theoretical
- ► Grapefruit juice moderately increases the exposure to oral budesonide. Avoid. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). Moderate Theoretical

Corticosteroids (continued)

- HIV-protease inhibitors are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). Moderate Theoretical
- ► Idelalisib is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects. [Severe] Study
- ► Imatinib is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study
- Corticosteroids are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). Severe Theoretical
- ▶ Letermovir is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. Moderate Study
- ► Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with corticosteroids (high-dose). UKHSA advises avoid (refer to Green Book). [Severe] Theoretical
- Lumacaftor is predicted to decrease the exposure to methylprednisolone. Adjust dose. Severe Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate]
- ► Macrolides (erythromycin) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose.

 Moderate Study
- ➤ Macrolides (clarithromycin) are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects.

 Severe Study
- ► Corticosteroids are predicted to decrease the efficacy of mifamurtide. Avoid. Severe Theoretical
- Mifepristone is predicted to decrease the efficacy of corticosteroids. Use with caution and adjust dose. [Moderate]

 Theoretical
- Mitotane is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose.

 Moderate | Study
- ► Mitotane is predicted to decrease the exposure to fluticasone.

 Unknown Theoretical
- ➤ Corticosteroids (betamethasone, deflazacort, dexamethasone, hydrocortisone, methylprednisolone, prednisolone) are predicted to decrease the efficacy of monoclonal antibodies (atezolizumab, ipilimumab, nivolumab, pembrolizumab). Use with caution or avoid. [Severe] Theoretical
- Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate]

 Theoretical
- Corticosteroids are predicted to increase the risk of immunosuppression when given with monoclonal antibodies (dinutuximab). Avoid except in life-threatening situations.
 Severe Theoretical
- Neurokinin-1 receptor antagonists (aprepitant) moderately increase the exposure to dexamethasone. Monitor and adjust dose. [Moderate] Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to oral budesonide.
 Moderate Study

- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to fluticasone. Moderate Study
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (netupitant) moderately increase the exposure to dexamethasone. Adjust dose. Moderate Study
- ➤ Corticosteroids are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. Severe Anecdotal
- ► Corticosteroids increase the risk of gastrointestinal perforation when given with nicorandil. Severe Anecdotal
- Nilotinib is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. Moderate Study
- ► Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). Moderate

 | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Moderate | Modera
- ➤ Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects and consider beclomethasone as an alternative. [Severe]
- ➤ Dexamethasone is predicted to decrease the concentration of NNRTIS (rilpivirine). Avoid multiple-dose dexamethasone.

 [Severe] Theoretical
- ► NSAIDs increase the risk of gastrointestinal bleeding when given with corticosteroids. Severe Study
- Corticosteroids are predicted to increase the effects of phenindione. [Moderate] Anecdotal
- ▶ Dexamethasone decreases the exposure to praziquantel. [Moderate] Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to fluticasone. [Unknown] Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose.
 Moderatel Study
- ► Corticosteroids potentially decrease the effects of sodium phenylbutyrate. Moderate Anecdotal
- Corticosteroids are predicted to decrease the effects of somatropin. [Moderate] Theoretical
- Corticosteroids are predicted to decrease the effects of suxamethonium. Severel Anecdotal

Coumarins → see TABLE 3 p. 1490 (anticoagulant effects)

acenocoumarol · warfarin

FOOD AND LIFESTYLE The effects of coumarins can be reduced or abolished by vitamin K, including that found in health foods, food supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control. Pomegranate juice is predicted to increase the INR in response to acenocoumarol and warfarin.

- Alcohol (in those who drink heavily) potentially decreases the anticoagulant effect of coumarins. Severe Study
- Alpelisib is predicted to decrease the efficacy of warfarin.
 Moderate Theoretical
- Anti-androgens (apalutamide) are predicted to decrease the exposure to coumarins. Avoid or monitor. [Mild] Study
- ► Anti-androgens (enzalutamide) potentially decrease the exposure to coumarins. Avoid or adjust dose and monitor INR. [Severe] Study
- ► Antiarrhythmics (amiodarone) increase the anticoagulant effect of coumarins. [Severe] Study
- ► Antiarrhythmics (propafenone) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine) decrease the effects of coumarins. Monitor and adjust dose. Severe Study
- ► Antiepileptics (fosphenytoin, phenytoin) are predicted to alter the anticoagulant effect of coumarins. [Moderate] Anecdotal
- ► Antiepileptics (phenobarbital, primidone) decrease the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate] Study
- ► Antifungals, azoles (fluconazole) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. Severe Study
- Antifungals, azoles (itraconazole) potentially increase the anticoagulant effect of coumarins. Severe Anecdotal
- Antifungals, azoles (ketoconazole) potentially increase the anticoagulant effect of warfarin. Monitor INR and adjust dose.
 Severe Anecdotal
- Antifungals, azoles (miconazole) greatly increase the anticoagulant effect of coumarins. MHRA advises avoid unless INR can be monitored closely; monitor for signs of bleeding.
 Severe Study
- ► Antifungals, azoles (voriconazole) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. Moderate Study
- Azathioprine decreases the anticoagulant effect of coumarins.
 Moderate Study
- ► Capecitabine increases the effects of coumarins. Monitor INR and adjust dose. [Moderate] Anecdotal
- Cephalosporins (cefazolin, ceftriaxone) potentially increase the risk of bleeding events when given with coumarins. Severel
- Ceritinib is predicted to increase the exposure to acenocoumarol. (Severe) Theoretical
- ► Ceritinib is predicted to increase the exposure to warfarin.

 Avoid. Severe Theoretical
- Chloramphenicol potentially increases the anticoagulant effect of coumarins. Moderate Anecdotal
- ► Cobicistat is predicted to affect the exposure to warfarin.

 Moderate Theoretical
- Corticosteroids are predicted to increase the effects of coumarins. [Moderate] Study
- Cranberry juice potentially increases the anticoagulant effect of warfarin. Avoid. Severe Anecdotal
- ► Crizotinib is predicted to increase the risk of bleeding events when given with coumarins. Severe Theoretical
- ▶ Dabrafenib is predicted to decrease the anticoagulant effect of coumarins. Severe Theoretical
- Disulfiram increases the anticoagulant effect of coumarins.
 Monitor and adjust dose. Severe Study
- Elvitegravir is predicted to decrease the anticoagulant effect of coumarins. [Moderate] Anecdotal
- ► Endothelin receptor antagonists (bosentan) decrease the anticoagulant effect of coumarins. Moderate Study
- ► Enteral feeds (vitamin-K containing) potentially decrease the anticoagulant effect of coumarins. <a>[Severe] Anecdotal
- ► Erlotinib increases the anticoagulant effect of coumarins.

 Severel Anecdotal
- ► Fibrates are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. Severe Study
 ► Fluorouracil increases the anticoagulant effect of coumarins.
- Fluorouracil increases the anticoagulant effect of coumarins
 Severe Anecdotal
- Fostamatinib potentially alters the anticoagulant effect of warfarin. Moderate Theoretical
- ► Gefitinib is predicted to increase the anticoagulant effect of coumarins. [Severe] Anecdotal
- ► Glucagon increases the anticoagulant effect of warfarin. Severe Study
- ► Glucosamine potentially decreases the anticoagulant effect of acenocoumarol. [Moderate] Anecdotal
- Glucosamine potentially increases the anticoagulant effect of warfarin. Avoid. [Moderate] Anecdotal
- ► Griseofulvin potentially decreases the anticoagulant effect of coumarins. [Moderate] Anecdotal
- ► H₂ receptor antagonists (cimetidine) increase the anticoagulant effect of coumarins. [Severe] Study
- ► HIV-protease inhibitors are predicted to affect the anticoagulant effect of coumarins. Moderate Study

- ► Imatinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- Ivacaftor is predicted to increase the exposure to warfarin.
 Moderate Theoretical
- Ivermectin potentially increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- ► Lapatinib is predicted to increase the risk of bleeding events when given with coumarins. Severe | Theoretical
- ► Leflunomide increases the anticoagulant effect of coumarins.

 Severe Anecdotal
- ► Letermovir is predicted to decrease the concentration of warfarin. Monitor and adjust dose. Moderate Theoretical
- ► Lomitapide increases the exposure to warfarin. Monitor INR and adjust dose. [Severe] Study
- ► Lorlatinib is predicted to decrease the exposure to coumarins.

 Moderate Theoretical
- ➤ Macrolides (clarithromycin, erythromycin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. Severel Anecdotal
- Mercaptopurine decreases the anticoagulant effect of coumarins. [Moderate] Anecdotal
- Metreleptin might alter the exposure to warfarin. Monitor INR and adjust dose. Severe Theoretical
- Metronidazole increases the anticoagulant effect of coumarins.
 Monitor INR and adjust dose. Severe Study
- Mexiletine potentially affects the exposure to warfarin. Avoid.
 [Unknown] Theoretical
- Mifepristone is predicted to increase the exposure to warfarin.
 Moderate Theoretical
- Monoclonal antibodies (bimekizumab) might affect the exposure to warfarin. [Moderate] Theoretical
- ► Monoclonal antibodies (blinatumomab) are predicted to transiently increase the exposure to warfarin. Monitor and adjust dose. Moderate Theoretical
- ► Monoclonal antibodies (sarilumab) potentially affect the exposure to warfarin. Monitor and adjust dose. Severe Theoretical
- ► Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to warfarin. Monitor and adjust dose. [Moderate]

 Theoretical
- Nandrolone is predicted to increase the anticoagulant effect of coumarins. Monitor and adjust dose. Severe Theoretical
- Neurokinin-1 receptor antagonists (aprepitant) decrease the anticoagulant effect of coumarins. [Moderate] Study
- ► Neurokinin-1 receptor antagonists (fosaprepitant) are predicted to decrease the anticoagulant effect of coumarins. Moderate Theoretical
- ► Nilotinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to affect the concentration of warfarin. [Moderate] Theoretical
- Nitisinone is predicted to increase the exposure to warfarin.
 Moderate Study
- NNRTIs (efavirenz) are predicted to affect the concentration of coumarins. Adjust dose. Moderate Theoretical
- ► NNRTIs (etravirine) increase the anticoagulant effect of coumarins. Moderate Theoretical
- ► NNRTIs (nevirapine) potentially alter the anticoagulant effect of coumarins. [Severe] Anecdotal
- ► Obeticholic acid decreases the anticoagulant effect of warfarin. Severe Study
- ➤ Oxymetholone increases the anticoagulant effect of coumarins. Severe Anecdotal
- Paracetamol increases the anticoagulant effect of coumarins.
 Moderate Study
- Pazopanib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- ► Penicillins potentially alter the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Anecdotal
- ► Pitolisant is predicted to decrease the exposure to warfarin.

 Mild Theoretical
- ► Quinolones increase the anticoagulant effect of coumarins. Severel Anecdotal
- ► Ranibizumab increases the risk of bleeding events when given with coumarins. Severe Theoretical

Coumarins (continued)

- ► Rifamycins (rifabutin) might decrease the anticoagulant effect of coumarins. [Moderate] Theoretical
- ► Rifamycins (rifampicin) decrease the anticoagulant effect of coumarins. Severe Study
- ► Rifaximin has been reported to decrease the anticoagulant effect of warfarin. Monitor INR and adjust dose. Severe

 Anecdotal
- Rucaparib slightly increases the exposure to warfarin. Monitor and adjust dose. [Severe] Study
- ➤ Selumetinib might increase the risk of bleeding when given with coumarins. Severe Theoretical
- ► Sorafenib increases the anticoagulant effect of coumarins.

 Severel Anecdotal
- St John's wort decreases the anticoagulant effect of coumarins.
 Avoid. (Severe) Anecdotal
- Statins (fluvastatin, rosuvastatin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. Severe Study
- ► Sucralfate potentially decreases the effects of warfarin. Separate administration by 2 hours. [Moderate] Anecdotal
- ► Sulfonamides (sulfadiazine) are predicted to increase the anticoagulant effect of coumarins. Severe Theoretical
- ➤ Sulfonamides (sulfamethoxazole) increase the anticoagulant effect of coumarins. Severe Study
- ► Tamoxifen increases the anticoagulant effect of coumarins.

 Severe Study
- ► Tegafur increases the anticoagulant effect of coumarins. [Moderate] Theoretical
- ► Teriflunomide affects the anticoagulant effect of coumarins.

 Severel Study
- ► Tetracyclines increase the anticoagulant effect of coumarins.

 Severe Anecdotal
- Tigecycline is predicted to alter the anticoagulant effect of coumarins. [Moderate] Anecdotal
- Tofacitinib is predicted to increase the risk of bleeding when given with coumarins. Severe Theoretical
 Toremifene is predicted to increase the anticoagulant effect of
- coumarins. Severe Theoretical
- Trimethoprim is predicted to increase the anticoagulant effect of coumarins. Severe Study
- Vemurafenib is predicted to increase the exposure to coumarins. Moderate Study
- Venetoclax slightly increases the exposure to warfarin.
 Moderate Study

Cranberry

 Cranberry juice potentially increases the anticoagulant effect of coumarins (warfarin). Avoid. [Severe] Anecdotal

Crisantaspase → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 15 p. 1493 (myelosuppression)

- ► Crisantaspase is predicted to increase the risk of hepatotoxicity when given with imatinib. Severe Theoretical → Also see TABLE 15 p. 1493
- ► Crisantaspase affects the efficacy of methotrexate. Severe

 Anecdotal → Also see TABLE 1 p. 1490 → Also see TABLE 15 p. 1493
- Crisantaspase potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before crisantaspase. Severe Anecdotal → Also see TABLE 1 p. 1490 → Also see TABLE 15 p. 1493

Crizotinib → see TABLE 6 p. 1491 (bradycardia), TABLE 9 p. 1492 (QT-interval prolongation)

GENERAL INFORMATION Caution with concurrent use of drugs that cause gastrointestinal perforation—discontinue treatment if gastrointestinal perforation occurs.

- Crizotinib is predicted to increase the exposure to abemaciclib.
 Moderate Study
- Crizotinib is predicted to increase the exposure to acalabrutinib. Avoid or monitor. Severe Study
- Crizotinib is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 210. Severe Study
- Crizotinib is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to crizotinib. Avoid. Severe Study → Also see TABLE 9 p. 1492

- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to crizotinib. [Moderate] Study → Also see TABLE 6 p. 1491 → Also see TABLE 9 p. 1492
- ► Crizotinib is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose.

 Moderate | Study → Also see TABLE 6 p. 1491
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to crizotinib. Avoid. Severe Study
- Antifungals, azoles (fluconazole, isavuconazole) are predicted to increase the exposure to crizotinib. Moderate Study → Also see
 TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to crizotinib. Avoid. [Moderate] Study → Also see TABLE 9 p. 1492
- Crizotinib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical
- antihistamines, non-sedating (mizolastine). [Severe] Theoretica
 ➤ Crizotinib is predicted to increase the exposure to
- antihistamines, non-sedating (rupatadine). Avoid. Moderate Study
- Crizotinib is predicted to increase the concentration of antimalarials (piperaquine). Severe Theoretical
- Crizotinib is predicted to increase the exposure to antipsychotics, second generation (cariprazine). Avoid. Severe Study
- Crizotinib is predicted to increase the exposure to antipsychotics, second generation (lurasidone). Adjust lurasidone dose. [Moderate] Study
- Crizotinib is predicted to increase the exposure to antipsychotics, second generation (quetiapine). Avoid. [Moderate]
 Study
- Crizotinib is predicted to increase the exposure to avapritinib.
 Avoid or adjust avapritinib dose, p. 1045. Moderate Study
- Crizotinib is predicted to increase the exposure to axitinib.
 Moderate Study
- ► Crizotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1492
- Crizotinib is predicted to increase the exposure to benzodiazepines (alprazolam). Severel Study
- Crizotinib is predicted to increase the exposure to benzodiazepines (midazolam). Monitor adverse effects and adjust dose. Severel Study
- ► Crizotinib is predicted to increase the exposure to bosutinib.

 Avoid or adjust dose. Severe Study → Also see TABLE 9 p. 1492
- ► Crizotinib is predicted to increase the exposure to brigatinib.
 Moderate Study → Also see TABLE 6 p. 1491
- Crizotinib is predicted to increase the exposure to buspirone.
 Use with caution and adjust dose. [Moderate] Study
- ► Crizotinib is predicted to increase the exposure to cabozantinib. Moderate Study → Also see TABLE 9 p. 1492
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to crizotinib. Avoid. [Moderate] Study → Also see TABLE 6 p. 1491
- Crizotinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- ► Crizotinib is predicted to increase the exposure to ceritinib.

 Moderate] Study → Also see TABLE 6 p. 1491 → Also see TABLE 9
 p. 1492
- Crizotinib is predicted to increase the concentration of ciclosporin. Severel Study
- ➤ Cobicistat is predicted to increase the exposure to crizotinib. Avoid. Moderate Study
- ► Crizotinib is predicted to increase the exposure to cobimetinib.

 Severe Study
- Crizotinib is predicted to increase the exposure to colchicine.
 Adjust colchicine dose with moderate CYP3A4 inhibitors,
 p. 1212. [Severe] Study
- Crizotinib is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose.
 Moderate Study
- ► Crizotinib is predicted to increase the risk of bleeding events when given with coumarins. Severe Theoretical
- Dabrafenib is predicted to decrease the exposure to crizotinib.
 Avoid. Severe Study

- Crizotinib is predicted to increase the exposure to dabrafenib.
 [Moderate] Study
- Crizotinib is predicted to increase the exposure to darifenacin.
 Moderate Study
- ► Crizotinib is predicted to increase the exposure to dasatinib.
 Severe Study → Also see TABLE 9 p. 1492
- Crizotinib is predicted to slightly increase the exposure to dienogest. [Moderate] Study
- Crizotinib is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Mild] Study
- ► Crizotinib is predicted to increase the exposure to domperidone. Avoid. Severe Study
- ► Crizotinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). Severe Theoretical
- Crizotinib is predicted to increase the concentration of dopamine receptor agonists (cabergoline). [Moderate] Anecdotal
- Crizotinib is predicted to moderately increase the exposure to dutasteride. Mild Study
- ➤ Crizotinib is predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. Severe Theoretical
- Crizotinib is predicted to increase the exposure to eliglustat.
 Avoid or adjust dose—consult product literature. Severe Study
- ► Crizotinib is predicted to moderately increase the exposure to encorafenib. Moderate Study → Also see TABLE 9 p. 1492
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to crizotinib. Avoid. [Severe] Study
- ➤ Crizotinib is predicted to increase the exposure to entrectinib.

 Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose,
 p. 1056. [Severe] Theoretical → Also see TABLE 9 p. 1492
- Crizotinib is predicted to increase the risk of ergotism when given with ergometrine. Severe Theoretical
- ► Crizotinib is predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- Crizotinib is predicted to increase the exposure to erlotinib.
 Moderate Study
- ► Crizotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- Crizotinib is predicted to increase the exposure to fedratinib.
 Monitor and adjust dose. [Moderate] Study
- Crizotinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Mild] Study
- Crizotinib is predicted to increase the exposure to gefitinib.
 Moderate Study
- Crizotinib potentially decreases the exposure to glecaprevir.
 Avoid. Severe Theoretical
- Grapefruit juice is predicted to increase the exposure to crizotinib. Avoid. [Moderate] Theoretical
- ► Crizotinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. Moderate Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to crizotinib. Avoid. Moderate | Study
- Crizotinib is predicted to increase the exposure to ibrutinib.
 Adjust ibrutinib dose with moderate CYP3A4 inhibitors,
 p. 1062. [Severe] Study
- Idelalisib is predicted to increase the exposure to crizotinib.
 Avoid. Moderate Study
- Imatinib is predicted to increase the exposure to crizotinib.
 [Moderate] Study
- ► Crizotinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 231. Severe Theoretical → Also see TABLE 6 p. 1491
- Crizotinib is predicted to increase the exposure to ivacaftor.
 Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. Moderate Study
- ► Crizotinib is predicted to increase the exposure to lapatinib.

 Moderate | Study → Also see TABLE 9 p. 1492
- Letermovir is predicted to increase the exposure to crizotinib.
 Moderate Study
- Crizotinib is predicted to increase the exposure to lomitapide.
 Avoid. Moderate Theoretical

- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to crizotinib. Avoid. [Moderate] Study → Also see TABLE 9 p. 1492
- Crizotinib is predicted to increase the exposure to midostaurin.
 Moderate Theoretical
- ► Mitotane is predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study
- Crizotinib is predicted to increase the exposure to naldemedine. [Moderate] Study
- Crizotinib is predicted to increase the exposure to naloxegol.
 Adjust naloxegol dose and monitor adverse effects, p. 67.
 Moderate Study
- Crizotinib is predicted to increase the exposure to neratinib. Avoid moderate CYP3A4 inhibitors or adjust neratinib dose and monitor for gastrointestinal adverse effects, p. 1069.
 [Severe] Study
- ► Neurokinin-1 receptor antagonists (netupitant) are predicted to increase the exposure to crizotinib. [Moderate] Study
- NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to crizotinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Crizotinib is predicted to increase the exposure to olaparib.

 Avoid moderate CYP3A4 inhibitors or adjust olaparib dose,
 p. 1088. Moderate Theoretical
- ► Crizotinib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 1491
- ► Crizotinib is predicted to increase the exposure to opioids (methadone). Moderate Theoretical → Also see TABLE 9 p. 1492
- ► Crizotinib is predicted to increase the exposure to pazopanib.

 Moderate | Study → Also see TABLE 9 p. 1492
- Crizotinib is predicted to increase the exposure to pemigatinib.
 Severe Study
- Crizotinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 878. [Moderate] Theoretical
- Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (siddenafil). Monitor or adjust sidenafil dose with moderate CYP3A4 inhibitors, p. 879.
 Moderate Study → Also see TABLE 9 p. 1492
- Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Severe Theoretical
- ➤ Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose.

 Severe Theoretical → Also see TABLE 9 p. 1492
- Crizotinib potentially decreases the exposure to pibrentasvir.
 Avoid. | Severe | Theoretical
- ► Crizotinib is predicted to increase the exposure to pimozide.

 Avoid. Severe | Theoretical → Also see TABLE 9 p. 1492
- ▶ Pitolisant is predicted to decrease the exposure to crizotinib. Avoid. Severe Theoretical
- Crizotinib is predicted to increase the exposure to ponatinib.
 Moderate Study
- ► Crizotinib is predicted to increase the exposure to ranolazine.

 Severe Study → Also see TABLE 9 p. 1492
- Crizotinib is predicted to increase the exposure to regorafenib.
 Moderate Study
- ► Crizotinib is predicted to increase the exposure to ribociclib.
 Moderate Study → Also see TABLE 9 p. 1492
- ► Rifamycins (rifampicin) are predicted to markedly decrease the exposure to crizotinib. Avoid. Severe Study
- ► Crizotinib is predicted to increase the exposure to ruxolitinib.

 [Moderate] Study
- ► Crizotinib is predicted to increase the exposure to selpercatinib. [Moderate] Study → Also see TABLE 9 p. 1492
- ► Crizotinib is predicted to increase the exposure to selumetinib.
- Avoid or adjust dose—consult product literature. Severe Study

 Crizotinib is predicted to increase the exposure to siponimod.
- Avoid depending on other drugs taken—consult product literature. [Severe] Study -> Also see TABLE 6 p. 1491
- Crizotinib increases the concentration of sirolimus. Monitor and adjust dose. Moderate Study

Crizotinib (continued)

- Crizotinib is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate CYP3A4 inhibitors, p. 887. Moderate Theoretical
- ▶ St John's wort is predicted to decrease the exposure to crizotinib. Avoid. Severe Study
- ► Crizotinib is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. Moderate Theoretical
- ► Crizotinib is predicted to increase the exposure to statins (pravastatin). Moderate Theoretical
- ► Crizotinib is predicted to increase the exposure to statins (simvastatin). Monitor and adjust dose. Severe Theoretical
- Crizotinib is predicted to increase the exposure to sunitinib. Moderate Study → Also see TABLE 9 p. 1492
- Crizotinib is predicted to increase the concentration of tacrolimus. Severe Study
- ► Crizotinib is predicted to increase the exposure to taxanes (cabazitaxel). Moderate Theoretical
- ► Crizotinib is predicted to increase the exposure to taxanes (docetaxel). Severe Study
- ► Crizotinib is predicted to increase the exposure to taxanes (paclitaxel). Moderate Anecdotal
- Crizotinib is predicted to increase the concentration of temsirolimus. Use with caution or avoid. Moderate Theoretical
- ► Crizotinib is predicted to increase the exposure to tezacaftor. Adjust dose with moderate CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320. Severe Study
- ► Crizotinib given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. Moderate Study
- ► Crizotinib is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate CYP3A4 inhibitors, p. 724. Moderate Study
- Crizotinib is predicted to increase the exposure to trazodone. Moderate Theoretical
- ► Crizotinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ Crizotinib is predicted to increase the exposure to vemurafenib. Severe Theoretical → Also see TABLE 9 p. 1492
- Crizotinib is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. Severe Study
- ► Crizotinib is predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 9 p. 1492
- Crizotinib is predicted to increase the exposure to zopiclone. Adjust dose. Moderate Study

Cyclizine → see antihistamines, sedating

Cyclopentolate → see TABLE 10 p. 1492 (antimuscarinics)

 Antipsychotics, second generation (clozapine) can cause constipation, as can cyclopentolate; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492

Cyclophosphamide → see alkylating agents Cycloserine

▶ Cycloserine increases the risk of CNS toxicity when given with isoniazid. Monitor and adjust dose. Moderate Study

Cyproheptadine → see antihistamines, sedating

Cyproterone → see anti-androgens

Cytarabine → see TABLE 15 p. 1493 (myelosuppression)

- ► Cytarabine decreases the concentration of flucytosine. Avoid. Severe Study
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cytarabine. UKHSA advises avoid (refer to Green Book). Severe

Cytomegalovirus immunoglobulin → see immunoglobulins **Dabigatran** → see thrombin inhibitors

Dabrafenib

- ▶ Dabrafenib is predicted to decrease the exposure to acalabrutinib. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to dabrafenib. Avoid. Moderate Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to antiandrogens (darolutamide). Avoid. [Moderate] Theoretical

- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to dabrafenib. Moderate Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dabrafenib. Avoid. Moderate Theoretical
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dabrafenib. [Moderate]
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. Severe Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to antipsychotics, second generation (cariprazine). Avoid. [Severe] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to antipsychotics, second generation (lurasidone). Monitor and adjust dose. Moderate Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to antipsychotics, second generation (quetiapine). Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to avapritinib. Avoid. Severe Study
- ▶ Dabrafenib is predicted to decrease the exposure to axitinib. Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to bedaquiline. Avoid. Severe Study
- Dabrafenib decreases the exposure to benzodiazepines (midazolam). Monitor and adjust dose. Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to bosutinib. Avoid. Severe Study
- ▶ Dabrafenib is predicted to decrease the exposure to brigatinib. Avoid. Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to cabozantinib. Moderate Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dabrafenib. Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. Moderate Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- Dabrafenib is predicted to decrease the exposure to ceritinib. Severe Study
- ► Clopidogrel is predicted to increase the exposure to dabrafenib. Moderate Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to cobicistat. Avoid. Severe Theoretical
- ► Cobicistat is predicted to increase the exposure to dabrafenib. Use with caution or avoid. Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to cobimetinib. Avoid. Severe Theoretical
- ► Dabrafenib is predicted to decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. Severe Theoretical
- ▶ Dabrafenib is predicted to decrease the anticoagulant effect of coumarins. Severe Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to crizotinib. Avoid. Severe Study
- ► Crizotinib is predicted to increase the exposure to dabrafenib. Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to dasatinib. Severe Study
- Dabrafenib is predicted to decrease the exposure to digoxin. Moderate Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to dolutegravir. Severe Study
- ► Dabrafenib is predicted to moderately decrease the exposure to elbasvir. Avoid. Severe Study
- ▶ Dabrafenib is predicted to decrease the concentration of elvitegravir. Avoid. Severe Theoretical
- ▶ Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to dabrafenib. Moderate Study

- Dabrafenib is predicted to decrease the exposure to entrectinib. Avoid. (Severe) Theoretical
- Dabrafenib is predicted to decrease the effects of ergotamine.
 Moderatel Theoretical
- Dabrafenib is predicted to decrease the exposure to erlotinib.
 Severe | Study
- Dabrafenib is predicted to decrease the concentration of everolimus. Avoid or adjust dose. Severe Study
- Dabrafenib is predicted to decrease the exposure to fedratinib.
 Avoid. [Moderate] Study
- ► Fibrates (gemfibrozil) are predicted to increase the exposure to dabrafenib. Moderate Theoretical
- Dabrafenib is predicted to decrease the exposure to gefitinib.
 Avoid. Severe Study
- ▶ Dabrafenib is predicted to decrease the exposure to glasdegib. Avoid or adjust glasdegib dose, p. 1087. [Moderate] Theoretical
- ► Dabrafenib is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- ▶ Dabrafenib is predicted to markedly decrease the exposure to grazoprevir. Avoid. Severe Study
- Dabrafenib is predicted to decrease the concentration of guanfacine. Adjust dose. Moderate Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to dabrafenib. Use with caution or avoid. Moderate Study
- ► Dabrafenib is predicted to decrease the exposure to ibrutinib. Avoid or monitor. Severe Study
- ▶ Dabrafenib is predicted to decrease the exposure to idelalisib. Avoid. Moderate Theoretical
- ► Idelalisib is predicted to increase the exposure to dabrafenib. Use with caution or avoid. Moderate Study
- Imatinib is predicted to increase the exposure to dabrafenib.
 Moderate Study
- Dabrafenib is predicted to decrease the exposure to imatinib.
 Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to ivacaftor. Moderate Study
- ► Dabrafenib is predicted to decrease the exposure to lapatinib.

 Avoid. Severe Study
- ► Dabrafenib is predicted to decrease the exposure to larotrectinib. Avoid. [Moderate] Study
- Letermovir is predicted to increase the exposure to dabrafenib.
 [Moderate] Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. Moderate Study
- Macrolides (erythromycin) are predicted to increase the exposure to dabrafenib. [Moderate] Study
- Dabrafenib is predicted to decrease the exposure to midostaurin. Severe Study
- ► Dabrafenib is predicted to decrease the exposure to mifepristone. Severe Theoretical
- Mitotane is predicted to decrease the exposure to dabrafenib.
 Avoid. Moderate Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to dabrafenib. Moderate Study
- ➤ Dabrafenib is predicted to decrease the exposure to neurokinin-1 receptor antagonists (netupitant). [Moderate] Theoretical
- Dabrafenib is predicted to decrease the exposure to nilotinib.
 Avoid. Severe Theoretical
- Nilotinib is predicted to increase the exposure to dabrafenib.
 Moderate Study
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to dabrafenib. Moderate Study
- Dabrafenib is predicted to decrease the exposure to NNRTIS (doravirine). Avoid or adjust doravirine p. 699 or lamivudine with tenofovir disoproxil and doravirine p. 709 dose. [Severe]
- ► Dabrafenib is predicted to decrease the exposure to NNRTIS (etravirine). Avoid. Severe Study
- ▶ Dabrafenib is predicted to decrease the exposure to NNRTIS (rilpivirine). Avoid. [Severe] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to olaparib. Avoid. Moderate Theoretical

- ▶ Dabrafenib decreases the exposure to opioids (methadone). Monitor and adjust dose. Severe Study
- Dabrafenib is predicted to decrease the exposure to osimertinib. Use with caution or avoid. Severe Study
- Dabrafenib is predicted to decrease the exposure to ospemifene. [Moderate] Study
- Dabrafenib is predicted to decrease the exposure to pazopanib.
 Severe Study
- Dabrafenib is predicted to decrease the exposure to pemigatinib. Avoid or monitor. Severe Study
- Dabrafenib is predicted to decrease the exposure to phenindione. [Moderate] Study
- ► Dabrafenib is predicted to decrease the exposure to pibrentasvir. Avoid. Severe Study
- ► Dabrafenib is predicted to decrease the exposure to ponatinib.

 Severe Study
- Dabrafenib is predicted to decrease the exposure to regorafenib. Severe Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. Moderate Study
- Dabrafenib is predicted to decrease the exposure to selpercatinib. [Moderate] Study
- Dabrafenib is predicted to decrease the exposure to selumetinib. Avoid. Severe Study
- ▶ Dabrafenib is predicted to decrease the exposure to siponimod. Manufacturer advises caution depending on genotype consult product literature. Severe| Theoretical
- Dabrafenib is predicted to decrease the exposure to sorafenib.
 [Moderate] Study
- ► St John's wort is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Study
 - ► Dabrafenib is predicted to decrease the exposure to statins (atorvastatin, simvastatin). Moderate Study
 - Dabrafenib is predicted to decrease the exposure to sunitinib.
 Moderate Study
 - ► Dabrafenib is predicted to decrease the exposure to taxanes (cabazitaxel). Moderate Theoretical
 - ► Dabrafenib is predicted to decrease the exposure to taxanes (docetaxel). Severe Theoretical
- Dabrafenib is predicted to decrease the exposure to taxanes (paclitaxel). Avoid. Severe Study
- Dabrafenib is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Theoretical
 Dabrafenib is predicted to decrease the exposure to ticagrelor.
- Moderate Theoretical

 ► Dabrafenib is predicted to decrease the exposure to tofacitinib.
- Dabrarenio is predicted to decrease the efficacy of ulipristal Avoid and for 4 weeks after stopping ulipristal. Severe Theoretical
- Dabrafenib is predicted to decrease the exposure to vandetanib. [Moderate] Study
- ► Dabrafenib is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical
- Dabrafenib is predicted to decrease the exposure to vemurafenib. [Severe] Study
- ► Dabrafenib is predicted to decrease the exposure to venetoclax. Avoid. Severe Study
- ► Dabrafenib is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical

Dacarbazine → see alkylating agents **Dacomitinib**

- Dacomitinib is predicted to markedly increase the exposure to atomoxetine. Avoid or adjust dose. [Severe] Study
- Dacomitinib is predicted to markedly increase the exposure to beta blockers, non-selective (propranolol). Avoid. Severe Study
- ➤ Dacomitinib is predicted to markedly increase the exposure to beta blockers, selective (metoprolol, nebivolol). Avoid. Severe
- ► Dacomitinib is predicted to markedly increase the exposure to eliglustat. Avoid or adjust dose—consult product literature.

 [Severe] Study

Dacomitinib (continued)

- H₂ receptor antagonists are predicted to decrease the concentration of dacomitinib. Dacomitinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. Mild Study
- Proton pump inhibitors are predicted to decrease the exposure to dacomitinib. Avoid. Moderate Study
- Dacomitinib is predicted to markedly increase the exposure to tolterodine. Avoid. (Severe) Study
- Dacomitinib is predicted to markedly increase the exposure to tricyclic antidepressants (imipramine, nortriptyline). Avoid.
 Severel Study

Dactinomycin → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 15 p. 1493 (myelosuppression)

 Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dactinomycin. UKHSA advises avoid (refer to Green Book).
 Severej Theoretical

Dalteparin → see low molecular-weight heparins

- **Danaparoid** → see TABLE 3 p. 1490 (anticoagulant effects)
- ► Ranibizumab is predicted to increase the risk of bleeding events when given with danaparoid. Severe Theoretical

Dantrolene → see TABLE 1 p. 1490 (hepatotoxicity)

 Intravenous dantrolene potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with calcium channel blockers (diltiazem, verapamil). Avoid. [Severe] Anecdotal

Dapagliflozin → see sodium glucose co-transporter 2 inhibitors **Dapoxetine** → see SSRIs

Dapsone

- ➤ Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severe Theoretical
- ▶ Dapsone is predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. Severe Theoretical
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severel Theoretical
- Antimalarials (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severe Theoretical
- ► Nitrates are predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severe
- ➤ Nitrofurantoin is predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severe Theoretical
- ► Nitroprusside is predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severe Theoretical
- Paracetamol is predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severe Theoretical
- ► Rifamycins decrease the exposure to dapsone. Moderate Study
- ➤ Sulfonamides are predicted to increase the risk of methaemoglobinaemia when given with dapsone. Severe Theoretical
- Dapsone increases the exposure to trimethoprim and trimethoprim increases the exposure to dapsone. Severe Study

Daptomycin

- ► Aspirin (high-dose) increases the risk of renal impairment when given with daptomycin. Moderate Theoretical
- ► Ciclosporin is predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical
- ► Fibrates are predicted to increase the risk of rhabdomyolysis when given with daptomycin. Severe Theoretical
 ► NSAIDs increase the risk of renal impairment when given with
- daptomycin. Moderate Theoretical
- ► Statins are predicted to increase the risk of rhabdomyolysis when given with daptomycin. Severe Theoretical

Daratumumab → see monoclonal antibodies

Darbepoetin alfa → see TABLE 5 p. 1491 (thromboembolism), TABLE 16 p. 1494 (increased serum potassium) Darifenacin → see TABLE 10 p. 1492 (antimuscarinics)

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to darifenacin. Moderate Study
- Darifenacin is predicted to increase the concentration of antiarrhythmics (flecainide). [Moderate] Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to darifenacin. Moderate Theoretical
- ► Antifungals, azoles (fluconazole) slightly increase the exposure to darifenacin. Moderate Study
- ► Antifungals, azoles (isavuconazole, posaconazole) are predicted to increase the exposure to darifenacin. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
- ➤ Antipsychotics, second generation (clozapine) can cause constipation, as can darifenacin; concurrent use might increase the risk of developing intestinal obstruction. [Severe] Theoretical → Also see TABLE 10 p. 1492
- ► Bupropion is predicted to slightly increase the exposure to darifenacin. [Mild] Study
- ► Calcium channel blockers (diltiazem) are predicted to increase the exposure to darifenacin. [Moderate] Study
- ► Calcium channel blockers (verapamil) are predicted to increase the exposure to darifenacin. Avoid. Moderate Study
- ► Cenobamate is predicted to decrease the exposure to darifenacin. Adjust dose. Moderate Theoretical
- ► Ciclosporin is predicted to increase the exposure to darifenacin. Avoid. Moderate Theoretical
- ► Cinacalcet is predicted to slightly increase the exposure to darifenacin. [Mild] Study
- ► Colicistat is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
- Crizotinib is predicted to increase the exposure to darifenacin.
 Moderatel Study
- ► Grapefruit juice is predicted to increase the exposure to darifenacin. Moderate Study
- ► H₂ receptor antagonists (cimetidine) increase the exposure to darifenacin. Mild Study
- ► HIV-protease inhibitors are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. Severe
- ► Idelalisib is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. Severe Study
- ► Imatinib is predicted to increase the exposure to darifenacin.

 [Moderate] Study
- ► Letermovir is predicted to increase the exposure to darifenacin. Moderate Study
- ► Macrolides (clarithromycin) are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. Severe
- Macrolides (erythromycin) slightly increase the exposure to darifenacin. [Moderate] Study
- Mitotane is predicted to decrease the exposure to darifenacin.
 Moderate Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to darifenacin. Moderate Study
- Nilotinib is predicted to increase the exposure to darifenacin.
 Moderate Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to darifenacin. Moderate Theoretical
- ► SSRIs (fluoxetine, paroxetine) are predicted to slightly increase the exposure to darifenacin. Mild Study
- St John's wort is predicted to decrease the exposure to darifenacin. Moderate Theoretical
- ► Terbinafine is predicted to slightly increase the exposure to darifenacin. Mild Study
- ► Darifenacin (high-dose) is predicted to increase the exposure to tricyclic antidepressants. Moderate Study → Also see TABLE 10 n. 1402
- ➤ Tucatinib is predicted to increase the exposure to darifenacin. Avoid or adjust dose. Moderatel Theoretical

Darolutamide → see anti-androgens

Darunavir → see HIV-protease inhibitors

Dasatinib → see TABLE 15 p. 1493 (myelosuppression), TABLE 9 p. 1492 (OT-interval prolongation), TABLE 4 p. 1490 (antiplatelet

- ▶ Oral antacids decrease the absorption of oral dasatinib. Separate administration by at least 2 hours. Moderate Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to dasatinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to dasatinib. Severe Study → Also see TABLE 9 p. 1492
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dasatinib. Avoid. Severe Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. Severe Study → Also see TABLE 9 p. 1492
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dasatinib. Severe Study
- ► Oral calcium salts (calcium carbonate) -containing antacids are predicted to decrease the exposure to oral dasatinib. Separate administration by at least 2 hours. Moderate Study
- ▶ Cenobamate is predicted to decrease the exposure to dasatinib. Adjust dose. Moderate Theoretical
- ► Cobicistat is predicted to increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. Severe Study
- ► Crizotinib is predicted to increase the exposure to dasatinib. Severe Study → Also see TABLE 9 p. 1492
- Dabrafenib is predicted to decrease the exposure to dasatinib.
- ▶ Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to dasatinib. Severe Study
- ▶ Grapefruit juice is predicted to increase the exposure to dasatinib. Avoid. Moderate Theoretical
- ▶ H₂ receptor antagonists are predicted to decrease the exposure to dasatinib. Avoid. Moderate Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. Severe Study
- ▶ Idelalisib is predicted to increase the exposure to dasatinib. Avoid or adjust dose-consult product literature. Severe Study
- Imatinib is predicted to increase the exposure to dasatinib. Severe Study → Also see TABLE 15 p. 1493 → Also see TABLE 4 p. 1490
- Letermovir is predicted to increase the exposure to dasatinib. Severe Study
- ▶ Macrolides (clarithromycin) are predicted to increase the exposure to dasatinib. Avoid or adjust dose-consult product literature. Severe Study → Also see TABLE 9 p. 1492
- ▶ Macrolides (erythromycin) are predicted to increase the exposure to dasatinib. Severe Study → Also see TABLE 9 p. 1492
- ▶ Mitotane is predicted to markedly decrease the exposure to dasatinib. Avoid. Severe Study → Also see TABLE 15 p. 1493
- ▶ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to dasatinib. Severe Study
- ▶ Nilotinib is predicted to increase the exposure to dasatinib.
- Severe Study → Also see TABLE 15 p. 1493 → Also see TABLE 9 p. 1492 ▶ Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of dasatinib. Avoid. Severe Theoretical
- ▶ NNRTIS (efavirenz, nevirapine) are predicted to decrease the
- exposure to dasatinib. Severe Study → Also see TABLE 9 p. 1492 ▶ Pitolisant is predicted to decrease the exposure to dasatinib.
- Avoid. Severe Theoretical ▶ Proton pump inhibitors are predicted to decrease the exposure
- to dasatinib. Avoid. Severe Study ▶ Rifamycins (rifampicin) are predicted to markedly decrease the
- exposure to dasatinib. Avoid. Severe Study
- ▶ Oral sodium bicarbonate -containing antacids are predicted to decrease the exposure to oral dasatinib. Separate administration by at least 2 hours. Moderate Study

- ► Sodium zirconium cyclosilicate is predicted to decrease the exposure to dasatinib. Separate administration by at least 2 hours. Moderate Theoretical
- ▶ St John's wort is predicted to decrease the exposure to dasatinib. Severe Study
- ► Dasatinib is predicted to increase the exposure to statins (simvastatin). [Moderate] Theoretical

Daunorubicin → see anthracyclines

Decitabine → see TABLE 15 p. 1493 (myelosuppression)

Deferasirox → see iron chelators

Deferiprone → see iron chelators

Deflazacort → see corticosteroids **Delafloxacin** → see quinolones

Delamanid → see TABLE 9 p. 1492 (QT-interval prolongation)

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to slightly decrease the exposure to delamanid. Avoid. Moderate Study → Also see TABLE 9 p. 1492
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to delamanid. Avoid. Moderate Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very slightly increase the exposure to delamanid. Severe Study → Also see TABLE 9 p. 1492
- ► Cobicistat very slightly increases the exposure to delamanid. Severe Study
- ▶ HIV-protease inhibitors very slightly increase the exposure to delamanid. Severe Study
- Idelalisib very slightly increases the exposure to delamanid. Severe Study
- ► Macrolides (clarithromycin) very slightly increase the exposure to delamanid. Severe Study → Also see TABLE 9 p. 1492
- ▶ Mitotane is predicted to slightly decrease the exposure to delamanid. Avoid. Moderate Study
- ▶ Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of delamanid. Severe Theoretical
- ▶ Rifamycins (rifampicin) are predicted to slightly decrease the exposure to delamanid. Avoid. Moderate Study

Demeclocycline → see tetracyclines

Denosumab

- ▶ Cinacalcet might increase the risk of hypocalcaemia when given with denosumab. Severe Theoretical
- ▶ Etelcalcetide might increase the risk of hypocalcaemia when given with denosumab. Severe Theoretical

Desferrioxamine → see iron chelators

Desflurane → see volatile halogenated anaesthetics

Desloratadine → see antihistamines, non-sedating **Desmopressin** → see TABLE 18 p. 1494 (hyponatraemia)

- ► Antiepileptics (lamotrigine) are predicted to increase the risk of hyponatraemia when given with desmopressin. Severe
- ▶ Loperamide greatly increases the absorption of oral desmopressin (and possibly sublingual). Moderate Study
- ▶ Phenothiazines (chlorpromazine) are predicted to increase the risk of hyponatraemia when given with desmopressin. Severe Theoretical

Desogestrel

- ► Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 859, Severe Theoretical
- ▶ Desogestrel is predicted to increase the exposure to antiepileptics (lamotrigine). Moderate Study
- ▶ Berotralstat might decrease the efficacy of desogestrelcontaining contraceptives. Use alternatives to desogestrelonly contraceptives. Severe Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- Griseofulvin potentially decreases the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Anecdotal
- ▶ HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical

Desogestrel (continued)

- Modafinil is predicted to decrease the efficacy of desogestrel.
 For FSRH guidance, see Contraceptives, interactions p. 859.
 Severel Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- ▶ Rifamycins are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- ➤ St John's wort is predicted to decrease the efficacy of desogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- Sugammadex is predicted to decrease the exposure to desogestrel. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
- ➤ Desogestrel might decrease the efficacy of ulipristal and ulipristal might decrease the efficacy of desogestrel. Avoid or use additional contraceptive precautions. Severe Theoretical

Dexamethasone → see corticosteroids **Dexamfetamine** → see amfetamines **Dexketoprofen** → see NSAIDs

Dexmedetomidine → see TABLE 11 p. 1492 (CNS depressant effects)

Dexrazoxane → see iron chelators **Diamorphine** → see opioids **Diazepam** → see benzodiazepines

Diazoxide → see TABLE 8 p. 1491 (hypotension)

- Diazoxide decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. [Moderate] Anecdotal
- Diazoxide increases the risk of severe hypotension when given with hydralazine. Severe Study → Also see TABLE 8 p. 1491

Diclofenac → see NSAIDs

Dicycloverine → see TABLE 10 p. 1492 (antimuscarinics)

➤ Antipsychotics, second generation (clozapine) can cause constipation, as can dicycloverine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492

Dienogest

- Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to dienogest. [Severe] Study
- Antiarrhythmics (dronedarone) are predicted to slightly increase the exposure to dienogest. Moderate Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dienogest. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to slightly increase the exposure to dienogest.
 Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to dienogest.

 Moderatel Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to slightly increase the exposure to dienogest. Moderate Study
- ► Cobicistat is predicted to moderately increase the exposure to dienogest. Moderate Study
- Crizotinib is predicted to slightly increase the exposure to dienogest. Moderate Study
- HIV-protease inhibitors are predicted to moderately increase the exposure to dienogest. Moderate Study
- ldealaish is predicted to moderately increase the exposure to dienogest. [Moderate] Study
- ► Imatinib is predicted to slightly increase the exposure to dienogest. [Moderate] Study
- ▶ Letermovir is predicted to slightly increase the exposure to dienogest. [Moderate] Study
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to dienogest. [Moderate] Study

- ► Macrolides (erythromycin) are predicted to slightly increase the exposure to dienogest. Moderate Study
- ► Mitotane is predicted to markedly decrease the exposure to dienogest. [Severe] Study
- ▶ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to slightly increase the exposure to dienogest. Moderate Study
- ► Nilotinib is predicted to slightly increase the exposure to dienogest. [Moderate] Study
- Rifamycins (rifampicin) are predicted to markedly decrease the exposure to dienogest. Severe Study

Digoxin → see TABLE 6 p. 1491 (bradycardia)

- ► Abrocitinib might increase the exposure to digoxin. [Moderate]
 Theoretical

 Acarbose decreases the concentration of digoxin. [Moderate]
- ➤ Acarbose decreases the concentration of digoxin. Moderate Study
- ► Aldosterone antagonists (eplerenone) very slightly increase the exposure to digoxin. [Mild] Study
- ► Aldosterone antagonists (spironolactone) increase the concentration of digoxin. Monitor and adjust dose. [Moderate] Study
- Aminoglycosides potentially increase the concentration of digoxin. Monitor and adjust dose. [Mild] Study
- ► Oral antacids decrease the absorption of oral digoxin. Separate administration by 2 hours. [Mild] Study
- Anti-androgens (apalutamide) are predicted to decrease the exposure to digoxin. [Mild] Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust digoxin dose, p. 117. Severe Study → Also see TABLE 6 p. 1491
- Antiarrhythmics (propafenone) increase the concentration of digoxin. Monitor and adjust dose. Severe Study → Also see
 TABLE 6 p. 1491
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. [Moderate] Anecdotal
- Antifungals, azoles (isavuconazole) slightly increase the exposure to digoxin. Monitor and adjust dose. Moderate Study
- Antifungals, azoles (itraconazole) are predicted to markedly increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (ketoconazole) are predicted to markedly increase the concentration of digoxin. Severe Study
- Antifungals, azoles (posaconazole) are predicted to increase the concentration of digoxin. [Severe] Study
- Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with digoxin. Severe Theoretical
- ► Antimalarials (quinine) increase the concentration of digoxin.

 Monitor and adjust digoxin dose, p. 117. [Severe] Anecdotal
- ► Balsalazide is predicted to decrease the concentration of digoxin. Moderate Theoretical
- ► Berotralstat is predicted to increase the concentration of digoxin. Monitor and adjust dose. Moderate Study
- ► Calcium channel blockers (diltiazem, verapamil) increase the concentration of digoxin. Monitor and adjust dose. Severe Study → Also see TABLE 6 p. 1491
- ► Intravenous calcium salts increase the effects of digoxin. Avoid. Moderate Anecdotal
- ► Carbimazole affects the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical
- ► Ceritinib is predicted to increase the risk of bradycardia when given with digoxin. Avoid. Severe Theoretical → Also see TABLE 6 p. 1491
- ► Ciclosporin increases the concentration of digoxin. Monitor and adjust dose. Severe Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to digoxin. Moderatel Theoretical
- Drugs that reduce serum potassium (see TABLE 17 p. 1494) are predicted to increase the risk of digoxin toxicity when given with digoxin. Severe Study
- ► Eliglustat increases the exposure to digoxin. Adjust dose.

 Moderate Study
- ► Fostamatinib slightly increases the exposure to digoxin.

 Monitor digoxin concentration and adjust dose, p. 117.

 Moderate Study

- Glecaprevir with pibrentasvir increases the exposure to digoxin. [Moderate] Study
- ► HIV-protease inhibitors (ritonavir) increase the concentration of digoxin. Adjust dose and monitor concentration. Severe Study
- ▶ Ibrutinib is predicted to increase the exposure to digoxin.

 Separate administration by at least 6 hours. Moderate

 Theoretical
- ► Ivacaftor slightly increases the exposure to digoxin. Moderate Study
- Lapatinib is predicted to increase the exposure to digoxin.
 Moderate Theoretical
- Ledipasvir is predicted to increase the exposure to digoxin.
 Monitor and adjust dose. [Moderate] Theoretical
- ► Lorlatinib is predicted to decrease the exposure to digoxin.

 [Moderate] Study
- ► Macrolides increase the concentration of digoxin. Severe Anecdotal
- Mirabegron slightly increases the exposure to digoxin. Monitor concentration and adjust dose. [Severe] Study
- ► Neomycin decreases the absorption of digoxin. Moderate Study
- ► Neratinib slightly increases the exposure to digoxin. Moderate Study
- Neuromuscular blocking drugs, non-depolarising (pancuronium) are predicted to increase the risk of cardiovascular adverse effects when given with digoxin. Severel Anecdotal
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of digoxin. [Severe] Theoretical
- ► NSAIDs (indometacin) increase the concentration of digoxin. Severel Study
- Olaparib might increase the exposure to digoxin. Moderate
 Theoretical
- administration by at least 6 hours. Moderate Theoretical
- Penicillamine potentially decreases the concentration of digoxin. Separate administration by 2 hours. Severe Anecdotal
- ► Pibrentasvir with glecaprevir increases the exposure to digoxin. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to digoxin.
 Mild Theoretical
- ► Ranolazine increases the concentration of digoxin. Moderate
 Study
- ► Ribociclib is predicted to increase the exposure to digoxin.

 [Moderate] Theoretical
- ► Rifamycins (rifampicin) decrease the concentration of digoxin.

 Moderate Study
- ► Sotorasib is predicted to increase the exposure to digoxin.

 Avoid or adjust dose. Moderate Study
- ► St John's wort decreases the concentration of digoxin. Avoid.

 | Severe | Anecdotal |
- ➤ Sucralfate decreases the absorption of digoxin. Separate administration by 2 hours. Severe Anecdotal
- ► Sulfasalazine decreases the concentration of digoxin. Moderate Study
- ➤ Suxamethonium is predicted to increase the risk of cardiovascular adverse effects when given with digoxin. Severe

 Anecdotal → Also see TABLE 6 p. 1491
- ► Tepotinib is predicted to increase the concentration of digoxin. Severe Study
- Thyroid hormones are predicted to affect the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical
- ► Ticagrelor increases the concentration of digoxin. Moderate Study → Also see TABLE 6 p. 1491
- ► Tolvaptan increases the concentration of digoxin. [Mild] Study
- ► Trimethoprim increases the concentration of digoxin. Moderate
 Study
- Tucatinib slightly increases the exposure to digoxin. Use with caution and adjust dose. Moderate Study
- ► Vandetanib slightly increases the exposure to digoxin.

 Moderate Study
- Velpatasvir is predicted to increase the exposure to digoxin.
 Severe Study
- Vemurafenib slightly increases the exposure to digoxin. Use with caution and adjust dose. [Severe] Study

- Venetoclax increases the exposure to digoxin. Avoid or adjust dose. Severe Study
- Vitamin D substances are predicted to increase the risk of toxicity when given with digoxin. Severel Theoretical
- ➤ Voxilaprevir with sofosbuvir and velpatasvir is predicted to increase the exposure to digoxin. Monitor and adjust dose.

 [Severe] Theoretical

Dihydrocodeine → see opioids

Diltiazem → see calcium channel blockers

Dimenhydrinate → see TABLE 10 p. 1492 (antimuscarinics)

➤ Antipsychotics, second generation (clozapine) can cause constipation, as can dimenhydrinate; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492

Dimethyl fumarate

- Alcohol (excessive consumption) potentially increases the risk of gastrointestinal adverse effects when given with dimethyl fumarate. Avoid. [Moderate] Theoretical
- ► Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dimethyl fumarate. UKHSA advises avoid (refer to Green Book). Severe Theoretical

Dinutuximab → see monoclonal antibodies

Dipeptidylpeptidase-4 inhibitors → see TABLE 14 p. 1493 (antidiabetic drugs)

 $alog liptin \cdot linag liptin \cdot saxag liptin \cdot sitag liptin \cdot vildag liptin$

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to linagliptin. Moderate Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to saxagliptin. [Moderate]
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to saxagliptin. Mild Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to linagliptin. Moderate Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to saxagliptin. Moderate Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to saxagliptin. Mild
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to saxagliptin. [Moderate]
 Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to saxagliptin. [Mild] Study
- Cobicistat is predicted to increase the exposure to saxagliptin.
 Moderate Study
- ► Crizotinib is predicted to increase the exposure to saxagliptin.

 [Mild] Study
- ► Fenfluramine might decrease blood glucose concentrations when given with dipeptidylpeptidase-4 inhibitors. Moderate
- ► Grapefruit juice is predicted to increase the exposure to saxagliptin. [Mild] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to saxagliptin. [Moderate] Study
- Idelalisib is predicted to increase the exposure to saxagliptin.
 Moderate Study
- ► Imatinib is predicted to increase the exposure to saxagliptin. Mild Study
- ► Letermovir is predicted to increase the exposure to saxagliptin.

 [Mild] Study
- Linagliptin is predicted to increase the exposure to lomitapide.
 Separate administration by 12 hours. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to saxagliptin. Moderate Study
- ► Macrolides (erythromycin) are predicted to increase the exposure to saxagliptin. [Mild] Study
- ► Mitotane is predicted to decrease the exposure to linagliptin. Moderate Study
- ► Mitotane is predicted to moderately decrease the exposure to saxagliptin. Moderatel Study

Dipeptidylpeptidase-4 inhibitors (continued)

- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to saxagliptin. [Mild] Study
- ► Nilotinib is predicted to increase the exposure to saxagliptin.

 Mild Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to linagliptin. Moderate Study
- ▶ Rifamycins (rifampicin) are predicted to moderately decrease the exposure to saxagliptin. Moderate Study
- Vemurafenib is predicted to increase the exposure to sitagliptin. Use with caution or avoid. Moderate Theoretical

Diphenoxylate → see opioids

Dipipanone → see opioids

Dipyridamole → see TABLE 8 p. 1491 (hypotension), TABLE 4 p. 1490 (antiplatelet effects)

- ➤ Oral antacids are predicted to decrease the absorption of oral dipyridamole (immediate release tablets). [Moderate] Theoretical
- ► Dipyridamole increases the exposure to antiarrhythmics (adenosine). Avoid or adjust dose. [Severe] Study
- Dipyridamole might increases the exposure to cladribine.
 Moderate Theoretical
- ► H₂ receptor antagonists are predicted to decrease the absorption of dipyridamole (immediate release tablets).
 Moderate | Theoretical
- ▶ Proton pump inhibitors are predicted to decrease the absorption of dipyridamole (immediate release tablets). Moderate | Theoretical
- ➤ Selumetinib might increase the risk of bleeding when given with dipyridamole. [Moderate] Theoretical

Diroximel fumarate

 Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with diroximel fumarate. Use with caution or avoid. Severe Theoretical

Disopyramide → see antiarrhythmics

Disulfiram → see TABLE 12 p. 1493 (peripheral neuropathy)

- ➤ Alcohol causes an extremely unpleasant systemic reaction when given with disulfiram. Avoid for at least 24 hours before and up to 14 days after stopping treatment. Severe Study
- ▶ Disulfiram increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 12 p. 1493
- ▶ Disulfiram increases the anticoagulant effect of coumarins. Monitor and adjust dose. Severe Study
- Methylphenidate has been reported to cause psychotic symptoms when given with disulfiram. [Severe] Anecdotal
- ▶ Disulfiram increases the risk of acute psychoses when given with metronidazole. Severe Study → Also see TABLE 12 p. 1493
- Disulfiram is predicted to increase the anticoagulant effect of phenindione. Severe Theoretical

Dobutamine → see sympathomimetics, inotropic

Docetaxel → see taxanes

Docusates

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use of **docusates** unless specified.

 Oral docusates might decrease the concentration of the active metabolite of oral baloxavir marboxil. Severe Theoretical

Dolutegravir

- ➤ Oral antacids decrease the exposure to oral dolutegravir.
 Dolutegravir should be taken 2 hours before or 6 hours after antacids. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to dolutegravir. Severe Study
- Antiepileptics (carbamazepine) decrease the exposure to dolutegravir. Adjust dolutegravir dose, p. 696. Severel Study
- ► Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dolutegravir. Adjust dolutegravir dose, p. 696. [Severe] Study
- ► Antiepileptics (oxcarbazepine) are predicted to decrease the exposure to dolutegravir. Adjust dolutegravir dose, p. 696. [Severe] Theoretical
- ➤ Oral calcium salts decrease the absorption of dolutegravir.

 Dolutegravir should be taken 2 hours before or 6 hours after calcium salts. [Moderate] Study

- ► Dabrafenib is predicted to decrease the exposure to dolutegravir. Severe Study
- Dolutegravir is predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. [Moderate] Study
- ► Encorafenib is predicted to increase the exposure to dolutegravir. Moderate Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to dolutegravir. Severe Study
- ➤ Dolutegravir might increase the concentration of fampridine.

 Avoid. [Severe] Theoretical
- ► HIV-protease inhibitors (atazanavir) (alone or boosted with ritonavir) slightly increase the exposure to dolutegravir. Adjust dose—consult product literature. [Moderate] Study
- ► HIV-protease inhibitors (fosamprenavir) boosted with ritonavir slightly decrease the exposure to dolutegravir. Avoid if resistant to HIV-integrase inhibitors. (Severe) Study
- ► HIV-protease inhibitors (tipranavir) moderately decrease the exposure to dolutegravir. Adjust dolutegravir dose, p. 696. [Severe] Study
- Oral iron decreases the absorption of oral dolutegravir.
 Dolutegravir should be taken 2 hours before or 6 hours after iron. Moderate Study
- ▶ Dolutegravir increases the exposure to metformin. Adjust dose. Moderate Study
- ► Mitotane is predicted to decrease the exposure to dolutegravir.

 Severe Study
- NNRTIs (efavirenz) moderately decrease the exposure to dolutegravir. Adjust dolutegravir dose, p. 696. Severe Study
- NNRTIS (etravirine) moderately decrease the exposure to dolutegravir. Adjust dolutegravir dose unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir), p. 696. [Severe] Study
- ► NNRTIs (nevirapine) are predicted to decrease the exposure to dolutegravir. Adjust dolutegravir dose, p. 696. Severe Study
- ▶ Rifamycins (rifampicin) moderately decrease the exposure to dolutegravir. Adjust dolutegravir dose, p. 696. [Severe] Study
- ► St John's wort is predicted to decrease the exposure to
- dolutegravir. Adjust dolutegravir dose, p. 696. Severe Study
 ► Sucralfate decreases the absorption of dolutegravir. Moderate

Domperidone → see TABLE 9 p. 1492 (QT-interval prolongation)

- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to domperidone. Avoid. Severe Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to domperidone. Avoid. [Severe] Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to domperidone. Avoid. [Severe] Study
- ➤ Cobicistat is predicted to increase the exposure to domperidone. Avoid. Severe Study
- ► Crizotinib is predicted to increase the exposure to domperidone. Avoid. Severe Study
- ➤ Domperidone is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (bromocriptine, cabergoline). Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to domperidone. Avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to domperidone. Avoid. Severe Study
- ► Imatinib is predicted to increase the exposure to domperidone. Avoid. |Severe| Study
- Letermovir is predicted to increase the exposure to domperidone. Avoid. Severe Study
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to domperidone. Avoid. Severe Study
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to domperidone. Avoid. [Severe] Study
- Nilotinib is predicted to increase the exposure to domperidone.
 Avoid. [Severe] Study

Donepezil → see anticholinesterases, centrally acting

 $\textbf{Dopamine} \ \, \rightarrow \text{see sympathomimetics, inotropic}$

Dopamine receptor agonists → see TABLE 8 p. 1491 (hypotension),
TABLE 9 p. 1492 (QT-interval prolongation), TABLE 10 p. 1492
(antimuscarinics)

amantadine · apomorphine · bromocriptine · cabergoline · pramipexole · quinagolide · ropinirole · rotigotine

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment with **ropinirole**.

- ➤ Apomorphine is predicted to increase the risk of severe hypotension when given with 5-HT3-receptor antagonists (granisetron, palonosetron). Severe Theoretical
- Apomorphine increases the risk of severe hypotension when given with 5-HT3-receptor antagonists (ondansetron). Avoid. [Severe] Study → Also see TABLE 9 p. 1492
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to bromocriptine. Severe Theoretical
- Antiarrhythmics (dronedarone) are predicted to increase the concentration of cabergoline. [Severe] Anecdotal
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bromocriptine.

 [Severe] Theoretical
- Antifungals, azoles (isavuconazole) are predicted to increase the exposure to pramipexole. Adjust dose. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to bromocriptine. [Severe] Study
- ➤ Antipsychotics, second generation (amisulpride, olanzapine, paliperidone, quetiapine, risperidone) are predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 9 p. 1492
- Antipsychotics, second generation (aripiprazole, clozapine) are predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 10 p. 1492
- ► Antipsychotics, second generation (asenapine) are predicted to decrease the effects of dopamine receptor agonists. Adjust dose. Moderate Theoretical → Also see TABLE 8 p. 1491
- Axitinib is predicted to increase the exposure to ropinirole.
 Moderate Theoretical
- ▶ Benperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. Moderate Theoretical → Also see TABLE 8 p. 1491
- Bupropion increases the risk of adverse effects when given with amantadine. Moderate Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bromocriptine. Severe Theoretical → Also see TABLE 8 p. 1491
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of cabergoline. [Moderate] Anecdotal → Also see TABLE 8 p. 1491
- Cobicistat increases the exposure to bromocriptine. Severe
- Cobicistat is predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- Combined hormonal contraceptives is predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
- Crizotinib is predicted to increase the exposure to bromocriptine. [Severe] Theoretical
- Crizotinib is predicted to increase the concentration of cabergoline. Moderate Anecdotal
- Dolutegravir is predicted to increase the exposure to pramipexole. Adjust dose. Moderate Study
- ➤ Domperidone is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (bromocriptine, cabergoline). Moderate Theoretical
- Dopamine receptor agonists (cabergoline) are predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine). Avoid. Moderate Theoretical → Also see TABLE 8 p. 1491
- Dopamine receptor agonists (amantadine) are predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 1491
- ► Droperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. Moderate Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 9 p. 1492

- ► Ergometrine is predicted to increase the risk of ergotism when given with cabergoline. Avoid. Moderate Theoretical
- ► Ergotamine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical
- ► Flupentixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. Moderate Theoretical → Also see TABLE 8 p. 1491
- Givosiran is predicted to increase the exposure to ropinirole.
 Use with caution and adjust dose. [Moderate] Study
- ► H₂ receptor antagonists (cimetidine) are predicted to increase the exposure to pramipexole. Adjust dose. Moderate Study
- ► Haloperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. Moderate Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 9 p. 1492 → Also see TABLE 10 p. 1492
- ► HIV-protease inhibitors increase the exposure to bromocriptine.

 Severe Study
- HIV-protease inhibitors are predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- ► Hormone replacement therapy decreases the clearance of ropinirole. Monitor and adjust dose. Moderate Study
- Idelalisib increases the exposure to bromocriptine. Severe Study
 Idelalisib is predicted to increase the concentration of cabergoline. Moderate Anecdotal
- ► Imatinib is predicted to increase the exposure to bromocriptine. Severe Theoretical
- ► Imatinib is predicted to increase the concentration of cabergoline. Moderate Anecdotal
- Letermovir is predicted to increase the exposure to bromocriptine. Severe Theoretical
- ► Loxapine is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 10 p. 1492
- ► Macrolides (clarithromycin) increase the exposure to bromocriptine. [Severe] Study
- Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of cabergoline. Avoid. Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to bromocriptine. Severe Theoretical
- Amantadine increases the risk of CNS toxicity when given with memantine. Use with caution or avoid. Severe Theoretical
- Memantine is predicted to increase the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pramipexole, quinagolide, ropinirole, rotigotine). Moderate Theoretical
- Metoclopramide is predicted to decrease the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pramipexole, quinagolide, ropinirole, rotigotine).
 Avoid. [Moderate] Study
- ► Mexiletine is predicted to increase the exposure to ropinirole. Adjust dose. Moderate Study
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to bromocriptine. Severe Theoretical
- ➤ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the concentration of cabergoline.

 [Moderate] Anecdotal
- ► Nilotinib is predicted to increase the exposure to bromocriptine. Severe Theoretical
- Nilotinib is predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- Osilodrostat is predicted to increase the exposure to ropinirole.
 Adjust dose. Moderate Study
- ► Phenothiazines are predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 9 p. 1492 → Also see TABLE 10 p. 1492
- ▶ Pimozide is predicted to decrease the effects of dopamine receptor agonists. Avoid. Moderate Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 9 p. 1492 → Also see TABLE 10 p. 1492
- ► Quinolones (ciprofloxacin) are predicted to increase the exposure to ropinirole. Adjust dose. Moderate Study
- Ranolazine is predicted to increase the exposure to pramipexole. Adjust dose. Moderate Study

A1

Dopamine receptor agonists (continued)

- Rucaparib is predicted to increase the exposure to ropinirole.
 Adjust dose. Moderate Study
- ► SSRIs (fluvoxamine) are predicted to increase the exposure to ropinirole. Adjust dose. Moderate Study
- ► Sulpiride is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 9 p. 1492
- Sympathomimetics, vasoconstrictor (isometheptene) potentially increase the risk of adverse effects when given with
- bromocriptine. Avoid. Severe Anecdotal

 ► Trimethoprim is predicted to increase the exposure to
- pramipexole. Adjust dose. Moderate Study
- Vandetanib is predicted to increase the exposure to pramipexole. Adjust dose. Moderate Study
- Vemurafenib is predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
- ➤ Zuclopenthixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. Moderate Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 9 p. 1492

Doravirine → see NNRTIs

Dorzolamide

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **dorzolamide**, the possibility of interactions should be borne in mind.

Dostarlimab → see monoclonal antibodies **Dosulepin** → see tricyclic antidepressants

Doxapram

- Aminophylline increases the risk of agitation when given with doxapram. [Moderate] Study
- MAOIs, irreversible are predicted to increase the effects of doxapram. [Moderate] Theoretical
- ► Theophylline increases the risk of agitation when given with doxapram. Moderate Study

Doxazosin → see alpha blockers

Doxepin → see tricyclic antidepressants

Doxorubicin → see anthracyclines **Doxycycline** → see tetracyclines

Doxylamine → see antihistamines, sedating

Dronabinol → see TABLE 11 p. 1492 (CNS depressant effects)

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to dronabinol. Avoid or adjust dose.
 Mildl Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dronabinol. Avoid or adjust dose. Mild Study → Also see
 TABLE 11 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dronabinol. Adjust dose.
 Mild Study
- ► Cobicistat is predicted to increase the exposure to dronabinol.

 Adjust dose. Mild Study
- HIV-protease inhibitors are predicted to increase the exposure to dronabinol. Adjust dose. Mild Study
- Idelalisib is predicted to increase the exposure to dronabinol.
 Adjust dose. Mild Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to dronabinol. Adjust dose. [Mild] Study
- ► Mitotane is predicted to decrease the exposure to dronabinol. Avoid or adjust dose. [Mild] Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to dronabinol. Avoid or adjust dose. [Mild] Study
- ► St John's wort is predicted to decrease the exposure to dronabinol. Avoid or adjust dose. [Mild] Study

Dronedarone → see antiarrhythmics

Droperidol → see TABLE 8 p. 1491 (hypotension), TABLE 9 p. 1492 (QT-interval prolongation), TABLE 11 p. 1492 (CNS depressant effects)

- Droperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. Moderate Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 9 p. 1492
- ▶ Droperidol decreases the effects of levodopa. Severe Study → Also see TABLE 8 p. 1491

Drospirenone → see TABLE 16 p. 1494 (increased serum potassium)

- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to drospirenone. Severe
- ► Cobicistat is predicted to increase the exposure to drospirenone. [Severe] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to drospirenone. Severe Study
- Idelalisib is predicted to increase the exposure to drospirenone. Severe Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to drospirenone. [Severe] Study

Drugs that cause serotonin syndrome

- ▶ Bupropion might enhance the risk of serotonin syndrome when given with drugs that cause serotonin syndrome. Severe Anecdotal
- Opioids (tapentadol) are predicted to increase the risk of serotonin syndrome when given with drugs that cause serotonin syndrome. [Severe] Theoretical

Drugs that reduce serum potassium

 Drugs that reduce serum potassium (see TABLE 17 p. 1494) are predicted to increase the risk of digoxin toxicity when given with digoxin. [Severe] Study

Drugs with anticoagulant effects

- ► Bismuth subsalicylate is predicted to increase the risk of bleeding events when given with drugs with anticoagulant effects (see TABLE 3 p. 1490). [Moderate] Theoretical
- ► Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can cabozantinib; concurrent use might increase the risk of developing this effect. Severe Theoretical
- ► Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can caplacizumab; concurrent use might increase the risk of developing this effect. Severe Theoretical
- ➤ Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can cobimetinib; concurrent use might increase the risk of developing this effect. Severe Theoretical
- ▶ Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can inotersen; concurrent use might increase the risk of developing this effect. Severe Theoretical
- Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can monoclonal antibodies (bevacizumab, trastuzumab emtansine); concurrent use might increase the risk of developing this effect. Severe Theoretical
- ➤ Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can ruxolitinib; concurrent use might increase the risk of developing this effect. Severe Theoretical
- ➤ Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can trametinib; concurrent use might increase the risk of developing this effect. [Severe] Theoretical
- Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can volanesorsen; concurrent use might increase the risk of developing this effect. Avoid depending on platelet count—consult product literature. [Severe] Theoretical

Drugs with antimuscarinic effects

► Drugs with antimuscarinic effects (see TABLE 10 p. 1492) decrease the absorption of levodopa. Moderate Theoretical

Drugs with antiplatelet effects

- ▶ Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can cabozantinib; concurrent use might increase the risk of developing this effect. Severe Theoretical
- ➤ Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can caplacizumab; concurrent use might increase the risk of developing this effect. [Severe] Theoretical
- ► Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can cobimetinib; concurrent use might increase the risk of developing this effect. [Severe] Theoretical
- ➤ Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can inotersen; concurrent use might increase the risk of developing this effect. [Severe] Theoretical
- Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can monoclonal antibodies (bevacizumab, trastuzumab emtansine); concurrent use might increase the risk of developing this effect. [Severe] Theoretical
- ➤ Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can ruxolitinib; concurrent use might increase the risk of developing this effect. [Severe] Theoretical

- ▶ Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can trametinib; concurrent use might increase the risk of developing this effect. Severe Theoretical
- Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can volanesorsen; concurrent use might increase the risk of developing this effect. Avoid depending on platelet count—consult product literature. [Severe] Theoretical

Dulaglutide → see glucagon-like peptide-1 receptor agonists

Duloxetine → see SNRIs

Dupilumab → see monoclonal antibodies

Durvalumab → see monoclonal antibodies

Dutasteride

- Antiarrhythmics (dronedarone) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dutasteride. Monitor adverse effects and adjust dose. Moderate Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to dutasteride. Mild Study
- Cobicistat is predicted to increase the exposure to dutasteride.
 Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ► Crizotinib is predicted to moderately increase the exposure to dutasteride. [Mild] Study
- HIV-protease inhibitors are predicted to increase the exposure to dutasteride. Monitor adverse effects and adjust dose.
 Moderate Theoretical
- Idelalisib is predicted to increase the exposure to dutasteride.
 Monitor adverse effects and adjust dose. Moderate Theoretical
- Imatinib is predicted to moderately increase the exposure to dutasteride. Mild Study
- ► Letermovir is predicted to moderately increase the exposure to dutasteride. [Mild] Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to dutasteride. Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ► Macrolides (erythromycin) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to moderately increase the exposure to dutasteride.
 Mild Study
- ► Nilotinib is predicted to moderately increase the exposure to dutasteride. [Mild] Study

Eculizumab → see monoclonal antibodies

Edoxaban → see factor XA inhibitors **Efavirenz** → see NNRTIs

Eicosapentaenoic acid → see TABLE 4 p. 1490 (antiplatelet effects) **Elbasyir**

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to elbasvir. Avoid. Severe Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to elbasvir. Avoid. [Severe] Study
- Dabrafenib is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study
- ► Endothelin receptor antagonists (bosentan) are predicted to moderately decrease the exposure to elbasvir. Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to elbasvir.
 Avoid. Severe Study
- Modafinil is predicted to decrease the exposure to elbasvir.
 Avoid. [Unknown] Theoretical
- ► NNRTIs (efavirenz, nevirapine) are predicted to moderately decrease the exposure to elbasvir. Avoid. Severe Study
- NNRTIs (etravirine) are predicted to decrease the exposure to elbasvir. Avoid. <u>Unknown</u> Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to elbasvir. Avoid. [Severe] Study
- ► St John's wort is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study
- ► Elbasvir with grazoprevir slightly increases the exposure to statins (atorvastatin). Adjust atorvastatin dose, p. 220. [Moderate] Study

- ► Elbasvir with grazoprevir is predicted to increase the exposure to statins (fluvastatin). Adjust fluvastatin dose, p. 220. Moderate

 Theoretical
- ► Elbasvir with grazoprevir moderately increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 221.

 [Moderate] Study
- Elbasvir with grazoprevir is predicted to increase the exposure to statins (simvastatin). Adjust simvastatin dose, p. 222.
 Moderate Theoretical
- Elbasvir is predicted to increase the concentration of sunitinib.
 Use with caution and adjust dose. Moderate Theoretical
- ► Elbasvir is predicted to increase the concentration of thrombin inhibitors (dabigatran). Moderate Theoretical

Eletriptan → see triptans

Elexacaftor

- ► Anti-androgens (apalutamide, enzalutamide) is predicted to decrease the exposure to elexacaftor. Avoid. [Severe] Theoretical
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors.
 [Severe] Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) is predicted to decrease the exposure to elexacaftor. Avoid. Severe Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with potent CYP3A4 inhibitors. [Severe] Study
- ► Elexacaftor is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). Moderate Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- Cobicistat is predicted to increase the exposure to elexacaftor.
 Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with potent CYP3A4 inhibitors. Severe Study
- ➤ Crizotinib is predicted to increase the exposure to elexacaftor.

 Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- Elexacaftor is predicted to increase the exposure to endothelin receptor antagonists (bosentan). [Moderate] Theoretical
 Grapefruit juice is predicted to increase the exposure to
- elexacaftor. Avoid. [Moderate] Theoretical

 HIV-protease inhibitors are predicted to increase the exposure
- to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with potent CYP3A4 inhibitors. Severe Study
- ► Idelalisib is predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with potent CYP3A4 inhibitors. [Severe] Study
- ► Imatinib is predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. Severe Theoretical
- ► Letermovir is predicted to increase the exposure to elexacaftor.

 Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose

 with moderate CYP3A4 inhibitors. Severe Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with potent CYP3A4 inhibitors. Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors.
 Severel Theoretical
- Elexacaftor is predicted to increase the exposure to meglitinides (repaglinide). [Moderate] Theoretical
- ► Mitotane is predicted to decreases the exposure to elexacaftor. Avoid. Severe Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to elexacaftor. Adjust

Elexacaftor (continued)

- tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. \fbox{Severe} Theoretical
- ► Nilotinib is predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. Severe Theoretical
- ▶ Rifamycins (rifabutin) are predicted to decrease the exposure to elexacaftor. Avoid. (Severe) Theoretical
- ▶ Rifamycins (rifampicin) is predicted to decrease the exposure to elexacaftor. Avoid. [Severe] Theoretical
- ► St John's wort is predicted to decrease the exposure to elexacaftor. Avoid. Severe Theoretical
- ► Elexacaftor is predicted to increase the exposure to statins (atorvastatin, pravastatin, rosuvastatin, simvastatin). Moderate Theoretical
- Elexacaftor is predicted to increase the exposure to sulfonylureas (glibenclamide). Moderate Theoretical

Eliglustat

- Eliglustat is predicted to increase the exposure to aliskiren.
 Adjust dose. Moderate Study
- ► Anti-androgens (abiraterone) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to eliglustat. Avoid. [Severe] Study
- ➤ Antiarrhythmics (dronedarone, propafenone) are predicted to increase the exposure to eliglustat. Avoid or adjust dose consult product literature. Severe Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to eliglustat. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to eliglustat. Avoid or adjust dose consult product literature. [Severe] Study
- Eliglustat is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). Adjust dose.
 [Moderate] Study
- Eliglustat is predicted to increase the exposure to atomoxetine.
 Adjust dose. Moderate Theoretical
- ► Berotralstat is predicted to increase the exposure to eliglustat.

 Adjust dose. Moderate Study
- Eliglustat is predicted to increase the exposure to beta blockers, non-selective (propranolol). Adjust dose. Moderate Study
- Eliglustat is predicted to increase the exposure to beta blockers, selective (metoprolol). Adjust dose. [Moderate] Study
- Bupropion is predicted to increase the exposure to eliglustat.
 Avoid or adjust dose—consult product literature. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to eliglustat. Avoid or adjust dose consult product literature. [Severe] Study
- Cinacalcet is predicted to increase the exposure to eliglustat.
 Avoid or adjust dose—consult product literature. [Severe] Study
- ➤ Cobicistat is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- ► Eliglustat is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1212. Severe Theoretical
- ► Crizotinib is predicted to increase the exposure to eliglustat.

 Avoid or adjust dose—consult product literature. Severe Study
- ► Dacomitinib is predicted to markedly increase the exposure to eliglustat. Avoid or adjust dose—consult product literature.

 Severe Study
- ► Eliglustat increases the exposure to digoxin. Adjust dose.

 [Moderate] Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to eliglustat. [Moderate] Theoretical
- ► Eliglustat is predicted to increase the exposure to everolimus.

 Adjust dose. [Moderate] Study
- Eliglustat is predicted to increase the exposure to factor XA inhibitors (edoxaban). Adjust dose. Moderate Study
- ► Fedratinib is predicted to increase the exposure to eliglustat.

 Monitor and adjust dose. [Moderate] Theoretical
- Givosiran is predicted to increase the exposure to eliglustat.
 Use with caution and adjust dose. [Moderate] Study

- ► Grapefruit juice is predicted to increase the exposure to eliglustat. Avoid. Severe Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to eligiustat. Avoid or adjust dose—consult product literature.

 Severe Study
- ► Idelalisib is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- ► Imatinib is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- ► Interferons (ropeginterferon alfa) are predicted to increase the
- exposure to eliglustat. Moderate Theoretical
- ▶ Letermovir is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- ► Eliglustat is predicted to increase the exposure to loperamide.

 Adjust dose. Moderate Study
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to eliglustat. Avoid or adjust dose consult product literature. Severe Study
- ► Mirabegron is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- Mitotane is predicted to decrease the exposure to eligiustat.
 Avoid. (Severe) Study
- ► Moclobemide is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature.

 Severe Theoretical
- ➤ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study
- Nilotinib is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- ► NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to eliglustat. Moderate Theoretical
- ► Quinolones (ciprofloxacin) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to eliglustat. Avoid. Severe Study
- Eliglustat is predicted to increase the exposure to sirolimus.
 Adjust dose. Moderate Study
- ➤ SNRIs (duloxetine) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature.

 Severe Study
- ► SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study
- ► St John's wort is predicted to increase the exposure to eliglustat. Avoid. [Severe] Study
- ► Eliglustat is predicted to increase the exposure to taxanes (paclitaxel). Adjust dose. Moderate Study
- ► Terbinafine is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- ► Eliglustat is predicted to increase the exposure to thrombin inhibitors (dabigatran). Adjust dose. [Moderate] Study
- ► Eliglustat is predicted to increase the exposure to tolterodine.

 Adjust dose. Moderate Theoretical
- ► Eliglustat is predicted to increase the exposure to topotecan.

 Adjust dose. Moderate Study
- ► Eliglustat is predicted to increase the exposure to tricyclic antidepressants (nortriptyline). Adjust dose. Moderate Theoretical

$\textbf{Elotuzumab} \ \, \textbf{\rightarrow} \, \text{see monoclonal antibodies}$

Eltrombopag

- ► Eltrombopag is predicted to increase the exposure to alpelisib.

 Moderate Theoretical
- Oral antacids decrease the absorption of oral eltrombopag.
 Eltrombopag should be taken 2 hours before or 4 hours after antacids. Severe) Study
- Eltrombopag is predicted to increase the exposure to berotralstat. Severe Theoretical
- Oral calcium salts decrease the absorption of eltrombopag.
 Eltrombopag should be taken 2 hours before or 4 hours after calcium salts. Severe Study
- ► Ciclosporin causes a small decrease in the exposure to eltrombopag. Monitor platelet count and adjust dose. Moderate Study

- ► Eltrombopag is predicted to increase the exposure to cladribine. Avoid or adjust dose. Moderate Theoretical
- ➤ Oral iron is predicted to decrease the absorption of oral eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after iron. [Severe] Theoretical
- ► Eltrombopag is predicted to increase the exposure to larotrectinib. [Mild] Study
- ► Eltrombopag is predicted to increase the concentration of letermovir. [Moderate] Study
- ► Eltrombopag is predicted to increase the concentration of methotrexate. [Moderate] Theoretical
- Eltrombopag is predicted to increase the exposure to the active metabolites of ozanimod. Avoid. Moderate Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to eltrombopag and eltrombopag is predicted to increase the concentration of rifamycins (rifampicin). Moderate Theoretical
- ➤ Oral selenium is predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after selenium. [Severe] Theoretical
- ► SSRIs (fluvoxamine) are predicted to increase the exposure to eltrombopag. [Moderate] Theoretical
- Eltrombopag is predicted to increase the exposure to statins.
 Monitor and adjust dose. [Moderate] Study
- Eltrombopag is predicted to increase the exposure to talazoparib. Avoid or monitor. [Moderate] Theoretical
- Eltrombopag is predicted to increase the exposure to tenofovir alafenamide. Moderate Theoretical
- Eltrombopag is predicted to increase the exposure to tenofovir disoproxil. [Moderate] Theoretical
- Eltrombopag is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- ➤ Oral zinc is predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after zinc. [Severe] Theoretical

lvitegravir

- Oral antacids decrease the exposure to oral elvitegravir.
 Separate administration by at least 4 hours. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of elvitegravir. Avoid. Severe Study
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of elvitegravir. Avoid. Severe Study
- Elvitegravir is predicted to decrease the anticoagulant effect of coumarins. Moderate Anecdotal
- ► Dabrafenib is predicted to decrease the concentration of elvitegravir. Avoid. Severe Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the concentration of elvitegravir. Avoid. Severe Theoretical
- ► Elvitegravir markedly increases the exposure to grazoprevir. Avoid. Severe Study
- ► HIV-protease inhibitors (atazanavir, lopinavir) boosted with ritonavir increase the concentration of elvitegravir. Refer to specialist literature. [Moderate] Study
- Elvitegravir boosted with ritonavir is predicted to increase the exposure to midostaurin. Severe Theoretical
- ► Mitotane is predicted to decrease the concentration of elvitegravir. Avoid. Severe Study
- ► NNRTIs (efavirenz, nevirapine) are predicted to decrease the concentration of elvitegravir. Avoid. Severe Theoretical
- Rifamycins (rifampicin) are predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Study
- St John's wort is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

Empagliflozin → see sodium glucose co-transporter 2 inhibitors **Emtricitabine** → see NRTIs

Enalapril → see ACE inhibitors

Encorafenib → see TABLE 9 p. 1492 (QT-interval prolongation)

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to encorafenib. [Severe] Theoretical → Also see TABLE 9 p. 1492
- ► Antiarrhythmics (dronedarone) are predicted to moderately increase the exposure to encorafenib. Moderate Study → Also see TABLE 9 p. 1492

- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to encorafenib. [Severe] Theoretical
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to encorafenib. [Moderate] Study → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to encorafenib. Avoid or monitor. Severe Study → Also see TABLE 9 p. 1492
- Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to encorafenib. [Moderate]

 Study
- ► Cobicistat is predicted to increase the exposure to encorafenib. Avoid or monitor. Severe Study
- ► Encorafenib is predicted to affect the exposure to combined hormonal contraceptives. Severe Theoretical
- ► Crizotinib is predicted to moderately increase the exposure to encorafenib. [Moderate] Study → Also see TABLE 9 p. 1492
- ► Encorafenib is predicted to increase the exposure to dolutegravir. Moderate Theoretical
- ► Grapefruit juice is predicted to increase the exposure to encorafenib. Avoid. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to encorafenib. Avoid or monitor. (Severe) Study
- ► Idelalisib is predicted to increase the exposure to encorafenib. Avoid or monitor. [Severe] Study
- ► Imatinib is predicted to moderately increase the exposure to encorafenib. Moderate Study
- Letermovir is predicted to moderately increase the exposure to encorafenib. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to encorafenib. Avoid or monitor. Severe Study → Also see TABLE 9 p. 1492
- Macrolides (erythromycin) are predicted to moderately increase the exposure to encorafenib. Moderate Study → Also see TABLE 9 n 1492
- ► Mitotane is predicted to decrease the exposure to encorafenib. Severe | Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to moderately increase the exposure to encorafenib.
 Moderate Study
- Nilotinib is predicted to moderately increase the exposure to encorafenib. Moderate Study → Also see TABLE 9 p. 1492
- ▶ Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of encorafenib. Avoid or monitor. Severe Theoretical
- Encorafenib is predicted to increase the exposure to raltegravir. [Moderate] Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to encorafenib. [Severe] Theoretical
- Encorafenib is predicted to increase the exposure to the active component of sacituzumab govitecan. Severe Theoretical
- ► St John's wort is predicted to decrease the exposure to encorafenib. Severe Theoretical

Endothelin receptor antagonists

ambrisentan • bosentan • macitentan

- Bosentan is predicted to decrease the exposure to acalabrutinib. Severe Study
- Anti-androgens (apalutamide, enzalutamide) affect the exposure to bosentan. Avoid. [Severe] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to macitentan. Avoid. [Severe] Study
- Bosentan is predicted to decrease the efficacy of anti-androgens (cyproterone) with ethinylestradiol (co-cyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. [Severe] Study
- Bosentan is predicted to decrease the exposure to antiandrogens (darolutamide). Avoid. Moderate Theoretical
- Bosentan is predicted to decrease the exposure to antiarrhythmics (dronedarone). Severe Theoretical
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) affect the exposure to bosentan. Avoid.

 [Severe] Study

Endothelin receptor antagonists (continued)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to macitentan. Avoid. [Severe| Study
- ► Antifungals, azoles (fluconazole) are predicted to increase the exposure to bosentan. Avoid. Severe Study
- Antifungals, azoles (itraconazole) are predicted to increase the exposure to bosentan. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to macitentan. Moderate
- Antifungals, azoles (ketoconazole) moderately increase the exposure to bosentan. [Moderate] Study
- Antifungals, azoles (voriconazole) are predicted to increase the exposure to bosentan. Avoid. Severe Theoretical
- Bosentan is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. Severe Theoretical
- Bosentan is predicted to decrease the exposure to antipsychotics, second generation (cariprazine). Avoid. Severe Theoretical
- ▶ Bosentan is predicted to decrease the exposure to antipsychotics, second generation (lurasidone). Monitor and adjust dose. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to antipsychotics, second generation (quetiapine). Moderate Study
- Bosentan is predicted to decrease the exposure to avapritinib.
 Avoid. [Severe] Study
- Bosentan is predicted to decrease the exposure to axitinib.
 Moderate Study
- Bosentan is predicted to decrease the exposure to bedaquiline.
 Avoid. [Severe] Study
- ➤ Bosentan is predicted to decrease the concentration of benzodiazepines (midazolam). Monitor and adjust dose. Moderate Theoretical
- ▶ Bosentan is predicted to decrease the exposure to bosutinib. Avoid. Severe Study
- ▶ Bosentan is predicted to decrease the exposure to brigatinib. Avoid. [Moderate] Study
- ► Bosentan is predicted to decrease the exposure to cabozantinib. [Moderate] Study
- Bosentan is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- ► Cephalosporins (ceftobiprole) are predicted to increase the exposure to bosentan. Moderate Theoretical
- Bosentan is predicted to decrease the exposure to ceritinib.
 Severe Study
- Ciclosporin moderately increases the exposure to ambrisentan.
 Adjust ambrisentan dose, p. 199. Moderatel Study
- Bosentan moderately decreases the exposure to ciclosporin and ciclosporin moderately increases the exposure to bosentan. Avoid. [Severe] Study
- Bosentan is predicted to decrease the exposure to cobicistat.
 Avoid. Severe Theoretical
- ► Cobicistat is predicted to increase the exposure to macitentan.

 Moderate Study
- ► Bosentan is predicted to decrease the exposure to cobimetinib.
- Avoid. [Severe] Theoretical

 Bosentan is predicted to decrease the efficacy of combined
- hormonal contraceptives. For FSRH guidance, see
 Contraceptives, interactions p. 859. Severe Study
 ➤ Bosentan decreases the anticoagulant effect of coumarins.
- Moderate Study
 ► Bosentan is predicted to decrease the exposure to crizotinib.

Avoid. Severe Study

- Bosentan is predicted to decrease the exposure to dabrafenib.
 [Moderate] Study
- Bosentan is predicted to decrease the exposure to dasatinib.

 | Severe| Study
- ► Bosentan is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 859.

 | Severe | Theoretical |

- ► Bosentan is predicted to decrease the exposure to dolutegravir.

 | Severe | Study |
- Bosentan is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study
- ► Elexacaftor is predicted to increase the exposure to bosentan.

 [Moderate] Theoretical
- ▶ Bosentan is predicted to decrease the exposure to eliglustat. Moderate Theoretical
- Bosentan is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- ▶ Bosentan is predicted to decrease the exposure to entrectinib. Avoid. Severe Theoretical
- ▶ Bosentan is predicted to decrease the effects of ergotamine. Moderate | Theoretical
- ► Bosentan is predicted to decrease the exposure to erlotinib.

 Severel Study
- ► Bosentan is predicted to decrease the efficacy of estradiol.

 Moderate Theoretical
- ► Bosentan is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. | Severe | Theoretical |
- ► Bosentan is predicted to decrease the concentration of everolimus. Avoid or adjust dose. Severe Study
- Bosentan is predicted to decrease the exposure to fedratinib.
 Avoid. Moderate Study
- ▶ Bosentan is predicted to decrease the exposure to gefitinib. Avoid. Severe Study
- ▶ Bosentan is predicted to decrease the exposure to glasdegib. Avoid or adjust glasdegib dose, p. 1087. Moderate Theoretical
- Bosentan is predicted to decrease the exposure to glecaprevir.
 Avoid. Severe Study
- ► Bosentan is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ➤ Bosentan is predicted to decrease the concentration of guanfacine. Adjust dose. Moderate Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to bosentan. [Severe] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to macitentan. [Moderate] Study
- Bosentan is predicted to decrease the effects of hormone replacement therapy. Moderate Anecdotal
- ► Bosentan is predicted to decrease the exposure to ibrutinib.

 Avoid or monitor. Severe Study
- ▶ Bosentan is predicted to decrease the exposure to idelalisib. Avoid. Moderate Theoretical
- ► Idelalisib is predicted to increase the exposure to macitentan.

 [Moderate] Study
- ► Bosentan is predicted to decrease the exposure to imatinib.

 [Moderate] Study
- ► Bosentan is predicted to decrease the exposure to ivacaftor.

 [Moderate] Study
- ▶ Bosentan is predicted to decrease the exposure to lapatinib. Avoid. Severe Study
- Bosentan is predicted to decrease the exposure to larotrectinib. Avoid. Moderate Study
- ► Leflunomide is predicted to increase the exposure to bosentan.

 Moderate Study
- ► Letermovir is predicted to increase the concentration of bosentan. Moderate Theoretical
- ▶ Bosentan is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- ► Macrolides (clarithromycin) are predicted to increase the exposure to bosentan. Moderate Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to macitentan. [Moderate] Study
- ▶ Bosentan is predicted to decrease the exposure to maraviroc. Avoid. Moderate Theoretical
- ➤ Bosentan is predicted to decrease the exposure to midostaurin and midostaurin is predicted to increase the exposure to bosentan. Severe Study
- ► Bosentan is predicted to decrease the exposure to mifepristone. Severe Theoretical
- ▶ Mitotane affects the exposure to bosentan. Avoid. Severe Study

- Mitotane is predicted to decrease the exposure to macitentan. Avoid. |Severe| Study
- Bosentan is predicted to decrease the exposure to neratinib.
 Severel Study
- Bosentan is predicted to decrease the exposure to neurokinin-1 receptor antagonists (aprepitant). [Moderate] Study
- ▶ Bosentan is predicted to decrease the exposure to neurokinin-1 receptor antagonists (fosaprepitant, netupitant). Moderate Theoretical
- ▶ Bosentan is predicted to decrease the exposure to nilotinib. Avoid. Severe Theoretical
- ► Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of bosentan. Severe Theoretical
- Bosentan is predicted to decrease the exposure to NNRTIs (doravirine). Avoid or adjust doravirine p. 699 or lamivudine with tenofovir disoproxil and doravirine p. 709 dose. (Severe) Theoretical
- ► Bosentan is predicted to decrease the exposure to NNRTIS (etravirine). Avoid. [Severe] Study
- ► Bosentan is predicted to decrease the exposure to NNRTIS (nevirapine). Severe Theoretical
- ► Bosentan is predicted to decrease the exposure to NNRTIS (rilpivirine). Avoid. [Severe] Theoretical
- Bosentan is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Anecdotal
- Bosentan is predicted to decrease the exposure to olaparib.
 Avoid. Moderate Theoretical
- Bosentan decreases the exposure to opioids (methadone).
 Monitor and adjust dose. Severe Study
- Bosentan is predicted to decrease the exposure to osimertinib.
 Use with caution or avoid. [Severe] Study
- ▶ Bosentan is predicted to decrease the exposure to ospemifene. Moderate | Study
- Bosentan is predicted to decrease the exposure to pazopanib.

 Severe | Study
- ► Bosentan is predicted to decrease the exposure to pemigatinib.

 Avoid or monitor. [Severe] Study
- Bosentan decreases the exposure to phosphodiesterase type-5 inhibitors. Moderate Study
- Bosentan is predicted to decrease the exposure to pibrentasvir.
 Avoid. | Severe | Study
- ► Bosentan is predicted to decrease the exposure to ponatinib.

 [Severe] Study
- ► Bosentan is predicted to decrease the exposure to regorafenib.

 Severe Study
- Bosentan is predicted to decrease the exposure to ribociclib.
 Moderate Study
- Rifamycins (rifampicin) transiently increase the exposure to ambrisentan. [Moderate] Study
- Rifamycins (rifampicin) affect the exposure to bosentan. Avoid.
 Severe Study
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to macitentan. Avoid. [Severe] Study
 ▶ Roxadustat is predicted to increase the exposure to bosentan.
- Monitor adverse effects and adjust dose. Moderate Study

 Rosentan is predicted to decrease the exposure to ruxolitinih
- Bosentan is predicted to decrease the exposure to ruxolitinib.
 Monitor and adjust dose. Moderate Study
- Bosentan is predicted to decrease the exposure to selpercatinib. Moderate Study
- Bosentan is predicted to decrease the exposure to selumetinib.
 Avoid. Severe Study
- ▶ Bosentan is predicted to decrease the exposure to siponimod. Manufacturer advises caution depending on genotype consult product literature. [Severe] Theoretical
- ► Bosentan is predicted to decrease the concentration of sirolimus and sirolimus potentially increases the concentration of bosentan. Avoid. Severe Theoretical
- ► Bosentan is predicted to decrease the exposure to sorafenib.

 [Moderate] Study
- ► St John's wort is predicted to decrease the exposure to bosentan. Avoid. Moderate Theoretical
- ► St John's wort is predicted to decrease the exposure to macitentan. Avoid. Severe Theoretical

- ► Bosentan is predicted to decrease the exposure to statins (atorvastatin, simvastatin). Moderate Study
- ▶ Bosentan increases the risk of hepatotoxicity when given with sulfonylureas (glibenclamide). Avoid. Severe Study
- Bosentan is predicted to decrease the exposure to sunitinib.
 Moderate Study
- ▶ Bosentan is predicted to decrease the concentration of tacrolimus and tacrolimus potentially increases the concentration of bosentan. Avoid. Severel Theoretical
- ► Bosentan is predicted to decrease the exposure to taxanes (cabazitaxel). [Moderate] Theoretical
- ► Bosentan is predicted to decrease the exposure to taxanes (docetaxel). Severe Theoretical
- ► Bosentan is predicted to decrease the exposure to taxanes (paclitaxel). Avoid. Severe Study
- ► Bosentan is predicted to decrease the concentration of temsirolimus. Avoid. Severe Theoretical
- ► Teriflunomide is predicted to increase the exposure to bosentan. Moderate Study
- ► Bosentan is predicted to decrease the exposure to ticagrelor.

 Moderate | Theoretical
- Bosentan is predicted to decrease the exposure to tofacitinib.
 Moderate Study
- ► Bosentan decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 859. Severe
- Bosentan is predicted to decrease the exposure to vandetanib.
 Moderate Study
- Bosentan is predicted to decrease the exposure to velpatasvir.
 Avoid. [Moderate] Theoretical
- Vemurafenib is predicted to increase the exposure to ambrisentan. Use with caution or avoid. [Moderate] Theoretical
- ► Bosentan is predicted to decrease the exposure to vemurafenib. Severe Study
- ▶ Bosentan is predicted to decrease the exposure to venetoclax. Avoid. Severe Study
- ▶ Venetoclax is predicted to increase the exposure to bosentan. Moderate Theoretical
- Bosentan is predicted to decrease the concentration of voxilaprevir. Avoid. Severel Theoretical

Enoxaparin → see low molecular-weight heparins

Entacapone

- ➤ Oral entacapone is predicted to decrease the absorption of oral iron. Separate administration by at least 2 hours. [Moderate]
 Theoretical
- Entacapone increases the exposure to levodopa. Monitor adverse effects and adjust dose. [Moderate] Study
- Entacapone is predicted to increase the risk of elevated blood pressure when given with MAOIs, irreversible. Avoid. Severe
- Entacapone is predicted to increase the exposure to methyldopa. [Moderate] Theoretical
- Entacapone is predicted to increase the risk of cardiovascular adverse effects when given with sympathomimetics, inotropic.
 Moderatel Theoretical
- Entacapone is predicted to increase the risk of cardiovascular adverse effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] Study

Enteral feeds

- ► Aluminium hydroxide increases the risk of blocked enteral or nasogastric tubes when given with enteral feeds. Moderate
- Enteral feeds decrease the absorption of antiepileptics (phenytoin). [Severe] Study
- ► Enteral feeds (vitamin-K containing) potentially decrease the anticoagulant effect of coumarins. Severe Anecdotal
- ► Enteral feeds (vitamin-K containing) potentially decrease the effects of phenindione. [Severe] Theoretical
- ► Enteral feeds decrease the exposure to quinolones (ciprofloxacin). Moderate Study
- ➤ Sucralfate increases the risk of blocked enteral or nasogastric tubes when given with enteral feeds. Separate administration by 1 hour. [Moderate] Study

Enteral feeds (continued)

 Enteral feeds decrease the exposure to theophylline. Moderate Study

Entrectinib → see TABLE 9 p. 1492 (QT-interval prolongation)

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to entrectinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. [Severe] Theoretical → Also see TABLE 9 p. 1492
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to entrectinib. Avoid. [Severe] Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056.
 [Severe] Theoretical → Also see TABLE 9 p. 1492
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to entrectinib. Avoid potent CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. [Severe] Study → Also see TABLE 9 p. 1492
- Entrectinib slightly increases the exposure to benzodiazepines (midazolam). [Mild] Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. [Severe] Theoretical
- ► Entrectinib is predicted to increase the exposure to ciclosporin.

 [Mild] Theoretical
- Cobicistat is predicted to increase the exposure to entrectinib.
 Avoid potent CYP3A4 inhibitors or adjust entrectinib dose,
 p. 1056. Severe Study
- ➤ Crizotinib is predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. Severe Theoretical → Also see TABLE 9 p. 1492
- Dabrafenib is predicted to decrease the exposure to entrectinib. Avoid. Severe Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to entrectinib. Avoid. [Severe] Theoretical
- ► Entrectinib is predicted to increase the exposure to ergotamine. Mild Theoretical
- ► Entrectinib is predicted to increase the exposure to everolimus.

 [Mild] Theoretical
- Grapefruit is predicted to increase the exposure to entrectinib.
 Avoid. [Severe] Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to entrectinib. Avoid potent CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. [Severe] Study
- Idelalisib is predicted to increase the exposure to entrectinib.
 Avoid potent CYP3A4 inhibitors or adjust entrectinib dose,
 p. 1056. [Severe] Study
- ► Imatinib is predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. Severe Theoretical
- ▶ Letermovir is predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to entrectinib. Avoid potent CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. Severe Study → Also see TABLE 9 p. 1492
- Macrolides (erythromycin) are predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. [Severe] Theoretical → Also see
 TABLE 9 p. 1492
- Mitotane is predicted to decrease the exposure to entrectinib.
 Avoid. Severe Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056.
 [Severe] Theoretical
- Nilotinib is predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. Severe Theoretical → Also see TABLE 9 p. 1492

- ► NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to entrectinib. Avoid. Severe Theoretical → Also see TABLE 9 p. 1492
- Entrectinib is predicted to increase the exposure to opioids (alfentanil, fentanyl). [Mild] Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to entrectinib. Avoid. (Severe) Study
- Entrectinib is predicted to increase the exposure to sirolimus.
 [Mild] Theoretical
- St John's wort is predicted to decrease the exposure to entrectinib. Avoid. [Severe] Theoretical
- ► Entrectinib is predicted to increase the exposure to temsirolimus. [Mild] Theoretical

Enzalutamide → see anti-androgens

Ephedrine → see sympathomimetics, vasoconstrictor

Epirubicin → see anthracyclines

Eplerenone → see aldosterone antagonists

Epoetin alfa → see TABLE 5 p. 1491 (thromboembolism), TABLE 16 p. 1494 (increased serum potassium)

Epoetin beta → see TABLE 5 p. 1491 (thromboembolism), TABLE 16 p. 1494 (increased serum potassium)

Epoetin zeta → see TABLE 5 p. 1491 (thromboembolism), TABLE 16 p. 1494 (increased serum potassium)

Epoprostenol -> see TABLE 8 p. 1491 (hypotension), TABLE 4 p. 1490 (antiplatelet effects)

Eprosartan → see angiotensin-II receptor antagonists

Eptifibatide → see TABLE 3 p. 1490 (anticoagulant effects) **Ergocalciferol** → see vitamin D substances

Ergometrine

- ► Antiarrhythmics (dronedarone) are predicted to increase the risk of ergotism when given with ergometrine. Severe

 Theoretical
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergometrine. Severe Theoretical
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- Antifungals, azoles (miconazole) are predicted to increase the exposure to ergometrine. Avoid. [Moderate] Theoretical
- ▶ Beta blockers, non-selective are predicted to increase the risk of peripheral vasoconstriction when given with ergometrine. |Severe| Study
- ➤ Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergometrine.

 Severel Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergometrine.

 Severe Theoretical
- ► Cobicistat is predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- ► Crizotinib is predicted to increase the risk of ergotism when given with ergometrine. Severe Theoretical
- Ergometrine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (cabergoline). Avoid.
 Moderate Theoretical
- ► Esketamine is predicted to increase the risk of elevated blood pressure when given with ergometrine. Avoid. Severe

 Theoretical
- ► Grapefruit juice is predicted to increase the exposure to ergometrine. [Severe] Theoretical
- ► HIV-protease inhibitors are predicted to increase the risk of ergotism when given with ergometrine. Avoid. Severe Theoretical
- ► Idelalisib is predicted to increase the risk of ergotism when given with ergometrine. Avoid. Severe Theoretical
- ► Imatinib is predicted to increase the risk of ergotism when given with ergometrine. Severe Theoretical
- Ketamine is predicted to increase the risk of elevated blood pressure when given with ergometrine. Severe Theoretical
- ► Letermovir is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. Severe

 Theoretical

- Macrolides (erythromycin) are predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the risk of ergotism when given with ergometrine. Severe Theoretical
- Nilotinib is predicted to increase the risk of ergotism when given with ergometrine. Severe Theoretical
- ► Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of ergometrine. Avoid. (Severe) Theoretical
- Olaparib might alter the exposure to ergometrine. Moderate
 Theoretical
- ► Ergometrine potentially increases the risk of peripheral vasoconstriction when given with sympathomimetics, inotropic (dopamine). Avoid. [Severe] Anecdotal
- Ergometrine is predicted to increase the risk of peripheral vasoconstriction when given with sympathomimetics, vasoconstrictor (noradrenaline/norepinephrine). [Severe] Anecdotal

Ergotamine

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the effects of ergotamine. Moderate Theoretical
- ► Antiarrhythmics (dronedarone) are predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of ergotamine. Moderate Theoretical
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- Antifungals, azoles (miconazole) are predicted to increase the exposure to ergotamine. Avoid. [Moderate] Theoretical
- ► Berotralstat is predicted to increase the exposure to ergotamine. [Moderate] Study
- ▶ Beta blockers, non-selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. [Severe] Study
- Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine.
 Severe | Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergotamine.

 [Severe] Theoretical
- Ceritinib is predicted to increase the exposure to ergotamine.
 Avoid. Severe Theoretical
- Cobicistat is predicted to increase the risk of ergotism when given with ergotamine. Avoid. Severe Theoretical
- Crizotinib is predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- ▶ Dabrafenib is predicted to decrease the effects of ergotamine. Moderate Theoretical
- ► Ergotamine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the effects of ergotamine. Moderate Theoretical
- ► Entrectinib is predicted to increase the exposure to ergotamine. Mild Theoretical
- Fedratinib is predicted to increase the exposure to ergotamine.
 Monitor and adjust dose. Moderate Theoretical
- ► Grapefruit juice is predicted to increase the exposure to ergotamine. Severe Theoretical
- HIV-protease inhibitors are predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- ergotism when given with **ergotamine**. Avoid. [Severe] Theoretic Idelalisib is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ► Imatinib is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- ► Larotrectinib is predicted to increase the exposure to ergotamine. Use with caution and adjust dose. [Mild] Theoretical
- ► Letermovir is predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- Lorlatinib is predicted to decrease the exposure to ergotamine.
 Avoid. [Moderate] Theoretical

- Macrolides (clarithromycin) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. Severe Theoretical
- Macrolides (erythromycin) are predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- ► Mifepristone is predicted to increase the exposure to ergotamine. Severe Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- ► Nilotinib is predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of ergotamine. Avoid. Severe Theoretical
- ► NNRTIs (efavirenz, nevirapine) are predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- ► Olaparib might alter the exposure to ergotamine. Moderate Theoretical
- Palbociclib is predicted to increase the exposure to ergotamine. Adjust dose. [Moderate] Theoretical
- ► Ribociclib (high-dose) is predicted to increase the exposure to ergotamine. Avoid. Moderate Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the effects of ergotamine. Moderate Theoretical
- Rucaparib is predicted to increase the exposure to ergotamine.
 Monitor and adjust dose. Moderate Study
- Selpercatinib is predicted to increase the exposure to ergotamine. Avoid. [Moderate] Study
- Sotorasib is predicted to decrease the exposure to ergotamine.
 Avoid or adjust dose. [Moderate] Theoretical
- St John's wort is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Ticagrelor is predicted to increase the exposure to ergotamine.
 Avoid. Severe Theoretical
- Triptans (almotriptan) are predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after almotriptan. (Severe) Theoretical
- ► Triptans (eletriptan) increase the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours.

 Severe Study
- ➤ Triptans (frovatriptan, naratriptan) are predicted to increase the risk of vasoconstriction when given with ergotamine.

 Separate administration by 24 hours. (Severe Theoretical
- Triptans (rizatriptan) are predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after rizatriptan. [Severe] Theoretical
- ► Triptans (sumatriptan) increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after sumatriptan. [Severe] Study
- Triptans (zolmitriptan) are predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after zolmitriptan. [Severe] Theoretical
- Eribulin → see TABLE 15 p. 1493 (myelosuppression), TABLE 12 p. 1493 (peripheral neuropathy), TABLE 9 p. 1492 (QT-interval prolongation)

Erlotinib

FOOD AND LIFESTYLE Dose adjustment may be necessary if smoking started or stopped during treatment.

- ➤ Oral antacids are predicted to decrease the absorption of oral erlotinib. Erlotinib should be taken 2 hours before or 4 hours after antacids. Moderate Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 1057. Severe Study
- Antiarrhythmics (amiodarone) are predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to erlotinib. Moderate Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 1057. [Severe] Study

Erlotinib (continued)

- Antiepileptics (eslicarbazepine) are predicted to decrease the exposure to erlotinib. Severe Theoretical
- Antiepileptics (oxcarbazepine) decrease the exposure to erlotinib. Severe Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to erlotinib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to erlotinib. Use with caution and adjust dose. Severe Study
- ► Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with aspirin (high-dose). Severe

 Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to erlotinib. Moderate Study
- Oral calcium salts (calcium carbonate) -containing antacids are predicted to decrease the absorption of oral erlotinib. Erlotinib should be taken 2 hours before or 4 hours after antacids.
 [Moderate] Theoretical
- ► Ciclosporin is predicted to increase the exposure to erlotinib. Moderate Theoretical
- Cobicistat is predicted to increase the exposure to erlotinib.
 Use with caution and adjust dose. Severe Study
- Combined hormonal contraceptives are predicted to increases the exposure to erlotinib. Monitor adverse effects and adjust dose. [Moderate] Study
- Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with corticosteroids. Severe Theoretical
 Erlotinib increases the anticoagulant effect of coumarins.
- Severe Anecdotal
 ➤ Crizotinib is predicted to increase the exposure to erlotinib.

 Moderate | Study
- Dabrafenib is predicted to decrease the exposure to erlotinib.

 | Severe | Study |
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to erlotinib. Severe Study
- ► Grapefruit juice is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- ► H₂ receptor antagonists are predicted to decrease the exposure to erlotinib. Erlotinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to erlotinib. Use with caution and adjust dose. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to erlotinib. Use with caution and adjust dose. [Severe] Study
- ► Imatinib is predicted to increase the exposure to erlotinib. Moderate Study
- Ivacaftor is predicted to increase the exposure to erlotinib.
 Moderate Theoretical
- Lapatinib is predicted to increase the exposure to erlotinib.
 Moderate Theoretical
- ► Letermovir is predicted to increase the exposure to erlotinib.

 Moderate Study
- Macrolides (azithromycin) are predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to erlotinib. Use with caution and adjust dose. [Severe]
- ► Macrolides (erythromycin) are predicted to increase the exposure to erlotinib. [Moderate] Study
- Mexiletine are predicted to increases the exposure to erlotinib.
 Monitor adverse effects and adjust dose. [Moderate] Study
- ► Mitotane is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 1057. Severe Study
- Neratinib is predicted to increase the exposure to erlotinib.
 [Moderate] Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to erlotinib. Moderate Study
- ► Nilotinib is predicted to increase the exposure to erlotinib. Moderate Study
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to erlotinib. Severel Study
- ► Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. [Severe] Theoretical

- ➤ Osilodrostat are predicted to increases the exposure to erlotinib. Monitor adverse effects and adjust dose. Moderate Study
- ► Erlotinib is predicted to increase the risk of bleeding events when given with phenindione. Severe Theoretical
- Proton pump inhibitors are predicted to decrease the exposure to erlotinib. Avoid. Moderate Study
- Quinolones (ciprofloxacin) are predicted to increase the exposure to erlotinib. Monitor adverse effects and adjust dose.
 Moderatel Study
- ► Ranolazine is predicted to increase the exposure to erlotinib.

 Moderate | Theoretical
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 1057. (Severe) Study
- Rucaparib are predicted to increases the exposure to erlotinib.
 Monitor adverse effects and adjust dose. Moderate Study
- Erlotinib is predicted to increase the exposure to the active component of sacituzumab govitecan. Severe Theoretical
- Oral sodium bicarbonate-containing antacids are predicted to decrease the absorption of oral erlotinib. Erlotinib should be taken 2 hours before or 4 hours after antacids. [Moderate]
- ➤ Sodium zirconium cyclosilicate is predicted to decrease the exposure to erlotinib. Separate administration by at least 2 hours. Moderate Theoretical
- ➤ SSRIs (fluvoxamine) are predicted to increase the exposure to erlotinib. Monitor adverse effects and adjust dose. [Moderate]
 Theoretical
- ► St John's wort is predicted to decrease the exposure to erlotinib. Severe Study
- Vandetanib is predicted to increase the exposure to erlotinib.
 Moderate Theoretical
- ▶ Vemurafenib are predicted to increases the exposure to erlotinib. Monitor adverse effects and adjust dose. Moderate Study

Ertapenem → see carbapenems

 $\textbf{Ertugliflozin} \ \, \rightarrow \text{see sodium glucose co-transporter 2 inhibitors}$

Erythromycin → see macrolides

Escitalopram → see SSRIs

Esketamine → see TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects)

- Esketamine is predicted to increase the risk of seizures when given with aminophylline. Avoid. Severe Theoretical
- ▶ Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to esketamine. Adjust dose. Moderate Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to esketamine. Adjust dose. Moderate Theoretical → Also see TABLE 11 p. 1492
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to esketamine. Adjust dose. Moderate Study
- ► Cobicistat is predicted to increase the exposure to esketamine. Adjust dose. Moderate Study
- Esketamine is predicted to increase the risk of elevated blood pressure when given with ergometrine. Avoid. Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to esketamine. Adjust dose. [Moderate] Study
- ► Idelalisib is predicted to increase the exposure to esketamine.

 Adjust dose. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to esketamine. Adjust dose. [Moderate] Study
- ► Mitotane is predicted to decrease the exposure to esketamine. Adjust dose. Moderate Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to esketamine. Adjust dose. [Moderate] Theoretical
- Esketamine is predicted to increase the risk of seizures when given with theophylline. Avoid. Severe Theoretical

Eslicarbazepine → see antiepileptics

Esmolol → see beta blockers, selective

Esomeprazole → see proton pump inhibitors

Ectradial

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of estradiol. [Moderate] Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the efficacy of estradiol. [Moderate] Theoretical
- HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of estradiol. [Moderate] Theoretical
- Modafinil is predicted to decrease the efficacy of estradiol.
 Moderate Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant) are predicted to decrease the efficacy of estradiol. Moderate

 Theoretical
- ► NNRTIS (efavirenz, nevirapine) are predicted to decrease the efficacy of estradiol. [Moderate] Theoretical
- Rifamycins are predicted to decrease the efficacy of estradiol.
 Moderate Theoretical

Estramustine → see alkylating agents

Etanercept

- Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Avoid. [Severe] Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with etanercept. Avoid.
 Severel Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. UKHSA advises avoid (refer to Green Book). <u>Severe</u> Theoretical
- Monoclonal antibodies (sarilumab) might cause severe infection and neutropenia when given with etanercept. Severe Theoretical

Etelcalcetid

- ► Cinacalcet increases the risk of hypocalcaemia when given with etelcalcetide. Avoid. Severe Theoretical
- Etelcalcetide might increase the risk of hypocalcaemia when given with denosumab. Severe Theoretical

Ethambutol

► Isoniazid increases the risk of optic neuropathy when given with ethambutol. Severe Anecdotal

Ethinylestradiol

► Fostemsavir increases the concentration of ethinylestradiol from a combined hormonal contraceptive. Adjust dose—consult product literature. Severe Study

Ethosuximide → see antiepileptics

Etodolac → see NSAIDs

Etomidate → see TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects)

Etonogestrel

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of subdermal etonogestrel. Moderate | Theoretical
- Cobicistat is predicted to increase the concentration of subdermal etonogestrel. [Moderate] Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- ► Griseofulvin decreases the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Anecdotal
- ► HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- ► HIV-protease inhibitors are predicted to increase the concentration of subdermal etonogestrel. [Moderate] Theoretical
- ► Idelalisib is predicted to increase the concentration of subdermal etonogestrel. Moderate Theoretical
- ► Lumacaftor might decrease the efficacy of subdermal etonogestrel. Use additional contraceptive precautions. Severe

- ► Macrolides (clarithromycin) are predicted to increase the concentration of subdermal etonogestrel. [Moderate] Theoretical
- ► Modafinil is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severel Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- ► NNRTIs (efavirenz, nevirapine) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- ► Rifamycins are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- ➤ St John's wort is predicted to decrease the efficacy of etonogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- ► Sugammadex is predicted to decrease the efficacy of etonogestrel. Use additional contraceptive precautions. Severe

 Theoretical
- ► Etonogestrel might decrease the efficacy of ulipristal and ulipristal might decrease the efficacy of etonogestrel. Avoid.

 Severel Theoretical

Etoposide → see TABLE 15 p. 1493 (myelosuppression)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of etoposide. Moderate Study
- ► Ciclosporin increases the exposure to etoposide. Monitor and adjust dose. Severe Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etoposide. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ► Neurokinin-1 receptor antagonists (netupitant) slightly increase the exposure to etoposide. Moderate Study

Etoricoxib → see NSAIDs

Etravirine → see NNRTIS

Everolimus

- Abrocitinib might increase the exposure to everolimus.
 Moderate Theoretical
- ► Everolimus potentially increases the risk of angioedema when given with ACE inhibitors. [Severe] Anecdotal
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. Severe Study
- ➤ Antiarrhythmics (dronedarone) are predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of everolimus. Avoid or adjust dose. Moderate Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to everolimus. Avoid.

 | Severe | Study |
- ► Berotralstat is predicted to increase the concentration of everolimus. Monitor and adjust dose. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of everolimus. Avoid or adjust dose. <u>Moderate</u> Study
- ► Cenobamate is predicted to decrease the exposure to everolimus. Adjust dose. [Moderate] Theoretical
- Ceritinib is predicted to increase the exposure to everolimus.
 Moderate Theoretical
- ► Ciclosporin moderately increases the exposure to everolimus. Avoid or adjust dose. Severe Study
- ► Cobicistat is predicted to increase the exposure to everolimus.

 Avoid. Severe Study
- ► Crizotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the concentration of everolimus. Avoid or adjust dose. Severe Study

Everolimus (continued)

- Eliglustat is predicted to increase the exposure to everolimus.
 Adjust dose. [Moderate] Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. Severe Study
- Entrectinib is predicted to increase the exposure to everolimus.
 Mild Theoretical
- Fedratinib is predicted to increase the exposure to everolimus.
 Monitor and adjust dose. Moderate Theoretical
- ► Grapefruit juice is predicted to increase the exposure to everolimus. Avoid. Severe Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to everolimus. Avoid. [Severe] Study
- ► Ibrutinib is predicted to increase the exposure to everolimus. Separate administration by at least 6 hours. Moderate Theoretical
- Idelalisib is predicted to increase the exposure to everolimus.
 Avoid. Severe Study
- Imatinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- ► Ivacaftor is predicted to increase the exposure to everolimus. Moderate Study
- Lapatinib is predicted to increase the exposure to everolimus.
 Moderate | Theoretical
- Letermovir is predicted to increase the concentration of everolimus. Avoid or adjust dose. Moderate Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with everolimus. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Everolimus is predicted to increase the exposure to lomitapide.
 Separate administration by 12 hours. Mild Theoretical
- Lorlatinib is predicted to decrease the exposure to everolimus.
 Avoid. Moderate Study
- ► Lumacaftor is predicted to decrease the exposure to everolimus. Avoid. [Severe] Theoretical
- ► Macrolides (clarithromycin) are predicted to increase the exposure to everolimus. Avoid. Severe Study
- ► Macrolides (erythromycin) are predicted to increase the concentration of everolimus. Avoid or adjust dose. Moderate Study
- ► Mifepristone is predicted to increase the exposure to everolimus. Severe Theoretical
- Mirabegron is predicted to increase the exposure to everolimus. Mild Theoretical
- ► Mitotane is predicted to decrease the concentration of everolimus. Avoid or adjust dose. Severe Study
- Neratinib is predicted to increase the exposure to everolimus.
 Moderate Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the concentration of everolimus. Avoid or adjust dose. Moderate Study
- Nilotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of everolimus. Severe Theoretical
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. Severe Study
- ► Olaparib might increase the exposure to everolimus. Moderate
 Theoretical
- ➤ Osimertinib is predicted to increase the exposure to everolimus. [Moderate] Study
- Palbociclib is predicted to increase the exposure to everolimus.
 Adjust dose. Moderate Theoretical
- ▶ Pemigatinib might increase the exposure to everolimus. Separate administration by at least 6 hours. Moderate Theoretical
- Pibrentasvir with glecaprevir is predicted to increase the exposure to everolimus. Moderate Study
- Pitolisant is predicted to decrease the exposure to everolimus.
 Avoid. Severe Theoretical
- Ribociclib is predicted to increase the exposure to everolimus.
 Use with caution and adjust dose. Moderate Theoretical

- ▶ Rifamycins (rifampicin) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. Severe Study
- ➤ Selpercatinib is predicted to increase the exposure to everolimus. Avoid. Moderate Study
- ► Sotorasib is predicted to increase the exposure to everolimus. Avoid or adjust dose. [Moderate] Study
- ► St John's wort is predicted to decrease the concentration of everolimus. Avoid or adjust dose. Severe Study
- Tepotinib is predicted to increase the concentration of everolimus. Severe Study
- ► Tucatinib is predicted to increase the exposure to everolimus. Avoid or adjust dose. [Moderate] Theoretical
- ► Vandetanib is predicted to increase the exposure to everolimus. [Moderate] Study
- ► Velpatasvir is predicted to increase the exposure to everolimus. Severe Theoretical
- ► Vemurafenib is predicted to increase the exposure to everolimus. Use with caution and adjust dose. [Severe] Theoretical
- ► Venetoclax is predicted to increase the exposure to everolimus. Avoid or adjust dose. Severe Study

Exemestane

- Anti-androgens (apalutamide, enzalutamide) moderately decrease the exposure to exemestane. Moderate Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to exemestane. Moderatel Study
- Mitotane moderately decreases the exposure to exemestane.
 Moderate Study
- ► Rifamycins (rifampicin) moderately decrease the exposure to exemestane. [Moderate] Study
- St John's wort is predicted to decrease the exposure to exemestane. [Moderate] Theoretical

Exenatide → see glucagon-like peptide-1 receptor agonists

- ► Ciclosporin moderately increases the exposure to ezetimibe and ezetimibe slightly increases the exposure to ciclosporin.

 Moderatel Study
- ► Fibrates are predicted to increase the risk of gallstones when given with ezetimibe. Severe Theoretical

Factor XA inhibitors → see TABLE 3 p. 1490 (anticoagulant effects)

apixaban • edoxaban • fondaparinux • rivaroxaban

- ► Abrocitinib might increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). [Moderate] Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to apixaban. [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to rivaroxaban. Avoid unless patient
- can be monitored for signs of thrombosis. Severe Study

 Antiarrhythmics (amiodarone) slightly increase the exposure to edoxaban. Severe Study
- Antiarrhythmics (amiodarone) might increase the exposure to rivaroxaban. Moderate Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to apixaban. [Moderate] Theoretical
- Antiarrhythmics (dronedarone) slightly increase the exposure to edoxaban. Adjust edoxaban dose, p. 138. Severe Study
- Adjust edoxadan dose, p. 138. [Severe] Study
 Antiarrhythmics (dronedarone) might increase the exposure to rivaroxaban. Avoid. [Moderate] Study
- Antiepileptics (carbamazepine) are predicted to decrease the exposure to edoxaban. Moderate Study
- Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ➤ Antiepileptics (carbamazepine, phenytoin) are predicted to decrease the exposure to apixaban. Use with caution or avoid.

 [Severe] Study
- Antiepileptics (fosphenytoin) are predicted to decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Theoretical
- ► Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to edoxaban. Severe Theoretical
- Antiepileptics (fosphenytoin, primidone) are predicted to decrease the exposure to apixaban. Severe Study

- Antiepileptics (oxcarbazepine) are predicted to decrease the exposure to rivaroxaban. Severe Study
- ► Antiepileptics (phenobarbital) are predicted to decrease the exposure to apixaban. Use with caution or avoid. Severe

 Anecdotal
- ► Antifungals, azoles (fluconazole) might increase the risk of bleeding when given with apixaban. [Moderate] Study
- ► Antifungals, azoles (itraconazole) are predicted to increase the exposure to edoxaban. [Severe] Theoretical
- Antifungals, azoles (ketoconazole) slightly increase the exposure to edoxaban. Adjust edoxaban dose, p. 138. Severe Study
- Antifungals, azoles (posaconazole, voriconazole) are predicted to increase the exposure to apixaban. Avoid. [Moderate] Theoretical
- Antifungals, azoles (posaconazole, voriconazole) are predicted to increase the exposure to rivaroxaban. Avoid. Severe Theoretical
- Antifungals, azoles (itraconazole) are predicted to increase the exposure to factor XA inhibitors (apixaban, rivaroxaban). Avoid. [Severe] Theoretical
- ► Antifungals, azoles (ketoconazole) moderately increase the exposure to factor XA inhibitors (apixaban, rivaroxaban). Avoid. [Severe] Study
- ► Aspirin (high-dose) increases the exposure to edoxaban.

 Avoid. Severe Study
- ► Berotralstat is predicted to increase the concentration of factor XA inhibitors (edoxaban, rivaroxaban). Monitor and adjust dose. Moderate | Study
- ► Calcium channel blockers (verapamil) are predicted to increase the exposure to apixaban. Moderate Theoretical
- Calcium channel blockers (verapamil) slightly increase the exposure to edoxaban. Severe Study
- Ceritinib is predicted to increase the exposure to edoxaban.
 Moderate Theoretical
- ► Ciclosporin is predicted to increase the exposure to apixaban. Moderate Theoretical
- Ciclosporin slightly increases the exposure to edoxaban. Adjust edoxaban dose, p. 138. Severe Study
- Ciclosporin slightly increases the exposure to rivaroxaban.
 Moderate Study
- Cobicistat is predicted to increase the exposure to factor XA inhibitors (apixaban, edoxaban, rivaroxaban). Avoid. Severe Theoretical
- ► Eliglustat is predicted to increase the exposure to edoxaban.

 Adjust dose. Moderate Study
- ► HIV-protease inhibitors (atazanavir) boosted with ritonavir are predicted to increase the exposure to apixaban. Severe

 Theoretical
- ► HIV-protease inhibitors (atazanavir, fosamprenavir, tipranavir) boosted with ritonavir are predicted to increase the exposure to rivaroxaban. Avoid. Severe Theoretical
- ► HIV-protease inhibitors (darunavir) boosted with ritonavir or cobicistat are predicted to increase the exposure to apixaban. Avoid. [Severe] Theoretical
- ► HIV-protease inhibitors (darunavir) boosted with ritonavir are predicted to increase the exposure to rivaroxaban. Avoid.

 [Severe] Anecdotal
- ► HIV-protease inhibitors (fosamprenavir, tipranavir) boosted with ritonavir are predicted to increase the exposure to apixaban.

 Moderate Theoretical
- ► HIV-protease inhibitors (lopinavir) boosted with ritonavir are predicted to slightly increase the exposure to edoxaban.

 [Severe] Theoretical
- ► HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to anivahan. Avoid (Source) Theoretical
- exposure to apixaban. Avoid. Severe Theoretical

 HIV-protease inhibitors (ritonavir) are predicted to slightly
- increase the exposure to edoxaban. [Severe] Theoretical
 ► HIV-protease inhibitors (ritonavir) moderately increase the exposure to rivaroxaban. Avoid. [Severe] Study
- ► HIV-protease inhibitors (lopinavir) boosted with ritonavir are predicted to increase the exposure to factor XA inhibitors (apixaban, rivaroxaban). Avoid. Severe Theoretical
- ► Ibrutinib is predicted to increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Separate administration by at least 6 hours. [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to apixaban.
 Moderate Theoretical

- ► Ivacaftor is predicted to increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Moderate Study
- Lapatinib is predicted to increase the exposure to apixaban.
 Moderate Theoretical
- Lapatinib is predicted to slightly increase the exposure to edoxaban. Severe Theoretical
- ► Lorlatinib is predicted to decrease the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Moderate Study
- Macrolides (azithromycin, clarithromycin) are predicted to increase the exposure to edoxaban. [Severe] Theoretical
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to apixaban. [Moderate] Theoretical
- Macrolides (clarithromycin) slightly increase the exposure to apixaban. [Moderate] Study
- ► Macrolides (erythromycin) slightly increase the exposure to edoxaban. Adjust edoxaban dose, p. 138. Severe Study
- ► Macrolides (erythromycin) slightly increase the exposure to rivaroxaban. Mild Study
- ► Mirabegron is predicted to increase the exposure to edoxaban.

 Mild Theoretical
- Mitotane is predicted to decrease the exposure to apixaban.
 Moderate Study
- Mitotane is predicted to decrease the exposure to rivaroxaban.
 Avoid unless patient can be monitored for signs of thrombosis. |Severe| Study
- Neratinib is predicted to increase the exposure to apixaban. [Moderate] Theoretical
- Neratinib is predicted to increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). [Moderate] Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of factor XA inhibitors (apixaban, rivaroxaban).
 Avoid. [Severe] Theoretical
- ► NNRTIs (nevirapine) are predicted to decrease the exposure to rivaroxaban. Severe Anecdotal
- Olaparib might increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Moderate Theoretical
- Osimertinib is predicted to increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Moderate Study
- ► Pemigatinib might increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Separate administration by at least 6 hours. [Moderate] Theoretical
- Pibrentasvir with glecaprevir is predicted to increase the exposure to edoxaban. [Moderate] Study
- ▶ Pitolisant is predicted to decrease the exposure to edoxaban.

 [Mild] Theoretical
- Ranolazine is predicted to increase the exposure to apixaban.
 Moderate Theoretical
- ► Ranolazine is predicted to slightly increase the exposure to edoxaban. Severe Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to apixaban. Use with caution or avoid. Severe Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to edoxaban. Moderate Study
- ➤ Rifamycins (rifampicin) are predicted to decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- Sotorasib is predicted to increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Avoid or adjust dose.
 Moderate Study
- ► St John's wort is predicted to decrease the exposure to apixaban. Use with caution or avoid. Severe Study
- ► St John's wort is predicted to decrease the exposure to edoxaban. Moderate Study
- St John's wort is predicted to decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ► Tepotinib is predicted to increase the concentration of factor XA inhibitors (edoxaban, rivaroxaban). Severe Study
- ► Tucatinib is predicted to increase the exposure to edoxaban. Avoid or adjust dose. Moderate Theoretical
- ► Tucatinib is predicted to increase the exposure to rivaroxaban.

 Use with caution and adjust dose. [Moderate] Theoretical
- Vandetanib is predicted to increase the exposure to apixaban.
 Moderate Theoretical

Factor XA inhibitors (continued)

- Vandetanib is predicted to increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Moderate Study
- Velpatasvir is predicted to increase the exposure to edoxaban.
 Severe Theoretical
- Vemurafenib is predicted to increase the exposure to apixaban.
 Moderate Theoretical
- Vemurafenib is predicted to slightly increase the exposure to edoxaban. Severe Theoretical
- Vemurafenib might increase the exposure to rivaroxaban. Use with caution and adjust dose. Moderate Theoretical
- ▶ Venetoclax is predicted to increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Avoid or adjust dose. Severe Study
- ➤ Voxilaprevir with sofosbuvir and velpatasvir is predicted to increase the concentration of edoxaban. Avoid. Severe

 Theoretical

Famciclovir

► Famciclovir is predicted to decrease the efficacy of live vaccines (herpes-zoster vaccine, live). Moderate Theoretical

Famotidine → see H₂ receptor antagonists

Fampridine

- Dolutegravir might increase the concentration of fampridine.
 Avoid. Severe Theoretical
- H₂ receptor antagonists (cimetidine) increase the concentration of fampridine. Avoid. (Severe) Theoretical

Febuxostat

- Febuxostat is predicted to increase the exposure to azathioprine. Avoid. Severe Theoretical
- Febuxostat is predicted to increase the exposure to mercaptopurine. Avoid. Severe Theoretical

Fedratinib

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to fedratinib. Avoid. [Moderate] Study
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to fedratinib. Monitor and adjust dose. Moderate Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fedratinib. Avoid. Moderate Study
- ► Antifungals, azoles (fluconazole) are predicted to increase the exposure to fedratinib. Avoid. [Moderate] Theoretical
- ► Antifungals, azoles (isavuconazole, posaconazole) are predicted to increase the exposure to fedratinib. Monitor and adjust dose. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fedratinib. Adjust fedratinib dose, but avoid depending on other drugs taken consult product literature, p. 1060. [Moderate] Study
- Fedratinib is predicted to increase the exposure to atomoxetine. Monitor and adjust dose. Moderate Theoretical
- Fedratinib moderately increases the exposure to benzodiazepines (midazolam). Monitor and adjust dose.
 Moderatel Study
- Fedratinib moderately increases the exposure to beta blockers, selective (metoprolol). Monitor and adjust dose. Moderate Study
- Fedratinib is predicted to increase the exposure to beta blockers, selective (nebivolol). Monitor and adjust dose.
 Moderate Theoretical
- ➤ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fedratinib. Monitor and adjust dose. Moderate) Study
- ► Cobicistat is predicted to increase the exposure to fedratinib.

 Adjust fedratinib dose, but avoid depending on other drugs taken—consult product literature, p. 1060. [Moderate] Study
- Crizotinib is predicted to increase the exposure to fedratinib.
 Monitor and adjust dose. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to fedratinib. Avoid. Moderate Study
- ► Fedratinib is predicted to increase the exposure to eliglustat.

 Monitor and adjust dose. [Moderate] Theoretical
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to fedratinib. Avoid. Moderate Study
- Fedratinib is predicted to increase the exposure to ergotamine.
 Monitor and adjust dose. Moderate Theoretical

- Fedratinib is predicted to increase the exposure to everolimus.
 Monitor and adjust dose. Moderate Theoretical
- ► Grapefruit and grapefruit juice is predicted to increase the exposure to fedratinib. Avoid. [Moderate] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to fedratinib. Adjust fedratinib dose, but avoid depending on other drugs taken—consult product literature, p. 1060.
 Moderatel Study
- ► Idelalisib is predicted to increase the exposure to fedratinib. Adjust fedratinib dose, but avoid depending on other drugs taken—consult product literature, p. 1060. Moderate Study
- Imatinib is predicted to increase the exposure to fedratinib.
 Monitor and adjust dose. Moderate Study
- ► Letermovir is predicted to increase the exposure to fedratinib.

 Monitor and adjust dose. Moderate Study
- Macrolides (clarithromycin) are predicted to increase the exposure to fedratinib. Adjust fedratinib dose, but avoid depending on other drugs taken—consult product literature, p. 1060. [Moderate] Study
- ► Macrolides (erythromycin) are predicted to increase the exposure to fedratinib. Monitor and adjust dose. [Moderate] Study
- Mitotane is predicted to decrease the exposure to fedratinib.
 Avoid. [Moderate] Study
- ➤ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to fedratinib. Monitor and adjust dose. [Moderate] Study
- Nilotinib is predicted to increase the exposure to fedratinib.
 Monitor and adjust dose. Moderate Study
- ► NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to fedratinib. Avoid. [Moderate] Study
- ► Fedratinib is predicted to increase the exposure to opioids (alfentanil). Monitor and adjust dose. [Moderate] Theoretical
- ► Fedratinib moderately increases the exposure to proton pump inhibitors (omeprazole). Monitor and adjust dose. Moderate Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to fedratinib. Avoid. [Moderate] Study
- Fedratinib is predicted to increase the exposure to sirolimus.
 Monitor and adjust dose. [Moderate] Theoretical
- ➤ SSRIs (fluoxetine) are predicted to increase the exposure to fedratinib. Avoid depending on other drugs taken—consult product literature. [Moderate] Theoretical
- SSRIs (fluvoxamine) are predicted to increase the exposure to fedratinib. Avoid. [Moderate] Theoretical
- St John's wort is predicted to decrease the exposure to fedratinib. Avoid. [Moderate] Study
- ► Fedratinib is predicted to increase the exposure to temsirolimus (oral). Monitor and adjust dose. Moderate Theoretical

Felbinac → see NSAIDs

Felodipine → see calcium channel blockers

Fenfluramine → see TABLE 13 p. 1493 (serotonin syndrome)
Fenfluramine might decrease blood glucose concentrations

when given with acarbose. Moderate Theoretical

- Antiepileptics (carbamazepine) are predicted to decrease the concentration of fenfluramine. Adjust dose. [Severe] Theoretical
- Antiepileptics (stiripentol) (given with clobazam, and with or without valproate) modestly increase the exposure to
- fenfluramine. Adjust fenfluramine dose, p. 341. Severe Study

 ➤ Antihistamines, sedating (cyproheptadine) might decrease the efficacy of fenfluramine. Severe Theoretical
- ► Fenfluramine might decrease blood glucose concentrations when given with dipeptidylpeptidase-4 inhibitors. Moderate Theoretical
- Fenfluramine might decrease blood glucose concentrations when given with glucagon-like peptide-1 receptor agonists.
 Moderate Theoretical
- Fenfluramine might decrease blood glucose concentrations when given with insulin. Moderate Theoretical
- ► Fenfluramine might decrease blood glucose concentrations when given with meglitinides. Moderate Theoretical
- ► Fenfluramine might decrease blood glucose concentrations when given with metformin. Moderate Theoretical

- Fenfluramine might decrease blood glucose concentrations when given with pioglitazone. Moderate Theoretical
- Rifamycins (rifampicin) are predicted to decrease the concentration of fenfluramine. [Severe] Theoretical
- ► Fenfluramine might decrease blood glucose concentrations when given with sodium glucose co-transporter 2 inhibitors.

 Moderate Theoretical
- Fenfluramine might decrease blood glucose concentrations when given with sulfonylureas. [Moderate] Theoretical

Fenofibrate → see fibrates

Fentanyl → see opioids

Fesoterodine → see TABLE 10 p. 1492 (antimuscarinics)

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to fesoterodine. Avoid. Moderate Study
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Mild] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Miid] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to fesoterodine.
 Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 840. Severe Study
- ➤ Antipsychotics, second generation (clozapine) can cause constipation, as can fesoterodine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- ► Bupropion is predicted to increase the exposure to fesoterodine. Use with caution and adjust dose. [Mild] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Mild] Study
- ► Cinacalcet is predicted to increase the exposure to fesoterodine. Use with caution and adjust dose. Mild Theoretical
- Cobicistat is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 840.
- Crizotinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Mild] Study
- HIV-protease inhibitors are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 840. [Severe] Study
- Idelalisib is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 840.
 Severel Study
- ► Imatinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. Mild Study
- ► Letermovir is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Mild] Study
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 840. Severel Study
- Macrolides (erythromycin) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Miid] Study
- Mitotane is predicted to decrease the exposure to fesoterodine.
 Avoid. Moderate Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to fesoterodine. Adjust

- fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Mild] Study
- Nilotinib is predicted to increase the exposure to fesoterodine.
 Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. Mild Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- ➤ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to fesoterodine. Use with caution and adjust dose.

 [Mild] Theoretical
- ► St John's wort is predicted to decrease the exposure to fesoterodine. Avoid. Severe Theoretical
- ► Terbinafine is predicted to increase the exposure to fesoterodine. Use with caution and adjust dose. [Wild] Theoretical Fexofenadine → see antihistamines, non-sedating Fibrates

bezafibrate · ciprofibrate · fenofibrate · gemfibrozil

- Acipimox is predicted to increase the risk of rhabdomyolysis when given with fibrates. Severe Theoretical
- ► Oral antacids decrease the exposure to oral gemfibrozil.

 [Moderate] Study
- ► Gemfibrozil slightly increases the exposure to anti-androgens (apalutamide). [Mild] Study
- ► Gemfibrozil moderately increases the exposure to antiandrogens (enzalutamide). Avoid or adjust enzalutamide dose, p. 1023. [Severe] Study
- ► Bezafibrate is predicted to increase the risk of nephrotoxicity when given with ciclosporin. Severe Theoretical
- Fenofibrate increases the risk of nephrotoxicity when given with ciclosporin. [Severe] Study
- ► Colchicine increases the risk of rhabdomyolysis when given with fibrates. Severe Anecdotal
- ► Fibrates are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. Severe Study
- ► Gemfibrozil is predicted to increase the exposure to
- dabrafenib. Moderate Theoretical
 ➤ Fibrates are predicted to increase the risk of rhabdomyolysis when given with daptomycin. Severe Theoretical
- Fibrates are predicted to increase the risk of gallstones when given with ezetimibe. [Severe] Theoretical
- Fibrates are predicted to increase the risk of hypoglycaemia when given with insulin. Moderate Theoretical
- Gemfibrozil is predicted to increase the exposure to irinotecan.
 Avoid. [Moderate] Theoretical
- ► Gemfibrozil is predicted to increase the concentration of letermovir. [Moderate] Study
- Gemfibrozil increases the exposure to meglitinides (repaglinide). Avoid. Severe Study
- Gemfibrozil is predicted to moderately increase the exposure to montelukast. Moderate Study
- ► Gemfibrozil is predicted to increase the exposure to the active metabolites of ozanimod. [Moderate] Study
- ► Fibrates are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe] Study
- ► Gemfibrozil increases the exposure to pioglitazone. Monitor blood glucose and adjust dose. Severe Study
- ▶ Gemfibrozil is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1356. Moderate Theoretical
- Gemfibrozil increases the concentration of retinoids (bexarotene). Avoid. Severe Study
- ► Gemfibrozil moderately increases the exposure to roxadustat.

 Monitor haemoglobin and adjust dose. [Moderate] Study
- Gemfibrozil increases the exposure to selexipag. Avoid. Severe Study
- Ciprofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin). Avoid or adjust dose. <u>Severe</u> Study
- ► Fenofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin). Monitor and adjust fenofibrate dose, p. 217. [Severe] Anecdotal
- ► Bezafibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, fluvastatin). [Severe] Study
- ► Ciprofibrate increases the risk of rhabdomyolysis when given with statins (fluvastatin). (Severe) Study

Fibrates (continued)

- Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (fluvastatin). Use with caution and adjust fenofibrate dose, p. 217. [Severe] Theoretical
- Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (pravastatin). Avoid. Severe Theoretical
- Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (pravastatin). Avoid.
 Severe Study
- Fenofibrate increases the risk of rhabdomyolysis when given with statins (rosuvastatin). Adjust fenofibrate and rosuvastatin doses, p. 217, p. 221. [Severe] Anecdotal
- ► Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (rosuvastatin). Adjust rosuvastatin dose, p. 221. [Severe] Study
- ► Fenofibrate increases the risk of rhabdomyolysis when given with statins (simvastatin). Adjust fenofibrate dose, p. 217. Severe
- ► Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (simvastatin). Adjust simvastatin dose, p. 222. Severe Study
- ► Gemfibrozil increases the risk of rhabdomyolysis when given with statins. Avoid. Severe Anecdotal
- ► Fibrates are predicted to increase the risk of hypoglycaemia when given with sulfonylureas. Moderate Theoretical
- Gemfibrozil is predicted to increase the concentration of taxanes (paclitaxel). Severe Anecdotal
- Gemfibrozil increases the exposure to treprostinil. Adjust dose.
 Moderate Study
 Gemfibrozil is predicted to increase the exposure to tucatinib.
- Avoid or adjust tucatinib dose, p. 1085. Severe Study
- ► Fibrates are predicted to decrease the efficacy of ursodeoxycholic acid. Avoid. Severe Theoretical

Fidaxomicin

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Calcium channel blockers (verapamil) are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Ciclosporin is predicted to increase the exposure to fidaxomicin. Avoid. Moderate Study
- ► HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to fidaxomicin. Avoid. Moderate Study
- Ivacaftor is predicted to increase the exposure to fidaxomicin.
 Avoid. Moderate Study
- ► Lapatinib is predicted to increase the exposure to fidaxomicin.

 Avoid. Moderatel Study
- Macrolides are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Neratinib is predicted to increase the exposure to fidaxomicin.
 Avoid. Moderate Study
- Ranolazine is predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Rucaparib is predicted to increase the exposure to fidaxomicin.
 Avoid. Moderate Study
- Vandetanib is predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Vemurafenib is predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study

Filgotinib

- Filgotinib is predicted to increase the risk of immunosuppression when given with abatacept. Avoid. [Severe] Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with anakinra. Avoid. Severe Theoretical
- ► Filgotinib is predicted to increase the risk of immunosuppression when given with azathioprine. Avoid.

 [Severe] Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with baricitinib. Avoid. [Severe] Theoretical

- ► Filgotinib is predicted to increase the risk of immunosuppression when given with ciclosporin. Avoid.

 Severe | Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with etanercept. Avoid.
 Severe Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with leflunomide. Avoid.
 Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with filgotinib. Avoid. Severe Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with monoclonal antibodies (adalimumab, certolizumab pegol, golimumab, infiliximab, rituximab, sarilumab, secukinumab, tocilizumab). Avoid. Severe Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with tacrolimus. Avoid.
 Severe Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with teriflunomide. Avoid.
 Severe Theoretical
- Filgotinib is predicted to increase the risk of immunosuppression when given with tofacitinib. Avoid.
 Severe Theoretical
- Fingolimod → see TABLE 6 p. 1491 (bradycardia), TABLE 9 p. 1492 (QT-interval prolongation)
- ► Live vaccines might increase the risk of generalised infection (possibly life-threatening) when given with fingolimod.

 UKHSA advises avoid (refer to Green Book). [Severe] Theoretical
- ► Monoclonal antibodies (alemtuzumab) are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fingolimod. Avoid. Severe Theoretical
- ► St John's wort is predicted to decrease the exposure to fingolimod. Avoid. [Moderate] Theoretical

Flavoxate → see TABLE 10 p. 1492 (antimuscarinics)

➤ Antipsychotics, second generation (clozapine) can cause constipation, as can flavoxate; concurrent use might increase the risk of developing intestinal obstruction. [Severe] Theoretical → Also see TABLE 10 p. 1492

Flecainide → see antiarrhythmics **Flucloxacillin** → see penicillins

Fluconazole → see antifungals, azoles

Flucytosine

- Amphotericin B increases the risk of toxicity when given with flucytosine. [Severe] Study
- Cytarabine decreases the concentration of flucytosine. Avoid.
 Severe Study
- ► NRTIs (zidovudine) increase the risk of haematological toxicity when given with flucytosine. Monitor and adjust dose. Severe Theoretical

Fludarabine → see TABLE 15 p. 1493 (myelosuppression)

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fludarabine. UKHSA advises avoid (refer to Green Book).
 Severej Theoretical
- ► Fludarabine increases the risk of pulmonary toxicity when given with pentostatin. Avoid. Severe Study → Also see TABLE 15 n. 1493

Fludrocortisone → see corticosteroids

Fluocinolone

- With intravitreal use of fluocinolone in adults: caution with concurrent administration of anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage).
- Interactions do not generally apply to corticosteroids used for topical action unless specified.

Fluorouracii → see TABLE 15 p. 1493 (myelosuppression), TABLE 5 p. 1491 (thromboembolism)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **fluorouracil**, the possibility of interactions should be borne in mind.

- ► Fluorouracil increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal
- ► Fluorouracil increases the anticoagulant effect of coumarins.

 Severe Anecdotal
- ► Folates (folic acid) are predicted to increase the risk of toxicity when given with fluorouracil. Avoid. [Severe] Theoretical
- ► Folates (folinic acid) are predicted to increase the risk of toxicity when given with fluorouracil. Monitor and adjust dose. Severe Theoretical
- ► H₂ receptor antagonists (cimetidine) slightly increase the exposure to fluorouracil. [Severe] Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fluorouracil. UKHSA advises avoid (refer to Green Book).
 Severel Theoretical
- ► Methotrexate potentially increases the risk of severe skin reaction when given with topical fluorouracil. [Severe] Anecdotal → Also see TABLE 15 p. 1493 → Also see TABLE 5 p. 1491
- Metronidazole increases the risk of toxicity when given with fluorouracil. Severe Study

Fluoxetine → see SSRIs

Flupentixol → see TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects)

- Antipsychotics, second generation (clozapine) can cause constipation, as can flupentixol; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492
- ► Flupentixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. Moderate Theoretical → Also see TABLE 8 p. 1491
- ► Flupentixol decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. Severe Theoretical → Also see TABLE 8 p. 1491

Flurazepam → see benzodiazepines **Flurbiprofen** → see NSAIDs

Flutamide → see anti-androgens

Fluticasone → see corticosteroids

Fluvastatin → see statins

Fluvoxamine → see SSRIs

Folates

folic acid · folinic acid · levofolinic acid

- Folates are predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Monitor concentration and adjust dose. Severe Study
- ► Folates are predicted to increase the risk of toxicity when given with capecitabine. Severe Anecdotal
- ► Folic acid is predicted to increase the risk of toxicity when given with fluorouracil. Avoid. [Severe] Theoretical
- Folinic acid is predicted to increase the risk of toxicity when given with fluorouracil. Monitor and adjust dose. Severe Theoretical
- Folates are predicted to alter the effects of raltitrexed. Avoid.
 Moderate Study
- Sulfasalazine is predicted to decrease the absorption of folates.
 Moderate Study
- ► Folates are predicted to increase the risk of toxicity when given with tegafur. Severe Theoretical

Folic acid → see folates

Folinic acid → see folates

Fondaparinux → see factor XA inhibitors

Formoterol → see beta₂ agonists

Fosamprenavir → see HIV-protease inhibitors

 $\textbf{Fosaprepitant} \ \, \textbf{\rightarrow} \, \text{see neurokinin-1 receptor antagonists}$

Foscarnet → see TABLE 2 p. 1490 (nephrotoxicity)

Foscarnet increases the risk of hypocalcaemia when given with pentamidine. Severe Anecdotal → Also see TABLE 2 p. 1490

Fosinopril → see ACE inhibitors

Fosphenytoin → see antiepileptics

Fostamatinib

 Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to fostamatinib. Avoid. [Severe] Study

- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fostamatinib. Avoid. [Severe] Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose. [Moderate] Study
- Antifungals, azoles (posaconazole) are predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ► Calcium channel blockers (diltiazem) are predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose. Moderate Theoretical
- ► Cobicistat is predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose.

 Moderate | Study
- ► Fostamatinib potentially alters the anticoagulant effect of coumarins (warfarin). Moderate Theoretical
- Fostamatinib slightly increases the exposure to digoxin.
 Monitor digoxin concentration and adjust dose, p. 117.
 Moderate Study
- ► Grapefruit juice is predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose. Moderate Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose.
 [Moderate] Study
- ► Idelalisib is predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose. Moderate Study
- Macrolides (clarithromycin) are predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose. [Moderate] Study
- Mitotane is predicted to decrease the exposure to fostamatinib.
 Avoid. Severe Study
 - ▶ Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of fostamatinib. Monitor adverse effects and adjust dose. [Moderate] Theoretical
 - ► Rifamycins (rifampicin) are predicted to decrease the exposure to fostamatinib. Avoid. [Severe] Study
 - ► Fostamatinib slightly increases the exposure to statins (rosuvastatin). Moderate Study
 - ► Fostamatinib slightly increases the exposure to statins (simvastatin). Monitor adverse effects and adjust dose.

 Moderate | Study

Fostemsavir

- ➤ Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to the active metabolite of fostemsavir. Avoid. [Severe] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to the active metabolite of fostemsavir. Avoid. Severe Study
- ► Fostemsavir increases the concentration of ethinylestradiol from a combined hormonal contraceptive. Adjust dose—consult product literature. | Severe| Study
- ► Fostemsavir is predicted to increase the exposure to grazoprevir. Avoid. Severe Theoretical
- Mitotane is predicted to decrease the exposure to the active metabolite of fostemsavir. Avoid. Severe Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to the active metabolite of fostemsavir. Avoid. Severe Study
- ► St John's wort is predicted to decrease the exposure to the active metabolite of fostemsavir. Avoid. Severe Study
- Fostemsavir is predicted to increase the exposure to statins (atorvastatin, fluvastatin, simvastatin). Adjust starting dose and monitor. [Severe] Theoretical
- Fostemsavir increases the exposure to statins (rosuvastatin).
 Adjust starting dose and monitor. [Severe] Study
- Fostemsavir is predicted to increase the exposure to tenofovir alafenamide. Adjust dose—consult product literature.
 Moderate Theoretical

Frovatriptan → see triptans

Fulvestrant → see TABLE 5 p. 1491 (thromboembolism)

Furosemide \rightarrow see loop diuretics

Fusidate

 Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of fusidate. Avoid. Moderate Theoretical

Fusidate (continued)

 Fusidate has been reported to cause rhabdomyolysis when given with statins. Avoid. Severe Anecdotal

Gabapentin → see antiepileptics

Galantamine → see anticholinesterases, centrally acting

Ganciclovir → see TABLE 15 p. 1493 (myelosuppression), TABLE 2 p. 1490 (nephrotoxicity)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Ganciclovir is predicted to increase the risk of seizures when given with carbapenems (imipenem). Avoid. [Severe] Anecdotal
- ► Leflunomide is predicted to increase the exposure to ganciclovir. [Moderate] Theoretical → Also see TABLE 15 p. 1493
- Mycophenolate is predicted to increase the risk of haematological toxicity when given with ganciclovir. [Moderate] Theoretical
- Nitisinone is predicted to increase the exposure to ganciclovir.
 Moderate Study
- Teriflunomide is predicted to increase the exposure to ganciclovir. Moderate Study

Gefitinih

- Oral antacids are predicted to decrease the exposure to oral gefitinib. Moderate Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to gefitinib. Moderate Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- Antiepileptics (eslicarbazepine) are predicted to decrease the exposure to gefitinib. [Moderate] Theoretical
- Antiepileptics (oxcarbazepine) decrease the exposure to gefitinib. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole)
 are predicted to increase the exposure to gefitinib. [Moderate]
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to gefitinib. (Severe) Study
- ► Bupropion is predicted to increase the exposure to gefitinib.

 Moderate Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to gefitinib. [Moderate] Study
- ➤ Oral calcium salts (calcium carbonate) -containing antacids are predicted to decrease the exposure to oral gefitinib. Moderate

 Theoretical
- Cinacalcet is predicted to increase the exposure to gefitinib.
 Moderate Theoretical
- Cobicistat is predicted to increase the exposure to gefitinib.
 Severe Study
- Gefitinib is predicted to increase the anticoagulant effect of coumarins. Severel Anecdotal
 Severel Anecdotal
- ► Crizotinib is predicted to increase the exposure to gefitinib. Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to gefitinib. Avoid. Severe Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- H₂ receptor antagonists are predicted to slightly to moderately decrease the exposure to gefitinib. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to gefitinib. Severe Study
- ► Idelalisib is predicted to increase the exposure to gefitinib.

 Severe Study
- ► Imatinib is predicted to increase the exposure to gefitinib.

 [Moderate] Study
- ▶ Letermovir is predicted to increase the exposure to gefitinib. Moderate Study
- Macrolides (clarithromycin) are predicted to increase the exposure to gefitinib. Severel Study
- Macrolides (erythromycin) are predicted to increase the exposure to gefitinib. [Moderate] Study
- Mitotane is predicted to decrease the exposure to gefitinib.
 Avoid. Severe Study

- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to gefitinib. Moderate Study
- Nilotinib is predicted to increase the exposure to gefitinib.
 Moderate Study
- ► NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to gefitinib. Avoid. Severe Study
- ► Gefitinib is predicted to increase the risk of bleeding events when given with phenindione. Severe Theoretical
- ► Proton pump inhibitors are predicted to decrease the exposure to gefitinib. (Severe) Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to gefitinib. Avoid. (Severe) Study
- ► Gefitinib is predicted to increase the exposure to the active component of sacituzumab govitecan. Severe Theoretical
- Oral sodium bicarbonate -containing antacids are predicted to decrease the exposure to oral gefitinib. Moderate Theoretical
- ➤ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to gefitinib. Moderate Theoretical
- ► St John's wort is predicted to decrease the exposure to gefitinib. Avoid. Severe Study
- ► Terbinafine is predicted to increase the exposure to gefitinib.

 [Moderate] Theoretical
- Gefitinib might affect the exposure to vemurafenib. Moderate
 Theoretical

Gemcitabine → see TABLE 15 p. 1493 (myelosuppression)

 Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with gemcitabine. UKHSA advises avoid (refer to Green Book).
 Severej Theoretical

Gemfibrozil → see fibrates

Gemtuzumab ozogamicin → see TABLE 15 p. 1493 (myelosuppression)

Gentamicin → see aminoglycosides

Gilteritinib

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to gilteritinib. [Moderate] Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the exposure to gilteritinib. Avoid.

 [Severe] Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to gilteritinib. [Moderate] Study
- ► Calcium channel blockers (verapamil) are predicted to increase the exposure to gilteritinib. [Moderate] Theoretical
- ► Ciclosporin is predicted to increase the exposure to gilteritinib.

 Moderate Theoretical
- ► Cobicistat is predicted to increase the exposure to gilteritinib.

 Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to gilteritinib. Moderate Study
- ► Idelalisib is predicted to increase the exposure to gilteritinib. Moderate Study
- ► Ivacaftor is predicted to increase the exposure to gilteritinib.

 Moderate Theoretical
- Lapatinib is predicted to increase the exposure to gilteritinib.
 Moderate Theoretical
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to gilteritinib. [Moderate] Theoretical
- ► Macrolides (clarithromycin) are predicted to increase the exposure to gilteritinib. [Moderate] Study
- Neratinib is predicted to increase the exposure to gilteritinib.
 Moderate Theoretical
- ► Ranolazine is predicted to increase the exposure to gilteritinib. Moderate Theoretical
- ▶ Rifamycins (rifampicin) moderately decrease the exposure to gilteritinib. Avoid. Severe Study
- ► Gilteritinib is predicted to decrease the efficacy of SSRIs (escitalopram, fluoxetine, sertraline). Avoid. Moderate
 Theoretical
- ► St John's wort is predicted to decrease the exposure to gilteritinib. Avoid. [Severe Study
- ▶ Vandetanib is predicted to increase the exposure to gilteritinib. Moderate Theoretical
- Vemurafenib is predicted to increase the exposure to gilteritinib. [Moderate] Theoretical

Givociran

- Givosiran is predicted to increase the exposure to agomelatine.
 Use with caution and adjust dose. [Moderate] Study
- ► Givosiran is predicted to increase the exposure to atomoxetine.

 Use with caution and adjust dose. Moderate Study
- ► Givosiran is predicted to increase the exposure to beta blockers, selective (nebivolol). Use with caution and adjust dose.

 Moderate| Study
- Givosiran is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Use with caution and adjust dose.
 Moderate Study
- ► Givosiran is predicted to increase the exposure to eliglustat.

 Use with caution and adjust dose. Moderate Study
- Givosiran is predicted to increase the exposure to MAO-B inhibitors (rasagiline). Use with caution and adjust dose.
 Moderate Study
- Givosiran is predicted to increase the exposure to melatonin.
 Use with caution and adjust dose. Moderate Study
- ► Givosiran is predicted to increase the exposure to SNRIs (duloxetine). Use with caution and adjust dose. Moderate Study
- Givosiran is predicted to increase the exposure to tizanidine.
 Use with caution and adjust dose. [Moderate] Study

Glasdegib → see TABLE 9 p. 1492 (QT-interval prolongation) ► Anti-androgens (apalutamide, enzalutamide) are predicted to

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to glasdegib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to glasdegib. Avoid. Severe Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to glasdegib. Use with caution or avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (posaconazole) are predicted to increase the exposure to glasdegib. Use with caution or avoid. [Severe]
- ► Cobicistat is predicted to increase the exposure to glasdegib.

 Use with caution or avoid. Severe Study
- ► Dabrafenib is predicted to decrease the exposure to glasdegib.

 Avoid or adjust glasdegib dose, p. 1087. Moderate Theoretical
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to glasdegib. Avoid or adjust glasdegib
- dose, p. 1087. [Moderate] Theoretical

 ► Grapefruit juice is predicted to increase the exposure to glasdegib. Use with caution or avoid. [Moderate] Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to glasdegib. Use with caution or avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to glasdegib.

 Use with caution or avoid. [Severe] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to glasdegib. Use with caution or avoid. Severe Study → Also see TABLE 9 p. 1492
- Mitotane is predicted to decrease the exposure to glasdegib.
 Avoid. Severel Study
- Modafinil is predicted to decrease the exposure to glasdegib.
 Avoid or adjust glasdegib dose, p. 1087. Moderate Theoretical
- NNRTIs (efavirenz, etravirine, nevirapine) are predicted to decrease the exposure to glasdegib. Avoid or adjust glasdegib dose, p. 1087. [Moderate] Theoretical → Also see TABLE 9 p. 1492
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to glasdegib. Avoid. [Severe] Study
- ➤ St John's wort is predicted to decrease the exposure to glasdegib. Avoid or adjust glasdegib dose, p. 1087. Moderate

 Theoretical

Glecaprevir

- ► Anti-androgens (enzalutamide) are predicted to greatly decrease the concentration of glecaprevir. Avoid. [Severe] Study
- Antiarrhythmics (dronedarone) potentially increase the exposure to glecaprevir. [Moderate] Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to glecaprevir. Avoid. Severe Study
- Antiepileptics (eslicarbazepine, oxcarbazepine) potentially decrease the exposure to glecaprevir. Avoid. Severe Theoretical
- Antifungals, azoles (itraconazole, ketoconazole) potentially increase the exposure to glecaprevir. [Moderate] Theoretical

- Ciclosporin increases the exposure to glecaprevir. Avoid or monitor. Severe Study
- Cobicistat potentially increases the exposure to glecaprevir.
 Moderate Theoretical
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with glecaprevir. Avoid. [Severe] Study
- Crizotinib potentially decreases the exposure to glecaprevir.
 Avoid. [Severe] Theoretical
- ➤ Dabrafenib is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- Glecaprevir with pibrentasvir increases the exposure to digoxin. [Moderate] Study
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to glecaprevir. Avoid. Severe Study
- ► HIV-protease inhibitors (atazanavir, darunavir, lopinavir) boosted with ritonavir increase the exposure to glecaprevir. Avoid.

 [Severe] Study
- ► HIV-protease inhibitors (ritonavir) increase the exposure to glecaprevir. Avoid. Severe Study
- ► Lumacaftor potentially decreases the exposure to glecaprevir.

 Avoid. Severe Theoretical
- ► Mitotane is predicted to greatly decrease the concentration of glecaprevir. Avoid. |Severe| Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of glecaprevir. Avoid. Severe Theoretical
- ► NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to glecaprevir. Avoid. Severe Study
- Rifamycins (rifampicin) markedly affect the exposure to glecaprevir. Avoid. [Severe] Study
- St John's wort is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- ► Glecaprevir with pibrentasvir markedly increases the exposure to statins (atorvastatin). Avoid. Severe Study
- Glecaprevir with pibrentasvir is predicted to increase the exposure to statins (fluvastatin). [Moderate] Theoretical
- ► Glecaprevir with pibrentasvir moderately increases the exposure to statins (pravastatin). Use with caution and adjust pravastatin dose, Moderatel Study
- Glecaprevir with pibrentasvir moderately increases the exposure to statins (rosuvastatin). Use with caution and adjust rosuvastatin dose, p. 221. [Moderate] Study
- Glecaprevir with pibrentasvir moderately increases the exposure to statins (simvastatin). Avoid. [Moderate] Study
- Glecaprevir with pibrentasvir slightly increases the exposure to tacrolimus. Monitor and adjust dose. Mild Study
- Glecaprevir with pibrentasvir increases the exposure to thrombin inhibitors (dabigatran). Avoid. Moderate Study

Glibenclamide → see sulfonylureas

Gliclazide → see sulfonylureas

Glimepiride → see sulfonylureas Glipizide → see sulfonylureas

Glucagon

► Glucagon increases the anticoagulant effect of coumarins (warfarin). Severe Study

Glucagon-like peptide-1 receptor agonists → see TABLE 14 p. 1493 (antidiabetic drugs)

dulaglutide • exenatide • liraglutide • lixisenatide • semaglutide

- With standard-release exenatide: some orally administered drugs should be taken at least 1 hour before, or 4 hours after, exenatide injection.
- ► Some orally administered drugs should be taken at least 1 hour before, or 4 hours after, **lixisenatide** injection.
- ➤ Fenfluramine might decrease blood glucose concentrations when given with glucagon-like peptide-1 receptor agonists.

 [Moderate] Theoretical

Glucosamine

- Glucosamine potentially decreases the anticoagulant effect of coumarins (acenocoumarol). [Moderate] Anecdotal
- Glucosamine potentially increases the anticoagulant effect of coumarins (warfarin). Avoid. Moderate Anecdotal

Glycerol phenylbutyrate

- Antiepileptics (valproate) potentially oppose the effects of glycerol phenylbutyrate. [Moderate] Theoretical
- Corticosteroids potentially oppose the effects of glycerol phenylbutyrate. [Moderate] Theoretical
- Haloperidol potentially opposes the effects of glycerol phenylbutyrate. Moderate Theoretical

Glyceryl trinitrate → see nitrates

Glycopyrronium → see TABLE 10 p. 1492 (antimuscarinics)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **glycopyrronium**, the possibility of interactions should be borne in mind.

➤ Antipsychotics, second generation (clozapine) can cause constipation, as can glycopyrronium; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492

Golimumab → see monoclonal antibodies

Granisetron → see 5-HT3-receptor antagonists

Grapefruit

- ► Grapefruit juice is predicted to increase the exposure to abemaciclib. Avoid. Moderate Theoretical
- Grapefruit juice moderately decreases the exposure to aliskiren. Avoid. Severe Study
- Grapefruit juice increases the exposure to antiarrhythmics (amiodarone). Avoid. Moderate Study
- ► Grapefruit juice moderately increases the exposure to antiarrhythmics (dronedarone). Avoid. Severe Study
- ► Grapefruit juice increases the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study
- ► Grapefruit juice slightly increases the exposure to antiepileptics (carbamazepine). Monitor and adjust dose. Moderate Study
- ▶ Grapefruit juice slightly decreases the exposure to antihistamines, non-sedating (bilastine). Bilastine should be taken 1 hour before or 2 hours after grapefruit. [Moderate] Study
- Grapefruit juice increases the exposure to antihistamines, nonsedating (rupatadine). Avoid. [Moderate] Study
- Grapefruit juice increases the exposure to antimalarials (artemether). [Unknown] Study
- Grapefruit juice is predicted to increase the concentration of antimalarials (piperaquine). Avoid. Severe Theoretical
- Grapefruit juice is predicted to increase the exposure to antipsychotics, second generation (cariprazine). Avoid. [Moderate]
 Study
- ► Grapefruit juice is predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid. [Severe] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to avapritinib. Avoid. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to axitinib. Moderate Theoretical
- Grapefruit juice is predicted to increase the exposure to berotralstat. Moderate Theoretical
- Grapefruit juice greatly decreases the exposure to beta blockers, selective (celiprolol). Moderate Study
- ► Grapefruit juice is predicted to increase the exposure to bosutinib. Avoid. Moderate Theoretical
- Grapefruit juice is predicted to increase the concentration of brigatinib. Avoid. Severe Study
- ► Grapefruit juice increases the exposure to buspirone. Avoid.

 [Mild] Study
- Grapefruit juice is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical
- Grapefruit juice very slightly increases the exposure to calcium channel blockers (amlodipine). Avoid. [Mild] Study
- ► Grapefruit juice increases the exposure to calcium channel blockers (felodipine). Avoid. Moderate Study
- ► Grapefruit juice is predicted to increase the exposure to calcium channel blockers (lercanidipine). Avoid. Moderate Theoretical
- Grapefruit juice increases the exposure to calcium channel blockers (nicardipine). Mild Study
- ► Grapefruit juice increases the exposure to calcium channel blockers (nifedipine, verapamil). Avoid. [Mild] Study
- Grapefruit juice is predicted to increase the exposure to ceritinib. Avoid. Severe Theoretical

- ► Grapefruit juice increases the concentration of ciclosporin.

 Avoid. | Severe | Study |
- Grapefruit juice markedly decreases the exposure to clopidogrel. [Severe] Study
- ► Grapefruit juice is predicted to increase the exposure to cobimetinib. Avoid. Severe Theoretical
- ► Grapefruit juice moderately increases the exposure to oral corticosteroids (budesonide). Avoid. [Moderate] Study
- Grapefruit juice is predicted to increase the exposure to crizotinib. Avoid. Moderate Theoretical
- ► Grapefruit juice is predicted to increase the exposure to darifenacin. Moderate Study
- ► Grapefruit juice is predicted to increase the exposure to dasatinib. Avoid. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Mild] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to elexacaftor. Avoid. [Moderate] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to eliglustat. Avoid. Severe Theoretical
- ► Grapefruit juice is predicted to increase the exposure to encorafenib. Avoid. Moderate Study
- ► Grapefruit is predicted to increase the exposure to entrectinib.

 Avoid. [Severe] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to ergometrine. [Severe] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to ergotamine. [Severe] Theoretical
- Grapefruit juice is predicted to increase the exposure to erlotinib. Moderate Theoretical
- ➤ Grapefruit juice is predicted to increase the exposure to everolimus. Avoid. Severe Theoretical
- ► Grapefruit and grapefruit juice is predicted to increase the exposure to fedratinib. Avoid. [Moderate] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose.

 Moderate Theoretical
- Grapefruit juice is predicted to increase the exposure to glasdegib. Use with caution or avoid. Moderate Theoretical
- ► Grapefruit juice is predicted to increase the exposure to guanfacine. Avoid. [Moderate] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to ibrutinib. Avoid. Moderate Theoretical
- Grapefruit juice is predicted to increase the exposure to imatinib. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to ivabradine. Avoid. Moderate Study
- Grapefruit juice is predicted to increase the exposure to ivacaftor. Avoid. Moderate Theoretical
 Grapefruit juice is predicted to increase the exposure to
- lapatinib. Avoid. Moderate Theoretical

 ► Grapefruit juice is predicted to increase the exposure to
- larotrectinib. Avoid. [Moderate] Theoretical

 Grapefruit juice is predicted to increase the exposure to
- lomitapide. Avoid. Mild Theoretical
- ► Grapefruit juice is predicted to increase the concentration of lorlatinib. Avoid. [Moderate] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to mifepristone. [Moderate] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to naldemedine. Avoid or monitor. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to naloxegol. Avoid. [Moderate] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to neratinib. Avoid. Severe Theoretical
- ► Grapefruit juice is predicted to increase the exposure to nilotinib. Avoid. [Severe] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to olaparib. Avoid. [Moderate] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to palbociclib. Avoid. Severe Theoretical
- Grapefruit juice is predicted to increase the exposure to pazopanib. Avoid. [Severe] Theoretical

- Grapefruit and grapefruit juice is predicted to increase the exposure to pemigatinib. Avoid. Severe Study
- ▶ Grapefruit juice is predicted to increase the exposure to phosphodiesterase type-5 inhibitors. Use with caution or avoid. Moderate Study
- ► Grapefruit juice increases the exposure to pimozide. Avoid.

 [Severe] Theoretical
- Grapefruit juice is predicted to increase the exposure to ponatinib. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to praziquantel. Moderate Study
- Grapefruit juice is predicted to increase the concentration of ranolazine. Avoid. Severe Theoretical
- ► Grapefruit juice is predicted to increase the exposure to regorafenib. Avoid. Moderate Theoretical
- ► Grapefruit juice is predicted to increase the exposure to ribociclib. Avoid. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to ruxolitinib. [Severe] Theoretical
- Grapefruit juice is predicted to increase the exposure to selumetinib. Avoid. Moderate Theoretical
- ► Grapefruit juice increases the concentration of sirolimus.

 Avoid. Moderate Study
- ► Grapefruit juice moderately increases the exposure to SSRIs (sertraline). Avoid. [Moderate] Study
- Grapefruit juice increases the exposure to statins (atorvastatin).
 Mild Study
- Grapefruit juice increases the exposure to statins (simvastatin).
 Avoid. Severe Study
- Grapefruit juice is predicted to increase the exposure to sunitinib. Avoid. Moderate Theoretical
- Grapefruit juice greatly increases the concentration of tacrolimus. Avoid. [Severe] Study
- ► Grapefruit juice is predicted to increase the concentration of temsirolimus. Use with caution or avoid. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to tezacaftor. Avoid. Severe Study
- Grapefruit juice moderately increases the exposure to ticagrelor. Moderate Study
- Grapefruit juice increases the exposure to tolvaptan. Avoid.
 Moderate Study
- ► Grapefruit juice is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Theoretical
- Grapefruit is predicted to increase the exposure to upadacitinib. Avoid. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to venetoclax. Avoid. Severel Theoretical

Grass pollen extract

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

Grazoprevir

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- Grazoprevir is predicted to increase the concentration of calcium channel blockers. [Moderate] Theoretical
- ► Ciclosporin greatly increases the exposure to grazoprevir.

 Avoid. Severe Study
- Cobicistat is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. Severe Study
- Dabrafenib is predicted to markedly decrease the exposure to grazoprevir. Avoid. Severe Study
- ► Elvitegravir markedly increases the exposure to grazoprevir. Avoid. [Severe] Study
- ► Endothelin receptor antagonists (bosentan) are predicted to markedly decrease the exposure to grazoprevir. Avoid. Severe Study

- ► Fostemsavir is predicted to increase the exposure to grazoprevir. Avoid. Severe Theoretical
- ► HIV-protease inhibitors are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. Severe Study
- Idelalisib is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- ► Macrolides (clarithromycin) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to grazoprevir. Avoid. Severe Study
- Modafinil is predicted to decrease the exposure to grazoprevir.
 Avoid. Severe Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of grazoprevir. Severe Theoretical
- ► NNRTIs (efavirenz, nevirapine) are predicted to markedly decrease the exposure to grazoprevir. Avoid. Severe Study
- NNRTIs (etravirine) are predicted to decrease the exposure to grazoprevir. Avoid. [Mild] Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- b St John's wort is predicted to markedly decrease the exposure to grazoprevir. Avoid. Severe Study
- ► Grazoprevir moderately increases the exposure to statins
- (atorvastatin). Adjust atorvastatin dose, p. 220. Moderate Study
 ► Grazoprevir with elbasvir is predicted to increase the exposure to statins (fluvastatin). Adjust fluvastatin dose, p. 220. Moderate Theoretical
- Grazoprevir with elbasvir moderately increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 221.
 Moderate Study
- Grazoprevir with elbasvir is predicted to increase the exposure to statins (simvastatin). Adjust simvastatin dose, p. 222.
 [Moderate] Theoretical
- ► Grazoprevir is predicted to increase the concentration of sunitinib. Use with caution and adjust dose. Moderate

 Theoretical
- Grazoprevir increases the exposure to tacrolimus. Moderate
 Study

Griseofulvin

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use unless specified.

- ► Alcohol potentially causes a disulfiram-like reaction when given with griseofulvin. Moderate Anecdotal
- Griseofulvin is predicted to decrease the efficacy of antiandrogens (cyproterone) with ethinylestradiol (co-cyprindiol).
 Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. [Severe]
- ► Antiepileptics (phenobarbital, primidone) decrease the effects of griseofulvin. Moderate Study
- ► Griseofulvin potentially decreases the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Anecdotal
- Griseofulvin potentially decreases the anticoagulant effect of coumarins. [Moderate] Anecdotal
- ➤ Griseofulvin potentially decreases the efficacy of desogestrel.

 For FSRH guidance, see Contraceptives, interactions p. 859.

 Severel Anecdotal
- ► Griseofulvin decreases the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe

 Anecdotal
- ► Griseofulvin potentially decreases the efficacy of oral levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Anecdotal
- ► Griseofulvin potentially decreases the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe Anecdotal
- Griseofulvin potentially decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Aperdotal

Guanfacine → see TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects)

Guanfacine (continued)

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 384. Moderate Study
- Antiarrhythmics (dronedarone) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384.
 Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Study → Also see TABLE 11 p. 1492
- Antiepileptics (oxcarbazepine) are predicted to decrease the concentration of guanfacine. Monitor and adjust guanfacine dose, p. 384. [Moderate] Theoretical
- Guanfacine increases the concentration of antiepileptics (valproate). Monitor and adjust dose. [Moderate] Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 384. Moderate Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. Moderate Theoretical → Also see TABLE 8 p. 1491
- Chloramphenicol is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to guanfacine.
 Adjust guanfacine dose, p. 384. [Moderate] Study
- Crizotinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Theoretical
- ► Dabrafenib is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the concentration of guanfacine. Adjust dose.

 Moderate Theoretical
- ► Grapefruit juice is predicted to increase the exposure to guanfacine. Avoid. [Moderate] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Study
- ► Idelalisib is predicted to increase the exposure to guanfacine.

 Adjust guanfacine dose, p. 384. [Moderate] Study
- Imatinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. Moderate Theoretical
- ➤ Letermovir is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Theoretical
- ► Macrolides (clarithromycin) are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 384. Moderate Study
- ► Macrolides (erythromycin) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384.
 Moderate Theoretical
- Guanfacine is predicted to increase the concentration of metformin. Moderate Theoretical
- Mitotane is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Theoretical
- Neurokinin-1 receptor antagonists (fosaprepitant) are predicted to increase the concentration of guanfacine. Moderate Theoretical
- ► Nilotinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. Moderate Theoretical
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- Rifamycins (rifampicin) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 384.
 Moderate Study
- ► St John's wort is predicted to decrease the concentration of guanfacine. Adjust dose. Moderate Theoretical

Guselkumab → see monoclonal antibodies

H₂ receptor antagonists

cimetidine • famotidine • nizatidine • ranitidine

- H₂ receptor antagonists are predicted to decrease the exposure to acalabrutinib. Acalabrutinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate] Theoretical
- ► Cimetidine decreases the clearance of albendazole. [Moderate] Study
- Cimetidine increases the concentration of aminophylline.
 Adjust dose. Severe Study
- Cimetidine slightly increases the exposure to anthracyclines (epirubicin). Avoid. [Moderate] Study
- Cimetidine increases the exposure to antiarrhythmics (amiodarone). [Moderate] Study
- ► Cimetidine slightly increases the exposure to antiarrhythmics (flecainide). Monitor and adjust dose. [Mild] Study
- ► Cimetidine increases the exposure to antiarrhythmics (lidocaine). Monitor and adjust dose. Moderate Study
- Cimetidine is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose.
 Moderate Theoretical
- Cimetidine transiently increases the concentration of antiepileptics (carbamazepine). Monitor concentration and adjust dose. [Moderate] Study
- ► Cimetidine increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (itraconazole). Administer itraconazole capsules with an acidic beverage. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (ketoconazole). Administer ketoconazole with an acidic beverage. Moderate Study
- H₂ receptor antagonists are predicted to decrease the exposure to antifungals, azoles (posaconazole). Avoid use of posaconazole oral suspension. [Moderate] Study
- ► Cimetidine decreases the clearance of antimalarials (chloroquine). Moderate Study
- ► Cimetidine slightly increases the exposure to antimalarials (quinine). [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the absorption of bosutinib. Moderate Theoretical
- ➤ Cimetidine slightly increases the exposure to calcium channel blockers (diltiazem, nimodipine). Monitor and adjust dose. [Moderate] Study
- ► Cimetidine (high-dose) is predicted to increase the exposure to calcium channel blockers (lercanidipine). [Moderate] Theoretical
- Cimetidine moderately increases the exposure to calcium channel blockers (nifedipine). Monitor and adjust dose. Severe Study
- Cimetidine increases the exposure to calcium channel blockers (verapamil). [Moderate] Study
- ► Cimetidine is predicted to slightly increase the exposure to capecitabine. [Severe] Theoretical
- ► H₂ receptor antagonists are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical
- ► Cimetidine increases the concentration of ciclosporin. Mild
- ➤ Cimetidine increases the anticoagulant effect of coumarins. Severel Study
- H₂ receptor antagonists are predicted to decrease the concentration of dacomitinib. Dacomitinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. Mild
 Study
- ► Cimetidine increases the exposure to darifenacin. Mild Study
- ► H₂ receptor antagonists are predicted to decrease the exposure to dasatinib. Avoid. Moderate Study
- ► H₂ receptor antagonists are predicted to decrease the absorption of dipyridamole (immediate release tablets). Moderate Theoretical
- Cimetidine is predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the exposure to erlotinib. Erlotinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate] Study
- Cimetidine increases the concentration of fampridine. Avoid.
 Severe Theoretical

- Cimetidine slightly increases the exposure to fluorouracil.
 Severel Study
- ► H₂ receptor antagonists are predicted to slightly to moderately decrease the exposure to gefitinib. Moderate Study
- H₂ receptor antagonists decrease the exposure to HIV-protease inhibitors (atazanavir). Monitor and adjust dose. Moderate Study
- ► Cimetidine is predicted to decrease the clearance of hydroxychloroquine. Moderate Theoretical
- H₂ receptor antagonists are predicted to decrease the absorption of lapatinib. Avoid. Moderate Theoretical
- ► H₂ receptor antagonists are predicted to decrease the exposure to ledipasvir. Adjust dose, see ledipasvir with sofosbuvir p. 683. Moderate Study
- ▶ Leflunomide is predicted to increase the exposure to H₂ receptor antagonists (cimetidine, famotidine). Moderate Theoretical
- ► Cimetidine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Mild Theoretical
- ▶ Ranitidine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- ► Cimetidine slightly increases the exposure to macrolides (erythromycin). [Moderate] Study
- Cimetidine increases the concentration of mebendazole.
 Moderate Study
- Cimetidine increases the exposure to metformin. Monitor and adjust dose. [Moderate] Study
- ► Cimetidine slightly increases the exposure to mirtazapine. Use with caution and adjust dose. [Moderate] Theoretical
- Cimetidine increases the exposure to moclobemide. Adjust moclobemide dose, p. 394. [Mild] Study
- ► H₂ receptor antagonists are predicted to decrease the exposure to neratinib. Avoid. Severe Theoretical
- ► H₂ receptor antagonists might affect the absorption of nilotinib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after nilotinib. [Mild] Theoretical
- Nitisinone is predicted to increase the exposure to H₂ receptor antagonists (cimetidine, famotidine). [Moderate] Study
- ► H₂ receptor antagonists are predicted to decrease the exposure to NNRTIs (rilpivirine). H₂ receptor antagonists should be taken 12 hours before or 4 hours after rilpivirine. [Severe] Study
- ► Cimetidine increases the concentration of opioids (alfentanil). Use with caution and adjust dose. Severe Study
- Cimetidine increases the exposure to opioids (fentanyl).
 [Moderate] Study
- ► H₂ receptor antagonists are predicted to decrease the exposure to pazopanib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after pazopanib. Moderate Theoretical
- ► Cimetidine increases the exposure to phenindione. Severe

 Anecdotal
- Cimetidine slightly increases the exposure to phosphodiesterase type-4 inhibitors (roflumilast). [Moderate] Study
- Cimetidine moderately increases the exposure to praziquantel.
 [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the exposure to selpercatinib. Manufacturer advises take 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate] Study
- Cimetidine slightly increases the exposure to SNRIs (venlafaxine). [Mild] Study
- H₂ receptor antagonists potentially decrease the exposure to sofosbuvir. Adjust dose, see ledipasvir with sofosbuvir p. 683, sofosbuvir with velpatasvir p. 685, and sofosbuvir with velpatasvir and voxilaprevir p. 685. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the exposure to sotorasib. Avoid. Moderate Study
- ► Cimetidine slightly increases the exposure to SSRIs (citalopram, escitalopram). Adjust dose. Moderate Study
- Cimetidine slightly increases the exposure to SSRIs (paroxetine, sertraline). [Moderate] Study
- Cimetidine is predicted to increase the risk of toxicity when given with tegafur. Severe Theoretical
- ► Teriflunomide is predicted to increase the exposure to H₂ receptor antagonists (cimetidine, famotidine). Moderate Study
- ➤ Cimetidine increases the concentration of theophylline. Adjust dose. Severe Study

- ► Cimetidine increases the exposure to tricyclic antidepressants.

 Moderate Study
- ► Cimetidine slightly increases the exposure to triptans (zolmitriptan). Adjust zolmitriptan dose, p. 515. [Mild] Study
- ► H₂ receptor antagonists are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir p. 685. Moderate Study
- Haloperidol → see TABLE 8 p. 1491 (hypotension), TABLE 9 p. 1492 (QT-interval prolongation), TABLE 11 p. 1492 (CNS depressant effects), TABLE 10 p. 1492 (antimuscarinics)
 - **FOOD AND LIFESTYLE** Dose adjustment might be necessary if smoking started or stopped during treatment.
- ► Anti-androgens (apalutamide, enzalutamide) decrease the concentration of haloperidol. Adjust dose. Moderate Study → Also see TABLE 9 p. 1492
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of haloperidol. Adjust dose. Moderate Study → Also see TABLE 11 p. 1492
- Haloperidol potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
- Antifungals, azoles (itraconazole) increase the concentration of haloperidol. Moderate Study
- ➤ Antipsychotics, second generation (clozapine) can cause constipation, as can haloperidol; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- ► Haloperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 9 p. 1492 → Also see TABLE 10 p. 1492
- Haloperidol potentially opposes the effects of glycerol phenylbutyrate. [Moderate] Theoretical
 Hilly protocol philipters (rightpartie) are prodicted to increase to the protocol philipters (rightpartie) are prodicted to increase to
- ► HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to haloperidol. [Severe] Theoretical
 ► Haloperidol decreases the effects of levodopa. [Severe] Study →
- Also see TABLE 8 p. 1491

 ➤ Mitotane decreases the concentration of haloperidol. Adjust
- dose. [Moderate] Study
 ➤ Nirmatrelvir boosted with ritonavir is predicted to increase the
- concentration of haloperidol. Severe Theoretical

 ➤ Rifamycins (rifampicin) decrease the concentration of haloperidol. Adjust dose. [Moderate] Study
- ► SNRIs (venlafaxine) slightly increase the exposure to haloperidol. Severe Study → Also see TABLE 9 p. 1492 → Also see TABLE 11 p. 1492
- Haloperidol potentially decreases the effects of sodium phenylbutyrate. Moderate Anecdotal
- SSRIs (fluoxetine) increase the concentration of haloperidol.
 Adjust dose. Moderate Anecdotal
- SSRIs (fluvoxamine) increase the concentration of haloperidol.
 Adjust dose. Moderate Study

Heparin → see TABLE 16 p. 1494 (increased serum potassium), TABLE 3 p. 1490 (anticoagulant effects)

- Andexanet alfa has been reported to affect the anticoagulant effect of heparin. Avoid. (Severe) Anecdotal
- Ranibizumab increases the risk of bleeding events when given with heparin. Severe Theoretical

Hepatitis B immunoglobulin → see immunoglobulins Herpes-zoster vaccine, live → see live vaccines HIV-protease inhibitors

atazanavir • darunavir • fosamprenavir • lopinavir • ritonavir • tipranavir •

- Caution on concurrent use of atazanavir, lopinavir with ritonavir, and ritonavir with drugs that prolong the PR interval.
- Caution with concurrent use of tipranavir with drugs that increase risk of bleeding.
- ► HIV-protease inhibitors are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1042. [Severe] Study

HIV-protease inhibitors (continued)

- ► HIV-protease inhibitors are predicted to increase the exposure to acalabrutinib. Avoid. [Severe] Study
- HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to afatinib. [Moderate] Study
- Ritonavir is predicted to decrease the exposure to agomelatine.
 Moderate Theoretical
- Ritonavir decreases the exposure to albendazole. Moderate Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. Severe Study
- Ritonavir is predicted to increase the exposure to aliskiren.
 Moderate Theoretical
- HIV-protease inhibitors are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to alpha blockers (doxazosin). Moderate Study
- HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to amfetamines. Severe Theoretical
- Ritonavir decreases the exposure to aminophylline. Adjust dose. Moderate Study
- Ritonavir is predicted to decrease the exposure to anaesthetics, local (ropivacaine). [Moderate] Theoretical
- ➤ Oral antacids are predicted to decrease the absorption of oral atazanavir. Atazanavir should be taken 2 hours before or 1 hour after antacids. [Severe] Theoretical
- Oral antacids are predicted to decrease the absorption of oral tipranavir. Separate administration by 2 hours. Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to anti-androgens (apalutamide). Mild Study
- Ritonavir is predicted to decrease the efficacy of anti-androgens (cyproterone) with ethinylestradiol (co-cyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. [Severe] Study
- HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to anti-androgens (darolutamide).
 Monitor and adjust dose. Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to antiarrhythmics (amiodarone). Avoid. Severe Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to antiarrhythmics (disopyramide). Severe Theoretical
- HIV-protease inhibitors very markedly increase the exposure to antiarrhythmics (dronedarone). Avoid. [Severe] Study
- Ritonavir is predicted to increase the exposure to antiarrhythmics (flecainide). Avoid or monitor adverse effects.
 Severe | Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to antiarrhythmics (lidocaine). Avoid. Severe Study
- HIV-protease inhibitors are predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose.
 Severel Study
- HIV-protease inhibitors are predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to antiepileptics (carbamazepine) and antiepileptics (carbamazepine) are predicted to decrease the exposure to HIV-protease inhibitors. Monitor and adjust dose. Severe

 Theoretical
- HIV-protease inhibitors are predicted to affect the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of HIVprotease inhibitors. [Severe] Theoretical
- Ritonavir slightly decreases the exposure to antiepileptics (lamotrigine). Severe Study
- HIV-protease inhibitors are predicted to very slightly increase the exposure to antiepileptics (perampanel). Mild Study
- HIV-protease inhibitors are predicted to affect the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of HIV-protease inhibitors. [Severe]

- Ritonavir is predicted to decrease the concentration of antiepileptics (valproate). Severe Anecdotal
- Antifungals, azoles (fluconazole) slightly increase the exposure to tipranavir. Avoid or adjust dose. Moderate Study
- Antifungals, azoles (miconazole) are predicted to increase the concentration of HIV-protease inhibitors. Use with caution and adjust dose. Moderate Theoretical
- Antifungals, azoles (posaconazole) are predicted to increase the exposure to HIV-protease inhibitors. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor adverse effects. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (itraconazole). Use with caution and adjust dose. [Severe] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (ketoconazole). Use with caution and adjust dose. [Moderate] Study
- HIV-protease inhibitors are predicted to affect the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) potentially affect the exposure to HIV-protease inhibitors. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. [Severe] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. Moderate Study
- ► HIV-protease inhibitors decrease the exposure to antimalarials (atovaquone). Avoid if boosted with ritonavir. [Moderate] Study
 ► HIV-protease inhibitors are predicted to increase the
- concentration of antimalarials (piperaquine). [Severe] Theoretical
- HIV-protease inhibitors are predicted to decrease the exposure to antimalarials (proguanil). Avoid. Moderate Study
- HIV-protease inhibitors are predicted to affect the exposure to antimalarials (quinine). Severe Study
- HIV-protease inhibitors are predicted to slightly increase the exposure to antipsychotics, second generation (aripiprazole).
 Adjust aripiprazole dose, p. 427. [Moderate] Study
- HIV-protease inhibitors are predicted to moderately increase the exposure to antipsychotics, second generation (cariprazine).
 Avoid. [Severe] Study
- Ritonavir is predicted to affect the exposure to antipsychotics, second generation (clozapine). Avoid. Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine).
 Avoid. [Severe] Study
- Ritonavir is predicted to decrease the exposure to antipsychotics, second generation (olanzapine). Monitor and adjust dose. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to antipsychotics, second generation (risperidone). Adjust dose. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to avapritinib. Avoid. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to axitinib. Avoid or adjust dose. Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Study
- HIV-protease inhibitors moderately increase the exposure to benzodiazepines (alprazolam). Avoid. [Moderate] Study
- Ritonavir is predicted to increase the exposure to benzodiazepines (diazepam, flurazepam). Avoid. Moderate Theoretical
- HIV-protease inhibitors are predicted to markedly to very markedly increase the exposure to benzodiazepines (midazolam). Avoid or adjust dose. [Severe] Study
- ► HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to berotralstat. Severe Study
- HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to beta blockers, non-selective (nadolol).
 Moderate) Study
- Ritonavir is predicted to increase the exposure to beta blockers, selective (metoprolol). [Moderate] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to beta₂ agonists (salmeterol). Avoid. Severe Study

- Atazanavir moderately increases the exposure to bictegravir.
 Avoid. Severe Study
- ► HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to bictegravir. Use with caution or avoid. Moderate Theoretical
- HIV-protease inhibitors slightly increase the exposure to bortezomib. Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study
- HIV-protease inhibitors are predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1048. Severe
- ► Ritonavir is predicted to decrease the exposure to bupropion.

 [Moderate] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 373. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to cabozantinib. Moderate Study
- Ritonavir is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. Moderatel Study
- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). Severe Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid.
 Severel Study
- ► HIV-protease inhibitors are predicted to increase the exposure to cannabidiol. Avoid or adjust dose. [Mild] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 1050. [Severe] Study
- ► HIV-protease inhibitors increase the concentration of ciclosporin. Severe Study
- HIV-protease inhibitors are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 252.
 Moderate Study
- ► HIV-protease inhibitors are predicted to moderately increase the exposure to cinacalcet. Adjust dose. Moderate Study
- Ritonavir might increases the exposure to cladribine. Moderate
 Theoretical
- Ritonavir might decrease the efficacy of clopidogrel. Avoid.
 [Moderate] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to colchicine. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1212. Severe Study
- Atazanavir affects the exposure to combined hormonal contraceptives. Adjust dose. [Severe] Study
- ► Ritonavir is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects.
- ► HIV-protease inhibitors are predicted to affect the anticoagulant effect of coumarins. Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to crizotinib. Avoid. Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to dabrafenib. Use with caution or avoid. Moderate Study
- ► HIV-protease inhibitors are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. Severe Study

- ► HIV-protease inhibitors are predicted to increase the exposure to dasatinib. Avoid or adjust dose—consult product literature.

 Severe Study
- ► HIV-protease inhibitors very slightly increase the exposure to delamanid. Severe Study
- ► Ritonavir is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- ► HIV-protease inhibitors are predicted to moderately increase the exposure to dienogest. [Moderate] Study
- ► Ritonavir increases the concentration of digoxin. Adjust dose and monitor concentration. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Moderate] Study
- ► Atazanavir (alone or boosted with ritonavir) slightly increases the exposure to dolutegravir. Adjust dose—consult product literature. Moderate Study
- Fosamprenavir boosted with ritonavir slightly decreases the exposure to dolutegravir. Avoid if resistant to HIV-integrase inhibitors. Severe Study
- ► Tipranavir moderately decreases the exposure to dolutegravir.

 Adjust dolutegravir dose, p. 696. Severe Study
- HIV-protease inhibitors are predicted to increase the exposure to domperidone. Avoid. Severe Study
- HIV-protease inhibitors increase the exposure to dopamine receptor agonists (bromocriptine). (Severe) Study
- HIV-protease inhibitors are predicted to increase the concentration of dopamine receptor agonists (cabergoline).
 Moderate Anecdotal
- HIV-protease inhibitors are predicted to increase the exposure to dronabinol. Adjust dose. Mild Study
- HIV-protease inhibitors are predicted to increase the exposure to drospirenone. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to dutasteride. Monitor adverse effects and adjust dose.
 Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with potent CYP3A4 inhibitors. Severe
- HIV-protease inhibitors are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature.
 Severe Study
- ► HIV-protease inhibitors (atazanavir, lopinavir) boosted with ritonavir increase the concentration of elvitegravir. Refer to specialist literature. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to encorafenib. Avoid or monitor. (Severe) Study
- HIV-protease inhibitors are predicted to increase the exposure to endothelin receptor antagonists (bosentan). Severe Study
- HIV-protease inhibitors are predicted to increase the exposure to endothelin receptor antagonists (macitentan). [Moderate] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to entrectinib. Avoid potent CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. Severe Study
- ► HIV-protease inhibitors are predicted to increase the risk of ergotism when given with ergometrine. Avoid. Severe Theoretical
- ► HIV-protease inhibitors are predicted to increase the risk of ergotism when given with ergotamine. Avoid. Severe Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to erlotinib. Use with caution and adjust dose. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to esketamine. Adjust dose. Moderate Study
- Ritonavir is predicted to decrease the efficacy of estradiol.
 Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the concentration of subdermal etonogestrel. [Moderate] Theoretical
- ► Ritonavir is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859.

 Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to everolimus. Avoid. Severe Study
- Atazanavir boosted with ritonavir is predicted to increase the exposure to factor XA inhibitors (apixaban). [Severe] Theoretical

HIV-protease inhibitors (continued)

- Darunavir boosted with ritonavir or cobicistat is predicted to increase the exposure to factor XA inhibitors (apixaban). Avoid. [Severe] Theoretical
- Ritonavir is predicted to increase the exposure to factor XA inhibitors (apixaban). Avoid. [Severe] Theoretical
- HIV-protease inhibitors (fosamprenavir, tipranavir) boosted with ritonavir are predicted to increase the exposure to factor XA inhibitors (apixaban). [Moderate] Theoretical
- Lopinavir boosted with ritonavir is predicted to increase the exposure to factor XA inhibitors (apixaban, rivaroxaban). Avoid. [Severe] Theoretical
- ➤ Lopinavir boosted with ritonavir is predicted to slightly increase the exposure to factor XA inhibitors (edoxaban). Severe Theoretical
- ► Ritonavir is predicted to slightly increase the exposure to factor XA inhibitors (edoxaban). Severe Theoretical
- Darunavir boosted with ritonavir is predicted to increase the exposure to factor XA inhibitors (rivaroxaban). Avoid. Severel Apendatal
- Ritonavir moderately increases the exposure to factor XA inhibitors (rivaroxaban). Avoid. Severel Study
- HIV-protease inhibitors (atazanavir, fosamprenavir, tipranavir) boosted with ritonavir are predicted to increase the exposure to factor XA inhibitors (rivaroxaban). Avoid. [Severe] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to fedratinib. Adjust fedratinib dose, but avoid depending on other drugs taken—consult product literature, p. 1060.
 Moderatel Study
- HIV-protease inhibitors are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 840. [Severe] Study
- HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to fidaxomicin. Avoid. Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose.
 [Moderate] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to gefitinib. [Severe] Study
 ► HIV-protease inhibitors are predicted to increase the exposure
- to gilteritinib. Moderate Study

 HIV-protease inhibitors are predicted to increase the exposure
- HIV-protease inhibitors are predicted to increase the exposure to glasdegib. Use with caution or avoid. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, lopinavir) boosted with ritonavir increase the exposure to glecaprevir. Avoid.
 [Severe] Study
- ► Ritonavir increases the exposure to glecaprevir. Avoid. Severe Study
- ► HIV-protease inhibitors are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. Severe
- ► HIV-protease inhibitors are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Study
- ► H₂ receptor antagonists decrease the exposure to atazanavir.

 Monitor and adjust dose. Moderate Study
- ► Ritonavir is predicted to increase the exposure to haloperidol.

 | Severe | Theoretical |
- ► Ritonavir is predicted to decrease the effects of hormone replacement therapy. Moderate Anecdotal
- HIV-protease inhibitors are predicted to increase the exposure to ibrutinib. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1062. [Severe] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to imatinib. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the risk of toxicity when given with irinotecan. Avoid. Moderate Study
- Ritonavir is predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose.
 Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to ivabradine. Avoid. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to ivacaftor. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 317, lumacaftor with ivacaftor p. 318, tezacaftor

- with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Severe] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to lapatinib. Avoid. Moderate Study
- ► HIV-protease inhibitors are predicted to moderately increase the exposure to larotrectinib. Avoid or adjust larotrectinib dose, p. 1065. Moderate Study
- ► Tipranavir boosted with ritonavir is predicted to decrease the exposure to ledipasvir. Avoid. Severe Theoretical
- HIV-protease inhibitors (atazanavir, lopinavir) boosted with ritonavir are predicted to increase the concentration of letermovir. [Moderate] Study
- ► Ritonavir is predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- Ritonavir is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- HIV-protease inhibitors are predicted to markedly increase the exposure to lomitapide. Avoid. <u>Severe</u> Study
- ► HIV-protease inhibitors are predicted to increase the exposure to lorlatinib. Avoid or adjust lorlatinib dose, p. 1067. Severe Study
- Atazanavir is predicted to increase the exposure to macrolides (clarithromycin). Adjust dose in renal impairment. [Severe] Study
- ► Ritonavir increases the exposure to macrolides (clarithromycin).

 Adjust dose in renal impairment. Severe Study
- Tipranavir boosted with ritonavir increases the exposure to macrolides (clarithromycin) and macrolides (clarithromycin) increase the exposure to tipranavir boosted with ritonavir. Monitor; adjust dose in renal impairment. Severe Study
- HIV-protease inhibitors (darunavir, fosamprenavir, lopinavir) boosted with ritonavir are predicted to increase the exposure to macrolides (clarithromycin). Adjust dose in renal impairment. [Severe] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to macrolides (erythromycin). [Severe] Theoretical
- Atazanavir moderately to markedly increases the exposure to maraviroc. Refer to specialist literature. [Severe] Study
- Darunavir boosted with ritonavir markedly increases the exposure to maraviroc. Refer to specialist literature. Severel Study
- Maraviroc potentially decreases the exposure to fosamprenavir and fosamprenavir potentially decreases the exposure to maraviroc. Avoid. [Severe] Study
- ► Lopinavir boosted with ritonavir moderately increases the exposure to maraviroc. Refer to specialist literature. Severe Study
- Ritonavir markedly increases the exposure to maraviroc. Refer to specialist literature. [Severe] Study
- ► HIV-protease inhibitors are predicted to increase the concentration of intramuscular medroxyprogesterone.

 Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to meglitinides (repaglinide). Moderate Study
- Ritonavir is predicted to decrease the exposure to melatonin.
 Moderate Theoretical
- Ritonavir is predicted to increase the clearance of mexiletine.
 Monitor and adjust dose. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to midostaurin. Avoid or monitor for toxicity. [Severe] Study
 HIV-protease inhibitors are predicted to increase the exposure
- to mifepristone. [Moderate] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 843. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to mirtazapine. [Moderate] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to modafinil. [Mild] Theoretical
- HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose.
 Severe) Study

- HIV-protease inhibitors are predicted to increase the exposure to monoclonal antibodies (polatuzumab vedotin). [Moderate]
 Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to naldemedine. Avoid or monitor. Moderate Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to neratinib. Avoid potent CYP3A4 inhibitors or adjust neratinib dose, p. 1069. [Severe] Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to neurokinin-1 receptor antagonists (aprepitant).
 Moderatel Study
- ► HIV-protease inhibitors are predicted to increase the exposure to neurokinin-1 receptor antagonists (fosaprepitant). Moderate

 Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to neurokinin-1 receptor antagonists (netupitant). Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to nilotinib. Avoid. Severe Study
- ► HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, tipranavir) boosted with ritonavir are predicted to increase the exposure to nintedanib. [Moderate] Theoretical
- HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to nintedanib. Moderate Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, tipranavir). Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to nitisinone. Adjust dose. [Moderate] Theoretical
- NNRTIs (efavirenz) decrease the exposure to HIV-protease inhibitors. Refer to specialist literature. Severe Study
- ► NNRTIS (etravirine) increase the exposure to fosamprenavir boosted with ritonavir. Refer to specialist literature. Moderate Study
- NNRTIs (nevirapine) decrease the exposure to HIV-protease inhibitors. Refer to specialist literature. [Moderate] Study
- ► Tipranavir decreases the exposure to NNRTIS (etravirine). Avoid. Severe Study
- ► Ritonavir is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Anecdotal
- ► Tipranavir slightly decreases the exposure to NRTIs (abacavir).

 Avoid. Severe Study
- ► Tipranavir slightly decreases the exposure to NRTIs (zidovudine). Avoid. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to olaparib. Avoid potent CYP3A4 inhibitors or adjust olaparib dose, p. 1088. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone).

 Monitor and adjust dose. Severe Study
- HIV-protease inhibitors boosted with ritonavir are predicted to decrease the exposure to opioids (methadone). Moderate Study
- Ritonavir is predicted to decrease the concentration of opioids (morphine). [Moderate] Theoretical
- Ritonavir increases the risk of CNS toxicity when given with opioids (pethidine). Avoid. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to osilodrostat. [Moderate] Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to ospemifene. Avoid in poor CYP2C9 metabolisers. Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to oxybutynin. Mild Study
- ► HIV-protease inhibitors are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 1072. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 1009. Moderate Study

- ► HIV-protease inhibitors are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 1073. Moderate Study
- ► HIV-protease inhibitors are predicted to increase the exposure to pemigatinib. Avoid or adjust pemigatinib dose, p. 1074.

 Severe | Study
- HIV-protease inhibitors are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil).
 Avoid. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent CYP3A4 inhibitors or adjust sildenafil dose, p. 879. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study
- ► HIV-protease inhibitors (atazanavir, lopinavir) boosted with ritonavir increase the exposure to pibrentasvir. Avoid. Severe
- ► Ritonavir potentially increases the exposure to pibrentasvir.

 Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to pimozide. Avoid. Severe Study
- Ritonavir is predicted to decrease the exposure to pirfenidone.
 Moderate Theoretical
- ► HIV-protease inhibitors are predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 1075. [Moderate] Study
- ► HIV-protease inhibitors are predicted to moderately increase the exposure to praziquantel. [Mild] Study
- HIV-protease inhibitors given with carbimazole are predicted to increase the exposure to propiverine. Adjust starting dose.
 Moderate Theoretical
- ► Proton pump inhibitors decrease the exposure to atazanavir.

 Avoid or adjust dose. Severe Study
- ► Tipranavir decreases the exposure to proton pump inhibitors. Avoid. Severe Study
- Atazanavir increases the exposure to raltegravir (high-dose).
 Avoid. Moderate Study
- ► Darunavir increases the risk of rash when given with raltegravir. Moderate Study
- Fosamprenavir boosted with ritonavir decreases the exposure to raltegravir and raltegravir decreases the exposure to fosamprenavir boosted with ritonavir. Avoid. [Severe] Study
- Tipranavir boosted with ritonavir is predicted to decrease the exposure to raltegravir (high-dose). Avoid. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to ranolazine. Avoid. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to reboxetine. Avoid. Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to regorafenib. Avoid. Moderate Study
- ► HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to relugolix. Avoid or take relugolix first and separate administration by at least 6 hours. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1356.
 Moderate Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 1077. [Moderate]
- Rifamycins (rifampicin) slightly decrease the exposure to ritonavir. Severe Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to tipranavir. Avoid. Severe Study
- Rifamycins (rifampicin) are predicted to moderately to markedly decrease the exposure to HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir). Avoid. Severe Study
- ► Ritonavir markedly increases the exposure to rifamycins (rifabutin). Avoid or adjust dose. Severe Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, tipranavir) boosted with ritonavir increase the exposure to rifamycins (rifabutin). Monitor and adjust dose.
 [Severe] Study

HIV-protease inhibitors (continued)

- Ritonavir is predicted to increase the exposure to riociguat.
 Adjust dose and monitor blood pressure. [Moderate] Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor adverse effects.

 Moderate | Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, tipranavir) boosted with ritonavir are predicted to decrease the exposure to the active component of sacituzumab govitecan. [Severe] Theoretical
- Ritonavir is predicted to decrease the exposure to the active component of sacituzumab govitecan. Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to selpercatinib. Adjust selpercatinib dose, p. 1079. [Moderate]
 Study
- ► HIV-protease inhibitors are predicted to increase the exposure to selumetinib. Avoid or adjust dose—consult product literature. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to siponimod. Avoid depending on other drugs taken—consult product literature. Severe Theoretical
- ► HIV-protease inhibitors are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
 ► Ritonavir is predicted to decrease the exposure to SNRIs
- (duloxetine). Moderate Theoretical

 HIV-protease inhibitors are predicted to increase the exposure
- to SNRIs (venlafaxine). [Moderate] Study

 Sodium zirconium cyclosilicate is predicted to decrease the
- Sodium zirconium cyclosilicate is predicted to decrease the exposure to HIV-protease inhibitors. Separate administration by at least 2 hours. Moderate Theoretical
- Tipranavir is predicted to decrease the exposure to sofosbuvir.
 Avoid. Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to solifenacin. Adjust solifenacin p. 842 or tamsulosin with solifenacin p. 848 dose; avoid in hepatic and renal impairment. Severel Study
- ► HIV-protease inhibitors are predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid potent CYP3A4 inhibitors or adjust dapoxetine dose, p. 887. Severe Study
- St John's wort is predicted to decrease the exposure to HIVprotease inhibitors. Avoid. Severe Study
- HIV-protease inhibitors are predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- HIV-protease inhibitors might affect the exposure to statins (pravastatin). Moderate Study
- ► HIV-protease inhibitors (atazanavir, lopinavir) are predicted to increase the exposure to statins (rosuvastatin). Avoid or adjust rosuvastatin dose, p. 221. Severe Study
- ► HIV-protease inhibitors (darunavir, ritonavir) are predicted to increase the exposure to statins (rosuvastatin). Avoid or adjust dose. Severe Study
- ► HIV-protease inhibitors (fosamprenavir, tipranavir) are predicted to increase the exposure to statins (rosuvastatin). Use with caution and adjust dose. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to statins (simvastatin). Avoid. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 1080. Moderate
- HIV-protease inhibitors are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. Severe Study
- HIV-protease inhibitors (darunavir, tipranavir) are predicted to increase the exposure to talazoparib. Avoid or adjust talazoparib dose, p. 1091. [Moderate] Theoretical
- ► HIV-protease inhibitors (lopinavir, ritonavir) are predicted to slightly increase the exposure to talazoparib. Avoid or adjust talazoparib dose, p. 1091. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to taxanes (cabazitaxel). Avoid or monitor—consult product literature. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to taxanes (docetaxel). Avoid or adjust dose. Severe Study

- HIV-protease inhibitors are predicted to increase the exposure to taxanes (paclitaxel). Moderate Anecdotal
- HIV-protease inhibitors are predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, lopinavir) increase the exposure to tenofovir alafenamide. Avoid or adjust dose.
 Moderate Study
- ► Tipranavir is predicted to decrease the exposure to tenofovir alafenamide. Avoid. Moderate Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, lopinavir) are predicted to increase the risk of renal impairment when given with tenofovir disoproxil. [Severe] Anecdotal
- Lopinavir boosted with ritonavir might increase the exposure to tepotinib. Avoid. Severe Theoretical
- Ritonavir might increase the exposure to tepotinib. Avoid.
 Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to tezacaftor. Adjust dose with potent CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320. Severe Study
- Ritonavir is predicted to decrease the exposure to theophylline.
 Adjust dose. [Moderate] Study
- Ritonavir is predicted to increase the exposure to thrombin inhibitors (dabigatran). Avoid. Severe Study
- ► HIV-protease inhibitors (atazanavir, darunavir, lopinavir) boosted with ritonavir are predicted to increase the exposure to thrombin inhibitors (dabigatran). Avoid. [Severe] Anecdotal
- HIV-protease inhibitors (fosamprenavir, tipranavir) boosted with ritonavir are predicted to increase the exposure to thrombin inhibitors (dabigatran). Avoid. (Severe) Theoretical
- Ritonavir decreases the concentration of thyroid hormones (levothyroxine). MHRA advises monitor TSH for at least one month after starting or stopping ritonavir. [Moderate] Anecdotal
- ► HIV-protease inhibitors are predicted to markedly increase the exposure to ticagrelor. Avoid. Severe Study
- HIV-protease inhibitors (lopinavir, ritonavir) might increase the exposure to tigecycline. Mild Anecdotal
- Ritonavir moderately decreases the exposure to tizanidine.
 Mild Study
- HIV-protease inhibitors are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. [Moderate] Study
- ► HIV-protease inhibitors are predicted to increase the exposure to tolterodine. Avoid. |Severe| Study
- ► HIV-protease inhibitors are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent CYP3A4 inhibitors, p. 724. [Severe] Study
- HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the exposure to topotecan. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to toremifene. Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to trabectedin. Avoid or adjust dose. Severe Theoretical
- ► HIV-protease inhibitors (lopinavir, ritonavir) are predicted to increase the concentration of trametinib. [Moderate] Theoretical
- HIV-protease inhibitors are predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. Moderate Study
- ► HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to tricyclic antidepressants. Moderate Theoretical
- HIV-protease inhibitors increase the exposure to triptans (almotriptan). [Mild] Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to triptans (eletriptan). Avoid. Severe Study
- ► Tucatinib is predicted to increase the exposure to HIV-protease inhibitors (darunavir, tipranavir). Avoid or adjust dose. Moderate Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, tipranavir) boosted with ritonavir are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study
- ▶ Ritonavir decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 859. Severel Anecdotal

- HIV-protease inhibitors are predicted to increase the exposure to upadacitinib. Use with caution or avoid. Severe Study
- ► Tipranavir is predicted to increase the exposure to velpatasvir.

 Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to vemurafenib. [Severe] Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to vinca alkaloids. Severe Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study
- Atazanavir boosted with ritonavir increases the concentration of voxilaprevir. Avoid. Severe Study
- Lopinavir boosted with ritonavir is predicted to increase the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- Tipranavir boosted with ritonavir is predicted to increase the concentration of voxilaprevir. Severe Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to zopiclone. Adjust dose. Moderate Theoretical

Homatropine → see TABLE 10 p. 1492 (antimuscarinics)

➤ Antipsychotics, second generation (clozapine) can cause constipation, as can homatropine; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492

Hormone replacement therapy

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- ► Hormone replacement therapy is predicted to alter the exposure to antiepileptics (lamotrigine). [Moderate] Theoretical
- Hormone replacement therapy decreases the clearance of dopamine receptor agonists (ropinirole). Monitor and adjust dose. [Moderate] Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- HIV-protease inhibitors (ritonavir) are predicted to decrease the effects of hormone replacement therapy. Moderate Anecdotal
- Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with lenalidomide.
 Moderate Theoretical
- Hormone replacement therapy is predicted to increase the exposure to MAO-B inhibitors (selegiline). Avoid. Moderate Study
- Modafinil is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant) are predicted to decrease the effects of hormone replacement therapy. Moderate Anecdotal
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the effects of hormone replacement therapy. Moderate Anecdotal
- ► NSAIDs (etoricoxib) increase the exposure to hormone replacement therapy. Moderate Study
- Hormone replacement therapy potentially opposes the effects of ospemifene. Avoid. (Severe) Theoretical
- ► Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with pomalidomide. Severe Theoretical
- ► Hormone replacement therapy potentially opposes the effects of raloxifene. Avoid. Severe Theoretical
- Rifamycins are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- St John's wort is predicted to decrease the efficacy of hormone replacement therapy. Moderate Theoretical
- ► Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with thalidomide.
 Severel Theoretical
- Oral hormone replacement therapy is predicted to decrease the effects of thyroid hormones. [Moderate] Theoretical

Hydralazine → see TABLE 8 p. 1491 (hypotension)

▶ Diazoxide increases the risk of severe hypotension when given with hydralazine. Severe Study → Also see TABLE 8 p. 1491

Hydrochlorothiazide → see thiazide diuretics

Hydrocortisone → see corticosteroids

Hydroflumethiazide → see thiazide diuretics

Hydromorphone → see opioids

 $\textbf{Hydroxycarbamide} \rightarrow \text{see TABLE 15 p. 1493 (myelosuppression)}$

 Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with hydroxycarbamide. UKHSA advises avoid (refer to Green Book). [Severe] Theoretical

Hydroxychloroquine → see TABLE 9 p. 1492 (QT-interval prolongation)

- ► Hydroxychloroquine is predicted to decrease the effects of agalsidase alfa. [Moderate] Theoretical
- ► Hydroxychloroquine is predicted to decrease the exposure to agalsidase beta. Moderate Theoretical
- ➤ Oral antacids are predicted to decrease the absorption of oral hydroxychloroquine. Separate administration by at least 4 hours. [Moderate] Theoretical
- Calcium salts (calcium carbonate) are predicted to decrease the absorption of hydroxychloroquine. Moderate Theoretical
- Hydroxychloroquine is predicted to decrease the efficacy of oral cholera vaccine. [Moderate] Theoretical
- ► H₂ receptor antagonists (cimetidine) are predicted to decrease the clearance of hydroxychloroquine. Moderate Theoretical
- Oral kaolin is predicted to decrease the absorption of oral hydroxychloroquine. Moderate Theoretical
- ► Lanthanum is predicted to decrease the absorption of hydroxychloroquine. Separate administration by at least 2 hours. [Moderate] Theoretical
- ► Hydroxychloroquine is predicted to decrease the exposure to laronidase. Avoid simultaneous administration. Severe Theoretical
- ► Macrolides might increase the risk of serious cardiovascular adverse effects when given with hydroxychloroquine. Severe Theoretical → Also see TABLE 9 p. 1492
- Oral magnesium trisilicate is predicted to decrease the absorption of oral hydroxychloroquine. [Moderate] Theoretical
- Hydroxychloroquine is predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. Severe Theoretical
- Hydroxychloroquine is predicted to decrease efficacy rabies vaccine. [Moderate] Theoretical
- Hydroxychloroquine might decrease the effects of remdesivir.
 Avoid. [Moderate] Theoretical

Hydroxyzine → see antihistamines, sedating

Hyoscine → see TABLE 10 p. 1492 (antimuscarinics)

➤ Antipsychotics, second generation (clozapine) can cause constipation, as can hyoscine; concurrent use might increase the risk of developing intestinal obstruction. [Severe] Theoretical → Also see TABLE 10 p. 1492

Ibandronate → see bisphosphonates

Ibrutinib → see TABLE 15 p. 1493 (myelosuppression), TABLE 4 p. 1490 (antiplatelet effects)

FOOD AND LIFESTYLE Avoid food or drink containing bitter (Seville) oranges as they are predicted to increase the exposure to ibrutinib.

- ► Ibrutinib is predicted to increase the exposure to aliskiren. Separate administration by at least 6 hours. Moderate
 Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ibrutinib. Avoid or monitor. Severe Study
- ► Antiarrhythmics (amiodarone) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose, p. 1062. [Severe] Theoretical
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ibrutinib. Avoid or monitor. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062.
 [Severe] Study

Ibrutinib (continued)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ibrutinib. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1062. [Severe] Study
- ► Ibrutinib is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). Separate administration by at least 6 hours. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062. [Severe] Study
- ► Cenobamate is predicted to decrease the exposure to ibrutinib. Adjust dose. Moderate Theoretical
- Cobicistat is predicted to increase the exposure to ibrutinib.
 Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose,
 p. 1062. Severe Study
- ► Ibrutinib is predicted to increase the exposure to colchicine.

 Separate administration by at least 6 hours. Moderate

 Theoretical
- ► Crizotinib is predicted to increase the exposure to ibrutinib.

 Adjust ibrutinib dose with moderate CYP3A4 inhibitors,
 p. 1062. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to ibrutinib. Avoid or monitor. (Severe) Study
- ► Ibrutinib is predicted to increase the exposure to digoxin.

 Separate administration by at least 6 hours. Moderate

 Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to ibrutinib. Avoid or monitor. Severe Study
- ► Ibrutinib is predicted to increase the exposure to everolimus.

 Separate administration by at least 6 hours. [Moderate]

 Theoretical
- ► Ibrutinib is predicted to increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Separate administration by at least 6 hours. [Moderate] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to ibrutinib. Avoid. Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to ibrutinib. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1062. Severe Study
- ► Idelalisib is predicted to increase the exposure to ibrutinib. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1062. [Severe] Study
- ► Imatinib is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYPSA4 inhibitors, p. 1062. Severe Study → Also see TABLE 15 p. 1493 → Also see TABLE 4 p. 1490
- ▶ Letermovir is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062. Severe Study
- ► Ibrutinib is predicted to increase the exposure to loperamide.

 Separate administration by at least 6 hours. Moderate

 Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to ibrutinib. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1062. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062. [Severe] Study
- Mitotane is predicted to decrease the exposure to ibrutinib. Avoid or monitor. Severe Study → Also see TABLE 15 p. 1493
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062.
 [Severe] Study
- ▶ Neurokinin-1 receptor antagonists (fosaprepitant) are predicted to slightly increase the exposure to ibrutinib. Moderate Theoretical
- Nilotinib is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062. Severe Study → Also see TABLE 15 p. 1493
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of ibrutinib. Avoid or adjust ibrutinib dose, p. 1062. [Severe] Theoretical

- NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to ibrutinib. Avoid or monitor. Severe Study
- ► Quinolones (ciprofloxacin) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose, p. 1062. Severe Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to ibrutinib. Avoid or monitor. [Severe] Study
- ► Ibrutinib is predicted to increase the exposure to sirolimus. Separate administration by at least 6 hours. Moderate Theoretical
- ► St John's wort is predicted to decrease the exposure to ibrutinib. Avoid. Severe Theoretical
- ► Ibrutinib is predicted to increase the exposure to talazoparib.

 Separate administration by at least 6 hours. Moderate

 Theoretical → Also see TABLE 15 p. 1493
- ► Ibrutinib is predicted to increase the exposure to taxanes (docetaxel, paclitaxel). Separate administration by at least 6 hours. Moderate Theoretical → Also see TABLE 15 p. 1493
- ► Ibrutinib is predicted to increase the exposure to thrombin inhibitors (dabigatran). Separate administration by at least 6 hours. Moderate Theoretical
- ► Ibrutinib is predicted to increase the exposure to topotecan.

 Separate administration by at least 6 hours. [Moderate]

 Theoretical → Also see TABLE 15 p. 1493
- ► Tucatinib is predicted to increase the exposure to ibrutinib.

 Avoid or adjust dose. [Moderate] Theoretical

Ibuprofen → see NSAIDs

Icatibant

 ACE inhibitors are predicted to decrease the efficacy of icatibant and icatibant is predicted to decrease the efficacy of ACE inhibitors. Avoid. [Moderate] Theoretical

Idarubicin → see anthracyclines

Idelalisib

- ► Idelalisib is predicted to increase the exposure to abemaciclib.

 Avoid or adjust abemaciclib dose, p. 1042. Severe Study
- ► Idelalisib is predicted to increase the exposure to acalabrutinib. Avoid. Severe Study
- Idelalisib is predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. [Severe] Study
- Idelalisib is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- ► Idelalisib is predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to idelalisib. Avoid. Severe Study
- Idelalisib is predicted to increase the exposure to antiandrogens (apalutamide). [Mild] Study
- Idelalisib is predicted to increase the exposure to antiarrhythmics (amiodarone). Avoid. Moderate Theoretical
- Idelalisib very markedly increases the exposure to antiarrhythmics (dronedarone). Avoid. Severe Study
- Idelalisib is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. Severe Study
- ► Idelalisib is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to idelalisib. Avoid. Severel Study
- ► Idelalisib is predicted to very slightly increase the exposure to antiepileptics (perampanel). [Mild] Study
- Idelalisib is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor adverse effects.

 Severel Study
- Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Study
- Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. [Moderate] Study
- ► Idelalisib is predicted to increase the concentration of antimalarials (piperaquine). [Severe] Theoretical
- Idelalisib is predicted to slightly increase the exposure to antipsychotics, second generation (aripiprazole). Adjust aripiprazole dose, p. 427. Moderate Study

- Idelalisib is predicted to moderately increase the exposure to antipsychotics, second generation (cariprazine). Avoid. [Severe]
 Study
- Idelalisib is predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid.

 Severel Study
- Idelalisib is predicted to increase the exposure to antipsychotics, second generation (risperidone). Adjust dose.
 Moderate Study
- Idelalisib is predicted to increase the exposure to avapritinib.
 Avoid. Moderate Study
- ► Idelalisib is predicted to increase the exposure to axitinib. Avoid or adjust dose. Moderate Study
- ► Idelalisib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Study
- ► Idelalisib moderately increases the exposure to benzodiazepines (alprazolam). Avoid. [Moderate] Study
- Idelalisib is predicted to markedly to very markedly increase the exposure to benzodiazepines (midazolam). Avoid or adjust dose. Severe Study
- ► Idelalisib is predicted to increase the exposure to beta₂ agonists (salmeterol). Avoid. Severe Study
- Idelalisib slightly increases the exposure to bortezomib.
 Moderate Study
- ► Idelalisib is predicted to increase the exposure to bosutinib.

 Avoid or adjust dose. Severe Study
- ► Idelalisib is predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1048. Severe Study
- Idelalisib is predicted to increase the exposure to buspirone.
 Adjust buspirone dose, p. 373. Severe Study
- Idelalisib is predicted to increase the exposure to cabozantinib.
 Moderate Study
- Idelalisib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate]
 Study
- Idelalisib is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- Idelalisib is predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to cannabidiol. Avoid or adjust dose. Mild Study
- ► Idelalisib is predicted to increase the exposure to ceritinib.

 Avoid or adjust ceritinib dose, p. 1050. [Severe] Study
- Idelalisib increases the concentration of ciclosporin. Severe Study
- Idelalisib is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 252. [Moderate] Study
- ► Idelalisib is predicted to moderately increase the exposure to cinacalcet. Adjust dose. Moderate Study
- Idelalisib is predicted to increase the exposure to cobimetinib.
 Avoid or monitor for toxicity. Severe Study
- ► Idelalisib is predicted to increase the exposure to colchicine. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1212. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate]
- Idelalisib is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects.
- Idelalisib is predicted to increase the exposure to crizotinib.
 Avoid. Moderate Study
- ▶ Dabrafenib is predicted to decrease the exposure to idelalisib. Avoid. Moderate Theoretical
- Idelalisib is predicted to increase the exposure to dabrafenib.
 Use with caution or avoid. Moderate Study
- Idelalisib is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. Severe Study
- Idelalisib is predicted to increase the exposure to dasatinib.
 Avoid or adjust dose—consult product literature. [Severe] Study

- ► Idelalisib very slightly increases the exposure to delamanid.

 | Severe | Study |
- ► Idelalisib is predicted to moderately increase the exposure to dienogest. Moderate Study
- Idelalisib is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Moderate] Study
- ► Idelalisib is predicted to increase the exposure to domperidone. Avoid. Severe Study
- ► Idelalisib increases the exposure to dopamine receptor agonists (bromocriptine). Severe Study
- ► Idelalisib is predicted to increase the concentration of dopamine receptor agonists (cabergoline). Moderate Anecdotal
- ► Idelalisib is predicted to increase the exposure to dronabinol. Adjust dose. Mild Study
- ► Idelalisib is predicted to increase the exposure to drospirenone. [Severe] Study
- Idelalisib is predicted to increase the exposure to dutasteride.
 Monitor adverse effects and adjust dose. Moderate Theoretical
- ► Idelalisib is predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with potent CYP3A4 inhibitors. Severe Study
- Idelalisib is predicted to increase the exposure to eliglustat.
 Avoid or adjust dose—consult product literature. Severe Study
- ► Idelalisib is predicted to increase the exposure to encorafenib.

 Avoid or monitor. [Severe] Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to idelalisib. Avoid. Moderate Theoretical
- Idelalisib is predicted to increase the exposure to endothelin receptor antagonists (macitentan). Moderate) Study
- Idelalisib is predicted to increase the exposure to entrectinib.
 Avoid potent CYP3A4 inhibitors or adjust entrectinib dose,
 p. 1056. Severe Study
- ► Idelalisib is predicted to increase the risk of ergotism when given with ergometrine. Avoid. Severe Theoretical
- ► Idelalisib is predicted to increase the risk of ergotism when given with ergotamine. Avoid. Severe Theoretical
- ▶ Idelalisib is predicted to increase the exposure to erlotinib. Use with caution and adjust dose. [Severe] Study
- Idelalisib is predicted to increase the exposure to esketamine.
 Adjust dose. Moderate Study
- Idelalisib is predicted to increase the concentration of subdermal etonogestrel. Moderate Theoretical
- Idelalisib is predicted to increase the exposure to everolimus.
 Avoid. (Severe) Study
- Idelalisib is predicted to increase the exposure to factor XA inhibitors (apixaban). [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to fedratinib.
 Adjust fedratinib dose, but avoid depending on other drugs taken—consult product literature, p. 1060. [Moderate] Study
- ► Idelalisib is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 840.
 Severel Study
- ► Idelalisib is predicted to increase the exposure to fostamatinib. Monitor adverse effects and adjust dose. Moderate Study
- Idelalisib is predicted to increase the exposure to gefitinib.
 Severe Study
- ► Idelalisib is predicted to increase the exposure to gilteritinib. Moderate Study
- ► Idelalisib is predicted to increase the exposure to glasdegib.

 Use with caution or avoid. [Severe] Study
- Idelalisib is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 384. Moderate Study
- Idelalisib is predicted to increase the exposure to ibrutinib.
 Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose,
 p. 1062. [Severe] Study
- Idelalisib is predicted to increase the exposure to imatinib.
 Moderate Study
- ► Idelalisib is predicted to increase the risk of toxicity when given with irinotecan. Avoid. Moderate Study
- ► Idelalisib is predicted to increase the exposure to ivabradine. Avoid. Severe Study

Idelalisib (continued)

- Idelalisib is predicted to increase the exposure to ivacaftor.
 Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 317, lumacaftor with ivacaftor p. 318, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. Sewerel Study
- Idelalisib is predicted to increase the exposure to lapatinib.
 Avoid. Moderate Study
- Idelalisib is predicted to moderately increase the exposure to larotrectinib. Avoid or adjust larotrectinib dose, p. 1065.
 Moderate Study
- ► Idelalisib is predicted to markedly increase the exposure to lomitapide. Avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to Iorlatinib. Avoid or adjust Iorlatinib dose, p. 1067. Severe Study
- ► Idelalisib markedly increases the exposure to maraviroc.

 Adjust dose. Severe Theoretical
- Idelalisib is predicted to increase the concentration of intramuscular medroxyprogesterone. [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to meglitinides (repaglinide). [Moderate] Study
- Idelalisib is predicted to increase the exposure to midostaurin.
 Avoid or monitor for toxicity. [Severe] Study
- Idelalisib is predicted to increase the exposure to mifepristone.
 Moderate Study
 Idelalisib is predicted to increase the exposure to mirabegron.
- Adjust mirabegron dose in hepatic and renal impairment,
 p. 843. [Moderate] Study
- Idelalisib is predicted to increase the exposure to mirtazapine.
 Moderate Study
- Mitotane is predicted to decrease the exposure to idelalisib.
 Avoid. Severe Study
- Idelalisib is predicted to increase the exposure to modafinil.
 Mild Theoretical
- Idelalisib is predicted to increase the exposure to monoclonal antibodies (polatuzumab vedotin). [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical
- Idelalisib is predicted to increase the exposure to naldemedine.
 Avoid or monitor. Moderate Study
- ► Idelalisib is predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to neratinib. Avoid potent CYP3A4 inhibitors or adjust neratinib dose, p. 1069. [Severe] Study
- Idelalisib is predicted to markedly increase the exposure to neurokinin-1 receptor antagonists (aprepitant). [Moderate] Study
- Idelalisib is predicted to increase the exposure to neurokinin-1 receptor antagonists (fosaprepitant). [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to neurokinin-1 receptor antagonists (netupitant). Moderate Study
- ► Idelalisib is predicted to increase the exposure to nilotinib. Avoid. [Severe] Study
- Idelalisib is predicted to increase the exposure to nitisinone.
 Adjust dose. Moderate Theoretical
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to idelalisib. Avoid. [Moderate] Theoretical
- ► Idelalisib is predicted to increase the exposure to olaparib. Avoid potent CYP3A4 inhibitors or adjust olaparib dose, p. 1088. [Moderate] Study
- ► Idelalisib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Severe] Study
- Idelalisib is predicted to increase the exposure to opioids (methadone). Severe Theoretical
- Idelalisib is predicted to increase the exposure to osilodrostat.
 Moderate Theoretical
- Idelalisib is predicted to increase the exposure to ospemifene.
 Avoid in poor CYP2C9 metabolisers. [Moderate] Study
- Idelalisib is predicted to increase the exposure to oxybutynin.
 Mild Study
- ► Idelalisib is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 1072. Severe Study

- ► Idelalisib is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 1009. Moderate Study
- Idelalisib is predicted to increase the exposure to pazopanib.
 Avoid or adjust pazopanib dose, p. 1073. Moderate Study
- ► Idelalisib is predicted to increase the exposure to pemigatinib.

 Avoid or adjust pemigatinib dose, p. 1074. Severe Study
- Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent CYP3A4 inhibitors or adjust sildenafil dose, p. 879. Severe Study
- Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to pimozide. Avoid. Severe Study
- ► Idelalisib is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 1075. Moderate Study
- Idelalisib is predicted to moderately increase the exposure to praziquantel. Mild Study
- Idelalisib given with carbimazole is predicted to increase the exposure to propiverine. Adjust starting dose. Moderate
- Idelalisib is predicted to increase the exposure to ranolazine.
 Avoid. [Severe] Study
- Idelalisib is predicted to increase the exposure to reboxetine.
 Avoid. Moderate Study
- Idelalisib is predicted to increase the exposure to regorafenib.
 Avoid. Moderate Study
- ► Idelalisib is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1356. Moderate

 Theoretical
- Idelalisib is predicted to increase the exposure to ribociclib.
 Avoid or adjust ribociclib dose, p. 1077. [Moderate] Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to idelalisib. Avoid. Severe Study
- Idelalisib is predicted to increase the exposure to ruxolitinib.
 Adjust dose and monitor adverse effects. [Moderate] Study
- Idelalisib is predicted to increase the exposure to selpercatinib.
 Adjust selpercatinib dose, p. 1079. Moderate Study
- ► Idelalisib is predicted to increase the exposure to selumetinib. Avoid or adjust dose—consult product literature. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to siponimod.

 Avoid depending on other drugs taken—consult product literature. [Severe] Theoretical
- Idelalisib is predicted to increase the concentration of sirolimus. Avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to SNRIs (venlafaxine). Moderate Study
- ► Idelalisib is predicted to increase the exposure to solifenacin.

 Adjust solifenacin p. 842 or tamsulosin with solifenacin p. 848

 dose; avoid in hepatic and renal impairment. Severe Study
- ► Idelalisib is predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid potent CYP3A4 inhibitors or adjust dapoxetine dose, p. 887. [Severe] Study
- St John's wort is predicted to decrease the exposure to idelalisib. Avoid. [Moderate] Theoretical
- ► Idelalisib is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to statins (simvastatin). Avoid. Severe Study
- ► Idelalisib is predicted to increase the exposure to sunitinib.

 Avoid or adjust sunitinib dose, p. 1080. Moderate Study
- ► Idelalisib is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. Severe Study
- Idelalisib is predicted to increase the exposure to taxanes (cabazitaxel). Avoid or monitor—consult product literature.
 Severe Study
- Idelalisib is predicted to increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study

- Idelalisib is predicted to increase the exposure to taxanes (paclitaxel). [Moderate] Anecdotal
- Idelalisib is predicted to increase the concentration of temsirolimus. Avoid. Severe Theoretical
- Idealisib is predicted to increase the exposure to tezacaftor. Adjust dose with potent CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320. Severel Study
- ► Idelalisib is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to tofacitinib.

 Adjust tofacitinib dose, p. 1200. Moderate Study
- Idelalisib is predicted to increase the exposure to tolterodine.
 Avoid. Severe Study
- ▶ Idelalisib is predicted to increase the exposure to tolvaptan.

 Manufacturer advises caution or adjust tolvaptan dose with potent CYP3A4 inhibitors, p. 724. Severe Study
- Idelalisib is predicted to increase the exposure to toremifene.
 Moderate Theoretical
- Idelalisib is predicted to increase the exposure to trabectedin.
 Avoid or adjust dose. (Severe) Theoretical
- ► Idelalisib is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. Moderate Study
- ► Idelalisib increases the exposure to triptans (almotriptan). Mild Study
- Idelalisib is predicted to markedly increase the exposure to triptans (eletriptan). Avoid. Severe Study
- Idelalisib is predicted to increase the exposure to ulipristal.
 Avoid if used for uterine fibroids. Severe Study
- Idelalisib is predicted to increase the exposure to upadacitinib.
 Use with caution or avoid. [Severe] Study
- ► Idelalisib is predicted to increase the exposure to vemurafenib.

 Severe Theoretical
- ► Idelalisib is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. Severe Study
- ► Idelalisib is predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical
- Idelalisib is predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study
- Idelalisib is predicted to increase the exposure to zopiclone.
 Adjust dose. Moderate Theoretical

Ifosfamide → see alkylating agents

Iloprost → see TABLE 8 p. 1491 (hypotension), TABLE 4 p. 1490 (antiplatelet effects)

Imatinib → see TABLE 15 p. 1493 (myelosuppression), TABLE 4 p. 1490 (antiplatelet effects)

- Imatinib is predicted to increase the exposure to abemaciclib.
 [Moderate] Study
- ► Imatinib is predicted to increase the exposure to acalabrutinib. Avoid or monitor. Severe Study → Also see TABLE 4 p. 1490
- ► Imatinib is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 210. Severe Study
- Imatinib is predicted to increase the exposure to alpha blockers (tamsulosin). Moderate Theoretical
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study
- Imatinib is predicted to increase the exposure to antiarrhythmics (dronedarone). Severe Theoretical
- Imatinib is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose.
 Moderatel Study
- Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to imatinib. Avoid. Moderate Study
- Antiepileptics (eslicarbazepine) are predicted to decrease the exposure to imatinib. Moderate Theoretical
- Antiepileptics (topiramate) are predicted to decrease the exposure to imatinib. [Moderate] Study
- Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to imatinib. Moderate Theoretical
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to imatinib. Moderate Study
- Imatinib is predicted to increase the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical

- Imatinib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Severe Theoretical
- Imatinib is predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. [Moderate] Study
- Imatinib is predicted to increase the concentration of antimalarials (piperaquine). [Severe] Theoretical
- Imatinib is predicted to increase the exposure to antipsychotics, second generation (cariprazine). Avoid. Severe Study
- Imatinib is predicted to increase the exposure to antipsychotics, second generation (lurasidone). Adjust lurasidone dose.
 Moderate) Study
- Imatinib is predicted to increase the exposure to antipsychotics, second generation (quetiapine). Avoid. [Moderate] Study
- ► Asparaginase is predicted to increase the risk of hepatotoxicity when given with imatinib. Severe Theoretical → Also see TABLE 15 p. 1493
- ► Imatinib is predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. Moderate Study
- ► Imatinib is predicted to increase the exposure to axitinib.

 Moderate Study → Also see TABLE 15 p. 1493 → Also see TABLE 4

 p. 1490
- ► Imatinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Imatinib is predicted to increase the exposure to benzodiazepines (alprazolam). Severe Study
- Imatinib is predicted to increase the exposure to benzodiazepines (midazolam). Monitor adverse effects and adjust dose. [Severe] Study
- ► Imatinib is predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study → Also see TABLE 15 p. 1493 → Also see TABLE 4 p. 1490
- Imatinib is predicted to increase the exposure to brigatinib.
 Moderate Study
- ► Imatinib is predicted to increase the exposure to buspirone. Use with caution and adjust dose. Moderate Study
- ► Imatinib is predicted to increase the exposure to cabozantinib.
 Moderate Study → Also see TABLE 15 p. 1493
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to imatinib. Moderate Theoretical
- Imatinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercandipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- ► Imatinib is predicted to increase the exposure to ceritinib.

 Moderate Study → Also see TABLE 15 p. 1493
- ► Imatinib is predicted to increase the concentration of ciclosporin. Severe Study
- Cobicistat is predicted to increase the exposure to imatinib.
 Moderate Study
- ► Imatinib is predicted to increase the exposure to cobimetinib.

 | Severe | Study |
- ► Imatinib is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212. [Severe] Study
- ► Imatinib is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. Moderate Study
- ► Imatinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- ► Crisantaspase is predicted to increase the risk of hepatotoxicity when given with imatinib. Severe Theoretical → Also see TABLE 15 p. 1493
- Imatinib is predicted to increase the exposure to crizotinib.
 Moderate Study
- Imatinib is predicted to increase the exposure to dabrafenib.
 [Moderate] Study
- Dabrafenib is predicted to decrease the exposure to imatinib.
 Moderate Study
- ► Imatinib is predicted to increase the exposure to darifenacin. Moderate Study
- ► Imatinib is predicted to increase the exposure to dasatinib.

 Severe Study → Also see TABLE 15 p. 1493 → Also see TABLE 4 p. 1490
- Imatinib is predicted to slightly increase the exposure to dienogest. [Moderate] Study
- Imatinib is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Mild] Study

Imatinib (continued)

- Imatinib is predicted to increase the exposure to domperidone.
 Avoid. | Severe | Study
- ► Imatinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). [Severe] Theoretical
- ► Imatinib is predicted to increase the concentration of dopamine receptor agonists (cabergoline). Moderate Anecdotal
- ► Imatinib is predicted to moderately increase the exposure to dutasteride. Mild Study
- Imatinib is predicted to increase the exposure to elexacaftor.
 Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. Severe Theoretical
- ► Imatinib is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- ► Imatinib is predicted to moderately increase the exposure to encorafenib. [Moderate] Study
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to imatinib. Moderate Study
- ► Imatinib is predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. [Severe] Theoretical
- ► Imatinib is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
- Imatinib is predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- Imatinib is predicted to increase the exposure to erlotinib.
 Moderate Study
- Imatinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- Imatinib is predicted to increase the exposure to fedratinib.
 Monitor and adjust dose. Moderate Study
- Imatinib is predicted to increase the exposure to fesoterodine.
 Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. Mild Study
- ► Imatinib is predicted to increase the exposure to gefitinib. Moderate Study
- Grapefruit juice is predicted to increase the exposure to imatinib. [Moderate] Theoretical
- Imatinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to imatinib. Moderate Study
- Imatinib is predicted to increase the exposure to ibrutinib.
 Adjust ibrutinib dose with moderate CYP3A4 inhibitors,
 p. 1062. Severe Study → Also see TABLE 15 p. 1493 → Also see TABLE 4
 p. 1490
- Idelalisib is predicted to increase the exposure to imatinib.
 Moderate Study
- ► Imatinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 231. Severe Theoretical
- Imatinib is predicted to increase the exposure to ivacaftor.
 Adjust dose with moderate CYP5A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- ► Imatinib is predicted to increase the exposure to lapatinib.

 [Moderate] Study
- Letermovir is predicted to increase the exposure to imatinib.
 Moderate Study
- Imatinib is predicted to increase the exposure to lomitapide.
 Avoid. Moderate Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to imatinib. Moderate Study
- Macrolides (erythromycin) are predicted to increase the exposure to imatinib. Moderate Theoretical
- ► Imatinib is predicted to increase the exposure to midostaurin.

 [Moderate] Theoretical
- Mitotane is predicted to decrease the exposure to imatinib. Avoid. Moderate Study → Also see TABLE 15 p. 1493
- ► Imatinib is predicted to increase the exposure to naldemedine.

 Moderate Study
- ► Imatinib is predicted to increase the exposure to naloxegol.

 Adjust naloxegol dose and monitor adverse effects, p. 67.

 Moderate] Study
- Imatinib is predicted to increase the exposure to neratinib.
 Avoid moderate CYP3A4 inhibitors or adjust neratinib dose

- and monitor for gastrointestinal adverse effects, p. 1069.
 [Severe] Study
- ▶ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to imatinib. Moderate Theoretical
- ► Nilotinib is predicted to increase the exposure to imatinib.

 [Moderate] Study → Also see TABLE 15 p. 1493
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to imatinib. [Moderate] Study
- Imatinib is predicted to increase the exposure to olaparib.
 Avoid moderate CYP3A4 inhibitors or adjust olaparib dose,
 p. 1088. Moderate Theoretical → Also see TABLE 15 p. 1493
- Imatinib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. Moderate Study
- Imatinib is predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical
- Imatinib increases the risk of hepatotoxicity when given with paracetamol. Severe Anecdotal
- ► Imatinib is predicted to increase the exposure to pazopanib.
 Moderate Study → Also see TABLE 4 p. 1490
- ▶ Pegaspargase is predicted to increase the risk of hepatotoxicity when given with imatinib. Severe Theoretical → Also see TABLE 15 p. 1493
- ► Imatinib is predicted to increase the exposure to pemigatinib.

 Severe Study
- Imatinib is predicted to increase the risk of bleeding events when given with phenindione. Severe Theoretical
- Imatinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 878. [Moderate] Theoretical
- Imatinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate CYP3A4 inhibitors, p. 879.
 Moderate) Study
- Imatinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Severe Theoretical
- Imatinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose.
 Severel Theoretical
- Imatinib is predicted to increase the exposure to pimozide.
 Avoid. Severe Theoretical
- ► Imatinib is predicted to increase the exposure to ponatinib.

 [Moderate] Study → Also see TABLE 4 p. 1490
- Imatinib is predicted to increase the exposure to ranolazine.
 Severe Study
- ► Imatinib is predicted to increase the exposure to regorafenib.

 Moderate

 Study → Also see TABLE 15 p. 1493 → Also see TABLE 4

 p. 1490
- ► Imatinib is predicted to increase the exposure to ribociclib.

 [Moderate] Study → Also see TABLE 15 p. 1493
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to imatinib. Avoid. Moderate Study
- ► Imatinib is predicted to increase the exposure to ruxolitinib.
 Moderate Study → Also see TABLE 15 p. 1493
- Imatinib is predicted to increase the exposure to selpercatinib.
 Moderate Study
- ► Imatinib is predicted to increase the exposure to selumetinib. Avoid or adjust dose—consult product literature. Severe Study
- ► Imatinib is predicted to increase the exposure to siponimod. Avoid depending on other drugs taken—consult product literature. Severe Study
- ► Imatinib increases the concentration of sirolimus. Monitor and adjust dose. Moderate Study
- ► Imatinib is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate CYP3A4 inhibitors, p. 887. Moderate Theoretical → Also see TABLE 4 p. 1490
- ► St John's wort is predicted to decrease the exposure to imatinib. [Moderate] Study
- ► Imatinib is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Theoretical
- ► Imatinib moderately increases the exposure to statins (simvastatin). Monitor and adjust dose. [Severe] Study

- ► Imatinib is predicted to increase the exposure to sunitinib.

 Moderate Study → Also see TABLE 15 p. 1493 → Also see TABLE 4
 p. 1490
- Imatinib is predicted to increase the concentration of tacrolimus. [Severe] Study
- ► Imatinib is predicted to increase the exposure to taxanes (cabazitaxel). Moderate Theoretical → Also see TABLE 15 p. 1493
- ► Imatinib is predicted to increase the exposure to taxanes (docetaxel). (Severe) Study → Also see TABLE 15 p. 1493
- ► Imatinib is predicted to increase the exposure to taxanes (paclitaxel). [Moderate] Anecdotal → Also see TABLE 15 p. 1493
- ► Tedizolid is predicted to increase the exposure to imatinib.

 Avoid. [Moderate] Theoretical
- ► Imatinib is predicted to increase the concentration of temsirolimus. Use with caution or avoid. [Moderate] Theoretical → Also see TABLE 15 p. 1493
- Imatinib is predicted to increase the exposure to tezacaftor.
 Adjust dose with moderate CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320. Severe Study
- ► Imatinib causes hypothyroidism when given with thyroid hormones (levothyroxine) in thyroidectomy patients. Moderate Study
- ► Imatinib given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. [Moderate] Study
- Imatinib is predicted to increase the exposure to tolvaptan.
 Manufacturer advises caution or adjust tolvaptan dose with moderate CYP3A4 inhibitors, p. 724. [Moderate] Study
- Imatinib is predicted to increase the exposure to trazodone.
 Moderate Theoretical
- ► Imatinib is predicted to increase the exposure to ulipristal.

 Avoid if used for uterine fibroids. [Moderate] Study
- ► Imatinib is predicted to increase the exposure to vemurafenib.

 Severe Theoretical
- ► Imatinib is predicted to increase the exposure to venetoclax.

 Avoid or adjust dose—consult product literature. [Severe] Study
- ► Imatinib is predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 15 p. 1493
- Imatinib is predicted to increase the exposure to zopiclone.
 Adjust dose. Moderate Study

Imidapril → see ACE inhibitors **Imipenem** → see carbapenems

Imipramine → see tricyclic antidepressants

Immunoglobulins

Anti-D (Rh_o) immunoglobulin - antithymocyte immunoglobulin (rabbit) - cytomegalovirus immunoglobulin - hepatitis B immunoglobulin - normal immunoglobulin - rabies immunoglobulin - tetanus immunoglobulin - varicella-zoster immunoglobulin

- Cytomegalovirus immunoglobulin is predicted to decrease the efficacy of live vaccines (Bacillus Calmette-Guérin vaccine, herpes-zoster vaccine, live, influenza vaccine (live), measles, mumps and rubella vaccine, live, rotavirus vaccine, typhoid vaccine, oral). Avoid and for 3 months after stopping cytomegalovirus immunoglobulin. [Moderate] Theoretical
- Anti-D (Rh_o) immunoglobulin is predicted to decrease the
 efficacy of live vaccines (Bacillus Calmette-Guérin vaccine,
 herpes-zoster vaccine, live, influenza vaccine (live), measles,
 mumps and rubella vaccine, live, rotavirus vaccine, typhoid
 vaccine, oral, varicella-zoster vaccine). Avoid and for 3 months
 after stopping anti-D (Rh_o) immunoglobulin. [Moderate]
- Normal immunoglobulin is predicted to decrease the efficacy of live vaccines (Bacillus Calmette-Guérin vaccine, herpes-zoster vaccine, live, influenza vaccine (live), measles, mumps and rubella vaccine, live, rotavirus vaccine, typhoid vaccine, oral, varicella-zoster vaccine). Avoid and for 3 months after stopping normal immunoglobulin. [Moderate] Theoretical
- Varicella-zoster immunoglobulin is predicted to decrease the efficacy of live vaccines (Bacillus Calmette-Guérin vaccine, influenza vaccine (live), rotavirus vaccine, typhoid vaccine, oral, varicella-zoster vaccine). Avoid and for at least 3 months after stopping varicella-zoster immunoglobulin. Moderate Theoretical
- ► Varicella-zoster immunoglobulin is predicted to decrease the efficacy of live vaccines (herpes-zoster vaccine, live). Avoid and

- for 3 months after stopping varicella-zoster immunoglobulin.

 Moderate Theoretical
- Varicella-zoster immunoglobulin is predicted to decrease efficacy live vaccines (measles, mumps and rubella vaccine, live). Avoid and for at least 3 months after stopping varicella-zoster immunoglobulin. [Moderate] Theoretical
- Cytomegalovirus immunoglobulin is predicted to decrease the exposure to live vaccines (varicella-zoster vaccine). Avoid and for 3 months after stopping cytomegalovirus immunoglobulin. [Moderate] Theoretical
- ► Cytomegalovirus immunoglobulin is predicted to increase the risk of adverse effects when given with loop diuretics. Avoid.

 Moderate Theoretical
- ► Loop diuretics might increase the risk of adverse effects when given with normal immunoglobulin. Avoid. [Moderate] Theoretical
- Normal immunoglobulin is predicted to alter the effects of monoclonal antibodies (dinutuximab). Avoid. [Severe] Theoretical

Indacaterol → see beta₂ agonists

Indapamide → see thiazide diuretics Indometacin → see NSAIDs

Indornamin → see alpha blockers

Infliximab → see monoclonal antibodies

Influenza vaccine (live) → see live vaccines

Inotersen → see TABLE 2 p. 1490 (nephrotoxicity)

- ➤ Drugs with anticoagulant effects (see TABLE 3 p. 1490) cause bleeding, as can inotersen; concurrent use might increase the risk of developing this effect. [Severe] Theoretical
- ▶ Drugs with antiplatelet effects (see TABLE 4 p. 1490) cause bleeding, as can inotersen; concurrent use might increase the risk of developing this effect. (Severe Theoretical

Inotuzumab ozogamicin → see monoclonal antibodies

Insulin → see TABLE 14 p. 1493 (antidiabetic drugs)

- ► Fenfluramine might decrease blood glucose concentrations when given with insulin. Moderate Theoretical
- Fibrates are predicted to increase the risk of hypoglycaemia when given with insulin. Moderate Theoretical
- ► Metreleptin is predicted to increase the risk of hypoglycaemia when given with insulin. Monitor blood glucose and adjust dose. [Severe] Theoretical

Interferon beta → see interferons

Interferons → see TABLE 15 p. 1493 (myelosuppression)

interferon beta · peginterferon alfa · ropeginterferon alfa

- Interferons are predicted to slightly increase the exposure to aminophylline. Adjust dose. Moderate Theoretical
- Ropeginterferon alfa is predicted to increase the exposure to antipsychotics, second generation (risperidone). Moderate
 Theoretical
- ► Ropeginterferon alfa is predicted to increase the exposure to atomoxetine. Moderate Theoretical
- ► Ropeginterferon alfa is predicted to increase the exposure to beta blockers, selective (nebivolol). [Moderate] Theoretical
- ► Ropeginterferon alfa is predicted to increase the exposure to eliglustat. Moderate Theoretical
- Ropeginterferon alfa is predicted to increase the exposure to opioids (methadone). Moderate Theoretical
- ► Interferons slightly increase the exposure to theophylline. Adjust dose. [Moderate] Study
- Ropeginterferon alfa is predicted to increase the exposure to vortioxetine. Moderate Theoretical

Ipilimumab → see monoclonal antibodies

Ipratropium → see TABLE 10 p. 1492 (antimuscarinics)

- ► Antipsychotics, second generation (clozapine) can cause constipation, as can ipratropium; concurrent use might increase the risk of developing intestinal obstruction. Severe Theoretical → Also see TABLE 10 p. 1492
- Beta₂ agonists are predicted to increase the risk of glaucoma when given with ipratropium. [Moderate] Anecdotal

Irbesartan → see angiotensin-II receptor antagonists

Irinotecan → see TABLE 15 p. 1493 (myelosuppression)

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

Irinotecan (continued)

- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. Moderate Study
- ► Cobicistat is predicted to increase the risk of toxicity when given with irinotecan. Avoid. Moderate Study ▶ Fibrates (gemfibrozil) are predicted to increase the exposure to
- irinotecan. Avoid. Moderate Theoretical ▶ HIV-protease inhibitors are predicted to increase the risk of
- toxicity when given with irinotecan. Avoid. Moderate Study
- ▶ Idelalisib is predicted to increase the risk of toxicity when given with irinotecan. Avoid. Moderate Study
- ▶ Lapatinib increases the exposure to the active metabolite of irinotecan. Monitor adverse effects and adjust dose. Severe
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with irinotecan. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Macrolides (clarithromycin) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. Moderate Study
- ▶ Mitotane is predicted to decrease the exposure to irinotecan. Avoid. Severe Study → Also see TABLE 15 p. 1493
- ► Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant) are predicted to increase the exposure to intravenous irinotecan. Severe Theoretical
- ▶ Neurokinin-1 receptor antagonists (netupitant) are predicted to increase the exposure to irinotecan. Moderate Study
- Irinotecan is predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. Moderate Theoretical
- ▶ Pitolisant is predicted to decrease the exposure to irinotecan. Mild Theoretical
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to irinotecan. Avoid. Severe Study
- ► St John's wort slightly decreases the exposure to irinotecan. Avoid. Severe Study
- ▶ Irinotecan is predicted to increase the risk of prolonged neuromuscular blockade when given with suxamethonium. Moderate Theoretical

Iron

- ▶ Oral antacids decrease the absorption of oral iron. Manufacturer advises iron should be taken 1 hour before or 2 hours after antacids. Moderate Study
- ► Antipsychotics, second generation (clozapine) can cause constipation, as can iron; concurrent use might increase the risk of developing intestinal obstruction. Severe Anecdotal
- ▶ Oral iron might decrease the concentration of the active metabolite of oral baloxavir marboxil. Avoid. Severe Theoretical
- ► Oral iron decreases the exposure to oral bictegravir. Manufacturer advises bictegravir should be taken 2 hours before iron. Moderate Study
- ► Oral iron decreases the absorption of oral bisphosphonates (clodronate). Clodronate should be taken 1 hour before or 2 hours after iron. Moderate Study
- ▶ Oral iron is predicted to decrease the absorption of oral bisphosphonates (ibandronate). Ibandronate should be taken 1 hour before or 6 hours after iron. Moderate Theoretical
- ▶ Oral iron decreases the absorption of oral bisphosphonates (risedronate). Separate administration by at least 2 hours. Moderate Study
- ► Oral calcium salts (calcium carbonate) decrease the absorption of oral iron. Calcium carbonate should be taken 1 hour before or 2 hours after iron. Moderate Study
- Oral iron is predicted to decrease the exposure to oral carbidopa. Moderate Theoretical
- ► Chloramphenicol decreases the efficacy of iron. Moderate
- ► Oral iron decreases the absorption of oral dolutegravir. **Dolutegravir** should be taken 2 hours before or 6 hours after iron. Moderate Study
- ▶ Oral iron is predicted to decrease the absorption of oral eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after iron. Severe Theoretical

- ▶ Oral entacapone is predicted to decrease the absorption of oral iron. Separate administration by at least 2 hours. Moderate Theoretical
- ► Oral iron is predicted to decrease the absorption of oral iron chelators (deferiprone). Moderate Theoretical
- ► Oral iron decreases the absorption of oral levodopa. [Moderate]
- ► Oral iron decreases the effects of oral methyldopa. Moderate
- Oral iron is predicted to decrease the absorption of oral penicillamine. Separate administration by at least 2 hours. Mild Study
- ▶ Oral iron decreases the exposure to oral quinolones. Separate administration by at least 2 hours. Moderate Study
- ▶ Iron might decrease the exposure to roxadustat. Roxadustat should be taken at least 1 hour after iron. Moderate Theoretical
- ▶ Oral iron decreases the absorption of oral tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron. Moderate
- ▶ Oral iron decreases the absorption of oral thyroid hormones (levothyroxine). Separate administration by at least 4 hours. Moderate Study
- Oral trientine potentially decreases the absorption of oral iron. Moderate Theoretical
- ► Oral zinc is predicted to decrease the efficacy of oral iron and oral iron is predicted to decrease the efficacy of oral zinc. Moderate Study

Iron chelators → see TABLE 15 p. 1493 (myelosuppression)

deferasirox · deferiprone · desferrioxamine · dexrazoxane

- ▶ Aluminium hydroxide is predicted to decrease the exposure to deferasirox. Avoid. Moderate Theoretical
- ► Aluminium hydroxide is predicted to decrease the absorption of deferiprone. Avoid. Moderate Theoretical
- ▶ Deferasirox is predicted to increase the exposure to aminophylline. Avoid. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose. Moderate Theoretical
- ► Dexrazoxane might decrease the absorption of antiepileptics (fosphenytoin, phenytoin). Avoid. Severe Theoretical
- ▶ Deferasirox is predicted to increase the exposure to antipsychotics, second generation (clozapine). Avoid. Moderate Theoretical
- ▶ Ascorbic acid is predicted to increase the risk of cardiovascular adverse effects when given with deferiprone. [Severe] Theoretical
- ► Ascorbic acid might increase the risk of cardiovascular adverse effects when given with desferrioxamine. Manufacturer advises caution or adjust ascorbic acid dose; monitor cardiac function and avoid concurrent use in those with cardiac failure. Severe Theoretical
- ► Aspirin (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with deferasirox. Severe
- ▶ Bisphosphonates are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. Severe Theoretical
- ► Dexrazoxane might increase the risk of immunosuppression when given with ciclosporin. Severe Theoretical
- ► Corticosteroids are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. Severe
- ▶ HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose. Moderate Theoretical
- ▶ Oral iron is predicted to decrease the absorption of oral deferiprone. Moderate Theoretical
- ► Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dexrazoxane. Avoid. Severe Theoretical
- ► Deferasirox moderately increases the exposure to meglitinides (repaglinide). Avoid. Moderate Study
- ▶ Deferasirox is predicted to increase the exposure to montelukast. Moderate Theoretical

- ▶ NSAIDs are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. Severe Theoretical
- ▶ NSAIDs (diclofenac) are predicted to increase the exposure to deferiprone. Moderate Theoretical
- ▶ Deferasirox is predicted to increase the exposure to pioglitazone. Moderate Study
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose. Moderate Study
- Deferasirox is predicted to increase the exposure to selexipag. Adjust selexipag dose, p. 198. Moderate Study
- ▶ Dexrazoxane might increase the risk of immunosuppression when given with tacrolimus. Severe Theoretical
- ▶ Deferasirox is predicted to increase the concentration of taxanes (paclitaxel). Severe Anecdotal
- ▶ Deferasirox increases the exposure to theophylline. Avoid. Moderate Study
- Deferasirox is predicted to increase the exposure to tizanidine. Avoid. Moderate Theoretical
- ▶ Deferasirox is predicted to increase the exposure to treprostinil. Adjust dose. Moderate Theoretical
- ▶ Deferasirox is predicted to increase the exposure to tucatinib. Moderate Theoretical
- ▶ Oral zinc is predicted to decrease the absorption of oral deferiprone. Moderate Theoretical

Isavuconazole → see antifungals, azoles

Isocarboxazid → see MAOIs, irreversible

Isoflurane → see volatile halogenated anaesthetics

Isometheptene → see sympathomimetics, vasoconstrictor

Isoniazid → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 12 p. 1493 (peripheral neuropathy)

FOOD AND LIFESTYLE Avoid tyramine-rich foods (such as

mature cheeses, salami, pickled herring, $Bovril^{\circ}$, Oxo° , $Marmite^{\circ}$ or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines) or histamine-rich foods (such as very mature cheese or fish from the scromboid family (e.g. tuna, mackerel, salmon)) with isoniazid, as tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

- ▶ Isoniazid is predicted to affect the clearance of aminophylline. Severe Theoretical
- ▶ Isoniazid markedly increases the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) increase the risk of hepatotoxicity when given with isoniazid. Monitor concentration and adjust dose. Severe Study → Also see TABLE 1 n. 1490
- ► Isoniazid increases the concentration of antiepileptics (fosphenytoin, phenytoin). Moderate Study → Also see TABLE 12
- ▶ Cycloserine increases the risk of CNS toxicity when given with isoniazid. Monitor and adjust dose. Moderate Study
- ▶ Isoniazid increases the risk of optic neuropathy when given with ethambutol. Severe Anecdotal
- ► Isoniazid decreases the effects of levodopa. Moderate Study
- Isoniazid is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Unknown Theoretical → Also see TABLE 1 p. 1490
- ▶ Isoniazid is predicted to affect the clearance of theophylline. Severe Anecdotal
- ▶ Isoniazid potentially increases the risk of nephrotoxicity when given with volatile halogenated anaesthetics (methoxyflurane). Avoid. Severe Theoretical

Isosorbide dinitrate → see nitrates

Isosorbide mononitrate → see nitrates

Isotretinoin → see retinoids

Itraconazole → see antifungals, azoles

Ivabradine → see TABLE 6 p. 1491 (bradycardia), TABLE 9 p. 1492 (QT-interval prolongation)

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ivabradine. Adjust dose. Moderate
- ▶ Antiarrhythmics (dronedarone) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 231. Severe Theoretical → Also see TABLE 6 p. 1491

- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose. Moderate Theoretical
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 231. Severe Theoretical
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivabradine. Avoid. Severe Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivabradine. Avoid. Moderate Study → Also see TABLE 6 p. 1491
- ► Cobicistat is predicted to increase the exposure to ivabradine. Avoid. Severe Study
- ► Crizotinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 231. Severe Theoretical → Also see **TABLE 6** p. 1491
- ► Grapefruit juice is predicted to increase the exposure to ivabradine. Avoid. Moderate Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to ivabradine. Avoid. Severe Study
- ▶ Idelalisib is predicted to increase the exposure to ivabradine. Avoid. Severe Study
- ▶ Imatinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 231. Severe Theoretical
- ▶ Macrolides (clarithromycin) are predicted to increase the exposure to ivabradine. Avoid. Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to ivabradine. Avoid. Severe Theoretical
- ▶ Mitotane is predicted to decrease the exposure to ivabradine. Adjust dose. Moderate Theoretical
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 231. Severe Theoretical
- ▶ Nilotinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 231. Severe Theoretical
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical
- ► St John's wort decreases the exposure to ivabradine. Avoid. Moderate Study

Ivacaftor

FOOD AND LIFESTYLE Food or drinks containing bitter (Seville) oranges are predicted to increase the exposure to ivacaftor.

- ▶ Ivacaftor is predicted to increase the exposure to afatinib. Moderate Study
- ▶ Ivacaftor is predicted to increase the exposure to aliskiren. Moderate Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ivacaftor. Avoid. Severe Study
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to ivacaftor. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate]
- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivacaftor. Avoid. Severe Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivacaftor. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. Moderate Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivacaftor. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 317, lumacaftor with ivacaftor p. 318, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. Severe Study
- ▶ Ivacaftor is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). Moderate Study
- Ivacaftor is predicted to increase the exposure to berotralstat. Severe Study
- ▶ Ivacaftor is predicted to increase the exposure to bictegravir. Use with caution or avoid. Moderate Theoretical

Ivacaftor (continued)

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivacaftor. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- ► Cenobamate is predicted to decrease the exposure to ivacaftor. Adjust dose. [Moderate] Theoretical
- ► Ivacaftor is predicted to increase the exposure to ciclosporin.

 Moderate | Theoretical
- ➤ Cobicistat is predicted to increase the exposure to ivacaftor.
 Adjust dose with potent CYP3A4 inhibitors, see ivacaftor
 p. 317, lumacaftor with ivacaftor p. 318, tezacaftor with
 ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor
 p. 320. Severel Study
- ► Ivacaftor is predicted to increase the exposure to colchicine.

 [Moderate] Study
- Ivacaftor is predicted to increase the exposure to commarins (warfarin). Moderate Theoretical
- Crizotinib is predicted to increase the exposure to ivacaftor. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- ► Dabrafenib is predicted to decrease the exposure to ivacaftor.

 Moderate | Study
- ► Ivacaftor slightly increases the exposure to digoxin. [Moderate] Study
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to ivacaftor. [Moderate] Study
- Ivacaftor is predicted to increase the exposure to erlotinib.
 [Moderate] Theoretical
- Ivacaftor is predicted to increase the exposure to everolimus.
 Moderate Study
- ► Ivacaftor is predicted to increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Moderate Study
- Ivacaftor is predicted to increase the exposure to fidaxomicin.
 Avoid. Moderate Study
- ► Ivacaffor is predicted to increase the exposure to gilteritinib.

 Moderate Theoretical
- ► Grapefruit juice is predicted to increase the exposure to ivacaftor. Avoid. Moderate Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to ivacaftor. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 317, lumacaftor with ivacaftor p. 318, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Severe] Study
- Idelalisib is predicted to increase the exposure to ivacaftor.
 Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 317, lumacaftor with ivacaftor p. 318, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. Severe) Study
- Imatinib is predicted to increase the exposure to ivacaftor.
 Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate]
- Letermovir is predicted to increase the exposure to ivacaftor.
 Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- ► Ivacaftor is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Ivacaftor is predicted to increase the exposure to loperamide.
 Moderate Study
- Macrolides (clarithromycin) are predicted to increase the exposure to ivacaftor. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 317, lumacaftor with ivacaftor p. 318, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to ivacaftor. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate]
 Study
- ► Mitotane is predicted to decrease the exposure to ivacaftor. Avoid. Severe Study

- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to ivacaftor. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- Nilotinib is predicted to increase the exposure to ivacaftor.
 Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- Ivacaftor is predicted to increase the exposure to nintedanib.
 Moderate Study
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to ivacaftor. [Moderate] Study
- Ivacaftor is predicted to increase the exposure to relugolix.
 Avoid or take relugolix first and separate administration by at least 6 hours. [Moderate] Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to ivacaftor. Avoid. Severe Study
- Ivacaftor is predicted to increase the exposure to sirolimus.
 Moderate Study
- ► St John's wort is predicted to decrease the exposure to ivacaftor. Avoid. [Severe] Study
- Ivacaftor is predicted to increase the exposure to tacrolimus.
 [Moderate] Theoretical
- ➤ Ivacaftor is predicted to slightly increase the exposure to talazoparib. Avoid or adjust talazoparib dose, p. 1091. Severe Study
- Ivacaftor is predicted to increase the exposure to taxanes (docetaxel) (oral). [Unknown] Theoretical
- ► Ivacaftor is predicted to increase the exposure to taxanes (paclitaxel) (oral). Unknown Study
- ► Ivacaftor is predicted to increase the exposure to thrombin inhibitors (dabigatran). [Moderate] Study
- Ivacaftor might increase the exposure to tigecycline. Mild Anecdotal
- ► Ivacaftor is predicted to increase the exposure to topotecan.

 Severe Study
- Ivacaftor is predicted to increase the concentration of trametinib. Moderate Theoretical
- ► Ivacaftor is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. Severe Theoretical
- ► Ivacaftor might increase the exposure to vinca alkaloids.

 Severe Theoretical

Ivermectin

 $\begin{tabular}{ll} \textbf{ROUTE-SPECIFIC INFORMATION} & Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind. \\ \end{tabular}$

- Ivermectin potentially increases the anticoagulant effect of coumarins. Severe Anecdotal
- ► Levamisole increases the exposure to ivermectin. Moderate
 Study

Ixazomib

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to ixazomib. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ixazomib. Avoid. Severel Study
- Mitotane is predicted to decrease the exposure to ixazomib.
 Avoid. [Severe] Study
- Rifamycins (rifampicin) are predicted to decrease the exposure to ixazomib. Avoid. Severe Study
- ► St John's wort is predicted to decrease the exposure to ixazomib. Avoid. [Severe] Theoretical

Ixekizumab → see monoclonal antibodies

Kaolin

- ➤ Oral kaolin decreases the absorption of oral antimalarials (chloroquine). Separate administration by at least 4 hours.

 Moderate Study
- Oral kaolin is predicted to decrease the absorption of oral hydroxychloroquine. Moderate Theoretical
- Oral kaolin is predicted to decrease the absorption of oral tetracyclines. Moderate Theoretical

Ketamine → see TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects)

- Ketamine is predicted to increase the risk of elevated blood pressure when given with ergometrine. Severe Theoretical
- ► Memantine is predicted to increase the risk of CNS adverse effects when given with ketamine. Avoid. Severe Theoretical

Ketoconazole → see antifungals, azoles **Ketoprofen** → see NSAIDs

Ketorolac → see NSAIDs

Ketotifen → see antihistamines, sedating

Labetalol → see beta blockers, non-selective

Lacidipine → see calcium channel blockers

Lacosamide → see antiepileptics

Lamivudine → see NRTIs

Lamotrigine → see antiepileptics

Lanreotide

- ▶ Beta blockers, non-selective are predicted to increase the risk of bradycardia when given with lanreotide. Moderate Theoretical
- Beta blockers, selective are predicted to increase the risk of bradycardia when given with lanreotide. [Moderate] Theoretical
- ► Lanreotide is predicted to decrease the absorption of oral ciclosporin. Adjust dose. Severe Theoretical

Lansoprazole → see proton pump inhibitors

Lanthanum

- Lanthanum is predicted to decrease the absorption of antifungals, azoles (ketoconazole). Separate administration by at least 2 hours. [Moderate] Theoretical
- ► Lanthanum is predicted to decrease the absorption of antimalarials (chloroquine). Separate administration by at least 2 hours. [Moderate] Theoretical
- ► Lanthanum is predicted to decrease the absorption of hydroxychloroquine. Separate administration by at least 2 hours. Moderate Theoretical
- ► Lanthanum moderately decreases the exposure to quinolones. Quinolones should be taken 2 hours before or 4 hours after lanthanum. Moderate Study
- ► Oral lanthanum might decrease the absorption of oral tetracyclines. Separate administration by 2 hours. Moderate
 Theoretical
- Lanthanum decreases the absorption of thyroid hormones.
 Separate administration by 2 hours. Moderate Study

Lapatinib → see TABLE 9 p. 1492 (QT-interval prolongation)

Lapatinib is predicted to increase the exposure to afatinib.

- Lapatinib is predicted to increase the exposure to aratinib Moderate Study
- ► Lapatinib is predicted to increase the exposure to aliskiren.

 Moderate Theoretical
- ► Lapatinib is predicted to increase the exposure to alpelisib.

 Moderate | Theoretical | Theoretic
- ► Oral antacids is predicted to decrease the absorption of oral lapatinib. Avoid. [Moderate] Theoretical
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to lapatinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to lapatinib. Moderate Study → Also see TABLE 9 p. 1492
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lapatinib. Avoid. Severe Study
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lapatinib. [Moderate] Study → Also see TABLE 9 p. 1492
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lapatinib. Avoid. Moderate) Study → Also see TABLE 9 p. 1492
- Lapatinib is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). [Moderate] Theoretical
- Lapatinib is predicted to increase the exposure to berotralstat.
 Severe Study
- Lapatinib is predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study
- ► Lapatinib is predicted to increase the exposure to bictegravir. Use with caution or avoid. Moderate Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lapatinib. Moderate Study
- ➤ Oral calcium salts (calcium carbonate) -containing antacids are predicted to decrease the absorption of oral lapatinib. Avoid.

 Moderate Theoretical

- ► Lapatinib is predicted to increase the exposure to ceritinib.
 Moderate Theoretical → Also see TABLE 9 p. 1492
- Ciclosporin might increase the concentration of lapatinib.
 Severe Theoretical
- Cobicistat is predicted to increase the exposure to lapatinib.
 Avoid. [Moderate] Study
- ► Lapatinib is predicted to increase the exposure to colchicine. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1212. [Moderate] Theoretical
- Lapatinib is predicted to increase the risk of bleeding events when given with coumarins. Severel Theoretical
- ► Crizotinib is predicted to increase the exposure to lapatinib.
 Moderate Study → Also see TABLE 9 p. 1492
- Dabrafenib is predicted to decrease the exposure to lapatinib.
 Avoid. Severe Study
- ► Lapatinib is predicted to increase the exposure to digoxin.

 Moderate | Theoretical
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to lapatinib. Avoid. Severe Study
- ► Lapatinib is predicted to increase the exposure to erlotinib.

 Moderate | Theoretical
- ► Lapatinib is predicted to increase the exposure to everolimus.

 Moderate Theoretical
- Lapatinib is predicted to increase the exposure to factor XA inhibitors (apixaban). Moderate Theoretical
- Lapatinib is predicted to slightly increase the exposure to factor XA inhibitors (edoxaban). Severe Theoretical
- Lapatinib is predicted to increase the exposure to fidaxomicin.
 Avoid. [Moderate] Study
- Lapatinib is predicted to increase the exposure to gilteritinib.
 Moderate Theoretical
- Grapefruit juice is predicted to increase the exposure to lapatinib. Avoid. Moderate Theoretical
- H₂ receptor antagonists are predicted to decrease the absorption of lapatinib. Avoid. Moderate Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to lapatinib. Avoid. Moderate Study
- ► Idelalisib is predicted to increase the exposure to lapatinib.
- Avoid. Moderate Study

 Imatinib is predicted to increase the exposure to lapatinib.
- Moderate Study

 ► Lapatinib increases the exposure to the active metabolite of irinotecan. Monitor adverse effects and adjust dose. Severe
- Lapatinib is predicted to increase the exposure to larotrectinib.
 Mild Theoretical
- Letermovir is predicted to increase the exposure to lapatinib.
 Moderate Study
 Lapatinib is predicted to increase the exposure to lomitapide.
- Separate administration by 12 hours. Mild Theoretical

 Lapatinib is predicted to increase the exposure to loperamide.
- ► Lapatinib is predicted to increase the exposure to loperamide

 | Moderate | Theoretical |
- ► Macrolides (clarithromycin) are predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study → Also see TABLE 9 p. 1492
- Macrolides (erythromycin) are predicted to increase the exposure to lapatinib. Moderate Study → Also see TABLE 9 p. 1492
- Mitotane is predicted to decrease the exposure to lapatinib.
 Avoid. Severe Study
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to lapatinib. [Moderate] Study
- Nilotinib is predicted to increase the exposure to lapatinib. Moderate Study → Also see TABLE 9 p. 1492
- ► Lapatinib is predicted to increase the exposure to nintedanib.

 Moderate Study
- NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to lapatinib. Avoid. Severe Study → Also see TABLE 9
- ► Lapatinib is predicted to increase the exposure to panobinostat. Adjust dose. Moderate Theoretical → Also see TABLE 9 p. 1492
- ► Lapatinib increases the exposure to pazopanib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Lapatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Lapatinib (continued)

- Lapatinib is predicted to increase the exposure to pibrentasvir.
 Moderate Theoretical
- ► Pitolisant is predicted to decrease the exposure to lapatinib.

 Avoid. Severe Theoretical
- ► Lapatinib is predicted to increase the exposure to relugolix. Avoid or take relugolix first and separate administration by at least 6 hours. Moderate Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to lapatinib. Avoid. Severe Study
- ► Lapatinib is predicted to increase the exposure to the active component of sacituzumab govitecan. (Severe) Theoretical
- Lapatinib is predicted to increase the exposure to sirolimus.
 Moderate Theoretical
- ➤ Oral sodium bicarbonate-containing antacids are predicted to decrease the absorption of oral lapatinib. Avoid. Moderate Theoretical
- ► St John's wort is predicted to decrease the exposure to lapatinib. Avoid. Severe Study
- ► Lapatinib is predicted to slightly increase the exposure to talazoparib. Avoid or adjust talazoparib dose, p. 1091. Severe Study
- Lapatinib slightly increases the exposure to taxanes (paclitaxel). [Severe] Study
- ► Tedizolid is predicted to increase the exposure to lapatinib. Avoid. Moderate Theoretical
- Lapatinib is predicted to increase the exposure to thrombin inhibitors (dabigatran). Severe Theoretical
- Lapatinib might increase the exposure to tigecycline. Mild Anecdotal
- Lapatinib is predicted to increase the exposure to topotecan.
 Severel Study
- Lapatinib is predicted to increase the concentration of trametinib. [Moderate] Theoretical
- ► Lapatinib is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. Severe Theoretical
- ► Lapatinib might increase the exposure to vinca alkaloids.

 | Severe | Theoretical | → Also see TABLE 9 p. 1492|

Laronidase

- ► Antimalarials (chloroquine) are predicted to decrease the exposure to laronidase. Avoid simultaneous administration. Severe Theoretical
- ► Hydroxychloroquine is predicted to decrease the exposure to laronidase. Avoid simultaneous administration. Severe

 Theoretical

Larotrectinib

- Anti-androgens (apalutamide, enzalutamide) are predicted to moderately decrease the exposure to larotrectinib. Avoid.
 Moderatel Study
- ► Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to larotrectinib. [Mild] Theoretical
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to larotrectinib. Avoid. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to larotrectinib.
 Avoid or adjust larotrectinib dose, p. 1065. Moderate Study
- ► Larotrectinib slightly increases the exposure to benzodiazepines (midazolam). Use with caution and adjust dose. [Mild] Study
- Calcium channel blockers (verapamil) are predicted to increase the exposure to larotrectinib. Mild Theoretical
- ► Ciclosporin is predicted to increase the exposure to larotrectinib. [Mild] Study
- Cobicistat is predicted to moderately increase the exposure to larotrectinib. Avoid or adjust larotrectinib dose, p. 1065.
 Moderatel Study
- ► Larotrectinib potentially decreases the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to larotrectinib. Avoid. Moderate Study
- Eltrombopag is predicted to increase the exposure to larotrectinib. Mild Study
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to larotrectinib. Avoid. Moderate Study

- ► Larotrectinib is predicted to increase the exposure to ergotamine. Use with caution and adjust dose. [Mild] Theoretical
- ► Grapefruit juice is predicted to increase the exposure to larotrectinib. Avoid. Moderate Theoretical
- ► HIV-protease inhibitors are predicted to moderately increase the exposure to larotrectinib. Avoid or adjust larotrectinib dose, p. 1065. [Moderate] Study
- ► Idelalisib is predicted to moderately increase the exposure to larotrectinib. Avoid or adjust larotrectinib dose, p. 1065.

 Moderate Study
- ► Lapatinib is predicted to increase the exposure to larotrectinib.

 [Mild] Theoretical
- ► Leflunomide is predicted to increase the exposure to larotrectinib. [Mild] Study
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to larotrectinib. [Mild] Theoretical
- ► Macrolides (clarithromycin) are predicted to moderately increase the exposure to larotrectinib. Avoid or adjust larotrectinib dose, p. 1065. [Moderate] Study
- ► Mitotane is predicted to moderately decrease the exposure to larotrectinib. Avoid. [Moderate] Study
- ► NNRTIS (efavirenz, nevirapine) are predicted to decrease the exposure to larotrectinib. Avoid. [Moderate] Study
- ► Larotrectinib is predicted to increase the exposure to opioids (alfentanil, fentanyl). Use with caution and adjust dose. Mild Theoretical
- Larotrectinib is predicted to increase the exposure to pimozide.
 Use with caution and adjust dose. [Mild] Theoretical
- ► Ranolazine is predicted to increase the exposure to larotrectinib. [Mild] Theoretical
- ► Rifamycins (rifampicin) are predicted to moderately decrease the exposure to larotrectinib. Avoid. [Moderate] Study
- ► Larotrectinib is predicted to increase the exposure to sirolimus. Use with caution and adjust dose. [Mild] Theoretical
- ► St John's wort is predicted to decrease the exposure to larotrectinib. Avoid. Moderate Study
- ► Larotrectinib is predicted to increase the exposure to tacrolimus. Use with caution and adjust dose. [Mild] Theoretical
- ► Teriflunomide is predicted to increase the exposure to larotrectinib. Mild Study
- Vemurafenib is predicted to increase the exposure to larotrectinib. [Mild] Theoretical

Ledipasvir

- ➤ Oral antacids are predicted to decrease the exposure to oral ledipasvir. Separate administration by 4 hours. Moderate Theoretical
- Ledipasvir increases the risk of severe bradycardia or heart block when given with antiarrhythmics (amiodarone). Refer to specialist literature. Severe Anecdotal
- Antiepileptics (carbamazepine) are predicted to decrease the exposure to ledipasvir. Avoid. [Severe] Study
- Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ledipasvir. Avoid. [Severe] Theoretical
- ➤ Calcium salts (calcium carbonate) are predicted to decrease the exposure to ledipasvir. Separate administration by 4 hours. Moderate] Theoretical
- ► Ledipasvir is predicted to increase the exposure to digoxin.

 Monitor and adjust dose. Moderate Theoretical
- ► H₂ receptor antagonists are predicted to decrease the exposure to ledipasvir. Adjust dose, see ledipasvir with sofosbuvir p. 683. [Moderate] Study
- ► HIV-protease inhibitors (tipranavir) boosted with ritonavir are predicted to decrease the exposure to ledipasvir. Avoid. Severe Theoretical
- Proton pump inhibitors are predicted to decrease the exposure to ledipasvir. Adjust dose, see ledipasvir with sofosbuvir p. 683. [Moderate] Theoretical
- ► Rifamycins (rifabutin) are predicted to decrease the exposure to ledipasvir. Avoid. Severe Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to ledipasvir. Avoid. Severe Study
- ➤ Sodium zirconium cyclosilicate is predicted to decrease the exposure to ledipasvir. Separate administration by at least 2 hours. [Moderate] Theoretical

- ► St John's wort is predicted to decrease the exposure to ledipasvir. Avoid. Severe Study
- ► Ledipasvir with sofosbuvir is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose.

 Moderate Anecdotal
- ► Ledipasvir with sofosbuvir is predicted to increase the exposure to statins (fluvastatin, pravastatin, simvastatin). Monitor and adjust dose. Moderate Theoretical
- Ledipasvir with sofosbuvir is predicted to increase the exposure to statins (rosuvastatin). Avoid. [Severe] Theoretical
- ► Ledipasvir with sofosbuvir slightly increases the exposure to tenofovir disoproxil. [Moderate] Study
- ► Ledipasvir is predicted to increase the exposure to thrombin inhibitors (dabigatran). [Moderate] Theoretical

Leflunomide → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 15 p. 1493 (myelosuppression)

PHARMACOLOGY Leflunomide has a long half-life; washout procedure recommended before switching to other DMARDs (consult product literature).

- ► Leflunomide is predicted to increase the exposure to adefovir.

 [Moderate] Theoretical
- ► Leflunomide is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- Leflunomide is predicted to increase the exposure to alpelisib.
 Moderate Theoretical
- ► Leflunomide decreases the exposure to aminophylline. Adjust dose. Moderate Study
- ► Leflunomide is predicted to decrease the exposure to anaesthetics, local (ropivacaine). [Moderate] Theoretical
- ► Leflunomide is predicted to increase the exposure to anthracyclines (daunorubicin, doxorubicin, mitoxantrone). Moderate Theoretical → Also see TABLE 15 p. 1493
- Leflunomide is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). [Moderate] Study
- Leflunomide is predicted to decrease the exposure to antipsychotics, second generation (clozapine). [Moderate] Theoretical
- ► Leflunomide is predicted to decrease the exposure to antipsychotics, second generation (olanzapine). Monitor and adjust dose. Moderate Study
- ► Leflunomide is predicted to increase the exposure to baricitinib. [Moderate] Study
- ► Leflunomide is predicted to increase the exposure to berotralstat. Severe Theoretical
- ► Leflunomide is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. Moderate Study
- Leflunomide is predicted to increase the exposure to cephalosporins (cefaclor). [Moderate] Theoretical
- ► Leflunomide is predicted to increase the exposure to cladribine. Avoid or adjust dose. Moderate Theoretical → Also see TABLE 15 p. 1493
- ► Leflunomide increases the anticoagulant effect of coumarins.

 Severel Anecdotal
- ▶ Leflunomide is predicted to increase the exposure to endothelin receptor antagonists (bosentan). Moderate Study
- ► Filgotinib is predicted to increase the risk of immunosuppression when given with leflunomide. Avoid.

 Severe Theoretical
- ▶ Leflunomide is predicted to increase the exposure to ganciclovir. Moderate Theoretical → Also see TABLE 15 p. 1493
- ► Leflunomide is predicted to increase the exposure to H₂ receptor antagonists (cimetidine, famotidine). [Moderate] Theoretical
- ► Leflunomide is predicted to increase the exposure to larotrectinib. [Mild] Study
- ► Leflunomide is predicted to increase the concentration of letermovir. Moderate Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with leflunomide. UKHSA advises avoid (refer to Green Book).
 Severel Theoretical
- ► Leflunomide is predicted to increase the exposure to loop diuretics (furosemide). [Moderate] Theoretical
- ► Leflunomide is predicted to increase the exposure to meglitinides (repaglinide). Moderate Study

- Leflunomide is predicted to decrease the exposure to melatonin. [Moderate] Theoretical
- ► Leflunomide is predicted to increase the exposure to methotrexate. Moderate Theoretical → Also see TABLE 1 p. 1490 → Also see TABLE 15 p. 1493
- ► Leflunomide is predicted to increase the clearance of mexiletine. Monitor and adjust dose. Moderate Study
- Leflunomide is predicted to increase the exposure to montelukast. [Moderate] Theoretical
- ► Leflunomide is predicted to increase the exposure to NRTIS (zidovudine). [Moderate] Theoretical
- ▶ Leflunomide is predicted to increase the exposure to NSAIDs (indometacin, ketoprofen). [Moderate] Theoretical
- ► Leflunomide is predicted to increase the exposure to oseltamivir. [Moderate] Theoretical
- Leflunomide is predicted to increase the exposure to the active metabolites of ozanimod. Avoid. Moderate Study
- Leflunomide is predicted to increase the exposure to penicillins (benzylpenicillin). [Moderate] Theoretical
- Leflunomide is predicted to increase the exposure to pioglitazone. Moderate Study
- ► Leflunomide is predicted to decrease the exposure to pirfenidone. Moderate Theoretical
- ► Leflunomide is predicted to increase the exposure to quinolones (ciprofloxacin). Moderate Theoretical
- ▶ Leflunomide is predicted to increase the exposure to rifamycins (rifampicin). Moderate Theoretical
- ▶ Leflunomide is predicted to increase the exposure to selexipag. Adjust selexipag dose, p. 198. Moderate Study
- ► Leflunomide is predicted to decrease the exposure to SNRIs (duloxetine). Moderate Theoretical
- ► Leflunomide is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). [Moderate]
 Study → Also see TABLE 1 p. 1490
- ► Leflunomide is predicted to increase the exposure to statins (rosuvastatin). Adjust dose. Moderate Study → Also see TABLE 1 p. 1490
- ► Leflunomide is predicted to increase the exposure to sulfasalazine. [Moderate] Study → Also see TABLE 1 p. 1490 → Also see TABLE 15 p. 1493
- Leflunomide is predicted to increase the exposure to sulfonylureas (glibenclamide). [Moderate] Study
- ► Leflunomide is predicted to increase the exposure to talazoparib. Avoid or monitor. Moderate Theoretical → Also see TABLE 15 p. 1493
- ► Leflunomide is predicted to increase the concentration of taxanes (paclitaxel). Severel Anecdotal → Also see TABLE 15 p. 1493
- Leflunomide is predicted to increase the exposure to tenofovir alafenamide. Moderate Theoretical
- ► Leflunomide is predicted to increase the exposure to tenofovir disoproxil. [Moderate] Theoretical
- ► Leflunomide is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- Leflunomide moderately decreases the exposure to tizanidine.
 Mild Study
- ► Leflunomide is predicted to increase the exposure to topotecan. Moderate Study → Also see TABLE 15 p. 1493
- ▶ Leflunomide is predicted to increase the exposure to tucatinib. Moderate Theoretical
- Leflunomide is predicted to increase the exposure to
 venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- **Lenalidomide** → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 15 p. 1493 (myelosuppression), TABLE 5 p. 1491 (thromboembolism)
- ► Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with lenalidomide. Avoid. Severe Theoretical
- ► Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with lenalidomide.
 Moderate Theoretical

Lenvatinib → see TABLE 9 p. 1492 (QT-interval prolongation), TABLE 4 p. 1490 (antiplatelet effects)

 $\textbf{Lercanidipine} \ \, \rightarrow \text{see calcium channel blockers}$

Letermovir

► Letermovir is predicted to increase the exposure to abemaciclib. Moderate Study

Letermovir (continued)

- ▶ Letermovir is predicted to increase the exposure to acalabrutinib. Avoid or monitor. Severe Study
- ▶ Letermovir is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 210. Severe
- ▶ Letermovir is predicted to increase the exposure to alpha blockers (tamsulosin). Moderate Theoretical
- ▶ Letermovir is predicted to increase the concentration of antiarrhythmics (amiodarone). Moderate Theoretical
- ► Letermovir is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. Moderate Study
- ► Antiepileptics (carbamazepine, phenobarbital, primidone) are predicted to decrease the concentration of letermovir. Moderate Theoretical
- ▶ Letermovir is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of letermovir. Moderate Theoretical
- ▶ Letermovir slightly decreases the exposure to antifungals, azoles (voriconazole). Moderate Study
- ▶ Letermovir is predicted to increase the concentration of antihistamines, non-sedating (fexofenadine), Moderate Theoretical
- ► Letermovir is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical
- ▶ Letermovir is predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. Moderate Study
- ▶ Letermovir is predicted to increase the concentration of antimalarials (piperaquine). Severe Theoretical
- Letermovir is predicted to increase the exposure to antipsychotics, second generation (cariprazine). Avoid. [Severe]
- ▶ Letermovir is predicted to increase the exposure to antipsychotics, second generation (quetiapine). Avoid. [Moderate]
- ▶ Letermovir is predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. Moderate Study
- Letermovir is predicted to increase the exposure to axitinib. Moderate Study
- Letermovir is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical
- ▶ Letermovir is predicted to increase the exposure to benzodiazepines (alprazolam). Severe Study
- ▶ Letermovir is predicted to increase the exposure to benzodiazepines (midazolam). Monitor adverse effects and adjust dose. Severe Study
- ► Letermovir is predicted to increase the exposure to bosutinib. Avoid or adjust dose. Severe Study
- ▶ Letermovir is predicted to increase the exposure to brigatinib. Moderate Study
- ▶ Letermovir is predicted to increase the exposure to buspirone. Use with caution and adjust dose. Moderate Study
- ▶ Letermovir is predicted to increase the exposure to cabozantinib. Moderate Study
- ▶ Letermovir is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. Moderate Study
- ▶ Letermovir is predicted to increase the exposure to ceritinib. Moderate Study
- ► Letermovir increases the exposure to ciclosporin and ciclosporin increases the exposure to letermovir. Monitor and adjust letermovir dose, p. 693. Severe Study
- Letermovir is predicted to increase the exposure to cobimetinib. Severe Study
- ▶ Letermovir is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212. Severe Study
- ▶ Letermovir is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. Moderate Study
- ▶ Letermovir is predicted to decrease the concentration of coumarins (warfarin). Monitor and adjust dose. Moderate Theoretical

- ▶ Letermovir is predicted to increase the exposure to crizotinib.
- ▶ Letermovir is predicted to increase the exposure to dabrafenib. Moderate Study
- ▶ Letermovir is predicted to increase the exposure to darifenacin. Moderate Study
- ► Letermovir is predicted to increase the exposure to dasatinib. Severe Study
- ▶ Letermovir is predicted to slightly increase the exposure to dienogest. Moderate Study
- ▶ Letermovir is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Mild] Study
- ▶ Letermovir is predicted to increase the exposure to domperidone. Avoid. Severe Study
- ▶ Letermovir is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). Severe Theoretical
- ▶ Letermovir is predicted to moderately increase the exposure to dutasteride. Mild Study
- ► Letermovir is predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. Severe Theoretical
- ▶ Letermovir is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- ▶ Eltrombopag is predicted to increase the concentration of letermovir. Moderate Study
- ▶ Letermovir is predicted to moderately increase the exposure to encorafenib. Moderate Study
- ▶ Letermovir is predicted to increase the concentration of endothelin receptor antagonists (bosentan). Moderate Theoretical
- ▶ Letermovir is predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose,
- p. 1056. Severe Theoretical ▶ Letermovir is predicted to increase the risk of ergotism when given with ergometrine. Severe Theoretical
- ▶ Letermovir is predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- ▶ Letermovir is predicted to increase the exposure to erlotinib. Moderate Study
- ▶ Letermovir is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- ▶ Letermovir is predicted to increase the exposure to fedratinib. Monitor and adjust dose. Moderate Study
- ► Letermovir is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. Mild Study
- ▶ Fibrates (gemfibrozil) are predicted to increase the concentration of letermovir. Moderate Study
- ▶ Letermovir is predicted to increase the exposure to gefitinib. Moderate Study
- ▶ Letermovir is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. Moderate Theoretical
- ► HIV-protease inhibitors (atazanavir, lopinavir) boosted with ritonavir are predicted to increase the concentration of letermovir. Moderate Study
- ▶ HIV-protease inhibitors (ritonavir) are predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- ▶ Letermovir is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062. Severe Study
- ▶ Letermovir is predicted to increase the exposure to imatinib. Moderate Study
- ▶ Letermovir is predicted to increase the exposure to ivacaftor. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- ▶ Letermovir is predicted to increase the exposure to lapatinib. Moderate Study
- ► Leflunomide is predicted to increase the concentration of letermovir. Moderate Study
- ▶ Letermovir is predicted to increase the exposure to lomitapide. Avoid. Moderate Theoretical
- ▶ Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of letermovir. Moderate Study
- ▶ Letermovir is predicted to increase the concentration of meglitinides (repaglinide). Avoid. Moderate Theoretical

- Letermovir is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- Modafinil is predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- ► Letermovir is predicted to increase the exposure to naldemedine. [Moderate] Study
- ▶ Letermovir is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor adverse effects, p. 67. Moderatel Study
- Letermovir is predicted to increase the exposure to neratinib.
 Avoid moderate CYPSA4 inhibitors or adjust neratinib dose and monitor for gastrointestinal adverse effects, p. 1069.
 Severel Study
- Letermovir is predicted to increase the exposure to nilotinib.
 Moderate Study
- NNRTIs (efavirenz) are predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- ► NNRTIs (etravirine) are predicted to decrease the exposure to letermovir. Moderate Theoretical
- Letermovir is predicted to increase the exposure to olaparib.
 Avoid moderate CYP3A4 inhibitors or adjust olaparib dose,
 p. 1088. [Moderate] Theoretical
- Letermovir is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- Letermovir is predicted to increase the exposure to opioids (methadone). Moderate Theoretical
- Letermovir is predicted to increase the exposure to pazopanib.
 Moderate Study
- Letermovir is predicted to increase the exposure to pemigatinib. Severe Study
- ► Letermovir is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 878. [Moderate] Theoretical
- Letermovir is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate CYP3A4 inhibitors, p. 879.
 Moderatel Study
- Letermovir is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Severe Theoretical
- Letermovir is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose.
 Severe Theoretical
- Letermovir is predicted to increase the exposure to pimozide.
 Avoid. Severe Theoretical
- Letermovir is predicted to increase the exposure to ponatinib.
 Moderate Study
- Letermovir is predicted to increase the exposure to ranolazine.
 Severe Study
- ► Letermovir is predicted to increase the exposure to regorafenib. [Moderate] Study
- ► Letermovir is predicted to increase the exposure to ribociclib.

 [Moderate] Study
- Rifamycins (rifabutin) are predicted to decrease the concentration of letermovir. Moderate Theoretical
- Rifamycins (rifampicin) are predicted to affect the concentration of letermovir. Severe Theoretical
- ► Letermovir is predicted to increase the exposure to ruxolitinib.

 Moderate Study
- ► Letermovir is predicted to increase the exposure to selpercatinib. [Moderate] Study
- ► Letermovir is predicted to increase the exposure to selumetinib. Avoid or adjust dose—consult product literature. Severe Study
- ► Letermovir is predicted to increase the exposure to siponimod.

 Avoid depending on other drugs taken—consult product literature. [Severe] Study
- Letermovir increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- ▶ Letermovir is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate CYP3A4 inhibitors, p. 887. [Moderate] Theoretical
- St John's wort is predicted to decrease the concentration of letermovir. [Moderate] Theoretical

- ► Letermovir moderately increases the exposure to statins (atorvastatin). Avoid or adjust atorvastatin dose, p. 220. Severe
- ► Letermovir is predicted to increase the exposure to statins (fluvastatin). Monitor and adjust dose. Moderate Theoretical ► Letermovir is predicted to increase the exposure to statins
- (pravastatin). Avoid or adjust dose. Moderate Theoretical
- ► Letermovir is predicted to increase the exposure to statins (rosuvastatin, simvastatin). Avoid. [Severe] Study
- ► Letermovir is predicted to increase the concentration of sulfonylureas (glibenclamide). Moderate Theoretical
- Letermovir is predicted to increase the exposure to sunitinib.
 Moderate Study
- Letermovir is predicted to increase the concentration of tacrolimus. Severel Study
- ► Letermovir is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical
- Letermovir is predicted to increase the exposure to taxanes (docetaxel). [Severe] Study
- Letermovir is predicted to increase the exposure to taxanes (paclitaxel). [Moderate] Anecdotal
- ► Teriflunomide is predicted to increase the concentration of letermovir. [Moderate] Study
- ➤ Letermovir is predicted to increase the exposure to tezacaftor. Adjust dose with moderate CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320. [Severe] Study
- Letermovir is predicted to decrease the concentration of thrombin inhibitors (dabigatran). Avoid. [Severe] Theoretical
- ► Letermovir given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. [Moderate] Study
- ► Letermovir is predicted to increase the exposure to tolvaptan.

 Manufacturer advises caution or adjust tolvaptan dose with moderate CYP3A4 inhibitors, p. 724. [Moderate] Study
- ► Letermovir is predicted to increase the exposure to trazodone.

 Moderate Theoretical
- ► Letermovir is predicted to increase the exposure to ulipristal.

 Avoid if used for uterine fibroids. (Moderate) Study
- ► Letermovir is predicted to increase the exposure to vemurafenib. Severe Theoretical
- ► Letermovir is predicted to increase the exposure to venetoclax.

 Avoid or adjust dose—consult product literature. [Severe] Study
- Letermovir is predicted to increase the exposure to vinca alkaloids. Severe Theoretical
- Letermovir is predicted to increase the exposure to zopiclone.
 Adjust dose. [Moderate] Study

Levamisole

- ► Albendazole slightly decreases the exposure to levamisole and levamisole moderately decreases the exposure to albendazole.

 Moderatel Study
- ► Alcohol potentially causes a disulfiram-like reaction when given with levamisole. Moderate Study
- ► Levamisole increases the exposure to ivermectin. Moderate

Levetiracetam → see antiepileptics

Levobunolol → see beta blockers, non-selective

Levobupivacaine → see anaesthetics, local **Levocetirizine** → see antihistamines, non-sedating

Levodopa → see TABLE 8 p. 1491 (hypotension)

- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of levodopa. Moderate Study
- ➤ Antipsychotics, second generation (amisulpride) are predicted to decrease the effects of levodopa. Avoid. Severe Theoretical
- ► Antipsychotics, second generation (aripiprazole, clozapine, lurasidone, paliperidone) are predicted to decrease the effects of levodopa. [Severe] Theoretical → Also see TABLE 8 p. 1491
- ► Antipsychotics, second generation (asenapine) are predicted to decrease the effects of levodopa. Adjust dose. Severe
 Theoretical → Also see TABLE 8 p. 1491
- ► Antipsychotics, second generation (olanzapine) decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. Severe Anecdotal → Also see TABLE 8 p. 1491
- Antipsychotics, second generation (quetiapine) decrease the effects of levodopa. [Severe] Anecdotal → Also see TABLE 8 p. 1491

Levodopa (continued)

- Antipsychotics, second generation (risperidone) are predicted to decrease the effects of levodopa. Avoid or adjust dose. Severel Anecdotal → Also see TABLE 8 p. 1491
- ► Baclofen is predicted to increase the risk of adverse effects when given with levodopa. Severe Anecdotal → Also see TABLE 8 p. 1491
- ► Benperidol is predicted to decrease the effects of levodopa.
 Severe Study → Also see TABLE 8 p. 1491
- Bupropion increases the risk of adverse effects when given with levodopa. [Moderate] Study
- ▶ Droperidol decreases the effects of levodopa. Severe Study → Also see TABLE 8 p. 1491
- ▶ Drugs with antimuscarinic effects (see TABLE 10 p. 1492) decrease the absorption of levodopa. Moderate Theoretical
- ► Entacapone increases the exposure to levodopa. Monitor adverse effects and adjust dose. [Moderate] Study
- adverse effects and adjust dose. [Moderate] Study

 ► Flupentixol decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also
- see TABLE 8 p. 1491
 ► Haloperidol decreases the effects of levodopa. Severe Study →
- Also see TABLE 8 p. 1491
 ➤ Oral iron decreases the absorption of oral levodopa. [Moderate]
- Study
 ► Isoniazid decreases the effects of levodopa. [Moderate] Study
- Levodopa is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. Severe Theoretical
- Loxapine is predicted to decrease the effects of levodopa.
 Severe Theoretical → Also see TABLE 8 p. 1491
- MAO-B inhibitors are predicted to increase the effects of levodopa. Adjust dose. Mild Study → Also see TABLE 8 p. 1491
- ► Levodopa increases the risk of a hypertensive crisis when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Study → Also see TABLE 8 p. 1491
- ► Memantine is predicted to increase the effects of levodopa. Moderate Theoretical
- ► Metoclopramide decreases the effects of levodopa. Avoid.

 [Moderate] Study
- Levodopa increases the risk of adverse effects when given with moclobemide. [Moderate] Study
- Opicapone increases the exposure to levodopa. Adjust dose.
 Moderate Study
 Describing downson the effects of levodopa. Assist on
- ► Phenothiazines decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. Severe Study → Also see TABLE 8 p. 1491
- ▶ Pimozide decreases the effects of levodopa. Severe Theoretical → Also see TABLE 8 p. 1491
- ► Sulpiride is predicted to decrease the effects of levodopa. Avoid. Severe Theoretical → Also see TABLE 8 p. 1491
- ► Tetrabenazine is predicted to decrease the effects of levodopa. Use with caution or avoid. Moderate Theoretical
- ► Tolcapone increases the exposure to levodopa. Monitor and adjust dose. Moderate Study
- ► Tryptophan greatly decreases the concentration of levodopa.

 [Moderate] Study
- ➤ Zuclopenthixol is predicted to decrease the effects of levodopa.

 Avoid or monitor worsening parkinsonian symptoms. Severe

 Theoretical → Also see TABLE 8 p. 1491

Levofloxacin → see quinolones **Levofolinic acid** → see folates

Levomepromazine → see phenothiazines

Levonorgestrel

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severel Theoretical
- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- ► Griseofulvin potentially decreases the efficacy of oral levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Anecdotal

- ► HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- ► Lumacaftor is predicted to decrease the efficacy of levonorgestrel. Use additional contraceptive precautions. [Severe] Theoretical
- ► Modafinil is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant) are predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe

 Theoretical
- ► NNRTIS (efavirenz, nevirapine) are predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- ► Rifamycins are predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Theoretical
- ➤ St John's wort is predicted to decrease the efficacy of levonorgestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- ► Sugammadex is predicted to decrease the exposure to levonorgestrel. Use additional contraceptive precautions.

 [Severe] Theoretical
- ► Levonorgestrel might decrease the efficacy of ulipristal and ulipristal might decrease the efficacy of levonorgestrel. Avoid.

 [Severe] Theoretical

Levothyroxine → see thyroid hormones

Lidocaine → see antiarrhythmics

Linagliptin → see dipeptidylpeptidase-4 inhibitors **Linezolid** → see TABLE 13 p. 1493 (serotonin syndrome)

FOOD AND LIFESTYLE Patients taking linezolid should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, $Bovril^{\,\otimes}$, $Oxo^{\,\otimes}$,

- Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

 ▶ Beta₂ agonists are predicted to increase the risk of elevated
- blood pressure when given with linezolid. Avoid. Severe
 Theoretical

 Bupropion is predicted to increase the risk of intraoperative
- hypertension when given with linezolid. Severe Anecdotal
- Buspirone is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical
- Levodopa is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical
- Macrolides (clarithromycin) increase the exposure to linezolid.
 Moderate Anecdotal
- MAO-B inhibitors (rasagiline, selegiline) are predicted to increase the risk of adverse effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. Severe Theoretical → Also see TABLE 13 n. 1493
- MAO-B inhibitors (safinamide) are predicted to increase the risk of adverse effects when given with linezolid. Avoid and for 1 week after stopping safinamide. Severe Theoretical → Also see TABLE 13 p. 1493
- MAOIs, irreversible are predicted to increase the risk of adverse effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. Severe Theoretical → Also see TABLE 13 p. 1493
- Methylphenidate might increase the risk of elevated blood pressure when given with linezolid. Avoid. Severe Theoretical
- Moclobemide is predicted to increase the risk of adverse effects when given with linezolid. Avoid and for 14 days after stopping moclobemide. Severe Theoretical → Also see TABLE 13 n. 1493
- Ozanimod might increase the risk of a hypertensive crisis when given with linezolid. Avoid. Severe Theoretical
- ► Reboxetine is predicted to increase the risk of a hypertensive crisis when given with linezolid. Avoid. Severe Theoretical
- ► Rifamycins (rifampicin) slightly decrease the exposure to linezolid. [Moderate] Study
- ➤ Sympathomimetics, inotropic are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid.

 Severe Theoretical

- Sympathomimetics, vasoconstrictor (adrenaline/epinephrine, ephedrine, isometheptene, noradrenaline/norepinephrine, phenylephrine) are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. Severe Theoretical
- ➤ Sympathomimetics, vasoconstrictor (pseudoephedrine) increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Study

Liothyronine → see thyroid hormones

Liraglutide → see glucagon-like peptide-1 receptor agonists

Lisdexamfetamine → see amfetamines

Lisinopril → see ACE inhibitors

Lithium → see TABLE 13 p. 1493 (serotonin syndrome), TABLE 9 p. 1492 (QT-interval prolongation)

- ACE inhibitors are predicted to increase the concentration of lithium. Monitor and adjust dose. Severe Anecdotal
- Acetazolamide alters the concentration of lithium. Severe Anecdotal
- Aldosterone antagonists (eplerenone) potentially increase the concentration of lithium. Avoid. [Moderate] Theoretical
- ► Aldosterone antagonists (spironolactone) potentially increase the concentration of lithium. Moderate Study
- Aminophylline is predicted to decrease the concentration of lithium. [Moderate] Theoretical
- ➤ Angiotensin-II receptor antagonists potentially increase the concentration of lithium. Monitor concentration and adjust dose. [Severe] Anecdotal
- Antiepileptics (carbamazepine, oxcarbazepine) are predicted to increase the risk of neurotoxicity when given with lithium.
 Severe Anecdotal
- Antipsychotics, second generation (quetiapine, risperidone) potentially increase the risk of neurotoxicity when given with lithium. (Severe) Anecdotal → Also see TABLE 9 p. 1492
- ► Calcitonins decrease the concentration of lithium. Adjust dose.

 Moderate Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of neurotoxicity when given with lithium.
 Severel Anecdotal
- Loop diuretics increase the concentration of lithium. Monitor and adjust dose. Severe Study
- Methyldopa increases the risk of neurotoxicity when given with lithium. Severe Anecdotal
- ► Metronidazole is predicted to increase the concentration of lithium. Avoid or adjust dose. [Severe] Anecdotal
- Mexiletine potentially affects the exposure to lithium. Avoid.
 Unknown Theoretical
- ► NSAIDs increase the concentration of lithium. Monitor and adjust dose. |Severe| Study
- Phenothiazines potentially increase the risk of neurotoxicity when given with lithium. Severe Anecdotal → Also see TABLE 9 n. 1402
- Potassium-sparing diuretics (triamterene) potentially increase the clearance of lithium. [Moderate] Study
- ➤ Sodium bicarbonate decreases the concentration of lithium.

 [Severe] Anecdotal
- Sulpiride potentially increases the risk of neurotoxicity when given with lithium. Severe Anecdotal → Also see TABLE 9 p. 1492
 Tetracyclines are predicted to increase the risk of lithium
- toxicity when given with lithium. Avoid or adjust dose. Severe

 Anecdotal
- ► Theophylline is predicted to decrease the concentration of lithium. Monitor concentration and adjust dose. Moderate

 Anecdotal
- ► Thiazide diuretics increase the concentration of lithium. Avoid or adjust dose and monitor concentration. Severe Study
- ► Tricyclic antidepressants potentially increase the risk of neurotoxicity when given with lithium. Severe Anecdotal → Also see TABLE 13 p. 1493 → Also see TABLE 9 p. 1492
- ➤ Zuclopenthixol potentially increases the risk of neurotoxicity when given with lithium. Severe Anecdotal → Also see TABLE 9 p. 1492

Live vaccines

Bacillus Calmette-Guérin vaccine · herpes-zoster vaccine, live · influenza vaccine (live) · measles, mumps and rubella vaccine, live · rotavirus vaccine · typhoid vaccine, oral · varicella-zoster vaccine ·

yellow fever vaccine, live

GENERAL INFORMATION Oral typhoid vaccine is inactivated by concurrent administration of antibacterials or antimalarials: antibacterials should be avoided for 3 days before and after oral typhoid vaccination; *mefloquine* should be avoided for at least 12 hours before or after oral typhoid vaccination; for other antimalarials oral typhoid vaccine vaccination should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which can be given concurrently).

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ► Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abrocitinib. Avoid. [Severe] Theoretical
- Aciclovir is predicted to decrease the efficacy of herpes-zoster vaccine, live. [Moderate] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylating agents. UKHSA advises avoid (refer to Green Book).
 Severe! Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anakinra. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anthracyclines. UKHSA advises avoid (refer to Green Book).
 Severel Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with azathioprine (high-dose). UKHSA advises avoid (refer to Green Book). [Severe] Theoretical
- ► Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with baricitinib. Avoid. Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belatacept. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with bleomycin. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with capecitabine. UKHSA advises avoid (refer to Green Book).
 Severej Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with ciclosporin. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with clofarabine. UKHSA advises avoid (refer to Green Book).
 Severe! Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with corticosteroids (high-dose). UKHSA advises avoid (refer to Green Book). Severel Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cytarabine. UKHSA advises avoid (refer to Green Book). Severel Theoretical

Live vaccines (continued)

- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dactinomycin. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dimethyl fumarate. UKHSA advises avoid (refer to Green Book). Severe
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with diroximel fumarate. Use with caution or avoid. Severe
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etoposide. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with everolimus. UKHSA advises avoid (refer to Green Book). Severe
- ► Famciclovir is predicted to decrease the efficacy of herpeszoster vaccine, live. Moderate Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with filgotinib. Avoid. Severe Theoretical
- Live vaccines might increase the risk of generalised infection (possibly life-threatening) when given with fingolimod. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fludarabine. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fluorouracil. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with gemcitabine. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with hydroxycarbamide. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ► Immunoglobulins (cytomegalovirus immunoglobulin) are predicted to decrease the exposure to varicella-zoster vaccine. Avoid and for 3 months after stopping cytomegalovirus immunoglobulin. Moderate Theoretical
- ► Immunoglobulins (varicella-zoster immunoglobulin) are predicted to decrease the efficacy of herpes-zoster vaccine, live. Avoid and for 3 months after stopping varicella-zoster immunoglobulin. Moderate Theoretical
- ► Immunoglobulins (varicella-zoster immunoglobulin) are predicted to decrease efficacy measles, mumps and rubella vaccine, live. Avoid and for at least 3 months after stopping varicella-zoster immunoglobulin. [Moderate] Theoretical
- Immunoglobulins (cytomegalovirus immunoglobulin) are predicted to decrease the efficacy of live vaccines (Bacillus Calmette-Guérin vaccine, herpes-zoster vaccine, live, influenza vaccine (live), measles, mumps and rubella vaccine, live, rotavirus vaccine, typhoid vaccine, oral). Avoid and for 3 months after stopping cytomegalovirus immunoglobulin. Moderate Theoretical
- ► Immunoglobulins (anti-D (Rh₀) immunoglobulin) are predicted to decrease the efficacy of live vaccines (Bacillus Calmette-Guérin vaccine, herpes-zoster vaccine, live, influenza vaccine (live), measles, mumps and rubella vaccine, live, rotavirus vaccine, typhoid vaccine, oral, varicella-zoster vaccine). Avoid and for 3 months after stopping anti-D (Rh₀) immunoglobulin. Moderate Theoretical

- ▶ Immunoglobulins (normal immunoglobulin) are predicted to decrease the efficacy of live vaccines (Bacillus Calmette-Guérin vaccine, herpes-zoster vaccine, live, influenza vaccine (live), measles, mumps and rubella vaccine, live, rotavirus vaccine, typhoid vaccine, oral, varicella-zoster vaccine). Avoid and for 3 months after stopping **normal immunoglobulin**. Moderate Theoretical
- ► Immunoglobulins (varicella-zoster immunoglobulin) are predicted to decrease the efficacy of live vaccines (Bacillus Calmette-Guérin vaccine, influenza vaccine (live), rotavirus vaccine, typhoid vaccine, oral, varicella-zoster vaccine). Avoid and for at least 3 months after stopping varicella-zoster immunoglobulin. Moderate Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with irinotecan. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with iron chelators (dexrazoxane). Avoid. Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with leflunomide. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines (measles, mumps and rubella vaccine, live) might decrease the efficacy of live vaccines (herpes-zoster vaccine, live). Moderate Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mercaptopurine (high-dose). UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ► Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with methotrexate (high-dose). UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mitomycin. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mycophenolate. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines might increase the risk of generalised infection (possibly life-threatening) when given with ozanimod. Avoid and for 3 months after stopping ozanimod. Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with pemetrexed. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with platinum compounds. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines might increase the risk of generalised infection (possibly life-threatening) when given with ponesimod. Avoid and for 1 week after stopping ponesimod. Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with procarbazine. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with raltitrexed. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- ▶ Live vaccines might increase the risk of generalised infection (possibly life-threatening) when given with siponimod. Avoid and for 4 weeks after stopping siponimod. Severe Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with

- sirolimus. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with streptozocin. UKHSA advises avoid (refer to Green Book).
 Severej Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tacrolimus. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with taxanes (docetaxel, paclitaxel). UKHSA advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tegafur. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with temsirolimus. UKHSA advises avoid (refer to Green Book).
 [Severe] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with teriflunomide. UKHSA advises avoid (refer to Green Book).
 Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tioguanine. UKHSA advises avoid (refer to Green Book). Severe Theoretical
- Live vaccines potentially increase the risk of generalised infection (possibly life-threatening) when given with tofacitinib. Avoid. Severe Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with topotecan. UKHSA advises avoid (refer to Green Book). Severel Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with trabectedin. UKHSA advises avoid (refer to Green Book).
 Severel Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with upadacitinib. Avoid. Severel Theoretical
- ► Valaciclovir is predicted to decrease the efficacy of herpeszoster vaccine, live. Moderate Theoretical
- ► Venetoclax potentially decreases the efficacy of live vaccines. Avoid. Severe Theoretical
- ➤ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with vinca alkaloids. UKHSA advises avoid (refer to Green Book). Severe Theoretical

Lixisenatide → see glucagon-like peptide-1 receptor agonists **Lofepramine** → see tricyclic antidepressants

Lofexidine → see TABLE 8 p. 1491 (hypotension), TABLE 9 p. 1492 (QT-interval prolongation), TABLE 11 p. 1492 (CNS depressant effects)

Lomitapide → see TABLE 1 p. 1490 (hepatotoxicity)

FOOD AND LIFESTYLE Bitter (Seville) orange is predicted to increase the exposure to lomitapide; separate administration by 12 hours.

- ➤ Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to lomitapide. Monitor and adjust dose. Moderate] Theoretical
- ▶ Anti-androgens (bicalutamide) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- ► Antiarrhythmics (amiodarone) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderatel Theoretical
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to lomitapide. Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lomitapide. Monitor and adjust dose. Moderate Theoretical → Also see TABLE 1 p. 1490

- ► Antifungals, azoles (clotrimazole) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours.

 Moderate Theoretical
- ► Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lomitapide. Avoid.

 Moderate Theoretical → Also see TABLE 1 p. 1490
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to lomitapide. Avoid. [Severe] Study → Also see TABLE 1 p. 1490
- Benzodiazepines (alprazolam) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours.
 Moderate Theoretical
- ► Calcium channel blockers (amlodipine, lacidipine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lomitapide. Avoid. Moderate Theoretical
- ► Cenobamate is predicted to decrease the exposure to lomitapide. Adjust dose. Moderate Theoretical
- ► Ciclosporin is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- ► Cilostazol is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- ► Cobicistat is predicted to markedly increase the exposure to lomitapide. Avoid. Severe Study
- ➤ Oral combined hormonal contraceptives slightly increase the exposure to lomitapide. Separate administration by 12 hours.

 [Moderate] Theoretical
- Lomitapide increases the exposure to coumarins (warfarin).
 Monitor INR and adjust dose. Severel Study
- Crizotinib is predicted to increase the exposure to lomitapide.
 Avoid. [Moderate] Theoretical
- ▶ Dipeptidylpeptidase-4 inhibitors (linagliptin) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Everolimus is predicted to increase the exposure to lomitapide.
 Separate administration by 12 hours. Mild Theoretical
- ► Grapefruit juice is predicted to increase the exposure to lomitapide. Avoid. Mild Theoretical
- H₂ receptor antagonists (cimetidine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Mild] Theoretical
- H₂ receptor antagonists (ranitidine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours.
 [Moderate] Theoretical
- ► HIV-protease inhibitors are predicted to markedly increase the exposure to lomitapide. Avoid. Severe Study
- ► Idelalisib is predicted to markedly increase the exposure to lomitapide. Avoid. Severe Study
- ► Imatinib is predicted to increase the exposure to lomitapide.

 Avoid. Moderate Theoretical
- ► Isoniazid is predicted to increase the exposure to Iomitapide.

 Separate administration by 12 hours. Unknown Theoretical →

 Also see TABLE 1 p. 1490
- ► Ivacaftor is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- ► Lapatinib is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Mild Theoretical
- Letermovir is predicted to increase the exposure to lomitapide.
 Avoid. Moderate Theoretical
- ► Macrolides (azithromycin) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours.

 Moderate Theoretical
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to lomitapide. Avoid. Severe Study
- Macrolides (erythromycin) are predicted to increase the exposure to lomitapide. Avoid. [Moderate] Theoretical
- Mitotane is predicted to decrease the exposure to lomitapide.
 Monitor and adjust dose. Moderate Theoretical
- ► Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to lomitapide. Avoid. Moderate Theoretical
- ► Neurokinin-1 receptor antagonists (fosaprepitant) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Mild] Theoretical

Lomitapide (continued)

- Nilotinib is predicted to increase the exposure to lomitapide.
 Avoid. Moderate Theoretical
- ► Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of lomitapide. Avoid. [Severe] Theoretical
- ► Pazopanib is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Mild] Theoretical
- ▶ Peppermint oil is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- ► Propiverine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate
- Ranolazine is predicted to increase the exposure to lomitapide.
 Separate administration by 12 hours. Mild Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to lomitapide. Monitor and adjust dose. [Moderate] Theoretical
- ➤ SSRIs (fluoxetine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Unknown Theoretical
- ► SSRIs (fluvoxamine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Mild

 Theoretical
- Lomitapide increases the exposure to statins (atorvastatin). Adjust lomitapide dose or separate administration by 12 hours, p. 226. Mild Study → Also see TABLE 1 p. 1490
- ► Lomitapide increases the exposure to statins (simvastatin). Monitor and adjust simvastatin dose, p. 222. Moderate Study → Also see TABLE 1 p. 1490
- ► Tacrolimus is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- ► Ticagrelor is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- Tolvaptan is predicted to increase the exposure to lomitapide.
 Separate administration by 12 hours. [Moderate] Theoretical
- Tucatinib is predicted to increase the exposure to lomitapide.
 Avoid or adjust dose. [Moderate] Theoretical

Lomustine → see alkylating agents

Loop diuretics → see TABLE 18 p. 1494 (hyponatraemia), TABLE 8 p. 1491 (hypotension), TABLE 19 p. 1494 (ototoxicity), TABLE 17 p. 1494 (reduced serum potassium)

bumetanide · furosemide · torasemide

- ► Aliskiren slightly decreases the exposure to furosemide. Moderate Study → Also see TABLE 8 p. 1491
- ► Loop diuretics increase the risk of nephrotoxicity when given with aminoglycosides. Avoid. Moderate Study → Also see TABLE 19 p. 1494
- ► Antiepileptics (fosphenytoin, phenytoin) decrease the effects of furosemide. Moderate Study
- ► Intravenous furosemide potentially increases the risk of sweating, variable blood pressure, and tachycardia when given after chloral hydrate. [Moderate] Anecdotal
- ► Immunoglobulins (cytomegalovirus immunoglobulin) are predicted to increase the risk of adverse effects when given with loop diuretics. Avoid. [Moderate] Theoretical
- ► Loop diuretics might increase the risk of adverse effects when given with immunoglobulins (normal immunoglobulin). Avoid.

 Moderate Theoretical
- Leflunomide is predicted to increase the exposure to furosemide. Moderate Theoretical
- Loop diuretics increase the concentration of lithium. Monitor and adjust dose. [Severe] Study
- ► Nitisinone is predicted to increase the exposure to furosemide. Moderate Study
- ▶ Reboxetine is predicted to increase the risk of hypokalaemia when given with loop diuretics. [Moderate] Theoretical
- Selpercatinib is predicted to increase the exposure to torasemide. Avoid. [Severe] Study
- ► Teriflunomide is predicted to increase the exposure to furosemide. [Moderate] Study
- ► Furosemide might slightly decrease the clearance of treprostinil. Unknown Theoretical → Also see TABLE 8 p. 1491

Loperamide

 Antiarrhythmics (dronedarone) are predicted to increase the exposure to loperamide. Severe Theoretical

- Antipsychotics, second generation (clozapine) can cause constipation, as can loperamide; concurrent use might increase the risk of developing intestinal obstruction. Severe Anecdotal
- ► Berotralstat is predicted to increase the concentration of loperamide. Monitor and adjust dose. Moderate Study
- Ceritinib is predicted to increase the exposure to loperamide.
 Moderate Theoretical
- Loperamide greatly increases the absorption of oral desmopressin (and possibly sublingual). [Moderate] Study
- ► Eliglustat is predicted to increase the exposure to loperamide. Adjust dose. Moderate Study
- ► Ibrutinib is predicted to increase the exposure to loperamide.

 Separate administration by at least 6 hours. Moderate

 Theoretical
- ► Ivacaftor is predicted to increase the exposure to loperamide. Moderate Study
- Lapatinib is predicted to increase the exposure to loperamide.

 Moderate Theoretical
- Lorlatinib is predicted to decrease the exposure to loperamide.
 Moderate Study
- Mifepristone is predicted to increase the exposure to loperamide. [Moderate] Theoretical
- ► Mirabegron is predicted to increase the exposure to loperamide. Mild Theoretical
- ▶ Neratinib is predicted to increase the exposure to loperamide. Moderate Study
- Olaparib might increase the exposure to loperamide. Moderate
 Theoretical
- Opicapone is predicted to increase the exposure to loperamide.
 Avoid. Moderate Study
- Osimertinib is predicted to increase the exposure to loperamide. [Moderate] Study
- Pibrentasvir with glecaprevir is predicted to increase the exposure to loperamide. Moderate Study
- Pitolisant is predicted to decrease the exposure to loperamide.
 Mild Theoretical
- ► Sotorasib is predicted to increase the exposure to loperamide. Avoid or adjust dose. Moderate Study
- Tepotinib is predicted to increase the concentration of loperamide. [Severe] Study
- ► Tucatinib is predicted to increase the exposure to loperamide.

 Use with caution and adjust dose. Moderate Theoretical
- ► Vandetanib is predicted to increase the exposure to loperamide. [Moderate] Study
- ► Velpatasvir is predicted to increase the exposure to loperamide. Severe Theoretical
- Vemurafenib might increase the exposure to loperamide. Use with caution and adjust dose. [Moderate] Theoretical

Lopinavir → see HIV-protease inhibitors

Loprazolam → see benzodiazepines

Loratadine → see antihistamines, non-sedating **Lorazepam** → see benzodiazepines

Lorlatinib

- ► Lorlatinib is predicted to decrease the exposure to aliskiren.

 [Moderate] Study
- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to lorlatinib. Avoid. Severe Study
- ➤ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lorlatinib. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lorlatinib. Avoid or adjust lorlatinib dose, p. 1067. Severel Study
- Lorlatinib decreases the exposure to antihistamines, nonsedating (fexofenadine). [Moderate] Study
- Lorlatinib moderately decreases the exposure to benzodiazepines (midazolam). Avoid. [Moderate] Study
- ► Lorlatinib is predicted to decrease the exposure to ciclosporin.

 Avoid. Moderate Theoretical
- ► Cobicistat is predicted to increase the exposure to Iorlatinib.

 Avoid or adjust Iorlatinib dose, p. 1067. [Severe] Study
- Lorlatinib is predicted to decrease the exposure to colchicine.
 Moderate Study

- Lorlatinib is predicted to decrease the exposure to combined hormonal contraceptives. Avoid. Moderate Theoretical
- Lorlatinib is predicted to decrease the exposure to coumarins.
 Moderate Theoretical
- Lorlatinib is predicted to decrease the exposure to digoxin.
 Moderatel Study
- Lorlatinib is predicted to decrease the exposure to ergotamine.
 Avoid. Moderate Theoretical
- Lorlatinib is predicted to decrease the exposure to everolimus.
 Avoid. Moderate Study
- Lorlatinib is predicted to decrease the exposure to factor XA inhibitors (edoxaban, rivaroxaban). [Moderate] Study
- ► Grapefruit juice is predicted to increase the concentration of lorlatinib. Avoid. Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to lorlatinib. Avoid or adjust lorlatinib dose, p. 1067. Severe Study
- ► Idelalisib is predicted to increase the exposure to Iorlatinib.

 Avoid or adjust Iorlatinib dose, p. 1067. Severe Study
- Lorlatinib is predicted to decrease the exposure to loperamide.
 Moderate Study
- ► Macrolides (clarithromycin) are predicted to increase the exposure to lorlatinib. Avoid or adjust lorlatinib dose, p. 1067. [Severe] Study
- ► Mitotane is predicted to decrease the exposure to lorlatinib. Avoid. Severe Study
- Lorlatinib is predicted to decrease the exposure to opioids (alfentanil, fentanyl). Avoid. [Moderate] Theoretical
- Lorlatinib is predicted to decrease the exposure to pimozide.
 Avoid. Moderate Theoretical
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to lorlatinib. Avoid. Severe Study
- Lorlatinib is predicted to decrease the exposure to sirolimus.
 Avoid. Moderate Theoretical
- ► St John's wort is predicted to decrease the exposure to lorlatinib. Avoid. [Severe] Theoretical
- ► Lorlatinib is predicted to decrease the exposure to tacrolimus. Avoid. Moderate Theoretical
- Lorlatinib is predicted to decrease the exposure to talazoparib.
 Moderatel Study
- ► Lorlatinib is predicted to decrease the exposure to taxanes (paclitaxel). Moderate Study
- ► Lorlatinib is predicted to decrease the exposure to thrombin inhibitors (dabigatran). Moderate Study
- ► Lorlatinib is predicted to decrease the exposure to topotecan.

 Moderate Study

Lormetazepam → see benzodiazepines

Losartan → see angiotensin-II receptor antagonists

Low molecular-weight heparins → see TABLE 16 p. 1494 (increased serum potassium), TABLE 3 p. 1490 (anticoagulant effects)

bemiparin • dalteparin • enoxaparin • tinzaparin

- ► Andexanet alfa is predicted to affect the anticoagulant effect of low molecular-weight heparins. Avoid. [Severe] Theoretical
- Ranibizumab increases the risk of bleeding events when given with low molecular-weight heparins. Severe Theoretical

Loxapine → see TABLE 8 p. 1491 (hypotension), TABLE 11 p. 1492 (CNS depressant effects), TABLE 10 p. 1492 (antimuscarinics)

- Antipsychotics, second generation (clozapine) can cause constipation, as can loxapine; concurrent use might increase the risk of developing intestinal obstruction. [Severe]
 Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 11 p. 1492 → Also see TABLE 10 p. 1492
- Combined hormonal contraceptives is predicted to increase the exposure to loxapine. Avoid. Unknown Theoretical
- ► Loxapine is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 10 p. 1492
- ► Loxapine is predicted to decrease the effects of levodopa.

 Severe Theoretical → Also see TABLE 8 p. 1491
- Mexiletine is predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical
- Osilodrostat is predicted to increase the exposure to loxapine.
 Avoid. Unknown Theoretical

- ► Quinolones (ciprofloxacin) are predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical
- Rucaparib is predicted to increase the exposure to loxapine.
 Avoid. [Unknown] Theoretical
- ► SSRIs (fluvoxamine) are predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical
- Vemurafenib is predicted to increase the exposure to loxapine.
 Avoid. Unknown Theoretical

Lumacaftor

- Lumacaftor is predicted to decrease the exposure to antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. [Severe] Theoretical
- Lumacaftor is predicted to decrease the exposure to antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole). Avoid or monitor efficacy. Moderate Theoretical
- Lumacaftor is predicted to decrease the exposure to benzodiazepines (midazolam). Avoid. [Severe] Theoretical
- Lumacaftor is predicted to decrease the exposure to bupropion. Adjust dose. Moderate Theoretical
- Lumacaftor is predicted to decrease the exposure to ciclosporin. Avoid. Severe Theoretical
- ► Lumacaftor is predicted to decrease the exposure to combined hormonal contraceptives. Use additional contraceptive precautions. Severe Theoretical
- Lumacaftor is predicted to decrease the exposure to corticosteroids (methylprednisolone). Adjust dose. Severe Theoretical
- Lumacaftor might decrease the efficacy of subdermal etonogestrel. Use additional contraceptive precautions. Severe Theoretical
- Lumacaftor is predicted to decrease the exposure to everolimus. Avoid. Severe Theoretical
- ► Lumacaftor potentially decreases the exposure to glecaprevir.

 Avoid. Severe Theoretical
- ► Lumacaftor is predicted to decrease the efficacy of levonorgestrel. Use additional contraceptive precautions. [Severe] Theoretical
- Lumacaftor is predicted to decrease the exposure to macrolides (clarithromycin, erythromycin). Moderate Theoretical
- ► Lumacaftor is predicted to decrease the exposure to NNRTIS (doravirine). Avoid. Severe Theoretical
- ► Lumacaftor potentially decreases the exposure to pibrentasvir. Avoid. Severe Theoretical
- ► Lumacaftor might decrease the efficacy of oral progestogenonly contraceptives. Use additional contraceptive precautions.

 | Severe | Theoretical |
- ► Lumacaftor is predicted to decrease the exposure to rifamycins (rifabutin). Adjust dose. [Moderate] Theoretical
- Lumacaftor is predicted to decrease the exposure to sirolimus.
 Avoid. Severe Theoretical
- ► Lumacaftor is predicted to decrease the exposure to tacrolimus. Avoid. Severe Theoretical
- ► Lumacaftor is predicted to decrease the exposure to temsirolimus. Avoid. Severe Theoretical
- Lumacaftor is predicted to decrease the efficacy of ulipristal.
 Use additional contraceptive precautions. Severe Theoretical

Lumefantrine → see antimalarials

Lurasidone → see antipsychotics, second generation

Lymecycline → see tetracyclines

Macritentan → see endothelin receptor antagonists

Macrolides → see TABLE 9 p. 1492 (QT-interval prolongation)

azithromycin • clarithromycin • erythromycin

- Interactions do not generally apply to topical use of azithromycin unless specified.
- Since systemic absorption can follow topical application of erythromycin, the possibility of interactions should be borne in mind.
- ► Clarithromycin is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1042. Severe
- ► Erythromycin is predicted to increase the exposure to abemaciclib. [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to acalabrutinib. Avoid. Severe Study

A1

Macrolides (continued)

- ► Erythromycin is predicted to increase the exposure to acalabrutinib. Avoid or monitor. [Severe] Study
- ► Macrolides are predicted to increase the exposure to afatinib. Moderate Study
- ► Clarithromycin is predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. Severe Study
- Erythromycin is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 210. [Severe] Study
- ► Azithromycin is predicted to increase the exposure to aliskiren. Moderate Theoretical
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to aliskiren. [Moderate] Study
- Clarithromycin is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study
- Erythromycin is predicted to increase the exposure to alpha blockers (tamsulosin). Moderate Theoretical
- Azithromycin is predicted to increase the exposure to aminophylline. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to aminophylline. Adjust dose. Moderate Theoretical
- Aminophylline is predicted to decrease the exposure to erythromycin. Adjust dose. Severe Study
- ► Clarithromycin is predicted to increase the exposure to antiandrogens (apalutamide). Mild Study → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to increase the exposure to antiandrogens (darolutamide). Monitor and adjust dose. [Moderate] Theoretical
- ► Clarithromycin very markedly increases the exposure to antiarrhythmics (dronedarone). Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to moderately increase the exposure to antiarrhythmics (dronedarone). Avoid. Severe Theoretical → Also see TABLE 9 p. 1492
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to antiarrhythmics (lidocaine). [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. Severe Study
- Erythromycin is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose.
 Moderate Study
- ► Clarithromycin is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study
- Clarithromycin slightly increases the concentration of antiepileptics (carbamazepine). Monitor concentration and adjust dose. [Severe] Study
- Erythromycin markedly increases the concentration of antiepileptics (carbamazepine). Monitor concentration and adjust dose. [Severe] Study
- Clarithromycin is predicted to very slightly increase the exposure to antiepileptics (perampanel). Mild Study
- Clarithromycin is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor adverse effects. Severel Study
- ► Erythromycin is predicted to increase the exposure to antifungals, azoles (isavuconazole). Moderate Theoretical
- Clarithromycin is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. Severe Study
- ► Erythromycin is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. Moderate Study
- Macrolides might increase the risk of serious cardiovascular adverse effects when given with antimalarials (chloroquine).
 Severe Theoretical

- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of antimalarials (piperaquine).

 [Severe] Theoretical
- Clarithromycin is predicted to slightly increase the exposure to antipsychotics, second generation (aripiprazole). Adjust aripiprazole dose, p. 427. [Moderate] Study
- Clarithromycin is predicted to moderately increase the exposure to antipsychotics, second generation (cariprazine).
 Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to antipsychotics, second generation (cariprazine). Avoid. [Severe]
 Study
- ► Erythromycin potentially increases the risk of toxicity when given with antipsychotics, second generation (clozapine). Severe Anecdotal
- Erythromycin is predicted to increase the exposure to antipsychotics, second generation (lurasidone). Adjust lurasidone dose. [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to antipsychotics, second generation (lurasidone, quetiapine). Avoid.

 Severe Study
- ► Erythromycin is predicted to increase the exposure to antipsychotics, second generation (quetiapine). Avoid. [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to antipsychotics, second generation (risperidone). Adjust dose.

 Moderate Study → Also see TABLE 9 p. 1492
- ► Clarithromycin is predicted to increase the exposure to avapritinib. Avoid. [Moderate] Study
- Erythromycin is predicted to increase the exposure to avapritinib. Avoid or adjust avapritinib dose, p. 1045. [Moderate]
 Study
- ► Clarithromycin is predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Erythromycin is predicted to increase the exposure to axitinib.
 Moderate Study
- Clarithromycin is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Study → Also see TABLE 9
- ► Erythromycin is predicted to increase the exposure to bedaquiline. Avoid prolonged use. Mild Theoretical → Also see TABLE 9 p. 1492
- Clarithromycin moderately increases the exposure to benzodiazepines (alprazolam). Avoid. [Moderate] Study
- ► Erythromycin is predicted to increase the exposure to benzodiazepines (alprazolam). Severe Study
- ► Clarithromycin is predicted to markedly to very markedly increase the exposure to benzodiazepines (midazolam). Avoid or adjust dose. [Severe] Study
- ► Erythromycin is predicted to increase the exposure to benzodiazepines (midazolam). Monitor adverse effects and adjust dose. Severe Study
- Macrolides are predicted to increase the exposure to berotralstat. [Severe] Study
- Macrolides are predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study
- Clarithromycin is predicted to increase the exposure to beta₂ agonists (salmeterol). Avoid. [Severe] Study
- Macrolides are predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical
- ► Clarithromycin slightly increases the exposure to bortezomib.

 Moderate Study
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to bosutinib. Avoid or adjust dose.

 Severe Study → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1048. Severe Study
- Erythromycin is predicted to increase the exposure to brigatinib. [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 373. Severe Study
- Erythromycin is predicted to increase the exposure to buspirone. Use with caution and adjust dose. Moderate Study

- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to cabozantinib. Moderate Study → Also see TABLE 9 p. 1492
- Erythromycin is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate]
- Erythromycin is predicted to increase the exposure to calcium channel blockers (diltiazem). Severe Theoretical
- Clarithromycin is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). Severe Study
- ► Clarithromycin is predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to calcium channel blockers (verapamil). Severe Study
- Clarithromycin is predicted to increase the exposure to cannabidiol. Avoid or adjust dose. Mild Study
- ► Clarithromycin is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 1050. Severe Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to ceritinib.

 Moderate | Study → Also see TABLE 9 p. 1492
- ► Clarithromycin increases the concentration of ciclosporin.

 Severe Study
- Erythromycin greatly increases the exposure to ciclosporin.
 Avoid or monitor. Severel Study
- Clarithromycin is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 252. [Moderate]
 Study
- Erythromycin slightly increases the exposure to cilostazol.
 Adjust cilostazol dose, p. 252. [Moderate] Study
- Clarithromycin is predicted to moderately increase the exposure to cinacalcet. Adjust dose. Moderate Study
- ► Cobicistat is predicted to increase the concentration of erythromycin. Moderate Theoretical
- Clarithromycin is predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. Severe Study
- ► Erythromycin is predicted to increase the exposure to cobimetinib. Severe Study
- ► Azithromycin is predicted to increase the exposure to colchicine. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1212. [Severe] Theoretical
- Clarithromycin is predicted to increase the exposure to colchicine. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1212. Severe Study
- ► Erythromycin is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1212. Severe Study
- Clarithromycin is predicted to increase the exposure to corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate]
- Clarithromycin is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor adverse effects.
 Severel Study
- ► Erythromycin is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose.

 Moderate] Study
- ▶ Macrolides (clarithromycin, erythromycin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Anecdotal
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to crizotinib. Avoid. Moderate Study → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- Erythromycin is predicted to increase the exposure to dabrafenib. Moderate Study

- ► Clarithromycin is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
- ► Erythromycin slightly increases the exposure to darifenacin.

 [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to dasatinib. Avoid or adjust dose—consult product literature.

 [Severe] Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to dasatinib. Severe Study → Also see TABLE 9 p. 1492
- ► Clarithromycin very slightly increases the exposure to delamanid. Severe Study → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to moderately increase the exposure to dienogest. [Moderate] Study
- Erythromycin is predicted to slightly increase the exposure to dienogest. Moderate Study
- ► Macrolides increase the concentration of digoxin. Severe
- Clarithromycin is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Moderate] Study
- Erythromycin is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). Mild Study
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to domperidone. Avoid. Severel Study
- Clarithromycin increases the exposure to dopamine receptor agonists (bromocriptine). Severel Study
- Erythromycin is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). Severe Theoretical
- Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of dopamine receptor agonists (cabergoline). Avoid. [Severe] Study
- ► Clarithromycin is predicted to increase the exposure to dronabinol. Adjust dose. Mild Study
- ► Clarithromycin is predicted to increase the exposure to drospirenone. Severe Study
- ➤ Clarithromycin is predicted to increase the exposure to dutasteride. Monitor adverse effects and adjust dose. Moderate Theoretical
- ► Erythromycin is predicted to moderately increase the exposure to dutasteride. Mild Study
- ► Clarithromycin is predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with potent CYP3A4 inhibitors. | Severe | Study
- ► Erythromycin is predicted to increase the exposure to elexacaftor. Adjust tezacaftor with ivacaftor and elexacaftor p. 320 dose with moderate CYP3A4 inhibitors. Severe Theoretical
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. Severe Study
- Clarithromycin is predicted to increase the exposure to encorafenib. Avoid or monitor. Severe Study → Also see TABLE 9
- ► Erythromycin is predicted to moderately increase the exposure to encorafenib. Moderate Study → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to increase the exposure to endothelin receptor antagonists (bosentan). [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to endothelin receptor antagonists (macitentan). Moderate) Study
- ► Clarithromycin is predicted to increase the exposure to entrectinib. Avoid potent CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. Severe Study → Also see TABLE 9 p. 1492
- Erythromycin is predicted to increase the exposure to entrectinib. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1056. Severe Theoretical → Also see TABLE 9 p. 1492
- ► Clarithromycin is predicted to increase the risk of ergotism when given with ergometrine. Avoid. Severe Theoretical
- ► Erythromycin is predicted to increase the risk of ergotism when given with ergometrine. Severe Theoretical
- ► Clarithromycin is predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- ► Erythromycin is predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
- Azithromycin is predicted to increase the exposure to erlotinib.
 [Moderate] Theoretical

Macrolides (continued)

- Clarithromycin is predicted to increase the exposure to erlotinib. Use with caution and adjust dose. [Severe] Study
- Erythromycin is predicted to increase the exposure to erlotinib.
 Moderate Study
- ► Clarithromycin is predicted to increase the exposure to esketamine. Adjust dose. Moderate Study
- Clarithromycin is predicted to increase the concentration of subdermal etonogestrel. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to everolimus. Avoid. Severe Study
- ► Erythromycin is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- ► Clarithromycin slightly increases the exposure to factor XA inhibitors (apixaban). Moderate Study
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to factor XA inhibitors (apixaban).
 Moderate Theoretical
- ► Erythromycin slightly increases the exposure to factor XA inhibitors (edoxaban). Adjust edoxaban dose, p. 138. Severe Study
- ► Macrolides (azithromycin, clarithromycin) are predicted to increase the exposure to factor XA inhibitors (edoxaban). Severe Theoretical
- Erythromycin slightly increases the exposure to factor XA inhibitors (rivaroxaban). Mild Study
- Clarithromycin is predicted to increase the exposure to fedratinib. Adjust fedratinib dose, but avoid depending on other drugs taken—consult product literature, p. 1060.
 Moderatel Study
- Erythromycin is predicted to increase the exposure to fedratinib. Monitor and adjust dose. [Moderate] Study
- Clarithromycin is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 840. [Severe] Study
- Erythromycin is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 840. [Mild] Study
- Macrolides are predicted to increase the exposure to fidaxomicin. Avoid. Moderate Study
 Clarithromycin is predicted to increase the exposure to
- fostamatinib. Monitor adverse effects and adjust dose.

 Moderate Study
- ► Clarithromycin is predicted to increase the exposure to gefitinib. [Severe] Study
- Erythromycin is predicted to increase the exposure to gefitinib.
 Moderate Study
- ► Clarithromycin is predicted to increase the exposure to gilteritinib. [Moderate] Study
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to gilteritinib. [Moderate] Theoretical
- ► Clarithromycin is predicted to increase the exposure to glasdegib. Use with caution or avoid. Severe Study → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. <u>Severe</u> Study
- Clarithromycin is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 384. Moderate Study
- Erythromycin is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 384. Moderate Theoretical
- ► H₂ receptor antagonists (cimetidine) slightly increase the exposure to erythromycin. [Moderate] Study
- ► HIV-protease inhibitors (atazanavir) are predicted to increase the exposure to clarithromycin. Adjust dose in renal impairment. [Severe] Study
- HIV-protease inhibitors (darunavir, fosamprenavir, lopinavir) boosted with ritonavir are predicted to increase the exposure to clarithromycin. Adjust dose in renal impairment. Severel Study
- ► HIV-protease inhibitors (ritonavir) increase the exposure to clarithromycin. Adjust dose in renal impairment. [Severe] Study
- ► HIV-protease inhibitors (tipranavir) boosted with ritonavir increase the exposure to clarithromycin and clarithromycin increases the exposure to HIV-protease inhibitors (tipranavir)

- boosted with ritonavir. Monitor; adjust dose in renal impairment. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to erythromycin. Severe Theoretical
- Macrolides might increase the risk of serious cardiovascular adverse effects when given with hydroxychloroquine. Severe Theoretical → Also see TABLE 9 p. 1492
- ► Clarithromycin is predicted to increase the exposure to ibrutinib. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1062. Severe Study
- ► Erythromycin is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1062. Severe Study
- ► Clarithromycin is predicted to increase the exposure to imatinib. Moderate Study
- ► Erythromycin is predicted to increase the exposure to imatinib.

 [Moderate] Theoretical
- ► Clarithromycin is predicted to increase the risk of toxicity when given with irinotecan. Avoid. Moderate Study
- ► Clarithromycin is predicted to increase the exposure to ivabradine. Avoid. Severe Study
- ► Erythromycin is predicted to increase the exposure to ivabradine. Avoid. Severe Theoretical
- Clarithromycin is predicted to increase the exposure to ivacaftor. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 317, lumacaftor with ivacaftor p. 318, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. Severe) Study
- Erythromycin is predicted to increase the exposure to ivacaftor. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 317, tezacaftor with ivacaftor p. 319, and tezacaftor with ivacaftor and elexacaftor p. 320. [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to lapatinib. Avoid. Moderate Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to lapatinib. [Moderate] Study → Also see TABLE 9 p. 1492
- ► Clarithromycin is predicted to moderately increase the exposure to larotrectinib. Avoid or adjust larotrectinib dose, p. 1065. Moderate Study
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to larotrectinib. Mild Theoretical
- Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of letermovir. [Moderate] Study
- Clarithromycin increases the exposure to linezolid. Moderate
 Apecdotal
- ➤ Azithromycin is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical
- Clarithromycin is predicted to markedly increase the exposure to lomitapide. Avoid. Severe Study
- ► Erythromycin is predicted to increase the exposure to lomitapide. Avoid. Moderate Theoretical
- ► Clarithromycin is predicted to increase the exposure to lorlatinib. Avoid or adjust lorlatinib dose, p. 1067. [Severe] Study
- Lumacaftor is predicted to decrease the exposure to macrolides (clarithromycin, erythromycin). [Moderate] Theoretical
- Clarithromycin is predicted to markedly increase the exposure to maraviroc. Adjust dose. [Severe] Study
- ► Clarithromycin is predicted to increase the concentration of intramuscular medroxyprogesterone. Moderate Theoretical
- ► Clarithromycin is predicted to increase the exposure to meglitinides (repaglinide). Moderate Study
- ► Clarithromycin is predicted to increase the exposure to midostaurin. Avoid or monitor for toxicity. Severe Study
- ► Erythromycin is predicted to increase the exposure to midostaurin. Moderate Theoretical
- ► Clarithromycin is predicted to increase the exposure to mifepristone. Moderate Study
- ► Clarithromycin is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 843. [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to mirtazapine. Moderate Study
- Clarithromycin is predicted to increase the exposure to modafinil. [Mild] Theoretical

- ► Clarithromycin increases the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. [Severe] Theoretical
- ► Clarithromycin is predicted to increase the exposure to monoclonal antibodies (polatuzumab vedotin). Moderate

 Theoretical
- Clarithromycin is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. Severe Theoretical
- Clarithromycin is predicted to increase the exposure to naldemedine. Avoid or monitor. Moderate Study
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to naldemedine. Moderate Study
- Clarithromycin is predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
- ► Erythromycin is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor adverse effects, p. 67. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to neratinib. Avoid potent CYP3A4 inhibitors or adjust neratinib dose, p. 1069. Severe Study
- Erythromycin is predicted to increase the exposure to neratinib. Avoid moderate CYP3A4 inhibitors or adjust neratinib dose and monitor for gastrointestinal adverse effects, p. 1069. [Severe] Study
- Clarithromycin is predicted to markedly increase the exposure to neurokinin-1 receptor antagonists (aprepitant). Moderate Study
- Erythromycin is predicted to increase the exposure to neurokinin-1 receptor antagonists (aprepitant). [Moderate] Study
- Clarithromycin is predicted to increase the exposure to neurokinin-1 receptor antagonists (fosaprepitant). [Moderate]
 Theoretical
- Clarithromycin is predicted to increase the exposure to neurokinin-1 receptor antagonists (netupitant). Moderate Study
- ► Clarithromycin is predicted to increase the exposure to nilotinib. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to nilotinib.

 Moderate Study → Also see TABLE 9 p. 1492
- Macrolides are predicted to increase the exposure to nintedanib. [Moderate] Study
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of erythromycin. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to nitisinone. Adjust dose. Moderate Theoretical
- NNRTIs (efavirenz, nevirapine) decrease the exposure to clarithromycin. Moderate Study → Also see TABLE 9 p. 1492
- NNRTIs (etravirine) decrease the exposure to clarithromycin and clarithromycin slightly increases the exposure to NNRTIs (etravirine). Severe Study
- ► Erythromycin is predicted to increase the exposure to NNRTIS (nevirapine). Moderate Theoretical
- ► Clarithromycin decreases the absorption of NRTIS (zidovudine). Separate administration by at least 2 hours. Moderate Study
- Clarithromycin is predicted to increase the exposure to olaparib. Avoid potent CYP3A4 inhibitors or adjust olaparib dose, p. 1088. [Moderate] Study
- ► Erythromycin is predicted to increase the exposure to olaparib. Avoid moderate CYP3A4 inhibitors or adjust olaparib dose, p. 1088. Moderate Theoretical
- ► Clarithromycin is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. Severe Study
- ► Erythromycin is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- ► Clarithromycin is predicted to increase the concentration of opioids (methadone). Severe Theoretical → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical → Also see TABLE 9 p. 1492
- ► Clarithromycin is predicted to increase the exposure to osilodrostat. Moderate Theoretical → Also see TABLE 9 p. 1492
- ► Clarithromycin is predicted to increase the exposure to ospemifene. Avoid in poor CYP2C9 metabolisers. Moderate Study

- ► Clarithromycin is predicted to increase the exposure to oxybutynin. [Mild] Study
- ► Clarithromycin is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 1072. Severe Study
- Clarithromycin is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 1009. [Moderate] Study → Also see TABLE 9 p. 1492
- ► Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 1492
- ► Clarithromycin is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 1073. Moderate Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to pazopanib. [Moderate] Study → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to increase the exposure to pemigatinib. Avoid or adjust pemigatinib dose, p. 1074. Severel Study
- ► Erythromycin is predicted to increase the exposure to pemigatinib. [Severe] Study
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 878. Moderate Theoretical
- ➤ Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. Severe Study → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent CYP3A4 inhibitors or adjust sildenafil dose, p. 879. Severe Study -> Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sidenafil). Monitor or adjust sidenafil dose with moderate CYP3A4 inhibitors, p. 879. Moderate] Study → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. Severe Study
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical
- ► Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. Severe | Theoretical → Also see TABLE 9 p. 1492
- Macrolides are predicted to increase the exposure to pibrentasvir. [Moderate] Theoretical
- ► Clarithromycin is predicted to increase the exposure to pimozide. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to pimozide. Avoid. Severe Theoretical → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 1075. Moderate
- ► Erythromycin is predicted to increase the exposure to ponatinib. [Moderate] Study
- Clarithromycin is predicted to moderately increase the exposure to praziquantel. [Mild] Study
- ► Clarithromycin given with carbimazole is predicted to increase the exposure to propiverine. Adjust starting dose. Moderate
- ► Clarithromycin is predicted to increase the exposure to ranolazine. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to ranolazine. Severe Study → Also see TABLE 9 p. 1492
- ► Clarithromycin is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to regorafenib. Avoid. Moderate Study
- Erythromycin is predicted to increase the exposure to regorafenib. [Moderate] Study
- ► Macrolides are predicted to increase the exposure to relugolix. Avoid or take relugolix first and separate administration by at least 6 hours. Moderate Study

Macrolides (continued)

- Clarithromycin is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1356.
 Moderate Theoretical
- ► Clarithromycin is predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 1077. [Moderate] Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to ribociclib. Moderate Study → Also see TABLE 9 p. 1492
- Rifamycins (rifabutin) have been reported to cause neutropenia when given with azithromycin. Severe Study
 Rifamycins (rifabutin) decrease the concentration of
- clarithromycin and clarithromycin increases the concentration of rifamycins (rifabutin). Monitor and adjust dose. [Severe] Study
- ▶ Rifamycins (rifampicin) greatly decrease the concentration of clarithromycin. (Severe) Study
- Erythromycin is predicted to increase the concentration of rifamycins (rifabutin) and rifamycins (rifabutin) are predicted to decrease the concentration of erythromycin. Monitor and adjust dose. [Severe] Theoretical
- Clarithromycin is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor adverse effects. Moderate Study
- Erythromycin slightly increases the exposure to ruxolitinib.
 Mild Study
- ► Clarithromycin is predicted to increase the exposure to selpercatinib. Adjust selpercatinib dose, p. 1079. Moderate Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to selpercatinib. Moderate Study → Also see TABLE 9 p. 1492
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to selumetinib. Avoid or adjust dose consult product literature. [Severe] Study
- ► Clarithromycin is predicted to increase the exposure to siponimod. Avoid depending on other drugs taken—consult product literature. Severe Theoretical
- ► Erythromycin is predicted to increase the exposure to siponimod. Avoid depending on other drugs taken—consult product literature. Severe Study
- Clarithromycin is predicted to increase the concentration of sirolimus. Avoid. Severe Study
- ► Erythromycin increases the concentration of sirolimus.

 Monitor and adjust dose. [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to SNRIs (venlafaxine). [Moderate] Study → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to increase the exposure to solifenacin. Adjust solifenacin p. 842 or tamsulosin with solifenacin p. 848 dose; avoid in hepatic and renal impairment. [Severe] Study
- Clarithromycin is predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid potent CYP3A4 inhibitors or adjust dapoxetine dose, p. 887. [Severe] Study
- Erythromycin is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate CYP3A4 inhibitors, p. 887. [Moderate] Theoretical
- ► Clarithromycin is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- Erythromycin slightly increases the exposure to statins (atorvastatin). Monitor and adjust dose. Severe Study
- Clarithromycin moderately increases the exposure to statins (pravastatin). Severe Study
- Erythromycin slightly increases the exposure to statins (pravastatin). Severel Study
- ► Clarithromycin is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study
- ► Erythromycin markedly increases the exposure to statins (simvastatin). Avoid. Severe Study
- ► Clarithromycin is predicted to slightly increase the exposure to sulfonylureas. Moderate Theoretical
- ► Clarithromycin is predicted to increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 1080. [Moderate] Study → Also see TABLE 9 p. 1492
- ► Erythromycin is predicted to increase the exposure to sunitinib. [Moderate] Study → Also see TABLE 9 p. 1492

- Clarithromycin is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Erythromycin is predicted to increase the concentration of tacrolimus. (Severe) Study
- ► Macrolides are predicted to slightly increase the exposure to talazoparib. Avoid or adjust talazoparib dose, p. 1091. Severe Study
- ➤ Clarithromycin is predicted to increase the exposure to taxanes (cabazitaxel). Avoid or monitor—consult product literature.

 [Severe] Study
- ► Erythromycin is predicted to increase the exposure to taxanes (cabazitaxel). Moderate Theoretical
- ► Clarithromycin is predicted to increase the exposure to taxanes (docetaxel). Avoid or adjust dose. Severe Study
- ► Erythromycin is predicted to increase the exposure to taxanes (docetaxel). Severe Study
- ► Azithromycin is predicted to increase the exposure to taxanes (docetaxel, paclitaxel) (oral). Unknown Theoretical
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to taxanes (paclitaxel). Moderate Anecdotal
- Clarithromycin is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical
- Erythromycin is predicted to increase the concentration of temsirolimus. Use with caution or avoid. Moderate Theoretical
- ► Clarithromycin might increase the exposure to tepotinib.

 Avoid. Severe Theoretical
- Clarithromycin is predicted to increase the exposure to tezacaftor. Adjust dose with potent CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 319 and tezacaftor with ivacaftor and elexacaftor p. 320. [Severe] Study
- Erythromycin is predicted to increase the exposure to tezacaffor. Adjust dose with moderate CYP5A4 inhibitors, see tezacaffor with ivacaffor p. 319 and tezacaffor with ivacaffor and elexacaffor p. 320. [Severe] Study
- ► Erythromycin decreases the clearance of theophylline and theophylline potentially decreases the clearance of erythromycin. Adjust dose. Severe Study
- Macrolides (azithromycin, clarithromycin) are predicted to increase the exposure to theophylline. Adjust dose. Moderate Anecdotal
- ► Clarithromycin increases the exposure to thrombin inhibitors (dabigatran). Moderate Study
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to thrombin inhibitors (dabigatran).
 Severe Theoretical
- ► Azithromycin is predicted to increase the exposure to ticagrelor. Use with caution or avoid. Severe Study
- ► Clarithromycin is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- ► Macrolides might increase the exposure to tigecycline. Mild
- ► Clarithromycin is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. [Moderate] Study
- ► Erythromycin given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1200. Moderate Study
- ► Clarithromycin is predicted to increase the exposure to tolterodine. Avoid. Severe Study → Also see TABLE 9 p. 1492
- ► Clarithromycin is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent CYP3A4 inhibitors. p. 724. [Severe] Study
- Erythromycin is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate CYP3A4 inhibitors, p. 724. [Moderate] Study
- Macrolides are predicted to increase the exposure to topotecan. Severe Study
- Clarithromycin is predicted to increase the exposure to toremifene. [Moderate] Theoretical → Also see TABLE 9 p. 1492
- Clarithromycin is predicted to increase the exposure to trabectedin. Avoid or adjust dose. Severe Theoretical
- Macrolides are predicted to increase the concentration of trametinib. [Moderate] Theoretical
- Clarithromycin is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. [Moderate] Study

- Erythromycin is predicted to increase the exposure to trazodone. [Moderate] Theoretical
- Clarithromycin increases the exposure to triptans (almotriptan).
 [Mild] Study
- Clarithromycin is predicted to markedly increase the exposure to triptans (eletriptan). Avoid. (Severe) Study
- Erythromycin moderately increases the exposure to triptans (eletriptan). Avoid. [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study
- ► Erythromycin moderately increases the exposure to ulipristal.

 Avoid if used for uterine fibroids. [Moderate] Study
- ► Clarithromycin is predicted to increase the exposure to upadacitinib. Use with caution or avoid. Severe Study
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to vemurafenib. Severe Theoretical → Also see TABLE 9 p. 1492
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to venetoclax. Avoid or adjust dose consult product literature. Severe Study
- Azithromycin might increase the exposure to vinca alkaloids.
 Severe Theoretical
- ► Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to vinca alkaloids. Severe Theoretical → Also see TABLE 9 p. 1492
- ► Clarithromycin is predicted to increase the exposure to vitamin D substances (paricalcitol). Moderate Study
- Clarithromycin is predicted to increase the exposure to zopiclone. Adjust dose. Moderate Theoretical
- ► Erythromycin is predicted to increase the exposure to zopiclone. Adjust dose. Moderate Study

Magnesium

SEPARATION OF ADMINISTRATION Magnesium-containing antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Magnesium-containing antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- ► Oral magnesium trisilicate decreases the absorption of oral antimalarials (chloroquine). Separate administration by at least 4 hours. [Moderate] Study
- ► Oral magnesium might decrease the concentration of the active metabolite of oral baloxavir marboxil. Avoid. Severe Theoretical
- ➤ Oral magnesium decreases the absorption of oral bisphosphonates (alendronate). Alendronate should be taken at least 30 minutes before magnesium. [Moderate] Study
- ➤ Oral magnesium decreases the absorption of oral bisphosphonates (clodronate). Avoid magnesium for 2 hours before or 1 hour after clodronate. [Moderate] Study
- Oral magnesium is predicted to decrease the absorption of oral bisphosphonates (ibandronate). Avoid for at least 6 hours before or 1 hour after ibandronate. Moderate Theoretical
- Oral magnesium decreases the absorption of oral bisphosphonates (risedronate). Separate administration by at least 2 hours. [Moderate] Study
- ► Intravenous magnesium potentially increases the risk of hypotension when given with calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil) in pregnant women. Severe Anecdotal
- ► Oral magnesium trisilicate is predicted to decrease the absorption of oral hydroxychloroquine. [Moderate] Theoretical
- ► Intravenous magnesium increases the effects of neuromuscular blocking drugs, non-depolarising. Moderate Study
- Oral magnesium trisilicate decreases the absorption of oral nitrofurantoin. Moderate Study
- ▶ Magnesium might decrease the exposure to roxadustat. Roxadustat should be taken at least 1 hour after magnesium. Moderate Theoretical
- Intravenous magnesium is predicted to increase the effects of suxamethonium. Moderate Study

MAO-B inhibitors → see TABLE 6 p. 1491 (bradycardia), TABLE 8 p. 1491 (hypotension), TABLE 13 p. 1493 (serotonin syndrome)

rasagiline · safinamide · selegiline

FOOD AND LIFESTYLE Hypertension is predicted to occur when high-dose **selegiline** is taken with tyramine-rich foods (such as mature cheese, salami, pickled herring, *Bovril®*, *Oxo®*, *Marmite®* or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- ► MAO-B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with amfetamines. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1493
- ► Safinamide is predicted to increase the risk of severe hypertension when given with amfetamines. Severe Theoretical → Also see TABLE 13 p. 1493
- Axitinib is predicted to increase the exposure to rasagiline.
 Moderatel Theoretical
- ► MAO-B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with beta₂ agonists. Avoid. Severe Theoretical
- Safinamide is predicted to increase the risk of severe hypertension when given with beta₂ agonists. Severe Theoretical
- Bupropion is predicted to increase the risk of severe hypertension when given with MAO-B inhibitors. Avoid.
 Moderate Theoretical
- Combined hormonal contraceptives slightly increases the exposure to rasagiline. Moderate Study
- ► Combined hormonal contraceptives increase the exposure to selegiline. Avoid. Severe Study
- Givosiran is predicted to increase the exposure to rasagiline.
 Use with caution and adjust dose. [Moderate] Study
- ► Hormone replacement therapy is predicted to increase the exposure to selegiline. Avoid. [Moderate] Study
- ► MAO-B inhibitors are predicted to increase the effects of
- levodopa. Adjust dose. [Mild] Study → Also see TABLE 8 p. 1491

 MAO-B inhibitors (rasagiline, selegiline) are predicted to increase the risk of adverse effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1493
- ➤ Safinamide is predicted to increase the risk of adverse effects when given with linezolid. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 1493
- ► MAO-B inhibitors (rasagiline, selegiline) are predicted to increase the risk of adverse effects when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 13 p. 1493
- Safinamide is predicted to increase the risk of adverse effects when given with MAOIs, irreversible. Avoid and for 1 week after stopping safinamide. Severe Theoretical → Also see TABLE 13 p. 1493
- Rasagiline is predicted to increase the risk of a hypertensive crisis when given with methylphenidate. Avoid. Severe Theoretical
- Selegiline might increase the risk of a hypertensive crisis when given with methylphenidate. Avoid. Severe Theoretical
- Mexiletine slightly increases the exposure to rasagiline.
 Moderate Study
- Moclobemide is predicted to increase the effects of MAO-B inhibitors (rasagiline, selegiline). Avoid. Severe Theoretical → Also see TABLE 13 p. 1493
- ► Moclobemide is predicted to increase the risk of adverse effects when given with safinamide. Avoid and for 1 week after stopping safinamide. Severe Theoretical → Also see TABLE 13 p. 1493
- Rasagiline is predicted to increase the risk of adverse effects when given with opioids (pethidine). Avoid and for 14 days after stopping rasagiline. Severe Theoretical → Also see TABLE 13 p. 1493
- Safinamide is predicted to increase the risk of adverse effects when given with opioids (pethidine). Avoid and for 1 week after stopping safinamide. Severe Theoretical → Also see TABLE 13 p. 1493
- ► Selegiline increases the risk of adverse effects when given with opioids (pethidine). Avoid, [Severe] Anecdotal → Also see TABLE 13
- Osilodrostat slightly increases the exposure to rasagiline.
 Moderatel Study

MAO-B inhibitors (continued)

- Ozanimod might increase the risk of a hypertensive crisis when given with MAO-B inhibitors and MAO-B inhibitors might decrease the exposure to the active metabolites of ozanimod. Avoid. [Severe] Theoretical → Also see TABLE 6 p. 1491
- Quinolones (ciprofloxacin) slightly increase the exposure to rasagiline. Moderate Study
- Reboxetine is predicted to increase the risk of a hypertensive crisis when given with MAO-B inhibitors (rasagiline, selegiline).
 Avoid. Severe Theoretical
- Rucaparib slightly increases the exposure to rasagiline.
 Moderate Study
- ➤ Solriamfetol is predicted to increase the risk of a hypertensive crisis when given with MAO-B inhibitors. Avoid and for 14 days after stopping MAO-B inhibitors. Severe Theoretical
- ➤ Sympathomimetics, inotropic are predicted to increase the risk of a hypertensive crisis when given with MAO-B inhibitors. Avoid. [Severe] Anecdotal
- ➤ Sympathomimetics, vasoconstrictor are predicted to increase the risk of a hypertensive crisis when given with MAO-B inhibitors. Avoid. Severe Anecdotal
- ► Tetrabenazine potentially increases the risk of CNS excitation and hypertension when given with MAO-B inhibitors. Severe

 Theoretical
- Vemurafenib slightly increases the exposure to rasagiline.
 Moderate Study

MAOIs, irreversible → see TABLE 8 p. 1491 (hypotension), TABLE 13 p. 1493 (serotonin syndrome)

isocarboxazid · phenelzine · tranylcypromine

FOOD AND LIFESTYLE Potentially life-threatening hypertensive crisis can develop in those taking MAOIs who eat tyramine-rich food (such as mature cheese, salami, pickled herring, $Bovil^0$, Oxo^0 , $Marmite^0$ or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines) or foods containing dopa (such as broad bean pods). Avoid tyramine-rich or dopa-rich food or drinks with, or for 2 to 3 weeks after stopping, the MAOI.

- ► MAOIs, irreversible are predicted to increase the effects of alpha blockers (indoramin). Avoid. Severe Theoretical → Also see TABLE 8 p. 1491
- ► Amfetamines are predicted to increase the risk of a hypertensive crisis when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Anecdotal → Also see TABLE 13 p. 1493
- Antiepileptics (carbamazepine) are predicted to increase the risk of severe toxic reaction when given with MAOIs, irreversible.
 Avoid and for 14 days after stopping the MAOI. Severe Theoretical
- Antiepileptics (phenobarbital, primidone) are predicted to increase the effects of MAOIs, irreversible. Severe Theoretical
- MAOIs, irreversible are predicted to increase the risk of antimuscarinic adverse effects when given with antihistamines, non-sedating. Avoid. [Severe] Theoretical
- MAOIs, irreversible are predicted to increase the risk of antimuscarinic adverse effects when given with antihistamines, sedating. Avoid. [Severe] Theoretical
- ► MAOIs, irreversible are predicted to increase the risk of adverse effects when given with atomoxetine. Avoid and for 2 weeks after stopping the MAOI. [Severe] Theoretical
- MAOIs, irreversible are predicted to increase the risk of cardiovascular adverse effects when given with beta₂ agonists.
 Moderate Anecdotal
- ► Bupropion is predicted to increase the risk of severe hypertension when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severel Theoretical
- ▶ Buspirone is predicted to increase the risk of elevated blood pressure when given with MAOIs, irreversible. Avoid. Severe Anecdotal
- ► MAOIs, irreversible are predicted to increase the effects of doxapram. [Moderate] Theoretical
- ► Entacapone is predicted to increase the risk of elevated blood pressure when given with MAOIs, irreversible. Avoid. Severe

 Theoretical

- ► Levodopa increases the risk of a hypertensive crisis when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Study → Also see TABLE 8 p. 1491
- MAOIs, irreversible are predicted to increase the risk of adverse effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1493
- ► MAÖ-B inhibitors (rasagiline, selegiline) are predicted to increase the risk of adverse effects when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 13 p. 1493
- ► MAO-B inhibitors (safinamide) are predicted to increase the risk of adverse effects when given with MAOIs, irreversible. Avoid and for 1 week after stopping safinamide, p. 459. Severe Theoretical → Also see TABLE 13 p. 1493
- ► MAOIs, irreversible are predicted to alter the antihypertensive effects of methyldopa. Avoid. [Severe] Theoretical → Also see

 TABLE 8 p. 1491
- Methylphenidate causes a hypertensive crisis when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- ► Mianserin is predicted to increase the risk of toxicity when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Theoretical
- ► Nefopam is predicted to increase the risk of serious elevations in blood pressure when given with MAOIs, irreversible. Avoid. |Severe| Theoretical
- ➤ Opicapone is predicted to increase the risk of elevated blood pressure when given with MAOIs, irreversible. Avoid. Severe
- ➤ Opioids are predicted to increase the risk of CNS excitation or depression when given with MAOIs, irreversible. Avoid. Severe Study → Also see TABLE 13 p. 1493
- Ozanimod might increase the risk of a hypertensive crisis when given with MAOIs, irreversible. Avoid. [Severe] Theoretical
- ► MAOIs, irreversible are predicted to increase the risk of neuroleptic malignant syndrome when given with phenothiazines. Severe Theoretical → Also see TABLE 8 p. 1491
- ► Pholcodine is predicted to increase the risk of CNS excitation or depression when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Theoretical
- ▶ Reboxetine is predicted to increase the risk of a hypertensive crisis when given with MAOIs, irreversible. Avoid. Severe Theoretical
- ➤ Solriamfetol is predicted to increase the risk of a hypertensive crisis when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Theoretical
- ➤ Sympathomimetics, inotropic are predicted to increase the risk of a hypertensive crisis when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe
- Sympathomimetics, vasoconstrictor are predicted to increase the risk of a hypertensive crisis when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI.
 Severel Study
- ► Tetrabenazine potentially increases the risk of CNS excitation and hypertension when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Theoretical
- ► Tolcapone is predicted to increase the effects of MAOIs, irreversible. Avoid. Severe Theoretical
- ➤ Tricyclic antidepressants are predicted to increase the risk of severe toxic reaction when given with MAOIs, irreversible.

 Avoid and for 14 days after stopping the MAOI. Severe

 Theoretical → Also see TABLE 8 p. 1491 → Also see TABLE 13 p. 1493
- ► MAOIs, irreversible are predicted to increase the exposure to triptans (rizatriptan, sumatriptan). Avoid and for 14 days after stopping the MAOI. Severe Theoretical → Also see TABLE 13 p. 1493
- MAOIs, irreversible are predicted to increase the exposure to triptans (zolmitriptan). Severe Theoretical → Also see TABLE 13 p. 1493
- Tryptophan increases the risk of adverse effects when given
 with MAOIs, irreversible. (Severe) Anecdotal → Also see TABLE 13
 p. 1493
 Maraviroc
- ➤ Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to maraviroc. Adjust dose. Severe Study

- ► Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to maraviroc. Adjust dose. Severe Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to maraviroc. Adjust dose. Severe Study
- ▶ Cenobamate is predicted to decrease the exposure to maraviroc. Adjust dose. Moderate Theoretical
- ► Cobicistat markedly increases the exposure to maraviroc. Refer to specialist literature. Severe Study
- ▶ Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to maraviroc. Avoid. Moderate Theoretical
- ► HIV-protease inhibitors (atazanavir) moderately to markedly increase the exposure to maraviroc. Refer to specialist literature. Severe Study
- ► HIV-protease inhibitors (darunavir) boosted with ritonavir markedly increase the exposure to maraviroc. Refer to specialist literature. Severe Study
- ► HIV-protease inhibitors (lopinavir) boosted with ritonavir moderately increase the exposure to maraviroc. Refer to specialist literature. Severe Study
- ▶ HIV-protease inhibitors (ritonavir) markedly increase the exposure to maraviroc. Refer to specialist literature. Severe
- ► Maraviroc potentially decreases the exposure to HIV-protease inhibitors (fosamprenavir) and HIV-protease inhibitors (fosamprenavir) potentially decrease the exposure to maraviroc. Avoid. Severe Study
- ▶ Idelalisib markedly increases the exposure to maraviroc. Adjust dose. Severe Theoretical
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to maraviroc. Adjust dose. Severe Study
- ▶ Mitotane is predicted to decrease the exposure to maraviroc. Adjust dose. Severe Study
- ▶ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to maraviroc. [Moderate]
- ▶ Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of maraviroc. Refer to specialist literature. Severe Theoretica
- ▶ NNRTIS (efavirenz) decrease the exposure to maraviroc. Refer to specialist literature. Severe Theoretical
- ▶ NNRTIS (etravirine) slightly decrease the exposure to maraviroc. Refer to specialist literature. Moderate Study
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to maraviroc. Adjust dose. Severe Study
- St John's wort is predicted to decrease the exposure to maraviroc. Avoid. Severe Theoretical
- Vemurafenib is predicted to increase the exposure to maraviroc. Use with caution or avoid. Moderate Theoretical Measles, mumps and rubella vaccine, live → see live vaccines

Mebendazole ► H₂ receptor antagonists (cimetidine) increase the concentration

Medroxyprogesterone

of mebendazole. [Moderate] Study

- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of intramuscular medroxyprogesterone. Moderate Theoretical
- ▶ Cobicistat is predicted to increase the concentration of intramuscular medroxyprogesterone. Moderate Theoretical
- ▶ HIV-protease inhibitors are predicted to increase the concentration of intramuscular medroxyprogesterone. Moderate Theoretical
- ▶ Idelalisib is predicted to increase the concentration of intramuscular medroxyprogesterone. Moderate Theoretical
- ▶ Macrolides (clarithromycin) are predicted to increase the concentration of intramuscular medroxyprogesterone. Moderate Theoretical
- ▶ Sugammadex is predicted to decrease the exposure to medroxyprogesterone. Use additional contraceptive precautions. Severe Theoretical

Mefenamic acid → see NSAIDs

Meglitinides → see TABLE 14 p. 1493 (antidiabetic drugs)

Mefloquine → see antimalarials

- ► Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. Moderate Study
- ► Anti-androgens (darolutamide) are predicted to increase the concentration of repaglinide. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. Moderate Study
- ► Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to repaglinide. Moderate
- ► Ciclosporin moderately increases the exposure to repaglinide. Moderate Study
- ► Clopidogrel increases the exposure to repaglinide. Avoid. Severe Study
- ► Cobicistat is predicted to increase the exposure to repaglinide. Moderate Study
- ▶ Elexacaftor is predicted to increase the exposure to repaglinide. Moderate Theoretical
- ► Fenfluramine might decrease blood glucose concentrations when given with meglitinides. Moderate Theoretical
- ► Fibrates (gemfibrozil) increase the exposure to repaglinide. Avoid. Severe Study
- ► HIV-protease inhibitors are predicted to increase the exposure to repaglinide. Moderate Study
- ▶ Idelalisib is predicted to increase the exposure to repaglinide.
- Moderate Study ▶ Iron chelators (deferasirox) moderately increase the exposure to repaglinide. Avoid. Moderate Study
- ▶ Leflunomide is predicted to increase the exposure to repaglinide. Moderate Study
- ▶ Letermovir is predicted to increase the concentration of
- repaglinide. Avoid. Moderate Theoretical ▶ Macrolides (clarithromycin) are predicted to increase the
- exposure to repaglinide. Moderate Study ▶ Mifepristone is predicted to increase the exposure to repaglinide. Moderate Theoretical
- ▶ Mitotane is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. Moderate Study
- ▶ Opicapone is predicted to increase the exposure to repaglinide. Avoid. Moderate Study
- ▶ Pitolisant is predicted to decrease the exposure to repaglinide. Mild Theoretical
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. Moderate Study
- ▶ Roxadustat is predicted to increase the exposure to repaglinide. Monitor adverse effects and adjust dose. Moderate
- ► Selpercatinib increases the exposure to repaglinide. Avoid. Moderate Study
- ► Taxanes (cabazitaxel) are predicted to affect the exposure to repaglinide. Manufacturer advises take 12 hours before or 3 hours after cabazitaxel. [Moderate] Theoretical
- ▶ Teriflunomide is predicted to increase the exposure to repaglinide. Moderate Study
- ▶ Trimethoprim slightly increases the exposure to repaglinide. Avoid or monitor blood glucose. Moderate Study
- ▶ Venetoclax is predicted to increase the exposure to repaglinide. Moderate Theoretical

Melatonin → see TABLE 11 p. 1492 (CNS depressant effects)

- ▶ Antiepileptics (phenytoin) are predicted to decrease the exposure to melatonin. Moderate Theoretical
- Axitinib is predicted to increase the exposure to melatonin. Moderate Theoretical
- ▶ Combined hormonal contraceptives is predicted to increase the exposure to melatonin. Moderate Theoretical
- ► Givosiran is predicted to increase the exposure to melatonin. Use with caution and adjust dose. Moderate Study
- ▶ HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to melatonin. [Moderate] Theoretical
- ▶ Leflunomide is predicted to decrease the exposure to melatonin. Moderate Theoretical

Melatonin (continued)

- Mexiletine is predicted to increase the exposure to melatonin.
 Moderate Theoretical
- Osilodrostat is predicted to increase the exposure to melatonin. [Moderate] Theoretical
- Quinolones (ciprofloxacin) are predicted to increase the exposure to melatonin. [Moderate] Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to melatonin. Moderate Theoretical
- Rucaparib is predicted to increase the exposure to melatonin.
 Moderate Theoretical
- ► SSRIs (fluvoxamine) very markedly increase the exposure to melatonin. Avoid. [Severe] Study
- ► Teriflunomide is predicted to decrease the exposure to melatonin. Moderate Theoretical
- Vemurafenib is predicted to increase the exposure to melatonin. [Moderate] Theoretical

Meloxicam → see NSAIDs

Melphalan → see alkylating agents

Memantine

- ► Dopamine receptor agonists (amantadine) increase the risk of CNS toxicity when given with memantine. Use with caution or avoid. Severe Theoretical
- Memantine is predicted to increase the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pramipexole, quinagolide, ropinirole, rotigotine). Moderate Theoretical
- Memantine is predicted to increase the risk of CNS adverse effects when given with ketamine. Avoid. Severe Theoretical
- ► Memantine is predicted to increase the effects of levodopa.

 Moderate Theoretical

Menacrine

 Mepacrine is predicted to increase the concentration of antimalarials (primaquine). Avoid. [Moderate] Theoretical

Mepivacaine → see anaesthetics, local

Meptazinol → see opioids

Mercaptopurine → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 15 p. 1493 (myelosuppression)

- ► Allopurinol potentially increases the risk of haematological toxicity when given with mercaptopurine. Adjust mercaptopurine dose, p. 986. [Severe] Study
- Mercaptopurine decreases the anticoagulant effect of coumarins. Moderate Anecdotal
- Febuxostat is predicted to increase the exposure to mercaptopurine. Avoid. <u>Severe</u> Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mercaptopurine (high-dose). UKHSA advises avoid (refer to Green Book). [Severe] Theoretical
- ► Trimethoprim might increase the risk of haematological toxicity when given with mercaptopurine in renal transplant patients. Severe Theoretical

Meropenem → see carbapenems

Mesalazine

ROUTE-SPECIFIC INFORMATION The manufacturers of some mesalazine gastro-resistant and modified-release medicines (*Asacol MR* tablets, *Ipocol*, *Salofalk* granules) suggest that preparations that lower stool pH (e.g. lactulose) might prevent the release of mesalazine.

Metaraminol → see sympathomimetics, vasoconstrictor **Metformin** → see TABLE 14 p. 1493 (antidiabetic drugs)

- Alcohol (excessive consumption) potentially increases the risk of lactic acidosis when given with metformin. Avoid excessive alcohol consumption. [Moderate] Theoretical
- Bictegravir slightly increases the exposure to metformin.
 Moderate Study
- Dolutegravir increases the exposure to metformin. Adjust dose.
 Moderate Study
- Fenfluramine might decrease blood glucose concentrations when given with metformin. [Moderate] Theoretical
- Guanfacine is predicted to increase the concentration of metformin. Moderate Theoretical
- ► H₂ receptor antagonists (cimetidine) increase the exposure to metformin. Monitor and adjust dose. [Moderate] Study

- ► Mexiletine is predicted to affect the exposure to metformin.

 [Unknown] Theoretical
- ► Pitolisant is predicted to increase the exposure to metformin.

 [Mild] Theoretical
- Ribociclib is predicted to increase the exposure to metformin.
 Moderate Theoretical
- Risdiplam is predicted to increase the concentration of metformin. Monitor and adjust dose. [Moderate] Theoretical
- Vandetanib increases the exposure to metformin. Monitor and adjust dose. Moderate Study

Methadone → see opioids

Methenamine

- Acetazolamide is predicted to decrease the efficacy of methenamine. Avoid. Moderate Theoretical
- Potassium citrate is predicted to decrease the efficacy of methenamine. Avoid. Moderate Theoretical
- Sodium bicarbonate is predicted to decrease the efficacy of methenamine. Avoid. Moderate Theoretical
- Sodium citrate is predicted to decrease the efficacy of methenamine. Avoid. Moderate Theoretical
- ► Thiazide diuretics (metolazone) are predicted to decrease the efficacy of methenamine. [Moderate] Theoretical

Methocarbamol → see TABLE 11 p. 1492 (CNS depressant effects)
Methotrexate → see TABLE 1 p. 1490 (hepatotoxicity), TABLE 15
p. 1493 (myelosuppression), TABLE 2 p. 1490 (nephrotoxicity),
TABLE 5 p. 1491 (thromboembolism)

- Acetazolamide increases the urinary excretion of methotrexate. Moderate Study
- ► Methotrexate is predicted to decrease the clearance of aminophylline. [Moderate] Theoretical
- ► Anti-androgens (apalutamide) are predicted to decrease the exposure to methotrexate. Mild Study
- Anti-androgens (darolutamide) are predicted to increase the concentration of methotrexate. Moderate Theoretical
- Antiepileptics (levetiracetam) decrease the clearance of methotrexate. Severe Anecdotal
- ► Antimalarials (pyrimethamine) are predicted to increase the risk of adverse effects when given with methotrexate. Severe

 Theoretical
- ► Asparaginase affects the efficacy of methotrexate. Severe Anecdotal → Also see TABLE 1 p. 1490 → Also see TABLE 15 p. 1493
- Aspirin (high-dose) is predicted to increase the risk of toxicity when given with methotrexate. Severe Study
- ▶ Baricitinib is predicted to enhance the risk of immunosuppression when given with methotrexate. Severe Study
- ► Crisantaspase affects the efficacy of methotrexate. Severe Anecdotal → Also see TABLE 1 p. 1490 → Also see TABLE 15 p. 1493
- Eltrombopag is predicted to increase the concentration of methotrexate. [Moderate] Theoretical
- ► Methotrexate potentially increases the risk of severe skin reaction when given with topical fluorouracil. Severe
- Anecdotal → Also see TABLE 15 p. 1493 → Also see TABLE 5 p. 1491 ► Leflunomide is predicted to increase the exposure to
- methotrexate. Moderate Theoretical → Also see TABLE 1 p. 1490 → Also see TABLE 15 p. 1493
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with methotrexate (high-dose). UKHSA advises avoid (refer to Green Book). [Severe] Theoretical
- Nitisinone is predicted to increase the exposure to methotrexate. Moderate Study
- Nitrous oxide potentially increases the risk of methotrexate toxicity when given with methotrexate. Avoid. Severe Study
- NSAIDs are predicted to increase the risk of toxicity when given with methotrexate. Severe Study → Also see TABLE 2 p. 1490
- ► Pegaspargase affects the efficacy of methotrexate. Severel

 Anecdotal → Also see TABLE 1 p. 1490 → Also see TABLE 15 p. 1493
- ▶ Penicillins are predicted to increase the risk of toxicity when given with methotrexate. Severe Anecdotal → Also see TABLE 1 p. 1490
- Potassium aminobenzoate increases the concentration of methotrexate. [Moderate] Theoretical
- ► Proton pump inhibitors decrease the clearance of methotrexate (high-dose). Use with caution or avoid. [Severe] Study

- ▶ Quinolones (ciprofloxacin) potentially increase the risk of toxicity when given with methotrexate. Severe Anecdotal
- ▶ Regorafenib is predicted to increase the exposure to methotrexate. Moderate Theoretical → Also see TABLE 15 p. 1493
- Retinoids (acitretin) are predicted to increase the concentration of methotrexate. Avoid. [Moderate] Anecdotal
- ▶ Methotrexate is predicted to decrease the efficacy of sapropterin. Moderate Theoretical
- ▶ Sulfonamides are predicted to increase the exposure to methotrexate. Use with caution or avoid. Severe Theoretical
- ▶ Tedizolid is predicted to increase the exposure to methotrexate. Avoid. Moderate Theoretical
- ▶ Methotrexate is predicted to increase the risk of toxicity when given with tegafur. Severe Theoretical → Also see TABLE 15 p. 1493
- ▶ Teriflunomide is predicted to increase the exposure to methotrexate. Moderate Study → Also see TABLE 1 p. 1490
- ► Methotrexate decreases the clearance of theophylline. Moderate Study
- ▶ Trimethoprim increases the risk of adverse effects when given with methotrexate. Avoid. Severe Anecdotal → Also see TABLE 2 n 1490

Methoxy polyethylene glycol-epoetin beta → see TABLE 5 p. 1491 (thromboembolism)

Methoxyflurane → see volatile halogenated anaesthetics

Methyldopa → see TABLE 8 p. 1491 (hypotension)

- ▶ Entacapone is predicted to increase the exposure to methyldopa. Moderate Theoretical
- ▶ Oral iron decreases the effects of oral methyldopa. Moderate
- ► Methyldopa increases the risk of neurotoxicity when given with lithium. Severe Anecdotal
- ► MAOIs, irreversible are predicted to alter the antihypertensive effects of methyldopa. Avoid. Severe Theoretical → Also see TABLE 8 p. 1491

Methylphenidate

- Alcohol might increase the concentration of methylphenidate. Avoid. Moderate Study
- ► Antiepileptics (carbamazepine) might decrease the concentration of methylphenidate. Moderate Anecdotal
- ► Antiepileptics (valproate) might enhance the effects of methylphenidate. Severe Anecdotal
- ▶ Methylphenidate might increase the risk of dyskinesias when given with antipsychotics, second generation (paliperidone). Severe Theoretical
- ▶ Methylphenidate increases the risk of dyskinesias when given with antipsychotics, second generation (risperidone). Severe
- ▶ Methylphenidate is predicted to decrease the effects of apraclonidine. Avoid. Severe Theoretical
- ▶ Methylphenidate has been reported to cause psychotic symptoms when given with disulfiram. Severe Anecdotal
- ▶ Methylphenidate might increase the risk of elevated blood pressure when given with linezolid. Avoid. Severe Theoretical
- ► MAO-B inhibitors (rasagiline) are predicted to increase the risk of a hypertensive crisis when given with methylphenidate. Avoid. Severe Theoretical
- ▶ MAO-B inhibitors (selegiline) might increase the risk of a hypertensive crisis when given with methylphenidate. Avoid. Severe Theoretical
- ▶ Methylphenidate causes a hypertensive crisis when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Theoretical
- ▶ Methylphenidate is predicted to cause a hypertensive crisis when given with methylthioninium chloride. Severe Theoretical
- Methylphenidate is predicted to cause a hypertensive crisis when given with moclobemide. Severe Theoretical
- Nirmatrelvir boosted with ritonavir is predicted to increase the concentration of methylphenidate. Severe Theoretical
- ▶ Methylphenidate is predicted to increase the risk of a hypertensive crisis when given with ozanimod. Severe Theoretical
- ▶ Methylphenidate might increase the concentration of tricyclic antidepressants. Use with caution and adjust dose. Moderate

▶ Methylphenidate might increase the risk of hypertension and arrhythmias when given with volatile halogenated anaesthetics. Avoid methylphenidate on day of surgery, p. 379. Severe Theoretical

Methylprednisolone → see corticosteroids

Methylthioninium chloride → see TABLE 13 p. 1493 (serotonin syndrome)

- ▶ Methylthioninium chloride is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. Severe Theoretical
- ▶ Methylphenidate is predicted to cause a hypertensive crisis when given with methylthioninium chloride. Severe Theoretical

Metoclopramide

- ▶ Metoclopramide is predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (prilocaine). Avoid. Severe Theoretical
- ▶ Metoclopramide potentially decreases the absorption of antifungals, azoles (posaconazole) oral suspension. Moderate Study
- ▶ Metoclopramide decreases the concentration of antimalarials (atovaquone). Avoid. Moderate Study
- ▶ Metoclopramide is predicted to decrease the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pramipexole, quinagolide, ropinirole, rotigotine). Avoid. Moderate Study
- ▶ Metoclopramide decreases the effects of levodopa. Avoid. Moderate Study
- ▶ Metoclopramide is predicted to increase the effects of neuromuscular blocking drugs, non-depolarising. Moderate Theoretical
- Metoclopramide increases the effects of suxamethonium. Moderate Study

Metolazone → see thiazide diuretics

should be borne in mind.

Metoprolol → see beta blockers, selective Metreleptin

- ► Metreleptin might alter the exposure to aminophylline. Severe Theoretical
- ▶ Metreleptin might alter the exposure to ciclosporin. Monitor concentration and adjust dose. Severe Theoretical
- ► Metreleptin might decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. Severe Theoretical
- ▶ Metreleptin might alter the exposure to coumarins (warfarin). Monitor INR and adjust dose. Severe Theoretical
- ▶ Metreleptin is predicted to increase the risk of hypoglycaemia when given with insulin. Monitor blood glucose and adjust dose. Severe Theoretical
- ▶ Metreleptin is predicted to increase the risk of hypoglycaemia when given with sulfonylureas. Monitor blood glucose and adjust dose. Severe Theoretical
- ▶ Metreleptin might alter the exposure to theophylline. Monitor concentration and adjust dose. Severe Theoretical

Metronidazole → see TABLE 12 p. 1493 (peripheral neuropathy) ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions

- ▶ Alcohol potentially causes a disulfiram-like reaction when given with metronidazole. Avoid for at least 48 hours after stopping treatment. Moderate Study
- ▶ Metronidazole increases the risk of toxicity when given with alkylating agents (busulfan). Severe Study
- ► Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to metronidazole. [Moderate] Study
- ▶ Metronidazole is predicted to increase the risk of capecitabine toxicity when given with capecitabine. [Severe] Theoretical
- ▶ Metronidazole increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. Severe Study
- ▶ Disulfiram increases the risk of acute psychoses when given with metronidazole. Severe Study → Also see TABLE 12 p. 1493
- ▶ Metronidazole increases the risk of toxicity when given with fluorouracil. Severe Study
- ▶ Metronidazole is predicted to increase the concentration of lithium. Avoid or adjust dose. Severe Anecdotal

Metyrapone

- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of metyrapone. Avoid. [Moderate] Study
- Antihistamines, sedating (cyproheptadine) decrease the effects of metyrapone. Avoid. Moderate Study
- Carbimazole decreases the effects of metyrapone. Avoid.
 Moderate Theoretical
- ► Combined hormonal contraceptives decrease the effects of metyrapone. Avoid. [Moderate] Theoretical
- Phenothiazines (chlorpromazine) decrease the effects of metyrapone. Avoid. [Moderate] Theoretical
- ► Propylthiouracil is predicted to decrease the effects of metyrapone. Avoid. Moderate Theoretical
- Tricyclic antidepressants (amitriptyline) decrease the effects of metyrapone. Avoid. [Moderate] Theoretical

Mexiletine

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment.

- ► Mexiletine is predicted to increase the exposure to agomelatine. Moderate Study
- Mexiletine is predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Mexiletine is predicted to increase the exposure to anaesthetics, local (ropivacaine). [Moderate] Theoretical
- Mexiletine is predicted to increase the exposure to anagrelide.
 Moderate Theoretical
- Mexiletine is predicted to increase the risk of torsade de pointes when given with antiarrhythmics. Avoid. Severe Theoretical
- ➤ Antiepileptics (phenytoin) are predicted to increase the clearance of mexiletine. Monitor and adjust dose. [Moderate]
 Study
- Mexiletine increases the concentration of antipsychotics, second generation (clozapine). Monitor adverse effects and adjust dose. [Severe] Study
- Mexiletine is predicted to increase the exposure to antipsychotics, second generation (olanzapine). Adjust dose.
 Moderate Anecdotal
- Mexiletine potentially increases the risk of cardiovascular adverse effects when given with beta blockers, non-selective.
 Avoid or monitor. Severe Theoretical
- Mexiletine potentially increases the risk of cardiovascular adverse effects when given with beta blockers, selective. Avoid or monitor. [Severe] Theoretical
- Bupropion is predicted to increase the exposure to mexiletine.
 [Moderate] Study
- Mexiletine increases the risk of cardiovascular adverse effects when given with calcium channel blockers (diltiazem). Avoid or monitor. Severe Theoretical
- Mexiletine potentially increases the risk of cardiovascular adverse effects when given with calcium channel blockers (verapamil). Avoid or monitor. Severe Theoretical
- ► Cinacalcet is predicted to increase the exposure to mexiletine. Moderate Study
- ► Cobicistat potentially increases the exposure to mexiletine.

 Severe Theoretical
- Mexiletine potentially affects the exposure to coumarins (warfarin). Avoid. [Unknown] Theoretical
- Mexiletine is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. Moderate Study
- Mexiletine are predicted to increases the exposure to erlotinib.
 Monitor adverse effects and adjust dose. Moderate Study
- ► HIV-protease inhibitors (ritonavir) are predicted to increase the clearance of mexiletine. Monitor and adjust dose. Moderate

 Study
- ► Leflunomide is predicted to increase the clearance of mexiletine. Monitor and adjust dose. [Moderate] Study
- Mexiletine potentially affects the exposure to lithium. Avoid.
 Unknown Theoretical
- Mexiletine is predicted to increase the exposure to loxapine.
 Avoid. Unknown Theoretical
- Mexiletine slightly increases the exposure to MAO-B inhibitors (rasagiline). [Moderate] Study

- Mexiletine is predicted to increase the exposure to melatonin.
 Moderate Theoretical
- ► Mexiletine is predicted to affect the exposure to metformin. Unknown Theoretical
- Opioids potentially decrease the absorption of oral mexiletine.
 Moderate Study
- Mexiletine is predicted to increase the exposure to phenothiazines (chlorpromazine). Moderate Theoretical
- Mexiletine is predicted to increase the exposure to phosphodiesterase type-4 inhibitors (roflumilast). Moderate
- ► Mexiletine is predicted to increase the exposure to pirfenidone.

 Use with caution and adjust dose. [Moderate] Study
- ► Rifamycins (rifampicin) are predicted to increase the clearance of mexiletine. Monitor and adjust dose. Moderate Study
- ► Mexiletine is predicted to increase the exposure to riluzole.

 [Moderate] Theoretical
- Mexiletine is predicted to increase the exposure to SNRIs (duloxetine). [Moderate] Theoretical
- ➤ SSRIs (fluoxetine, fluoxamine, paroxetine) are predicted to increase the exposure to mexiletine. [Moderate] Study
- ► Terbinafine is predicted to increase the exposure to mexiletine. Moderate Study
- Teriflunomide is predicted to increase the clearance of mexiletine. Monitor and adjust dose. [Moderate] Study
- Mexiletine is predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- ► Mexiletine increases the exposure to tizanidine. Avoid. Moderate Study
- Mexiletine is predicted to increase the exposure to triptans (zolmitriptan). Adjust zolmitriptan dose, p. 515. [Moderate]
 Theoretical
- Mianserin → see TABLE 11 p. 1492 (CNS depressant effects)
- Antiepileptics (carbamazepine) markedly decrease the exposure to mianserin. Adjust dose. [Moderate] Study
- ► Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to mianserin. [Moderate] Study → Also see TABLE 11 p. 1492
- ► Mianserin is predicted to increase the risk of toxicity when given with MAOIs, irreversible. Avoid and for 14 days after stopping the MAOI. Severe Theoretical
- Mianserin is predicted to increase the risk of toxicity when given with moclobemide. Avoid and for 1 week after stopping mianserin. [Severe] Theoretical
- Mianserin is predicted to decrease the efficacy of pitolisant.
 Moderate Theoretical
- Mianserin decreases the effects of sympathomimetics, vasoconstrictor (ephedrine). Severe Anecdotal

Micafungin → see TABLE 1 p. 1490 (hepatotoxicity)

► Micafungin slightly increases the exposure to amphotericin B. Avoid or monitor toxicity. Moderate Study

Miconazole → see antifungals, azoles

Midazolam → see benzodiazepines

Midodrine → see sympathomimetics, vasoconstrictor

Midostaurir

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to midostaurin. Avoid. Severe Study
- ► Antiarrhythmics (dronedarone) are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
- ➤ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to midostaurin. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to midostaurin. Avoid or monitor for toxicity. Severe Study
- Midostaurin moderately decreases the exposure to the active metabolite of bupropion. Moderate Study
- ► Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- ► Midostaurin might increase the concentration of ciclosporin.

 Severe Anecdotal

- Cobicistat is predicted to increase the exposure to midostaurin.
 Avoid or monitor for toxicity. (Severe) Study
- ► Crizotinib is predicted to increase the exposure to midostaurin.

 [Moderate] Theoretical
- Dabrafenib is predicted to decrease the exposure to midostaurin. Severe Study
- Elvitegravir boosted with ritonavir is predicted to increase the exposure to midostaurin. Severe Theoretical
- Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to midostaurin and midostaurin is predicted to increase the exposure to endothelin receptor antagonists (bosentan). [Severe] Study
- ► Grapefruit juice is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to midostaurin. Avoid or monitor for toxicity. Severe Study
- ► Idelalisib is predicted to increase the exposure to midostaurin. Avoid or monitor for toxicity. Severe Study
- ► Imatinib is predicted to increase the exposure to midostaurin. Moderate Theoretical
- Letermovir is predicted to increase the exposure to midostaurin. Moderate Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to midostaurin. Avoid or monitor for toxicity. Severe Study
- ► Macrolides (erythromycin) are predicted to increase the exposure to midostaurin. Moderate Theoretical
- Mitotane is predicted to decrease the exposure to midostaurin.
 Avoid. Severe Study
- Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- Nilotinib is predicted to increase the exposure to midostaurin.
 Moderate Theoretical
- ► NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to midostaurin. [Severe] Study
- ► Rifamycins (rifampicin) are predicted to decrease the exposure to midostaurin. Avoid. Severe Study
- St John's wort is predicted to decrease the exposure to midostaurin. Avoid. <u>Severe</u> Theoretical

Mifamurtide → see TABLE 15 p. 1493 (myelosuppression)

- Ciclosporin is predicted to decrease the efficacy of mifamurtide. Avoid. Severe Theoretical
- Corticosteroids are predicted to decrease the efficacy of mifamurtide. Avoid. Severe Theoretical
- NSAIDs (high-dose) are predicted to decrease the efficacy of mifamurtide. Avoid. Severe | Theoretical
- ► Pimecrolimus is predicted to decrease the efficacy of mifamurtide. Avoid. Severe Theoretical
- ➤ Sirolimus is predicted to decrease the efficacy of mifamurtide. Avoid. Severe Theoretical
- ► Tacrolimus is predicted to affect the efficacy of mifamurtide. Avoid. Severe Theoretical

Mifepristone

- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to mifepristone. Severe Theoretical
 Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
- phenytoin, primidone) are predicted to decrease the exposure to mifepristone. [Severe] Theoretical

 ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mifepristone. [Moderate]
 Study
- Antifungals, azoles (posaconazole) are predicted to increase the exposure to mifepristone. Moderate Theoretical
- Mifepristone is predicted to increase the exposure to avatrombopag. Moderate Theoretical
- Cobicistat is predicted to increase the exposure to mifepristone. [Moderate] Study
- ► Mifepristone is predicted to decrease the efficacy of corticosteroids. Use with caution and adjust dose. Moderate Theoretical
- Mifepristone is predicted to increase the exposure to coumarins (warfarin). [Moderate] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to mifepristone. [Severe] Theoretical

- ► Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to mifepristone. [Severe] Theoretical
- Mifepristone is predicted to increase the exposure to ergotamine. [Severe] Theoretical
- ► Mifepristone is predicted to increase the exposure to everolimus. Severe Theoretical
- ► Grapefruit juice is predicted to increase the exposure to mifepristone. [Moderate] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to mifepristone. Moderate Study
- ► Idelalisib is predicted to increase the exposure to mifepristone. Moderate Study
- ► Mifepristone is predicted to increase the exposure to loperamide. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to mifepristone. Moderate Study
- Mifepristone is predicted to increase the exposure to meglitinides (repaglinide). Moderate Theoretical
- Mitotane is predicted to decrease the exposure to mifepristone.
 Severe Theoretical
- Mifepristone is predicted to increase the exposure to montelukast. [Moderate] Theoretical
- NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to mifepristone. Severe Theoretical
- Mifepristone is predicted to increase the exposure to opioids (alfentanil). (Severe) Theoretical
- Mifepristone is predicted to increase the exposure to pioglitazone. Moderate Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to mifepristone. Severe Theoretical
- Mifepristone is predicted to increase the exposure to siponimod. Moderate Theoretical
- Mifepristone is predicted to increase the exposure to sirolimus.
 Severe Theoretical
- St John's wort is predicted to decrease the exposure to mifepristone. Severe Theoretical
- Mifepristone moderately increases the exposure to statins (fluvastatin). [Moderate] Study
- Mifepristone very markedly increases the exposure to statins (simvastatin). [Severe] Study
- Mifepristone is predicted to increase the exposure to sulfonylureas (glimepiride, tolbutamide). [Moderate] Theoretical
- Mifepristone is predicted to increase the exposure to oral temsirolimus. [Severe] Theoretical

Minocycline → see tetracyclines

Minoxidil → see TABLE 8 p. 1491 (hypotension)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Mirabegron

- Mirabegron is predicted to increase the exposure to aliskiren.
 Mild Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 843.
 Moderatel Study
- Mirabegron is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). [Mild] Theoretical
- Mirabegron is predicted to increase the exposure to beta blockers, selective (metoprolol). [Moderate] Study
- ➤ Cobicistat is predicted to increase the exposure to mirabegron.

 Adjust mirabegron dose in hepatic and renal impairment,
 p. 843. [Moderate] Study
- ► Mirabegron is predicted to increase the exposure to colchicine.

 [Mild] Theoretical
- Mirabegron slightly increases the exposure to digoxin. Monitor concentration and adjust dose. (Severe) Study
- Mirabegron is predicted to increase the exposure to eliglustat.
 Avoid or adjust dose—consult product literature. Severe Study
- Mirabegron is predicted to increase the exposure to everolimus. Mild Theoretical
- Mirabegron is predicted to increase the exposure to factor XA inhibitors (edoxaban). [Mild] Theoretical

Mirabegron (continued)

- HIV-protease inhibitors are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 843. [Moderate] Study
- ► Idelalisib is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 843. [Moderate] Study
- ► Mirabegron is predicted to increase the exposure to loperamide. Mild Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 843. [Moderate] Study
- Mirabegron is predicted to increase the exposure to sirolimus.
 Mild Theoretical
- Mirabegron is predicted to increase the exposure to taxanes (paclitaxel). [Mild] Theoretical
- Mirabegron is predicted to increase the exposure to thrombin inhibitors (dabigatran). [Severe] Theoretical
- ► Mirabegron is predicted to increase the exposure to topotecan.

 Mild Theoretical
- Mirtazapine → see TABLE 13 p. 1493 (serotonin syndrome), TABLE 11 p. 1492 (CNS depressant effects)
- Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mirtazapine. Adjust dose. Moderate Study → Also see TABLE 11 p. 1492
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirtazapine. Moderate Study
- Cobicistat is predicted to increase the exposure to mirtazapine.
 [Moderate] Study
- ► H₂ receptor antagonists (cimetidine) slightly increase the exposure to mirtazapine. Use with caution and adjust dose. Moderate Theoretical
- ► HIV-protease inhibitors are predicted to increase the exposure to mirtazapine. Moderate Study
- ► Idelalisib is predicted to increase the exposure to mirtazapine. Moderate Study
- Macrolides (clarithromycin) are predicted to increase the exposure to mirtazapine. [Moderate] Study
- ► Mitotane is predicted to decrease the exposure to mirtazapine. Adjust dose. Moderate Study
- Mirtazapine is predicted to decrease the efficacy of pitolisant.
 Moderate | Theoretical
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to mirtazapine. Adjust dose. Moderate Study

Misoprostol

 Misoprostol can cause uterine contractions, as can oxytocin; concurrent use might increase the risk of developing this effect. Avoid and for 4 hours after stopping misoprostol.
 Severe Theoretical

Mitomycin → see TABLE 15 p. 1493 (myelosuppression), TABLE 5 p. 1491 (thromboembolism)

 Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mitomycin. UKHSA advises avoid (refer to Green Book). Severe Theoretical

Mitotane → see TABLE 15 p. 1493 (myelosuppression)

- Mitotane is predicted to decrease the exposure to 5-HT3-receptor antagonists (ondansetron). [Moderate] Study
- ► Mitotane is predicted to markedly decrease the exposure to abemaciclib. Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to acalabrutinib. Avoid. Severe Study
- Aldosterone antagonists (spironolactone) are predicted to decrease the effects of mitotane. Avoid. [Severe] Anecdotal
- Mitotane is predicted to decrease the exposure to aldosterone antagonists (eplerenone). Avoid. Moderate Theoretical
- ► Mitotane is predicted to decrease the exposure to antiandrogens (abiraterone). Avoid. [Severe] Study
- Mitotane is predicted to decrease the exposure to antiandrogens (darolutamide). Avoid. [Moderate] Study

- ► Mitotane is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. Severe
- Mitotane is predicted to decrease the efficacy of antiarrhythmics (propafenone). [Moderate] Study
- ► Mitotane is predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil). Mild Study
- ► Mitotane is predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. [Moderate] Study
- Mitotane is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to antimalarials (artemether) with lumefantrine. Avoid. Severe Study
- Mitotane is predicted to decrease the concentration of antimalarials (piperaquine). Avoid. [Moderate] Theoretical
- Mitotane is predicted to moderately decrease the exposure to antipsychotics, second generation (aripiprazole). Adjust aripiprazole dose, p. 427. [Moderate] Study
- Mitotane is predicted to decrease the exposure to antipsychotics, second generation (cariprazine). Avoid. Severe Theoretical
- ► Mitotane is predicted to decrease the exposure to antipsychotics, second generation (lurasidone). Avoid. [Moderate] Study
- Mitotane is predicted to decrease the exposure to antipsychotics, second generation (paliperidone). Monitor and adjust dose. Severe Study
- ► Mitotane is predicted to decrease the exposure to
- antipsychotics, second generation (quetiapine). Moderate Study ► Mitotane is predicted to decrease the exposure to
- antipsychotics, second generation (risperidone). Adjust dose. [Moderate] Study
- ► Mitotane is predicted to decrease the exposure to avapritinib. Avoid. (Severe) Study
- ► Mitotane is predicted to decrease the exposure to axitinib. Avoid or adjust dose. Moderate Study → Also see TABLE 15 p. 1493
- Mitotane decreases the exposure to bedaquiline. Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to benzodiazepines (alprazolam). Adjust dose. [Moderate] Theoretical
- Mitotane is predicted to decrease the exposure to benzodiazepines (midazolam). Monitor and adjust dose.
 Moderate Study
- Mitotane is predicted to decrease the exposure to bictegravir.
 Avoid. Moderate Study
- ► Mitotane slightly decreases the exposure to bortezomib. Avoid. Severe Study → Also see TABLE 15 p. 1493
- ► Mitotane is predicted to very markedly decrease the exposure to bosutinib. Avoid. Severe Study → Also see TABLE 15 p. 1493
- ► Mitotane is predicted to decrease the exposure to brigatinib. Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. Severe Study
- ► Mitotane moderately decreases the exposure to cabozantinib. Avoid. Moderate Study → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- ► Mitotane is predicted to decrease the exposure to calcium channel blockers (diltiazem). Severe Study
- Mitotane is predicted to decrease the exposure to cannabidiol.
 Adjust dose. Moderate Study
- Mitotane is predicted to decrease the exposure to ceritinib. Avoid. |Severe| Study → Also see TABLE 15 p. 1493
- ► Mitotane decreases the concentration of ciclosporin. Severe
- ► Mitotane is predicted to alter the effects of cilostazol. Moderate

 Theoretical
- Mitotane is predicted to decrease the exposure to cinacalcet.
 Monitor and adjust dose. [Moderate] Study
- Mitotane decreases the exposure to clomethiazole. Monitor and adjust dose. Moderate Study
- ► Mitotane is predicted to decrease the exposure to cobicistat. Avoid. Severe Study

- Mitotane is predicted to decrease the exposure to cobimetinib.
 Avoid. Severe Theoretical
- Mitotane is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose.
 Moderatel Study
- Mitotane is predicted to decrease the exposure to corticosteroids (fluticasone). (Unknown) Theoretical
- Mitotane is predicted to markedly decrease the exposure to crizotinib. Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to dabrafenib.
 Avoid. Moderate Theoretical
- Mitotane is predicted to decrease the exposure to darifenacin.
 Moderate | Theoretical
- Mitotane is predicted to markedly decrease the exposure to dasatinib. Avoid. Severe Study → Also see TABLE 15 p. 1493
- Mitotane is predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- Mitotane is predicted to markedly decrease the exposure to dienogest. [Severe] Study
- Mitotane is predicted to decrease the exposure to dipeptidylpeptidase-4 inhibitors (linagliptin). [Moderate] Study
- Mitotane is predicted to moderately decrease the exposure to dipeptidylpeptidase-4 inhibitors (saxagliptin). [Moderate] Study
- Mitotane is predicted to decrease the exposure to dolutegravir.
 Severe Study
- ► Mitotane is predicted to decrease the exposure to dronabinol.

 Avoid or adjust dose. [Mild] Study
- Mitotane is predicted to decrease the exposure to elbasvir.
 Avoid. [Severe] Study
- ► Mitotane is predicted to decreases the exposure to elexacaftor. Avoid. Severe Theoretical
- ► Mitotane is predicted to decrease the exposure to eliglustat. Avoid. Severe Study
- ► Mitotane is predicted to decrease the concentration of elvitegravir. Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to encorafenib.
 Severe Theoretical
- ► Mitotane affects the exposure to endothelin receptor antagonists (bosentan). Avoid. [Severe] Study
- Mitotane is predicted to decrease the exposure to endothelin receptor antagonists (macitentan). Avoid. [Severe] Study
- ► Mitotane is predicted to decrease the exposure to entrectinib. Avoid. Severe Study
- ► Mitotane is predicted to decrease the effects of ergotamine.

 [Moderate] Theoretical
- ► Mitotane is predicted to decrease the exposure to erlotinib.
- Avoid or adjust erlotinib dose, p. 1057. [Severe] Study Mitotane is predicted to decrease the exposure to esketamine.
- Adjust dose. Moderate Theoretical

 ➤ Mitotane is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- Mitotane moderately decreases the exposure to exemestane.
 Moderatel Study
- Mitotane is predicted to decrease the exposure to factor XA inhibitors (apixaban). [Moderate] Study
- ► Mitotane is predicted to decrease the exposure to factor XA inhibitors (rivaroxaban). Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- Mitotane is predicted to decrease the exposure to fedratinib.
 Avoid. Moderate Study
- Mitotane is predicted to decrease the exposure to fesoterodine.
 Avoid. Moderate Study
- AVOID. [Moderate] Study
 ► Mitotane is predicted to decrease the exposure to fostamatinib.
- Avoid. Severe Study

 Mitotane is predicted to decrease the exposure to the active metabolite of fostemsavir. Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to gefitinib.

 Avoid. | Severe | Study
- ► Mitotane is predicted to decrease the exposure to glasdegib. Avoid. Severe Study
- Mitotane is predicted to greatly decrease the concentration of glecaprevir. Avoid. Severe Study

- Mitotane is predicted to decrease the exposure to grazoprevir.
 Avoid. Severe Study
- Mitotane is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 384. [Moderate] Study
- Mitotane decreases the concentration of haloperidol. Adjust dose. Moderate Study
- ► Mitotane is predicted to decrease the exposure to ibrutinib. Avoid or monitor. Severe Study → Also see TABLE 15 p. 1493
- ► Mitotane is predicted to decrease the exposure to idelalisib.

 Avoid. [Severe] Study
- ► Mitotane is predicted to decrease the exposure to imatinib.

 Avoid. Moderate Study → Also see TABLE 15 p. 1493
- ► Mitotane is predicted to decrease the exposure to irinotecan.

 Avoid. Severe Study → Also see TABLE 15 p. 1493
- ► Mitotane is predicted to decrease the exposure to ivabradine.

 Adjust dose. [Moderate] Theoretical
- ► Mitotane is predicted to decrease the exposure to ivacaftor. Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to ixazomib. Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to lapatinib.
 Avoid. [Severe] Study
- ► Mitotane is predicted to moderately decrease the exposure to larotrectinib. Avoid. Moderate Study
- ► Mitotane is predicted to decrease the exposure to lomitapide.
- Monitor and adjust dose. Moderate Theoretical

 ➤ Mitotane is predicted to decrease the exposure to lorlatinib.

 Avoid. [Severe | Study
- Mitotane is predicted to decrease the exposure to maraviroc.
 Adjust dose. | Severe | Study
- Mitotane is predicted to decrease the exposure to meglitinides (repaglinide). Monitor blood glucose and adjust dose. Moderate Study
- ► Mitotane is predicted to decrease the exposure to midostaurin. Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to mifepristone.

 Severe | Theoretical
- Mitotane is predicted to decrease the exposure to mirtazapine.
 Adjust dose. Moderate Study
- Mitotane is predicted to decrease the exposure to monoclonal antibodies (polatuzumab vedotin). [Moderate] Theoretical
- Mitotane is predicted to decrease the exposure to montelukast.
 Mild Study
- Mitotane is predicted to markedly decrease the exposure to naldemedine. Avoid. Severe Study
- Mitotane is predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study
- Mitotane is predicted to decrease the exposure to neratinib.
 Avoid. [Severe] Study
- Mitotane is predicted to markedly decrease the exposure to neurokinin-1 receptor antagonists (aprepitant). Avoid. [Voderate]
- Mitotane is predicted to decrease the exposure to neurokinin-1 receptor antagonists (fosaprepitant). Avoid. [Moderate] Theoretical
- ► Mitotane is predicted to decrease the exposure to neurokinin-1 receptor antagonists (netupitant). Avoid. [Severe] Study
- Mitotane is predicted to moderately decrease the exposure to nilotinib. Avoid. Severe Study → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to nirmatrelvir boosted with ritonavir. Avoid. [Severe] Study
- Mitotane is predicted to decrease the exposure to nitisinone.
 Adjust dose. Moderate Theoretical
- Mitotane is predicted to decrease the exposure to NNRTIS (doravirine). Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to NNRTIS (etravirine). Avoid. Severel Theoretical
- Mitotane is predicted to decrease the exposure to NNRTIS (nevirapine). Severe Theoretical
- Mitotane markedly decreases the exposure to NNRTIS (rilpivirine). Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to olaparib.

 Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study

Mitotane (continued)

- Mitotane is predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. Moderate Theoretical
- ► Mitotane decreases the exposure to opioids (methadone).

 Monitor and adjust dose. [Severe] Study
- Mitotane is predicted to decrease the exposure to opioids (oxycodone). Monitor and adjust dose. Moderate Study
- Mitotane is predicted to decrease the exposure to osilodrostat.
 Moderate Theoretical
- Mitotane is predicted to moderately decrease the exposure to osimertinib. Avoid. Moderate Study
- ► Mitotane is predicted to moderately decrease the exposure to ospemifene. Moderate Study
- Mitotane is predicted to decrease the exposure to palbociclib. Avoid. Severe Study → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to panobinostat. Avoid. Moderate Theoretical → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to pazopanib.
 Avoid. Severe Theoretical
- Mitotane is predicted to decrease the exposure to pemigatinib.
 Avoid. Severe Study
- Mitotane moderately decreases the exposure to phosphodiesterase type-4 inhibitors (apremilast). Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to phosphodiesterase type-4 inhibitors (roflumilast). Avoid.
 Moderate Study
- Mitotane is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil). Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil).
 Moderate Theoretical
- Mitotane is predicted to moderately to markedly decrease the exposure to pibrentasvir. Avoid. Severe Study
- Mitotane is predicted to moderately decrease the exposure to pitolisant. [Moderate] Study
- Mitotane is predicted to decrease the exposure to ponatinib.
 Avoid. Moderate Theoretical
- Mitotane might decrease the exposure to ponesimod. Moderate
 Theoretical
- Mitotane is predicted to markedly decrease the exposure to praziquantel. Avoid. [Moderate] Study
- Mitotane is predicted to decrease the exposure to ranolazine.
 Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to reboxetine.

 [Moderate] Anecdotal
- Mitotane is predicted to decrease the exposure to regorafenib. Avoid. Moderate Study → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to relugolix.
 Avoid. Moderate Study
- Mitotane might decrease the exposure to remdesivir. Avoid.
 [Moderate] Theoretical
- Mitotane is predicted to markedly decrease the exposure to ribociclib. Avoid. Severe Study → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. Moderate Study → Also see TABLE 15 n. 1403
- Mitotane is predicted to decrease the exposure to selpercatinib. Avoid. [Moderate] Study
- Mitotane is predicted to decrease the exposure to selumetinib.
 Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to siponimod. Severe Study
- Mitotane is predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study
- Mitotane is predicted to decrease the exposure to solifenacin.
 Moderate Theoretical
- Mitotane is predicted to decrease the exposure to sorafenib.

 Moderate Theoretical → Also see TABLE 15 p. 1493

 Mitotane is predicted to decrease the exposure to soforacib
- Mitotane is predicted to decrease the exposure to sotorasib.
 Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to statins (atorvastatin, simvastatin). Moderate Study

- ► Mitotane is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 1080. Moderate Study → Also see TABLE 15 p. 1493
- Mitotane decreases the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- ► Mitotane is predicted to decrease the exposure to taxanes (cabazitaxel). Avoid. Moderate Study → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to taxanes (docetaxel). (Severe) Theoretical → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to taxanes (paclitaxel). Avoid. Severe Study → Also see TABLE 15 p. 1493
- ▶ Mitotane is predicted to decrease the concentration of
- temsirolimus. Avoid. Severe Study → Also see TABLE 15 p. 1493

 Mitotane might decrease the exposure to tepotinib. Avoid.
 Severe Theoretical
- ► Mitotane is predicted to decrease the exposure to tezacaftor.

 Avoid. Severe Theoretical
- ► Mitotane is predicted to markedly decrease the exposure to ticagrelor. Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to tivozanib.
 Severe Study
- Mitotane is predicted to decrease the exposure to tofacitinib.
 Avoid. Severe Study
- ► Mitotane is predicted to decrease the exposure to tolvaptan.

 Use with caution or avoid depending on indication. Severe
- Mitotane is predicted to decrease the exposure to toremifene.
 Adjust dose. [Moderate] Study
- Mitotane is predicted to decrease the exposure to trabectedin. Avoid. Severel Theoretical → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to tucatinib.
 Avoid. [Severe] Study
- ► Mitotane is predicted to decrease the efficacy of ulipristal.

 Avoid and for 4 weeks after stopping ulipristal. Severe

 Theoretical
- Mitotane is predicted to decrease the exposure to upadacitinib.
 Moderate Study
- Mitotane is predicted to decrease the exposure to vandetanib.
 Avoid. Moderate Study
- Mitotane is predicted to moderately decrease the exposure to velpatasvir. Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to vemurafenib.
 Avoid. [Severe] Study
- ► Mitotane is predicted to decrease the exposure to venetoclax.

 Avoid. | Severe | Study |
- Mitotane is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). Severe Theoretical → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. Severe Theoretical → Also see TABLE 15 p. 1493
- ► Mitotane is predicted to decrease the exposure to vinca alkaloids (vinorelbine). Use with caution or avoid. Severe Theoretical → Also see TABLE 15 p. 1493
- Mitotane is predicted to decrease the exposure to vismodegib.
 Avoid. Moderate Theoretical
- Mitotane is predicted to decrease the exposure to vortioxetine.
 Monitor and adjust dose. Moderate Study
- Mitotane is predicted to decrease the concentration of voxilaprevir. Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to zopiclone.
 Adjust dose. Moderate Study

Mitoxantrone → see anthracyclines

Mivacurium → see neuromuscular blocking drugs, non-depolarising Mizolastine → see antihistamines, non-sedating

Moclobemide → see TABLE 13 p. 1493 (serotonin syndrome)

FOOD AND LIFESTYLE Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- ► Amfetamines are predicted to increase the risk of a hypertensive crisis when given with moclobemide. Avoid. Severe Theoretical → Also see TABLE 13 p. 1493
- Anti-androgens (apalutamide) are predicted to decrease the exposure to moclobemide. Avoid or monitor. [Mild] Study
- Moclobemide potentially increases the exposure to benzodiazepines (clobazam). Adjust dose. [Moderate] Theoretical
- ▶ Bupropion is predicted to increase the risk of severe hypertension when given with moclobemide. Avoid. Severe Theoretical
- Moclobemide is predicted to increase the exposure to cannabidiol. [Moderate] Theoretical
- Moclobemide is predicted to increase the exposure to cilostazol. [Moderate] Theoretical
- Moclobemide is predicted to decrease the efficacy of clopidogrel. Avoid. Moderate Study
- ► Moclobemide is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature.

 [Severe] Theoretical
- H₂ receptor antagonists (cimetidine) increase the exposure to moclobemide. Adjust moclobemide dose, p. 394. [Mild] Study
- Levodopa increases the risk of adverse effects when given with moclobemide. [Moderate] Study
- Moclobemide is predicted to increase the risk of adverse effects when given with linezolid. Avoid and for 14 days after stopping moclobemide. Severe Theoretical → Also see TABLE 13 p. 1493
- Moclobemide is predicted to increase the effects of MAO-B inhibitors (rasagiline, selegiline). Avoid. Severe Theoretical → Also see TABLE 13 p. 1493
- Moclobemide is predicted to increase the risk of adverse effects when given with MAO-B inhibitors (safinamide). Avoid and for 1 week after stopping safinamide. Severe Theoretical → Also see TABLE 13 p. 1493
- Methylphenidate is predicted to cause a hypertensive crisis when given with moclobemide. Severe Theoretical
- Mianserin is predicted to increase the risk of toxicity when given with moclobemide. Avoid and for 1 week after stopping mianserin. Severe Theoretical
- ➤ Opicapone is predicted to increase the risk of elevated blood pressure when given with moclobemide. Avoid. Severe Theoretical
- Ozanimod might increase the risk of a hypertensive crisis when given with moclobemide. Avoid. [Severe] Theoretical
- ► Moclobemide increases the risk of adverse effects when given with phenothiazines (levomepromazine). Moderate Study
- Reboxetine is predicted to increase the risk of a hypertensive crisis when given with moclobemide. Avoid. Severel Theoretical
- Moclobemide is predicted to increase the exposure to selumetinib. Avoid or adjust dose—consult product literature.
 Severel Theoretical
- Moclobemide is predicted to increase the exposure to SSRIs (escitalopram). Use with caution and adjust dose. Severe
 Study → Also see TABLE 13 p. 1493
- Sympathomimetics, vasoconstrictor (ephedrine, isometheptene, phenylephrine, pseudoephedrine) are predicted to increase the risk of a hypertensive crisis when given with moclobemide.
 Avoid. [Severe] Study
- ➤ Tetrabenazine potentially increases the risk of CNS excitation and hypertension when given with moclobemide. Severe

 Theoretical
- ► Tricyclic antidepressants are predicted to increase the risk of severe toxic reaction when given with moclobemide. Avoid. Severe | Theoretical → Also see TABLE 13 p. 1493
- Moclobemide moderately increases the exposure to triptans (rizatriptan, sumatriptan). Avoid. [Moderate] Study → Also see TABLE 13 p. 1493
- ► Moclobemide slightly increases the exposure to triptans (zolmitriptan). Adjust zolmitriptan dose, p. 515. [Moderate] Study → Also see TABLE 13 p. 1493

Modafinil

 Modafinil is predicted to decrease the efficacy of anti-androgens (cyproterone) with ethinylestradiol (co-cyprindiol). Use alternative methods during treatment with, and for 28 days after, the enzyme inducing drug is stopped. [Severe] Study

- ► Antiepileptics (carbamazepine, phenobarbital, primidone) are predicted to decrease the exposure to modafinil. Mild

 Theoretical
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to modafinil and modafinil is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate]
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to modafinil. Mild Theoretical
- ► Modafinil is predicted to decrease the exposure to bosutinib. Avoid. Severe Theoretical
- Cobicistat is predicted to increase the exposure to modafinil.
 Mild Theoretical
- ► Modafinil is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Study
- Modafinil is predicted to decrease the efficacy of desogestrel.
 For FSRH guidance, see Contraceptives, interactions p. 859.
 Severel Theoretical
- Modafinil is predicted to decrease the exposure to elbasvir.
 Avoid. [Unknown] Theoretical
- Modafinil is predicted to decrease the efficacy of estradiol.
 Moderate Theoretical
- ► Modafinil is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 859.

 Severe Theoretical
- Modafinil is predicted to decrease the exposure to glasdegib.
 Avoid or adjust glasdegib dose, p. 1087. [Moderate] Theoretical
- ► Modafinil is predicted to decrease the exposure to grazoprevir.
- Avoid. Severe Theoretical

 HIV-protease inhibitors are predicted to increase the exposure
- to modafinil. Mild Theoretical

 Modafinil is predicted to decrease the effects of hormone
- replacement therapy. Moderate Anecdotal
- Idelalisib is predicted to increase the exposure to modafinil.
 Mild Theoretical
- Modafinil is predicted to decrease the concentration of letermovir. [Moderate] Theoretical
- ► Modafinil is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 859. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to modafinil. Mild Theoretical
- Modafinil is predicted to decrease the exposure to NNRTIs (doravirine). Avoid or adjust doravirine p. 699 or lamivudine with tenofovir disoproxil and doravirine p. 709 dose. (Severe) Theoretical
- ► Modafinil is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 859. Severe Anecdotal
- Modafinil is predicted to decrease the exposure to osimertinib.
 Use with caution or avoid. (Severe) Theoretical
- Rifamycins (rifampicin) are predicted to decrease the exposure to modafinil. Moderate Theoretical
- Modafinil is predicted to decrease the exposure to sofosbuvir.
 Avoid. Severe Theoretical
- ► Modafinil decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 859. Severe
- Modafinil is predicted to decrease the exposure to velpatasvir.
 Avoid. [Severe] Theoretical
- Modafinil is predicted to decrease the concentration of voxilaprevir. Avoid. Severe Theoretical

Mogamulizumab → see monoclonal antibodies

Mometasone → see corticosteroids

Monoclonal antibodies → see TABLE 15 p. 1493 (myelosuppression), TABLE 12 p. 1493 (peripheral neuropathy), TABLE 9 p. 1492 (OT-interval prolongation)

adalimumab · alemtuzumab · atezolizumab · avelumab · basiliximab · belimumab · bevacizumab · bimekizumab · blinatumomab · brentuximab vedotin · brodalumab · canakinumab · certolizumab pegol · cetuximab · daratumumab · dinutuximab · dostarlimab · dupilumab · durvalumab · eculizumab · elotuzumab · golimumab · guselkumab · infliximab · inotuzumab ozogamicin ·

- Certolizumab pegol is predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. Avoid. [Severe] Theoretical
- Abatacept is predicted to increase the risk of generalised infection (possibly life-threatening) when given with golimumab. Avoid. Severe Theoretical
- Blinatumomab is predicted to transiently increase the exposure to aminophylline. Monitor and adjust dose. Moderate Theoretical
- Sarilumab potentially affects the exposure to aminophylline.
 Monitor and adjust dose. [Moderate] Theoretical
- Tocilizumab is predicted to decrease the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
- Certolizumab pegol is predicted to increase the risk of generalised infection (possibly life-threatening) when given with anakinra. Avoid. Severe Theoretical
- Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with golimumab. Avoid. Severe Theoretical
- Anthracyclines are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (trastuzumab, trastuzumab emtansine). Avoid. [Severe] Theoretical -> Also see TABLE 15 p. 1493
- ► Anthracyclines are predicted to increase the risk of cardiotoxicity when given with trastuzumab deruxtecan.

 Severe Theoretical → Also see TABLE 15 p. 1493
- ➤ Anti-androgens (apalutamide, enzalutamide) are predicted to decrease the exposure to polatuzumab vedotin. [Moderate]
 Theoretical
- Antiarrhythmics (dronedarone) increase the risk of neutropenia when given with brentuximab vedotin. Monitor and adjust dose. Severe Theoretical
- ► Antiepileptics (carbamazepine) are predicted to decrease the effects of brentuximab vedotin. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to polatuzumab vedotin. [Moderate] Theoretical
- Tocilizumab is predicted to decrease the exposure to antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole) increase the risk of neutropenia when given with brentuximab vedotin. Monitor and adjust dose. [Severe] Study
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to polatuzumab vedotin.

 Moderatel Theoretical
- ➤ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to trastuzumab emtansine. Avoid. [Severe] Theoretical
- Tocilizumab is predicted to decrease the exposure to benzodiazepines (alprazolam, diazepam, midazolam). Monitor and adjust dose. Moderate Theoretical
- ► Brentuximab vedotin increases the risk of pulmonary toxicity when given with bleomycin. Avoid. Severe Study → Also see
 TABLE 15 p. 1493
- ► Tocilizumab is predicted to decrease the exposure to calcium channel blockers. Monitor and adjust dose. [Moderate] Theoretical
- ► Blinatumomab is predicted to transiently increase the exposure to ciclosporin. Monitor and adjust dose. Moderate Theoretical
- Sarilumab potentially affects the exposure to ciclosporin.
 Monitor and adjust dose. [Moderate] Theoretical
- Tocilizumab is predicted to decrease the exposure to ciclosporin. Monitor and adjust dose. Moderate Theoretical
- ► Cobicistat is predicted to increase the exposure to polatuzumab vedotin. Moderate Theoretical
- Cobicistat is predicted to increase the exposure to trastuzumab emtansine. Avoid. Severe Theoretical

- Sarilumab potentially decreases the exposure to combined hormonal contraceptives. Severe Theoretical
- ➤ Corticosteroids are predicted to increase the risk of immunosuppression when given with dinutuximab. Avoid except in life-threatening situations. Severe Theoretical
