(consult product literature).

NICE decisions

- Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284 Not recommended
- Bevacizumab in combination with gemcitabine and carboplatin for treating the first recurrence of platinumsensitive advanced ovarian cancer (May 2013) NICE TA285 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Carboplatin (Non-proprietary)

Carboplatin 10 mg per 1 ml Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial PoM £20.20-£23.70 (Hospital only) Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial PoM £56.92-£61.21 (Hospital only)

Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial PoM £232.64-£279.64 (Hospital only)

Carboplatin 600mg/60ml solution for infusion vials | 1 vial PoM £260.00 (Hospital only)

Carboplatin 450mg/45ml solution for infusion vials | 1 vial PoM £197.48 (Hospital only)

Carboplatin 150mg/15ml solution for infusion vials | 1 vial PoM £65.83 (Hospital only)

Carboplatin 50mg/5ml solution for infusion vials | 1 vial PoM £22.86 (Hospital only)

Cisplatin

07-Feb-2022

• INDICATIONS AND DOSE

Treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (alone or in combination)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

CAUTIONS

- Hydration Manufacturer advises cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting.
- INTERACTIONS → Appendix 1: platinum compounds
- SIDE-EFFECTS
- Common or very common Anaemia · arrhythmias · bone marrow failure · electrolyte imbalance · extravasation necrosis · fever · leucopenia · nephrotoxicity (dose-related and potentially cumulative) · sepsis · thrombocytopenia
- Uncommon Anaphylactoid reaction · ototoxicity (doserelated and potentially cumulative) · spermatogenesis abnormal

- ► Rare or very rare Acute leukaemia · cardiac arrest · encephalopathy · myocardial infarction · nerve disorders · seizure · stomatitis
- Frequency not known Alopecia · appetite decreased · asthenia · autonomic dysfunction · cardiac disorder · cerebrovascular insufficiency · deafness · dehydration · diarrhoea · haemolytic anaemia · hiccups · hyperuricaemia · infection · Lhermitte's sign · malaise · muscle spasms · myelopathy · nausea · papilloedema · pulmonary embolism · rash · Raynaud's phenomenon · renal impairment · renal tubular disorder · retinal discolouration · SIADH · taste loss · tetany · thrombotic microangiopathy · tinnitus · vision disorders · vomiting
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic and toxic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT Ever Avoid if possible (nephrotoxic; consult product literature).
- MONITORING REQUIREMENTS
- ► Monitor full blood count.
- ► Monitor audiology.
- ► Monitor plasma electrolytes.
- ► Nephrotoxicity Monitoring of renal function is essential.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Cisplatin (Non-proprietary)

Cisplatin 1 mg per 1 ml Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial $\boxed{\text{PoM}}$ £24.50-£28.11 DT = £26.72 (Hospital only)

Cisplatin 100mg/100ml solution for infusion vials | 1 vial PoM £50.22 (Hospital only)

Cisplatin 50mg/50ml solution for infusion vials | 1 vial Pom £25.37 DT = £26.72 (Hospital only)

Cisplatin 10mg/10ml concentrate for solution for infusion vials 1 vial Pom £5.36-£5.90 (Hospital only)

Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial PoM £52.86-£55.64 (Hospital only) | 1 vial PoM £52.86

Oxaliplatin

26-Aug-2021

• INDICATIONS AND DOSE

Treatment of metastatic colorectal cancer (in combination with fluorouracil and folinic acid) | Treatment of colon cancer after resection of the primary tumour (adjuvant treatment)

- ► BY INTRAVENOUS INFUSION
- ► Adult: (consult product literature)
- CONTRA-INDICATIONS Peripheral neuropathy with functional impairment
- INTERACTIONS → Appendix 1: platinum compounds
- SIDE-EFFECTS
- ➤ Common or very common Alopecia anaemia appetite decreased arthralgia asthenia chills conjunctivitis constipation cough decreased leucocytes dehydration depression diarrhoea dizziness dyspnoea electrolyte imbalance embolism and thrombosis fever flushing gastrointestinal discomfort gastrointestinal disorders haemorrhage headache hiccups hyperglycaemia hyperhidrosis hypersensitivity hypertension increased risk of infection insomnia meningism mucositis nail disorder nausea necrosis nerve disorders neutropenia neutropenic sepsis pain peripheral neuropathy (doselimiting) sensation abnormal skin reactions stomatitis -

taste altered • thrombocytopenia • urinary disorders • vision disorders • vomiting • weight changes

▶ Uncommon Metabolic acidosis • nervousness • ototoxicity

BNF 84

- ▶ Rare or very rare Acute kidney injury · acute tubular necrosis · antibiotic associated colitis · deafness · disseminated intravascular coagulation · dysarthria · haemolytic anaemia · hepatic disorders · immuno-allergic thrombocytopenia · nephritis acute interstitial · nodular regenerative hyperplasia · pancreatitis · posterior reversible encephalopathy syndrome (PRES) (with oxaliplatin combination chemotherapy) · respiratory disorders · sinusoidal obstruction syndrome · vision loss (reversible on discontinuation)
- ► Frequency not known Autoimmune pancytopenia · chest discomfort · dysphagia · extravasation necrosis · gait abnormal · hypersensitivity vasculitis · movement disorders · muscle complaints · muscle contractions involuntary · QT interval prolongation · rhabdomyolysis · throat complaints

SIDE-EFFECTS, FURTHER INFORMATION Neurotoxicity is dose limiting.

Respiratory symptoms If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.

- CONCEPTION AND CONTRACEPTION Effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT [EVGT] Avoid if creatinine clearance less than 30 mL/minute. ♠ See p. 21.

 Dose adjustments [EVGT] Adjust dose if toxicity occurs in mild to moderate impairment (consult product literature). ♠
- NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

- ► Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006) NICE TA100 Recommended
- ► Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Oxaliplatin (Non-proprietary)

Oxaliplatin 5 mg per 1 ml Oxaliplatin 100mg/20ml concentrate for solution for infusion vials | 1 vial PoM £289.50-£358.16 (Hospital only)

Oxaliplatin 50mg/10ml concentrate for solution for infusion vials | 1 vial [DoM] 1146.80-1178.85 (Hospital only) Oxaliplatin 200mg/40ml concentrate for solution for infusion vials | 1 vial [DoM] 5591.26-6716.27 (Hospital only)

ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES

Etoposide

21-Jun-2021

• INDICATIONS AND DOSE

Small cell carcinoma of the bronchus, the lymphomas and testicular cancer

- ► BY MOUTH
- ► Adult: 120-240 mg/m² daily for 5 days
- ► BY INTRAVENOUS INFUSION
 - Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- INTERACTIONS → Appendix 1: etoposide
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Abdominal pain · acute leukaemia · alopecia · anaemia · appetite decreased · arrhythmia · asthenia · bone marrow depression · constipation · diarrhoea · dizziness · hepatotoxicity · hypertension · leucopenia · malaise · mucositis · myocardial infarction · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting
- ► Uncommon Nerve disorders
- ▶ Rare or very rare Dysphagia · neurotoxicity · radiation recall reaction · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · taste altered · vision loss

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intravenous use Anaphylactic reaction · hypotension · infection
- With oral use Oesophagitis · stomatitis · transient systolic hypotension
- ► Uncommon
- ▶ With intravenous use Haemorrhage
- ► Rare or very rare
- ▶ With intravenous use Fever
- With oral use Drowsiness
- ► Frequency not known
- With intravenous use Angioedema extravasation necrosis infertility tumour lysis syndrome
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution (increased risk of accumulation).
- RENAL IMPAIRMENT

Dose adjustments Manufacturer advises dose reduction may be required (consult product literature).

- DIRECTIONS FOR ADMINISTRATION Manufacturer advises etoposide is given by slow intravenous infusion. It may also be given by mouth, but it is unpredictably absorbed.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Etoposide (Non-proprietary)

Etoposide 20 mg per 1 ml Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £11.50-£17.78 (Hospital only) Etoposide 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £60.70-£88.91 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 23

Vepesid (Neon Healthcare Ltd)

Etoposide 50 mg Vepesid 50mg capsules | 20 capsule PoM £99.82 Etoposide 100 mg Vepesid 100mg capsules | 10 capsule PoM £87.23

Powder for solution for injection

Etopophos (Neon Healthcare Ltd)
Etoposide (as Etoposide phosphate) 100 mg Etopophos 100mg powder for solution for injection vials | 10 vial Pom £261.68

ANTINEOPLASTIC DRUGS > TAXANES

Cahazitaxel

02-Nov-2021

• INDICATIONS AND DOSE

Treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen (in combination with prednisone or prednisolone)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)
- CAUTIONS Avoid in Acute porphyrias p. 1150 · consult product literature
- INTERACTIONS → Appendix 1: taxanes
- SIDE-EFFECTS
- ► Common or very common Acute kidney injury alopecia anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · chest pain · chills · confusion · conjunctivitis · constipation · cough · cystitis · deep vein thrombosis · dehydration · diarrhoea · dizziness · dry mouth · dyspnoea · excessive tearing · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hydronephrosis · hyperglycaemia · hypersensitivity · hypertension · hypokalaemia · hypotension · increased risk of infection · lethargy · leucopenia · malaise · mucositis · muscle complaints · nausea · nerve disorders · neutropenia · oedema · oropharyngeal pain · pain · pelvic pain · renal colic · renal failure (fatal cases of renal failure reported) · sensation abnormal · sepsis · skin reactions · taste altered · thrombocytopenia · tinnitus · ureteral obstruction · urinary disorders · vasodilation · vertigo · vomiting · weight decreased
- Frequency not known Respiratory disorders
 SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises pretreatment with a corticosteroid, antihistamine and histamine H2-receptor antagonist to reduce the risk and severity of hypersensitivity reactions.
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment (women) and for up to 6 months after treatment (men).
- PREGNANCY See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
 Dose adjustments Manufacturer advises dose reduction in mild to moderate impairment—consult product literature.
- RENAL IMPAIRMENT EVGT Caution if creatinine clearance less than 15 mL/minute (limited information available),
 N see p. 21.
- MONITORING REQUIREMENTS Monitor electrolytes correct dehydration.
- DIRECTIONS FOR ADMINISTRATION Intravenous infusion incompatible with PVC.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Cabazitaxel for hormone-relapsed metastatic prostate cancer treated with docetaxel (updated August 2016) NICE TA391 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Cabazitaxel (Jevtana®) in combination with prednisone or prednisolone is indicated for the treatment of adult patients with hormone refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen (December 2016) SMC No. 735/11 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol

Cabazitaxel (Non-proprietary)

Cabazitaxel (as Cabazitaxel monohydrate) 10 mg per 1 ml Cabazitaxel 45mg/4.5ml concentrate for solution for infusion vials | 1 vial PoM £2,772.00 (Hospital only)

Cabazitaxel 50mg/5ml concentrate for solution for infusion vials | 1 vial | PoM| £3.080.00 (Hospital only)

Cabazitaxel 60mg/6ml concentrate for solution for infusion vials | 1 vial Pom £3,696.00 (Hospital only)

Cabazitaxel 20 mg per 1 ml Cabazitaxel 60mg/3ml concentrate for solution for infusion vials | 1 vial PoM £2,587.20-£3,696.00 (Hospital only)

Cabazitaxel 40 mg per 1 ml Cabazitaxel 60 mg/1.5 ml concentrate and solvent for solution for infusion vials | 1 vial Pom £3,696.00 (Hospital only)

Jevtana (Sanofi Genzyme)

Cabazitaxel 40 mg per 1 ml JEVTANA 60mg/1.5ml concentrate and solvent for solution for infusion vials | 1 vial PoM £3,696.00 (Hospital only)

Docetaxel

06-Jul-2020

• INDICATIONS AND DOSE

Adjuvant treatment of operable node-positive and operable node-negative breast cancer (in combination with doxorubicin and cyclophosphamide) | Initial chemotherapy of locally advanced or metastatic breast cancer (with doxorubicin) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed (monotherapy) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed (with capecitabine) | Initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2 (with trastuzumab) | Locally advanced or metastatic non-small cell lung cancer where previous chemotherapy has failed Initial chemotherapy of unresectable, locally advanced or metastatic non-small cell lung cancer (with cisplatin) Hormone-resistant metastatic prostate cancer (in combination with prednisone or prednisolone) | Initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal iunction (with cisplatin and fluorouracil) | Induction treatment of locally advanced squamous cell carcinoma of the head and neck (with cisplatin and fluorouracil)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)
- CAUTIONS Avoid in Acute porphyrias p. 1150 ⋅ consult product literature
- INTERACTIONS → Appendix 1: taxanes
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · alopecia · anaemia · appetite decreased · arrhythmia · arthralgia · asthenia · constipation · diarrhoea · dyspnoea · fluid imbalance · haemorrhage · hypersensitivity · hypertension · hypotension · increased risk of infection · myalgia · nail

disorders · nausea · neutropenia · pain · peripheral neuropathy · sepsis · skin reactions · stomatitis · taste altered · thrombocytopenia · vomiting

▶ Uncommon Gastrointestinal disorders • heart failure

BNF 84

► Frequency not known Ascites · bone marrow depression · chest tightness · chills · cutaneous lupus erythematosus · disseminated intravascular coagulation · eye disorders · eye inflammation · fever · hearing impairment · hepatitis · hyponatraemia · loss of consciousness · multi organ failure · myocardial infarction · nail discolouration · neurotoxicity · ototoxicity · pericardial effusion · peripheral lymphoedema · peripheral oedema · pulmonary oedema · radiation injuries · renal impairment · respiratory disorders · sclerodermal-like changes · seizure · sensation abnormal · severe cutaneous adverse reactions (SCARs) · vasodilation · venous thromboembolism · vision disorders · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception for men and women during treatment, and for at least 6 months after stopping treatment in men.
- PREGNANCY Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate and to avoid in severe impairment.
 Dose adjustments Manufacturer advises dose reduction according to liver function tests in mild to moderate impairment —consult product literature.

Monitoring Monitor liver function in hepatic impairment.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Docetaxel for the treatment of hormone-refractory metastatic prostate cancer (June 2006) NICE TA101 Recommended
- Pertuzumab with trastuzumab and docetaxel for treating HER2-positive breast cancer (March 2018) NICE TA509 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Docetaxel 20 mg per 1 ml Docetaxel 80mg/4ml concentrate for solution for infusion vials | 1 vial Pom £51.00-£504.27 (Hospital only)

Docetaxel 160mg/8ml concentrate for solution for infusion vials | 1 vial [№M] 1101.25-1958.11 (Hospital only) Docetaxel 20mg/1ml concentrate for solution for infusion vials | 1 vial [№M] 115.00-£153.47 (Hospital only)

Paclitaxel

15-Feh-2022

 DRUG ACTION Paclitaxel is a member of the taxane group of drugs.

INDICATIONS AND DOSE

Treatment of ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin (conventional paclitaxel only) | Treatment of metastatic ovarian cancer where platinum-containing therapy has failed (conventional paclitaxel only) Treatment of locally advanced breast cancer (in combination with other cytotoxics) or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate) (conventional paclitaxel only) | Adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide (conventional paclitaxel only) | Treatment of non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate (conventional paclitaxel only) | Treatment of advanced AIDS-related Kaposi's sarcoma where liposomal anthracycline therapy has failed (conventional paclitaxel only) | Monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated (albumin-bound paclitaxel only) | In combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas (albumin-bound paclitaxel only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PACLITAXEL FORMULATIONS
(CONVENTIONAL AND NAB-PACLITAXEL): CAUTION REQUIRED DUE
TO POTENTIAL FOR MEDICATION ERROR (JANUARY 2022)

The MHRA reminds healthcare professionals that albumin-bound paclitaxel formulations (nab-paclitaxel; brand names Abraxane®, Pazenir®) differ from conventional paclitaxel formulations and are not interchangeable. Healthcare professionals are advised to make a clear distinction between formulations when prescribing, dispensing, administering, and communicating about paclitaxel. The use of brand names is advised for albumin-bound paclitaxel formulations to prevent medication errors. The product name and dose should be verified before administration and product literature followed for preparation and administration.

- CAUTIONS Avoid in Acute porphyrias p. 1150 · consult product literature · patients aged over 75 years with metastatic adenocarcinoma of the pancreas
- INTERACTIONS → Appendix 1: taxanes
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · bone marrow disorders · chest discomfort · chills · constipation · cough · decreased leucocytes · depression · diarrhoea · dizziness · drowsiness · dry eye · dyspnoea · electrolyte imbalance · excessive tearing · extravasation necrosis · eye inflammation · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hyperpyrexia · hypertension · increased risk of infection · influenza like illness · insomnia · laryngeal pain · lymphoedema · malaise · movement disorders · mucositis · muscle complaints · nail discolouration · nail disorders · nasal complaints · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · respiratory disorders · sensation abnormal · skin

reactions \cdot taste altered \cdot thrombocytopenia \cdot vasodilation \cdot vertigo \cdot vision disorders \cdot vomiting \cdot weight changes

- ▶ Uncommon Allergic rhinitis · breast pain · catheter related infection · dry mouth · dysphagia · ear pain · embolism and thrombosis · eye discomfort · facial swelling · gait abnormal · hepatomegaly · hoarseness · hyperglycaemia · hypoalbuminaemia · hypoglycaemia · hypotension · limb discomfort · muscle weakness · neoplasm complications · peripheral coldness · photosensitivity reaction · polydipsia · reflexes abnormal · sepsis · sweat changes · swelling · syncope · tinnitus · tremor · urinary disorders
- Rare or very rare Atrioventricular block · cardiac arrest · congestive heart failure · left ventricular dysfunction · radiation injuries · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises routine premedication with a corticosteroid, an antihistamine and a histamine H2-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication.

- CONCEPTION AND CONTRACEPTION Ensure effective contraception during and for at least 6 months after treatment in men or women.
- PREGNANCY Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT (Consult product literature)
- MONITORING REQUIREMENTS
- Cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or previous exposure to anthracyclines.
- Patients should be monitored for signs and symptoms of pneumonitis and sepsis.
- PRESCRIBING AND DISPENSING INFORMATION Paclitaxel is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

Prescribers should specify the brand to be dispensed.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Guidance on the use of paclitaxel in the treatment of ovarian cancer (updated May 2005) NICE TA55 Recommended
- Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284 Not recommended
- Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389 Recommended
- Paclitaxel as albumin-bound nanoparticles with gemcitabine for untreated metastatic pancreatic cancer (September 2017)
 NICE TA476 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Paclitaxel albumin (Abraxane®) for the treatment of metastatic breast cancer (April 2010) SMC No. 556/09 Recommended with restrictions
- Paclitaxel albumin (Abraxane®) in combination with gemcitabine for the first-line treatment of adult patients with metastatic adenocarcinoma of the pancreas (February 2015) SMC No. 968/14 Recommended

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polyoxyl castor oils

► Paclitaxel (Non-proprietary)

Paclitaxel 6 mg per 1 ml Paclitaxel 150mg/25ml concentrate for solution for infusion vials | 1 vial PoM £300.52-£589.22 (Hospital only)

Paclitaxel 30mg/5ml concentrate for solution for infusion vials | 1 vial Poml £35.00-£131.07 (Hospital only)

Paclitaxel 100mg/16.7ml concentrate for solution for infusion vials 1 vial PoM £87.50-£392.82 (Hospital only)

Paclitaxel 300mg/50ml concentrate for solution for infusion vials | 1 vial PoM £192.50-£1,178.44 (Hospital only)

Powder for suspension for infusion

ELECTROLYTES: May contain Sodium

► Abraxane (Bristol-Myers Squibb Pharmaceuticals Ltd)

Paclitaxel albumin 100 mg Abraxane 100mg powder for suspension for infusion vials | 1 vial PoM £246.00 (Hospital only)

ANTINEOPLASTIC DRUGS > TOPOISOMERASE I INHIBITORS

I Irinotecan hydrochloride

26-Aug-2020

 DRUG ACTION Irinotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

INDICATIONS AND DOSE

Metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed | Treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan (in combination with cetuximab) | First-line treatment of metastatic carcinoma of the colon or rectum (in combination with fluorouracil, folinic acid and bevacizumab) | First-line treatment of metastatic colorectal carcinoma (in combination with capecitabine with or without bevacizumab)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)

Metastatic adenocarcinoma of the pancreas in patients who have progressed following gemcitabine based therapy (in combination with fluorouracil and leucovorin) (specialist use only)

- ► BY INTRAVENOUS INFUSION USING LIPID FORMULATION
- Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: *ONIVYDE®* (IRINOTECAN, LIPOSOMAL FORMULATIONS): REPORTS OF SERIOUS AND FATAL THROMBOEMBOLIC EVENTS (MARCH 2019)

Onivyde[®] has been associated with reports of serious thromboembolic events, such as pulmonary embolism, venous thrombosis, and arterial thromboembolism. Healthcare professionals are advised to obtain a thorough medical history to identify patients with multiple risk factors. Patients should be advised to seek medical advice immediately if signs or symptoms of thromboembolism occur, such as sudden pain and swelling in a leg or an arm, sudden onset of coughing, chest pain or difficulty breathing.

MHRA/CHM ADVICE: LIPOSOMAL AND LIPID-COMPLEX FORMULATIONS: NAME CHANGE TO REDUCE MEDICATION ERRORS (IIIIY 2020)

Serious harm and fatal overdoses have occurred following confusion between liposomal, pegylated-liposomal, lipid-complex, and conventional formulations of the same drug substance. Medicines with these formulations will explicitly include 'liposomal', 'pegylated-liposomal', or 'lipid-complex' within their

name to reduce the risk of potentially fatal medication errors.

The MHRA reminds healthcare professionals that liposomal, pegylated-liposomal, lipid-complex, and conventional formulations containing the same drug substance are **not** interchangeable. Healthcare professionals are advised to make a clear distinction between formulations when prescribing, dispensing, administering, and communicating about irinotecan. The product name and dose should be verified before administration and the maximum dose should not be exceeded.

- CONTRA-INDICATIONS Bowel obstruction · chronic inflammatory bowel disease
- CAUTIONS Raised plasma-bilirubin concentration · risk factors for cardiac disease · risk factors for pulmonary toxicity · underweight patients (increased risk of adverse events)
- INTERACTIONS → Appendix 1: irinotecan
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia (doselimiting) · appetite decreased · asthenia · cholinergic syndrome · constipation · decreased leucocytes · diarrhoea (delayed diarrhoea requires prompt treatment) · dizziness · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · febrile neutropenia (dose-limiting) · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · hypoalbuminaemia · hypoglycaemia · hypotension · increased risk of infection · infusion related reaction · insomnia · mucositis · nausea · neutropenia (dose-limiting) · oedema · renal impairment · sepsis · stomatitis · taste altered · thrombocytopenia (doselimiting) · vomiting · weight decreased
- Uncommon Hypersensitivity hypoxia nail discolouration
 skin reactions
- Frequency not known Antibiotic associated colitis circulatory collapse - gastrointestinal haemorrhage hiccups - hypertension - interstitial lung disease - muscle cramps - paraesthesia - speech disorder - ulcerative colitis
- CONCEPTION AND CONTRACEPTION For conventional formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 3 months after treatment in men. For liposomal formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 4 months after treatment in men.
- PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING For conventional formulations, manufacturer advises avoid. For liposomal formulations, manufacturer advises avoid until one month after the last dose—no information available.
- HEPATIC IMPAIRMENT For conventional formulations, manufacturer advises caution if bilirubin concentration 1.5–3 times the upper limit of normal (risk of decreased clearance)—monitor liver function at baseline and before each cycle; avoid if bilirubin concentration greater than 3 times the upper limit of normal (no information available for combination therapy). For liposomal formulations, manufacturer advises caution; avoid if bilirubin greater than 2 mg/dL, or if transaminases are greater than 2.5 times the upper limit of normal, or greater than 5 times the upper limit of normal if liver metastasis present (limited information available).

Dose adjustments For *conventional* formulations, manufacturer advises dose reduction—consult product literature.

- RENAL IMPAIRMENT For conventional formulations, manufacturer advises avoid—no information available. For liposomal formulations, manufacturer advises avoid in severe impairment—no information available.
- MONITORING REQUIREMENTS Manufacturer advises monitor for respiratory symptoms in patients with risk factors for interstitial lung disease before and during treatment; monitor complete blood count weekly during treatment
- PRESCRIBING AND DISPENSING INFORMATION Irinotecan is available as both conventional and liposomal formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and visual disturbances within 24 hours of administration.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Pegylated liposomal irinotecan for treating pancreatic cancer after gemcitabine (April 2017) NICE TA440 Not recommended
 Scottish Medicines Consortium (SMC) decisions
- Liposomal irinotecan (Onivyde®) for treatment of metastatic adenocarcinoma of the pancreas, in combination with fluorouracil (5-FU) and leucovorin (folinic acid), in adult patients who have progressed following gemcitabine based therapy (March 2017) SMC No. 1217/17 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Sorbitol

► Irinotecan hydrochloride (Non-proprietary)

Irinotecan hydrochloride trihydrate 20 mg per 1 ml | Irinotecan 500mg/25ml concentrate for solution for infusion vials | 1 vial | PoM 1712.50-£837.96 (Hospital only) | Irinotecan 40mg/2ml concentrate for solution for infusion vials |

1 vial Pom £15.00-£59.88 (Hospital only) Irinotecan 300mg/15ml concentrate for solution for infusion vials | 1 vial Pom £110.00-£440.45 (Hospital only) | 1

Irinotecan 100mg/5ml concentrate for solution for infusion vials | 1 vial PoM £48.00-£146.83 (Hospital only)

Campto (Pfizer Ltd)

Irinotecan hydrochloride trihydrate 20 mg per 1 ml Campto 100mg/5ml concentrate for solution for infusion vials | 1 vial PoM 5130.00 (Hospital only) Campto 40mg/2ml concentrate for solution for infusion vials |

1 vial Pom £53.00 (Hospital only)

Campto 300mg/15ml concentrate for solution for infusion vials |

1 vial Pom £390.00 (Hospital only)

Dispersion for infusion

ELECTROLYTES: May contain Sodium

Onivyde (Servier Laboratories Ltd)

Irinotecan (as Irinotecan sucrosofate salt pegylated liposomal)
4.3 mg per 1 ml Onivyde pegylated liposomal 43mg/10ml
concentrate for dispersion for infusion vials | 1 vial Pom £615.35
(Hospital only)

Topotecan

17-Sen-2021

 DRUG ACTION Topotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

• INDICATIONS AND DOSE

Metastatic ovarian cancer when first-line or subsequent treatment has failed | Treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease (in combination with cisplatin)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)

continued →

Relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate

- ▶ BY INTRAVENOUS INFUSION, OR BY MOUTH
- Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- INTERACTIONS → Appendix 1: topotecan
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · asthenia · colitis neutropenic · constipation · diarrhoea · fever · gastrointestinal discomfort · hyperbilirubinaemia · hypersensitivity · infection · leucopenia · malaise · mucositis · nausea · neutropenia · pancytopenia · sepsis · skin reactions · thrombocytopenia · yomiting
- ▶ Rare or very rare Angioedema · interstitial lung disease
- Frequency not known Bone marrow depression (doselimiting) · haemorrhage
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (limited information available).
- RENAL IMPAIRMENT EVGT Avoid infusion if creatinine clearance less than 20 mL/minute (limited information available). Avoid oral route if creatinine clearance less than 30 mL/minute (limited information available).
 See p. 21.

Dose adjustments Evgr Reduce dose (consult product literature).

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183 Recommended
- ► Topotecan for the treatment of relapsed small-cell lung cancer (November 2009) NICE TA184 Recommended
- Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389 Not recommended

Scottish Medicines Consortium (SMC) decisions

- Topotecan (Hycamtin[®]) in combination with cisplatin for patients with carcinoma of the cervix recurrent after radiotherapy and for patients with stage IVB disease (December 2007) SMC No. 421/07 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Topotecan (Non-proprietary)

Topotecan (as Topotecan hydrochloride) 1 mg per 1 ml Topotecan 4mg/4ml concentrate for solution for infusion vials | 1 vial PoM £290.00 | 5 vial PoM £1,453.10 (Hospital only) Topotecan 1mg/1ml concentrate for solution for infusion vials | 1 vial PoM £97.00

Powder for solution for infusion

Hycamtin (Novartis Pharmaceuticals UK Ltd)
 Topotecan (as Topotecan hydrochloride) 1 mg Hycamtin 1mg powder for concentrate for solution for infusion vials | 1 vial PoM

Topotecan (as Topotecan hydrochloride) 4 mg Hycamtin 4mg powder for concentrate for solution for infusion vials | 1 vial PoM £348.76 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 25

Hycamtin (Novartis Pharmaceuticals UK Ltd)

Topotecan (as Topotecan hydrochloride) 250 microgram Hycamtin 0.25mg capsules | 10 capsule PoM

ANTINEOPLASTIC DRUGS > VINCA ALKALOIDS

Vinblastine sulfate

02-Jul-2020

• INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

Vinblastine is for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- CONTRA-INDICATIONS Intrathecal injection contraindicated.
- CAUTIONS Caution in handling—irritant to tissues
- INTERACTIONS → Appendix 1: vinca alkaloids
- SIDE-EFFECTS
- ▶ Rare or very rare Hearing impairment nerve disorders vestibular damage
- ► Frequency not known Abdominal pain · alopecia (reversible) · anaemia · appetite decreased · asthenia · balance impaired · cancer pain · constipation · depression · diarrhoea · dizziness · dyspnoea · haemorrhage · headache · hypertension · ileus · increased risk of infection · leucopenia (dose-limiting) · malaise · myalgia · myocardial infarction · nausea · nystagmus · oral blistering · pain · Raynaud's phenomenon · reflexes absent · respiratory disorders · seizure · sensation abnormal · SIADH · skin reactions · stroke · thrombocytopenia · vertigo · vomiting
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in significantly impaired hepatic or biliary function.
 Dose adjustments Manufacturer advises consider initial dose reduction in significantly impaired hepatic or biliary function.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Vinblastine sulfate (Non-proprietary)

Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial PoM £85.00 (Hospital only)

Vincristine sulfate

03-Jul-2020

• INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Vincristine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- CONTRA-INDICATIONS Intrathecal injection contraindicated.
- CAUTIONS Caution in handling—irritant to tissues · ileus · neuromuscular disease
- INTERACTIONS → Appendix 1: vinca alkaloids
- SIDE-EFFECTS
- ► Rare or very rare Hypersensitivity rash SIADH
- ► Frequency not known Abdominal cramps adrenal disorder · alopecia · anaemia · appetite decreased · azotaemia · bladder atony · bronchospasm · connective tissue disorders · constination · coronary artery disease · dehydration · diarrhoea · dizziness · dyspnoea · eighth cranial nerve damage · eye disorders · fever · gait abnormalities · gastrointestinal disorders · haemolytic anaemia · headache · hearing impairment · hypertension · hyponatraemia · hypotension · infection · leucopenia · movement disorders · muscle atrophy · myalgia · myocardial infarction · nausea · neuromuscular effects (dose-limiting) · neutropenia · oedema · oral ulceration · pain · paralysis · paresis · reflexes absent · renal disorder · secondary malignancy · sensation abnormal · sepsis · throat pain · thrombocytopenia · urinary disorders · vertigo · vestibular damage · vision loss · vomiting · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION **Bronchospasm** Severe bronchospasm following administration is more common when used in combination with mitomycin-C.

Neurotoxicity Sensory and motor neuropathies are common and are cumulative. Manufacturer advises monitoring patients for symptoms of neuropathy, such as hypoesthesia, hyperesthesia, paresthesia, hyporeflexia, areflexia, neuralgia, jaw pain, decreased vibratory sense, cranial neuropathy, ileus, burning sensation, arthralgia, myalgia, muscle spasm, or weakness, both before and during treatment—requires dose reduction, treatment interruption or treatment discontinuation, depending on severity.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
 Dose adjustments Manufacturer advises dose reduction.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Vincristine sulfate (Non-proprietary)

Vincristine sulfate 1 mg per 1 ml Vincristine 1mg/1ml solution for injection vials | 1 vial PoM £13.47 (Hospital only) | 5 vial PoM £67.35 (Hospital only)

Vincristine 2mg/2ml solution for injection vials | 1 vial Pom £26.66 (Hospital only) | 5 vial Pom £133.30 (Hospital only) Vincristine 5mg/5ml solution for injection vials | 5 vial Pom £329.50 (Hospital only)

Vindesine sulfate

03-Jul-2020

• INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

Vindesine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- CONTRA-INDICATIONS Intrathecal injection contraindicated.
- CAUTIONS Caution in handling—irritant to tissues neuromuscular disease
- INTERACTIONS → Appendix 1: vinca alkaloids
- SIDE-EFFECTS
- ► Common or very common Alopecia
- **Frequency not known Anaemia appetite decreased asthenia balance impaired cellulitis chills constipation depression diarrhoea dizziness dysphagia fever gastrointestinal discomfort gastrointestinal disorders granulocytopenia (dose-limiting) headache hearing impairment malaise nausea nerve disorders nystagmus oral disorders pain peroneal nerve palsy rash maculopapular reflexes absent seizure sensation abnormal thrombocytopenia thrombocytosis vertigo vestibular damage vision loss vomiting

 SIDE-EFFECTS, FURTHER INFORMATION Neurotoxicity, usually as peripheral expute per peripheral expute pairs purenothy; it occurs
 - usually as peripheral or autonomic neuropathy; it occurs less often with vindesine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes; and ototoxicity has been reported. There have been instances in which neurotoxicity has made it necessary to reduce the dosage or temporarily discontinue use of vindesine.
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
 Dose adjustments Manufacturer advises consider initial dose reduction in significant impairment.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► Eldisine (Genus Pharmaceuticals Ltd)

Vindesine sulfate 5 mg Eldisine 5mg powder for solution for injection vials | 1 vial PoM £78.30 (Hospital only)

Vinflunine

08-0ct-2021

• INDICATIONS AND DOSE

Treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen (monotherapy)

Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Vinflunine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- CONTRA-INDICATIONS Intrathecal injection contraindicated.
- CAUTIONS Cardiovascular disease · QT-interval prolongation (avoid hypokalaemia)
- INTERACTIONS → Appendix 1: vinca alkaloids
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chest pain · chills · constipation · cough · dehydration · diarrhoea · dizziness · dyspnoea · ear pain · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hyperhidrosis · hypersensitivity · hypertension · hyponatraemia · hypotension · increased risk of infection · insomnia · leucopenia · muscle weakness · myalgia · nausea · neutropenia · oedema · oral disorders · pain · peripheral neuropathy · skin reactions · swallowing difficulty · syncope · tachycardia · taste altered · thrombocytopenia · venous thrombosis · vomiting · weight changes
- Uncommon Acute respiratory distress syndrome (ARDS)cancer pain - laryngeal pain - myocardial infarction myocardial ischaemia - neutropenic sepsis - renal failure -SIADH - tinnitus - vertigo - visual impairment
- Rare or very rare Posterior reversible encephalopathy syndrome (PRES)
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for up to 3 months after treatment.
- PREGNANCY Avoid unless essential—teratogenicity and embryotoxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available in severe impairment).
 Dose adjustments Manufacturer advises dose reduction.
- RENAL IMPAIRMENT

Dose adjustments EvGr Reduce dose if creatinine clearance less than 60 mL/minute (consult product literature). See p. 21.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Vinflunine for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract (January 2013) NICE TA272 Not recommended
- MEDICINAL FORMS No licensed medicines listed.

Vinorelbine

04-Jul-2020

 DRUG ACTION Vinorelbine is a semi-synthetic vinca alkaloid

INDICATIONS AND DOSE

Advanced breast cancer | Advanced non-small cell lung cancer

- ► BY MOUTH
- Adult: 60 mg/m² once weekly for 3 weeks, then increased if tolerated to 80 mg/m² once weekly (max. per dose 160 mg once weekly)
- ► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

Vinorelbine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Concurrent radiotherapy if treating the liver

SPECIFIC CONTRA-INDICATIONS

- With oral use Long-term oxygen therapy · previous significant surgical resection of small bowel · previous significant surgical resection of stomach CONTRA-INDICATIONS, FURTHER INFORMATION Intrathecal injection contra-indicated.
- CAUTIONS Caution in handling—irritant to tissues ischaemic heart disease
- INTERACTIONS → Appendix 1: vinca alkaloids
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Alopecia · anaemia · appetite decreased · arthralgia · bone marrow depression (dose-limiting) · constipation · diarrhoea · dyspnoea · fever · hypertension · hypotension · increased risk of infection · leucopenia · myalgia · nausea · neutropenia (dose-limiting) · pain · reflexes absent · stomatitis · thrombocytopenia · yomiting
- Uncommon Flushing · peripheral coldness · respiratory disorders · sepsis
- ▶ Rare or very rare Circulatory collapse hyponatraemia myocardial infarction pancreatitis
- ► Frequency not known SIADH

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intravenous use Asthenia · cancer pain · chest pain · muscle weakness in legs · nervous system disorder · vein discolouration
- With oral use Abdominal pain · chills · cough · dizziness · dysphagia · dysuria · fatigue · gastrointestinal disorders · headache · insomnia · liver disorder · neuromuscular

disorder • sensory disorder • skin eruption • taste altered • urogenital disorder • vision disorder • weight changes

- ► Uncommon
- With intravenous use Paraesthesia
- With oral use Ataxia
- ► Rare or very rare
- With intravenous use Arrhythmias · ischaemic heart disease · necrosis · palpitations · paralytic ileus · skin reactions
- ► Frequency not known
- With intravenous use Febrile neutropenia
- With oral use Gastrointestinal haemorrhage hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION Bronchospasm
Severe bronchospasm following administration of the vinca alkaloids is more common when used in combination

with mitomycin-C.

Neurotoxicity Neurotoxicity reported in clinical trials, most commonly as constipation, paresthesia,

- hypersthesia, and hyporeflexia.

 CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment.
- PREGNANCY Avoid unless essential (teratogenicity, and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT
- With oral use Manufacturer advises caution in moderate impairment; avoid in severe impairment (no information available).
- With intravenous use Manufacturer advises caution in severe impairment.

Dose adjustments • With oral use Manufacturer advises dose reduction in moderate impairment—consult product literature

- With intravenous use Manufacturer advises dose reduction in severe impairment.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Vinorelbine (Non-proprietary)

Vinorelbine (as Vinorelbine tartrate) 10 mg per 1 ml Vinorelbine 50mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] E139.00 (Hospital only) | 1 vial [PoM] E139.00 | 10 vial [PoM] E1,539.80 (Hospital only)

ANTINEOPLASTIC DRUGS > OTHER

Amsacrine

15-Nov-2018

INDICATIONS AND DOSE

Acute leukaemia (refractory to anthracycline chemotherapy used alone or in combination with other chemotherapy agents) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- CAUTIONS Hypokalaemia—increased risk of ventricular fibrillation (correct hypokalaemia before initiating treatment)
- INTERACTIONS → Appendix 1: amsacrine
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · alopecia · arrhythmias · bone marrow disorders · cardiotoxicity · congestive heart failure · diarrhoea · dyspnoea · emotional lability · fever · generalised tonic -clonic seizure · haemorrhage · hepatic disorders · hypokalaemia · hypotension · infection · nausea · necrosis · skin reactions · stomatitis · thrombocytopenia · vomiting
- ▶ Rare or very rare Anaemia · cardiomyopathy · confusion · dizziness · granulocytopenia · headache · lethargy · leucopenia · numbness · peripheral neuropathy · proteinuria · renal impairment · visual impairment · weight changes
- ► Frequency not known Cardiac arrest hyperuricaemia
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for 3 months after treatment in women of child-bearing potential, and during and for 6 months after treatment in men.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (increased risk of toxicity).

Dose adjustments Manufacturer advises consider dose reduction (consult product literature).

 RENAL IMPAIRMENT Manufacturer advises monitor renal function at baseline and during treatment—increased risk of toxicity.

Dose adjustments Manufacturer advises consider dose reduction in renal impairment.

- MONITORING REQUIREMENTS
- ➤ Manufacturer advises monitor full blood count, liver function and renal function regularly; electrolytes should be re-evaluated prior to each treatment.
- Manufacturer advises monitor for cardiotoxicity during treatment.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

➤ Amsidine (Eurocept International bv)

Amsacrine 50 mg per 1 ml Amsidine 75mg/1.5ml solution for infusion ampoules and diluent | 6 ampoule PoM £1,200.00 (Hospital

Arsenic trioxide

10-Nov-2021

• INDICATIONS AND DOSE

Acute promyelocytic leukaemia (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)
- CAUTIONS Hypokalaemia (correct before treatment) hypomagnesaemia (correct before treatment) - previous treatment with anthracyclines (increased risk of QT interval prolongation) - vitamin B₁ deficiency (risk of encephalopathy)
- INTERACTIONS → Appendix 1: arsenic trioxide
- SIDE-EFFECTS
- ▶ Common or very common Abdominal pain · alveolar haemorrhage · anaemia · arrhythmias · arthralgia · chest pain · chills · diarrhoea · differentiation syndrome · dizziness · dyspnoea · electrolyte imbalance · fatigue · fever · headache · hyperbilirubinaemia · hyperglycaemia · hypotension · hypoxia · increased risk of infection · ketoacidosis · leucocytosis · myalgia · nausea · neutropenia · oedema · pain · pancytopenia · paraesthesia · pericardial effusion · QT interval prolongation · renal failure · respiratory disorders · seizure · skin reactions · thrombocytopenia · vasculitis · vision blurred · vomiting · weight increased
- Frequency not known Confusion · decreased leucocytes · encephalopathy · fluid imbalance · heart failure · hepatotoxicity · peripheral neuropathy · sepsis SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms of differentiation syndrome (leucocyte activation syndrome) include unexplained fever, dyspnoea, weight gain, pulmonary infiltrates, pleural or pericardial effusions, with or without leucocytosis—treat with high dose corticosteroids, consult product literature.
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment in men and
 women.
- PREGNANCY Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises use with caution—no information available.
- MONITORING REQUIREMENTS ECG required before and during treatment—consult product literature.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

► Arsenic trioxide for treating acute promyelocytic leukaemia (June 2018) NICE TA526 Recommended

Scottish Medicines Consortium (SMC) decisions

- Arsenic trioxide (Trisenox®) for newly diagnosed, low-tointermediate risk acute promyelocytic leukaemia (July 2019) SMC No. SMC2181 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Arsenic 10mg/10ml concentrate for solution for infusion ampoules | 10 ampoule | PoM £2,920.00 (Hospital only)

► Trisenox (Teva UK Ltd)

Arsenic trioxide 2 mg per 1 ml Trisenox 12mg/6ml concentrate for solution for infusion vials | 10 vial Pom £2,480.00 (Hospital only)

Asparaginase

03-Nov-2020

 DRUG ACTION Asparaginase is an enzyme which acts by breaking down L-asparagine to aspartic acid and ammonia, this disrupts protein synthesis of tumour cells.

• INDICATIONS AND DOSE

Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 5000 units/m² every 3 days
- CONTRA-INDICATIONS History of pancreatitis related to asparaginase therapy · history of serious haemorrhage related to asparaginase therapy · history of serious thrombosis related to asparaginase therapy · pancreatitis · pre-existing known coagulopathy
- CAUTIONS Diabetes (may raise blood glucose) hypersensitivity reactions - hypertriglyceridaemia (severe)—increased risk of acute pancreatitis CAUTIONS. FURTHER INFORMATION
- Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—asparaginase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated. Manufacturer advises an intracutaneous or small intravenous test dose can be used but is of limited value for predicting which patients will experience an allergic reaction.
- INTERACTIONS → Appendix 1: asparaginase
- SIDE-EFFECTS
- ➤ Common or very common Agitation · anaemia · angioedema · appetite decreased · arthralgia · bronchospasm · coagulation disorders · confusion · depression · diarrhoea · dizziness · drowsiness · dyspnoea · embolism and thrombosis · fatigue · flushing · gastrointestinal discomfort · haemorrhage · hallucination · hyperglycaemia · hyporesnitivity · hypoalbuminaemia · hypoglycaemia · hypotension · increased risk of infection · leucopenia · nausea · neurological effects · oedema · pain · pancreatitis acute · skin reactions · thrombocytopenia · vomiting · weight decreased
- Uncommon Headache · hyperammonaemia · hyperuricaemia
- Rare or very rare Coma · consciousness impaired · diabetic ketoacidosis · hepatic disorders · hyperparathyroidism · hypoparathyroidism · ischaemic stroke · necrotising pancreatitis · pancreatic pseudocyst · pancreatitis (sometimes fatal) · posterior reversible encephalopathy syndrome (PRES) · secondary hypothyroidism · seizure · tremor

SIDE-EFFECTS, FURTHER INFORMATION There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.

 CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in men and women of childbearing potential during treatment and for at least 3 months after last dose; asparaginase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also Pregnancy and reproductive function in Cytotoxic drugs p. 962.

- PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor trough serum asparaginase levels 3 days after administration; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
- Manufacturer advises monitor bilirubin, hepatic transaminases, and coagulation parameters before and during treatment; in addition, monitor plasma and urinary glucose, amylase, lipase, triglycerides, cholesterol and serum protein levels during treatment.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage conditions after reconstitution and dilution.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises asparaginase has moderate influence on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Asparaginase (Spectrila®) as a component of antineoplastic combination therapy for the treatment of acute lymphoblastic leukaemia in paediatric patients from birth to 18 years and adult patients (April 2018) SMC No. 1319/18 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Asparaginase 10000 unit Spectrila 10,000unit powder for concentrate for solution for infusion vials | 1 vial PoM £450.00 (Hospital only)

Crisantaspase

07-Aug-2020

 DRUG ACTION Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi.

• INDICATIONS AND DOSE

Acute lymphoblastic leukaemia

- ► BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- Adult: (consult product literature)
- CONTRA-INDICATIONS History of pancreatitis related to asparaginase therapy
- CAUTIONS Diabetes (may raise blood glucose)
- INTERACTIONS → Appendix 1: crisantaspase
- SIDE-EFFECTS
- ► Common or very common Chills · coagulation disorders · confusion · diarrhoea · dizziness · drowsiness · dyspnoea · face oedema · fever · headache · hepatic disorders · hypersensitivity · limb swelling · lip swelling · neurotoxicity · pain · pallor · pancreatitis · seizures · skin reactions · thrombosis
- Uncommon Hyperglycaemia · hyperlipidaemia · hypoxia · increased risk of infection · respiratory disorders
- Rare or very rare Arthritis reactive · coma · diabetic ketoacidosis · dysphagia · dysphasia · encephalopathy · haemorrhage · level of consciousness decreased · myalgia · myocardial infarction · necrotising pancreatitis · neutropenia · paresis · sepsis · thrombocytopenia

- ► Frequency not known Abdominal pain · flushing · hyperammonaemia · hypertension · hypotension · nausea · pseudocyst · vomiting
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- PREGNANCY Avoid. See also, Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises facilities for the management of anaphylaxis should be available.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► Erwinase (Porton Biopharma Ltd)

Crisantaspase 10000 unit Erwinase 10,000unit powder for solution for injection vials | 5 vial PoM £3,822.50

Eribulin

25-Aug-2021

INDICATIONS AND DOSE

Treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 1 chemotherapy regimen for advanced disease

- ► BY INTRAVENOUS INJECTION
- Adult: Give on day 1 and day 8 of a 21-day cycle, previous therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting unless the patient is unsuitable for these treatments (consult local protocol)
- CONTRA-INDICATIONS Congenital long QT syndrome
- CAUTIONS Bradyarrhythmias (increased susceptibility to QT-interval prolongation) · congestive heart failure (increased susceptibility to QT-interval prolongation) · electrolyte disturbances (increased susceptibility to QT-interval prolongation) · susceptibility to QT-interval prolongation
- INTERACTIONS → Appendix 1: eribulin
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chest pain · chills · conjunctivitis · constipation · cough · decreased leucocytes · dehydration · depression · diarrhoea · dizziness · dry mouth · dyspnoea · dysuria · electrolyte imbalance · embolism and thrombosis • excessive tearing • fever • gastrointestinal discomfort · gastrooesophageal reflux disease · haemorrhage · headache · hot flush · hyperbilirubinaemia · hyperglycaemia · increased risk of infection · influenza like illness · insomnia · lethargy · mucositis · muscle complaints · muscle weakness · nail disorder · nausea · nerve disorders · neurotoxicity · neutropenia · oral disorders · oropharyngeal pain · pain · peripheral oedema · rhinorrhoea · sensation abnormal · skin reactions · sweat changes · tachycardia · taste altered · $thrombocytopenia \cdot tinnitus \cdot vertigo \cdot vomiting \cdot weight$ decreased
- ► **Uncommon** Angioedema · hepatotoxicity · interstitial lung disease · pancreatitis · proteinuria · renal failure · sepsis
- ▶ Rare or very rare Disseminated intravascular coagulation
- ► Frequency not known QT interval prolongation severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during and for up to 3 months after treatment in men or women.
- PREGNANCY Avoid unless essential (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.

- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution (increased risk of neutropenia).

Dose adjustments Manufacturer advises dose reduction—consult product literature.

- RENAL IMPAIRMENT EVGT Use with caution. (*)

 Dose adjustments EVGT Consider dose reduction if creatinine clearance less than 50 mL/minute (risk of increased exposure). (*) See p. 21.
- MONITORING REQUIREMENTS
- Monitor for signs of peripheral neuropathy—severe peripheral neurotoxicity requires treatment delay or dose reduction (consult product literature).
- ECG monitoring recommended in patients prescribed concomitant use of drugs that prolong the QT-interval or who are susceptible to QT-interval prolongation.
- Monitor electrolytes periodically.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Eribulin for treating locally advanced or metastatic breast cancer after 2 or more chemotherapy regimens (December 2016) NICE TA423 Recommended with restrictions
- Eribulin for treating locally advanced or metastatic breast cancer after 1 chemotherapy regimen (March 2018) NICE TA515
 Not recommended

Scottish Medicines Consortium (SMC) decisions

- Eribulin (Halaven®) for the treatment of adult patients with locally advanced or metastatic breast cancer who have progressed after at least one chemotherapeutic regimen for advanced disease (March 2016) SMC No. 1065/15 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Ethanol

Halaven (Eisai Ltd)

Eribulin.44 mg per 1 ml Halaven 0.88mg/2ml solution for injection vials | 1 vial PoM £361.00 (Hospital only)

Hydroxycarbamide

04-Sep-2020

(Hvdroxvurea)

• INDICATIONS AND DOSE

Polycythaemia vera (specialist use only)

- ► BY MOUTH
- Adult: Initially 15–20 mg/kg daily, adjusted according to response, for information on dose adjustment based on haematocrit and platelet count—consult product literature; usual dose 500–1000 mg daily, dosage should be based on actual or ideal body weight, whichever is less

Essential thrombocythaemia (specialist use only)

- ▶ BY MOUTH
- Adult: Initially 15 mg/kg daily, adjusted according to response, for information on dose adjustment based on platelet count and white cell count—consult product literature, dosage should be based on actual or ideal body weight, whichever is less

Chronic myeloid leukaemia (specialist use only)

- ► BY MOUTH
- Adult: Initially 40 mg/kg daily, then reduced to 20 mg/kg daily, adjusted according to response, for information on dose adjustment based on white cell count—consult product literature, dosage should be based on actual or ideal body weight, whichever is less

HYDRF∆ [®]

Chronic myeloid leukaemia (specialist use only) | Cancer of the cervix (specialist use only)

- ▶ BY MOUTH
- Adult: 20-30 mg/kg daily, alternatively 80 mg/kg every 3 days, for information on dose adjustment based on platelet count, white cell count and actual or ideal body weight—consult product literature

SIKLOS

Sickle-cell disease [prevention of recurrent vaso-occlusive crises] (initiated by a specialist)

- ▶ BY MOUTH
- Adult: Initially 15 mg/kg daily, increased in steps of 2.5-5 mg/kg daily, dose to be increased every 12 weeks according to response; usual dose 15-30 mg/kg daily; maximum 35 mg/kg per day

XROMI [©]

Sickle-cell disease [prevention of vaso-occlusive complications] (specialist use only)

- ▶ BY MOUTH
- Adult: Initially 15 mg/kg daily, increased in steps of 5 mg/kg daily, dose to be increased every 8 weeks according to response; usual maintenance 20–25 mg/kg daily; maximum 35 mg/kg per day

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)
- INTERACTIONS → Appendix 1: hydroxycarbamide
- SIDE-EFFECTS
- ▶ Common or very common Alopecia · anaemia · appetite decreased · asthenia · bone marrow disorders · chills · constipation · cutaneous vasculitis · dermatomyositis · diarrhoea · disorientation · dizziness · drowsiness · dyspnoea · dysuria · fever · gastrointestinal discomfort · haemorrhage · hallucination · headache · hepatic disorders · leucopenia · malaise · mucositis · nail discolouration · nail disorder · nausea · neoplasms · neutropenia · oral disorders · pancreatitis · peripheral neuropathy · pulmonary oedema · red blood cell abnormalities · respiratory disorders · seizure · skin reactions · skin ulcers · sperm abnormalities · thrombocytopenia · vomiting
- ► Rare or very rare Cutaneous lupus erythematosus gangrene systemic lupus erythematosus (SLE)
- ► Frequency not known Amenorrhoea · gastrointestinal disorders · hypomagnesaemia · Parvovirus B19 infection · vitamin D deficiency · weight increased
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception before and during treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (unless used for malignant conditions).
- RENAL IMPAIRMENT In sickle-cell disease, avoid if eGFR less than 30 mL/minute/1.73 m². Use with caution in malignant disease.

Dose adjustments In sickle-cell disease, reduce initial dose by 50% if eGFR less than 60 mL/minute/1.73 m².

- MONITORING REQUIREMENTS
- Monitor renal and hepatic function before and during treatment

- Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 to 3 months thereafter (or every 2 weeks if on maximum dose).
- ► Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.
- PATIENT AND CARER ADVICE Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

Hydroxycarbamide oral solution (Xromi®) for the prevention
of vaso-occlusive complications of sickle-cell disease in
patients over 2 years of age (August 2020) SMC No. SMC2271
Recommended with restrictions

All Wales Medicines Strategy Group (AWMSG) decisions

- Hydroxycarbamide oral solution (Xromi[®]) for the prevention of vaso-occlusive complications of sickle-cell disease in patients over 2 years of age (August 2020) AWMSG No. 4264 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 27 EXCIPIENTS: May contain Hydroxybenzoates (parabens)

Xromi (Nova Laboratories Ltd)

Hydroxycarbamide 100 mg per 1 ml Xromi 100mg/ml oral solution sugar-free | 150 ml PoM £250.00 DT = £250.00

Tablet

➤ Siklos (Masters Pharmaceuticals Ltd)

Capsule

- ► Hydroxycarbamide (Non-proprietary)
 - Hydroxycarbamide 500 mg Hydroxycarbamide 500mg capsules | 100 capsule PoM £86.00 DT = £13.05
- Droxia (Imported (United States))
 Hydroxycarbamide 300 mg Droxia 300mg capsules |
 60 capsule PoM S
- ► Hydrea (Bristol-Myers Squibb Pharmaceuticals Ltd)
 Hydroxycarbamide 500 mg Hydrea 500mg capsules |
 100 capsule PoM £10.47 DT = £13.05

Mitotane

09-Sep-2021

 DRUG ACTION Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

• INDICATIONS AND DOSE

Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

- ► BY MOUTH
- Adult: Initially 2–3 g daily in 2–3 divided doses adjusted according to plasma-concentration monitoring, in severe illness initial dose can be increased up to 6 g daily, reduce dose or interrupt treatment if signs of toxicity, discontinue if inadequate response after 3 months

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

• CAUTIONS Avoid in Acute porphyrias p. 1150 · risk of accumulation in overweight patients

- INTERACTIONS → Appendix 1: mitotane
- SIDE-EFFECTS
- ➤ Common or very common Adrenal insufficiency · anaemia · appetite decreased · asthenia · cognitive impairment · confusion · diarrhoea · dizziness · drowsiness · dyslipidaemia · gastrointestinal discomfort · gynaecomastia · headache · hepatic disorders · leucopenia · movement disorders · mucositis · muscle weakness · nausea · paraesthesia · polyneuropathy · rash · thrombocytopenia · vertigo · vomiting
- Frequency not known Encephalopathy · eye disorders · flushing · fungal infection · generalised pain · growth retardation · haemorrhage · hyperpyrexia · hypersalivation · hypertension · hypothyroidism · hypouricaemia · lens opacity · neuro-psychological retardation · ovarian cyst · postural hypotension · proteinuria · taste altered · thyroid disorder · vision disorders
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (limited information available).
- RENAL IMPAIRMENT Ever Caution in mild to moderate impairment; avoid in severe impairment (no information available).
- MONITORING REQUIREMENTS
- ➤ Plasma-mitotane concentration for optimum response 14–20 mg/litre.
- Monitor plasma-mitotane concentration—consult product literature.
- PRESCRIBING AND DISPENSING INFORMATION Corticosteroid replacement therapy Corticosteroid

replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.

- PATIENT AND CARER ADVICE Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency).
 Driving and skilled tasks Central nervous system toxicity may affect performance of skilled tasks (e.g. driving).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 10, 21

Lysodren (HRA Pharma UK & Ireland Ltd)
Mitotane 500 mg Lysodren 500mg tablets | 100 tablet PoM
£590.97 DT = £590.97

Panobinostat

28-Jul-2020

 DRUG ACTION Panobinostat is a histone deacetylase inhibitor, which promotes cell-cycle arrest and apoptosis of tumour cells via multiple pathways.

• INDICATIONS AND DOSE

Treatment of relapsed or refractory multiple myeloma (in combination with bortezomih and dexamethasone), in patients who have received at least two prior regimens, including bortezomib and an immunomodulatory agent

- ▶ BY MOUTH
- Adult 18-74 years: 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles continued -

(48 weeks), for doses of dexamethasone and bortezomib, or dose adjustment due to side-effectsconsult product literature

Adult 75 years and over: 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles: total duration 16 cycles (48 weeks). alternatively initially 15 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 1 cycle, increased if tolerated to 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 7 subsequent cycles, patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), lower dose may be used for the first cycle depending on patient's condition and co-morbidities, for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects-consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to 10 mg with concurrent use of potent inhibitors of CYP3A4; if the potent inhibitor of CYP3A4 is to be continued, consider increasing the dose to 15 mg if tolerated.
- ▶ Manufacturer advises avoid potent inhibitors of CYP3A4 if possible in patients taking a reduced panobinostat dose due to side-effects, or in those with hepatic impairment.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Coagulation disorders elderly OT-interval prolongation • risk factors for OT-interval prolongation CAUTIONS, FURTHER INFORMATION
- Risk factors for OT-interval prolongation Patients at risk of developing OT-interval prolongation include those with long OT syndrome, or uncontrolled or significant cardiac disease.
- INTERACTIONS → Appendix 1: panobinostat
- SIDE-EFFECTS
- ► Common or very common Anaemia · antibiotic associated colitis · appetite decreased · arrhythmias · asthenia · cheilitis · chills · cough · decreased leucocytes · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte imbalance · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hyperuricaemia · hypoalbuminaemia · hypotension · hypothyroidism · increased risk of infection · insomnia · intracranial haemorrhage · joint swelling · malaise · nausea · neutropenia · palpitations · pancytopenia · peripheral oedema · OT interval prolongation · renal failure · respiratory disorders · sepsis · skin reactions · syncope · taste altered · thrombocytopenia · tremor · urinary incontinence · vomiting · weight decreased
- ▶ Uncommon Haemorrhagic shock myocardial infarction SIDE-EFFECTS, FURTHER INFORMATION Side-effects are reported when used in combination with bortezomib and dexamethasone.

Gastro-intestinal disorders Manufacturer advises that patients are treated with anti-diarrhoeals, or any additional treatment, in accordance with local treatment guidelines at the first sign of abdominal cramping or onset of diarrhoea.

 CONCEPTION AND CONTRACEPTION Manufacturer advises exclude pregnancy before starting treatment in women of child-bearing potential, and ensure highly effective contraception used during treatment and for 3 months after last dose. Women using hormonal contraceptives should also use a barrier method of contraception. Highly

- effective contraception also required for men and their female partners during treatment and for 6 months after last dose.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild and moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).

Dose adjustments In mild impairment, manufacturer advises dose reduction to 15 mg for the first treatment cycle, dose may be increased to 20 mg based on patient tolerability; in moderate impairment, manufacturer advises dose reduction to 10 mg for the first treatment cycle, dose may be increased to 15 mg based on patient tolerability.

MONITORING REQUIREMENTS

- Manufacturer advises monitor full blood count before treatment, then frequently during treatment; reduce dose or interrupt treatment if thrombocytopenia or neutropenia occur—consult product literature.
- Manufacturer advises monitor ECG before treatment and repeat periodically before each treatment cycle: OTcF should be <480 milliseconds before treatment initiation consult product literature.
- ▶ Manufacturer advises monitor electrolytes before treatment and periodically as clinically indicated, especially in patients with diarrhoea; monitor thyroid and pituitary function (free T4 and TSH) as clinically indicated; monitor hepatic function before treatment and regularly during treatment as clinically indicated.
- ► Manufacturer advises monitor patients over 65 years more frequently, especially for thrombocytopenia and gastrointestinal toxicity.
- PATIENT AND CARER ADVICE Manufacturer advises that patients and their carers should be told to seek medical advice if severe gastro-intestinal toxicity occurs. Missed doses Manufacturer advises if a dose is missed, it can be taken up to 12 hours after the specified dose time. Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ► Panobinostat for treating multiple myeloma after at least 2 previous treatments (January 2016) NICE TA380 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Cansule

CAUTIONARY AND ADVISORY LABELS 25

Pegaspargase

25-Aug-2020

 DRUG ACTION Pegaspargase breaks down the amino acid L-asparagine, thereby interfering with the growth of malignant cells, which are unable to synthesise Lasparagine.

INDICATIONS AND DOSE

Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
- Adult 18-21 years: 2500 units/m² every 14 days
- Adult 22 years and over: 2000 units/m² every 14 days
- CONTRA-INDICATIONS History of pancreatitis · history of serious haemorrhagic event with previous L-asparaginase therapy · history of serious thrombosis with previous Lasparaginase therapy
- CAUTIONS Concomitant use of other hepatotoxic drugs (particularly in pre-existing hepatic impairment)—monitor hepatic function · diabetes (may raise blood glucose)· hypersensitivity reactions · marked decrease of leukocyte count at start of treatment is possible—may be associated with significant rise in serum uric acid and development of uric acid nephropathy

CAUTIONS, FURTHER INFORMATION

- Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—pegaspargase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises patients should be closely monitored for signs of hypersensitivity during treatment and for an hour after administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.
- INTERACTIONS → Appendix 1: pegaspargase
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · anaemia · appetite decreased · ascites · coagulation disorders · diarrhoea · dyslipidaemia · embolism and thrombosis · febrile neutropenia · hepatic disorders · hyperglycaemia · hypersensitivity · hypoalbuminaemia · hypokalaemia · hypoxia · increased risk of infection · nausea · pain in extremity · pancreatitis (discontinue if suspected and do not restart if confirmed) · peripheral neuropathy · seizure · sepsis · skin reactions · stomatitis · syncope · vomiting · weight decreased
- ▶ Rare or very rare Encephalopathy haemorrhage necrotising pancreatitis
- ► Frequency not known Acute kidney injury bone marrow disorders confusion diabetic ketoacidosis drowsiness fever hyperammonaemia (monitor if symptoms present) hyperglycaemic hyperosmolar nonketotic syndrome hypoglycaemia pancreatic pseudocyst stroke toxic epidermal necrolysis tremor
 - SIDE-EFFECTS, FURTHER INFORMATION There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome in patients receiving pegaspargase.
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in men and women of childbearing potential during treatment and for at least 6 months after discontinuing treatment; pegaspargase may reduce effectiveness of oral contraceptives additional precautions (e.g. barrier method) are required, see also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless essential.
 See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.

- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment.
- MONITORING REQUIREMENTS
- Manufacturer advises trough serum asparaginase activity levels may be measured before the next administration of pegaspargase; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
- Manufacturer advises monitor plasma and urine glucose levels during treatment; monitor coagulation profile at baseline and periodically during and after treatment (particularly with concomitant use of other drugs that inhibit coagulation); monitor serum amylase.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intramuscular injection, volumes over 3 mL must be divided between more than one site.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator between 2–8°C.
- PATIENT AND CARER ADVICE

Pancreatitis Manufacturer advises patients and carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develon.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of confusion and somnolence.

NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

 Pegaspargase for treating acute lymphoblastic leukaemia (September 2016) NICE TA408 Recommended

Scottish Medicines Consortium (SMC) decisions

- Pegaspargase (Oncaspar®) as a component of antineoplastic combination therapy in acute lymphoblastic leukaemia (ALL) in paediatric patients from birth to 18 years, and adult patients (November 2016) SMC No. 1197/16 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Pegaspargase 3750 unit Oncaspar 3,750 unit powder for solution for injection vials | 1 vial PoM £1,296.19 (Hospital only)

Procarbazine

16-Nov-2021

DRUG ACTION Procarbazine is a mild monoamine-oxidase inhibitor

• INDICATIONS AND DOSE

Hodgkin's lymphoma

- ► BY MOUTH
- Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS Pre-existing severe leucopenia pre-existing severe thrombocytopenia
- CAUTIONS Cardiovascular disease · cerebrovascular disease · epilepsy · phaeochromocytoma · procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)
- INTERACTIONS → Appendix 1: procarbazine

- SIDE-EFFECTS
- Common or very common Appetite decreased
- Frequency not known Azoospermia hepatic disorders infection hethargy leucopenia hausea neutropenia ovarian failure pneumonitis skin reactions thrombocytopenia vomiting
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic in animal studies and isolated reports in humans). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- RENAL IMPAIRMENT EVGF Caution in mild to moderate impairment; avoid in severe impairment.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
 Capsule

Procarbazine (as Procarbazine hydrochloride)
50 mg Procarbazine 50mg capsules | 50 capsule PoM £411.35£503 61 DT = £503 61

Raltitrexed

10-Aug-2021

DRUG ACTION Raltitrexed is a thymidylate synthase inhibitor.

• INDICATIONS AND DOSE

Palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used

- ► BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)
- INTERACTIONS → Appendix 1: raltitrexed
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cellulitis · conjunctivitis · constipation · dehydration · diarrhoea · fever · gastrointestinal discomfort · headache · hyperbilirubinaemia · hyperhidrosis · influenza like illness · leucopenia · malaise · mucositis · muscle cramps · muscle tone increased · nausea · neutropenia · oral disorders · pain · peripheral oedema · sepsis · skin reactions · taste altered · thrombocytopenia · vomiting · weight decreased
- ► Frequency not known Gastrointestinal haemorrhage
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during and for at least 6 months after treatment in men or women.
- PREGNANCY See Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment, jaundice or decompensated disease (no information available).
- RENAL IMPAIRMENT [EVGT] Avoid if creatinine clearance less than 25 mL/minute.

Dose adjustments Ever Reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature). See p. 21.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

➤ Tomudex (Pfizer Ltd)
Raltitrexed 2 mg Tomudex 2mg powder for solution for infusion vials
| 1 vial Fom £148.75 (Hospital only)

IMMUNOSTIMULANTS > INTERFERONS

Ropeginterferon alfa-2b

10-Sep-2021

 DRUG ACTION Ropeginterferon alfa-2b is a recombinant interferon alfa-2b conjugated with a two-arm methoxypolyethylene glycol, which increases the persistence of interferon alfa in the blood and decreases the mutated JAK2 V617F allele burden in patients with polycythaemia vera.

• INDICATIONS AND DOSE

Polycythaemia vera (initiated under specialist supervision)

- ► BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)
- CONTRA-INDICATIONS History or presence of autoimmune disease • immunosuppressed transplant patients • severe cardiovascular disease • severe psychiatric disorders (or history of), particularly severe depression, suicidal ideation or attempts • uncontrolled diabetes • uncontrolled thyroid disease
- INTERACTIONS → Appendix 1: interferons
- SIDE-EFFECTS
- Common or very common Alopecia · anaemia · anxiety · appetite decreased · arthralgia · arthritis · asthenia · atrial fibrillation · chills · constipation · depression · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dyspnoea · fever · gastrointestinal discomfort · hepatic disorders · hyperhidrosis · hyperthyroidism · hypertriglyceridaemia · hypothyroidism · increased risk of infection · influenza like illness · leucopenia · mood altered · muscle complaints · nausea · neutropenia · pain · pancytopenia · sensation abnormal · Sjögren's syndrome · skin reactions · sleep disorders · thrombocytopenia · thyroiditis
- ▶ Uncommon Abdominal wall disorder · aortic valve incompetence · atrioventricular block · cardiovascular disorder · cognitive impairment · coronary thrombosis · cough · deafness · erectile dysfunction · eye discomfort · flushing · gastrointestinal disorders · haematospermia · haemorrhage · hallucination · headaches · hypertension · muscle weakness · nail dystrophy · nerve disorders · odynophagia · photosensitivity reaction · pneumonitis · Raynaud's phenomenon · sarcoidosis · sensitivity to weather change · throat irritation · tinnitus · tremor · urinary disorders · vertigo · vision disorders · weight decreased
- PREGNANCY EVGT Avoid—toxicity in animal studies.
- BREAST FEEDING Evgr Avoid—no information available.
- HEPATIC IMPAIRMENT Ever Avoid in severe impairment and decompensated cirrhosis. (♠)
 Dose adjustments Ever Reduce dose if progressive and persistent increases in liver enzyme levels occur—consult product literature. (♠)
- RENAL IMPAIRMENT EVGr Avoid in end-stage renal disease.

Dose adjustments Evgr Reduce dose in severe impairment—consult product literature.

- MONITORING REQUIREMENTS
- ► Ever Full blood count (including haematocrit level, leucocyte and platelet counts), renal function and liver function should be monitored regularly during treatment.

- ► Patients should be monitored for signs of visual disturbances—eye examinations are recommended at baseline and during treatment.
- DIRECTIONS FOR ADMINISTRATION Ever Inject into the thigh or abdomen (except for the 5 cm around the navel); avoid skin that is tender, infected or scarred. ♠ Patients may self-administer Besremi[®] after appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION
 Ropeginterferon alfa-2b is a biological medicine.
 Biological medicines must be prescribed and dispensed by
 brand name, see Biological medicines and Biosimilar
 medicines, under Guidance on prescribing p. 1; record the
 brand name and batch number after each administration.
- HANDLING AND STORAGE Store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage conditions after first
- PATIENT AND CARER ADVICE

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, polysorbates

► Besremi (AOP Orphan Ltd) ▼
Interferon alfa-2b (as Ropeginterferon alfa-2b) 500 microgram per 1 ml Besremi 250micrograms/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £1,782.14

RETINOID AND RELATED DRUGS

Bexarotene

20-Nov-2020

 DRUG ACTION Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. Bexarotene can cause regression of cutaneous T-cell lymphoma.

• INDICATIONS AND DOSE

Skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment

- ► BY MOUTH
- Adult: Initially 300 mg/m² once daily, adjusted according to response, to be taken with a meal

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: ORAL RETINOID MEDICINES: REVISED AND SIMPLIFIED PREGNANCY PREVENTION EDUCATIONAL MATERIALS FOR HEALTHCARE PROFESSIONALS AND WOMEN (JUNE 2019)

Materials to support the Pregnancy Prevention Programme in women and girls of childbearing potential taking oral actiretin, alitretinoin, or isotretinoin have been updated. Oral tretinoin and bexarotene do not have a Pregnancy Prevention Programme in light of their oncology indication and specialist care setting. However, healthcare professionals are advised that these medicines are extremely teratogenic and product information should be consulted for contraceptive and pregnancy testing requirements when used in females of childbearing potential.

Neuropsychiatric reactions have been reported in patients taking oral retinoids. Healthcare professionals are advised to monitor patients for signs of depression or suicidal ideation and refer for appropriate treatment, if necessary; particular care is needed in those with a history of depression. Patients should be advised to speak to their doctor if they experience any changes in

mood or behaviour, and encouraged to ask family and friends to look out for any change in mood.

- CONTRA-INDICATIONS History of pancreatitis hypervitaminosis A uncontrolled hyperlipidaemia uncontrolled hypothyroidism
- CAUTIONS Avoid in Acute porphyrias p. 1150 · history of depression (risk of neuropsychiatric reactions) · hyperlipidaemia · hypothyroidism
- INTERACTIONS → Appendix 1: retinoids
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chills · constipation · deafness · diarrhoea · dizziness · dry eye · dry mouth · dyslipidaemia · eye disorders · gastrointestinal discomfort · gastrointestinal disorders · headaches · hyperhidrosis · hypersensitivity · hypoproteinaemia · hypothyroidism · increased risk of infection · insomnia · leucopenia · lymphadenopathy · muscle complaints · nausea · oedema · oral disorders · pain · pseudolymphoma · sensation abnormal · skin nodule · skin reactions · skin ulcer · thyroid disorder · vomiting · weight changes
- ▶ Uncommon Albuminuria · anxiety · arrhythmias · ataxia · blood disorder · cataract · coagulation disorder · depression · ear disorder · eosinophilia · eye inflammation · fever · gout · haemorrhage · hair disorder · hepatic failure · hyperbilirubinaemia · hypertension · hyperthyroidism · increased leucocytes · mucous membrane disorder · muscle weakness · nail disorder · neoplasms · nerve disorders · pancreatitis · renal impairment · serous drainage · thrombocytopenia · thrombocytosis · varicose veins · vasodilation · vertigo · vision disorders
- Frequency not known Burping · chest pain · confusion · cough aggravated · dehydration · drowsiness · dysphagia · dyspnoea · emotional lability · hypercalcaemia · hyperuricaemia · libido decreased · muscle tone increased · pelvic pain · peripheral vascular disease · red blood cell abnormality · taste altered · thirst · tinnitus · white blood cell abnormalities
- ALLERGY AND CROSS-SENSITIVITY Ever Caution hypersensitivity to retinoids.
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 1 month after treatment in men and women.
- PREGNANCY Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in hepatic insufficiency.
- PATIENT AND CARER ADVICE

Risk of neuropsychiatric reactions The MHRA advises patients and carers to seek medical attention if changes in mood or behaviour occur.

Scottish Medicines Consortium (SMC) decisions

- Bexarotene (Targretin®) for skin manifestations of advanced stage cutaneous T-cell lymphoma (November 2002)
 SMC No. 14/02 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule Targretin (Fisai Ltd)

Bexarotene 75 mg Targretin 75mg capsules | 100 capsule PoM £937.50

Tretinoin

18-May-2021

INDICATIONS AND DOSE

Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

- ► BY MOUTH
- Adult: 45 mg/m² daily in 2 divided doses maximum duration of treatment is 90 days, consult product literature for details of concomitant chemotherapy

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL RETINOID MEDICINES: REVISED AND SIMPLIFIED PREGNANCY PREVENTION EDUCATIONAL MATERIALS FOR HEALTHCARE PROFESSIONALS AND WOMEN (JUNE 2019) Materials to support the Pregnancy Prevention Programme in women and girls of childbearing potential taking oral acitretin, alitretinoin, or isotretinoin have been updated. Oral tretinoin and bexarotene do not have a Pregnancy Prevention Programme in light of their oncology indication and specialist care setting. However, healthcare professionals are advised that these medicines are extremely teratogenic and product information should be consulted for contraceptive and pregnancy testing requirements when used in females of childbearing potential.

Neuropsychiatric reactions have been reported in patients taking oral retinoids. Healthcare professionals are advised to monitor patients for signs of depression or suicidal ideation and refer for appropriate treatment, if necessary; particular care is needed in those with a history of depression. Patients should be advised to speak to their doctor if they experience any changes in mood or behaviour, and encouraged to ask family and friends to look out for any change in mood.

- CAUTIONS History of depression (risk of neuropsychiatric reactions) · increased risk of thromboembolism during first month of treatment
- INTERACTIONS → Appendix 1: retinoids
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · alopecia · anxiety · appetite decreased · arrhythmia · asthma · bone pain · cheilitis · chest pain · chills · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · flushing · headache · hearing impairment · hyperhidrosis · insomnia · intracranial pressure increased · malaise · nasal dryness · nausea · pancreatitis · paraesthesia · respiratory disorders · skin reactions · visual impairment · vomiting
- Frequency not known Embolism and thrombosis erythema nodosum genital ulceration hepatotoxicity hypercalcaemia increased leucocytes myocardial infarction myositis necrotising fasciitis QT interval prolongation stroke thrombocytosis vasculitis SIDE-EFFECTS, FURTHER INFORMATION Retinoic acid syndrome Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.
- CONCEPTION AND CONTRACEPTION Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Teratogenic. See Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Avoid (discontinue breast-feeding).

- HEPATIC IMPAIRMENT Manufacturer advises caution.
 Dose adjustments Manufacturer advises dose reduction to 25 mg/m².
- RENAL IMPAIRMENT

Dose adjustments EvGr Reduce dose to 25 mg/m².

- MONITORING REQUIREMENTS Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.
- PRESCRIBING AND DISPENSING INFORMATION Tretinoin is the acid form of vitamin A
- PATIENT AND CARER ADVICE

Risk of neuropsychiatric reactions The MHRA advises patients and carers to seek medical attention if changes in mood or behaviour occur.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ANTIDOTES AND CHELATORS > IRON CHELATORS

Dexrazoxane

13-Sep-2021

• DRUG ACTION Dexrazoxane is an iron chelator.

INDICATIONS AND DOSE

CARDIOXANE ®

Prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of $300~\text{mg/m}^2$ of doxorubicin or a prior cumulative dose of $540~\text{mg/m}^2$ of epirubicin when further anthracycline treatment is required

- ► BY INTRAVENOUS INFUSION
- Adult: Administer 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose, dose to be given 30 minutes before anthracycline administration

SAVENE®

Anthracycline extravasation

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 1 g/m² daily (max. per dose 2 g) for 2 days, then 500 mg/m² for 1 day, first dose to be given as soon as possible and within 6 hours after injury
- CAUTIONS Myelosuppression (effects may be additive to those of chemotherapy)

CARDIOXANE® Heart failure—no information available · myocardial infarction in previous 12 months—no information available · symptomatic valvular heart disease—no information available · uncontrolled angina—no information available

- INTERACTIONS → Appendix 1: iron chelators
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · appetite decreased · asthenia · constipation · cough · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · embolism and thrombosis · fever · gastrointestinal discomfort · headache · increased risk of infection · leucopenia · myalgia · nail disorder · nausea · neutropenia · peripheral neuropathy · peripheral oedema · post procedural infection · sensation abnormal · skin reactions · stomatitis · syncope ·

tachycardia • thrombocytopenia • tremor • vaginal haemorrhage • vomiting • weight decreased • wound complications

- ► Uncommon Acute myeloid leukaemia · lymphoedema · sepsis · thirst · vertigo
- ► Frequency not known Anaphylactic reaction
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during and for at least 3 months after treatment in men and women.
- PREGNANCY Avoid unless essential (toxicity in animal studies)
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT

CARDIOXANE Manufacturer advises caution (no information available).

Dose adjustments Manufacturer advises if anthracycline dose is reduced, reduce the $Cardioxane^{\circ}$ dose by a similar ratio.

SAVENE [®] Manufacturer advises avoid (no information available).

RENAL IMPAIRMENT

Dose adjustments [EvGr] Reduce dose by 50% if creatinine clearance less than 40 mL/minute. •• See p. 21.

- MONITORING REQUIREMENTS
- ► Monitor full blood count.
- ► Monitor for cardiac toxicity.
- ► Monitor liver function.

• DIRECTIONS FOR ADMINISTRATION

CARDIOXANE For *intravenous infusion*, give intermittently *in* Compound sodium lactate; reconstitute each vial with 25 mL water for injections and dilute each vial with 25–100 mL infusion fluid; give requisite dose over 15 minutes.

SAVENE® For intravenous infusion, give intermittently in diluent; reconstitute each 500-mg vial with 25 mL of diluent; dilute requisite dose further in remaining diluent and give over 1–2 hours into a large vein in an area other than the one affected. Local coolants such as ice packs should be removed at least 15 minutes before administration

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

VITAMINS AND TRACE ELEMENTS > FOLATES

Folinic acid

17-Feb-2021

INDICATIONS AND DOSE

Prevention of methotrexate-induced adverse effects

- ► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 15 mg every 6 hours for 24 hours, to be started usually 12–24 hours after start of methotrexate infusion, dose may be continued by mouth, consult local treatment protocol for further information

Suspected methotrexate overdosage

- ► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Initial dose equal to or exceeding dose of methotrexate, to be given at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

Adjunct to fluorouracil in colorectal cancer

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: (consult product literature)

SODIOFOLIN®

As an antidote to methotrexate

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: (consult product literature)

Adjunct to fluorouracil in colorectal cancer

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Intrathecal injection
- CAUTIONS Avoid simultaneous administration of methotrexate · not indicated for pernicious anaemia or

other megaloblastic anaemias caused by vitamin $B_{12} \ \mbox{deficiency}$

- INTERACTIONS → Appendix 1: folates
- SIDE-EFFECTS
- ► Common or very common
- With intravenous use Bone marrow failure · dehydration · diarrhoea · mucositis · nausea · oral disorders · skin reactions · vomiting
- ▶ Uncommon Fever
- Rare or very rare
- With intramuscular use Agitation (with high doses) depression (with high doses) - epilepsy exacerbated gastrointestinal disorder · insomnia (with high doses) urticaria
- With intravenous use Agitation (with high doses) depression (with high doses) - epilepsy exacerbated gastrointestinal disorder · insomnia (with high doses) sensitisation
- ► Frequency not known
- ▶ With intravenous use Hyperammonaemia
- PREGNANCY Not known to be harmful; benefit outweighs risk.
- BREAST FEEDING Presence in milk unknown but benefit outweighs risk.
- NATIONAL FUNDING/ACCESS DECISIONS

4 Hormone responsive malignancy

Breast cancer

14-Sep-2020

Description of condition

Breast cancer is the most common form of malignancy in women, especially in those aged over 50 years. Established risk factors include age, early onset of menstruation, late menopause, older age at first completed pregnancy, and a family history of breast cancer. The use of oral contraceptives or hormone replacement therapy (HRT) is also associated with an increased risk of breast cancer.

Breast cancer in men is rare. Although risk factors are not fully understood, it may be associated with abnormalities of sex hormone metabolism, including those caused by liver disease or testicular trauma, genetic predisposition, and environmental risk factors such as industrial exposure to chronic heat.

Additional risk factors include obesity and alcohol consumption.

Physical activity and breast-feeding protect against breast cancer.

Non-invasive breast cancer, also known as ductal carcinoma *in situ*, is when the cancer remains localised in the ducts. However, in most cases, the cancer is invasive at the time of diagnosis, which means that malignant cells are liable to spread beyond the immediate area of the tumour. Invasive breast cancer, where malignant cells spread beyond the ducts, can be defined as early breast cancer (stage I/II), locally advanced disease (stage III) and advanced disease (stage IV).

Aims of treatment

Reducing mortality, increasing progression-free and diseasefree survival and improving quality of life are the main aims of treatment, and are dependent on the stage of the disease.

Surgery and radiotherapy aim to remove the tumour mass, whilst adjuvant drug therapy (drug treatment following surgery) aims to reduce the risk of disease recurrence and the risk of developing invasive disease. Neoadjuvant drug therapy (drug treatment before surgery) aims to reduce the size of the tumour to allow breast-conserving surgery to be possible and to reduce axillary lymph node involvement. Advanced breast cancer is not curable, and treatment aims to prolong survival, relieve symptoms and improve quality of life.

Overview

The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these. The course of the disease and the therapeutic approach vary depending on the characteristics of the cancer. Factors such as patient age, menopausal status, tumour size and grade, involvement of axillary lymph nodes or skin, and the presence of hormone receptors within the tumour, may inform the extent and aggressiveness of the disease. [EVG] The risks and benefits of each therapy should be discussed with the patient before being started.

Early and locally advanced breast cancer

For operable breast cancer, treatment involves surgery to the breast (breast-conserving surgery or mastectomy) and to the axillary lymph nodes, with or without radiotherapy to reduce local recurrence rates. This is often followed by adjuvant drug therapy to eradicate the micro-metastases that cause relapses. Evgr In women with invasive breast cancer, radiotherapy is recommended after breast-conserving surgery with clear margins (no cancer cells are found at the edges of the removed tissue), as it reduces local recurrence rates. However, the use of radiotherapy may be omitted if risk of local recurrence is very low and the woman is willing to take adjuvant endocrine therapy for a minimum of 5 years. Radiotherapy is also recommended after mastectomy in patients with node-positive invasive breast cancer or involved resection margins (cancer cells are found at the edges of the removed tissue). It should also be considered in patients with node-negative T3 or T4 invasive breast cancer. Â

Adjuvant drug therapy

Adjuvant drug therapy may include the use of chemotherapy, endocrine therapy, biological therapy, or bisphosphonate therapy. EvGr The decision to use adjuvant drug therapy should be based on the risks and benefits of treatment, disease prognosis and predictive factors such as oestrogen receptor (ER), progesterone receptor (PR), and human epidermal growth receptor 2 (HER2) status of the primary tumour.

In women with invasive breast cancer in only one breast who have not received treatment, including the use of neoadjuvant chemotherapy, NICE clinical guideline 101 recommends the use of the PREDICT tool to estimate prognosis and the absolute benefits of adjuvant therapy (www.predict.nhs.uk). (A)

Chemotherapy

Ever Adjuvant anthracycline–taxane combination chemotherapy is recommended in patients with invasive breast cancer who are at sufficient risk of disease recurrence to require chemotherapy. A The choice of chemotherapy regimen is usually guided by local policy, Cancer Alliances, and the National Cancer Drugs Fund list.

Biological therapy

Evor Trastuzumab p. 958 should be offered to patients with tumour size T1c and above HER2-positive invasive breast cancer, in combination with surgery, chemotherapy, or radiotherapy. It should also be considered in patients with a smaller tumour size (T1a or T1b) depending on their comorbidities, prognosis, and possible toxicity with concomitant chemotherapy. Cardiac function should be regularly assessed in patients receiving trastuzumab p. 958, and particular caution should be taken in patients with underlying cardiac disease (consult product literature for further details).

Endocrine therapy

Evor Tamoxifen p. 1028 should be used as initial adjuvant endocrine therapy in men and premenopausal women with oestrogen-receptor-positive invasive breast cancer. In addition, ovarian function suppression with a gonadotropin-releasing hormone (GnRH) should be considered in premenopausal women, taking into account the risk of temporary menopause. A Ovarian function suppression aims to stop the production of circulating oestrogen, which can stimulate breast cancer progression. It may be most beneficial in women who are at sufficient risk of disease recurrence to have been offered chemotherapy.

Ever In postmenopausal women with oestrogen-receptor positive invasive breast cancer who are at medium or highrisk of disease recurrence, an aromatase inhibitor should be given as first-line therapy. Alternatively, tamoxifen should be given if an aromatase inhibitor is not tolerated or is contra-indicated, or if the risk of disease recurrence is low.

Extended endocrine therapy

Ever Extended endocrine therapy (total duration longer than 5 years) with an aromatase inhibitor [unlicensed indication] should be offered to postmenopausal women with oestrogen-receptor-positive invasive breast cancer at medium or high-risk of disease recurrence who have been taking tamoxifen for 2 to 5 years. Extended therapy should also be considered in postmenopausal women at low risk of disease recurrence.

Extended tamoxifen therapy for longer than 5 years can also be considered in both premenopausal and postmenopausal women with oestrogen-receptor-positive invasive breast cancer.

Endocrine therapy for ductal carcinoma in situ

Evsi Following breast-conserving surgery, endocrine therapy should be offered to women with oestrogen-positive ductal carcinoma *in situ*, if radiotherapy is recommended but not given. If radiotherapy is **not** recommended, the use of endocrine therapy should also be considered. (A)

Bisphosphonate therapy

Zoledronic acid p. 732 and sodium clodronate p. 731 have been shown to improve disease-free survival and overall survival in postmenopausal women with node-positive invasive breast cancer. However, there is insufficient evidence to recommend their use in premenopausal women.

[Ever] Intravenous zoledronic acid [unlicensed indication] or oral sodium clodronate [unlicensed indication] should be offered to postmenopausal women with lymph-node-positive invasive breast cancer. Treatment should be considered in those with lymph-node-negative invasive breast cancer who are at high-risk of recurrence.

Bisphosphonate therapy is also recommended in women at high-risk of osteoporosis due to the use of aromatase inhibitors in postmenopausal women, or in women with treatment-induced premature menopause. For further information, see Guidance for the management of breast cancer treatment-induced bone loss: a consensus position statement from a UK expert group, 2008.

Neoadjuvant drug therapy

Neoadjuvant drug therapy may involve the use of chemotherapy or endocrine therapy.

Chemotherapy

Evor Neoadjuvant chemotherapy should be offered to reduce tumour size in patients with oestrogen-receptor-negative invasive breast cancer. In patients with oestrogen-receptor-positive invasive breast cancer, chemotherapy should be considered. In patients with HER2-positive invasive breast cancer, neoadjuvant chemotherapy should be offered in combination with trastuzumab p. 958 and pertuzumab p. 952.

A chemotherapy regimen containing both a platinum [unlicensed indication] and an anthracycline should be considered in patients with triple-negative invasive breast cancer (oestrogen-receptor-negative, progesterone-receptor negative and HER2-negative).

Endocrine therapy

Ever If chemotherapy is not indicated, neoadjuvant endocrine therapy should be considered as an alternative in postmenopausal women with oestrogen-receptor-positive invasive breast cancer. A Chemotherapy and endocrine therapy are equally effective in postmenopausal women in terms of breast-conservation and shrinking of the tumour. Although chemotherapy is more effective than endocrine therapy at shrinking the tumour in premenopausal women, some tumours may respond to endocrine treatment.

Advanced breast cancer

Treatment of advanced breast cancer depends on the patient's treatment history, disease severity, and oestrogen receptor and HER2 status.

Endocrine therapy

Ever For the majority of patients with oestrogen-receptorpositive advanced breast cancer, endocrine therapy is recommended as first-line treatment. Aromatase inhibitors should be offered to postmenopausal women with no previous history of endocrine treatment, or to those previously treated with tamoxifen p. 1028.

Tamoxifen in combination with ovarian function suppression should be offered as first-line treatment to preand perimenopausal women with oestrogen-receptor-positive advanced breast cancer not previously treated with tamoxifen.

Ovarian function suppression should be offered to preand perimenopausal women who have had disease progression despite treatment with tamoxifen.

Tamoxifen should be offered as first-line treatment to men with oestrogen-receptor-positive advanced breast cancer.

Chemotherapy

Ever Chemotherapy should be offered as first-line treatment in patients with oestrogen-receptor-positive advanced breast cancer that is imminently life-threatening or requires early relief of symptoms because of significant visceral organ involvement. Once chemotherapy treatment is completed, endocrine therapy should be offered. The choice of chemotherapy regimen is usually guided by local policy, Cancer Alliances, and the National Cancer Drugs Fund list.

Biological therapy

Every Trastuzumab is recommended for the treatment of HER2-positive advanced breast cancer. It is used in combination with paclitaxel p. 999 in those who have not

received chemotherapy for metastatic breast cancer, and as monotherapy for patients who have received at least two chemotherapy regimens for metastatic breast cancer (see trastuzumab *National funding/access decisions*). (a)

Bisphosphonate therapy

EvGr The use of bisphosphonates should be considered in patients with metastatic breast cancer to reduce pain and prevent skeletal complications of bone metastases.

Familial breast cancer

EvGr Chemoprevention should be offered to all women who have been identified as being at high-risk of developing breast cancer. Chemoprevention should also be considered in women at moderate-risk. Other strategies to reduce breast cancer risk should also be considered, for example bilateral mastectomy or bilateral oophorectomy. Women who were at high-risk of breast cancer and have undergone a bilateral mastectomy should not receive chemoprevention.

Treatment options for chemoprevention

EvGr Chemoprevention should only be continued for 5 years. Tamoxifen is recommended for premenopausal women

who do not have a history of, or increased risk of thromboembolic disease or endometrial cancer.

Anastrozole p. 1029 [unlicensed indication] is recommended in postmenopausal women who do not have severe osteoporosis, see Osteoporosis p. 725. In women who have severe osteoporosis, or who do not wish to take anastrozole, treatment with tamoxifen can be given, provided there is no history, or increased risk of thromboembolic disease or endometrial cancer. Alternatively, raloxifene hydrochloride p. 814 is an option [unlicensed indication] in postmenopausal women with a uterus who do not wish to take tamoxifen, unless there is a history or increased risk of thromboembolic disease.

Treatment of menopausal symptoms

Ever Some treatments used in the management of breast cancer, such as tamoxifen or ovarian function suppression may lead to menopausal symptoms or early menopause, and women should be counselled about these side-effects prior to starting any of these treatments.

Women diagnosed with breast cancer should discontinue their hormone replacement therapy (HRT) because of possible tumour stimulation and interference with adjuvant endocrine therapy. HRT should not be offered routinely to women with menopausal symptoms if they have a history of breast cancer; however, in exceptional circumstances, HRT can be offered to women with severe menopausal symptoms once the associated risks have been discussed.

Selective serotonin re-uptake inhibitor (SSRIs) antidepressants may be offered to relieve menopausal symptoms such as hot flushes in women with breast cancer who are not taking tamoxifen. Clonidine hydrochloride p. 161, venlafaxine p. 400 [unlicensed indication] and gabapentin p. 343 [unlicensed indication] are sometimes used for the treatment of hot flushes in women with breast cancer after discussion with the patient and information given about side effects. The MHRA/CHM have released important safety information on the use of antiepileptic drugs and the risk of suicidal thoughts and behaviour. For further information, see Epilepsy p. 330.

Prostate cancer

26-Nov-2021

Description of condition

Prostate cancer is the most common form of cancer affecting men. It can also affect transgender women, as the prostate is usually conserved after gender-confirming surgery. The main risk factors are age (most cases being diagnosed in men over 70 years of age), ethnicity (more common in black African-Caribbean men), obesity, and a familial component. Prostate cancer is usually slow-growing and asymptomatic at diagnosis, however, the presenting symptoms of advanced disease are usually urinary outflow obstruction, or, pelvic or back pain due to bone metastases. Treatment decisions are guided by baseline prostate specific antigen (PSA) levels, tumour grade (Gleason score), the stage of the tumour, the patient's life expectancy (based on age and comorbid conditions), treatment morbidity, and patient preference.

Aims of treatment

Reducing mortality, increasing progression-free and diseasefree survival and improving quality of life are the main aims of treatment, and are dependent on the stage of disease.

Watchful waiting or active surveillance aim to monitor for disease progression, while radical treatments such as prostatectomy and radiotherapy aim to eliminate the malignancy. Hormone therapy and chemotherapy aim to slow the progression of prostate cancer and to control symptoms. In metastatic disease, treatment is aimed at prolonging survival and relieving symptoms.

Overview

Ever Treatment options for patients with prostate cancer include watchful waiting, active surveillance, prostatectomy, radiotherapy (such as external beam), brachytherapy, hormone therapy, and chemotherapy. The benefits and risks of each option should be discussed with patients.

Watchful waiting is a strategy for 'controlling' rather than 'curing' prostate cancer and is aimed at patients in whom curative treatment is unsuitable or declined. It involves monitoring for disease progression and is often suitable in patients not likely to suffer significant morbidity from their prostate cancer. Active surveillance, a 'curative' strategy, is aimed at patients who do not wish to have immediate treatment. It involves the deferred use of radical treatment until disease progression occurs or until the patient requests treatment. For information on monitoring in watchful waiting or the protocol for active surveillance, see NICE clinical guideline **Prostate cancer** (see *Useful resources*).

Evg: At any stage of care, when moving from active surveillance to radical treatment, patient preferences, comorbidities and life expectancy should be taken into account.

Hormone therapy includes anti-androgen therapy—to block the effects of androgens, androgen deprivation therapy such as a luteinising hormone-releasing hormone (LHRH) agonist, or a gonadorelin antagonist—to reduce androgen levels, and bilateral orchidectomy—to remove the endogenous supply of androgens.

In patients with localised prostate cancer, the choice of treatment is guided by whether the disease is considered low, intermediate, or high risk according to the Gleason score, the serum PSA level, and the tumour clinical stage. High risk localised prostate cancer is also included in the definition of locally advanced prostate cancer. For further information on risk stratification, see NICE clinical guideline **Prostate cancer** (see *Useful resources*).

Localised or locally advanced prostate cancer

EvGr In patients with low-risk localised prostate cancer, offer a choice between active surveillance, radical prostatectomy or radiotherapy.

Radical treatment should be offered to patients with localised prostate cancer undergoing active surveillance who show evidence of disease progression.

In patients with **intermediate-risk localised prostate cancer**, radical treatments (prostatectomy or radiotherapy) should be offered, and for those who decline them, active surveillance can be considered.

In patients with high-risk localised prostate cancer (when there is a realistic prospect of long-term disease control), and in those with locally advanced disease, radical prostatectomy or radiotherapy should be offered.

In patients with intermediate-risk and high-risk localised prostate cancer who have chosen radical radiotherapy, this should be offered in combination with androgen deprivation therapy. Androgen deprivation therapy should be given for 6 months before, during or after radiotherapy; in patients with high-risk localised prostate cancer, consider continuing therapy for up to 3 years. Brachytherapy in combination with radiotherapy can also be considered in these patients.

In patients with newly diagnosed **non-metastatic prostate cancer** discuss the option of chemotherapy with docetaxel p. 998 [unlicensed indication] if they are starting long term androgen deprivation therapy, have no significant co-morbidities and have high-risk disease.

In patients with hormone-relapsed non-metastatic prostate cancer who are at high risk of developing metastatic disease, darolutamide p. 1022 or apalutamide p. 1021, with androgen deprivation therapy is recommended as a treatment option. If a patient's prostate cancer metastasised while on treatment with darolutamide or apalutamide, it would be expected to be resistant to treatment with enzalutamide or abiraterone for metastatic disease because of the similar way these drugs work.

Evor Pelvic radiotherapy should be considered in those with locally advanced prostate cancer who have a higher than 15% risk of pelvic lymph node involvement and are to receive neoadjuvant hormonal therapy and radical radiotherapy.

Metastatic prostate cancer

Ever Patients with newly diagnosed metastatic prostate cancer who do not have significant comorbidities, should be offered chemotherapy with docetaxel.

Bilateral orchidectomy should be offered to all patients with **metastatic prostate** cancer as an alternative to continuous LHRH agonist treatment. Anti-androgen monotherapy with bicalutamide p. 1022 [unlicensed indication] can be offered to those who are willing to accept the adverse impact on overall survival and gynaecomastia, in the hope of retaining sexual function. However, if satisfactory sexual function is not maintained, stop bicalutamide and start androgen deprivation therapy.

Abiraterone acetate p. 1021 (in combination with prednisone or prednisolone p. 747) and enzalutamide

p. 1023 are both recommended as options for the treatment of hormone-relapsed metastatic prostate cancer in patients who have no or mild symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated.

In patients with **hormone-relapsed metastatic prostate cancer**, chemotherapy with docetaxel can be used. It is recommended that treatment with docetaxel is stopped after 10 cycles, or if severe adverse events occur, or if there is evidence of disease progression.

Abiraterone acetate (in combination with prednisone or prednisolone) and enzalutamide are also recommended in **hormone-relapsed metastatic prostate cancer** if disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen.

In patients with **hormone-relapsed metastatic prostate** cancer, a corticosteroid such as dexamethasone p. 743 can be offered as third line therapy after androgen deprivation therapy and anti-androgen therapy.

In patients with **hormone-relapsed metastatic prostate cancer**, zoledronic acid p. 732 can be considered to prevent or reduce skeletal-related events.

Bisphosphonates can be considered for pain relief in **hormone-relapsed metastatic prostate cancer** when other treatments have failed to give satisfactory pain relief.

Management of side-effects of treatment

Ever Patients should be informed about the side-effects of treatment; particularly urinary and sexual dysfunction, loss of fertility, radiation-induced enteropathy, osteoporosis, gynaecomastia, fatigue, and hot flushes.

Tumour flare due to an initial surge in testosterone concentrations has been reported in the initial stages of treatment with LHRH agonists; the manufacturers advise that the use of prophylactic anti-androgen therapy (such as cyproterone acetate p. 830) should be considered.

Evgr Medroxyprogesterone acetate p. 876 [unlicensed indication] can be used, initially for up to 10 weeks, to manage troublesome hot flushes caused by long-term androgen suppression; cyproterone acetate can be considered as an alternative if medroxyprogesterone acetate is not effective or not tolerated. (A)

The MHRA/CHM have issued important safety information on the use of cyproterone acetate and risk of meningioma. For further information, see *Important safety information* for cyproterone acetate.

Evgr Patients who experience loss of sexual function should have access to specialist erectile dysfunction services and be considered for treatment with a phosphodiesterase type-5 inhibitor.

Patients who are on androgen deprivation therapy should be offered a supervised exercise program (at least twice a week for 12 weeks) to reduce fatigue and improve quality of life.

A bisphosphonate should be offered to patients who have osteoporosis and who are having androgen deprivation therapy; denosumab p. 734 is an alternative if bisphosphonates are not appropriate.

Although there is limited evidence, intermittent therapy may be considered for patients who are having long-term androgen deprivation therapy to reduce side-effects.

Gynaecomastia can occur with long-term (longer than 6 months) bicalutamide p. 1022 treatment. Prophylactic radiotherapy (within the first month of treatment) should be offered; or if radiotherapy is unsuccessful, weekly tamoxifen p. 1028 [unlicensed indication] can be considered.

ANTINEOPLASTIC DRUGS > ANTI-ANDROGENS

Abiraterone acetate

10-Sep-2021

INDICATIONS AND DOSE

Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen (in combination with prednisone or prednisolone) | Metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated (in combination with prednisone or prednisolone) | High risk metastatic hormone-sensitive prostate cancer in newly diagnosed patients (in combination with androgen deprivation therapy, and prednisone or prednisolone)

- ► BY MOUTH
- Adult: 1 g once daily, for dose of concurrent prednisone or prednisolone—consult product literature
- CAUTIONS Diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently) history of cardiovascular disease

CAUTIONS, FURTHER INFORMATION

- Cardiovascular disease Manufacturer advises correct hypertension and hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure, uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring).
- INTERACTIONS → Appendix 1: anti-androgens
- SIDE-EFFECTS
- ► Common or very common Angina pectoris · arrhythmias · bone fracture · diarrhoea · dyspepsia · haematuria · heart failure · hepatic disorders · hypertension · hypertriglyceridaemia · hypokalaemia · left ventricular dysfunction · osteoporosis · peripheral oedema · rash · sepsis · urinary tract infection
- ▶ Uncommon Adrenal insufficiency myopathy
- ► Rare or very rare Alveolitis allergic
- ► Frequency not known Myocardial infarction QT interval prolongation
- CONCEPTION AND CONTRACEPTION Men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises use with caution in moderate impairment and only if benefit clearly outweighs risk; avoid in severe impairment.
- RENAL IMPAIRMENT EVGT Caution in severe impairment (no information available).
- MONITORING REQUIREMENTS
- Monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for management of hypertension, hypokalaemia and oedema.
- Monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for

- details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (updated July 2016) NICE TA259 Recommended with restrictions
- Abiraterone for treating metastatic hormone-relapsed prostate cancer before chemotherapy is indicated (updated July 2016) NICE TA387 Recommended with restrictions
- Abiraterone for treating newly diagnosed high-risk hormonesensitive metastatic prostate cancer (August 2021) NICE TA721
 Not recommended

Scottish Medicines Consortium (SMC) decisions

- Abiraterone acetate (Zytiga®) with prednisone or prednisolone for the treatment of metastatic castrationresistant prostate cancer (mCRPC) in adult men whose disease has progressed on or after a docetaxel-based chemotherapy regimen (August 2012) SMC No. 764/12 Recommended with restrictions
- Abiraterone acetate (Zytiga®) is indicated with prednisone or prednisolone for the treatment of metastatic castrationresistant prostate cancer (mCRPC) in adult men who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated (October 2015) SMC No. 873/13 Recommended
- Abiraterone acetate (Zytiga®) with prednisone or prednisolone for the treatment of adult men with newly diagnosed high-risk metastatic hormone-sensitive prostate cancer (mHSPC) in combination with androgen deprivation therapy (ADT) (January 2020) SMC No. SMC2215 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

- Adult: Initially 240 mg, to be administered as 2 injections of 120 mg, then 80 mg every 28 days, dose to be administered into the abdominal region
- CAUTIONS Diabetes · susceptibility to QT-interval prolongation
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · chills · diarrhoea · dizziness · fatigue · fever · gynaecomastia · headache · hot flush · influenza like illness · insomnia · musculoskeletal discomfort · musculoskeletal pain · nausea · sexual dysfunction · skin reactions · sweat changes · testicular disorders · weight changes
- ► Uncommon Alopecia · appetite decreased · arrhythmias · bone disorders · breast pain · cognitive impairment · constipation · depression · diabetes mellitus · dry mouth ·

- dyspnoea · gastrointestinal discomfort · genital discomfort · hyperglycaemia · hypertension · hypotension · joint disorders · malaise · muscle spasms · muscle weakness · numbness · palpitations · pelvic pain · peripheral oedema · QT interval prolongation · renal impairment · urinary disorders · vision blurred · vomiting
- Rare or very rare Febrile neutropenia · heart failure · injection site necrosis · myocardial infarction
- HEPATIC IMPAIRMENT Manufacturer advises caution (limited information available)—monitor liver function.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—no information available.
- MONITORING REQUIREMENTS Monitor bone density.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Degarelix for treating advanced hormone-dependent prostate cancer (August 2016) NICE TA404 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► Firmagon (Ferring Pharmaceuticals Ltd)

Degarelix (as Degarelix acetate) 80 mg Firmagon 80 mg powder and solvent for solution for injection vials | 1 vial PoM £129.37 DT = £129.37 DT =

Degarelix (as Degarelix acetate) 120 mg Firmagon 120mg powder and solvent for solution for injection vials | 2 vial Pom £260.00 DT = £260.00

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOSTATIN ANALOGUES

Somatostatin analogues

- CAUTIONS Diabetes mellitus (antidiabetic requirements may be altered) • growth hormone-secreting pituitary tumours can expand during treatment (causing serious complications) • insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses)
- SIDE-EFFECTS
- ► Common or very common Alopecia · appetite decreased · asthenia · cholecystitis · cholelithiasis (following long term use) · cholestasis · constipation · diabetes mellitus · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · glucose tolerance impaired (following long term use) · headache · hyperglycaemia (long term use) · hypoglycaemia · myalgia · nausea · pruritus · sinus bradycardia · vomiting
- MONITORING REQUIREMENTS
- Monitor for signs of tumour expansion (e.g. visual field defects).
- ➤ Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment.
- DIRECTIONS FOR ADMINISTRATION Injection sites should be rotated.

07-Apr-2021

Lanreotide

INDICATIONS AND DOSE

SOMATULINE AUTOGEL®

Acromegaly (if somatostatin analogue not given previously)

- ► BY DEEP SUBCUTANEOUS INJECTION
- Adult: Initially 60 mg every 28 days, adjusted according to response, (consult product literature), for patients treated previously with somatostatin analogue, consult product literature for initial dose, dose to be given in the gluteal region

Neuroendocrine (particularly carcinoid) tumours

- ► BY DEEP SUBCUTANEOUS INJECTION
- ► Adult: Initially 60–120 mg every 28 days, adjusted according to response, dose to be given in the gluteal region

Unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded

- ► BY DEEP SUBCUTANEOUS INJECTION
- Adult: 120 mg every 28 days

SOMATULINE LA ®

Acromegaly and neuroendocrine (particularly carcinoid) tumours

- ► BY INTRAMUSCULAR INJECTION
- Adult: Initially 30 mg every 14 days, increased to 30 mg every 7–10 days, adjusted according to response

Thyroid tumours

- **▶** BY INTRAMUSCULAR INJECTION
- Adult: Initially 30 mg every 14 days, increased to 30 mg every 10 days, adjusted according to response
- CAUTIONS Cardiac disorders (including bradycardia)
- INTERACTIONS → Appendix 1: lanreotide
- CIDE EFFECT
- ► Common or very common Biliary dilatation · lethargy · musculoskeletal pain · weight decreased
- ▶ Uncommon Hot flush · insomnia
- ► Frequency not known Pancreatitis
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises caution—no information available.
- MONITORING REQUIREMENTS Monitor for hypothyroidism when clinically indicated.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

All Wales Medicines Strategy Group (AWMSG) decisions

- Lanreotide (Somatuline® Autogel®) for treatment of grade 1 and a subset of grade 2 (Ki67 index up to 10 %) gastroenteropancreatic neuroendocrine tumours (GEP-NETs) of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded, in adult patients with unresectable locally advanced or metastatic disease (September 2018) AWMSG No. 1988 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Somatuline Autogel (Ipsen Ltd)

Lanreotide (as Lanreotide acetate) 120 mg per 1 ml Somatuline Autogel 60mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection PoM £551.00 DT = £551.00

Lanreotide (as Lanreotide acetate) 180 mg per 1 ml Somatuline Autogel 90mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection PoM £736.00 DT = 5736.00

Lanreotide (as Lanreotide acetate) 240 mg per 1 ml Somatuline Autogel 120mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection PoM £937.00 DT = £937.00

Powder and solvent for suspension for injection

Somatuline LA (Ipsen Ltd)

Lanreotide (as Lanreotide acetate) 30 mg Somatuline LA 30mg powder and solvent for suspension for injection vials | 1 vial PoM £323.00 DT = £323.00

F 1024 14-Sen-2020

Octreotide

INDICATIONS AND DOSE

INDICATIONS AND DOSE

Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas

- ► BY SUBCUTANEOUS INJECTION
 - Adult: Initially 50 micrograms 1–2 times a day, adjusted according to response; increased to 200 micrograms 3 times a day, higher doses may be required exceptionally; maintenance doses are variable; in carcinoid tumours, discontinue after 1 week if no effect, if rapid response required, initial dose may be given by intravenous injection (with ECG monitoring and after dilution)

Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective

- ► BY SUBCUTANEOUS INJECTION
- Adult: 100–200 micrograms 3 times a day, discontinue if no improvement within 3 months

Prevention of complications following pancreatic surgery

- ► BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

Test dose before use of depot preparation

- ► BY SUBCUTANEOUS INJECTION
- Adult: Test dose 50-100 micrograms for 1 dose, test dose should be given if subcutanous octreotide not previously given

Acromegaly | Neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide

- ▶ BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION
- Adult: Initially 20 mg every 4 weeks for 3 months then adjusted according to response, increased if necessary up to 30 mg every 4 weeks, to be administered into the gluteal muscle, for *acromegaly*, start depot 1 day after the last dose of subcutaneous octreotide, for *neuroendocrine tumours*, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded

- ▶ BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION
- Adult: 30 mg every 4 weeks

Reduce intestinal secretions in palliative care | Reduce vomiting due to bowel obstruction in palliative care

- ► BY CONTINUOUS SUBCUTANEOUS INFUSION
- Adult: 0.25-0.5 mg/24 hours (max. per dose 0.75 mg/24 hours), occasionally doses higher than the maximum are sometimes required
- INTERACTIONS → Appendix 1: octreotide
- SIDE-EFFECTS
- ➤ Common or very common Arrhythmias · biliary sludge · dyspnoea · hyperbilirubinaemia · hypothyroidism · skin reactions · thyroid disorder
- ▶ Uncommon Dehydration
- ► Frequency not known Hepatic disorders pancreatitis acute (after administration) thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION Administering nondepot injections of octreotide between meals and at bedtime may reduce gastrointestinal side-effects.

- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment.
- PREGNANCY Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased half-life in cirrhosis).

Dose adjustments Manufacturer advises consider dose reduction—consult product literature.

- MONITORING REQUIREMENTS
- ▶ Monitor thyroid function on long-term therapy.
- ► Monitor liver function.
- With intravenous use ECG monitoring required with intravenous administration.
- TREATMENT CESSATION Avoid abrupt withdrawal of shortacting subcutaneous octreotide (associated with biliary colic and pancreatitis).
- DIRECTIONS FOR ADMINISTRATION For intravenous injection or intravenous infusion, manufacturer advises dilute requisite dose to a ratio of at least 1:1 and up to a maximum of 1:9 by volume with Sodium Chloride 0.9%.
- PRESCRIBING AND DISPENSING INFORMATION

Palliative care For further information on the use of octreotide in palliative care, see www.medicinescomplete. com/#/content/palliative/octreotide.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

All Wales Medicines Strategy Group (AWMSG) decisions

- Octreotide (Sandostatin® LAR®) for the treatment of patients with advanced neuroendocrine tumours of the midgut or of unknown primary origin where non-midgut sites of origin have been excluded (September 2018) AWMSG No. 3732 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Octreotide (Non-proprietary)

Octreotide (as Octreotide acetate) 50 microgram per

1 ml Octreotide 50micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection PoM £18.85-£19.54 DT = £19.54

1 ml Sandostatin 500micrograms/1ml solution for injection ampoules | 5 ampoule PoM £135.47 DT = £135.47

Powder and solvent for suspension for injection

Olatuton (Teva UK Ltd)

Octreotide (as Octreotide acetate) 10 mg Olatuton 10mg powder and solvent for prolonged-release suspension for injection vials | 1 vial PoM £494.74 DT = £549.71

Octreotide (as Octreotide acetate) 20 mg Olatuton 20mg powder and solvent for prolonged-release suspension for injection vials | 1 vial PoM £719.40 DT = £799.33

Octreotide (as Octreotide acetate) 30 mg Olatuton 30mg powder and solvent for prolonged-release suspension for injection vials | 1 vial Pom £898.57 DT = £998.41

Sandostatin LAR (Novartis Pharmaceuticals UK Ltd)
 Octreotide (as Octreotide acetate) 10 mg
 Sandostatin LAR 10mg
 powder and solvent for suspension for injection vials | 1 vial [PoM]
 5549.71 DT = 5549.71

Octreotide (as Octreotide acetate) 20 mg Sandostatin LAR 20mg powder and solvent for suspension for injection vials | 1 vial PoM £799.33 DT = £799.33

Octreotide (as Octreotide acetate) 30 mg Sandostatin LAR 30mg powder and solvent for suspension for injection vials | 1 vial PoM £998.41 DT = £998.41

F 1024

Pasireotide

22-Jan-2019

• INDICATIONS AND DOSE

Cushing's disease [when surgery has failed or is inappropriate]

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 600 micrograms twice daily for 2 months, then increased if necessary to 900 micrograms twice daily, consider discontinuation if no response after 2 months of treatment, for dose adjustment due to side-effects—consult product literature
- ► BY DEEP INTRAMUSCULAR INJECTION
- Adult: Initially 10 mg every 4 weeks, increased if necessary up to 40 mg every 4 weeks, dose may be titrated every 2–4 months based on response and tolerability, consider discontinuation if no clinical benefit observed, for dose adjustment due to sideeffects—consult product literature

Acromegaly [when surgery has failed or is inappropriate, and control with another somatostatin analogue is inadequate]

- ► BY DEEP INTRAMUSCULAR INJECTION
- Adult: Initially 40 mg every 4 weeks, increased if necessary up to 60 mg every 4 weeks, dose may be increased if levels of growth hormone and/or insulinlike growth factor-1 are not fully controlled after 3 months of initial dosing, for dose adjustment due to side-effects—consult product literature
- CAUTIONS Cardiac disorders (including bradycardia) susceptibility to QT-interval prolongation (including electrolyte disturbances)
- INTERACTIONS → Appendix 1: pasireotide
- SIDE-EFFECTS
- ► Common or very common Adrenal insufficiency arthralgia hypotension QT interval prolongation
- ▶ Uncommon Anaemia
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment (risk of increased exposure); avoid in severe impairment.

Dose adjustments

▶ With subcutaneous use for Cushing's disease Manufacturer advises reduce initial dose to 300 micrograms twice

daily (max. dose 600 micrograms twice daily) in moderate impairment.

- With intramuscular use for Cushing's disease Manufacturer advises max. dose 20 mg every four weeks in moderate impairment.
- When used for Acromegaly Manufacturer advises reduce initial dose to 20 mg every four weeks (max. dose 40 mg every four weeks) in moderate impairment.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—increased plasma-pasireotide exposure.
- MONITORING REQUIREMENTS
- Manufacturer advises consider monitoring pituitary function before treatment initiation and periodically thereafter.
- With subcutaneous use Manufacturer advises monitor liver function before treatment initiation, after 1, 2, 4, 8, and 12 weeks of treatment, and thereafter as clinically indicated. Manufacturer advises assess glycaemic status before treatment initiation, weekly for the first 2–3 months of treatment, over the first 2–4 weeks after any dose increase, periodically thereafter, and 3 months after treatment is complete—if glycaemic control is poor, diabetes management and monitoring should be intensified before and during treatment. Manufacturer advises monitor ECG and electrolytes before treatment initiation, after one week of treatment, and periodically thereafter.
- With intramuscular use Manufacturer advises monitor liver function before treatment initiation, after the first 2–3 weeks of treatment, then monthly for 3 months, and thereafter as clinically indicated. Manufacturer advises assess glycaemic status before treatment initiation, weekly for the first 3 months of treatment, over the first 4–6 weeks after any dose increase, periodically thereafter, and 3 months after treatment is complete—if glycaemic control is poor, diabetes management and monitoring should be intensified before and during treatment. Manufacturer advises monitor ECG and electrolytes before treatment initiation, after 3 weeks of treatment, and periodically thereafter.
- PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations

- When used for Cushing's disease There are no clinical data available on switching between formulations; if a switch is required, manufacturer advises to maintain an interval of at least 28 days between the last intramuscular injection and the first subcutaneous injection—for further information, consult product literature.
- PATIENT AND CARER ADVICE Manufacturer advises
 patients and their carers should be informed of the signs
 and symptoms of hypocortisolism (including weakness,
 fatigue, anorexia, nausea, vomiting, hypotension,
 hyperkalaemia, hyponatraemia, hypoglycaemia).
 Driving and skilled tasks Manufacturer advises patients and
 carers should be counselled on the effects on driving and
 performance of skilled tasks—increased risk of fatigue and
 dizziness.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Signifor (Recordati Rare Diseases UK Ltd)

Pasireotide (as Pasireotide diaspartate) 300 microgram per 1 ml Signifor 0.3mg/1ml solution for injection ampoules | 60 ampoule PoM £2,800.00

PROGESTOGENS

Megestrol acetate

31-Jan-2020

• INDICATIONS AND DOSE

Treatment of breast cancer

- ▶ BY MOUTH
- Adult: 160 mg once daily
- CONTRA-INDICATIONS Acute porphyrias p. 1150
- CAUTIONS Elderly · history of thrombophlebitis
- SIDE-EFFECTS
- ➤ Common or very common Adrenal insufficiency · alopecia appetite increased · asthenia · carpal tunnel syndrome · constipation · Cushing's syndrome · diabetes mellitus · diarrhoea · dyspnoea · embolism and thrombosis · erectile dysfunction · flatulence · glucose tolerance impaired · heart failure · hot flush · hypercalcaemia · hyperglycaemia · hypertension · lethargy · menorrhagia · mood altered · nausea · oedema · pain · skin reactions · tumour flare · urinary frequency increased · vomiting · weight increased
- PREGNANCY Avoid. Reversible feminisation of male fetuses reported in animal studies. Risk of hypospadias in male fetuses and masculinisation of female fetuses.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Oral suspension

► Megestrol acetate (Non-proprietary)

Megestrol acetate 40 mg per 1 ml Megestrol 200mg/5ml oral suspension | 240 ml [PoM] [复]

Γablet

► Megestrol acetate (Non-proprietary)

Megestrol acetate 40 mg Megestrol 40mg tablets | 100 tablet **⑤** DT = £265.72

Megace (Bausch & Lomb UK Ltd)

Megastrol acetate 160 mg Megace 160mg tablets | 30 tablet PoM

4.1 Hormone responsive breast cancer

ANTINEOPLASTIC DRUGS > ANTI-OESTROGENS

Fulvestrant

10-Aug-2021

• INDICATIONS AND DOSE

Oestrogen-receptor-positive breast cancer

- ► BY DEEP INTRAMUSCULAR INJECTION
- Adult: 500 mg every 2 weeks for the first 3 doses, then 500 mg every month, to be administered into the buttock
- INTERACTIONS → Appendix 1: fulvestrant
- SIDE-EFFECTS
- Common or very common Appetite decreased · arthralgia asthenia · diarrhoea · headache · hot flush · hypersensitivity · increased risk of infection · nausea · pain · rash · vaginal haemorrhage · venous thromboembolism · vomiting
- ▶ Uncommon Hepatic disorders vaginal discharge
- ► Frequency not known Myalgia
- PREGNANCY Manufacturer advises avoid—increased incidence of fetal abnormalities and death in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment—risk of increased exposure; avoid in severe impairment—no information available.
- RENAL IMPAIRMENT Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available. See p. 21.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Fulvestrant for untreated locally advanced or metastatic oestrogen-receptor positive breast cancer (January 2018)
 NICE TA503 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ► Fulvestrant (Non-proprietary)
 - Fulvestrant 50 mg per 1 ml Fulvestrant 250mg/5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection PoM £522.41 DT = £522.41 (Hospital only)
- ► Faslodex (AstraZeneca UK Ltd)
 Fulvestrant 50 mg per 1 ml Faslodex 250mg/5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection PoM 5522.41 DT = 5522.41

Tamoxifen

28-Jul-2020

 DRUG ACTION An anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct in the treatment of female infertility.

INDICATIONS AND DOSE

Pre- and perimenopausal women with oestrogenreceptor-positive breast cancer not previously treated with tamoxifen

- ► BY MOUTH
- Adult: 20 mg daily

Anovulatory infertility

- ► BY MOUTH
- Adult: Initially 20 mg daily on days 2, 3, 4 and 5 of cycle, if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs

Gynaecomastia [prevention in men undergoing long-term bicalutamide treatment, if radiotherapy unsuccessful]

- BY MOUTH
- Adult: 20 mg once weekly

Breast cancer [chemoprevention in women at moderateto-high risk]

- ► BY MOUTH
- Adult: 20 mg daily for 5 years
- UNLICENSED USE Tamoxifen may be used as detailed below, although these situations are considered outside the scope of its licence:
 - EvGr the prevention of gynaecomastia in men (A).
- CONTRA-INDICATIONS Treatment of infertility contraindicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism
- CAUTIONS Acute porphyrias p. 1150
- INTERACTIONS → Appendix 1: tamoxifen
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · cataract · cerebral ischaemia · constipation · diarrhoea · dizziness · embolism and thrombosis · fatigue · fluid retention · headache · hepatic disorders · hot flush · hypersensitivity · hypertriglyceridaemia · muscle complaints · nausea · neoplasms · retinopathy · sensation abnormal · skin reactions · taste altered · uterine disorders · vaginal haemorrhage · vomiting · vulvovaginal disorders
- ► Uncommon Hypercalcaemia · interstitial pneumonitis · leucopenia · pancreatitis · thrombocytopenia · vision disorders
- ► Rare or very rare Agranulocytosis · angioedema · corneal changes · cutaneous lupus erythematosus · cutaneous vasculitis · cystic ovarian swelling · nerve disorders · neutropenia · radiation recall reaction · Stevens-Johnson syndrome · tumour flare
- ▶ Frequency not known Amenorrhoea

SIDE-EFFECTS, FURTHER INFORMATION Endometrial changes Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen.

Risk of thromboembolism Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment and initiating anticoagulant measures).

- CONCEPTION AND CONTRACEPTION Unless being used in the treatment of female infertility, effective contraception must be used during treatment and for 2 months after stopping. Patients being treated for infertility should be warned that there is a risk of multiple pregnancy (rarely more than twins).
- PREGNANCY Avoid—possible effects on fetal development.
- BREAST FEEDING Suppresses lactation. Avoid unless potential benefit outweighs risk.

PRESCRIBING AND DISPENSING INFORMATION

Patient decision aids Taking tamoxifen to reduce the chance of developing breast cancer: premenopausal women at moderately increased risk; Taking tamoxifen to reduce the chance of developing breast cancer: premenopausal women at high risk. National Institute for Health and Care Excellence. March 2017.

www.nice.org.uk/about/what-we-do/our-programmes/nice-guidance/nice-guidelines/shared-decision-making

PATIENT AND CARER ADVICE

Endometrial changes Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly.

Thromboembolism Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

► Tamoxifen (Non-proprietary)

Tamoxifen (as Tamoxifen citrate) 2 mg per 1 ml Tamoxifen 10mg/5ml oral solution sugar free sugar-free | 150 ml PoM €74.52 DT = €56.83

Tablet

► Tamoxifen (Non-proprietary)

Tamoxifen (as Tamoxifen citrate) 10 mg Tamoxifen 10mg tablets | 30 tablet PoM £47.21 DT = £38.01

Tamoxifen (as Tamoxifen citrate) 20 mg Tamoxifen 20mg tablets | 30 tablet PoM £13.00 DT = £3.35

Tamoxifen (as Tamoxifen citrate) 40 mg Tamoxifen 40mg tablets

Tamoxifen (as Tamoxifen citrate) 40 mg Tamoxifen 40mg tablet 30 tablet PoM £98.93 DT = £87.60

Toremifene

25-Aug-2020

INDICATIONS AND DOSE

Hormone-dependent metastatic breast cancer in postmenopausal women

- ► BY MOUTH
- Adult: 60 mg daily
- CONTRA-INDICATIONS Bradycardia · electrolyte disturbances (particularly uncorrected hypokalaemia) · endometrial hyperplasia · heart failure with reduced leftventricular ejection fraction · history of arrhythmias · QT prolongation
- CAUTIONS Avoid in Acute porphyrias p. 1150 · history of severe thromboembolic disease
- INTERACTIONS → Appendix 1: toremifene
- SIDE-EFFECTS
- ► Common or very common Dizziness · fatigue · hot flush · hyperhidrosis · nausea · oedema · skin reactions · vaginal discharge · vomiting
- ▶ Uncommon Appetite decreased · constipation · depression · dyspnoea · headache · insomnia · thromboembolism · uterine disorders · weight increased
- ► Rare or very rare Alopecia · corneal opacity · endometrial cancer · hepatic disorders · uterine haemorrhage · vertigo
- ► Frequency not known Anaemia · leucopenia · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION Increased endometrial changes, including hyperplasia, polyps and cancer reported.

- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution; avoid in severe hepatic failure (risk of decreased elimination).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Fareston (Orion Pharma (UK) Ltd)

Toremifene (as Toremifene citrate) 60 mg Fareston 60mg tablets

HORMONE ANTAGONISTS AND RELATED AGENTS > AROMATASE INHIBITORS

Anastrozole

29-Jul-2021

INDICATIONS AND DOSE

Adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women | Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2-3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen

- ▶ BY MOUTH
- Adult: 1 mg daily

Breast cancer [chemoprevention in postmenopausal women at moderate to high risk] (initiated under specialist supervision)

- ► BY MOUTH
- Adult: 1 mg daily for 5 years
- UNLICENSED USE EVGT Anastrozole is used for chemoprevention of breast cancer, but it is not licensed for this indication.
- CONTRA-INDICATIONS Not for premenopausal women
- CAUTIONS Susceptibility to osteoporosis
- SIDE-EFFECTS
 - ➤ Common or very common Alopecia appetite decreased arthritis asthenia bone pain carpal tunnel syndrome diarrhoea drowsiness headache hot flush hypercholesterolaemia hypersensitivity joint disorders myalgia nausea osteoporosis sensation abnormal skin reactions taste altered vaginal haemorrhage vomiting vulvovaginal dryness
 - ▶ Uncommon Hepatitis hypercalcaemia trigger finger
 - ▶ Rare or very rare Angioedema Stevens-Johnson syndrome vasculitis
 - ▶ Frequency not known Mood altered
 - PREGNANCY Avoid.
 - BREAST FEEDING Avoid.
 - **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in moderate-to-severe impairment.
 - RENAL IMPAIRMENT EVG! Caution if eGFR less than 30 mL/minute/1.73 m² (limited information available). See p. 21.
 - PRE-TREATMENT SCREENING Laboratory test for menopause if doubt.
 - MONITORING REQUIREMENTS
 - ➤ Osteoporosis Assess bone mineral density before treatment and at regular intervals.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Asthenia and drowsiness may affect ability to drive or operate machinery.

Scottish Medicines Consortium (SMC) decisions

- Anastrozole (Arimidex®) for the adjuvant treatment of postmenopausal women with oestrogen receptor-positive early invasive breast cancer (September 2005) SMC No. 198/05 Recommended with restrictions
- Anastrozole (Arimidex®) for early breast cancer in hormone receptor-positive postmenopausal women who have received 2 to 3 years of adjuvant tamoxifen (November 2006) SMC No. 322/06 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Anastrozole (Non-proprietary)

Anastrozole 1 mg Anastrozole 1 mg tablets | 28 tablet PoM £68.56 DT = £1.18

Arimidex (AstraZeneca UK Ltd)

Anastrozole 1 mg Arimidex 1mg tablets | 28 tablet PoM £68.56 DT = £1.18

Exemestane

11-Jun-2021

INDICATIONS AND DOSE

Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2-3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed

► BY MOUTH

▶ Adult: 25 mg daily

- CONTRA-INDICATIONS Not indicated for premenopausal women
- INTERACTIONS → Appendix 1: exemestane
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · appetite decreased · arthralgia · asthenia · bone fracture · carpal tunnel syndrome · constipation · depression · diarrhoea · dizziness · gastrointestinal discomfort · headache · hot flush · hyperhidrosis · insomnia · leucopenia · nausea · osteoporosis · pain · paraesthesia · peripheral oedema · skin reactions · thrombocytopenia · vomiting
- ▶ Rare or very rare Acute generalised exanthematous pustulosis (AGEP) · drowsiness · hepatic disorders
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
- RENAL IMPAIRMENT Manufacturer advises caution.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

► Exemestane (Non-proprietary)

Exemestane 25 mg Exemestane 25mg tablets | 30 tablet PoM £88.80 DT = £7.96

► Aromasin (Pfizer Ltd)

Exemestane 25 mg Aromasin 25mg tablets | 30 tablet PoM £88.80 DT = £7.96

Letrozole

20-Jul-2021

• INDICATIONS AND DOSE

First-line treatment in postmenopausal women with hormone-dependent advanced breast cancer | Adjuvant treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women | Advanced breast cancer in postmenopausal women (naturally or artificially induced menopause) in whom other antioestrogen therapy has failed | Extended adjuvant treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years | Neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated

- ► BY MOUTH
- Adult: 2.5 mg daily
- CONTRA-INDICATIONS Not indicated for premenopausal women
- CAUTIONS Susceptibility to osteoporosis
- SIDE-EFFECTS
- ► Common or very common Alopecia · appetite abnormal · arthralgia · asthenia · bone fracture · bone pain · constipation · depression · diarrhoea · dizziness · gastrointestinal discomfort · headache · hot flush · hypercholesterolaemia · hyperhidrosis · hypertension · malaise · myalgia · nausea · oedema · osteoporosis · skin reactions · vaginal haemorrhage · vomiting · weight changes
- Uncommon Anxiety · arthritis · breast pain · cancer pain · carpal tunnel syndrome · cataract · cerebrovascular insufficiency · cough · drowsiness · dry mouth · dysaesthesia · dyspnoea · embolism and thrombosis · eye irritation · fever · insomnia · irritability · ischaemic heart disease · leucopenia · memory loss · mucosal dryness · myocardial infarction · palpitations · stomatitis · tachycardia · taste altered · thirst · urinary frequency increased · urinary tract infection · vision blurred · vulvovaginal disorders
- ► Frequency not known Angioedema · hepatitis · toxic epidermal necrolysis · trigger finger
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception required until postmenopausal status fully established (return of ovarian function reported in postmenopausal women).
- PREGNANCY Avoid (isolated cases of birth defects reported).
- BREAST FEEDING Manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (increased exposure and half-life).
- RENAL IMPAIRMENT EVGT Use with caution if creatinine clearance less than 10 mL/minute (limited information available), see p. 21.
- MONITORING REQUIREMENTS
- Osteoporosis Assess bone mineral density before treatment and at regular intervals.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Letrozole (Non-proprietary)

Letrozole 2.5 mg Letrozole 2.5mg tablets | 14 tablet Pom £49.90

DT = £1.20 | 28 tablet Pom £2.38-£84.86

► Femara (Novartis Pharmaceuticals UK Ltd)
Letrozole 2.5 mg Femara 2.5 mg tablets | 30 tablet | PoM £90.92

5 Immunotherapy responsive malignancy

ANTINEOPLASTIC DRUGS

Talimogene laherparepvec

25-Jul-20

 DRUG ACTION Talimogene laherparepvec is an oncolytic immunotherapy derived from herpes simplex virus type-1 which causes tumour lysis and the release of tumourderived antigens.

• INDICATIONS AND DOSE

Unresectable metastatic melanoma with no bone, brain, or visceral disease

- ► BY INTRALESIONAL INJECTION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Severely immunocompromised patients

CONTRA-INDICATIONS, FURTHER INFORMATION

Manufacturer advises avoid in patients who are severely immunocompromised, for example, those with severe congenital or acquired cellular and/or humoral immune deficiency—may be at increased risk of disseminated herpetic infection.

 CAUTIONS Administration of antivirals (may interfere with effectiveness of *Imlygic*[®]) - autoimmune disease immunocompromised patients - multiple myeloma (risk of plasmacytoma at injection site)

CAUTIONS, FURTHER INFORMATION

Immunocompromised patients Manufacturer advises caution in patients who are immunocompromised, for example, those with HIV/AIDS, leukaemia, lymphoma, common variable immunodeficiency, or in those who require chronic high-dose steroids or other immunosuppressive agents—risk of disseminated herpetic infection.

SIDE-EFFECTS

- ► Common or very common Anaemia · anxiety · arthralgia · chills · confusion · constipation · cough · deep vein thrombosis · dehydration · depression · diarrhoea · dizziness · dyspnoea · ear pain · fatigue · fever · flushing · gastrointestinal discomfort · headache · hypertension · immune-mediated events · increased risk of infection · influenza like illness · insomnia · malaise · myalgia · nausea · neoplasm complications · oropharyngeal pain · pain · peripheral oedema · procedural pain · secretion discharge · skin reactions · tachycardia · vomiting · weight decreased · wound complications
- ► Uncommon Glomerulonephritis · injection site plasmacytoma · post procedural infection · respiratory disorders · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Necrosis or ulceration of tumour tissue may occur, and impaired healing at the injection site has been reported. Manufacturer advises careful wound care and infection precautions; if persistent infection or delayed healing develops, the risks and benefits of continuing treatment should be considered.

- CONCEPTION AND CONTRACEPTION Manufacturer advises use of latex condoms.
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Consult product literature for information on injection technique.

- HANDLING AND STORAGE Manufacturer advises caution in handling—risk of accidental exposure; avoid preparation or administration if immunocompromised or pregnant. For further information, see the *Physician's Brochure* provided by the manufacturer. Store and transport frozen at -90°C to -70°C—consult product literature for further information on thawing and storage after thawing.
- PATIENT AND CARER ADVICE Manufacturer advises that patients and carers should be informed about the risks of treatment, advised to avoid touching or scratching injection sites, and to keep these sites covered with occlusive dressings. Close contacts should avoid direct contact with injected lesions or body fluids of treated patients during treatment and for up to 30 days after last treatment—if exposed, clean the affected area and seek medical attention if symptoms of herpetic infection develop; close contacts who are immunocompromised or pregnant should not be exposed to potentially contaminated materials. For further information, see the Information for Patients and Close Contacts provided by the manufacturer.

Provide patient alert card—record batch number for each administration of *Imlygic* [®].

Driving and skilled tasks Manufacturer advises that patients and their carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness and confusion.

• NATIONAL FUNDING/ACCESS DECISIONS
For full details see funding body website

- Talimogene laherparepvec for treating unresectable metastatic melanoma (September 2016) NICE TA410 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sorbitol ELECTROLYTES: May contain Sodium

► Imlygic (Amgen Ltd)

Talimogene laherparepvec 1 million plaque forming units per 1 ml | Imlygic 1 million plaque forming units/1 ml solution for injection vials | 1 vial | Pom | £1,670.00 (Hospital only)

Talimogene laherparepvec 100 million plaque forming units per 1 ml | Imlygic 100 million plaque forming units/1ml solution for injection vials | 1 vial | PoM | £1,670.00 (Hospital only)

IMMUNOSTIMULANTS > INTERFERONS

Interferon gamma-1b

25-May-2021

(Immune interferon)

INDICATIONS AND DOSE

To reduce the frequency of serious infection in chronic granulomatous disease

► BY SUBCUTANEOUS INJECTION

Adult: 50 micrograms/m² 3 times a week

To reduce the frequency of serious infection in severe malignant osteopetrosis

- ► BY SUBCUTANEOUS INJECTION
- Adult: 50 micrograms/m² 3 times a week
- CONTRA-INDICATIONS Simultaneous administration of foreign proteins including immunological products (such as vaccines)—risk of exaggerated immune response
- CAUTIONS Arrhythmias · cardiac disease · congestive heart failure · ischaemia · seizure disorders (including seizures associated with fever)
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · arthralgia · back pain · chills · depression · diarrhoea · fatigue · fever · headache · nausea · rash · vomiting

- Frequency not known Atrioventricular block · chest discomfort · confusion · connective tissue disorders · embolism and thrombosis · gait abnormal · gastrointestinal haemorrhage · hallucination · heart failure · hepatic failure · hypertriglyceridaemia · hypoglycaemia · hyponatraemia · hypotension · influenza like illness · myocardial infarction · neutropenia · pancreatitis · parkinsonism · proteinuria · renal failure · respiratory disorders · seizure · syncope · systemic lupus erythematosus (SLE) · tachycardia · thrombocytopenia · transient ischaemic attack
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment—consult product literature.
- PREGNANCY Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).
- BREAST FEEDING Manufacturers advise avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (increased risk of accumulation).
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—risk of accumulation.
- MONITORING REQUIREMENTS Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Immukin (Clinigen Healthcare Ltd)
 Interferon gamma-1b (recombinant human) 200 microgram per
 1 ml Immukin 100micrograms/0.5ml solution for injection vials |
 6 vial [₱№] £930.00

IMMUNOSTIMULANTS > INTERLEUKINS

Aldesleukin

24-Jul-2020

 DRUG ACTION Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival.

• INDICATIONS AND DOSE

Metastatic renal cell carcinoma (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- UNLICENSED USE Aldesleukin is not licensed for use in patients in whom all three of the following prognostic factors are present: performance status of Eastern Cooperative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment.
- CONTRA-INDICATIONS Consult product literature
- CAUTIONS Consult product literature
- INTERACTIONS → Appendix 1: aldesleukin
- SIDE-EFFECTS
- ► Common or very common Acidosis · alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · ascites · asthenia · cardiovascular disorders · chest pain · chills · coagulation disorders · confusion · conjunctivitis · constipation · cough · cyanosis · dehydration · depression · diarrhoea · dizziness · drowsiness · dyspepsia · dysphogai dyspnoea · electrolyte imbalance · eosinophilia · fever · gastrointestinal disorders · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hyperhidrosis · hypettension · hyperthyroidism · hypotension ·

- hypothermia · hypothyroidism · hypoxia · increased risk of infection · insomnia · irritability · ischaemic heart disease · leucopenia · malaise · mucositis · myalgia · nasal congestion · nausea · nerve disorders · oedema · oral disorders · pain · palpitations · paraesthesia · pulmonary oedema · renal impairment · respiratory disorders · sepsis · skin reactions · speech disorder · syncope · taste loss · thrombocytopenia · vomiting · weight changes
- Uncommon Angioedema · cardiac arrest · cardiac inflammation · cardiomyopathy · coma · embolism and thrombosis · hypoglycaemia · muscle weakness · myopathy · neutropenia · pancreatitis · paralysis · pericardial disorders · seizure
- Rare or very rare Agranulocytosis · aplastic anaemia · cholecystitis · Crohn's disease aggravated · diabetes mellitus · haemolytic anaemia · injection site necrosis · Stevens Johnson syndrome · ventricular dysfunction
- Frequency not known Capillary leak syndrome · immune complex RPGN · inflammatory arthritis · intracranial haemorrhage · leukoencephalopathy · myocardial infarction · oculo-bulbar myasthenia gravis · psychiatric disorder · stroke · thyroiditis · vasculitis cerebral
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment in men and women.
- PREGNANCY Use only if potential benefit outweighs risk (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- DIRECTIONS FOR ADMINISTRATION Intravenous infusion is associated with increased risk of capillary leak syndrome (which can cause pulmonary oedema and hypotension), compared to subcutaneous injection.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

 Proleukin (Clinigen Healthcare Ltd)
 Aldesleukin 18 mega unit Proleukin 18 million unit powder for solution for injection vials | 1 vial Pom £636.00 | 10 vial Pom £6.360.00

IMMUNOSTIMULANTS > OTHER

Bacillus Calmette-Guérin

16-Mar-2021

 DRUG ACTION Bacillus Calmette-Guérin is a live attenuated strain derived from Mycobacterium bovis.

• INDICATIONS AND DOSE

Bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection

- ► BY INTRAVESICAL INSTILLATION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Fever of unknown origin HIV infection impaired immune response severe haematuria tuberculosis urinary-tract infection
- CAUTIONS Bladder injury (delay administration until mucosal damage healed) • traumatic catheterisation (delay administration until mucosal damage healed) • urethral injury (delay administration until mucosal damage healed)
- SIDE-EFFECTS
- ► Common or very common Appetite decreased · arthritis · bladder cramps · bladder disorders · cardiovascular event · chills · cystitis · diarrhoea · fatigue · fever · haematuria · hepatic disorders · increased risk of infection · joint disorders · malaise · myalgia · nausea · pain · skin reactions · urinary disorders · vomiting
- ► Uncommon Abdominal pain · anaemia · coagulation disorder · constipation · dizziness · genital pain · headache · leucopenia · mucositis · nephrotoxicity · stomatitis ·

- thrombocytopenia \cdot tissue in urine \cdot ulcer \cdot ureteral obstruction
- Frequency not known Erythema nodosum · eye disorders · eye inflammation · glomerulonephritis · influenza like illness · interstitial lung disease · nephritis · renal abscess · renal failure
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- PRE-TREATMENT SCREENING Screen for active tuberculosis (contra-indicated if tuberculosis confirmed).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for reconstitution for instillation

Mifamurtide

28-Jun-2021

• INDICATIONS AND DOSE

Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)

- ► BY INTRAVENOUS INFUSION
- Adult: Infusion to be given over 1 hour (consult product literature or local protocols)
- UNLICENSED USE Not licensed for use in patients over 30 years of age at initial diagnosis.
- CAUTIONS Asthma—consider prophylactic bronchodilator therapy · chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy · history of autoimmune disease · history of collagen disease · history of inflammatory disease
- INTERACTIONS → Appendix 1: mifamurtide
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · cancer pain · chest discomfort · chills · confusion · constipation · cough · cyanosis · dehydration · depression · diarrhoea · dizziness · drowsiness · dysmenorrhoea · dyspnoea · feeling cold · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · hearing loss · hepatic pain · hyperhidrosis · hypertension · hypokalaemia · hypotension · hypothermia · increased risk of infection · insomnia · laryngeal pain · leucopenia · malaise · mucositis · muscle complaints · musculoskeletal stiffness · nasal congestion · nausea · neutropenia · oedema · pain · pallor · palpitations · respiratory disorders · sensation abnormal · sepsis · skin reactions · tachycardia · thrombocytopenia · tinnitus · tremor · urinary disorders · vertigo · vision blurred · vomiting · weight decreased
- CONCEPTION AND CONTRACEPTION Effective contraception required.
- PREGNANCY Avoid.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT EVG Caution in moderate to severe impairment (limited or no information available).
- RENAL IMPAIRMENT [EVGT] Caution in severe impairment (no information available).
- MONITORING REQUIREMENTS
- Monitor renal function, hepatic function and clotting parameters.
- Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.

NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for suspension for infusion

Mepact (Takeda UK Ltd)

Mifamurtide 4 mg Mepact 4mg powder for suspension for infusion vials | 1 vial Pom £2,375.00 (Hospital only)

IMMUNOSUPPRESSANTS > THALIDOMIDE AND RELATED ANALOGUES

Lenalidomide

24-May-2021

 DRUG ACTION Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and proerythropoietic properties.

INDICATIONS AND DOSE

Newly diagnosed multiple myeloma in patients who have undergone autologous stem cell transplantation (specialist use only)

- ► BY MOUTH
- Adult: 10 mg once daily for 28 consecutive days of repeated 28-day cycles; increased if tolerated to 15 mg once daily, after 3 cycles, for dose adjustments due to side-effects—consult product literature

Newly diagnosed multiple myeloma in patients not eligible for transplant (in combination with dexamethasone) (specialist use only) | Multiple myeloma in patients who have received at least one prior therapy (in combination with dexamethasone) (specialist use only)

- ► BY MOUTH
- Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects—consult product literature

Newly diagnosed multiple myeloma in patients not eligible for transplant (in combination with melphalan and prednisone) (specialist use only)

- ► BY MOUTH
- Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles for up to 9 cycles, patients who complete 9 cycles or are intolerant to combination therapy should continue treatment with lenalidomide as monotherapy, for doses of melphalan and prednisone, and dose adjustments due to side-effects consult product literature

Newly diagnosed multiple myeloma in patients not eligible for transplant (in combination with bortezomib and dexamethasone) (specialist use only)

- ► BY MOUTE
- Adult: 25 mg once daily for 14 consecutive days of repeated 21-day cycles for up to 8 cycles, followed by 25 mg once daily for 21 consecutive days of repeated 28-day cycles (in combination with dexamethasone alone), for doses of bortezomib and dexamethasone, and dose adjustments due to side-effects—consult product literature

Myelodysplastic syndromes (specialist use only)

- ► BY MOUTH
- Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustments due to side-effects—consult product literature continued →

Mantle cell lymphoma (specialist use only)

- ► BY MOUTH
- Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustments due to side-effects—consult product literature

Follicular lymphoma (in combination with rituximab) (specialist use only)

- ► BY MOUTH
- Adult: 20 mg once daily for 21 consecutive days of repeated 28-day cycles for up to 12 cycles, for doses of rituximab, and dose adjustments due to side-effects consult product literature

IMPORTANT SAFETY INFORMATION

until further notice.

MHRA/CHM ADVICE: IMMUNOMODULATORY DRUGS AND PREGNANCY PREVENTION: TEMPORARY ADVICE FOR MANAGEMENT DURING CTORNAVIRUS (COVID-19) (MAY 2020)
The MHRA has issued temporary guidance for female patients on lenalidomide during the coronavirus (COVID-19) pandemic to support adherence to the Pregnancy Prevention Programme (see Conception and contraception), particularly for those who are shielding

due to other health conditions, and should be followed

- CAUTIONS Avoid blood donation during treatment (including during dose interruptions) and for at least 7 days after stopping treatment—teratogenic risk · high tumour burden—risk of tumour lysis syndrome · patients with risk factors for myocardial infarction

 CAUTIONS. FURTHER INFORMATION
- Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors.
- Second primary malignancy Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.
- INTERACTIONS → Appendix 1: lenalidomide
- SIDE-EFFECTS
- Common or very common Anaemia · appetite decreased · arthralgia · asthenia · atrial fibrillation · chills · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · fall · fever · gastrointestinal discomfort · haemorrhage · headache · heart failure · hyperglycaemia · hypertension · hyperthyroidism · hypotension · hypothyroidism · increased risk of infection · influenza like illness · insomnia ·iron overload · lethargy · mood altered · muscle complaints · muscle weakness · myocardial infarction · nausea · neoplasms · nerve disorders · neutropenia · night sweats · pain · pancytopenia · paraesthesia · peripheral oedema · renal failure · respiratory disorders · rhinorrhoea · sepsis · skin reactions · taste altered · thrombocytopenia · toothache · tumour flare · vertigo · vomiting · weight decreased
- ▶ Uncommon Angioedema
- Rare or very rare Hypersensitivity · severe cutaneous adverse reactions (SCARs) · tumour lysis syndrome
- Frequency not known Acquired haemophilia gastrointestinal disorders hepatic disorders hypersensitivity vasculitis pancreatitis progressive multifocal leukoencephalopathy (PML) reactivation of infections solid organ transplant rejection SIDE-EFFECTS, FURTHER INFORMATION If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.

Discontinue permanently if angioedema, exfoliative or bullous rash, or if Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected.

- CONCEPTION AND CONTRACEPTION EVGr Pregnancy must be excluded in female patients of childbearing potential before starting treatment with lenalidomide. A medically supervised pregnancy test should be performed on, or within 3 days prior to, initiation and repeated every 4 weeks thereafter (including 4 weeks after the last dose). except in the case of confirmed tubal sterilisation. Females of childbearing potential must use effective contraception for at least 4 weeks before, during, and for at least 4 weeks after stopping treatment (including during dose interruptions), unless the patient is committed to absolute and continuous abstinence confirmed on a monthly basis; oral combined hormonal contraceptives and copperreleasing intra-uterine devices are not recommended. As lenalidomide is present in semen, male patients, even after successful vasectomy, must use condoms during treatment (including during dose interruptions) and for at least 1 week after stopping, if their partner is pregnant or is of childbearing potential and not using effective contraception.
- PREGNANCY Important: teratogenic risk. Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.
- BREAST FEEDING Discontinue breast-feeding—no information available.

RENAL IMPAIRMENT

Dose adjustments EvGr Reduce dose in moderate to severe impairment—consult product literature.

- MONITORING REQUIREMENTS
- Monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature).
- Monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard anticoagulation therapy; lenalidomide may be restarted with continued anticoagulation therapy once thromboembolic event resolved—consult product literature).
- ▶ Monitor thyroid function.
- ► Monitor for signs and symptoms of peripheral neuropathy.
- ▶ Monitor visual ability regularly (risk of cataract).
- Hepatic disorders Liver function should be monitored particularly when there is history of, or concurrent viral liver infection, or when lenalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).
- PRESCRIBING AND DISPENSING INFORMATION Patients, prescribers, and pharmacists must comply with the manufacturer's Pregnancy Prevention Programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

For females of childbearing potential, each prescription for lenalidomide should be limited to a maximum supply of 4 weeks' treatment. Pregnancy testing should ideally be carried out on the same day as prescription issuing and dispensing.

For all other patients, each prescription should be limited to a maximum supply of 12 weeks' treatment.

• PATIENT AND CARER ADVICE

Thromboembolism Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Patients should be given a patient card and information leaflet about the Pregnancy Prevention Programme.

Conception and contraception Patient counselling is advised for lenalidomide capsules (pregnancy and contraception).

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Lenalidomide for treating myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality (updated June 2019) NICE TA322 Recommended with restrictions
- ► Lenalidomide for the treatment of multiple myeloma in people who have received at least 2 prior therapies (updated June 2019) NICE TAI71 Recommended with restrictions
- Ixazomib with lenalidomide and dexamethasone for treating relapsed or refractory multiple myeloma (February 2018)
 NICE TA505 Recommended with restrictions
- Lenalidomide plus dexamethasone for multiple myeloma after 1 treatment with bortezomib (June 2019) NICE TA586 Recommended with restrictions
- ► Lenalidomide plus dexamethasone for previously untreated multiple myeloma (June 2019) NICE TA587 Recommended with restrictions
- ► Lenalidomide with rituximab for previously treated follicular lymphoma (April 2020) NICE TA627 Recommended
- ► Lenalidomide maintenance treatment after an autologous stem cell transplant for newly diagnosed multiple myeloma (March 2021) NICE TA680 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Lenalidomide (*Revlimid*®) for third line treatment of multiple myeloma (May 2010) SMC No. 441/08 Recommended with restrictions
- Lenalidomide (Revlimid®) in combination with dexamethasone, for the treatment of multiple myeloma in adult patients who have received at least one prior therapy (April 2014) SMC No. 441/08 Recommended with restrictions
- Lenalidomide (Revlimid®) for the treatment of adult patients with previously untreated multiple myeloma who are not eligible for transplant (December 2015) SMC No. 1096/15 Recommended with restrictions
- ► Lenalidomide (*Revlimid*®) as monotherapy for the maintenance treatment of adult patients with newly diagnosed multiple myeloma who have undergone autologous stem cell transplantation (October 2020) SMC No. SMC2289 Recommended
- Lenalidomide (Revlimid[®]) in combination with rituximab (anti-CD20 antibody) for the treatment of adult patients with previously treated follicular lymphoma (Grade 1 to 3a) (October 2020) SMC No. SMC2281 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Pomalidomide

£3.426.00 DT = £3.426.00

25-May-2021

 DRUG ACTION Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-myeloma tumoricidal activity.

• INDICATIONS AND DOSE

Treatment of relapsed and refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment (in combination with dexamethasone)

- ► BY MOUTH
- Adult: 4 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone and dose adjustment due to side effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises halve dose with concurrent use of potent inhibitors of CYP1A2 and ciprofloxacin.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RISK OF HEPATITIS B REACTIVATION (MAY 2016)

An EU wide review has concluded that pomalidomide can cause hepatitis B reactivation; the MHRA recommends to establish hepatitis B virus status in all patients before initiation of treatment.

MHRA/CHM ADVICE: IMMUNOMODULATORY DRUGS AND PREGNANCY PREVENTION: TEMPORARY ADVICE FOR MANAGEMENT DURING CORONAVIRUS (COVID-19) (MAY 2020)

The MHRA has issued temporary guidance for female patients on pomalidomide during the coronavirus (COVID-19) pandemic to support adherence to the Pregnancy Prevention Programme (see Conception and contraception), particularly for those who are shielding due to other health conditions, and should be followed until further notice.

• CAUTIONS Avoid blood donation during treatment (including during dose interruptions) and for at least 7 days after stopping treatment—teratogenic risk · cardiac disease · cardiac risk factors · hepatitis B infection · high tumour burden—risk of tumour lysis syndrome · interstitial lung disease—discontinue if suspected · peripheral neuropathy

CALITIONS, FURTHER INFORMATION

- Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis should be considered, particularly in patients with additional risk factors.
- Second primary malignancy Patients should be carefully evaluated before and during treatment with pomalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.
- Hepatitis B infection The MHRA advises that those with a history of hepatitis B infection should be closely monitored for signs and symptoms of active infection throughout treatment; expert advice should be sought for patients who test positive for active infection.
- INTERACTIONS → Appendix 1: pomalidomide
- SIDE-EFFECTS
- Common or very common Anaemia · angioedema · appetite decreased · atrial fibrillation · cataract · Clostridioides difficile colitis · confusion · constipation · cough · decreased leucocytes · depression · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · fall · fatigue · fever · gastrointestinal discomfort · haemorrhage · heart failure · hyperglycaemia · hypertension · hyperuricaemia · hypotension · increased risk of infection · insomnia · intracranial haemorrhage · level of consciousness decreased · muscle spasms · muscle weakness · myocardial infarction · nausea · neoplasms · neutropenia · oedema · pain · pancytopenia · paraesthesia · pelvic pain · peripheral neuropathy · renal impairment · respiratory disorders · sepsis · skin reactions · stomatitis · syncope · taste altered · thrombocytopenia · tremor · urinary retention · vertigo · vomiting · weight decreased
- ▶ **Uncommon** Hepatitis · hyperbilirubinaemia · stroke · tumour lysis syndrome
- ► Frequency not known Hepatitis B reactivation severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION EVGF Pregnancy must be excluded in female patients of childbearing potential before starting treatment with pomalidomide. A medically supervised pregnancy test should be performed on, or within 3 days prior to, initiation and repeated every 4 weeks thereafter (including 4 weeks after the last dose), except in the case of confirmed tubal sterilisation. Females of childbearing potential must use effective contraception for at least 4 weeks before, during, and for at least 4 weeks after stopping treatment (including during dose interruptions), unless the patient is committed to absolute and continuous abstinence confirmed on a monthly basis; oral combined hormonal contraceptives and copperreleasing intra-uterine devices are not recommended. As pomalidomide is present in semen, male patients, even after successful vasectomy, must use condoms during treatment (including during dose interruptions) and for at least 1 week after stopping, if their partner is pregnant or is of childbearing potential and not using effective contraception.
- PREGNANCY Important: teratogenic risk.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure).
- MONITORING REQUIREMENTS
- Maufacturer advises monitor full blood count before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).
- Manufacturer advises monitor for arterial or venous thromboembolism
- Manufacturer advises monitor for signs and symptoms of cardiac failure.

- Manufacturer advises monitor for acute onset or unexplained worsening of respiratory symptoms.
- Manufacturer advises monitor liver function for 6 months after initiation, then as clinically indicated.
- PRESCRIBING AND DISPENSING INFORMATION Patients, prescribers, and pharmacists must comply with the manufacturer's Pregnancy Prevention Programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

For females of childbearing potential, each prescription for pomalidomide should be limited to a maximum supply of 4 weeks' treatment. Pregnancy testing should ideally be carried out on the same day as prescription issuing and dispensing.

For all other patients, each prescription should be limited to a maximum supply of 12 weeks' treatment.

 PATIENT AND CARER ADVICE Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Patients should be given a patient card and information leaflet about the Pregnancy Prevention Programme.

Conception and contraception Patient counselling is advised for pomalidomide capsules (pregnancy and contraception).

Thalidomide

24-May-2021

 DRUG ACTION Thalidomide has immunomodulatory and anti-inflammatory activity.

• INDICATIONS AND DOSE

First-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors) in combination with melphalan and prednisolone

- ▶ BY MOUTH
- Adult 18-75 years: 200 mg once daily for 6-week cycle for a maximum of 12 cycles, dose to be taken at bedtime

 Adult 76 years and over: 100 mg once daily for 6-week cycle for a maximum of 12 cycles, dose to be taken at bedtime

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: IMMUNOMODULATORY DRUGS AND PREGNANCY PREVENTION: TEMPORARY ADVICE FOR MANAGEMENT DURING CORONAVIRUS (COVID-19) (MAY 2020)

The MHRA has issued temporary guidance for female patients on thalidomide during the coronavirus (COVID-19) pandemic to support adherence to the Pregnancy Prevention Programme (see *Conception and contraception*), particularly for those who are shielding due to other health conditions, and should be followed until further notice.

 CAUTIONS Avoid blood donation during treatment (including during dose interruptions) and for at least 7 days after stopping treatment—teratogenic risk · high tumour burden—risk of tumour lysis syndrome · patients aged 76 years and over—increased risk of serious sideeffects

CAUTIONS, FURTHER INFORMATION

- Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors.
- Second primary malignancy Patients should be carefully evaluated before and during treatment with thalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated
- Peripheral neuropathy Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk.
- INTERACTIONS → Appendix 1: thalidomide
- SIDE-EFFECTS
- ► Common or very common Anaemia · arrhythmias · asthenia · confusion · constipation · decreased leucocytes · depression · dizziness · drowsiness · dry mouth · dyspnoea · embolism and thrombosis · fever · heart failure · increased risk of infection · malaise · movement disorders · neutropenia · peripheral neuropathy · peripheral oedema · respiratory disorders · sensation abnormal · skin reactions · thrombocytopenia · tremor · vomiting
- ▶ Frequency not known Atrioventricular block gastrointestinal disorders gastrointestinal haemorrhage hearing impairment hypothyroidism liver disorder menstrual cycle irregularities myocardial infarction neoplasms pancreatitis pancytopenia posterior reversible encephalopathy syndrome (PRES) pulmonary hypertension reactivation of infections renal failure seizure severe cutaneous adverse reactions (SCARs) sexual dysfunction tumour lysis syndrome

 SIDE-EFFECTS, FURTHER INFORMATION Rash If rash occurs, treatment should be discontinued and only

Peripheral neuropathy If symptoms suggestive of peripheral neuropathy develop (such as paraesthesia, abnormal coordination, or weakness) dose reduction, dose interruption, or treatment discontinuation may be necessary—consult product literature.

restarted following appropriate clinical evaluation.

• CONCEPTION AND CONTRACEPTION [Evgr Pregnancy must be excluded in female patients of childbearing potential before starting treatment with thalidomide. A medically supervised pregnancy test should be performed on, or within 3 days prior to, initiation and repeated every 4 weeks thereafter (including 4 weeks after the last dose), except in the case of confirmed tubal sterilisation. Females of childbearing potential must use effective contraception

for at least 4 weeks before, during, and for at least 4 weeks after stopping treatment (including during dose interruptions), unless the patient is committed to absolute and continuous abstinence confirmed on a monthly basis; oral combined hormonal contraceptives and copperreleasing intra-uterine devices are not recommended. As thalidomide is present in semen, male patients, even after successful vasectomy, must use condoms during treatment (including during dose interruptions) and for at least 1 week after stopping, if their partner is pregnant or is of childbearing potential and not using effective contraception.

- PREGNANCY Important: teratogenic risk.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).
- RENAL IMPAIRMENT EVGT Use with caution in severe impairment—no information available.
- MONITORING REQUIREMENTS
- Monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop consult product literature).
- ▶ Monitor for arterial or venous thromboembolism.
- Monitor patients for signs and symptoms of peripheral neuropathy.
- Hepatic disorder Liver function should be monitored, particularly when there is history of, or concurrent viral liver infection, or when thalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).
- PRESCRIBING AND DISPENSING INFORMATION Patients, prescribers, and pharmacists must comply with the manufacturer's Pregnancy Prevention Programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

For females of childbearing potential, each prescription for thalidomide should be limited to a maximum supply of 4 weeks' treatment. Pregnancy testing should ideally be carried out on the same day as prescription issuing and dispensing.

For all other patients, each prescription should be limited to a maximum supply of 12 weeks' treatment.

 PATIENT AND CARER ADVICE Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Patients and their carers should be advised to seek medical advice if symptoms of peripheral neuropathy such as paraesthesia, abnormal coordination, or weakness develon.

Patients should be given a patient card and information leaflet about the Pregnancy Prevention Programme. Conception and contraception Patient counselling advised for thalidomide capsules (pregnancy and contraception).

- PREGNANCY Manufacturer advises avoid unless essential.
- BREAST FEEDING No information available—manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment (may increase duration of photosensitivity); avoid in severe impairment (no information available).
- PATIENT AND CARER ADVICE

Photosensitivity Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Photofrin (Axcan Pharma Inc, Pinnacle Biologics BV)
Porfimer sodium 15 mg Photofrin 15mg powder for solution for injection vials | 1 vial PoM S (Hospital only)

Porfimer sodium 75 mg Photofrin 75mg powder for solution for injection vials | 1 vial Pom £1,011.00 (Hospital only)

Temoporfin

03-Sep-202

 DRUG ACTION Temoporfin accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

INDICATIONS AND DOSE

Photodynamic therapy of advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Acute porphyrias p. 1150 concomitant photosensitising treatment · diseases exacerbated by light · elective surgery · ophthalmic slitlamp examination for 30 days after administration
- SIDE-EFFECTS
- ► Common or very common Anaemia · constipation · dizziness · dysphagia · fever · haemorrhage · headache · local infection · nausea · oedema · oral disorders · pain · paraesthesia · photosensitivity reaction (sunscreens ineffective) · skin reactions · stomatitis necrotising · sunburn · vomiting
- ▶ Frequency not known Fistula obstructive airway disorder sepsis vascular rupture
- CONCEPTION AND CONTRACEPTION Manufacturer advises avoid pregnancy for at least 3 months after treatment.
- PREGNANCY Toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid breastfeeding for at least 1 month after treatment—no information available.

• PATIENT AND CARER ADVICE

Photosensitivity Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 15 days after administration.

Avoid prolonged exposure of injection site arm to direct sunlight for 6 months after administration.

If extravasation occurs protect area from light for at least 3 months.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Foscan (Biolitec Pharma Ltd)

Bortezomib 3.5 mg Bortezomib 3.5 mg powder for solution for injection vials | 1 vial [₱5M] £533.67-£762.38 (Hospital only)

Velcade (Janssen-Cilag Ltd)

Bortezomib 3.5 mg Velcade 3.5mg powder for solution for injection vials | 1 vial Pom £762.38 (Hospital only)

Carfilzomib

15-Dec-2021

 DRUG ACTION Carfilzomib is an irreversible selective proteasome inhibitor that disrupts tumour cell turnover and induces apoptosis.

• INDICATIONS AND DOSE

Multiple myeloma (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CARFILZOMIB (KYPROLIS®): REMINDER OF RISK OF POTENTIALLY FATAL CARDIAC EVENTS (AUGUST 2019) Cases of cardiac arrest, cardiac failure, and myocardial infarction, including fatalities, have been reported in patients with or without pre-existing cardiac disorders receiving carfilzomib. Healthcare professionals are advised to monitor patients for signs and symptoms of cardiac disorders before and during carfilzomib treatment. Carfilzomib should be discontinued if severe or life-threatening cardiac events occur; restarting treatment may be considered at a lower dose once the condition is controlled and the patient is stable.

MHRA/CHM ADVICE: CARFILZOMIB (KYPROLIS®): RISK OF REACTIVATION OF HEPATITIS B VIRUS (NOVEMBER 2019)

An EU review of worldwide data has identified reports of hepatitis B virus (HBV) reactivation in patients treated with carfilzomib. Healthcare professionals are advised to screen all patients for HBV before initiating treatment; those with unknown serology already being treated with carfilzomib should also be screened. Patients with positive serology should be considered for antiviral prophylaxis, and be monitored for signs of HBV reactivation during and after treatment; immediate medical attention should be sought if signs and symptoms of HBV reactivation develop. Experts should be consulted for advice about HBV treatment and the continuation, interruption, or resumption of carfilzomib in patients with HBV reactivation.

• CAUTIONS Elderly (over 75 years)—higher incidence of adverse effects • ensure adequate hydration • hepatitis B carriers (consider antiviral prophylaxis) • infusion-related reactions • recent history of myocardial infarction • risk factors for thromboembolism • risk of cardiac failure • risk of herpes zoster reactivation • uncontrolled angina • uncontrolled arrhythmias

CAUTIONS, FURTHER INFORMATION

- Infusion-related reactions Evg: Premedication with dexamethasone advised to reduce incidence and severity of infusion-related reactions.
- ▶ Risk of herpes zoster reactivation FvGr Consider antiviral prophylaxis for herpes zoster infection.
- Hepatitis B reactivation Evor Hepatitis B reactivation has been reported in patients taking carfilzomib. Patients with positive hepatitis B serology should be considered for prophylactic antiviral therapy, and closely monitored for clinical and laboratory signs of active hepatitis B infection during and after treatment. Experts in the treatment of hepatitis B infection should be consulted as necessary.
- INTERACTIONS → Appendix 1: carfilzomib
- SIDE-EFFECTS
- ► Common or very common Anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · cataract · chest pain · chills · confusion · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · heart failure · hyperbilirubinaemia · hyperglycaemia · hyperhidrosis · hypertension · hyperuricaemia · hypoalbuminaemia · hypotension · increased risk of infection · influenza like illness · infusion related reaction · insomnia · malaise · muscle complaints · muscle weakness · myocardial infarction · nausea · neutropenia · oropharyngeal pain · pain · palpitations · peripheral neuropathy · peripheral oedema · pulmonary hypertension · pulmonary oedema · renal impairment · respiratory disorders · sensation abnormal · sepsis · skin reactions · thrombocytopenia · tinnitus · toothache · vision blurred · vomiting
- Uncommon Cardiac arrest · cardiomyopathy ·
 Clostridioides difficile colitis · gastrointestinal perforation
 · haemolytic uraemic syndrome · hepatic disorders ·
 hepatitis B reactivation · intracranial haemorrhage
 · multiple organ dysfunction syndrome · myocardial
 ischaemia · pericardial effusion · pericarditis · stroke ·
 tumour lysis syndrome
- Rare or very rare Angioedema · posterior reversible encephalopathy syndrome (PRES) · thrombotic microangiopathy
- ► Frequency not known Progressive multifocal leukoencephalopathy (PML) QT interval prolongation
- CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception during and for 1 month after treatment in women of childbearing potential; hormonal contraceptives associated with a risk of thrombosis should be avoided. Male patients should use effective contraception during and for 3 months after treatment if their partner is pregnant or of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during and for at least 2 days after treatment—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (increased risk of side-effects), particularly in moderate to severe impairment (limited information available).
- RENAL IMPAIRMENT Manufacturer advises caution increased incidence of adverse effects.
- PRE-TREATMENT SCREENING EVGT Patients should be screened for hepatitis B before treatment.
- MONITORING REQUIREMENTS [EVGT] Monitor the following patient parameters: serum potassium concentration at least monthly; signs and symptoms of fluid overload,

especially in those at risk of cardiac failure; renal function at treatment initiation and at least monthly during treatment—consider dose modification; hepatic function at treatment initiation and monthly during treatment—consider dose modification; platelet count; blood pressure at treatment initiation and regularly during treatment. Also monitor for signs and symptoms of thrombotic microangiopathy, tumour lysis syndrome and progressive multifocal leukoencephalopathy—withhold treatment if suspected.

- HANDLING AND STORAGE Manufacturer advises store in a refrigerator at 2–8°C.
- PATIENT AND CARER ADVICE Manufacturer advises that patients and carers are warned to report signs and symptoms of thromboembolism (such as dyspnoea, chest pain, arm or leg swelling or pain).

Driving and skilled tasks Patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness, hypotension and blurred vision.

Carfilzomib 30 mg Kyprolis 30mg powder for solution for infusion vials | 1 vial Pom £528.00 (Hospital only)

Carfilzomib 60 mg Kyprolis 60mg powder for solution for infusion vials | 1 vial Pom £1,056.00 (Hospital only)

Ixazomib

01-May-2019

DRUG ACTION Ixazomib is a proteasome inhibitor.

INDICATIONS AND DOSE

Multiple myeloma in patients who have received at least one prior therapy, in combination with lenalidomide and dexamethasone (specialist use only)

- BY MOUTH
- Adult: 4 mg once weekly on days 1, 8, and 15 of a 28-day treatment cycle, for dose adjustments due to side-effects, consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Risk of herpes zoster reactivation
 CAUTIONS, FURTHER INFORMATION
- Herpes zoster reactivation Manufacturer advises consider concomitant antiviral prophylaxis to decrease the risk of herpes zoster reactivation.
- INTERACTIONS → Appendix 1: ixazomib
- SIDE-FFFFCTS
- ► Common or very common Back pain · constipation · diarrhoea · increased risk of infection · nausea · neutropenia · peripheral neuropathy (monitor for symptoms) · peripheral oedema · skin reactions · thrombocytopenia · vomiting
- Rare or very rare Posterior reversible encephalopathy syndrome (PRES) (discontinue) • Stevens-Johnson syndrome • thrombotic microangiopathy • transverse myelitis • tumour lysis syndrome
- ► Frequency not known Appetite decreased · conjunctivitis · dizziness · dry eye · fatigue · hepatic disorders · hypokalaemia
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for at least 90 days after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).

Dose adjustments Manufacturer advises dose reduction to 3 mg in moderate to severe impairment.

RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose to 3 mg in severe impairment (creatinine clearance less than 30 mL/min). See p. 21.

 MONITORING REQUIREMENTS Manufacturer advises to monitor hepatic function regularly and adjust dose accordingly—consult product literature.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if less than 72 hours remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Ixazomib with lenalidomide and dexamethasone for treating relapsed or refractory multiple myeloma (February 2018)
 NICE TA505 Recommended with restrictions MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ANTINEOPLASTIC DRUGS > PROTEIN KINASE INHIBITORS

Abemaciclib

06-0ct-2021

 DRUG ACTION Abemaciclib is a selective inhibitor of cyclin-dependent kinases 4 and 6, which leads to disruption of cancer cell proliferation.

• INDICATIONS AND DOSE

Locally advanced or metastatic breast cancer (initiated by a specialist)

- ► BY MOUTH
- Adult: 150 mg twice daily, for dose adjustments due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce abemaciclib dose to 100 mg twice daily; in those already taking a reduced dose, consult product literature. If the CYP3A4 inhibitor is stopped, increase the abemaciclib dose (after 3–5 half lives of the inhibitor) to the dose used before starting the CYP3A4 inhibitor.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: CDK4/6 INHIBITORS (ABEMACICLIB, PALBOCICLIB, RIBOCICLIB): REPORTS OF INTERSTITIAL LUNG DISEASE AND PNEUMONITIS, INCLUDING SEVERE CASES (JUNE 2021)

Interstitial lung disease and pneumonitis, in some cases severe or fatal, have been reported in patients being treated with CDK4/6 inhibitors, such as abemaciclib. Healthcare professionals are advised to ask patients taking abemaciclib about pulmonary symptoms indicative of interstitial lung disease and pneumonitis, such as cough or dyspnoea. Patients should be advised to seek advice right away if these symptoms occur. Healthcare professionals should ensure patients have a copy of the Patient Information Leaflet (PIL) for abemaciclib.

- INTERACTIONS → Appendix 1: abemaciclib
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · decreased leucocytes · diarrhoea · dizziness · embolism and thrombosis · excessive tearing · fatigue · fever · infection · muscle weakness · nausea · neutropenia · respiratory disorders · skin reactions · taste altered · thrombocytopenia · vomiting
- CONCEPTION AND CONTRACEPTION Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for at least 3 weeks after completing treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.

- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment. Temporary or permanent withdrawal may be needed following increases in aminotransferases consult product literature.

Dose adjustments Manufacturer advises dose reduction to 150 mg once daily in severe impairment.

- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—monitor for signs of toxicity.
- MONITORING REQUIREMENTS Manufacturer advises monitor full blood count, and alanine and aspartate aminotransferases before starting treatment, every 2 weeks for the first 2 months, monthly for the following 2 months, and as clinically indicated thereafter.
- PATIENT AND CARER ADVICE Patients should be instructed to start an antidiarrhoeal such as loperamide, increase oral fluids, and seek medical advice at the first sign of loose stools. Patients should also be instructed to seek medical advice if fever occurs.

Driving and skilled tasks Patients should be cautioned on the effects on driving and performance of skilled tasks—increased risk of fatigue and dizziness.

Acalabrutinib

25-Jun-2021

• DRUG ACTION Acalabrutinib is a tyrosine kinase inihibitor.

• INDICATIONS AND DOSE

Chronic lymphocytic leukaemia (specialist use only)

- ▶ BY MOUTH
- Adult: 100 mg twice daily, doses should be taken approximately 12 hours apart, for dose adjustment,

interruption, or treatment discontinuation due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Exposure to sun (risk of skin cancer)—protect skin from exposure to sun · patients at high risk for thromboembolic disease—consider alternative treatment options to acalabrutinib · patients at increased risk for opportunistic infections—consider prophylaxis and monitor for signs and symptoms of infection · risk of haemorrhage—consider withholding acalabrutinib treatment for at least 3 days before and after surgery
- INTERACTIONS → Appendix 1: acalabrutinib
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · anaemia · arrhythmias · arthralgia · asthenia · constipation · diarrhoea · dizziness · haemorrhage · headache · increased risk of infection · intracranial haemorrhage · musculoskeletal pain · nausea · neutropenia · second primary malignancy · skin reactions · thrombocytopenia · vomiting
- Uncommon Hepatitis B reactivation · lymphocytosis · tumour lysis syndrome
- Frequency not known Cough · leucopenia · progressive multifocal leukoencephalopathy (PML) · sepsis
- PREGNANCY EvGr Avoid unless potential benefit outweighs risk—toxicity in animal studies. (*) See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING EVGT Avoid breast feeding during treatment and for 2 days after the last dose—present in milk in *animal* studies.
- HEPATIC IMPAIRMENT [EVG] Caution in moderate impairment; avoid in severe impairment (risk of increased exposure).
- RENAL IMPAIRMENT EVGT Caution in severe impairment (no information available).
- PRE-TREATMENT SCREENING Patients should be evaluated for hepatitis B virus status before starting treatment consult product literature.
- PATIENT AND CARER ADVICE

Missed doses [vor] If a dose is more than 3 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Driving and skilled tasks [vor] Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and fatigue.

NATIONAL FUNDING/ACCESS DECISIONS

Afatinih

30-Sep-2021

DRUG ACTION Afatinib is a protein kinase inhibitor.

INDICATIONS AND DOSE

Treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with EGFR tyrosine kinase inhibitor

- ► BY MOUTH
- Adult: 40 mg once daily; increased if tolerated to up to 50 mg once daily, dose increase may be considered after 3 weeks at initial dose; consult product literature for details on dosing and dose adjustment due to side effects

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Cardiac risk factors · conditions which may affect left ventricular ejection fraction-consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment. diarrhoea-proactive management recommended (consult product literature) • exposure to sun (protect skin from exposure to sun) · history of keratitis · new pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded · severe dry eyes · signs and symptoms of keratitis— promptly refer to ophthalmologist for assessment · signs and symptoms of skin reaction—treat promptly and interrupt afatinib treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature) · ulcerative keratitis · use of contact lenses · worsening pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded
- INTERACTIONS → Appendix 1: afatinib
- SIDE-EFFECTS
- ► Common or very common Appetite decreased · cystitis · dehydration · diarrhoea · dry eye · dyspepsia · epistaxis · eye inflammation · fever · hypokalaemia · muscle spasms · nausea · oral disorders · paronychia · renal impairment · rhinorrhoea · skin reactions · taste altered · vomiting · weight decreased
- ▶ Uncommon Interstitial lung disease pancreatitis
- ► Rare or very rare Severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during and for at least one month after treatment in women of childbearing potential.

- PREGNANCY Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises consider dose interruption if hepatic function worsens in mild to moderate impairment—consult product literature.

- RENAL IMPAIRMENT [EVG] Avoid if eGFR less than 15 mL/minute/1.73 m² (no information available). Dose adjustments [EVG] Caution if eGFR 15–29 mL/minute/1.73 m² (risk of increased exposure)—monitor and adjust dose if not tolerated. See p. 21.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets should be taken whole on an empty stomach. Food should not be consumed for at least 3 hours before and at least 1 hour after each dose.

Giotrif® tablets may be dispersed in approximately $100\,\mathrm{mL}$ of noncarbonated water by stirring occasionally for up to 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube.

- PATIENT AND CARER ADVICE Patient counselling advised (administration).
 Driving and skilled tasks Ocular adverse reactions may affect performance of skilled tasks e.g. driving.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Afatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-smallcell lung cancer (April 2014) NICE TA310 Recommended with restrictions

Alectinib

31-Aug-2020

DRUG ACTION Alectinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only)

- ► BY MOUTH
- Adult: 600 mg twice daily, for dose adjustments due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

INTERACTIONS → Appendix 1: alectinib

SIDE-EFFECTS

- ➤ Common or very common Acute kidney injury · anaemia · arrhythmias · constipation · diarrhoea · eye disorders · eye inflammation · hyperbilirubinaemia · musculoskeletal pain · myalgia · nausea · oedema · oral disorders · photosensitivity reaction · skin reactions · taste altered · vision disorders · yomiting · weight increased
- Uncommon Drug-induced liver injury respiratory disorders
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of child-bearing potential should use effective contraception during and for at least 3 months after stopping treatment.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose to 450 mg twice daily in severe impairment.

MONITORING REQUIREMENTS

- Manufacturer advises monitor creatine phosphokinase every 2 weeks for the first month and as clinically indicated thereafter in patients reporting symptoms of myalgia.
- Manufacturer advises monitor heart rate and blood pressure as clinically indicated.
- Manufacturer advises monitor liver function at baseline then every 2 weeks during the first 3 months of treatment and periodically thereafter as clinically indicated; more frequent monitoring should be performed in patients who develop aminotransferase and bilirubin elevations.
- Manufacturer advises monitor for symptoms of interstitial lung disease and pneumonitis.

• PATIENT AND CARER ADVICE

Photosensitivity Manufacturer advises patients should use a broad spectrum sunscreen and lip balm and be advised to avoid prolonged sun exposure during treatment, and for 7 days after discontinuation.

Myalgia Manufacturer advises patients should advised to report any unexplained muscle pain, tenderness or weakness.

Vomiting Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time. Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of symptomatic bradycardia and vision disorders.

 DRUG ACTION Alpelisib is an alpha-specific class 1 protein kinase inhibitor.

INDICATIONS AND DOSE

Locally advanced or metastatic breast cancer (in combination with fulvestrant) [in postmenopausal women and men] (initiated by a specialist)

- ► BY MOUTH
- Adult: 300 mg once daily, for dose adjustments, treatment interruption, or discontinuation due to sideeffects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS History of severe cutaneous reactions · osteonecrosis of the jaw
- CAUTIONS History of diabetes mellitus (risk of hyperglycaemia)
- INTERACTIONS → Appendix 1: alpelisib
- SIDE-FFFFCTS
- ➤ Common or very common Acute kidney injury · alopecia · anaemia · appetite decreased · asthenia · dehydration · diarrhoea · dry eye · dry mouth · electrolyte imbalance · eyelid oedema · facial swelling · fever · gastrointestinal discomfort · headache · hypersensitivity · hypertension · increased risk of infection · insomnia · lymphoedema · mucosal abnormalities · muscle complaints · nausea · oedema · oral disorders · osteonecrosis of jaw · tespiratory disorders · skin reactions · taste altered · urosepsis · vision blurred · vomiting · vulvovaginal dryness · weight decreased
- ► Uncommon Diabetic ketoacidosis · ketoacidosis · pancreatitis · severe cutaneous adverse reactions (SCARs)
- ▶ Frequency not known Hyperglycaemia
- CONCEPTION AND CONTRACEPTION Manufacturer advises male patients should use effective contraception during treatment and for one week after last dose if their partner is pregnant or of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962. The effect on human fertility is not known—impairment of fertility has been observed in animal studies.
- RENAL IMPAIRMENT Manufacturer advises use with caution in severe renal impairment—no information available
- MONITORING REQUIREMENTS Manufacturer advises assess fasting plasma glucose and HbA1c levels before initiation and monitor frequently in the first 4 weeks of treatment consult product literature.

PATIENT AND CARER ADVICE

Vomiting Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.

Missed doses Manufacturer advises if dose is more than 9 hours late, the missed dose should not be taken and the next dose should be taken at the usual time.

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and

performance of skilled tasks—increased risk of fatigue or blurred vision.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Axitinib

15-Oct-2020

• DRUG ACTION Axitinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Advanced renal cell carcinoma (specialist use only)

- ► BY MOUTH
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with axitinib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS Recent active gastro-intestinal bleeding untreated brain metastases
- CAUTIONS Hypertension risk factors for aneurysm or artery dissection

CAUTIONS, FURTHER INFORMATION

- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: axitinib
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · constipation · cough · dehydration · diarrhoea · dizziness · dysphonia · dyspnoea ·

electrolyte imbalance • embolism and thrombosis • gastrointestinal discomfort • gastrointestinal disorders • haemorrhage • headache • heart failure • hyperbilirubinaemia • hypertension • hyperthyroidism • hypothyroidism • mucositis • myalgia • nausea • oral disorders • oropharyngeal pain • pain in extremity • polycythaemia • proteinuria • renal failure • skin reactions • taste altered • thrombocytopenia • tinnitus • vomiting • weight decreased

- ► Uncommon Leucopenia · neutropenia · posterior reversible encephalopathy syndrome (PRES)
- ► Frequency not known Aneurysm artery dissection
- CONCEPTION AND CONTRACEPTION Effective contraception required during and for up to 1 week after treatment
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.
 Dose adjustments Manufacturer advises reduce dose in moderate impairment.
- MONITORING REQUIREMENTS
- ► Monitor for thyroid dysfunction.
- Monitor haemoglobin or haematocrit before and during treatment.
- ▶ Monitor for symptoms of gastro-intestinal perforation.
- ▶ Monitor for symptoms of fistula.
- ▶ Monitor for proteinuria before and during treatment.
- ▶ Monitor liver function before and during treatment.
- NATIONAL FUNDING/ACCESS DECISIONS

Binimetinib

05-Mar-2019

• DRUG ACTION Binimetinib inhibits the mitogen-activated protein kinase (MAPK) pathway, specifically mitogenactivated extracellular kinases MEK 1 and 2, thereby inhibiting BRAF V600 mutation-positive cell growth.

INDICATIONS AND DOSE

Unresectable or metastatic melanoma with a BRAF V600 mutation (in combination with encorafenib) (specialist use only)

- ▶ BY MOUTH
- Adult: 45 mg twice daily, for dose adjustments due to side-effects, consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS History of retinal vein occlusion
- CAUTIONS Left ventricular dysfunction (ejection fraction below 50%, or below the institutional lower limits of normal) · neuromuscular conditions associated with elevated creatine kinase and rhabdomyolysis · risk factors for retinal vein occlusion · risk factors for venous thromboembolism
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · angioedema · arthralgia · constipation · detachment of retinal pigment epithelium · diarrhoea · dizziness · embolism and thrombosis · eve inflammation · fatigue · fever · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · heart failure · hypersensitivity · hypersensitivity vasculitis · hypertension · intracranial haemorrhage · left ventricular dysfunction · lip squamous cell carcinoma · muscle complaints · muscle weakness · myopathy · nausea · neoplasms · nerve disorders · oedema · pain · panniculitis · photosensitivity reaction · renal failure · skin reactions · taste altered · ulcerative colitis · vision disorders · vomiting
- ▶ Uncommon Facial paralysis pancreatitis
- ► Frequency not known Respiratory disorders retinal occlusion (discontinue permanently)
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of child-bearing potential should use effective contraception during and for at least one month after stopping treatment.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in moderate or severe impairment (increased exposure).
- MONITORING REQUIREMENTS
- Manufacturer advises monitor liver function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.
- ► Manufacturer advises assess left ventricular ejection fraction before treatment, one month after starting treatment, then every 3 months or more frequently as clinically indicated.
- ► Manufacturer advises monitor for visual disturbances.
- Manufacturer advises monitor blood pressure before and during treatment.
- ▶ Manufacturer advises monitor creatine kinase and creatinine levels monthly during the first 6 months of treatment, and as clinically indicated.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks-increased risk of visual dieturhancee

Bosutinih

05-Dec-2019

INDICATIONS AND DOSE

Previously treated chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia (specialist use only)

- ► BY MOUTH
- Adult: 500 mg once daily, consult product literature for dose adjustment due to side-effects, or incomplete haematologic response by week 8, or incomplete cytogenetic response by week 12

Newly-diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (specialist use only)

- ► BY MOUTH
- Adult: 400 mg once daily, consult product literature for dose adjustment due to side-effects, or failure to demonstrate breakpoint cluster region-Abelson (BCR-ABL) transcripts < 10% by month 3

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS An EU wide review has concluded that bosutinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- CAUTIONS Cardiac disease hepatitis B infection history of pancreatitis—withhold treatment if lipase elevated and abdominal symptoms occur · history of OT prolongation monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · recent cardiac event-monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · risk factors for OT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · significant gastrointestinal disorder
- CAUTIONS, FURTHER INFORMATION
- ▶ Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for

patients who test positive for hepatitis B virus and in those with active infection.

- INTERACTIONS → Appendix 1: bosutinib
- SIDE-EFFECTS
- ► Common or very common Anaemia · appetite decreased · arthralgia · asthenia · chest discomfort · cough · dehydration · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · fever · gastritis · gastrointestinal discomfort · haemorrhage · headache · hepatic disorders · hyperbilirubinaemia · hyperlipasaemia · hypertension · increased risk of infection · leucopenia · long QT syndrome · malaise · myalgia · nausea · neutropenia · oedema · pain · pericardial effusion · QT interval prolongation · renal impairment · respiratory disorders · skin reactions · taste altered · thrombocytopenia · tinnitus · vomiting
- ▶ Uncommon Pancreatitis pericarditis pulmonary hypertension • pulmonary oedema • tumour lysis syndrome
- ► Frequency not known Hepatitis B reactivation severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment in women.
- PREGNANCY Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid.
- RENAL IMPAIRMENT

Dose adjustments For chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia, manufacturer advises reduce dose to 400 mg in moderate impairment; reduce dose to 300 mg in severe impairment; consult product literature for dose adjustment due to side-effects, or incomplete haematological, cytogenetic, or molecular response.

For newly-diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia, manufacturer advises reduce dose to 300 mg in moderate impairment; reduce dose to 200 mg in severe impairment; consult product literature for dose adjustment due to side-effects, or incomplete haematological, cytogenetic, or molecular response.

- MONITORING REQUIREMENTS
- Manufacturer advises monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated—consult product literature for management of raised transaminases.
- Manufacturer advises monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated.
- Manufacturer advises monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema).
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Brigatinib

12-Feh-2021

• DRUG ACTION Brigatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only)

- ▶ BY MOUTH
- Adult: Initially 90 mg once daily for 7 days, then increased to 180 mg once daily, for dose adjustments, treatment interruption, or discontinuation due to sideeffects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce brigatinib dose to 90 mg once daily; in those starting treatment or already taking a reduced dose, consult product literature.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- INTERACTIONS → Appendix 1: brigatinib
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · appetite decreased · arrhythmias · arthralgia · asthenia · cataract · chest discomfort · constipation · cough · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · facial swelling · fever · flatulence · gastrointestinal discomfort · glaucoma · headaches · hyperbilirubinaemia · hyperglycaemia · hyperinsulinaemia · hypertension · increased risk of infection · insomnia · memory loss · muscle complaints · musculoskeletal discomfort · nausea · nerve disorders · neurotoxicity · oedema · oral disorders · pain · palpitations · peripheral swelling · photosensitivity reaction · QT interval prolongation · respiratory disorders · sensation abnormal · skin reactions · taste altered · vision disorders · vomiting · weight decreased
- ▶ Uncommon Pancreatitis
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective non-hormonal contraception in females of childbearing potential during and for at least 4 months after treatment. Male patients with partners of childbearing potential should use effective contraception during and for at least 3 months after treatment.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.

Dose adjustments Manufacturer advises dose reduction to 60 mg once daily for 7 days, then increase to 120 mg once daily in severe impairment.

 RENAL IMPAIRMENT Manufacturer advises caution in severe impairment.

Dose adjustments Manufacturer advises dose reduction to 60 mg once daily for 7 days, then increase to 90 mg once daily in severe impairment.

MONITORING REQUIREMENTS

- Manufacturer advises monitor for new or worsening respiratory symptoms, particularly in the first week of treatment—promptly investigate if pneumonitis suspected (consult product literature).
- Manufacturer advises monitor blood pressure, heart rate, creatine phosphokinase, amylase, and lipase regularly.

- ► Manufacturer advises monitor liver function at baseline. then every 2 weeks during the first 3 months of treatment, and periodically thereafter.
- ► Manufacturer advises monitor fasting serum glucose at baseline and periodically thereafter.
- PATIENT AND CARER ADVICE Manufacturer advises patients and carers should be told to report symptoms of visual disturbance, or unexplained muscle pain, tenderness, or weakness.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks-increased risk of visual disturbance, dizziness, or fatigue.

Cabozantinib

22-Nov-2021

 DRUG ACTION Cabozantinib is an inhibitor of several protein kinases.

INDICATIONS AND DOSE

Progressive, unresectable locally advanced or metastatic medullary thyroid carcinoma (initiated by a specialist)

- ► BY MOUTH USING CAPSULES
- Adult: 140 mg once daily, for dose adjustment or treatment interruption due to side-effects, consult product literature (closely monitor for first 8 weeks of therapy)

Advanced renal cell carcinoma (as monotherapy) (initiated by a specialist) | Hepatocellular carcinoma (initiated by a specialist)

- ► BY MOUTH USING TABLETS
- Adult: 60 mg once daily, for dose adjustment or treatment interruption due to side-effects, consult product literature (closely monitor for first 8 weeks of therapy)

Advanced renal cell carcinoma (in combination with nivolumab) (initiated by a specialist)

- ► BY MOUTH USING TABLETS
- Adult: 40 mg once daily, for dose adjustment or treatment interruption due to side-effects, consult product literature (closely monitor for first 8 weeks of therapy)

DOSE EQUIVALENCE AND CONVERSION

· Cabozantinib tablets and capsules are not bioequivalent—consult product literature when switching formulations.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY **DISSECTION (JULY 2020)**

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with cabozantinib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required. RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS Reversible posterior leucoencephalopathy syndrome
- CAUTIONS Hypertension palmar-plantar erythrodysaesthesia syndrome-consider treatment interruption if severe and restart at a lower dose when resolved to grade 1 · patients at increased risk of fistulasconsult product literature · patients at increased risk of gastro-intestinal perforation—consult product literature • patients at increased risk of intra-abdominal abscessconsult product literature • patients at risk of haemorrhage (including tumour involvement of the trachea or bronchi)—discontinue if symptoms develop · patients at risk of thromboembolic events including myocardial infarction—discontinue if symptoms develop · risk factors for aneurysm or artery dissection · risk of osteonecrosis of the jaw · susceptibility to OT-interval prolongation (e.g. cardiac disease, electrolyte disturbances, bradycardia, concomitant use of drugs that prolong the QT interval)

CAUTIONS, FURTHER INFORMATION

- Elective surgery Withhold treatment for at least 28 days before elective surgery and restart only if adequate wound healing—discontinue in patients with wound healing complications requiring medical intervention.
- Risk of osteonecrosis of the jaw Discontinue treatment at least 28 days before elective invasive dental procedures monitor for symptoms before and during treatment and discontinue if osteonecrosis develops.
- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly-consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: cabozantinib
- SIDE-EFFECTS
- ► Common or very common Abscess · alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · chills · cholelithiasis · confusion · constipation · cough · dehydration · depression · diarrhoea · dizziness · dry mouth · dyslipidaemia · dysphagia · dysphonia · dyspnoea · dysuria · ear pain · electrolyte imbalance · embolism and thrombosis · encephalopathy · fistula ·

gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hair changes · headache · healing impaired · hyperblirubinaemia · hyperglycaemia · hypotension · hypothyroidism · increased risk of infection · lymphopenia · mucositis · muscle spasms · nausea · nerve disorders · neutropenia · oedema · oral disorders · oropharyngeal pain · osteonecrosis of jaw · pain · pallor · pancreatitis · paraesthesia · peripheral coldness · proteinuria · respiratory disorders · skin reactions · stroke · taste altered · thrombocytopenia · tinnitus · tracheo-oesophageal fistula · tremor · vision blurred · vomiting · weight decreased

- Uncommon Abnormal dreams · acute kidney injury · amenorrhoea · angina pectoris · ataxia · cataract · concentration impaired · conjunctivitis · cyst · delirium · hearing impairment · hepatic disorders · loss of consciousness · rhabdomyolysis · seizure · skin ulcer · speech disorder · telangiectasia · throat oedema · wound complications
- Frequency not known Aneurysm artery dissection myocardial infarction
- CONCEPTION AND CONTRACEPTION Patients and their sexual partners must use effective contraception (in addition to barrier method) during treatment and for at least 4 months after the last dose.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after the last dose.
- HEPATIC IMPAIRMENT For capsules manufacturer advises caution in mild to moderate impairment (risk of increased exposure); avoid in severe impairment (no information available). For tablets manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).
 Dose adjustments For capsules manufacturer advises dose reduction to 60 mg once daily in mild to moderate impairment.
- RENAL IMPAIRMENT Ever Caution in mild to moderate impairment; avoid in severe impairment (no information available).
- MONITORING REQUIREMENTS
- Evgr Monitor urine protein regularly and discontinue if nephrotic syndrome develops.
- Monitor blood pressure, ECG and electrolytes during treatment.
- Measure baseline thyroid function before treatment and monitor during treatment.
- Perform liver function tests before starting, and monitor during treatment.
- ► Monitor platelet counts during treatment. ♠
- PATIENT AND CARER ADVICE Food should not be consumed for at least 2 hours before and at least 1 hour after each dosp.

Driving and skilled tasks Fatigue and weakness may affect performance of skilled tasks e.g. driving.

NATIONAL FUNDING/ACCESS DECISIONS

Ceritinib

10-Jun-202

 DRUG ACTION Ceritinib is a tyrosine kinase inhibitor, with particular activity against anaplastic lymphoma kinase (ALK).

• INDICATIONS AND DOSE

First-line treatment of anaplastic lymphoma kinase (ALK)positive advanced non-small cell lung cancer (specialist use only) | Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib (specialist use only)

- ► BY MOUTH
- Adult: 450 mg once daily, dose interruption, dose reduction or discontinuation may be required based on individual safety and tolerability—consult product literature; discontinue treatment if patient unable to tolerate at least 150 mg daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce the dose by one-third (rounded to the nearest multiple of the 150 mg dosage form).

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS Congenital long OT syndrome
- CAUTIONS Diabetes mellitus history or susceptibility to QT-interval prolongation

CAUTIONS, FURTHER INFORMATION

 QT-interval prolongation QT-interval prolongation has been observed in clinical studies, which may lead to an increased risk for ventricular tachyarrhythmias (e.g.

torsade de pointes) or sudden death. Risk factors include pre-existing bradycardia, other relevant pre-existing cardiac disease or electrolyte disturbances; manufacturer advises to monitor ECG and electrolytes periodically.

- INTERACTIONS → Appendix 1: ceritinib
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · appetite decreased · arrhythmias · asthenia · azotaemia · constipation · diarrhoea · dysphagia · gastrointestinal discomfort · gastrooesophageal reflux disease · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypophosphataemia · nausea · oesophageal disorder · pericardial effusion · pericarditis · QT interval prolongation · renal impairment · respiratory disorders · skin reactions · vision disorders · vitreous floater · vomiting · weight decreased
- ▶ Uncommon Pancreatitis

SIDE-EFFECTS, FURTHER INFORMATION Gastro-intestinal effects Manufacturer advises monitor for signs of gastro-intestinal toxicity and consider dose reduction or discontinuation of treatment.

Interstitial lung disease Manufacturer advises monitor patients who exhibit pulmonary symptoms and consider dose reduction or discontinuation of treatment.

- CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception in women of childbearing potential during treatment and for up to 3 months after discontinuation of treatment.
- PREGNANCY Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (limited information available).
 Dose adjustments Manufacturer advises reduce dose by approx. 33% in severe impairment (round to the nearest multiple of the 150 mg dosage strength).
- RENAL IMPAIRMENT EVGT Caution in severe impairment (no information available).
- MONITORING REQUIREMENTS
- Manufacturer advises monitor fasting plasma-glucose concentration, amylase and lipase levels before treatment initiation and periodically thereafter as clinically indicated
- Manufacturer advises measure baseline liver function, then monitor every 2 weeks for the first three months of treatment and monthly thereafter; if transaminases are elevated, more frequent monitoring should be performed as clinically indicated.
- Manufacturer advises monitor for pulmonary symptoms indicative of interstitial lung disease and pneumonitis discontinue treatment if diagnosis confirmed; also monitor heart rate and blood pressure regularly.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises Zykadia[®] tablets should be taken with food at the same time each day—consult product literature for dosing information if patients are unable to take tablets with food.
- PATIENT AND CARER ADVICE Patients and carers should be counselled on the administration of tablets

Missed doses Manufacturer advises if a patient vomits during a course of treatment or if a dose is more than 12 hours late, the replacement or missed dose should not be taken and the next dose should be taken at the normal

Driving and skilled tasks Manufacturer advises patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of fatigue and vision disorders.

- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

Cobimetinib

30-Anr-2019

- DRUG ACTION Cobimetinib is a mitogen-activated protein kinase (MAPK) inhibitor.
 - INDICATIONS AND DOSE

Treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma (in combination with vemurafenib) (specialist use only)

- ▶ BY MOUTH
- Adult: 60 mg once daily for 21 days; subsequent cycles repeated after a 7-day interval, for dose adjustment due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Left ventricular dysfunction risk factors for bleeding
- INTERACTIONS → Appendix 1: cobimetinib
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · basal cell carcinoma · chills · dehydration · diarrhoea · electrolyte imbalance · fever · haemorrhage · hyperglycaemia · hypertension · nausea · photosensitivity · pneumonitis · retinal detachment · retinopathy · skin reactions · sunburn · vision disorders · vomiting
- ► Uncommon Rhabdomyolysis
- ► Frequency not known Intracranial haemorrhage
- CONCEPTION AND CONTRACEPTION Manufacturer advises use of two effective contraceptive methods during treatment and for at least 3 months after stopping treatment.
- PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available
- HEPATIC IMPAIRMENT Manufacturer advises caution.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—limited information available.
- MONITORING REQUIREMENTS
- Creatine kinase elevation Manufacturer advises baseline creatine kinase and creatinine levels should be measured before starting treatment, and then at monthly intervals during treatment or as clinically indicated—consult product literature if elevated.

- ▶ Left ventricular function Manufacturer advises ejection fraction should be evaluated before initiation of treatment, then after the first month of treatment and at least every 3 months thereafter (or as clinically indicated) until treatment discontinuation.
- Liver function Manufacturer advises liver function should be evaluated before initiation of treatment and monthly thereafter (or more frequently as clinically indicated).
- Visual disturbances Manufacturer advises assess for new or worsening visual disturbances at each visit; if symptoms of new or worsening visual disturbances are identified, an ophthalmologic examination is recommended.

PATIENT AND CARER ADVICE

Vomiting Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time. Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances.

• NATIONAL FUNDING/ACCESS DECISIONS

• DRUG ACTION Crizotinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only) | ROS1-positive advanced non-small cell lung cancer (specialist use only)

- ► BY MOUTH
- Adult: 250 mg twice daily, consult product literature for information on dose adjustments based on individual patient safety and tolerability

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF CARDIAC FAILURE Severe, sometimes fatal cases of cardiac failure have

- Severe, sometimes fatal cases of cardiac failure have been reported in patients treated with crizotinib. The MHRA has issued the following advice:

 monitor all patients for signs and symptoms of heart
- monitor all patients for signs and symptoms of heart failure (including dyspnoea, oedema, or rapid weight gain from fluid retention)
- consider reducing the dose, or interrupting or stopping treatment if symptoms of heart failure occur
- CAUTIONS History of diverticulitis (risk of gastrointestinal perforation—discontinue treatment if gastrointestinal perforation occurs) · metastases of gastrointestinal tract (risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs) · patients with susceptibility to QTprolongation (including bradycardia, history of cardiac

disease, concomitant use of drugs that prolong QT interval, and electrolyte disturbances)—periodic renal monitoring required -risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs · vision disorders reported—consider full ophthalmological evaluation if vision disorder worsens or persists

CAUTIONS, FURTHER INFORMATION

- Fatal interstitial lung disease and pneumonitis Fatal interstitial lung disease and pneumonitis reported (monitor patients with pulmonary symptoms, withdraw treatment if suspected, and permanently discontinue treatment if diagnosed).
- INTERACTIONS → Appendix 1: crizotinib
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · appetite decreased · arrhythmias · constipation · diarrhoea · dizziness · fatigue · gait abnormal · gastrointestinal discomfort · gastrointestinal disorders · heart failure · hepatic function abnormal · hypogonadism · hypophosphataemia · leucopenia · local swelling · movement disorders · muscle atrophy · muscle tone decreased · muscle weakness · nausea · nerve disorders · neuralgia · neurotoxicity · neutropenia · oedema · periorbital oedema · peroneal nerve palsy · pulmonary oedema · QT interval prolongation · renal abscess · renal cyst · respiratory disorders · sensation abnormal · skin reactions · syncope · taste altered · vision disorders · vitreous floater · vomiting
- ► Uncommon Gastrointestinal perforation (including fatal cases) hepatic failure (including fatal cases) renal impairment
 - SIDE-EFFECTS, FURTHER INFORMATION Consider reducing the dose, or interrupting or stopping treatment if symptoms of cardiac failure occur.
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during and for at least 90 days after treatment.
- PREGNANCY Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises use with caution.

Dose adjustments Manufacturer advises reduce dose in moderate to severe impairment—consult product literature.

RENAL IMPAIRMENT

Dose adjustments EvGr Reduce dose to 250 mg once daily in severe impairment not requiring peritoneal dialysis or haemodialysis, may be increased to 200 mg twice daily after at least 4 weeks, based on individual assessment of safety and tolerability.

- MONITORING REQUIREMENTS Monitor liver function once a week during the first 2 months of treatment, then at least monthly thereafter and as clinically indicated. Monitor ECG and electrolytes (correct if abnormal) in all patients before starting treatment, then periodically and as clinically indicated thereafter. Monitor for signs and symptoms of treatment emergent bradycardia (including syncope, dizziness and hypotension)—monitor blood pressure and heart rate regularly.
- PATIENT AND CARER ADVICE Counsel all patients on the early signs and symptoms of gastrointestinal perforation advice to seek immediate medical attention.
 Driving and skilled tasks Symptomatic bradycardia (including syncope, dizziness and hypotension), vision disorder and fatigue may affect performance of skilled tasks (e.g. driving or operating machinery).
- NATIONAL FUNDING/ACCESS DECISIONS

Dabrafenib

21-Aug-2020

 DRUG ACTION Dabrafenib is a BRAF kinase inhibitor, which inhibits BRAF V600 mutation-positive melanoma cell growth.

INDICATIONS AND DOSE

Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with trametinib) (specialist use only) | Advanced non-small cell lung cancer with a BRAF V600 mutation (in combination with trametinib) (specialist use only)

- ► BY MOUTH
- Adult: 150 mg every 12 hours, for dose adjustments due to side-effects, consult product literature

Adjuvant treatment of stage III melanoma with a BRAF V600 mutation following complete resection (in combination with trametinib) (specialist use only)

- ► BY MOUTH
- Adult: 150 mg every 12 hours for 12 months, for dose adjustments due to side-effects, consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS BRAF wild-type melanoma · BRAF wild-type non-small cell lung cancer
- CAUTIONS Elderly (more frequent dose adjustments may be required) • prior or concurrent cancer associated with RAS mutations—risk of secondary or recurrent malignancy
- INTERACTIONS → Appendix 1: dabrafenib
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · appetite decreased · arthralgia · asthenia · chills · constipation · cough · diarrhoea · fever · headach · hyperglycaemia · hypophosphataemia · influenza like illness · myalgia · nausea · neoplasms · pain in extremity · photosensitivity reaction · skin reactions · vomiting
- ► Uncommon Nephritis pancreatitis panniculitis renal impairment uveitis
 - SIDE-EFFECTS, FURTHER INFORMATION Additional side-effects reported when used in combination with trametinib include dizziness, hyperhidrosis, hyponatraemia,

- hypotension, leucopenia, muscle spasms, myocarditis, neutropenia, night sweats, and thrombocytopenia.
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of child-bearing potential should use effective non-hormonal contraception during and for 4 weeks after stopping treatment.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment—no information available.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—no information available.
- MONITORING REQUIREMENTS Manufacturer advises assess
 for cutaneous squamous cell carcinoma and new primary
 melanoma before treatment, monthly during treatment,
 and for 6 months after discontinuation or until initiation
 of alternative treatment; assess and monitor for noncutaneous secondary or recurrent malignancy before,
 during, and for 6 months after discontinuation or until
 initiation of alternative treatment—consult product
 literature; monitor full blood count as clinically indicated;
 monitor for ophthalmologic reactions including uveitis,
 iridocyclitis and iritis; monitor serum creatinine.
- PATIENT AND CARER ADVICE Manufacturer advises
 patients should be informed to immediately report new
 skin lesions—risk of cutaneous squamous cell carcinoma
 and new primary melanoma.

Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of ocular adverse reactions

NATIONAL FUNDING/ACCESS DECISIONS

Dacomitinib

31-Aug-2020

 DRUG ACTION Dacomitinib is a tyrosine kinase inhibitor that inhibits epidermal growth factor receptor (EGFR).

INDICATIONS AND DOSE

Non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations (specialist use only)

- ► BY MOUTH
- Adult: 45 mg once daily, for dose adjustments, treatment interruption or discontinuation due to sideeffects—consult product literature
- INTERACTIONS → Appendix 1: dacomitinib
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · appetite decreased · asthenia · dehydration · diarrhoea · dry eye · dry mouth · eye inflammation · hypertrichosis · hypokalaemia · increased risk of infection · interstitial lung disease (discontinue permanently) · mucositis · nail discolouration · nail disorders · nausea · oral disorders · oropharyngeal pain · pneumonitis (discontinue permanently) · skin reactions · taste altered · vomiting · weight decreased
- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential should use effective contraception during treatment and for at least 17 days after stopping treatment.
- PREGNANCY Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).
- MONITORING REQUIREMENTS Manufacturer advises monitor liver function periodically—interrupt treatment if severe changes in liver function occur.
- PATIENT AND CARER ADVICE

Photosensitivity Manufacturer advises patients should wear protective clothing and apply sunscreen before sun exposure.

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of fatigue and ocular side-effects.

• NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

 Dacomitinib for untreated EGFR mutation-positive non-small cell lung cancer (August 2019) NICE TA595 Recommended

Scottish Medicines Consortium (SMC) decisions

- ▶ Dacomitinib (Vizimpro[®]) as monotherapy for the first-line treatment of adult patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) with epidermal growth factor receptor (EGFR)-activating mutations (September 2019) SMC No. SMC2184 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Dasatinib

24-Nov-2020

• DRUG ACTION Dasatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Chronic phase chronic myeloid leukaemia (initiated by a specialist)

- ► BY MOUTH USING TABLETS
- Adult: 100 mg once daily, then increased if necessary up to 140 mg once daily, for dose adjustment due to side-effects—consult product literature
- ▶ BY MOUTH USING ORAL SUSPENSION
- Adult (body-weight 30-44 kg): 105 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
- Adult (body-weight 45 kg and above): 120 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects consult product literature

Accelerated and blast phase chronic myeloid leukaemia [resistant or intolerant to prior therapy] (initiated by a specialist) | Acute lymphoblastic leukaemia [resistant or intolerant to prior therapy] (initiated by a specialist)

- ► BY MOUTH USING TABLETS
- Adult: 140 mg once daily, then increased if necessary up to 180 mg once daily, for dose adjustment due to side-effects—consult product literature

DOSE EQUIVALENCE AND CONVERSION

➤ Sprycel® film-coated tablets and Sprycel® powder for oral suspension are **not** bioequivalent. Follow correct dosing recommendations for the dosage form when switching formulations.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS

An EU wide review has concluded that dasatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- CAUTIONS Hepatitis B infection · risk of cardiac dysfunction (monitor closely) · susceptibility to QTinterval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment)
 CAUTIONS, FURTHER INFORMATION
- Hepatitis B infection The MHRA advises that patients who
 are carriers of hepatitis B virus should be closely
 monitored for signs and symptoms of active infection
 throughout treatment and for several months after
 stopping treatment; expert advice should be sought for
 patients who test positive for hepatitis B virus and in those
 with active infection.
- INTERACTIONS → Appendix 1: dasatinib
- SIDE-EFFECTS
- ➤ Common or very common Alopecia anaemia appetite abnormal arrhythmias arthralgia asthenia bone marrow depression · cardiac disorder · cardiomyopathy · chest pain · chills · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry eye · dyspnoea · eye inflammation · facial swelling · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · genital abnormalities · haemorrhage · headache · heart failure · hypertension · hyperuricaemia · increased risk of infection · insomnia · milia · mucositis · muscle complaints · muscle weakness · musculoskeletal stiffness ·

myocardial dysfunction • nausea • nerve disorders • neutropenia • oedema • oral disorders • pain • palpitations • pericardial effusion • perinephric effusion • peripheral swelling • pulmonary hypertension • pulmonary oedema • respiratory disorders • sepsis • skin reactions • sweat changes • taste altered • thrombocytopenia • tinnitus • vision disorders • vomiting • weight changes

BNF 84

- ▶ Uncommon Acute coronary syndrome anxiety arthritis ascites · asthma · cardiac inflammation · cardiomegaly · cerebrovascular insufficiency · cholecystitis · CNS haemorrhage · confusion · dysphagia · embolism and thrombosis · emotional lability · excessive tearing · gynaecomastia · hair disorder · hearing loss · hepatic disorders · hypercholesterolaemia · hypoalbuminaemia · hypotension · hypothyroidism · ischaemic heart disease · libido decreased · lymphadenopathy · lymphopenia · malaise · memory loss · menstrual disorder · movement disorders · myopathy · nail disorder · osteonecrosis · pancreatitis · panniculitis · penile disorders · photosensitivity reaction · proteinuria · QT interval prolongation · renal impairment · scrotal oedema · skin ulcer · syncope · tendinitis · testicular swelling · tremor · tumour lysis syndrome · urinary frequency increased · vertigo · vulvovaginal swelling
- Rare or very rare Cardiac arrest · dementia · diabetes mellitus · epijphyses delayed fusion · facial paralysis · gait abnormal · growth retardation · hypersensitivity vasculitis · hyperthyroidism · pure red cell aplasia · seizure · thyroiditis
- ▶ Frequency not known Hepatitis B reactivation nephrotic syndrome • Stevens-Johnson syndrome • thrombotic microangiopathy
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
- MONITORING REQUIREMENTS
- Manufacturer advises evaluate for signs and symptoms of underlying cardiopulmonary disease before initiation of therapy—echocardiography should be performed at treatment initiation in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease.
- Manufacturer advises monitor patients with risk factors or a history of cardiac disease for signs or symptoms of cardiac dysfunction during treatment.
- When used for Accelerated or blast phase chronic myeloid leukaemia or Acute lymphoblastic leukaemia Manufacturer advises monitor full blood count weekly for the first 2 months, then monthly or as clinically indicated thereafter.
- When used for Chronic phase chronic myeloid leukaemia Manufacturer advises monitor full blood count every 2 weeks for 3 months, then every 3 months or as clinically indicated thereafter.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016) NICE TA426 Recommended with restrictions
- Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016) NICE TA425 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Dasatinib (Sprycel®) tablets for the treatment of adult patients with chronic, accelerated or blast phase chronic myelogenous leukaemia (CML) with resistance or intolerance to prior therapy including imatinib mesilate (September 2016) SMC No. 370/07 Recommended
- Dasatinib (Sprycel®) tablets for the treatment of adult patients with newly diagnosed Philadelphia chromosome positive (Ph+) chronic myelogenous leukaemia (CML) in the chronic phase (September 2016) SMC No. 1170/16 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Encorafenib

28-May-2021

 DRUG ACTION Encorafenib inhibits the mitogen-activated protein kinase (MAPK) pathway, specifically BRAF kinase, thereby inhibiting BRAF V600 mutation-positive cell growth.

• INDICATIONS AND DOSE

Unresectable or metastatic melanoma with a BRAF V600 mutation (in combination with binimetinib) (specialist use only)

- ► BY MOUTH
- Adult: 450 mg once daily, for dose adjustments due to side-effects, consult product literature

Metastatic colorectal cancer with a BRAF V600E mutation (in combination with cetuximab) (specialist use only)

- ► BY MOUTH
- Adult: 300 mg once daily, for dose adjustments due to side-effects, consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS BRAF wild-type colorectal cancer BRAF wild-type malignant melanoma
- CAUTIONS Prior or concurrent cancer associated with RAS mutation • risk factors for QT-interval prolongation
- INTERACTIONS → Appendix 1: encorafenib

SIDE-EFFECTS

- Common or very common Alopecia · anaemia · angioedema · appetite decreased · arrhythmias · arthralgia · arthritis · constipation · detachment of retinal pigment epithelium · diarrhoea · dizziness · embolism and thrombosis · eye inflammation · facial paralysis · fatigue · fever · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · heart failure · hypersensitivity · hypersensitivity vasculitis · hypertension · insomnia · intracranial haemorrhage · left ventricular dysfunction · lip squamous cell carcinoma · muscle complaints · muscle weakness · myopathy · nausea · neoplasms · nerve disorders · oedema · pain · panniculitis · paresis · photosensitivity reaction · renal impairment · skin reactions · taste altered · ulcerative colitis · vision disorders · vomiting
- ▶ Uncommon Pancreatitis
- ▶ Frequency not known OT interval prolongation
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of child-bearing potential should use effective contraception during and for at least one month after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild impairment (increased exposure); avoid in moderate or severe impairment (no information available).
 Dose adjustments Manufacturer advises dose reduction to 300 mg once daily in mild impairment.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).
- MONITORING REQUIREMENTS
- ▶ Manufacturer advises assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, every 2 months during treatment, and for up to 6 months after discontinuation; assess for non-cutaneous malignancy and monitor full blood count before, during, and after treatment discontinuation as clinically indicated—consult product literature.
- Manufacturer advises monitor liver function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.
- Manufacturer advises assess ECG before treatment, one month after starting treatment, then every 3 months or more frequently as clinically indicated.
- Manufacturer advises monitor blood creatinine levels as clinically indicated.
- Manufacturer advises monitor for ophthalmologic reactions including uveitis, iridocyclitis, and iritis.
- PATIENT AND CARER ADVICE Manufacturer advises
 patients should be informed to immediately report new
 skin lesions—risk of cutaneous squamous cell carcinoma
 and new primary melanoma.

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

► Encorafenib with binimetinib for unresectable or metastatic BRAF V600 mutation-positive melanoma (February 2019) NICE TA562 Recommended with restrictions ► Encorafenib plus cetuximab for previously treated BRAF V600E mutation-positive metastatic colorectal cancer (January 2021) NICE TA668 Recommended

Scottish Medicines Consortium (SMC) decisions

- Encorafenib (Braftovi®) in combination with binimetinib for the treatment of adult patients with unresectable or metastatic melanoma with a BRAF V600 mutation (February 2020) SMC No. SMC2238 Recommended
- Encorafenib (Braftovi®) in combination with cetuximab, for the treatment of adult patients with metastatic colorectal cancer with a BRAF V600E mutation, who have received prior systemic therapy (May 2021) 5MC No. 5MC2312 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

apsule

CAUTIONARY AND ADVISORY LABELS 3, 25

► Braftovi (Pierre Fabre Ltd) ▼ Encorafenib 50 mg Braftovi 50mg capsules | 28 capsule PoM £622.22 (Hospital only) Encorafenib 75 mg Braftovi 75mg capsules | 42 capsule PoM £1.400.00 (Hospital only)

Entrectinib

30-Mar-2021

 DRUG ACTION Entrectinib is a tropomyosin receptor kinase inhibitor.

INDICATIONS AND DOSE

Solid tumours with neurotrophic tyrosine receptor kinase gene fusion (initiated by a specialist)

► BY MOUTH

 Adult: 600 mg once daily, for dose adjustments, treatment interruption, or discontinuation due to sideeffects—consult product literature

ROS1-positive advanced non-small cell lung cancer (initiated by a specialist)

- ► BY MOUTH
- Adult: 600 mg once daily, for dose adjustments, treatment interruption, or discontinuation due to sideeffects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce entrectinib dose to 100 mg once daily; if concomitant use with moderate CYP3A4 inhibitors is unavoidable, reduce entrectinib dose to 200 mg once daily.
- CONTRA-INDICATIONS Congenital long QT syndrome
- CAUTIONS Susceptibility to QT-interval prolongation symptoms or risk factors for congestive heart failure (assess left ventricular ejection fraction before initiation)
 CAUTIONS. FURTHER INFORMATION
- QT-interval prolongation QT-interval prolongation has been observed in clinical studies. Manufacturer advises avoid in patients with pre-existing risk factors; if potential benefit outweighs risk in this patient group, additional monitoring should be considered. Monitor ECG and electrolytes in all patients before treatment, after 1 month, and periodically as clinically indicated (treatment not recommended if QT interval greater than 450 milliseconds at baseline)—consult product literature if QT-interval prolongation occurs during treatment.
- INTERACTIONS → Appendix 1: entrectinib
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone fractures · cognitive disorder · concentration impaired · confusion · constipation · cough · delirium · depression · diarrhoea · dizziness · drowsiness · dysphagia · dyspnoea · fever · fluid imbalance · gait abnormal · hallucinations ·

 $\label{eq:hoperurbal} \begin{tabular}{ll} headache \cdot heart failure \cdot hyperuricaemia \cdot hypotension \cdot increased risk of infection \cdot memory impairment \cdot mood altered \cdot movement disorders \cdot muscle weakness \cdot myalgia \cdot nausea \cdot neutropenia \cdot oedema \cdot pain \cdot peripheral neuropathy \cdot peripheral swelling \cdot photosensitivity reaction \cdot pleural effusion \cdot psychiatric disorders \cdot pulmonary oedema \cdot QT interval prolongation \cdot sensation abnormal \cdot skin reactions \cdot sleep disorders \cdot syncope \cdot taste altered \cdot urinary disorders \cdot vertigo \cdot vision disorders \cdot vomiting \cdot weight increased \\ \end{tabular}$

- ► Uncommon Tumour lysis syndrome
- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential should use effective contraception during treatment and for 5 weeks after last treatment; male patients should use effective contraception during treatment and for 3 months after last treatment if their partner is of childbearing potential. Additional barrier method recommended in females using hormonal contraceptives. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—limited information available. See also *Pregnancy and reproductive* function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs immediately after a dose is taken, patients may repeat the dose.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of cognitive disorders, syncope, blurred vision, or dizziness.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Entrectinib for treating ROS1-positive advanced non-small-cell lung cancer (August 2020) NICE TA643 Recommended
- ► Entrectinib for treating NTRK fusion-positive solid tumours (August 2020) NICE TA644 Recommended

Scottish Medicines Consortium (SMC) decisions

- ► Entrectinib (Rozlytrek®) for the treatment of adult patients with ROS1-positive, advanced non-small cell lung cancer (NSCLC) not previously treated with ROS-1 inhibitors (January 2021) SMC No. SMC294 Recommended
- Entrectinib (Rozlytrek®) for the treatment of adult and paediatric patients 12 years of age and older, with solid tumours that have a neurotrophic tyrosine receptor kinase (NTRK) gene fusion (March 2021) SMC No. SMC2295 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Erlotinib

18-May-2021

• DRUG ACTION Erlotinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy | Monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy

- ► BY MOUTH
- Adult: 150 mg once daily

Treatment of metastatic pancreatic cancer (in combination with gemcitabine)

- ► BY MOUTH
- Adult: 100 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, increase dose to 300 mg daily, if well tolerated for more than 2 weeks, further increase to 450 mg daily could be considered with close monitoring.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

CAUTIONS

- Smoking Dose adjustment may be necessary if smoking started or stopped during treatment.
- INTERACTIONS → Appendix 1: erlotinib
- SIDE-EFFECTS
- ► Common or very common Alopecia · diarrhoea · eye inflammation · haemorrhage · increased risk of infection · renal failure · skin reactions
- ▶ Uncommon Brittle nails · eye disorders · gastrointestinal disorders · hair changes · interstitial lung disease · nephritis · proteinuria
- ▶ Rare or very rare Hepatic failure severe cutaneous adverse reactions (SCARs)
- Frequency not known Appetite decreased · chills · cough · depression · dyspnoea · fatigue · fever · gastrointestinal discomfort · headache · nausea · neuropathy sensory · stomatitis · vomiting · weight decreased
- CONCEPTION AND CONTRACEPTION Effective contraception required during and for at least 2 weeks after treatment.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid breastfeeding during treatment and for at least 2 weeks after the last dose.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment—monitor liver function and

interrupt treatment if changes in liver function are severe (increased risk of hepatic failure); avoid in severe impairment—no information available.

Dose adjustments Manufacturer advises consider dose reduction or interruption if serious adverse effects occur.

- RENAL IMPAIRMENT Manufacturer advises avoid in severe impairment.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

- Erlotinib monotherapy for maintenance treatment of nonsmall-cell lung cancer (June 2011) NICE TA227 Not recommended
- Erlotinib for the first-line treatment of locally advanced or metastatic EGFR-TK mutation-positive non-small-cell lung cancer (June 2012) NICE TA258 Recommended with restrictions
- Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy [in patients with tumours that are EGFR-TK mutation-negative] (December 2015) NICE TA374 Not recommended
- Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy [in patients with tumours of unknown EGFR-TK mutation status] (December 2015) NICE TA374 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Everolimus

25-Oct-2021

• DRUG ACTION Everolimus is a protein kinase inhibitor.

INDICATIONS AND DOSE

Neuroendocrine tumours of pancreatic origin Neuroendocrine tumours of gastro-intestinal origin

- Adult: 10 mg once daily, for dose interruption or adjustments due to side effects-consult product literature

Neuroendocrine tumours of pancreatic origin Neuroendocrine tumours of lung origin | Neuroendocrine tumours of gastro-intestinal origin | Renal cell carcinoma Hormone-receptor positive HER2-negative breast cancer [in combination with exemestane]

- ► BY MOUTH
- Adult: 10 mg once daily, for dose interruption or adjustments due to side-effects-consult product literature

CERTICAN ®

Liver transplantation

- ▶ BY MOUTH
- Adult: Initially 1 mg twice daily, to be started approximately 4 weeks after transplantation: maintenance, dose adjusted according to response and whole blood everolimus concentration: dose adjustments can be made every 4-5 days

Renal transplantation | Heart transplantation

- ▶ BY MOUTH
- Adult: Initially 750 micrograms twice daily, to be started as soon as possible after transplantation: maintenance, dose adjusted according to response and whole blood everolimus concentration; dose adjustments can be made every 4-5 days

VOTUBIA ® **DISPERSIBLE TABLETS**

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

- ► BY MOUTH USING DISPERSIBLE TABLETS
- Adult: (consult product literature)

Adjunctive treatment of refractory partial-onset seizures, with or without secondary generalisation, associated with tuberous sclerosis complex

- ► BY MOUTH USING DISPERSIBLE TABLETS
- Adult: (consult product literature)

VOTUBIA ® TABLETS

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

- ► BY MOUTH USING TABLETS
- Adult: (consult product literature)

Renal angiomyolipoma associated with tuberous sclerosis

- ► BY MOUTH USING TABLETS
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008) See Epilepsy p. 330.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 330 and see also Prescribing and dispensing information.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 330.

- CAUTIONS History of bleeding disorders peri-surgical period (impaired wound healing)
- INTERACTIONS → Appendix 1: everolimus
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cough · decreased leucocytes · dehydration · diabetes mellitus · diarrhoea · dry mouth · dyslipidaemia · dysphagia · dyspnoea · electrolyte imbalance · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · headache · hyperglycaemia · hypertension · increased risk of infection · insomnia · menstrual cycle irregularities · mucositis · nail disorders · nausea · neutropenia · oral disorders · peripheral oedema · proteinuria · renal impairment · respiratory disorders · skin reactions · taste altered · thrombocytopenia · vomiting · weight decreased
- **Uncommon** Congestive heart failure embolism and thrombosis · flushing · healing impaired · hepatitis B ·

musculoskeletal chest pain \cdot pancytopenia \cdot sepsis \cdot urinary frequency increased

- ▶ Rare or very rare Pure red cell aplasia
- ► Frequency not known Hepatitis B reactivation suicidal behaviours

SIDE-EFFECTS, FURTHER INFORMATION Reduce dose or discontinue if severe side-effects occur—consult product literature.

- CONCEPTION AND CONTRACEPTION Effective contraception must be used during and for up to 8 weeks after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962. See also Pregnancy in Enilensy p. 330
- BREAST FEEDING Manufacturer advises avoid.
- HEPATIC IMPAIRMENT Consult product literature.
- MONITORING REQUIREMENTS
- For Votubia[®] preparations: manufacturer advises everolimus blood concentration monitoring is required consult product literature.
- ➤ For Certican[®]: manufacturer advises pre-dose ('trough') whole blood everolimus concentration should be 3–8 nanograms/mL; monitoring should be performed every 4–5 days (using chromatographic assay) after initiation or dose adjustment until 2 consecutive stable concentrations; monitor patients with hepatic impairment taking concomitant strong CYP3A4 inducers and inhibitors when switching formulation, and/or if concomitant ciclosporin dose is reduced.
- Manufacturer advises monitor blood-glucose concentration, complete blood count, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.
- Manufacturer advises monitor renal function before treatment and periodically thereafter.
- Manufacturer advises monitor for signs and symptoms of infection before and during treatment.
- DIRECTIONS FOR ADMINISTRATION

VOTUBIA ® **DISPERSIBLE TABLETS** Manufacturer advises tablets must be dispersed in water before administration—consult product literature for details.

VOTUBIA TABLETS Manufacturer advises tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

 PRESCRIBING AND DISPENSING INFORMATION Votubia [®] is available as both tablets and dispersible tablets. These formulations vary in their licensed indications and are not interchangeable—consult product literature for information on switching between formulations.

• PATIENT AND CARER ADVICE

Pneumonitis Non-infectious pneumonitis reported.
Manufacturer advises patients and their carers should be informed to seek urgent medical advice if new or worsening respiratory symptoms occur.
Infections Manufacturer advises patients and their carers should be informed of the risk of infection.

• NATIONAL FUNDING/ACCESS DECISIONS

Fedratinib

04-May-2022

 DRUG ACTION Fedratinib is a kinase inhibitor with activity against Janus-associated tyrosine kinase JAK2 and FMSlike tyrosine kinase FLT3, thereby reducing the abnormal production of blood cells and associated symptoms.

• INDICATIONS AND DOSE

Disease-related splenomegaly or symptoms [in patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis] (specialist use only)

- ► BY MOUTH
- Adult: 400 mg once daily, for dose reduction, interruption, or discontinuation due to side-effects consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- EvGr If concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce fedratinib dose to 200 mg once daily and monitor patients weekly for side-effects. If the potent CYP3A4 inhibitor is stopped, increase the dose to 300 mg once daily for two weeks, then to 400 mg once daily thereafter.
- CONTRA-INDICATIONS Absolute neutrophil count less than 1x10⁹ cells/litre (do not initiate) platelet count less than 50x10⁹/litre (do not initiate) thiamine deficiency
- CAUTIONS Patients 75 years of age or older (increased incidence of side-effects—limited information available)
- INTERACTIONS → Appendix 1: fedratinib
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · dysuria · haemorrhage · headache · hypertension · muscle spasms · nausea · neutropenia · pain · thrombocytopenia · urinary tract infection · vomiting · weight increased · Wernicke's encephalopathy
- ▶ Frequency not known Hepatic failure pancreatitis

 SIDE-EFFECTS, FURTHER INFORMATION Nausea is very common, often occurring within 2 days of starting treatment. Nausea can be managed by prescribing concurrent antiemetics (consult product literature), and/or taking doses with a high fat meal.
- CONCEPTION AND CONTRACEPTION Ever Females of childbearing potential should use effective contraception during treatment and for at least 1 month after last treatment.
- PREGNANCY EVGr Avoid—toxicity in animal studies.
- BREAST FEEDING EVGT Avoid during treatment and for at least 1 month after last treatment.
- HEPATIC IMPAIRMENT Ever Avoid in severe impairment (no information available).
- RENAL IMPAIRMENT EVGT Caution in moderate and severe impairment (creatinine clearance less than 59 mL/minute); monitor at least weekly and consider dose adjustment if side-effects occur (risk of increased exposure)—consult product literature.

Dose adjustments Fuel Reduce dose to 200 mg once daily in severe impairment (creatinine clearance 15–29 mL/minute). See p. 21.

- MONITORING REQUIREMENTS
- EvGr Monitor transaminases, serum creatinine, amylase, and lipase levels before treatment initiation, then monthly for the first 3 months and periodically during treatment, and as clinically indicated. Monitor patients every 2 weeks until resolution if levels are elevated.
- Monitor full blood count and blood urea nitrogen levels before treatment initiation, periodically during treatment, and as clinically indicated.

- Patients with haemoglobin less than 10 g/dL or platelet count less than 100x10⁹/litre at the start of treatment should be monitored weekly for the first month until levels improve.
- Monitor thiamine levels and nutritional status before treatment initiation, then monthly for the first 3 months and then every 3 months thereafter, and as clinically indicated. Correct thiamine levels if low before or during treatment.

PATIENT AND CARER ADVICE

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Fedratinib for treating disease-related splenomegaly or symptoms in myelofibrosis (December 2021) NICE TA756 Recommended with restrictions
- Scottish Medicines Consortium (SMC) decisions
- ▶ Fedratinib (Inrebic®) for the treatment of disease-related splenomegaly or symptoms in adult patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis or postessential thrombocythaemia myelofibrosis who are Janusassociated kinase inhibitor-naive or who have been treated with ruxolitinib (April 2022) SMC No. SMC2462 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

Gefitinib

19-Jul-2021

• DRUG ACTION Gefitinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor

- ► BY MOUTH
- Adult: 250 mg once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

- INTERACTIONS → Appendix 1: gefitinib
- SIDE-EFFECTS
- Common or very common Alopecia · angioedema · appetite decreased · asthenia · cystitis · dehydration · diarrhoea · dry eye · dry mouth · eye inflammation · fever · haemorrhage · hypersensitivity · interstitial lung disease (discontinue) ·

- nail disorder nausea proteinuria rash pustular skin reactions stomatitis vomiting
- Uncommon Corneal erosion gastrointestinal perforation hepatic disorders pancreatitis
- ► Rare or very rare Cutaneous vasculitis · severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment due to cirrhosis—monitor for adverse events (risk of increased drug plasma concentrations).
- RENAL IMPAIRMENT EVGT Use with caution if creatinine clearance less than 20 mL/minute (limited information available), see p. 21.
- MONITORING REQUIREMENTS
- Monitor for worsening of dyspnoea, cough and fever discontinue if interstitial lung disease confirmed.
- Monitor liver function—consider discontinuing if severe changes in liver function occur.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Gefitinib for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010) NICE TA192 Recommended with restrictions
- Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy (December 2015) NICE TA374 Not recommended

Scottish Medicines Consortium (SMC) decisions

- Gefitinib (Iressa®) for the treatment of adult patients with locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor tyrosine kinase (December 2015) SMC No. 615/10 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ► Gefitinib (Non-proprietary)
- **Gefitinib 250 mg** Gefitinib 250mg tablets | 30 tablet PoM £1,500.00-£2,167.71 | 30 tablet PoM £1,781.94 (Hospital only)
- ► Iressa (AstraZeneca UK Ltd)
 Gefitinib 250 mg | Iressa 250mg tablets | 30 tablet | PoM £2,167.71

Gilteritinib

06-Nov-2020

 DRUG ACTION Gilteritinib is a FMS-like tyrosine kinase-3 (FLT3) inhibitor.

INDICATIONS AND DOSE

FLT3 mutation-positive acute myeloid leukaemia (specialist use only)

- ► BY MOUTH
- Adult: 120 mg once daily, for dose adjustments, treatment interruption, or discontinuation due to sideeffects—consult product literature, if no response is observed after 4 weeks, dose may be increased to 200 mg once daily. Up to 6 months treatment may be required before a clinical response is seen
- CAUTIONS Risk factors for QT-interval prolongation (including hypokalaemia or hypomagnesaemia)
- INTERACTIONS → Appendix 1: gilteritinib

SIDE-EFFECTS

- ► Common or very common Acute kidney injury · anaphylactic reaction · arthralgia · asthenia · constipation · cough · diarrhoea · differentiation syndrome · dizziness · dyspnoea · heart failure · hypotension · malaise · myalgia · nausea · pain · pericardial effusion · pericarditis · peripheral oedema · QT interval prolongation
- ► Uncommon Posterior reversible encephalopathy syndrome (PRES)
- ► Frequency not known Pancreatitis
- CONCEPTION AND CONTRACEPTION Manufacturer advises perform pregnancy test in females of childbearing potential within 7 days prior to treatment initiation; effective contraception should be used during treatment and for at least 6 months after last treatment—additional barrier method recommended in those using hormonal contraceptives. Male patients should use effective contraception during treatment and for at least 4 months after last treatment if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises discontinue breast-feeding during treatment and for at least 2 months after stopping—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (no information available).
- MONITORING REQUIREMENTS
- Manufacturer advises monitor blood chemistry, including creatine phosphokinase, before treatment, on day 15 of treatment, and then monthly during treatment.
- Manufacturer advises monitor ECG before treatment, on days 8 and 15 of treatment, and then prior to the start of the next three subsequent months of treatment—consult product literature for dose modifications if QT-interval prolonged.
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Xospata[®] has provided a Risk minimisation materials document for healthcare professionals.

• PATIENT AND CARER ADVICE

Vomiting Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.

A patient alert card should be provided.

Missed doses Manufacturer advises if a dose is missed or not taken at the usual time, the missed dose should be taken as soon as possible on the same day. The next dose should be taken at the usual time.

Driving and skilled tasks Manufacturer advises patients and their carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

► Gilteritinib for treating relapsed or refractory acute myeloid leukaemia (August 2020) NICE TA642 Recommended

Scottish Medicines Consortium (SMC) decisions

 Gilteritinib (Xospata®) as monotherapy for the treatment of adult patients who have relapsed or refractory acute myeloid leukaemia with a FLT3 mutation (September 2020)
 SMC No. SMC2252 Recommended

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 25

➤ Xospata (Astellas Pharma Ltd) ▼
Gilteritinib (as Gilteritinib fumarate) 40 mg Xospata 40mg tablets
| 84 tablet | PoM | £14,188.00 (Hospital only)

Ibrutinib

18-Jan-2022

• DRUG ACTION Ibrutinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Mantle cell lymphoma (specialist use only)

► BY MOUTH

 Adult: 560 mg once daily, for dose adjustments due to side-effects—consult product literature

Chronic lymphocytic leukaemia (specialist use only) | Waldenström's macroglobulinaemia (specialist use only)

- BY MOUTH
- Adult: 420 mg once daily, for dose adjustments due to side-effects—consult product literature
- DOSE ADJUSTMENTS DUE TO INTERACTIONS
- Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4, amiodarone or ciprofloxacin is unavoidable, reduce dose to 280 mg once daily.
- Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 140 mg once daily, or withhold ibrutinib for up to 7 days.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: IBRUTINIB (IMBRUVICA®): REPORTS OF VENTRICULAR TACHYARRHYTHMIA; RISK OF HEPATITIS B REACTIVATION AND OF OPPORTUNISTIC INFECTIONS (AUGUST 2017)

Cases of ventricular tachyarrhythmia have been reported with the use of ibrutinib. The MHRA advises that ibrutinib should be temporarily discontinued in patients who develop symptoms suggestive of ventricular arrhythmia and to assess benefit-risk before restarting therapy.

Hepatitis B virus status should be established before initiating therapy—for patients with positive hepatitis B serology, consultation with a liver disease expert is recommended before the start of treatment; monitor and manage patients according to local protocols to minimise the risk of hepatitis B virus reactivation. Prophylaxis should be considered for those at an increased risk of opportunistic infections.

- CAUTIONS Family history of congenital short QT syndrome

 increased lymphocytes—increased risk of leukostasis,
 consider withholding treatment temporarily and monitor
 closely patients at risk from further shortening of QTc
 interval · personal history of congenital short QT
 syndrome · risk of haemorrhagic events—withhold
 ibrutinib treatment for at least 3 to 7 days before and after
 surgery depending on risk of bleeding
- INTERACTIONS → Appendix 1: ibrutinib
- SIDE-EFFECTS
- Common or very common Arrhythmias · arthralgia · broken nails · CNS haemorrhage · constipation · diarrhoea · dizziness · fever · haemorrhage · headache · hypertension · hyperuricaemia · increased leucocytes · increased risk of infection · interstitial lung disease · muscle spasms · musculoskeletal pain · nausea · neoplasms · neutropenia · peripheral neuropathy · peripheral oedema · sepsis · skin

- reactions stomatitis thrombocytopenia tumour lysis syndrome vision blurred vomiting
- ► Uncommon Angioedema · hepatitis B reactivation · leukostasis syndrome · panniculitis
- ▶ Frequency not known Anaemia hepatic failure progressive multifocal leukoencephalopathy (PML) Stevens-Johnson syndrome
- CONCEPTION AND CONTRACEPTION Highly effective contraception (must include a non-hormonal method) required during and for 3 months after stopping treatment.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises discontinue breastfeeding—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (risk of increased exposure)—monitor for toxicity.
 - Dose adjustments Manufacturer advises dose reduction to 280 mg daily in mild impairment and to 140 mg daily in moderate impairment with further adjustments if necessary—consult product literature.
- RENAL IMPAIRMENT Ever Maintain adequate hydration in mild to moderate impairment. (♠) Ever Use in severe impairment only if benefit outweighs risk and with close monitoring for toxicity. (♠)
- MONITORING REQUIREMENTS
- ▶ Monitor full blood count once a month.
- Monitor for atrial fibrillation (increased risk in cardiac risk factors, acute infections and history of atrial fibrillation), monitor all patients periodically and complete ECG if arrhythmic symptoms or dyspnoea develop—consult product literature for treatment options.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Ibrutinib for previously treated chronic lymphocytic leukaemia and untreated chronic lymphocytic leukaemia with 17p deletion or TP53 mutation (January 2017) NICE TA429 Recommended with restrictions
- ► Ibrutinib for treating Waldenstrom's macroglobulinaemia (November 2017) NICE TA491 Recommended with restrictions
- ▶ Ibrutinib for treating relapsed or refractory mantle cell lymphoma (January 2018) NICE TA502 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Ibrutinib (Imbruvica®) for the treatment of adult patients with chronic lymphocytic leukaemia who have received at least one prior therapy (April 2017) SMC No. 1151/16 Recommended with restrictions
- Ibrutinib (Imbruvica®) in combination with rituximab for the treatment of adult patients with Waldenström's macroglobulinaemia (October 2020) SMC No. SMC2259 Recommended with restrictions
- Ibrutinib (Imbruvica®) as a single agent for the treatment of adult patients with Waldenström's macroglobulinaemia who have received at least one prior therapy, or in first line treatment for patients unsuitable for chemo-immunotherapy (December 2021) SMC No. SMC2387 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Idelalisib

16-0ct-2020

• DRUG ACTION Idelalisib is a protein kinase inhibitor.

INDICATIONS AND DOSE

Treatment of chronic lymphocytic leukaemia in patients who have received at least one previous therapy, or as first-line treatment in the presence of 17p deletion or TP53 mutation in patients who are not eligible for any other therapies (in combination with rituximab) | Treatment of follicular lymphoma refractory to two lines of treatment (monotherapy)

- ▶ BY MOUTH
- Adult: 150 mg twice daily, for dose adjustment due to side effects, consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: IDELALISIB (ZYDELIG®): UPDATED INDICATIONS AND ADVICE ON MINIMISING THE RISK OF INFECTION (SEPTEMBER 2016)

In light of a recent safety review the indications for idelalisib have been updated. Manufacturer recommendations regarding monitoring for infection and prophylaxis of *Pneumocystis jirovecii* pneumonia have also been updated. Patients should be advised on the risk of serious or fatal infections during treatment, and idelalisib should not be initiated in patients with any evidence of infection.

- CAUTIONS Active hepatitis · diarrhoea—symptomatic management recommended (consult product literature) · pneumonitis—withhold treatment (consult product literature)
- INTERACTIONS → Appendix 1: idelalisib
- SIDE-FFFFCTS
- ► Common or very common Colitis · diarrhoea · fever · infection · neutropenia · pneumonitis · rash
- ► Rare or very rare Severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION Highly effective contraception (in addition to barrier method) required during and for one month after treatment.
- PREGNANCY Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure-limited information available in severe impairment)—monitor for adverse reactions.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor liver function—consult product literature.
- Manufacturer advises monitor for signs and symptoms of infection, including cytomegalovirus infection and respiratory infections; new symptoms should be reported promptly. Neutrophil count should be monitored in all patients every 2 weeks for the first 6 months of treatment; patients with neutrophil count <1000 per mm³ should be monitored weekly.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Idelalisib for treating chronic lymphocytic leukaemia (October 2015) NICE TA359 Recommended
- ► Idelalisib for treating refractory follicular lymphoma (October 2019) NICE TA604 Not recommended

Scottish Medicines Consortium (SMC) decisions

- Idelalisib (Zydelig[®]) in combination with rituximab for the treatment of adult patients with chronic lymphocytic leukaemia (CLL): who have received at least one prior therapy, or as first line treatment in the presence of 17p deletion or TPS3 mutation in patients unsuitable for chemoimmunotherapy (March 2015) SMC No. 1026/15 Recommended with restrictions
- Idelalisib (Zydelig®) as monotherapy for the treatment of adult patients with follicular lymphoma (FL) that is refractory to two prior lines of treatment (May 2015) SMC No. 1039/15 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Imatinib

25-Aug-2021

DRUG ACTION Imatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of chronic myeloid leukaemia in chronic phase after failure with interferon alfa

▶ BY MOUT

 Adult: 400 mg once daily, increased if necessary up to 800 mg daily in 2 divided doses

Treatment of chronic myeloid leukaemia in accelerated phase, or in blast crisis

► BY MOUTH

 Adult: 600 mg once daily, then increased if necessary up to 800 mg daily in 2 divided doses

Treatment of newly diagnosed acute lymphoblastic leukaemia (in combination with other chemotherapy) | Monotherapy for relapsed or refractory acute lymphoblastic leukaemia

► BY MOUTH

Adult: 600 mg once daily

Treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST) | Adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse | Treatment of

myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement

- ► BY MOUTH
- Adult: 400 mg once daily

Treatment of unresectable dermatofibrosarcoma protuberans | Recurrent or metastatic dermatofibrosarcoma protuberans, in patients who cannot have surgery

► BY MOUTH

Adult: 800 mg daily in 2 divided doses

continued \rightarrow

Treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia

- ► BY MOUTH
- ▶ Adult: 100-400 mg once daily

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS AN EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- CAUTIONS Cardiac disease · hepatitis B infection · history of renal failure · risk factors for heart failure
 CAUTIONS, FURTHER INFORMATION
- Hepatitis B infection The MHRA advises that patients who
 are carriers of hepatitis B virus should be closely
 monitored for signs and symptoms of active infection
 throughout treatment and for several months after
 stopping treatment; expert advice should be sought for
 patients who test positive for hepatitis B virus and in those
 with active infection.
- INTERACTIONS → Appendix 1: imatinib
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · appetite abnormal · asthenia · bone marrow disorders · chills · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · excessive tearing · eye inflammation · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · insomnia · joint disorders · hauscle complaints · nausea · neutropenia · oedema · pain · photosensitivity reaction · sensation abnormal · skin reactions · sweat changes · taste altered · thrombocytopenia · vision blurred · vomiting · weight changes
- **Uncommon** Anxiety · arrhythmias · ascites · breast abnormalities · broken nails · burping · chest pain · CNS haemorrhage · congestive heart failure · depression · drowsiness · dysphagia · electrolyte imbalance · eosinophilia · eye discomfort · gout · gynaecomastia · hearing loss · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hyperuricaemia · hypotension · increased risk of infection · laryngeal pain · lymphadenopathy · lymphopenia · malaise · memory loss · menstrual cycle irregularities · nerve disorders · oral disorders · palpitations · pancreatitis · peripheral coldness · pulmonary oedema · Raynaud's phenomenon · renal impairment · renal pain · respiratory disorders · restless legs · scrotal oedema · sepsis · sexual dysfunction · syncope · thrombocytosis · tinnitus · tremor · urinary frequency increased · vertigo
- ▶ Rare or very rare Angina pectoris · angioedema · arthritis · cardiac arrest · cataract · confusion · glaucoma · haemolytic anaemia · haemorrhagic ovarian cyst · hepatic failure (including fatal cases) · hypersensitivity vasculitis · inflammatory bowel disease · intracranial pressure increased · muscle weakness · myocardial infarction · myopathy · nail discolouration · pericardial disorders · pulmonary hypertension · seizure · severe cutaneous adverse reactions (SCARs) · thrombotic microangiopathy · tumour lysis syndrome
- ► Frequency not known Embolism and thrombosis hepatitis B reactivation • neoplasm complications • osteonecrosis • pericarditis
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.

- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
 Dose adjustments Manufacturer advises max. 400 mg once daily; consider further dose reduction if not tolerated—consult product literature.
- RENAL IMPAIRMENT Manufacturer advises use with caution.

Dose adjustments Manufacturer advises maximum starting dose 400 mg daily; reduce dose further if not tolerated (consult product literature).

- MONITORING REQUIREMENTS
- ▶ Monitor for gastrointestinal haemorrhage.
- Monitor complete blood counts regularly.
- Monitor for fluid retention.
- ▶ Monitor liver function.
- Monitor growth in children (may cause growth retardation).
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets may be dispersed in water or apple juice.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer imatinib tablets.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (November 2014) NICE TA326 Recommended
- Imatinib for chronic myeloid leukaemia (updated January 2016) NICE TA70 Recommended
- ► Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (updated November 2010)

 NICE TA86 Recommended with restrictions
- ► Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010) NICE TA209 Not recommended
- ➤ Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016) NICE TA426 Recommended
- Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016) NICE TA425 Not recommended

Scottish Medicines Consortium (SMC) decisions

- ► Imatinib (*Glivec*®) for chronic myeloid leukaemia (January 2003) SMC No. 26/02 Recommended with restrictions
- ► Imatinib (Glivec®) for the adjuvant treatment of gastrointestinal stromal tumours (September 2010) SMC No. 584/09 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 21, 27

Lapatinib

10-Jun-2021

• DRUG ACTION Lapatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2) with hormone-receptornegative disease who have had previous treatment with trastuzumab in combination with chemotherapy (in combination with trastuzumab)

- ► BY MOUTH
- Adult: 1 g once daily

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab (in combination with capecitabine)

- ▶ BY MOUTH
- Adult: 1.25 g once daily

Treatment of metastatic breast cancer with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for postmenopausal women with hormone-receptor-positive disease (in combination with an aromatase inhibitor)

- ► BY MOUTH
- Adult: 1.5 g once daily

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Diarrhoea—withhold treatment if severe (consult product literature) - low gastric pH (reduced absorption) - susceptibility to QT-interval prolongation (including electrolyte disturbances)
- INTERACTIONS → Appendix 1: lapatinib
- SIDE-EFFECTS
- ► Common or very common Alopecia · appetite decreased · arthralgia · asthenia · constipation · cough · dehydration · diarrhoea (treat promptly) · dyspnoea · epistaxis · gastrointestinal discomfort · headache · hepatotoxicity (discontinue permanently if severe) · hot flush · hyperbilirubinaemia · insomnia · mucositis · nail disorder · nausea · pain · paronychia · skin reactions · stomatitis · vomiting
- ► Uncommon Respiratory disorders
- ► Frequency not known Severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment—increased exposure (limited information available).
- RENAL IMPAIRMENT Evgr Caution in severe impairment (no information available).
- MONITORING REQUIREMENTS
- ▶ Monitor left ventricular function.
- ► Monitor for pulmonary toxicity.
- Monitor liver function before treatment and at monthly intervals
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises always take at the same time in relation to food: either one hour before or one hour after food.

- PATIENT AND CARER ADVICE Counselling advised (administration). Patients should be advised to report any unexpected changes in bowel habit.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormonereceptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

➤ Tyverb (Novartis Pharmaceuticals UK Ltd)

Lapatinib (as Lapatinib ditosylate monohydrate) 250 mg Tyverb
250mg tablets | 84 tablet PoM £965.16 | 105 tablet PoM
£1.206.45

Larotrectinib

03-Jun-2020

 DRUG ACTION Larotrectinib is a tropomyosin receptor kinase inhibitor.

INDICATIONS AND DOSE

Solid tumours with neurotrophic tyrosine receptor kinase gene fusion (initiated by a specialist)

- ▶ BY MOUT
- Adult: 100 mg twice daily, for dose adjustments, treatment interruption, or discontinuation due to sideeffects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce dose by 50%.

IMPORTANT SAFETY INFORMATION

- INTERACTIONS → Appendix 1: larotrectinib
- SIDE-FFFFCT
- Common or very common Anaemia · constipation · dizziness · fatigue · gait abnormal · leucopenia · muscle weakness · myalgia · nausea · neutropenia · paraesthesia · taste altered · vomiting · weight increased
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in females of childbearing potential and in men with a partner of childbearing potential, during treatment and for 1 month after last treatment; additional barrier method recommended in women using hormonal contraceptives. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—limited information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during treatment and for 3 days after last treatment—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (increased risk of exposure).
 - **Dose adjustments** Manufacturer advises dose reduction by 50 % in moderate to severe impairment.
- MONITORING REQUIREMENTS Manufacturer advises monitor liver function (including ALT and AST) at baseline, then monthly during the first 3 months of treatment, and periodically thereafter; more frequent monitoring should be performed in patients who develop transaminase elevations. Treatment should be withheld or

permanently discontinued based on severity—consult product literature.

 HANDLING AND STORAGE For oral solution, manufacturer advises store in a refrigerator (2–8°C).

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and fatigue.

• NATIONAL FUNDING/ACCESS DECISIONS
For full details see funding body website

NICE decisions

- ► Larotrectinib for treating NTRK fusion-positive solid tumours (May 2020) NICE TA630 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Lenvatinib

10-Nov-2020

 DRUG ACTION Lenvatinib is a multireceptor tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

KISPLYX®

Advanced renal cell carcinoma following one prior vascular endothelial growth factor-targeted therapy (in combination with everolimus) (specialist use only)

- ► BY MOUTH
- Adult: 18 mg once daily, dose should be taken at the same time every day, for dose adjustment due to sideeffects—consult product literature

LENVIMA®

Differentiated thyroid carcinoma (specialist use only)

- ► BY MOUTH
- Adult: 24 mg once daily, dose should be taken at the same time every day, for dose adjustments due to sideeffects—consult product literature

Hepatocellular carcinoma (specialist use only)

- ► BY MOUTH
- Adult (body-weight up to 60 kg): 8 mg once daily, dose should be taken at the same time every day, for dose adjustments due to side-effects—consult product literature
- Adult (body-weight 60 kg and above): 12 mg once daily, dose should be taken at the same time every day, for

dose adjustments due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with lenvatinib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS Fistulae
- CAUTIONS Arterial thromboembolism within the previous 6 months elderly (75 years and over)—reduced tolerability hypertension impaired wound healing—consider temporary interruption of treatment for major surgical procedures risk factors for aneurysm or artery dissection CAUTIONS, FURTHER INFORMATION
- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: lenvatinib
- SIDE-EFFECTS
- Common or very common Alopecia · appetite decreased · arthralgia · asthenia · cerebrovascular insufficiency · cholecystitis · constipation · decreased leucocytes · dehydration · diarrhoea · dizziness · dry mouth · dysphonia electrolyte imbalance • embolism and thrombosis • encephalopathy · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · heart failure · hepatic coma · hepatic disorders · hyperbilirubinaemia · hypercholesterolaemia · hypertension · hypoalbuminaemia · hypotension · hypothyroidism · increased risk of infection · insomnia · malaise · mucositis · mvalgia · mvocardial infarction · nausea · neutropenia · oral disorders · oropharyngeal complaints · pain · peripheral oedema · proteinuria · QT interval prolongation · renal impairment · renal tubular necrosis · skin reactions · taste altered · thrombocytopenia · vomiting · weight decreased
- ▶ Uncommon Healing impaired nephrotic syndrome pancreatitis paresis pneumothorax splenic infarction
- ► Frequency not known Aneurysm · artery dissection · cardiac disorder · cardiogenic shock · fistula

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises gastrointestinal toxicity should be actively managed — dehydration and/or hypovolaemia caused by gastrointestinal toxicity are identified as primary risk factors for renal impairment or failure.

- CONCEPTION AND CONTRACEPTION Manufacturer advises
 women of child-bearing potential should use highly
 effective contraception during treatment and for 1 month
 after the last dose, an additional barrier method of
 contraception should be used in women using oral
 hormonal contraceptives. See also Pregnancy and
 reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—teratogenic in animal studies. See

also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT

KISPLYX ® Manufacturer advises caution in severe impairment (risk of increased exposure).

Dose adjustments Manufacturer advises dose reduction to 10 mg once daily in severe impairment.

LENVIMA ® Manufacturer advises caution.

- When used for Hepatocellular carcinoma Manufacturer advises avoid in severe impairment (no information available).
 Dose adjustments
 - When used for Differentiated thyroid carcinoma Manufacturer advises dose reduction to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature.
- RENAL IMPAIRMENT

 ${\tt KISPLYX}^{\circledcirc}$ Manufacturer advises avoid in end-stage renal disease.

Dose adjustments Manufacturer advises reduce dose to 10 mg once daily in severe impairment; further dose adjustments may be necessary based on individual tolerability—consult product literature.

LENVIMA®

- When used for Differentiated thyroid carcinoma Manufacturer advises caution in severe impairment; avoid in end-stage renal disease.
- When used for Hepatocellular carcinoma The available data do not allow for a dosing recommendation in severe impairment—consult product literature.

Dose adjustments

 When used for Differentiated thyroid carcinoma Manufacturer advises dose reduction to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature.

MONITORING REQUIREMENTS

- Manufacturer advises monitor for signs and symptoms of cardiac decompensation (adjust dose as necessary consult product literature).
- ► Manufacturer advises monitor liver function before treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor urine protein regularly.
- Manufacturer advises monitor ECG and electrolytes before and periodically during treatment (calcium levels should be monitored at least monthly), correct electrolyte abnormalities prior to treatment; monitor thyroid function before and regularly during treatment.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises capsules should be swallowed whole. Alternatively, capsules may be added to a tablespoon of water or apple juice in a small glass (without breaking or crushing), allowed to sit for at least 10 minutes, then stirred for at least 3 minutes to dissolve the capsule shells before swallowing; the same amount of liquid should then be added to the glass, swirled a few times, then swallowed.
- PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and dizziness.

• NATIONAL FUNDING/ACCESS DECISIONS

Lorlatinib

01-Apr-2022

• DRUG ACTION Lorlatinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only)

► BY MOUTH

 Adult: 100 mg daily, for dose adjustments due to sideeffects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce starting dose to 75 mg once daily.

IMPORTANT SAFETY INFORMATION

- CAUTIONS Cardiac risk factors or conditions which may affect left ventricular ejection fraction—consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment lactose intolerance · worsening respiratory symptoms indicative of interstitial lung disease or pneumonitis (including dyspnoea, cough, and fever)—withhold or permanently discontinue treatment based on severity
- INTERACTIONS → Appendix 1: lorlatinib
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · anxiety · arthralgia · asthenia · behaviour abnormal · cognitive disorder ·

concentration impaired · confusion · constipation · delirium · dementia · depression · diarrhoea · dyslipidaemia · gait abnormal · hallucinations · headache · inflammation · learning disability · memory loss · mental impairment (thought disturbance) · mood altered · muscle weakness · myalgia · nausea · nerve disorders · neurotoxicity · oedema · pain · peroneal nerve palsy · respiratory disorders · sensation abnormal · skin reactions · speech impairment · vision disorders · vitreous floater · weight increased

- ► Frequency not known Atrioventricular block
- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential should use effective nonhormonal contraception during treatment and for 35 days after last treatment; male patients should use effective contraception during treatment and for 14 weeks after last treatment if their partner is pregnant or of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during treatment and for 7 days after last treatment—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in moderate to severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises avoid in severe impairment (limited information available).
- MONITORING REQUIREMENTS
- ► Manufacturer advises monitor serum cholesterol and triglycerides before starting treatment, then at weeks 2, 4, and 8, and regularly thereafter.
- Manufacturer advises monitor ECG before starting treatment and monthly thereafter, particularly in patients with predisposing conditions.
- Manufacturer advises monitor for lipase and amylase elevations before starting treatment, and regularly thereafter as clinically indicated.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of CNS effects.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Lorlatinib for previously treated ALK-positive advanced nonsmall-cell lung cancer (May 2020) NICE TA628 Recommended Scottish Medicines Consortium (SMC) decisions
- Lorlatinib (Lorviqua®) as monotherapy for the treatment of adult patients with anaplastic lymphoma kinase (ALK)positive advanced non-small cell lung cancer whose disease has progressed after alectinib or ceritinib as the first ALK tyrosine kinase inhibitor (TKI) therapy or crizotinib and at least one other ALK TKI (March 2020) SMC No. SMC2239 Recommended
- Lorlatinib (Lorviqua®) as monotherapy for the treatment of adult patients with anaplastic lymphoma kinase (ALK)positive advanced non-small cell lung cancer previously not treated with an ALK inhibitor (March 2022) SMC No. SMC2415 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Midostaurin

01-0ct-202

 DRUG ACTION Midostaurin is an inhibitor of multiple tyrosine kinases.

INDICATIONS AND DOSE

Acute myeloid leukaemia (specialist use only)

► BY MOUTH

 Adult: 50 mg twice daily, on days 8–21 of induction and consolidation chemotherapy cycles; for administration following consolidation chemotherapy, and dose adjustment or treatment interruption due to sideeffects—consult product literature

Aggressive systemic mastocytosis (specialist use only) | Systemic mastocytosis with associated haematological neoplasm (specialist use only) | Mast cell leukaemia (specialist use only)

- ▶ BY MOUTH
- Adult: 100 mg twice daily, for dose adjustment or treatment interruption due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

- CAUTIONS Active severe infection (control before initiation of monotherapy) elderly (limited experience) patients at risk of congestive heart failure risk factors for OT-interval prolongation
- INTERACTIONS → Appendix 1: midostaurin
- SIDE-EFFECTS
- Common or very common Asthenia · bruising · chills · concentration impaired · constipation · cough · cystitis · diarrhoea · dizziness · dyspepsia · dyspnoea · fall · febrile neutropenia · fever · haemorrhage · headache · hyperglycaemia · hypersensitivity · hypotension · increased risk of infection · nausea · oedema · oropharyngeal pain · QT interval prolongation · respiratory disorders · sepsis · tremor · vertigo · vomiting · weight increased
- ► Frequency not known Cardiac disorder congestive heart failure
- CONCEPTION AND CONTRACEPTION Manufacturer advises perform pregnancy test in women of childbearing potential within 7 days prior to treatment initiation; effective contraception must be used during treatment and for at least 4 months after stopping treatment—additional barrier method recommended in women using hormonal contraceptives. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during treatment and for 4 months after stopping treatment present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment and monitor for toxicity—no information available.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment and monitor for toxicity—limited information available.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor white blood cell count regularly, especially at treatment initiation; also monitor for signs and symptoms of infection.

- Manufacturer advises assess left ventricular ejection fraction in patients at risk of congestive heart failure at baseline and during treatment as clinically indicated; consider performing ECGs if concomitant use with drugs that can prolong OT-interval.
- Manufacturer advises monitor for pulmonary symptoms indicative of interstitial lung disease or pneumonitis.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Midostaurin for untreated acute myeloid leukaemia (June 2018) NICE TA523 Recommended with restrictions
- Midostaurin for treating advanced systemic mastocytosis (September 2021) NICE TA728 Recommended

Scottish Medicines Consortium (SMC) decisions

- Midostaurin (Rydapt®) for treatment of adult patients with newly diagnosed acute myeloid leukaemia who are FLT3 mutation positive in combination with standard daunorubicin and cytarabine induction and high dose cytarabine consolidation chemotherapy, and for patients in complete response followed by midostaurin single agent maintenance therapy (June 2018) SMC No. 1330/18 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Neratinib

11-Feb-2021

DRUG ACTION Neratinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

HER2-overexpressed/amplified breast cancer (specialist use only)

- ► BY MOUTH
- Adult: 240 mg once daily for 1 year, dose to be taken with food, preferably in the morning, for dose adjustments due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Evor If concurrent use of moderate CYP3A4 inhibitors or ciclosporin is unavoidable, reduce neratinib dose to 40 mg once daily. If tolerated, increase dose by 40 mg at least every 7 days; max. dose 160 mg daily.
- ► If concurrent use of potent CYP3A4 inhibitors is unavoidable, reduce neratinib dose to 40 mg once daily. (N)
- CAUTIONS Cardiac risk factors or conditions which may affect left ventricular ejection fraction—consider cardiac monitoring, including assessment of left ventricular ejection fraction, as clinically indicated • elderly (increased risk of complications of diarrhoea) • gastro-intestinal disorder (significant, chronic) with diarrhoea as a major symptom—no clinical experience
- INTERACTIONS → Appendix 1: neratinib
- SIDE-EFFECTS
- ► Common or very common Appetite decreased · dehydration · diarrhoea · dry mouth · epistaxis · fatigue · gastrointestinal discomfort · increased risk of infection · mucositis · muscle spasms · nail discolouration · nail disorders · nausea · oral disorders · skin reactions · vomiting · weight decreased
- ► Uncommon Renal failure SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea may be severe and associated with dehydration. Diarrhoea is more

- likely to occur during initiation and may be recurrent. Manufacturer advises prophylactic treatment, with antidiarrhoeal agent.
- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential should use highly effective contraception during treatment and for 1 month after last treatment; an additional barrier method of contraception should be used in females using hormonal contraceptives. Male patients should use effective contraception during treatment and for 3 months after last treatment if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (risk of increased exposure).
- RENAL IMPAIRMENT Manufacturer advises caution in mild to moderate impairment (increased risk of complications of dehydration from diarrhoea); avoid in severe impairment (no information available).
- MONITORING REQUIREMENTS Manufacturer advises monitor liver function (including ALT, AST, and total bilirubin) at 1 week, then monthly for the first 3 months, and every 6 weeks thereafter, during treatment or as clinically indicated. Treatment should be withheld or permanently discontinued, based on severity, in those who develop hepatotoxicity—consult product literature.
- PRESCRIBING AND DISPENSING INFORMATION Prophylactic treatment with an anti-diarrhoeal should be initiated with the first dose, and maintained during the first 1-2 months of treatment—consult product literature.

The manufacturer of $Nerlynx^{\otimes}$ has provided a Risk minimisation materials document for healthcare professionals.

 PATIENT AND CARER ADVICE A patient alert card, patient treatment journal, and patient guide should be provided.
 Missed doses Manufacturer advises if a dose is missed, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, dizziness, dehydration, and syncope.

NICE decisions

 Neratinib for extended adjuvant treatment of hormone receptor-positive, HER2-positive early stage breast cancer after adjuvant trastuzumab (November 2019) NICE TA612 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Neratinib (Nerlynx®) for extended adjuvant treatment of adult patients with early-stage hormone receptor positive HER2-overexpressed/amplified breast cancer and who completed adjuvant trastuzumab-based therapy less than one year ago (August 2020) SMC No. SMC2251 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

► Nerlynx (Pierre Fabre Ltd) ▼

Neratinib (as Neratinib maleate) 40 mg Nerlynx 40mg tablets | 180 tablet PoM £4,500.00 (Hospital only)

Nilotinib

22-Feh-2021

• DRUG ACTION Nilotinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Newly diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (initiated by a specialist)

- ► BY MOUTH
- Adult: 300 mg twice daily, for dose adjustments due to side-effects—consult product literature

Chronic and accelerated phase Philadelphia chromosomepositive chronic myeloid leukaemia resistant or intolerant to previous therapy, including imatinib (initiated by a specialist)

- ► BY MOUTH
- Adult: 400 mg twice daily, for dose adjustments due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH TYROSINE KINASE INHIBITORS

An EU wide review has concluded that nilotinib can cause hepatitis B virus reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

• CAUTIONS Clinically significant bradycardia · congestive heart failure · hepatitis B infection · history of pancreatitis · recent myocardial infarction · susceptibility to QT-interval prolongation (including electrolyte disturbances) · unstable angina

CAUTIONS, FURTHER INFORMATION

- Hepatitis B infection The MHRA advises that patients who
 are carriers of hepatitis B virus should be closely
 monitored for signs and symptoms of active infection
 throughout treatment and for several months after
 stopping treatment; expert advice should be sought for
 patients who test positive for hepatitis B virus and in those
 with active infection.
- INTERACTIONS → Appendix 1: nilotinib
- SIDE-EFFECTS
- Common or very common Alopecia · anaemia · angina pectoris · anxiety · appetite abnormal · arrhythmias · arthralgia · asthenia · bone marrow disorders · cardiac conduction disorders · chest discomfort · constipation · cough · decreased leucocytes · depression · diabetes mellitus · diarrhoea · dizziness · dry eye · dyslipidaemia · dyspnoea · electrolyte imbalance · eosinophilia · eye discomfort · eye disorders · eye inflammation · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · headaches · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · increased risk of infection · insomnia · muscle complaints · muscle weakness · myocardial infarction · nausea · neoplasms · neutropenia · oedema · pain · palpitations · peripheral neuropathy · OT interval prolongation · respiratory disorders · sensation abnormal · skin reactions · sweat changes · taste altered · thrombocytopenia · vertigo · vomiting · weight changes
- Uncommon Atherosclerosis · cerebrovascular insufficiency · chills · cyanosis · erectile dysfunction · gout · haemorrhage · heart failure · hyperaemia · malaise · oral disorders · pancreatitis · peripheral vascular disease · temperature sensation altered · vision disorders
- Frequency not known Breast abnormalities chorioretinopathy - diastolic dysfunction - dry mouth facial swelling - gynaecomastia - hepatitis B reactivation hyperparathyroidism - hyperuricaemia - hypoglycaemia -

- lethargy · memory loss · menorrhagia · oesophageal pain · oropharyngeal pain · pericardial effusion · pericarditis · restless legs · sebaceous hyperplasia · syncope · tremor · urinary disorders · urine discolouration
- CONCEPTION AND CONTRACEPTION Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for up to two weeks after stopping treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies; see also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure).
- MONITORING REQUIREMENTS
- Manufacturer advises monitor lipid profiles before initiating treatment, at 3 and 6 months, and then yearly thereafter; monitor blood glucose before initiating treatment and then periodically during treatment, as clinically indicated.
- Manufacturer advises monitor full blood count every 2 weeks for the first 2 months of treatment, then monthly thereafter, or as clinically indicated.
- Manufacturer advises perform baseline ECG before treatment and as clinically indicated thereafter; correct any electrolyte disturbances before treatment and monitor periodically during treatment.
- Manufacturer advises monitor and actively manage cardiovascular risk factors during treatment.
- DIRECTIONS FOR ADMINISTRATION Every Food should not be consumed 2 hours before and for at least one hour after each dose. Capsules should either be swallowed whole or the contents of each capsule may be dispersed in one teaspoon of apple sauce and taken immediately.
- PRESCRIBING AND DISPENSING INFORMATION All
 prescribers should be familiar with the Summary of Key
 Safety Recommendations for Tasigna[®] (nilotinib) provided
 by the manufacturer.
- PATIENT AND CARER ADVICE Manufacturer advises patients and carers should seek immediate medical attention if signs or symptoms of cardiovascular events occur.

All patients should be provided with the *Important Information About How to Take Your Medication* leaflet provided by the manufacturer.

DRUG ACTION Nintedanib is a tyrosine protein kinase inhibitor.

INDICATIONS AND DOSE

OFFV ®

Idiopathic pulmonary fibrosis (initiated by a specialist) | Chronic fibrosing interstitial lung disease with a progressive phenotype (initiated by a specialist) | Systemic sclerosis-associated interstitial lung disease (initiated by a specialist)

- ► BY MOUTH
- Adult: 150 mg twice daily, reduced if not tolerated to 100 mg twice daily, for dose adjustments due to sideeffects, consult product literature

VARGATEF®

Treatment of locally advanced, metastatic or locally recurrent non-small cell lung cancer of adenocarcinoma histology after first-line chemotherapy (in combination with docetaxel) (initiated under specialist supervision)

- ▶ BY MOUTH
- Adult: 200 mg twice daily on days 2–21 of a standard 21 day docetaxel cycle, for treatment following discontinuation of docetaxel and for dose adjustments due to side-effects, consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with nintedanib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required. RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

CONTRA-INDICATIONS

OFEV ® Severe pulmonary hypertension

• CAUTIONS History or risk factors for QT prolongation hypertension impaired wound healing increased risk of bleeding patients at high risk of cardiovascular disease previous abdominal surgery recent history of hollow organ perforation risk factors for aneurysm or artery dissection theoretical increased risk of gastrointestinal perforation theoretical increased risk of venous thromboembolism

OFEV ® Mild to moderate pulmonary hypertension

- INTERACTIONS → Appendix 1: nintedanib
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · abscess · alopecia · appetite decreased · dehydration · diarrhoea · drug-induced liver injury · electrolyte imbalance · haemorrhage · headache · hyperbilirubinaemia · hypertension · mucositis · nausea · neutropenia · peripheral neuropathy · sepsis · skin reactions · stomatitis ·

- thrombocytopenia \cdot venous thromboembolism \cdot vomiting \cdot weight decreased
- ► Uncommon Gastrointestinal disorders · myocardial infarction · pancreatitis · renal impairment
- ▶ Frequency not known Aneurysm · artery dissection
- ALLERGY AND CROSS-SENSITIVITY Evgr Contra-indicated in patients with peanut or soya hypersensitivity.
- CONCEPTION AND CONTRACEPTION Manufacturer advises exclude pregnancy before treatment and ensure effective contraception (in addition to barrier method) during treatment and for at least 3 months after last dose
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—present in milk in *animal* studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild impairment (risk of increased exposure); avoid in moderate to severe impairment (limited information available).

OFEV Dose adjustments Manufacturer advises dose reduction to 100 mg twice daily in mild impairment.

- RENAL IMPAIRMENT EVGT Caution in severe impairment (no information available).
- MONITORING REQUIREMENTS
- ► The MHRA advises to monitor blood pressure regularly.
- ➤ For Vargatef®, manufacturer advises monitor full blood count before each treatment cycle and regularly thereafter; monitor hepatic function before each treatment cycle during combination therapy and monthly during monotherapy; monitor renal function during treatment; monitor for thromboembolic events; monitor prothrombin time, INR and for bleeding if used concomitantly with anticoagulants; monitor for cerebral bleeding in patients with stable brain metastases.
- ➤ For Ofev® manufacturer advises monitor hepatic function before treatment initiation and during the first month of treatment, then at regular intervals during the subsequent 2 months and as clinically indicated thereafter; monitor renal function during treatment.
- PRESCRIBING AND DISPENSING INFORMATION
 VARGATEF[®] Not to be taken on the same day as docetaxel therapy.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Osimertinib

04-Feb-2022

• DRUG ACTION Osimertinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Non-small cell lung cancer (initiated by a specialist)

- ► BY MOUTH
- Adult: 80 mg once daily, for dose adjustment, interruption, or treatment discontinuation due to sideeffects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS Congenital long QT syndrome
- CAUTIONS Elderly (more frequent dose adjustments may be required) · history of interstitial lung disease · radiation pneumonitis requiring steroid treatment · risk factors for OTc interval prolongation
- INTERACTIONS → Appendix 1: osimertinib
- SIDE-EFFECTS
- ➤ Common or very common Diarrhoea · eyelid pruritus · increased risk of infection · nail discolouration · nail disorders · respiratory disorders · skin reactions · stomatitis
- ► Uncommon Cutaneous vasculitis · eye disorders · eye inflammation · QT interval prolongation
- ▶ Rare or very rare Stevens-Johnson syndrome
- ► Frequency not known Decreased leucocytes · neutropenia · thrombocytopenia
- CONCEPTION AND CONTRACEPTION Manufacturer advises use of effective, non-hormonal, contraception during and for 2 months after treatment in women, and 4 months after treatment in men.
- PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—may be present in milk based on animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises caution in severe and end-stage impairment—limited information available
- PRE-TREATMENT SCREENING Evgr Evidence of epidermal growth factor receptor (EGFR) mutation positive status is required before osimertinib treatment is initiated, and should be determined by an experienced laboratory using a validated test method.
- MONITORING REQUIREMENTS Manufacturer advises monitor ECG and electrolytes periodically in patients with risk factors for QTc interval prolongation; dose adjustment is advised if QTc interval is more than 500 milliseconds on at least 2 separate ECGs—consult product literature.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablet may be dispersed in 50 mL of non-carbonated water, by stirring until dispersed and swallowed immediately (do not crush). The residue must then be re-dispersed in an additional half a glass of water and immediately swallowed. Manufacturer advises if administration via a nasogastric tube is required, the tablet may be dispersed in 15 mL of non-carbonated water, by stirring until dispersed

and the residue re-dispersed in an additional 15 mL of water (do not crush). The total 30 mL of liquid should then be administered as per the nasogastric tube manufacturer's instructions with appropriate water flushes; the solution should be administered within 30 minutes of adding the tablets to water.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

Palbociclib

19-Jul-2021

 DRUG ACTION Palbociclib is a highly selective inhibitor of cyclin-dependent kinases 4 and 6, which leads to disruption of cancer cell proliferation.

• INDICATIONS AND DOSE

Locally advanced or metastatic breast cancer (initiated by a specialist)

- ► BY MOUTH
- Adult: 125 mg once daily for 21 consecutive days of repeated 28 day cycles, for dose adjustments due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce palbociclib dose to 75 mg once daily. If the CYP3A4 inhibitor is stopped, increase the palbociclib dose (after 3-5 half

lives of the inhibitor) to the dose used before starting the CYP3A4 inhibitor.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: CDK4/6 INHIBITORS (ABEMACICLIB, PALBOCICLIB, RIBOCICLIB): REPORTS OF INTERSTITIAL LUNG DISEASE AND PNEUMONITIS, INCLUDING SEVERE CASES (JUNE 2021)

Interstitial lung disease and pneumonitis, in some cases severe or fatal, have been reported in patients being treated with CDK4/6 inhibitors, such as palbociclib. Healthcare professionals are advised to ask patients taking palbociclib about pulmonary symptoms indicative of interstitial lung disease and pneumonitis, such as cough or dyspnoea. Patients should be advised to seek advice right away if these symptoms occur. Healthcare professionals should ensure patients have a copy of the Patient Information Leaflet (PIL) for palbociclib.

- INTERACTIONS → Appendix 1: palbociclib
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · asthenia · diarrhoea · dry eye · epistaxis · excessive tearing · fever · infection · leucopenia · mucositis · nausea · neutropenia · oral disorders · oropharyngeal complaints · respiratory disorders · skin reactions · taste altered · thrombocytopenia · vision blurred · vomiting SIDE-EFFECTS, FURTHER INFORMATION Side-effects are reported when used in combination with letrozole or fulvestrant.
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 3 weeks after completing treatment. Male patients should use effective contraception during treatment and for at least 14 weeks after completing treatment if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).

Dose adjustments Manufacturer advises dose reduction to 75 mg once daily in severe impairment.

- RENAL IMPAIRMENT Manufacturer advises caution and monitor closely for signs of toxicity in moderate-to-severe impairment.
- MONITORING REQUIREMENTS Manufacturer advises monitor full blood count prior to starting therapy, at the start of each cycle, on day 14 of the first 2 cycles and as clinically indicated.
- PATIENT AND CARER ADVICE

Missed doses Manufacturer advises to take palbociclib at the same time each day; if a dose is missed, the missed dose should not be taken and the next dose should be taken at the usual time.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Palbociclib with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER2-negative, locally advanced or metastatic breast cancer (December 2017)
 NICE TA495 Recommended with restrictions Palbociclib with fulvestrant for treating hormone receptorpositive, HER2-negative, advanced breast cancer (January 2020) NICE TA619 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Palbocicilo (Ibrance®) for the treatment of hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative locally advanced or metastatic breast cancer: in combination with an aromatase inhibitor; or in combination with fulvestrant in women who have received prior endocrine therapy (December 2017) SMC No. 1276/17 Recommended with restrictions
- Palbociclib (Ibrance®) for the treatment of hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative locally advanced or metastatic breast cancer-in combination with fulvestrant in women who have received prior endocrine therapy (July 2019) SMC No. SMC2149 Recommended

Pazopanib

07-Jul-2021

DRUG ACTION Pazopanib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

First-line treatment of advanced renal cell carcinoma | Treatment of advanced renal cell carcinoma in patients who have had previous treatment with cytokine therapy

► BY MOUTH

Adult: 800 mg daily, adjust dose in steps of 200 mg according to tolerability; maximum 800 mg per day

Treatment of selective subtypes of advanced soft-tissue sarcoma

- ► BY MOUTH
- ► Adult: (consult product literature)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 400 mg daily.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with pazopanib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required. RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

• CAUTIONS Cardiac disease • hypertension • increased risk of gastro-intestinal fistulas • increased risk of gastro-intestinal perforation • increased risk of haemorrhage •

increased risk of thrombotic microangiopathy—permanently discontinue if symptoms develop \cdot ischaemic stroke \cdot myocardial infarction \cdot risk factors for aneurysm or artery dissection \cdot risk of thrombotic events \cdot susceptibility to QT-interval prolongation (including electrolyte disturbances) \cdot transient ischaemic attack

- CAUTIONS, FURTHER INFORMATION
- Elective surgery Discontinue treatment 7 days before elective surgery and restart only if adequate wound healing.
- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: pazopanib
- SIDE-EFFECTS
- ► Common or very common Alopecia · appetite decreased · arthralgia · asthenia · bradycardia · cancer pain · cardiac disorder · chest pain · chills · cough · dehydration · diarrhoea · dizziness · drowsiness · dry mouth · dysphonia · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hair colour changes · headache · hepatic disorders · hiccups · hyperbilirubinaemia · hyperhidrosis · hypertension · hypoalbuminaemia · hypothyroidism · increased risk of infection · insomnia · left ventricular dysfunction · leucopenia · mucosal abnormalities · muscle complaints · musculoskeletal pain · nail disorder · nausea · neutropenia · oedema · oral disorders · peripheral neuropathy · proteinuria · respiratory disorders · sensation abnormal · skin reactions \cdot taste altered \cdot thrombocytopenia \cdot vasodilation · venous thromboembolism · vision blurred · vomiting · weight decreased
- Uncommon Cerebrovascular insufficiency eye disorders haemolytic uraemic syndrome menstrual cycle irregularities myocardial infarction myocardial ischaemia oropharyngeal pain pancreatitis photosensitivity reaction polycythaemia QT interval prolongation rhinorrhoea skin ulcer thrombotic microangiopathy
- Rare or very rare Posterior reversible encephalopathy syndrome (PRES)
- ► Frequency not known Aneurysm · artery dissection
- CONCEPTION AND CONTRACEPTION Effective contraception advised during treatment.
- PREGNANCY Avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
 Dose adjustments Manufacturer advises dose reduction to 200 mg daily in moderate impairment.
- RENAL IMPAIRMENT EVGT Use with caution if creatinine clearance less than 30 mL/minute (no information available); see p. 21.
- MONITORING REQUIREMENTS
- Monitor liver function before treatment and at weeks 3, 5, 7, and 9, then at months 3 and 4, and periodically thereafter as clinically indicated—consult product literature if elevated liver enzymes observed.
- Monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment.
- ▶ Monitor for proteinuria.
- Monitor thyroid function.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.

• NATIONAL FUNDING/ACCESS DECISIONS

Pemigatinib

01-Mar-2022

 DRUG ACTION Pemigatinib is a protein kinase inhibitor that inhibits fibroblast growth factor receptors (FGFR).

INDICATIONS AND DOSE

Cholangiocarcinoma with fibroblast growth factor receptor 2 (FGFR2) fusion or rearrangement (initiated by a specialist)

- ► BY MOUTH
- Adult: 13.5 mg once daily for 14 consecutive days of repeated 21-day cycles, to be taken at the same time each day, for dose adjustments, treatment interruption, or discontinuation due to side-effects consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Evsr If concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce pemigatinib dose to 9 mg once daily in those taking 13.5 mg once daily, or to 4.5 mg once daily in patients already taking a reduced dose.

IMPORTANT SAFETY INFORMATION

- CAUTIONS Clinically significant eye disorders (such as retinal disorders—consult product literature)
- INTERACTIONS → Appendix 1: pemigatinib
- SIDE-EFFECTS
- ► Common or very common Alopecia · arthralgia · constipation · diarrhoea · dry eye · dry mouth · electrolyte imbalance · eye disorders · fatigue · hair growth abnormal · increased risk of infection · nail discolouration · nail disorders · nausea · punctate keratitis · skin reactions · stomatitis · taste altered · vision blurred
- ► Frequency not known Soft tissue calcification
- CONCEPTION AND CONTRACEPTION Ever Females of childbearing potential and male patients with a partner of childbearing potential should use effective contraception during and for 1 week after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.

- PREGNANCY EVGT Avoid unless essential—toxicity in animal studies. (*) See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING EVG. Avoid during and for 1 week after stopping treatment—no information available.
- HEPATIC IMPAIRMENT EVGT Caution in severe impairment.

Dose adjustments Evgr Dose reduction in severe impairment—consult product literature.

• RENAL IMPAIRMENT EVGT Caution in severe impairment.

Dose adjustments EvGr Reduce dose in severe impairment—consult product literature.

- MONITORING REQUIREMENTS
- ► EvGr Monitor serum phosphate—consult product literature.
- Eye examination, including optical coherence tomography, should be performed before treatment, every 2 months for the first 6 months, then every 3 months thereafter, and urgently if visual symptoms occur.
- ► Consider using alternative markers of renal function if serum creatinine is persistently raised—consult product literature.
- PATIENT AND CARER ADVICE

Missed doses If a dose is more than 4 hours late or vomiting occurs after taking a dose, no additional dose should be taken and the next dose should be taken at the normal scheduled time.

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and visual disturbances.

• NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

 Pemigatinib for treating relapsed or refractory advanced cholangiocarcinoma with FGFR2 fusion or rearrangement (August 2021) NICE TA722 Recommended

Scottish Medicines Consortium (SMC) decisions

- Pemigatinib (Pemazyre®) as monotherapy for the treatment of adults with locally advanced or metastatic cholangiocarcinoma with a fibroblast growth factor receptor 2 gene fusion or rearrangement that have progressed after at least one prior line of systemic therapy (February 2022) SMC No. SMC2399 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 25

- ► Pemazyre (Incyte Biosciences UK Ltd) ▼

Pemigatinib 9 mg Pemazyre 9mg tablets | 14 tablet PoM £7,159.00 (Hospital only)

Pemigatinib 13.5 mg Pemazyre 13.5mg tablets | 14 tablet PoM £7,159.00 (Hospital only)

Ponatinib

19-Jul-2021

INDICATIONS AND DOSE

Treatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T3151 mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate | Treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T3151 mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate

- ► BY MOUTH
- Adult: 45 mg once daily, for dose adjustments due to side-effects or dose reduction due to risk of vascular occlusive events, consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises consider a reduced initial dose of 30 mg daily with concurrent use of potent inhibitors of CYP3A4.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS (MAY 2016)

An EU wide review has concluded that ponatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

MHRA/CHM ADVICE (UPDATED APRIL 2017): PONATINIB: RISK OF VASCULAR OCCLUSIVE EVENTS—UPDATED ADVICE ON POSSIBLE DOSE REDUCTION

The benefits and risks of ponatinib were reviewed by the European Medicines Agency's Committee on Medicinal Products for Human Use in 2014, which recommended that strengthened warnings should be added to the product information aimed at minimising the risk of blood clots and blockages in the arteries. Additional long-term follow-up data are now available that support new advice on dose modification to reduce this risk. The MHRA advises that although the recommended starting dose of ponatinib remains unchanged, prescribers should consider reducing the dose for patients with chronic phase chronic myeloid leukaemia (CP-CML) who have achieved a major cytogenetic response while on treatment. The following factors should be taken into account in the individual patient assessment:

- cardiovascular risk;
- side-effects of ponatinib therapy (including cardiovascular and other dose-related toxicity);
- time to cytogenetic response;
- BCR-ABL transcript levels.

The MHRA recommends close monitoring of response, if dose reduction is undertaken.

MHRA/CHM ADVICE: PONATINIB (ICLUSIG $^{\otimes}$): REPORTS OF POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (OCTOBER 2018)

Post-marketing cases of posterior reversible encephalopathy syndrome (PRES) have been reported in patients receiving ponatinib.

Treatment should be interrupted if PRES is confirmed and resumed only once the event is resolved and if the benefit of continued treatment outweighs the risk.

Patients should be advised to contact their healthcare professional immediately if they develop sudden-onset severe headache, confusion, seizures, or vision changes.

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may

lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with ponatinib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

• CAUTIONS Alcohol abuse—increased risk of pancreatitis current severe hypertriglyceridaemia—increased risk of pancreatitis discontinue treatment if a complete haematologic response has not occurred within 3 months hepatitis B infection history of myocardial infarction—do not use unless potential benefit outweighs potential risk history of pancreatitis history of stroke—do not use unless potential benefit outweighs potential risk hypertension risk factors for aneurysm or artery dissection

CAUTIONS, FURTHER INFORMATION

- Cardiovascular status Assess cardiovascular status before treatment—manage cardiovascular risk factors before and during treatment.
- Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.
- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: ponatinib
- SIDE-EFFECTS
- ► Common or very common Acute coronary syndrome alopecia · anaemia · appetite decreased · arrhythmias · arthralgia · asthenia · cerebrovascular insufficiency · chills · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · erectile dysfunction · eye inflammation · febrile neutropenia · fever · fluid imbalance · gastrointestinal discomfort · gastrooesophageal reflux disease · haemorrhage · headaches · heart failure · hyperglycaemia · hypertension · hypertriglyceridaemia · hyperuricaemia · hypothyroidism · increased risk of infection · influenza like illness · insomnia · ischaemic heart disease · lethargy · mass · muscle complaints · nausea · oedema · pain · pancreatitis · pancytopenia · pericardial effusion · peripheral neuropathy · peripheral vascular disease · pleural effusion · pulmonary hypertension · sensation abnormal · sepsis · skin reactions · stomatitis · sweat changes · vasodilation · vision disorders · vomiting · weight decreased
- ▶ Uncommon Cardiac discomfort · cardiomyopathy ischaemic · coronary vasospasm · hepatic disorders · hepatic failure (including fatal cases) · intracranial haemorrhage · left ventricular dysfunction · posterior reversible encephalopathy syndrome (PRES) · renal artery stenosis · splenic infarction · tumour lysis syndrome
- ► Frequency not known Aneurysm artery dissection
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment in men and women; effectiveness of hormonal contraception unknown alternative or additional methods of contraception should be used.

- PREGNANCY Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises discontinue breastfeeding—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
- RENAL IMPAIRMENT EVGT Use with caution if creatinine clearance less than 50 mL/minute (no information available), see p. 21.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter withhold treatment if lipase elevated and abdominal symptoms occur.
- Manufacturer advises a full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated.
- ► Manufacturer advises monitor liver function periodically.
- Manufacturer advises monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs.
- NATIONAL FUNDING/ACCESS DECISIONS

Regorafenib

22-Oct-2021

DRUG ACTION Regorafenib is an inhibitor of several protein kinases.

• INDICATIONS AND DOSE

Metastatic colorectal cancer (specialist use only) | Unresectable or metastatic gastrointestinal stromal tumours (specialist use only) | Hepatocellular carcinoma (specialist use only)

- ► BY MOUTH
- Adult: 160 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustment due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with regorafenib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Ensure measures to prevent hand-foot skin reaction · Gilbert's syndrome—risk of hyperbilirubinaemia · history of ischaemic heart disease—monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop · hypertension · may impair wound healing— withhold treatment for major surgical procedures · predisposition to bleeding · risk factors for aneurysm or artery dissection CAUTIONS, FURTHER INFORMATION
- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: regorafenib

SIDE-EFFECTS

- ► Common or very common Alopecia · anaemia · appetite decreased · asthenia · diarrhoea · dry mouth · dysphonia · electrolyte imbalance · fever · gastrooesophageal reflux disease · haemorrhage · headache · hyperbilirubinaemia · hypertension · hyperuricaemia · hypothyroidism · increased risk of infection · leucopenia · mucositis · musculoskeletal stiffness · nausea · pain · proteinuria · skin reactions · stomatitis · taste altered · thrombocytopenia · tremor · vomiting · weight decreased
- Uncommon Gastrointestinal fistula (discontinue) gastrointestinal perforation (including fatal cases, discontinue) - hepatic disorders - myocardial infarction myocardial ischaemia - nail disorder
- ▶ Rare or very rare Neoplasms · posterior reversible encephalopathy syndrome (PRES) · severe cutaneous adverse reactions (SCARs)
- ► Frequency not known Aneurysm artery dissection
- CONCEPTION AND CONTRACEPTION Women of childbearing potential and men must use effective contraception during treatment and up to 8 weeks after last dose.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).
- MONITORING REQUIREMENTS
- Monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding.
- Monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least monthly thereafter and as clinically indicated—consult product literature if changes in liver function observed.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizure, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)—discontinue treatment if symptoms occur.
- Monitor biochemical, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction—consult product literature if signs or symptoms develop.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat.
- PATIENT AND CARER ADVICE Counselling advised (administration).

Ribociclib

19-Jul-2021

 DRUG ACTION Ribociclib is an inhibitor of cyclindependent kinases 4 and 6, which are involved in cancer cell proliferation; their inhibition results in prevention of cancer cell growth.

• INDICATIONS AND DOSE

Locally advanced or metastatic breast cancer (specialist use only)

- ► BY MOUTH
- Adult: 600 mg once daily for 21 consecutive days of repeated 28 day cycles, to be taken at approximately the same time each day, preferably in the morning, for dose adjustments due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 400 mg once daily; in those already taking 400 mg once daily, reduce dose to 200 mg once daily.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: CDK4/6 INHIBITORS (ABEMACICLIB, PALBOCICLIB, RIBOCICLIB): REPORTS OF INTERSTITIAL LUNG DISEASE AND PNEUMONITIS, INCLUDING SEVERE CASES (JUNE 2021)

Interstitial lung disease and pneumonitis, in some cases severe or fatal, have been reported in patients being treated with CDK4/6 inhibitors, such as ribociclib. Healthcare professionals are advised to ask patients taking ribociclib about pulmonary symptoms indicative of interstitial lung disease and pneumonitis, such as cough or dyspnoea. Patients should be advised to seek advice right away if these symptoms occur. Healthcare professionals should ensure patients have a copy of the Patient Information Leaflet (PIL) for ribociclib.

- CONTRA-INDICATIONS Pre-existing QTc prolongation · risk factors for QTc prolongation (including concomitant use of drugs known to prolong QTc interval)
- INTERACTIONS → Appendix 1: ribociclib

Sorafenib

13-Nov-2020

DRUG ACTION Sorafenib is an inhibitor of multiple kinases.

INDICATIONS AND DOSE

Treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is unsuitable | Treatment of progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine | Treatment of hepatocellular carcinoma

- ▶ BY MOUTH
- Adult: 400 mg twice daily, for dose adjustments due to side effects, consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with sorafenib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

• CAUTIONS Cardiac ischaemia · hypertension · major surgical procedures · potential risk of bleeding—treat tracheal, bronchial, or oesophageal infiltration with localised therapy before initiating sorafenib in patients with differentiated thyroid carcinoma (DTC) and consider permanent withdrawal of sorafenib in any patient that requires medical intervention for bleeding · risk factors for aneurysm or artery dissection · susceptibility to QT-interval prolongation

CAUTIONS, FURTHER INFORMATION

- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: sorafenib
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · congestive heart failure · constipation · decreased leucocytes · depression · diarrhoea · dry mouth · dysphagia · dysphonia · electrolyte imbalance · erectile dysfunction · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypertension · hypothyroidism · increased risk of infection · influenza like illness · intracranial haemorrhage · mucositis · muscle complaints · myocardial infarction · myocardial ischaemia · nausea · neoplasms · neutropenia · oral disorders · pain · peripheral neuropathy · proteinuria · renal failure · rhinorrhoea · skin reactions · taste altered · thrombocytopenia · tinnitus · vomiting · weight decreased
- Uncommon Cholangitis · cholecystitis · dehydration · encephalopathy · gynaecomastia · hepatic disorders · hyperthyroidism · pancreatitis · radiation injuries · respiratory disorders
- Rare or very rare Angioedema · hypersensitivity vasculitis · nephrotic syndrome · QT interval prolongation · rhabdomyolysis · severe cutaneous adverse reactions (SCARs)

- ► Frequency not known Aneurysm artery dissection
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

MONITORING REQUIREMENTS

- ► Consider periodic monitoring of ECG and electrolytes in patients susceptible to OT-interval prolongation.
- Monitor plasma-calcium concentration (increased risk of hypocalcaemia if history of hypoparathyroidism).
- Monitor thyroid stimulating hormone in patients with differentiated thyroid carcinoma.
- NATIONAL FUNDING/ACCESS DECISIONS

- ➤ Sorafenib for treating advanced hepatocellular carcinoma (September 2017) NICE TA474 Recommended with restrictions
- ► Lenvatinib and sorafenib for treating differentiated thyroid cancer after radioactive iodine (August 2018) NICE TA535 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ➤ Sorafenib (Nexavar®) for the treatment of hepatocellular carcinoma (January 2016) SMC No. 482/08 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 23

- ► Sorafenib (Non-proprietary)
 - Sorafenib (as Sorafenib tosylate) 200 mg Sorafenib 200mg tablets | 112 tablet PoM £2,567.00-£3,218.00 (Hospital only)
- Nexavar (Bayer Plc)
 - Sorafenib (as Sorafenib tosylate) 200 mg Nexavar 200mg tablets | 112 tablet PoM £3,576.56

Sunitinib

26-Nov-2020

• DRUG ACTION Sunitinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib | Treatment of advanced or metastatic renal cell carcinoma

- ► BY MOUTH
- Adult: 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle, adjusted in steps of 12.5 mg, doses adjusted according to tolerability; usual dose 25-75 mg daily

Treatment of unresectable or metastatic pancreatic neuroendocrine tumours

- ► BY MOUTH
- Adult: 37.5 mg once daily without treatment-free period; adjusted in steps of 12.5 mg, doses adjusted according to tolerability; maximum 50 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

➤ Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, dose may need to be increased in steps of 12.5 mg to a max. dose of

- 87.5 mg per day for gastro-intestinal stromal tumours or renal cell carcinoma, or to a max. dose of 62.5 mg per day for pancreatic neuroendocrine tumours.
- Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, dose may need to be decreased to a minimum of 37.5 mg per day for gastrointestinal stromal tumours or renal cell carcinoma, or to a minimum of 25 mg per day for pancreatic neuroendocrine tumours.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BEVACIZUMAB AND SUNITINIB: RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with sunitinib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Cardiovascular disease—discontinue if congestive heart failure develops - hypertension - increased risk of bleeding - risk factors for aneurysm or artery dissection - susceptibility to QT-interval prolongation CAUTIONS, FURTHER INFORMATION
- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: sunitinib
- SIDE-EFFECTS
- ► Common or very common Abscess · alopecia · anaemia · appetite decreased · arthralgia · burping · chest pain · chills · constipation · cough · dehydration · depression · diarrhoea · dizziness · dry mouth · dysphagia · dyspnoea · embolism and thrombosis · excessive tearing · eye inflammation · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hair colour changes · headache · hypertension · hypoglycaemia · hypothyroidism · increased risk of infection · influenza like illness · insomnia · leucopenia · mucositis · muscle complaints · muscle weakness · myocardial ischaemia · nail disorder · nasal complaints · nausea · neutropenia · oedema · oral disorders · oropharyngeal pain · pain · peripheral neuropathy · proteinuria · renal impairment · respiratory disorders · sensation abnormal · sepsis · skin reactions · taste altered · thrombocytopenia · urine discolouration · vasodilation · vomiting · weight decreased

- ➤ Uncommon Anal fistula (interrupt treatment) · cardiomyopathy · cerebrovascular insufficiency · cholecystitis · fistula (interrupt treatment) · healing impaired · heart failure · hepatic disorders · hypersensitivity · hyperthyroidism · intracranial haemorrhage · myocardial infarction · osteonecrosis of jaw · pancreatitis · pancytopenia · pericardial effusion · QT interval prolongation · tumour haemorrhage
- ► Rare or very rare Angioedema · myopathy · nephrotic syndrome · posterior reversible encephalopathy syndrome (PRES) · pyoderma gangrenosum · severe cutaneous adverse reactions (SCARs) · thrombotic microangiopathy · thyroiditis · torsade de pointes · tumour lysis syndrome
- ► Frequency not known Aneurysm aortic dissection artery dissection
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs n. 962.
- BREAST FEEDING Discontinue breast-feeding.
- MONITORING REQUIREMENTS Monitor for thyroid dysfunction.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

 NICE decisions
- Sunitinib for the first-line treatment of advanced and/or metastatic renal cell carcinoma (March 2009) NICE TA169 Recommended
- ► Sunitinib for the treatment of gastrointestinal stromal tumours (September 2009) NICE TA179 Recommended with restrictions
- Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced and/or metastatic renal cell carcinoma (August 2009) NICE TAI78 Not recommended
- Everolimus and sunitinib for treating unresectable or metastatic neuroendocrine tumours in people with progressive disease (June 2017) NICE TA449 Recommended
 Scottish Medicines Consortium (SMC) decisions
- Sunitinib (Sutent®) for unresectable and/or metastatic malignant gastrointestinal stromal tumour (GIST) after failure of imatinib mesylate treatment due to resistance or intolerance (November 2009) SMC No. 275/06 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 14

► Sunitinib (Non-proprietary)

Sunitinib (as Sunitinib malate) 12.5 mg Sunitinib 12.5 mg capsules | 28 capsule PoM £627.76-£784.70 (Hospital only) | 28 capsule PoM £706.23

Sunitinib (as Sunitinib malate) 25 mg Sunitinib 25mg capsules | 28 capsule PoM £1,224.13-£1,569.40 (Hospital only) | 28 capsule PoM £1.412.46

Sunitinib (as Sunitinib malate) 50 mg Sunitinib 50mg capsules | 28 capsule PoM £2,511.04-£3,138.80 (Hospital only)

► Sutent (Pfizer Ltd)

Sunitinib (as Sunitinib malate) 12.5 mg Sutent 12.5 mg capsules | 28 capsule PoM £784.70 (Hospital only)

Sunitinib (as Sunitinib malate) 25 mg Sutent 25mg capsules | 28 capsule PoM £1,569.40 (Hospital only)

Sunitinib (as Sunitinib malate) 50 mg Sutent 50mg capsules | 28 capsule PoM £3,138.80 (Hospital only)

Temsirolimus

11-Jun-2021

• DRUG ACTION Temsirolimus is a protein kinase inhibitor.

INDICATIONS AND DOSE

First-line treatment of advanced renal cell carcinoma | Treatment of relapsed or refractory mantle cell lymphoma

- ► BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)
- INTERACTIONS → Appendix 1: temsirolimus
- SIDE-EFFECTS
- ➤ Common or very common Abscess · anaemia · anxiety · appetite decreased · arthralgia · asthenia · chest pain · chills · conjunctivitis · constipation · cough · cystitis · decreased leucocytes · dehydration · depression · diabetes mellitus · diarrhoea · dizziness · drowsiness · dyslipidaemia · dysphagia · dyspnoea · electrolyte imbalance · embolism and thrombosis · fever · gastrointestinal discomfort · gastrointestinal disorders · genital oedema · haemorrhage · headache · hypersensitivity · hypertension · increased risk of infection · insomnia · lacrimation disorder · mucositis · myalgia · nail disorder · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · post procedural infection · renal failure · respiratory disorders · scrotal oedema · sepsis · skin reactions · taste altered · thrombocytopenia · vomiting
- Uncommon Healing impaired · intracranial haemorrhage · pericardial effusion

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity reactions, including some life-threatening and rare fatal reactions, are associated with temsirolimus therapy. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

- CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment in men and women.
- PREGNANCY Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises discontinue breast-feeding.
- HEPATIC IMPAIRMENT
- When used for Renal cell carcinoma Manufacturer advises caution.
- When used for Mantle cell lymphoma Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

Dose adjustments

- When used for Renal cell carcinoma Manufacturer advises dose reduction in severe impairment—consult product literature.
- RENAL IMPAIRMENT Ever Caution in severe impairment (no information available).
- MONITORING REQUIREMENTS
- ► Monitor respiratory function.
- ► Monitor blood lipids.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced and/or metastatic renal cell carcinoma (August 2009) NICE TA178 Not recommended

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol, propylene glycol

► Torisel (Pfizer Ltd)

Temsirolimus 25 mg per 1 ml Torisel 30mg/1.2ml concentrate for solution for infusion vials and diluent \mid 1 vial $\boxed{\text{PoM}}$ £620.00 (Hospital only)

Tepotinib

30-Nov-2021

 DRUG ACTION Tepotinib is a kinase inhibitor which targets mesenchymal-epithelial transition (MET) factor gene including variants with exon 14 skipping alterations, thereby inhibiting tumour cell proliferation.

• INDICATIONS AND DOSE

Non-small cell lung cancer with mesenchymal-epithelial transition factor gene (MET) exon 14 skipping alterations (specialist use only)

- ▶ BY MOUTH
- Adult: 450 mg once daily, for dose adjustment, interruption, or treatment discontinuation due to sideeffects—consult product literature, discontinue treatment if patient unable to tolerate at least 225 mg once daily

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- INTERACTIONS → Appendix 1: tepotinib
- SIDE-EFFECTS
- Common or very common Asthenia · constipation · diarrhoea · gastrointestinal discomfort · hepatic disorders · hypoalbuminaemia · nausea · oedema · respiratory disorders · vomiting
- ► Frequency not known Dyspnoea · musculoskeletal pain · pneumonia · pulmonary embolism
- CONCEPTION AND CONTRACEPTION Evgr Females of childbearing potential and male patients with female partners of childbearing potential should use effective contraception during treatment and for at least 1 week after last treatment. ♠
- PREGNANCY Ever Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Ever Discontinue breast-feeding during treatment and for at least 1 week after last treatment—no information available.
- HEPATIC IMPAIRMENT EVG Caution in severe impairment (no information available).
- RENAL IMPAIRMENT EVG Caution in severe impairment (no information available).

Tepotinib may inhibit renal tubular transporter proteins leading to an increase in creatinine levels that is due to inhibition of active tubular secretion rather than renal injury. Caution is required when interpreting creatinine clearance or estimated glomerular filtration rate and further assessment of renal function is required—consult product literature.

- MONITORING REQUIREMENTS
- ► Ever Monitor liver enzymes and bilirubin before treatment initiation, then every 2 weeks for first three months and then once a month thereafter.
- Monitor for new or worsening pulmonary symptoms of dyspnoea, cough and fever which may develop during

treatment—increased risk of interstitial lung disease-like reactions.

PATIENT AND CARER ADVICE

Missed doses If a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of fatigue or asthenia.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

► Tepmetko (Merck Serono Ltd) ▼

Tepotinib (as Tepotinib hydrochloride) 225 mg Tepmetko 225mg tablets | 60 tablet | PoM £7,200.00 (Hospital only)

Tivozanib

11-Nov-2020

• DRUG ACTION Tivozanib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

Advanced renal cell carcinoma (specialist use only)

- ► BY MOUTH
- Adult: 1340 micrograms once daily for 21 consecutive days of repeated 28 day cycles, for dose adjustments due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with tivozanib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

• CAUTIONS History of arterial thromboembolic events - history of bleeding disorders - history of posterior reversible encephalopathy syndrome following tivozanib treatment - history of QT-interval prolongation - history of venous thromboembolic events - hypertension - major surgical procedures—interrupt treatment - patients aged over 65 years—increased risk of adverse effects - pre-existing cardiac disease - risk factors for aneurysm or artery dissection - risk factors for arterial thromboembolic events - risk factors for gastro-intestinal fistula - risk factors for gastro-intestinal perforation - risk factors for venous thromboembolic events - risk of bleeding

CAUTIONS, FURTHER INFORMATION

- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: tivozanib
- SIDE-EFFECTS
- Common or very common Alopecia · anaemia · angina pectoris · appetite decreased · arrhythmias · arthralgia · asthenia · cancer pain · cerebrovascular insufficiency · chest pain · chills · constipation · cough · diarrhoea · dizziness · dry mouth · dysphonia · dyspnoea · embolism

- and thrombosis · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypertension · hypothermia · hypothyroidism · increased risk of infection · insomnia · ischaemia · myalgia · myocardial infarction · nasal complaints · nausea · nerve disorders · oral disorders · oropharyngeal pain · pain · pancreatitis · peripheral oedema · proteinuria · sensation abnormal · skin reactions · swallowing difficulty · taste altered · tinnitus · vasodilation · vertigo · vision disorders · vomitine · weight decreased
- ▶ Uncommon Coronary artery insufficiency ear congestion excessive tearing goitre hyperhidrosis hyperthyroidism memory loss mucositis muscle weakness pulmonary oedema QT interval prolongation thrombocytopenia toxic nodular goitre
- Rare or very rare Posterior reversible encephalopathy syndrome (PRES)
- ► Frequency not known Aneurysm artery dissection heart failure
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in men, women of childbearing potential, and their partners during treatment and for at least one month after the last dose; an additional barrier method of contraception should be used in women using hormonal contraceptives. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild-to-moderate impairment—monitor patients for tolerability; avoid in severe impairment.
 Dose adjustments Manufacturer advises reduce dose to 1340 micrograms on alternate days in moderate impairment—increased risk of adverse effects due to increased exposure.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—limited information available.

MONITORING REQUIREMENTS

- Manufacturer advises perform liver function tests (including ALT, AST and AP) before and during treatment; monitor for proteinuria before treatment and periodically thereafter.
- Manufacturer advises monitor for signs or symptoms of cardiac failure during treatment.
- Manufacturer advises perform baseline ECG and monitor electrolytes before treatment and as clinically indicated thereafter.
- Manufacturer advises monitor thyroid function before treatment and periodically thereafter.
- Manufacturer advises monitor for symptoms of gastrointestinal perforation or fistula.

Trametinib

30-Mar-2021

• DRUG ACTION Trametinib is a protein kinase inhibitor.

INDICATIONS AND DOSE

Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with dabrafenib) (specialist use only) | Advanced non-small cell lung cancer with a BRAF V600 mutation (in combination with dabrafenib) (specialist use only)

- ► BY MOUTH
- Adult: 2 mg once daily, when used in combination with dabrafenib, the dose should be taken at the same time each day with either the morning or evening dose of dabrafenib, for dose adjustments due to side-effects, consult product literature

Adjuvant treatment of stage III melanoma with a BRAF V600 mutation following complete resection (in combination with dabrafenib) (specialist use only)

- ► BY MOUTH
- Adult: 2 mg once daily for 12 months, the dose should be taken at the same time each day with either the morning or evening dose of dabrafenib, for dose adjustments due to side-effects, consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2016): TRAMETINIB: RISK OF GASTROINTESTINAL PERFORATION AND COLITIS

A review by EU medicines regulators has concluded that trametinib can cause gastrointestinal perforation or colitis.

Trametinib should be used with caution in patients with risk factors for gastrointestinal perforation, such as gastrointestinal metastases, diverticulitis, or use of concomitant medicines that can cause gastrointestinal perforation. Prescribers should be vigilant for signs and symptoms of gastrointestinal perforation and should advise patients to seek urgent medical attention if they develop severe abdominal pain.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS History of retinal vein occlusion
- CAUTIONS Concomitant antiplatelet or anticoagulant therapy—increased risk of haemorrhage · conditions that could impair left ventricular function · elderly (more frequent dose adjustments may be required) · impaired left ventricular function · predisposing factors for retinal vein occlusion · risk factors for gastrointestinal perforation
- INTERACTIONS → Appendix 1: trametinib
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · alopecia · anaemia · asthenia · bradycardia · constipation · cough · dehydration · diarrhoea · dry mouth · dyspnoea · eye inflammation · fever · haemorrhage · hypersensitivity · hypertension · increased risk of infection · intracranial haemorrhage · left ventricular dysfunction · lymphoedema

- · mucositis · nausea · oedema · respiratory disorders · skin reactions · stomatitis · vision disorders · vomiting
- ► Uncommon Chorioretinopathy · gastrointestinal disorders · heart failure · retinal detachment · retinal occlusion · rhabdomyolysis

SIDE-EFFECTS, FURTHER INFORMATION Additional side-effects reported when used in combination with dabrafenib include dizziness, hyperhidrosis, hyponatraemia, hypotension, leucopenia, muscle spasms, myocarditis, neutropenia, night sweats, and thrombocytopenia.

- CONCEPTION AND CONTRACEPTION Manufacturer advises women of child-bearing potential should use highly effective non-hormonal contraception during, and for 4 months after stopping treatment.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—no information available.
- MONITORING REQUIREMENTS Manufacturer advises measure blood pressure at baseline and monitor during treatment; evaluate left ventricular ejection fraction before treatment, after one month of treatment, and then approximately every 3 months thereafter; monitor liver function every 4 weeks for 6 months after treatment initiation, and thereafter as clinically indicated.
- HANDLING AND STORAGE Manufacturer advises store in refrigerator (2–8 °C); once opened, bottle may be stored for 30 days at not more than 30 °C.
- PATIENT AND CARER ADVICE Manufacturer advises patients and their carers should be told to seek immediate medical attention if symptoms of pulmonary embolism or deep vein thrombosis occur; patients and their carers should also be advised to report new visual disturbances. Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness and visual disturbances.

Vandetanib

10-Aug-2021

• DRUG ACTION Vandetanib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease

- ► BY MOUT
- Adult: 300 mg once daily, for dose adjustment due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with vandetanib; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS Congenital long QT syndrome · QT interval greater than 480 milliseconds
- CAUTIONS Brain metastases (intracranial haemorrhage reported) · electrolyte disturbances · history of torsades de pointes · hypertension · phototoxicity reactions reported (wear protective clothing and/or sunscreen) · risk factors for aneurysm or artery dissection · susceptibility to QTprolongation

CAUTIONS, FURTHER INFORMATION

- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: vandetanib
- SIDE-EFFECTS
- ► Common or very common Alopecia · anxiety · appetite decreased · asthenia · cerebral ischaemia · cholelithiasis · constipation · corneal deposits · cystitis · dehydration · depression · diarrhoea · dizziness · dry eye · dry mouth · dysphagia · electrolyte imbalance · eye disorders · eye inflammation · fever · gastrointestinal discomfort · gastrointestinal disorders · glaucoma · haemorrhage · headache · hyperglycaemia · hypertension · hypothyroidism · increased risk of infection · insomnia ·

lethargy · loss of consciousness · movement disorders · nail disorder · nausea · nephrolithiasis · oedema · pain · photosensitivity reaction · proteinuria · QT interval prolongation · renal impairment · respiratory disorders · sensation abnormal · sepsis · skin reactions · stomatitis · taste altered · tremor · urinary disorders · vision disorders · vomiting · weight decreased

- ▶ Uncommon Arrhythmias · brain oedema · cardiac arrest · cardiac conduction disorder · cataract · healing impaired · heart failure · malnutrition · pancreatitis · posterior reversible encephalopathy syndrome (PRES) · seizure · urine discolouration
- ► Frequency not known Aneurysm artery dissection Stevens-Johnson syndrome
- CONCEPTION AND CONTRACEPTION Effective contraception required during and for at least 4 months after treatment.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk. Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester.
 Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid if liver function tests exceed specific limits—consult product literature
- RENAL IMPAIRMENT EVGT Avoid if creatinine clearance less than 30 mL/minute (limited information available).

Dose adjustments [EVG] Consider reducing starting dose to 200 mg if creatinine clearance 30–49 mL/minute (limited information available; consult product literature). (**) See p. 21.

- MONITORING REQUIREMENTS Monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer vandetanib tablets.
 Phototoxicity reactions Patients should be advised to wear protective clothing and/or sunscreen.
 Alert card An alert card should be provided.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Vandetanib for treating medullary thyroid cancer (December 2018) NICE TA550 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Caprelsa (Sanofi Genzyme)

Vandetanib 100 mg Caprelsa 100mg tablets | 30 tablet PoM £2,500.00

Vandetanib 300 mg Caprelsa 300mg tablets | 30 tablet PoM 55 000 00

Vemurafenib

10-Jun-2021

DRUG ACTION Vemurafenib is a BRAF kinase inhibitor.

INDICATIONS AND DOSE

Monotherapy for the treatment of BRAF V600 mutationpositive unresectable or metastatic melanoma

- ► BY MOUTH
- Adult: 960 mg twice daily, for dose adjustment due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION

DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS SYNDROME)

DRESS syndrome has been reported in patients taking venurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal.

Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF POTENTIATION OF RADIATION TOXICITY

Potentiation of radiation toxicity has been reported in patients treated with vemurafenib before, during, or after radiotherapy—use with caution.

- CONTRA-INDICATIONS Wild-type BRAF malignant melanoma
- CAUTIONS Electrolyte disturbances · prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression · susceptibility to QT-prolongation
- INTERACTIONS → Appendix 1: vemurafenib
- SIDE-EFFECTS
- ➤ Common or very common 7th nerve paralysis · alopecia · appetite decreased · arthralgia · arthritis · asthenia · connective tissue disorders · constipation · cough · diarrhoea · dizziness · eye inflammation · fever · folliculitis · headache · myalgia · nausea · neoplasms · pain · panniculitis · peripheral oedema · photosensitivity reaction · QT interval prolongation · radiation injuries · skin reactions · taste altered · vomiting · weight decreased
- ▶ Uncommon Liver injury · neutropenia · pancreatitis · peripheral neuropathy · retinal occlusion · severe cutaneous adverse reactions (SCARs) · vasculitis
- Rare or very rare Acute tubular necrosis · nephritis acute interstitial
- ► Frequency not known Acute kidney injury
- CONCEPTION AND CONTRACEPTION Effective contraception required during for at least 6 months after treatment.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (risk of increased exposure)—monitor ECG monthly during the first 3 months of treatment, followed by at least every 3 months thereafter (if QTc interval is prolonged, consult product literature).
- RENAL IMPAIRMENT EVGT Caution in severe impairment (limited information available).
- MONITORING REQUIREMENTS
- ► Monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not

- recommended if QT interval greater than 500 milliseconds at baseline).
- Monitor liver function before treatment and periodically thereafter.
- ▶ Monitor for uveitis, iritis and retinal vein occlusion.
- Monitor for cutaneous and non-cutaneous squamous cell carcinoma and new primary melanoma before, during and for up to 6 months after treatment—consult product literature.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises may be taken with or without food; avoid consistent intake of both daily doses on an empty stomach (may affect absorption).
- PATIENT AND CARER ADVICE Counselling advised (administration).

Drug rash with eosinophilia and systemic symptoms (DRESS syndrome) Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops.

• NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

 Vemurafenib for treating locally advanced or metastatic BRAF V600 mutation-positive malignant melanoma (updated January 2015) NICE TA269 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Vemurafenib (Zelboraf®) as monotherapy for the treatment of adult patients with BRAF V600 mutation-positive unresectable or metastatic melanoma (December 2013) SMC No. 792/12 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 25

➤ Zelboraf (Roche Products Ltd)

Vemurafenib 240 mg Zelboraf 240mg tablets | 56 tablet PoM
£1,750.00 (Hospital only)

ANTINEOPLASTIC DRUGS > OTHER

Glasdegib

02-Mar-2022

• DRUG ACTION Glasdegib is a hedgehog pathway inhibitor.

• INDICATIONS AND DOSE

Acute myeloid leukaemia [in combination with low-dose cytarabine] (specialist use only)

- BY MOUTH
- Adult: 100 mg once daily, for dose adjustments, treatment interruption, or discontinuation due to sideeffects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises if concurrent use of moderate CYP3A4 inducers, etravirine, or modafinil is unavoidable, double the once-daily dose.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- INTERACTIONS → Appendix 1: glasdegib
- SIDE-EFFECTS
- ➤ Common or very common Alopecia anaemia appetite decreased arrhythmias arthralgia CNS haemorrhage constipation diarrhoea dyspnoea eye contusion fatigue fever gastrointestinal discomfort haemorrhage increased risk of infection muscle complaints muscle contractions involuntary musculoskeletal pain nausea neutropenia peripheral oedema OT interval

- prolongation sepsis skin reactions stomatitis taste altered thrombocytopenia vomiting weight decreased
- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential and male patients with a partner who is pregnant or of childbearing potential should use effective contraception (including condoms in males) during treatment and for at least 30 days after last dose. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962. Fertility may be impaired in males and females—consult product literature.
- PREGNANCY Manufacturer advises avoid—embryotoxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during treatment and for at least one week after last dose—no information available.
- RENAL IMPAIRMENT Manufacturer advises use with caution

Monitoring Manufacturer advises monitor renal function in patients with pre-existing renal impairment or risk factors for renal dysfunction; assess before initiation and at least once weekly for the first month of treatment. Monitor electrolytes and renal function once monthly thereafter during treatment.

PATIENT AND CARER ADVICE

Vomiting Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time. Missed doses Manufacturer advises if a dose is more than 10 hours late, the missed dose should not be taken and the next dose should be taken at the usual time.

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of fatigue, muscle cramps, pain, or nausea.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Niraparib

04-May-202

 DRUG ACTION Niraparib is an inhibitor of PARP enzymes which are involved in DNA repair. PARP inhibition results in disruption of cellular homoeostasis and cell death.

• INDICATIONS AND DOSE

Advanced ovarian cancer (initiated by a specialist) | Advanced fallopian tube cancer (initiated by a specialist) |Advanced peritoneal cancer (initiated by a specialist)

- ► BY MOUTH
- Adult (body-weight up to 77 kg): 200 mg once daily, for dose adjustments due to side-effects—consult product literature
- Adult (body-weight 77 kg and above): 300 mg once daily, baseline platelet count should be 150x10⁹/litre or above for this dose schedule, for dose adjustments due to side-effects—consult product literature

Relapsed ovarian cancer (initiated by a specialist) | Relapsed fallopian tube cancer (initiated by a specialist) | Relapsed peritoneal cancer (initiated by a specialist)

- ► BY MOUTH
- Adult: 300 mg once daily, consider initial dose of 200 mg in patients with body-weight less than 58 kg,

continued \rightarrow

for dose adjustments due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: NIRAPARIB (ZEJULA®): REPORTS OF SEVERE HYPERTENSION AND POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), PARTICULARLY IN EARLY TREATMENT (OCTOBER 2020)

A European review of niraparib safety data identified worldwide reports of severe hypertension, including rare cases of hypertensive crisis, some with onset in the first month of treatment. Rare cases of PRES have also been reported, mostly associated with hypertension and within the first month of treatment.

Healthcare professionals are advised to control preexisting hypertension before starting niraparib. Blood pressure should be monitored at least weekly for the first 2 months of treatment, then monthly for the first year, and periodically thereafter. Home blood pressure monitoring may be considered if appropriate; patients should be trained and advised to contact their doctor in case of an increase in blood pressure.

Hypertension during treatment should be managed with antihypertensives; treatment interruption or dose adjustment of niraparib may be required—consult product literature. Niraparib should be discontinued in case of hypertensive crisis or medically significant hypertension that cannot be adequately controlled with antihypertensive therapy. In cases of PRES, niraparib should also be discontinued and patients treated for specific symptoms (including hypertension).

- CAUTIONS Pre-existing hypertension (control before treatment initiation)
- INTERACTIONS → Appendix 1: niraparib
- SIDE-EFFECTS
- ► Common or very common Anaemia angioedema · anxiety · appetite decreased · arthralgia · asthenia · back pain · cognitive impairment · concentration impaired · conjunctivitis · constipation · cough · depression · diarrhoea · dizziness · dry mouth · dyspnoea · epistaxis · gastrointestinal discomfort · headache · hypersensitivity · hypertension · hypokalaemia · increased risk of infection · insomnia · leucopenia · memory impairment · mucositis · myalgia · nausea · neutropenia · palpitations · peripheral oedema · photosensitivity reaction · skin reactions · stomatitis · tachycardia · taste altered · thrombocytopenia · vomiting · weight decreased
- ▶ Uncommon Confusion pancytopenia pneumonitis
- Rare or very rare Posterior reversible encephalopathy syndrome (PRES)
- ▶ Frequency not known Acute myeloid leukaemia (discontinue permanently) • hot flush • myelodysplastic syndrome (discontinue permanently)
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of childbearing potential during treatment and for 1 month after receiving the last dose.
- PREGNANCY Manufacturer advises avoid—limited information available.
- BREAST FEEDING Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—no information available.

MONITORING REQUIREMENTS

- Manufacturer advises monitor full blood count weekly for the first month of treatment, then monthly for the next 10 months and periodically thereafter.
- ➤ Manufacturer advises monitor blood pressure weekly for the first 2 months of treatment, then monthly for the first year, and periodically thereafter.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness and fatigue.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Niraparib for maintenance treatment of advanced ovarian, fallopian tube and peritoneal cancer after response to firstline platinum-based chemotherapy (February 2021) NICE TA673 Recommended
- Niraparib for maintenance treatment of relapsed, platinumsensitive ovarian, fallopian tube and peritoneal cancer (April 2022) NICE TA784 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Niraparib tosylate monohydrate (Zejula®) as monotherapy for the maintenance treatment of adult patients with platinumsensitive relapsed high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete or partial) to platinum-based chemotherapy (August 2018) SMC No. 1341/18 Recommended with restrictions
- Niraparib (Zejula®) as monotherapy for the maintenance treatment of adult patients with advanced epithelial (FIGO Stages III and IV) high-grade ovarian, fallopian tube or primary peritoneal cancer who are in response (complete or partial) following completion of first-line platinum-based chemotherapy (May 2021) SMC No. SMC2338 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

 Cancula

 Cancula

CAUTIONARY AND ADVISORY LABELS 25

► Zejula (GlaxoSmithKline UK Ltd) ▼

Niraparib (as Niraparib tosylate monohydrate) 100 mg Zejula 100mg capsules | 56 capsule PoM £4,500.00 (Hospital only) | 84 capsule PoM £6,750.00 (Hospital only)

Olaparib

21-Jan-202

 DRUG ACTION Olaparib is a PARP inhibitor. PARP are enzymes that repair damaged DNA in cancer cells and, in the absence of functional BRCA, inhibition of PARP results in an inability of cancer cells to repair. Therefore inhibition of PARP results in an antineoplastic effect.

• INDICATIONS AND DOSE

Ovarian cancer (specialist use only) | Fallopian tube cancer (specialist use only) | Peritoneal cancer (specialist use only)

- ► BY MOUTH USING CAPSULES
- Adult: 400 mg twice daily, patients should start treatment no later than 8 weeks after completion of their final dose of a platinum-containing regimen, for dose adjustments due to side-effects—consult product literature
- ► BY MOUTH USING TABLETS
- Adult: 300 mg twice daily, when using olaparib monotherapy, patients should start treatment no later than 8 weeks after completion of their final dose of a platinum-containing regimen, for dose adjustments due to side-effects—consult product literature

Breast cancer (specialist use only) | Adenocarcinoma of the pancreas (specialist use only) | Prostate cancer (specialist use only)

- ► BY MOUTH USING TABLETS
- Adult: 300 mg twice daily, for dose adjustments due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4 is unavoidable, reduce dose of capsules to 200 mg twice daily and tablets to 150 mg twice daily.
- Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose of capsules to 150 mg twice daily and tablets to 100 mg twice daily.

DOSE EQUIVALENCE AND CONVERSION

 Manufacturer advises capsules and tablets are not interchangeable on a milligram-for-milligram basis due to differences in dosing and bioavailability.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: LYNPARZA® (OLAPARIB): RISK OF MEDICATION ERRORS WITH NEW PHARMACEUTICAL FORM (MAY 2018)

A tablet formulation of olaparib was approved by the European Commission in May 2018. Capsules and tablets are not to be substituted on a milligram-to-milligram basis due to differences in dosing and bioavailability of each formulation. Prescribers should specify the formulation and dosage of olaparib on each prescription and pharmacists should ensure that the correct formulation and dose is dispensed. Patients should be instructed on the correct dose they should take for their capsules or tablets and if switched, informed of the difference in dosing.

- INTERACTIONS → Appendix 1: olaparib
- SIDE-EFFECTS
- ➤ Common or very common Agranulocytosis anaemia appetite decreased asthenia cough decreased leucocytes diarrhoea dizziness dyspnoea erythropenia gastrointestinal discomfort headache nausea neutropenia neutropenic infection neutropenic sepsis oral disorders skin reactions taste altered thrombocytopenia vomiting
- ▶ Uncommon Angioedema
- ▶ Rare or very rare Erythema nodosum
- ► Frequency not known Haematotoxicity neoplasms pneumonitis

SIDE-EFFECTS, FURTHER INFORMATION Haematological toxicity Withhold treatment if severe haematological toxicity develops; further analysis recommended if toxicity still present 4 weeks after treatment withdrawal.

Pneumonitis If dyspnoea, cough and fever, or radiological abnormalities develop, withhold treatment and investigate; if pneumonitis confirmed, discontinue.

- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential should use 2 methods of effective contraception during treatment and for 1 month after last treatment; male patients should use effective contraception during treatment and for 3 months after last treatment if their partner is pregnant or of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.

- BREAST FEEDING Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises avoid in severe impairment unless benefit outweighs potential risk—no information available.
- **Dose adjustments** For *capsules*, manufacturer advises reduce dose to 300 mg twice daily in moderate impairment. For *tablets*, manufacturer advises reduce dose to 200 mg twice daily in moderate impairment.
- MONITORING REQUIREMENTS Manufacturer advises monitor full blood count before treatment initiation, then every month for the first 12 months of treatment and periodically thereafter.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises capsules should be taken at least 1 hour after food, and food should preferably be avoided for up to 2 hours after administration.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of malaise and dizziness.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Olaparib for maintenance treatment of BRCA mutationpositive advanced ovarian, fallopian tube or peritoneal cancer after response to first-line platinum-based chemotherapy (August 2019) NICE TA598 Recommended with restrictions
 - Olaparib for maintenance treatment of relapsed platinumsensitive ovarian, fallopian tube or peritoneal cancer (January 2020) NICE TA620 Recommended with restrictions
 - Olaparib plus bevacizumab for maintenance treatment of advanced ovarian, fallopian tube or primary peritoneal cancer (April 2021) NICE TA693 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Olaparib (Lynparza®) capsules as monotherapy for the maintenance treatment of adult patients with platinumsensitive relapsed BRCA-mutated (germline and/or somatic) high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete response or partial response) to platinum-based chemotherapy (November 2016) SMC No. 1047/15 Recommended
- Olaparib (Lynparza®) tablets as monotherapy for the maintenance treatment of adult patients with newly diagnosed advanced (FIGO stages III and IV) BRCA1/2-mutated (germline and/or somatic) high-grade epithelial ovarian, fallopian tube or primary peritoneal cancer who are in response (complete or partial) following completion of first line platinum-based chemotherapy (December 2019) SMC NO. SMC2209 Recommended
- Olaparib (Lynparza®) tablets as monotherapy for the maintenance treatment of adult patients with platinumsensitive relapsed high-grade epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete or partial) to platinum-based chemotherapy (August 2021) SMC No. SMC2367 Recommended with restrictions
- Olaparib (Lynparza®) tablets in combination with bevacizumab for the maintenance treatment of adults with advanced high-grade epithelial ovarian, fallopian tube or primary peritoneal cancer who are in response (complete or partial) following completion of first-line platinum-based chemotherapy in combination with bevacizumab, and whose cancer is associated with homologous recombination deficiency (December 2021) SMC No. SMC2368 Recommended

- Olaparib (Lynparza®) as monotherapy for the treatment of adult patients with metastatic castration-resistant prostate cancer and BRCA1/2-mutations (germline and/or somatic) who have progressed following prior therapy that included a new hormonal agent (October 2021) SMC No. SMC2366 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Sotorasib

31-Mar-2022

 DRUG ACTION Sotorasib is a selective kirsten rat sarcoma viral oncogene homolog (KRAS^{G12C}) inhibitor, which blocks tumour cell signalling and survival, inhibits cell growth, and promotes apoptosis in tumour cells with a KRAS G12C mutation.

INDICATIONS AND DOSE

Non-small cell lung cancer with KRAS G12C mutation (initiated by a specialist)

- ► BY MOUTH
- Adult: 960 mg once daily, for dose adjustments, treatment interruption, or discontinuation due to sideeffects—consult product literature

IMPORTANT SAFETY INFORMATION

- INTERACTIONS → Appendix 1: sotorasib
- SIDE-EFFECTS
- ► Common or very common Anaemia · appetite decreased · arthralgia · constipation · cough · diarrhoea · dyspnoea · electrolyte imbalance · fatigue · fever · gastrointestinal discomfort · headache · hepatic disorders · hypertension · increased risk of infection · myalgia · nausea · pain · peripheral oedema · rash · vomiting
- ► Frequency not known Respiratory disorders
- PREGNANCY EvGr Avoid unless potential benefit outweighs risk—toxicity in animal studies. (*) See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING EVG! Avoid—no information available.
- MONITORING REQUIREMENTS EVGT Monitor liver function before treatment, then every 3 weeks for 3 months, then every 4 weeks or as clinically indicated.
- DIRECTIONS FOR ADMINISTRATION Ever Tablets may be dispersed in 120 mL of non-carbonated, room temperature water, by stirring until dispersed into small pieces and swallowed immediately (do not crush). Any residue must be re-dispersed in the same volume of water and immediately swallowed. If not consumed immediately, stir again to ensure dispersal and administer within 2 hours.

 PATIENT AND CARER ADVICE Patients and carers should be given advice on how to administer *Lumykras* tablets.
 Vomiting If vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

NATIONAL FUNDING/ACCESS DECISIONS

Venetoclax

04-May-2022

 DRUG ACTION Venetoclax is a selective inhibitor of B-cell lymphoma-2 (BCL-2), an anti-apoptotic protein which is overexpressed in tumour cells, thereby initiating programmed cell death.

• INDICATIONS AND DOSE

Chronic lymphocytic leukaemia (specialist use only) | Acute myeloid leukaemia (specialist use only)

- ▶ BY MOUTH
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: VENETOCLAX (VENCLYXTO®): UPDATED RECOMMENDATIONS ON TUMOUR LYSIS SYNDROME (TLS) (DECEMBER 2021)

The MHRA reminds healthcare professionals about the risk of tumour lysis syndrome (TLS) associated with venetoclax, with fatal cases reported, some in patients with chronic lymphocytic leukaemia (CLL) receiving the lowest dose (a single dose of venetoclax 20 mg) used in the dose-titration phase and in patients with low-to-medium TLS risk. All patients prescribed venetoclax should have a TLS risk assessment. Healthcare professionals should adhere to guidance on appropriate prophylactic measures, routine laboratory tests, dose titration, and drug interactions—consult product literature.

A patient alert card should be provided to each patient being treated for CLL. Patients should be advised about TLS including:

 the risk of developing TLS occurs in the first days or weeks of treatment with venetoclax, as the dose is increased:

- the importance of drinking plenty of water, having frequent blood tests, and taking medicines to prevent the build-up of uric acid;
- if they experience any symptoms of TLS listed in the patient information leaflet they should stop taking their tablets and contact a healthcare professional immediately.
- CAUTIONS Ensure adequate hydration
- INTERACTIONS → Appendix 1: venetoclax
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · anaemia · appetite decreased · arthralgia · asthenia · constipation · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · gallbladder disorders · haemorrhage · headache · hyperuricaemia · hypotension · increased risk of infection · lymphopenia · nausea · neutropenia · sepsis (sometimes fatal) · stomatitis · syncope · thrombocytopenia · tumour lysis syndrome (sometimes fatal) · vomiting · weight decreased
- CONCEPTION AND CONTRACEPTION Manufacturer advises ensure effective, non-hormonal contraception during and for 30 days after treatment in women of child-bearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- ◆ HEPATIC IMPAIRMENT EVGF Caution in moderate and severe impairment (increased risk of toxicity). (♠)
 Dose adjustments EvGF Dose reduction of at least 50% in severe impairment—consult product literature. (♠)
- RENAL IMPAIRMENT Manufacturer advises close monitoring (increased risk of tumour lysis syndrome); use only if potential benefit outweighs risk in severe impairment—no information available.
- MONITORING REQUIREMENTS EVG! Monitor blood chemistry before starting treatment and after each dose increase—consult product literature.
- PATIENT AND CARER ADVICE

Hydration Patients should be advised to drink 1.5–2 L of water daily, starting 2 days before and throughout the dose-titration phase; intravenous fluids should be administered for those who cannot maintain an adequate level of oral hydration with consideration of overall risk of tumour lysis syndrome.

Vomiting If vomiting occurs following dose administration, no additional doses should be taken on that day and the next dose should be taken at the normal time.

Chronic lymphocytic leukaemia (CLL) Patients should be

provided with a patient alert card—see also *Important* safety information.

Missed doses If a dose is more than 8 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and fatigue.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Venetoclax for treating chronic lymphocytic leukaemia (November 2017) NICE TA487 Recommended with restrictions
- Venetoclax with rituximab for previously treated chronic lymphocytic leukaemia (February 2019) NICE TA561 Recommended with restrictions

- ► Venetoclax with obinutuzumab for untreated chronic lymphocytic leukaemia (December 2020) NICE TA663 Recommended with restrictions
- ► Venetoclax with azacitidine for untreated acute myeloid leukaemia when intensive chemotherapy is unsuitable (February 2022) NICE TA765 Recommended
- Venetoclax with low dose cytarabine for untreated acute myeloid leukaemia when intensive chemotherapy is unsuitable (April 2022) NICE TA787 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Venetoclax (Venclyxto®) as monotherapy for the treatment of chronic lymphocytic leukaemia in the presence of 17p deletion or TP53 mutation in adult patients who are unsuitable for or have failed a B-cell receptor pathway inhibitor, or in the absence of 17p deletion or TP53 mutation in adult patients who have failed both chemoimmunotherapy and a B-cell receptor pathway inhibitor (August 2017) SMC No. 1249/17 Recommended
- Venetoclax (Venclyxto[®]) in combination with rituximab for the treatment of adult patients with chronic lymphocytic leukaemia (CLL) who have received at least one prior therapy (August 2019) SMC No. SMC2166 Recommended
- Venetoclax (Venclyxto®) in combination with obinutuzumab for the treatment of adult patients with previously untreated chronic lymphocytic leukaemia (CLL) (December 2020)
 SMC No. SMC2293 Recommended with restrictions
- Venetoclax (Venclyxto®) in combination with a hypomethylating agent for the treatment of adult patients with newly diagnosed acute myeloid leukaemia who are ineligible for intensive chemotherapy (April 2022)
 SMC No. SMC2412 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Vismodegib

25-Jun-2021

DRUG ACTION Vismodegib is a hedgehog pathway inhibitor

INDICATIONS AND DOSE

Symptomatic metastatic basal cell carcinoma | Locally advanced basal cell carcinoma not appropriate for surgery or radiotherapy

- ► BY MOUTH
- ▶ Adult: 150 mg once daily

IMPORTANT SAFETY INFORMATION

- INTERACTIONS → Appendix 1: vismodegib
- SIDE-EFFECTS
- ► Common or very common Alopecia · amenorrhoea · appetite decreased · arthralgia · asthenia · constipation · dehydration · diarrhoea · gastrointestinal discomfort · hair growth abnormal · muscle complaints · nausea · pain · skin reactions · taste altered · vomiting · weight decreased
- ► Frequency not known Epiphyses premature fusion
- CONCEPTION AND CONTRACEPTION For women of childbearing potential, pregnancy must be excluded before

initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib. Men must use a condom during treatment and for 2 months after the final dose.

- PREGNANCY Important: teratogenic risk—may cause severe birth defects and embryo-fetal death.
- BREAST FEEDING Avoid during treatment and for 24 months after final dose.
- RENAL IMPAIRMENT EVGT Use with caution in severe impairment (limited information available).
- PRESCRIBING AND DISPENSING INFORMATION Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer's Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme's pregnancy prevention measures—consult product literature for further information.
- PATIENT AND CARER ADVICE

Conception and contraception Counselling on pregnancy and contraception advised. Patients must comply with the manufacturer's pregnancy prevention programme.

NATIONAL FUNDING/ACCESS DECISIONS

£6,285.00 (Hospital only)

ANTINEOVASCULARISATION DRUGS > VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Aflibercept

28-Jun-2021

DRUG ACTION Aflibercept is a recombinant fusion protein
that acts as a soluble decoy receptor and binds to vascular
endothelial growth factors A and B (VEGF-A, VEGF-B) and
placental growth factor (PIGF). Aflibercept inhibits the
activation of VEGF receptors and the proliferation of
endothelial cells, thereby inhibiting the growth of new
vessels that supply tumours with oxygen and nutrients.

• INDICATIONS AND DOSE

In combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen

- ► BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before

initiating treatment with aflibercept; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

- CONTRA-INDICATIONS Moderate or severe congestive heart failure • uncontrolled hypertension
- CAUTIONS Febrile neutropenia · history of cardiovascular disease (may be exacerbated by hypertension) · increased risk of haemorrhage (including fatal events) · increased risk of hypertension · increased risk of thromboembolic events (consult product literature if event occurs) · may impair wound healing—withhold treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed · neutropenic infection · risk factors for aneurysm or artery dissection · risk of fistula formation (discontinue if fistula develops) · risk of neutropenia · risk of thrombocytopenia CAUTIONS. FURTHER INFORMATION
- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: aflibercept
- SIDE-EFFECTS
- ➤ Common or very common Appetite decreased · asthenic conditions · dehydration · diarrhoea · dysphonia · dyspnoea · embolism and thrombosis · fistula · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypersensitivity · hypertension · increased risk of infection · leucopenia · neutropenia · neutropenic sepsis · oral disorders · oropharyngeal pain · proteinuria · rhinorrhoea · skin reactions · thrombocytopenia · weight decreased
- Uncommon Healing impaired heart failure nephrotic syndrome • osteonecrosis of jaw • posterior reversible encephalopathy syndrome (PRES) • thrombotic microangiopathy
- ► Frequency not known Alopecia · anaemia · aneurysm · angina pectoris · artery dissection · cerebrovascular insufficiency · constipation · hyperbilirubinaemia · myocardial infarction · nausea · vomiting · wound complications
- CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment. Effective contraception required during and for at least 6 months after treatment in men and women. Contraceptive advice should be given to men and women before therapy begins (and should cover the duration of contraception required after therapy has ended).
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- RENAL IMPAIRMENT EVGT Caution in severe impairment (limited information available).
- MONITORING REQUIREMENTS
- Monitor for signs and symptoms of gastro-intestinal perforation—discontinue if perforation develops.
- Monitor full blood count, including differential count and platelets at baseline and before each treatment cycle.
- ► Monitor for proteinuria before each treatment administration—consult product literature if symptoms develop.

- ► Monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly—consult product literature if severe diarrhoea occurs.
- ► Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, altered mental status, nausea, vomiting, headache, or visual disturbance).
- Monitor for signs and symptoms of cardiac failure and decreased ejection fraction—consider baseline and periodic evaluations of left ventricular function during treatment; discontinue if cardiac failure or decreased ejection fraction develops.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Blood and blood-forming organs

Anaemias

Anaemias

15-Dec-2021

Anaemia treatment considerations

Before initiating treatment for anaemia, it is essential to determine which type is present. Iron salts may be harmful if given to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and restricted blood supply to organs results in severe pain. **EvGr** Sickle-cell crisis usually requires hospitalisation, fluid replacement, analgesia, and treatment of any concurrent

infection. Patients who can be managed at home are often provided with a management plan from their secondary care team that should be followed, including when to seek medical advice. (A) Complications include anaemia, leg ulcers, renal failure, and increased susceptibility to infection. EvGr Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine, and lifelong prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should also be given if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present which is accompanied by increased erythropoiesis; this may increase folate requirements and supplementation with folic acid is recommended. The optimum dose should be discussed with a specialist. (A)

Ĥydroxycarbamide p. 1008 can prevent acute chest syndrome, reduce the frequency of painful crises, and reduce transfusion requirements in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

EvGr Crizanlizumab p. 1106 is an option for preventing recurrent sickle cell crises (vaso-occlusive crises). A For further guidance, see NICE pathway: Blood and immune system conditions (available at: pathways.nice.org.uk/ pathways/blood-and-immune-system-conditions/).

G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is common in individuals originating from Africa, Asia, the Mediterranean region, and the Middle East; it can also occur less frequently in all other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs or when they have an infection. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans); this is termed favism.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals:
- the risk and severity of haemolysis is almost always doserelated

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing drugs that are associated with a risk of haemolysis in G6PD-deficient patients, including those listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

Very few G6PD-deficient individuals with chronic nonspherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. In these patients, exacerbation of haemolysis following oxidative stress, such as the administration of any of the drugs listed below, will

Drugs with definite risk of haemolysis in most G6PD-deficient individuals

- Dapsone and other sulfones
- Fluoroquinolones (including ciprofloxacin, moxifloxacin, norfloxacin, and ofloxacin)
- Methylthioninium chloride
- Niridazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine
- Quinolones
- Rasburicase
- Sulfonamides (including co-trimoxazole)

Drugs with possible risk of haemolysis in some G6PDdeficient individuals

- Aspirin
- Chloroquine
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinine (may be acceptable in acute malaria)
- Sulfonylureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

Aplastic and renal anaemias

Intravenous horse antithymocyte globulin in combination with ciclosporin, may be used as immunosuppressive treatment for aplastic anaemia. The response rate for nonsevere aplastic anaemia is higher with this combination than with ciclosporin alone. Prednisolone is used for the prevention of adverse effects associated with antithymocyte globulin treatment. Early reactions that may occur include fever, rash, fluid retention, rigors, acute respiratory distress syndrome, and anaphylaxis; serum sickness may occur

7–14 days later. Antithymocyte globulin should be given under specialist supervision with appropriate resuscitation facilities. Other treatment options for aplastic anaemia include ciclosporin alone or oxymetholone.

Pyridoxine hydrochloride p. 1175 is licensed for the treatment of idiopathic sideroblastic anaemia; the dose required is usually high.

Corticosteroids have an important place in the management of haematological disorders. For further information, see Corticosteroids, general use p. 737.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy.

Epoetin beta p. 1100 is also licensed for the prevention of anaemia in preterm neonates of low birth-weight; a therapeutic response may take several weeks.

Darbepoetin alfa p. 1097 is a hyperglycosylated derivative of epoetin; it has a longer half-life and can be administered less frequently than epoetin.

Methoxy polyethylene glycol-epoetin beta p. 1101 is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

For further guidance on the use of erythropoietins in patients with chronic kidney disease and anaemia, see NICE guideline: Chronic kidney disease: assessment and management (available at: www.nice.org.uk/guidance/ng203).

Epoetins

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOIETINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (UPDATED JANUARY 2018)

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens-Johnson

syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal. More severe cases were recorded with long-acting agents (darbepoetin alfa and methoxy polyethylene glycolepoetin beta).

Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

MHRA/CHM ADVICE (DECEMBER 2007 AND AUGUST 2008) ERYTHROPOIETINS—TUMOUR PROGRESSION AND SURVIVAL IN PATIENTS WITH CANCER

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of symptomatic anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis
- CONTRA-INDICATIONS Patients unable to receive thromboprophylaxis pure red cell aplasia following erythropoietin therapy uncontrolled hypertension
- CAUTIONS Aluminium toxicity (can impair the response to erythropoietin) · concurrent infection (can impair the response to erythropoietin) · correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment · during dialysis (increase in unfractionated or low molecular weight heparin dose may be needed) · epilepsy · inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled · ischaemic vascular disease · malignant disease · other inflammatory disease (can impair the response to erythropoietin) · risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular

disease including recent myocardial infarction or cerebrovascular accident - risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy - sickle-cell disease (lower target haemoglobin concentration may be appropriate) - sudden stabbing migraine-like pain (warning of a hypertensive crisis) - thrombocytosis (monitor platelet count for first 8 weeks)

SIDE-FFFFCTS

- ➤ Common or very common Arthralgia embolism and thrombosis • headache • hypertension (dose-dependent) • influenza like illness • skin reactions • stroke
- Uncommon Hypertensive crisis (in isolated patients with normal or low blood pressure) · respiratory tract congestion · seizure
- ▶ Rare or very rare Thrombocytosis
- Frequency not known Pure red cell aplasia (more common following subcutaneous administration in patients with chronic renal failure) - severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Hypertensive crisis In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.

Pure red cell aplasia There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

- MONITORING REQUIREMENTS
- Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients.

F 1096

• INDICATIONS AND DOSE

30-Apr-2019

Symptomatic anaemia associated with chronic renal failure in patients on dialysis

► BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION

Adult: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration extended to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by continued →

approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- ► BY INTRAVENOUS INJECTION
- Adult: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 6.75 micrograms/kg every 3 weeks, alternatively initially 2.25 micrograms/kg once weekly, if response inadequate after 9 weeks further treatment may not be effective; if adequate response obtained then reduce dose by 25–50%, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy
- INTERACTIONS → Appendix 1: darbepoetin alfa
- SIDE-EFFECTS
- ▶ Common or very common Hypersensitivity oedema
- PREGNANCY No evidence of harm in animal studies manufacturer advises caution.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).

• INDICATIONS AND DOSE

EPREX ® **PRE-FILLED SYRINGES**

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, maintenance dose can be given as a single dose or in divided doses, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite

dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

BNF 84

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults receiving cancer chemotherapy

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25-50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

- ► BY INTRAVENOUS INJECTION
- Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

Moderate anaemia (haemoglobin concentration 10–13 g/100 mt.) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site
- INTERACTIONS → Appendix 1: epoetin alfa
- SIDE-FFFFCTS
- ► Common or very common Chills · cough · diarrhoea · fever · myalgia · nausea · pain · peripheral oedema · vomiting
- ► Uncommon Hyperkalaemia
- PREGNANCY No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.
- BREAST FEEDING Unlikely to be present in milk. Minimal effect on infant.
- HEPATIC IMPAIRMENT Manufacturer advises caution in chronic hepatic failure.
- PRESCRIBING AND DISPENSING INFORMATION Epoetin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website NICE decisions
- Erythropoiesis-stimulating agents (epoetin and darbepoetin) for treating anaemia in people with cancer having chemotherapy (November 2014) NICE TA323 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

06-Dec-2019

• INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses: maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1-2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week
- **▶** BY INTRAVENOUS INJECTION
- Adult: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1-2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose: maximum 720 units/kg per week

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: Initially 450 units/kg once weekly for 4 weeks, dose to be given weekly as a single dose or in 3-7 divided doses, increase dose after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved). increased to 900 units/kg once weekly, dose to be given weekly as a single dose or in 3-7 divided doses, if adequate response obtained reduce dose by 25-50%, discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25-50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy; maximum 60 000 units per week

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)
- INTERACTIONS → Appendix 1: epoetin beta

- PREGNANCY No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.
- BREAST FEEDING Unlikely to be present in milk. Minimal effect on infant.

INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and not currently treated with ervthropoietins

- ▶ BY SUBCUTANEOUS INJECTION. OR BY INTRAVENOUS INJECTION
- Adult: Initially 600 nanograms/kg every 2 weeks, subcutaneous route preferred in patients not on haemodialysis, dose to be adjusted according to response at intervals of at least 1 month, maintenance dose of double the previous fortnightly dose may be given once a month if haemoglobin concentration is above 10 g/100 mL, reduce dose by approximately 25% if rate of rise in haemoglobin concentration exceeds 2 g/100 mL in 1 month or if haemoglobin concentration is increasing or approaching 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, dose may be increased by approximately 25% if the rate of rise in haemoglobin concentration is less than 1 g/100 mL over 1 month; further increases of approximately 25% may be made at monthly intervals until the individual target haemoglobin concentration continued → is obtained

1102 Anaemias BNF 84

Symptomatic anaemia associated with chronic kidney disease in patients not on dialysis and not currently treated with erythropoietins

- ► INITIALLY BY SUBCUTANEOUS INJECTION
- Adult: Initially 1.2 micrograms/kg every month. alternatively (by subcutaneous injection or by intravenous injection) initially 600 nanograms/kg every 2 weeks, subcutaneous route preferred in patients not on haemodialysis, dose to be adjusted according to response at intervals of at least 1 month, patients treated once every 2 weeks may be given a maintenance dose of double the previous fortnightly dose once a month if haemoglobin concentration is above 10 g/100 mL, reduce dose by approximately 25% if rate of rise in haemoglobin concentration exceeds 2 g/100 mL in 1 month or if haemoglobin concentration is increasing or approaching 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, dose may be increased by approximately 25% if the rate of rise in haemoglobin concentration is less than 1 g/100 mL over 1 month; further increases of approximately 25% may be made at monthly intervals until the individual target haemoglobin concentration

Symptomatic anaemia associated with chronic kidney disease in patients currently treated with erythropoietins

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOIETINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (UPDATED JANUARY 2018)

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal. More severe cases were recorded with long-acting agents (darbepoetin alfa and methoxy polyethylene glycolepoetin beta).

Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of

symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

- CONTRA-INDICATIONS Pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension
- CAUTIONS Bone marrow fibrosis (can impair the response to erythropoietin) · concurrent infection (can impair the response to erythropoietin) · haematological disease (can impair the response to erythropoietin) · haemolysis (can impair the response to erythropoietin) · inflammatory or traumatic episodes (can impair the response to erythropoietin) · malignant disease · occult blood loss (can impair the response to erythropoietin) · severe aluminium toxicity (can impair the response to erythropoietin)
- INTERACTIONS → Appendix 1: methoxy polyethylene glycol-epoetin beta
- SIDE-EFFECTS
- ► Common or very common Hypertension (dose-dependent)
- ▶ Uncommon Embolism and thrombosis headache
- Rare or very rare Hot flush · hypertensive encephalopathy · rash maculopapular
- ► Frequency not known Pure red cell aplasia (discontinue) severe cutaneous adverse reactions (SCARs) thrombocytopenia
- PREGNANCY No evidence of harm in animal studies manufacturer advises caution.
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.
- RENAL IMPAIRMENT Manufacturer advises caution with escalation of doses in chronic renal failure.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor haemoglobin concentration every 2 weeks until stabilised and periodically thereafter if patient fails to respond, check reticulocyte count, and search for causative factors such as deficiencies of iron, folic acid or vitamin B12, and correct if necessary. Monitor iron status before and during treatment.
- Manufacturer advises monitor blood pressure before and during treatment—if inadequately controlled, reduce dose or discontinue treatment.
- PRESCRIBING AND DISPENSING INFORMATION Methoxy polyethylene glycol-epoetin beta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

The manufacturer of *Mircera* has provided a *Physician's Guide* which includes important safety information to minimise the risk of pure red cell aplasia.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

HYPOXIA-INDUCIBLE FACTOR PROLYL HYDROXYLASE INHIBITORS

Roxadustat

BNF 84

06-0rt-2021

 DRUG ACTION Roxadustat is a hypoxia-inducible factor, prolyl hydroxylase inhibitor (HIF-PHI), which stimulates a coordinated erythropoietic response, thereby increasing haemoglobin production and improving iron bioavailability.

• INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic kidney disease in patients not currently treated with an erythropoiesis-stimulating agent (initiated by a specialist)

- ► BY MOUTH
- ➤ Adult (body-weight up to 100 kg): Initially 70 mg 3 times a week, adjusted according to response; usual maintenance 20–400 mg 3 times a week, doses should not be taken on consecutive days, dose adjusted at intervals of 4 weeks to achieve haemoglobin concentration of 10 to 12 g/dL. For dose adjustments and maximum recommended dose—consult product literature, consider discontinuation of treatment if adequate increase in haemoglobin concentration not achieved in 24 weeks
- Adult (body-weight 100 kg and above): Initially 100 mg 3 times a week, adjusted according to response; usual maintenance 20-400 mg 3 times a week, doses should not be taken on consecutive days, dose adjusted at intervals of 4 weeks to achieve haemoglobin concentration of 10 to 12 g/dL. For dose adjustments and maximum recommended dose—consult product literature, consider discontinuation of treatment if adequate increase in haemoglobin concentration not achieved in 24 weeks

Symptomatic anaemia associated with chronic kidney disease in patients currently treated with an erythropoiesis-stimulating agent (initiated by a specialist)

- ► BY MOUTH
- Adult: (consult product literature)
- CAUTIONS Active infection · history of seizures, epilepsy and other medical conditions associated with a predisposition to seizures · risk factors for venous thromboembolism
- INTERACTIONS → Appendix 1: roxadustat
- SIDE-EFFECTS
- Common or very common Constipation · diarrhoea · embolism and thrombosis · headache · hyperkalaemia · hypertension · insomnia · nausea · peripheral oedema · seizure · sepsis · vomiting
- ▶ Uncommon Hyperbilirubinaemia
- ▶ Frequency not known Increased risk of infection

- CONCEPTION AND CONTRACEPTION Ever Females of childbearing potential should use highly effective contraception during treatment and for at least 1 week after last treatment.
- PREGNANCY EVGr Avoid—toxicity in animal studies.
- BREAST FEEDING EVGT Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT [EVGT] Caution in moderate impairment; avoid in severe impairment (no information available).

Dose adjustments Ever Use half the normal starting dose in moderate impairment.

- PRE-TREATMENT SCREENING EVGr Ensure adequate iron stores before treatment.
- MONITORING REQUIREMENTS Ever Monitor haemoglobin concentration every 2 weeks until the desired haemoglobin concentration is achieved and stabilised, then every 4 weeks thereafter or as clinically indicated.
- PATIENT AND CARER ADVICE Patients and their carers should be advised to seek medical attention if symptoms of infection or venous thromboembolism develop during treatment.

Missed doses If a dose is missed, it should be administered as soon as possible only if there is more than 1 day until the next scheduled dose; if one day or less remains before the next scheduled dose, the missed dose should not be taken and the next dose should be taken on the next scheduled day.

Driving and skilled tasks Patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of seizures.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

IMMUNOSUPPRESSANTS >

Pegcetacoplan

31-Mar-2022

 DRUG ACTION Pegcetacoplan is a pegylated peptide molecule, which binds to C3 and C3b complement proteins, thereby inhibiting the complement cascade that leads to haemolysis.

• INDICATIONS AND DOSE

Paroxysmal nocturnal haemoglobinuria (initiated by a specialist)

- ► BY SUBCUTANEOUS INFUSION
- Adult: 1080 mg twice weekly, administer on day 1 and day 4 of each treatment week, continue current dose of C5 inhibitor for the first 4 weeks of treatment, for dose adjustments due to lactate dehydrogenase levels consult product literature

- CONTRA-INDICATIONS Patients unvaccinated against Neisseria meningitidis, Streptococcus pneumoniae, and Haemophilus influenzae · unresolved infection caused by encapsulated bacteria (including Neisseria meningitidis, Streptococcus pneumoniae, and Haemophilus influenzae) CONTRA-INDICATIONS. FURTHER INFORMATION
- ▶ Vaccination against serious infection [EvGr] To reduce the risk of serious infection, it is advised that patients are vaccinated against Neisseria meningitidis, Streptococcus pneumoniae, and Haemophilus influenzae according to local guidelines, at least 2 weeks, but no longer than 2 years, prior to starting treatment, unless the risk of delaying treatment outweighs the risk of developing an infection. If immediate treatment is needed, administer the required vaccines as soon as possible; treat with prophylactic antibiotics until 2 weeks after vaccination. ♠
- SIDE-EFFECTS
- Common or very common Asthenia · diarrhoea · dizziness · epistaxis · fever · gastrointestinal discomfort · headache · increased risk of infection · myalgia · nausea · pain · sepsis · skin reactions · thrombocytopenia
- CONCEPTION AND CONTRACEPTION Evgr Females of childbearing potential should use effective contraception during and for at least 8 weeks after treatment.
- PREGNANCY EVGr Avoid—toxicity in animal studies.
- BREAST FEEDING EVGT Avoid—no information available.
- MONITORING REQUIREMENTS
- ► Evgr Monitor for early signs of infection caused by encapsulated bacteria (including *Neisseria meningitidis*, *Streptococcus pneumoniae*, and *Haemophilus influenzae*).
- Monitor for signs and symptoms of haemolysis including lactate dehydrogenase levels during treatment, and for at least 8 weeks after treatment discontinuation—consult product literature.
- Regularly monitor renal function (risk of polyethylene glycol (PEG) accumulation in kidneys).
- EFFECT ON LABORATORY TESTS EvGr Pegcetacoplan may interfere with silica reagents in coagulation panels, resulting in artificially prolonged activated partial thromboplastin time (aPTT). ♠
- TREATMENT CESSATION Slow weaning and alternative therapy should be considered if treatment is to be discontinued due to the risk of serious intravascular haemolysis—consult product literature. Patients must be closely monitored for at least 8 weeks after treatment discontinuation
- DIRECTIONS FOR ADMINISTRATION For subcutaneous infusion, administer into the abdomen, thighs, hips or upper arms over approximately 30 minutes if using two sites (ensuring sites are at least 7.5 cm apart), or approximately 60 minutes if using one site; rotate infusion sites. Patients may self-administer Aspaveli®, after appropriate training in subcutaneous infusion technique.
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Aspaveli[®] has provided a Guide for Healthcare Professionals.
- HANDLING AND STORAGE Store in a refrigerator (2–8 °C) and protect from light.
- PATIENT AND CARER ADVICE If appropriate, patients and carers should be given training on how to administer pegcetacoplan subcutaneous infusion. Patients and carers should be informed of the signs and symptoms of serious infection and advised to seek immediate medical care if they occur.
 - Patient card and guide A patient card and guide for patients and caregivers should be provided.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Pegcetacoplan for treating paroxysmal nocturnal haemoglobinuria (March 2022) NICE TA778 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Sorbitol

Pegcetacoplan (non-proprietary)

Pegcetacoplan 54 mg per 1 ml Aspaveli 1080mg/20ml solution for infusion vials | 1 vial PoM £3,100.00 (Hospital only) | 8 vial PoM £24.800.00 (Hospital only)

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Eculizumab

10-Feb-2022

 DRUG ACTION Eculizumab is a recombinant monoclonal antibody that inhibits terminal complement activation at the C5 protein and thereby reduces complement-mediated cell damage.

• INDICATIONS AND DOSE

Paroxysmal nocturnal haemoglobinuria (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 600 mg once weekly for 4 weeks, then increased to 900 mg once weekly for 1 week, followed by maintenance 900 mg every 12–16 days

Atypical haemolytic uraemic syndrome (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- ► Adult: Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week, followed by maintenance 1.2 g every 12–16 days

Myasthenia gravis (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week, followed by maintenance 1.2 g every 12–16 days, consider discontinuation if no response within 12 weeks after initial infusion

Neuromyelitis optica spectrum disorder (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week, followed by maintenance 1.2 g every 12–16 days
- CONTRA-INDICATIONS Patients unvaccinated against Neisseria meningitidis • unresolved Neisseria meningitidis infection
- CAUTIONS Active systemic infection

CAUTIONS, FURTHER INFORMATION

- Meningococcal infection Manufacturer advises vaccinate against Neisseria meningitidis at least 2 weeks before treatment (vaccines against serotypes A, C, Y, W135 and B where available, are recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · asthenia · cough · decreased leucocytes · diarrhoea · dizziness · fever · gastrointestinal discomfort · headache · hypertension · increased risk of infection · influenza like illness · joint disorders · muscle complaints · nausea · oropharvngeal

pain • skin reactions • sleep disorders • taste altered • vomiting

BNF 84

- ▶ Uncommon Abscess · anxiety · appetite decreased · chest discomfort · chills · constipation · cystitis · depression · dysuria · haemorrhage · hepatosplenic abscess · hot flush · hyperhidrosis · hypersensitivity · hypotension · infusion related reaction · limb abscess · meningitis meningococcal · mood swings · nasal complaints · oedema · pain · palpitations · paraesthesia · renal abscess · sepsis · spontaneous penile erection · throat irritation · tinnitus · tremor · vascular disorders · vertigo · vision blurred
- Rare or very rare Abnormal clotting factor · conjunctival irritation · feeling hot · gastrooesophageal reflux disease · gingival discomfort · Grave's disease · jaundice · malignant melanoma · menstrual disorder · syncope · urogenital tract gonococcal infection
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for 5 months after treatment
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—limited information available. Eculizumab is an immunoglobulin G (IgG) monoclonal antibody; human IgG antibodies are known to cross the placenta.
- BREAST FEEDING Manufacturer advises use with caution limited information available; unlikely to be present in milk
- MONITORING REQUIREMENTS
- ▶ Monitor for 1 hour after infusion.
- For paroxysmal nocturnal haemoglobinuria, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
- ➤ For atypical haemolytic uraemic syndrome, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Soliris®), manufacturer advises give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur).
- PRESCRIBING AND DISPENSING INFORMATION Eculizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.

The manufacturer of *Soliris* has provided a *Physician's guide* and user manual for healthcare professionals.

- HANDLING AND STORAGE Store in a refrigerator (2-8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- PATIENT AND CARER ADVICE Patients or carers should be advised to report promptly any signs of meningococcal infection. Advice about prevention of gonorrhoea should also be given.

A patient information card and a patient safety card should be provided.

NICE decisions

 Eculizumab for treating atypical haemolytic uraemic syndrome (January 2015) NICE HST1 Recommended MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates ELECTROLYTES: May contain Sodium

Soliris (Alexion Pharma UK Ltd)

Eculizumab 10 mg per 1 ml Soliris 300mg/30ml concentrate for solution for infusion vials | 1 vial Pom £3,150.00 (Hospital only)

Ravulizumab

17-May-202

 DRUG ACTION Ravulizumab is a recombinant monoclonal antibody that inhibits terminal complement activation at the C5 protein, thereby reducing haemolysis and thrombotic microangiopathy.

• INDICATIONS AND DOSE

Atypical haemolytic uraemic syndrome (under expert supervision) | Paroxysmal nocturnal haemoglobinuria (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult (body-weight 40-59 kg): Loading dose 2.4 g for 1 dose, then maintenance 3 g every 8 weeks, start maintenance dosing 2 weeks after the loading dose, a maintenance dose (except for the first maintenance dose) may be given up to 7 days before or after the scheduled date; the subsequent dose should be given according to the original schedule, for duration of infusion—consult product literature
- Adult (body-weight 60-99 kg): Loading dose 2.7 g for 1 dose, then maintenance 3.3 g every 8 weeks, start maintenance dosing 2 weeks after the loading dose, a maintenance dose (except for the first maintenance dose) may be given up to 7 days before or after the scheduled date; the subsequent dose should be given according to the original schedule, for duration of infusion—consult product literature
- Adult (body-weight 100 kg and above): Loading dose 3 g for 1 dose, then maintenance 3.6 g every 8 weeks, start maintenance dosing 2 weeks after the loading dose, a maintenance dose (except for the first maintenance dose) may be given up to 7 days before or after the scheduled date; the subsequent dose should be given according to the original schedule, for duration of infusion—consult product literature

DOSE EQUIVALENCE AND CONVERSION

- For patients switching from eculizumab to ravulizumab, the initial loading dose of ravulizumab should be administered 2 weeks after the last eculizumab infusion.
- CONTRA-INDICATIONS Patients unvaccinated against Neisseria meningitidis unresolved Neisseria meningitidis infection
- CAUTIONS Active systemic infection
 CAUTIONS, FURTHER INFORMATION
- Meningococcal infection EvGr Vaccinate against Neisseria meningitidis at least 2 weeks before treatment (vaccines against serotypes A, C, Y, W135 and B where available, are recommended); revaccinate according to current medical guidelines. Patients receiving ravulizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Other immunisations should also be up to date for all age groups.
- SIDE-EFFECTS
- ► Common or very common Arthralgia · asthenia · back paindiarrhoea · dizziness · fever · gastrointestinal discomfort · headache · increased risk of infection · influenza like illness · infusion related reaction · muscle complaints · nausea · skin reactions · vomiting
- ▶ Uncommon Chills hypersensitivity meningococcal sepsis

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for up to 8 months after treatment.
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.
 Ravulizumab is an immunoglobulin G (IgG) monoclonal antibody; human IgG antibodies are known to cross the placenta.
- BREAST FEEDING Manufacturer advises avoid breastfeeding during and for up to 8 months after treatment—no information available.
- MONITORING REQUIREMENTS
- When used for paroxysmal nocturnal haemoglobinuria EvGr Monitor for intravascular haemolysis (including serumlactate dehydrogenase concentration) for at least 16 weeks after stopping treatment; consider restarting ravulizumab if haemolysis occurs. ♠>
- When used for atypical haemolytic uraemic syndrome EvGT Monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) after stopping treatment; consider restarting ravulizumab if thrombotic microangiopathy occurs.
- DIRECTIONS FOR ADMINISTRATION Ever For intravenous infusion using Ultomiris® 300 mg/3 mL, 1100 mg/11 mL concentrate for infusion, give intermittently in Sodium Chloride 0.9%. Dilute requisite dose with infusion fluid to a final concentration of 50 mg/mL and administer through an in-line filter (0.2 micron). For intravenous infusion using Ultomiris® 300 mg/30 mL concentrate for infusion, give intermittently in Sodium Chloride 0.9%. Dilute requisite dose with infusion fluid to a final concentration of 5 mg/mL and administer through an in-line filter (0.2 micron). ♠
- PRESCRIBING AND DISPENSING INFORMATION

Ravulizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

The manufacturer of *Ultomiris* [®] has provided a *Physician's guide* for healthcare professionals.

- HANDLING AND STORAGE Store in a refrigerator (2-8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- PATIENT AND CARER ADVICE Patients or carers should be advised to report promptly any signs of meningococcal infection. Advice about prevention of gonorrhoea should also be given.

1.1b Sickle-cell disease

Other drugs used for Sickle-cell disease

Hydroxycarbamide, p. 1008

P-SELECTIN INHIBITORS

Crizanlizumah

17-Nov-2021

 DRUG ACTION Crizanlizumab is a humanised monoclonal antibody that binds to P-selectin and blocks the interaction between endothelial cells, leucocytes, platelets, and red blood cells, thereby preventing vasoocclusion.

• INDICATIONS AND DOSE

Sickle-cell disease [prevention of recurrent vaso-occlusive crises] (initiated by a specialist)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg for 1 dose, followed by 5 mg/kg after 2 weeks, then maintenance 5 mg/kg every 4 weeks, if a maintenance dose is late, the missed dose should be given as soon as possible; if this is within 2 weeks of the usual scheduled time then continue with the original schedule. If the dose is more than 2 weeks late, dosing should be continued every 4 weeks thereafter
- SIDE-EFFECTS
- Common or very common Arthralgia · diarrhoea · fevergastrointestinal discomfort · infusion related reactionmyalgia · nausea · oropharyngeal pain · pain · pruritus · vomiting · vulvovaginal pruritus
- PREGNANCY EVGr Avoid—toxicity in animal studies.
- BREAST FEEDING Specialist sources indicate use with caution—no information available. Large molecular weight suggests limited excretion into milk; monitor breast-fed infants for adverse reactions such as nausea, back pain, arthralgia and pyrexia.
- MONITORING REQUIREMENTS [EVGT] Monitor for signs and symptoms of infusion-related reactions—discontinue treatment if severe.
- EFFECT ON LABORATORY TESTS EVG May interfere with automated platelet counts—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Evg. For intermittent intravenous infusion (Adakveo®), dilute requisite dose up to 100 mL with Glucose 5% or Sodium Chloride 0.9% to give a final concentration of 1–9.6 mg/mL (gently invert to mix, do not shake); give over 30 minutes through a 0.2 micron in-line filter.

• PRESCRIBING AND DISPENSING INFORMATION

Crizanlizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

 HANDLING AND STORAGE Store in a refrigerator (2°C-8°C) and protect from light—consult product literature about storage after preparation of the infusion.

PATIENT AND CARER ADVICE

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, fatigue, or somnolence.

1.2 Iron deficiency anaemia

Anaemia, iron deficiency

01-Sep-2020

Iron deficiency, treatment and prophylaxis

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastro-intestinal cancer).

Prophylaxis with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm negnates

For information on oral and intravenous iron use before and after surgery in patients with iron-deficiency anaemia, see NICE guideline: **Blood transfusion** (available from: www.nice.org.uk/guidance/ng24).

Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by the incidence of side-effects and

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulfate; for prophylaxis of iron-deficiency anaemia, ferrous sulfate may be effective.

Iron content of different iron salts						
Iron salt/amount	Content of ferrous iron					
ferrous fumarate 200 mg	65 mg					
ferrous gluconate 300 mg	35 mg					
ferrous sulfate 300 mg	60 mg					
ferrous sulfate, dried 200 mg	65 mg					

Compound preparations

Preparations containing iron and folic acid p. 1112 are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be

distinguished from those used for the prevention of neural tube defects in women planning a pregnancy.

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain ascorbic acid p. 1177 to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B** group of vitamins (except folic acid for pregnant women).

Modified-release preparations

Modified-release preparations of iron are licensed for oncedaily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

Parenteral iron

Iron can be administered parenterally as iron dextran p. 1109, iron sucrose p. 1109, ferric carboxymaltose p. 1108, or ferric derisomaltose p. 1108. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance).

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

MINERALS AND TRACE ELEMENTS > IRON, INJECTABLE

Iron (injectable)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including lifethreatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients,

intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

- CONTRA-INDICATIONS Disturbances in utilisation of iron iron overload
- CAUTIONS Allergic disorders eczema hepatic dysfunction • immune conditions • infection (discontinue if ongoing bacteraemia) • inflammatory conditions • oral iron should not be given until 5 days after the last injection • severe asthma
- SIDE-EFFECTS
- ► Common or very common Dizziness · flushing · headache · hypertension · hypophosphataemia · hypotension · nausea · skin reactions · taste altered
- ▶ Uncommon Arrhythmias · arthralgia · bronchospasm · chest pain · chills · constipation · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · hyperhidrosis · hypersensitivity · loss of consciousness · muscle complaints · pain · peripheral oedema · sensation abnormal · vision blurred · vomiting
- Rare or very rare Angioedema · anxiety · circulatory collapse · influenza like illness · malaise · pallor · palpitations · psychiatric disorder · seizure · syncope · tremor
- Frequency not known Kounis syndrome
 SIDE-EFFECTS, FURTHER INFORMATION Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available.

Overdose For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1473.

PREGNANCY

Monitoring in pregnancy Ever Fetal monitoring is recommended during administration due to the risk of fetal bradycardia.

F 1107

Ferric carboxymaltose

27-Nov-2020

• INDICATIONS AND DOSE

Iron-deficiency anaemia

formulations.

- ► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Dose calculated according to body-weight and iron deficit (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: FERRIC CARBOXYMALTOSE (FERINJECT®):
RISK OF SYMPTOMATIC HYPOPHOSPHATAEMIA LEADING TO
OSTEOMALACIA AND FRACTURES (NOVEMBER 2020)

A European review of worldwide data concluded that ferric carboxymaltose is associated with hypophosphataemia, resulting in hypophosphataemic osteomalacia and fractures, particularly in patients with existing risk factors and following prolonged exposure to high doses—some cases required clinical intervention, including surgery. The risk of persistent hypophosphatemia and osteomalacia may be higher with ferric carboxymaltose than with other intravenous iron

Healthcare professionals are advised to monitor serum phosphate levels in patients requiring multiple highdose administrations, on long-term treatment, or with pre-existing risk factors for hypophosphataemia Patients experiencing symptoms of hypophosphataemia (including new musculoskeletal symptoms or worsening

tiredness) should seek medical advice—be aware that these symptoms may be confused with those of iron deficiency anaemia. If hypophosphataemia persists, ferric carboxymaltose treatment should be re-evaluated.

- INTERACTIONS → Appendix 1: iron
- SIDE-EFFECTS
- ▶ Rare or very rare Face oedema · flatulence
- PREGNANCY Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.
- HEPATIC IMPAIRMENT Manufacturer advises caution—monitor iron status to avoid iron overload; avoid where iron overload increases risk of impairment (particularly porphyria cutanea tarda).
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Ferinject[®]), manufacturer advises give intermittently in Sodium chloride 0.9%, dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes.
- PRESCRIBING AND DISPENSING INFORMATION A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Sodium

03-Mar-2021

Ferric derisomaltose (Iron isomaltoside 1000)

INDICATIONS AND DOSE

- Iron-deficiency anaemia
 ► BY INTRAVENOUS INJECTION
- Adult: (consult product literature)
- INTERACTIONS → Appendix 1: iron
- SIDE-EFFECTS
- ▶ Uncommon Fishbane reaction infection
- ▶ Rare or very rare Dysphonia
- PREGNANCY Evg: Avoid in first trimester; use in second and third trimesters only if potential benefit outweighs risk—limited information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in compensated hepatic disease—monitor iron status to avoid iron overload; avoid in decompensated hepatic disease, in hepatitis and where iron overload is a precipitating factor (particularly porphyria cutanea tarda).
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Iron (III) isomaltoside 1000 5% (Diafer®) for iron deficiency in adults with chronic kidney disease (CKD) on dialysis, when oral iron preparations are ineffective or cannot be used (February 2017) SMC No. 1177/16 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Diafer (Pharmacosmos UK Ltd) ▼

Iron dextran

12-Jun-2021

• INDICATIONS AND DOSE

Iron-deficiency anaemia

- ► BY DEEP INTRAMUSCULAR INJECTION
- Adult: Intramuscular injection to be administered into the gluteal muscle, doses calculated according to bodyweight and iron deficit (consult product literature)
- ► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Doses calculated according to body-weight and iron deficit (consult product literature)
- INTERACTIONS → Appendix 1: iron
- SIDE-EFFECTS
- ► Uncommon Feeling hot
- ► Rare or very rare Deafness (transient) haemolysis
- Frequency not known Injection site necrosis rheumatoid arthritis aggravated
- PREGNANCY Avoid in first trimester.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in decompensated cirrhosis and hepatitis.
- RENAL IMPAIRMENT EVGr Avoid in acute renal failure.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use For intravenous infusion (Cosmofer®), manufacturer advises give intermittently in Glucose 5% or Sodium chloride 0.9%, dilute 100–200 mg in 100 mL infusion fluid; give 25mg over 15 minutes initially, then give at a rate not exceeding 6.67 mg/minute; total dose infusion diluted in 500 mL infusion fluid and given over 4–6 hours (initial dose 25 mg over 15 minutes).
- PRESCRIBING AND DISPENSING INFORMATION A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► CosmoFer (Pharmacosmos UK Ltd) ▼

Iron sucrose

20-Nov-2010

• INDICATIONS AND DOSE

Iron-deficiency anaemia

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Doses calculated according to body-weight and iron deficit (consult product literature)
- INTERACTIONS → Appendix 1: iron
- SIDE-EFFECTS
- ▶ Uncommon Asthenia
- ▶ Rare or very rare Drowsiness urine discolouration
- ▶ Frequency not known Cold sweat · confusion · level of consciousness decreased · thrombophlebitis
- PREGNANCY Avoid in first trimester.
- HEPATIC IMPAIRMENT Manufacturer advises caution monitor iron status to avoid iron overload; avoid where

- iron overload is a precipitating factor (particularly porphyria cutanea tarda).
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intermittent intravenous infusion (Venofer®), dilute to a concentration of 1 mg/mL with Sodium Chloride 0.9%; give at a rate not exceeding 6.67 mg/minute (consult product literature). Manufacturer advises for slow intravenous injection (Venofer®), give undiluted at a rate of 1 mL/minute; do not exceed 10 mL (200 mg iron) per injection.
- PRESCRIBING AND DISPENSING INFORMATION A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Venofer (Vifor Pharma UK Ltd, Imported (United States)) ▼
Iron (as Iron sucrose) 20 mg per 1 ml Venofer 100mg/5ml solution
for injection vials | 5 vial [PoM] £51.20 DT = £51.20
Venofer 50mg/2.5ml solution for injection vials | 5 vial [PoM] [S]

MINERALS AND TRACE ELEMENTS > IRON, ORAL

Iron (oral)

• CAUTIONS High doses in elderly

CAUTIONS, FURTHER INFORMATION

- Elderly Prescription potentially inappropriate (STOPP criteria) at oral doses greater than 200 mg elemental iron daily (no evidence of enhanced iron absorption above these doses). See also Prescribing in the elderly p. 29.
- SIDE-EFFECTS
- ► Common or very common Constipation diarrhoea gastrointestinal discomfort nausea
- ▶ Uncommon Vomiting
- ► Frequency not known Appetite decreased gastrointestinal disorders

SIDE-EFFECTS, FURTHER INFORMATION Iron can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

Overdose For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1473.

MONITORING REQUIREMENTS

- Therapeutic response The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.
- PRESCRIBING AND DISPENSING INFORMATION
- In children Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered. The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.
- PATIENT AND CARER ADVICE Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

F 1109

Ferric maltol

20-Nov-2020

INDICATIONS AND DOSE

Iron-deficiency anaemia

▶ BY MOUTH

- Adult: 30 mg twice daily continued until iron stores are replenished; usual duration at least 12 weeks
- CONTRA-INDICATIONS Exacerbation of inflammatory bowel disease · haemochromatosis · inflammatory bowel disease with haemoglobin less than 9.5 g/dL·iron overload syndromes · repeated blood transfusions
- INTERACTIONS → Appendix 1: iron
- SIDE-EFFECTS
- ► Uncommon Headache · joint stiffness · pain in extremity · skin reactions · small intestinal bacterial overgrowth ·
- NATIONAL FUNDING/ACCESS DECISIONS
 - For full details see funding body website

Iron-deficiency anaemia (therapeutic)

- ► BY MOUTH
- ▶ Adult: 4 mL 1-2 times a day
- INTERACTIONS → Appendix 1: iron
- SIDE-EFFECTS Tooth discolouration

PRESCRIBING AND DISPENSING INFORMATION

Iron content Ferrous sulfate 200 mg is equivalent to 65 mg iron; Ironorm® drops contain ferrous sulfate 125 mg (equivalent to 25 mg iron)/mL; Feospan® spansules contain ferrous sulfate 150 mg (47 mg iron) (spansule (=

modified-release capsules)); Ferrograd® tablets contain ferrous sulfate 325 mg (105 mg iron).

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

1.3 Megaloblastic anaemia

Anaemia, megaloblastic

Overview

Most megaloblastic anaemias result from a lack of either vitamin B_{12} or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited.

Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is *pernicious* anaemia in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B₁₂.

Vitamin B_{12} is also needed in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare syndrome of congenital transcobalamin II deficiency.

Vitamin B_{12} should be given prophylactically after total gastrectomy or total ileal resection (or after partial gastrectomy if a vitamin B_{12} absorption test shows vitamin B_{12} malabsorption).

Apart from dietary deficiency, all other causes of vitamin B_{12} deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B_{12} orally and none for vitamin B_{12} intrinsic factor complexes given by mouth. Vitamin B_{12} in larger oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 1114 has completely replaced cyanocobalamin p. 1113 as the form of vitamin B_{12} of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B_{12} neuropathy.

Folic acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B_{12} is administered concurrently otherwise neuropathy may be precipitated.

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in *chronic haemolytic states*, *malabsorption*, or *in renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexateinduced side-effects in severe Crohn's disease, rheumatic disease, and severe psoriasis.

Folinic acid p. 1015 is also effective in the treatment of folate deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs; it is given as calcium folinate.

There is ${\bf no}$ justification for prescribing multiple ingredient vitamin preparations containing vitamin B_{12} or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 1185.

VITAMINS AND TRACE ELEMENTS > FOLATES

Folic acid

10-Nov-2021

• INDICATIONS AND DOSE

Folate-deficient megaloblastic anaemia

- ► BY MOUTH
- Child 1-11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
- Child 1-17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

 Adult: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see Neural tube defects (prevention in pregnancy) p. 1185)

▶ BY MOUTH

BNF 84

 Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those in the highrisk group who wish to become pregnant or who are at risk of becoming pregnant see Neural tube defects (prevention in pregnancy) p. 1185)

- ► BY MOUTH
- Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those with sickle-cell disease)

- ► BY MOUTH
- Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy

Prevention of methotrexate-induced side-effects in rheumatic disease

- ▶ BY MOUTH
- Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prevention of methotrexate side-effects in severe Crohn's disease | Prevention of methotrexate side-effects in severe psoriasis

- ▶ BY MOUTH
- Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prophylaxis in chronic haemolytic states

- ► BY MOUTH
- Adult: 5 mg every 1–7 days, frequency dependent on underlying disease

Prophylaxis of folate deficiency in dialysis

- ► BY MOUTH
- Child 1 month-11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- ▶ Child 12-17 years: 5-10 mg once daily
- ▶ Adult: 5 mg every 1–7 days

Prophylaxis of folate deficiency in patients receiving parenteral nutrition

- ► BY INTRAVENOUS INFUSION
- ➤ Adult: 15 mg 1-2 times a week, usually given by intravenous infusion in the parenteral nutrition solution

UNLICENSED USE

- In adults Not licensed for prevention of methotrexateinduced side-effects in severe Crohn's disease. Not licensed for prevention of methotrexate-induced sideeffects in rheumatic disease. Not licensed for prevention of methotrexate-induced side-effects in severe psoriasis.
- CAUTIONS Should never be given alone for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency (may precipitate subacute combined degeneration of the spinal cord)
- INTERACTIONS → Appendix 1: folates
- SIDE-EFFECTS Abdominal distension appetite decreased flatulence nausea vitamin B12 deficiency exacerbated
- PATIENT AND CARER ADVICE

Medicines for Children leaflet: Folic acid for megaloblastic anaemia caused by folate deficiency and haemolytic anaemia www.medicinesforchildren.org.uk/medicines/folic-acid-formegaloblastic-anaemia-caused-by-folate-deficiency-and-haemolytic-anaemia/

Hydroxocobalamin

10-Feb-2021

• INDICATIONS AND DOSE

Prophylaxis of macrocytic anaemias associated with vitamin B₁₂ deficiency

► BY INTRAMUSCULAR INJECTION

Adult: 1 mg every 2–3 months

Pernicious anaemia and other macrocytic anaemias without neurological involvement

- ► BY INTRAMUSCULAR INJECTION
- Adult: Initially 1 mg 3 times a week for 2 weeks, then 1 mg every 2–3 months

Pernicious anaemia and other macrocytic anaemias with neurological involvement

- **▶** BY INTRAMUSCULAR INJECTION
- Adult: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months

Tobacco amblyopia

- ► BY INTRAMUSCULAR INJECTION
- Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

Leber's optic atrophy

- **▶** BY INTRAMUSCULAR INJECTION
- Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1-3 months

CYANOKIT®

Poisoning with cyanides

- **▶** BY INTRAVENOUS INFUSION
- Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes-2 hours depending on severity of poisoning and patient stability
- Adult: Initially 5 g, to be given over 15 minutes, then 5 g if required, this second dose can be given over 15 minutes-2 hours depending on severity of poisoning and patient stability
- CAUTIONS Diagnosis of Vitamin B₁₂ deficiency should be confirmed before giving hydroxocobalamin
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS Diarrhoea · dizziness · headache · hot flush · nausea · skin reactions · urine discolouration SPECIFIC SIDE-EFFECTS

- With intramuscular use Arrhythmia · chills · drug fever · hypokalaemia · malaise · pain · thrombocytosis · tremor · yomiting
- With intravenous use Angioedema · dysphagia · extrasystole · gastrointestinal discomfort · memory loss · mucosal discolouration red · peripheral oedema · pleural effusion · rash pustular · red discolouration of plasma · restlessness · swelling · throat complaints
- BREAST FEEDING Present in milk but not known to be harmful.
- EFFECT ON LABORATORY TESTS
- With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.

DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion (Cyanokit[®]), give intermittently in Sodium Chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).
- PRESCRIBING AND DISPENSING INFORMATION
- With intramuscular use The BP directs that when vitamin B₁₂ injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied.

Poisoning by cyanides

- With intravenous use Cyanokit® is the only preparation of hydroxocobalamin that is suitable for use in victims of smoke inhalation who show signs of significant cyanide poisoning.
- NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions *Cobalin-H*[®] is not prescribable in NHS primary care.

Neo-Cytamen® is not prescribable in NHS primary care.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Hydroxocobalamin (Non-proprietary)
- Cobalin (Advanz Pharma)

Powder for solution for infusion

Cyanokit (SERB)

Hydroxocobalamin 5 gram Cyanokit 5g powder for solution for infusion vials | 1 vial | PoM £772.00 (Hospital only)

2 Iron overload

Iron overload

Overview

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially thalassaemia major, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 1116 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by administration of ascorbic acid p. 1177 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

ANTIDOTES AND CHELATORS > IRON CHELATORS

Deferasirox

23-Nov-2020

DRUG ACTION Deferasirox is an oral iron chelator.

INDICATIONS AND DOSE

Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

- ► BY MOUTH
- Adult: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only) | Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)

- ► BY MOUTH
- Adult: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Chronic iron overload when desferrioxamine is contraindicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

- ► BY MOUTH
- Adult: Initially 7 mg/kg once daily, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 14 mg/kg per day
- CAUTIONS Elderly (increased risk of side-effects) history
 of liver cirrhosis not recommended in conditions which
 may reduce life expectancy (e.g. high-risk myelodysplastic
 syndromes) platelet count less than 50x10⁹/litre risk of
 gastro-intestinal ulceration and haemorrhage unexplained cytopenia—consider treatment interruption
- INTERACTIONS → Appendix 1: iron chelators
- SIDE-EFFECTS
- ► Common or very common Constipation · diarrhoea · gastrointestinal discomfort · headache · nausea · skin reactions · urine abnormalities · vomiting
- Uncommon Anxiety · cataract · cholelithiasis · dizziness · fatigue · fever · gastrointestinal disorders · gastrointestinal haemorrhage (including fatal cases) · hearing impairment · hepatic disorders · laryngeal pain · maculopathy · oedema · renal tubular disorders · sleep disorder
- ► Rare or very rare Optic neuritis severe cutaneous adverse reactions (SCARs)
- ► Frequency not known Acute kidney injury · alopecia · anaemia aggravated · hyperammonaemic encephalopathy · hypersensitivity vasculitis · lens opacity · leucopenia · metabolic acidosis · nephritis tubulointerstitial · nephrolithiasis · neutropenia · pancreatitis acute · pancytopenia · renal tubular necrosis · thrombocytopenia
- PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies.

- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment; avoid in severe impairment.
 Dose adjustments Manufacturer advises reduce initial dose considerably then gradually increase to max. 50% of normal dose in moderate impairment.
- RENAL IMPAIRMENT Manufacturer advises avoid if estimated creatinine clearance less than 60 mL/minute. Dose adjustments See p. 21.

Manufacturer advises reduce dose if creatinine clearance less than 90 mL/minute and serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—consult product literature.

- MONITORING REQUIREMENTS Manufacturer advises monitoring of the following patient parameters: baseline serum creatinine twice and creatinine clearance once before initiation of treatment, weekly in the first month after treatment initiation or modification, then monthly thereafter; proteinuria before treatment initiation then monthly thereafter, and other markers of renal tubular function as needed; liver function before treatment initiation, every 2 weeks during the first month of treatment, then monthly thereafter; eye and ear examinations before treatment and annually during treatment; serum-ferritin concentration monthly.
- DIRECTIONS FOR ADMINISTRATION For film-coated tablets, manufacturer advises tablets may be crushed and sprinkled on to soft food (yoghurt or apple sauce), then administered immediately.
- PATIENT AND CARER ADVICE Patient or carers should be given advice on how to administer deferasirox tablets.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Deferasirox (Exjade®) for the treatment of chronic iron overload due to blood transfusions when deferoxamine therapy is contra-indicated or inadequate, in adult and paediatric patients aged 2 years and older with rare acquired or inherited anaemias (January 2017) SMC No. 347/07 Recommended with restrictions
- Deferasirox (Exjade®) for the treatment of chronic iron overload: due to frequent blood transfusions in patients with beta thalassaemia major aged 6 years and over; due to blood transfusions when deferoxamine therapy is contra-indicated or inadequate in other patient groups (June 2017) SMC No. 1246/17 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 25

Deferiprone

28-Jun-2021

• DRUG ACTION Deferiprone is an oral iron chelator.

• INDICATIONS AND DOSE

Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate

- ▶ BY MOUTH
- Adult: 25 mg/kg 3 times a day; maximum 100 mg/kg per day
- CONTRA-INDICATIONS History of agranulocytosis or recurrent neutropenia
- INTERACTIONS → Appendix 1: iron chelators
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain (reducing dose and increasing gradually may improve tolerance) agranulocytosis appetite increased arthralgia diarrhoea (reducing dose and increasing gradually may improve tolerance) fatigue headache nausea (reducing dose and increasing gradually may improve tolerance) neutropenia urine discolouration vomiting (reducing dose and increasing gradually may improve tolerance)
- ► Frequency not known Skin reactions zinc deficiency
- CONCEPTION AND CONTRACEPTION Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in animal studies. Contraception advised in females of child-bearing potential.
- PREGNANCY Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available)—monitor hepatic function and consider interrupting treatment if persistent elevation in serum alanine aminotransferase. Manufacturer advises caution in patients with hepatitis C (ensure iron chelation is optimal)—monitor liver histology.
- RENAL IMPAIRMENT Evgr Caution in end-stage renal disease (no information available).
- MONITORING REQUIREMENTS
- Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
- ► Monitor plasma-zinc concentration.
- PATIENT AND CARER ADVICE

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Oral solution

Desferrioxamine mesilate

09-Jun-2021

(Deferoxamine Mesilate)

INDICATIONS AND DOSE

Iron poisoning

- ► BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

Aluminium overload in dialysis patients

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)

Chronic iron overload (low iron overload)

- ► BY SUBCUTANEOUS INFUSION
- Adult: The dose should reflect the degree of iron overload

Chronic iron overload (established overload)

- ► BY SUBCUTANEOUS INFUSION
- Adult: 20-50 mg/kg daily
- CAUTIONS Aluminium-related encephalopathy (may exacerbate neurological dysfunction)
- INTERACTIONS → Appendix 1: iron chelators
- SIDE-EFFECTS
- ► Common or very common Arthralgia · bone disorder · fever · growth retardation · headache · muscle complaints · nausea · skin reactions
- ► **Uncommon** Abdominal pain · asthma · deafness neurosensory · tinnitus · vomiting
- ► Rare or very rare Angioedema · blood disorder · cataract · diarrhoea · dizziness · encephalopathy · eye disorders · hypersensitivity · hypotension (more common when given too rapidly by intravenous injection) · increased risk of infection · nerve disorders · nervous system disorder · paraesthesia · respiratory disorders · shock · tachycardia · thrombocytopenia · vision disorders
- ► Frequency not known Acute kidney injury · hypocalcaemia · leucopenia · renal tubular disorder · seizure · urine discolouration
- PREGNANCY Teratogenic in animal studies. Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk—no information available.
- RENAL IMPAIRMENT EVGT Use with caution.
- MONITORING REQUIREMENTS Eye and ear examinations before treatment and at 3-month intervals during treatment.
- DIRECTIONS FOR ADMINISTRATION For full details and warnings relating to administration, consult product literature

For intravenous or subcutaneous infusion (Desferal®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute with water for injections to a concentration of 100 mg/ml; dilute with infusion fluid.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Desferrioxamine mesilate (Non-proprietary)
 Desferrioxamine mesilate 500 mg Desferrioxamine 500mg powder
 - Desterrioxamine mesilate 500 mg Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 2g powder for solution for injection vials | 10 vial | Desterrioxamine 2g powder for solution for injection vials | 10 vial | Desterrioxamine 2g powder for solution for injection vials | 10 vial | Desterrioxamine 2g powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 20 powder for solution for injection vials | 10 vial | Desterrioxamine 20 powder for solution for injection vials | 10 vial | Desterrioxamine 20 powder for solution for injection vials | 10 vial | Desterrioxamine 20 powder for solution for injection vials | 10 vial | Desterrioxamine 20 powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution for injection vials | 10 vial | Desterrioxamine 500mg powder for solution f

3 Neutropenia and stem cell mobilisation

3.1 Neutropenia

Neutropenia

05-Mar-2021

Management

Neutropenia is characterised by a low neutrophil count (absolute neutrophil count less than $1.5 \times 10^9/\mathrm{lire}$). Neutropenia is a risk factor for the development of infection and sepsis, especially in patients receiving high-intensity chemotherapy regimens. Recombinant human granulocytecolony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated febrile neutropenia; there is as yet no evidence that it improves overall survival. Granulocytecolony stimulating factors include filgrastim below, lenograstim p. 1118, pegfilgrastim p. 1119 and lipegfilgrastim p. 1119.

Filgrastim (unglycosylated rhG-CSF) and lenograstim (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings for the treatment of neutropenia. Pegfilgrastim and lipegfilgrastim are polyethylene glycol-conjugated ('pegylated') derivatives of filgrastim, which are longer-acting forms of filgrastim due to decreased renal clearance.

Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

IMMUNOSTIMULANTS > GRANULOCYTE-COLONY STIMULATING FACTORS

Granulocyte-colony stimulating Gactors

- DRUG ACTION Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.
- CAUTIONS Malignant myeloid conditions pre-malignant myeloid conditions risk of splenomegaly and rupture—spleen size should be monitored sickle-cell disease
- Acute respiratory distress syndrome There have been reports
 of pulmonary infiltrates leading to acute respiratory
 distress syndrome—patients with a recent history of
 pulmonary infiltrates or pneumonia may be at higher risk.
- SIDE-EFFECTS
- Common or very common Arthralgia · cutaneous vasculitis · dyspnoea · haemoptysis · headache · hypersensitivity · leucocytosis · pain · spleen abnormalities · thrombocytopenia
- ► Uncommon Acute febrile neutrophilic dermatosis capillary leak syndrome hypoxia pulmonary oedema respiratory disorders sickle cell anaemia with crisis SIDE-EFFECTS, FURTHER INFORMATION Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.
- PREGNANCY Manufacturers advise avoid—toxicity in animal studies.
- BREAST FEEDING There is no evidence for the use of granulocyte-colony stimulating factors during breastfeeding and manufacturers advise avoiding their use.

MONITORING REQUIREMENTS

- ► Full blood counts including differential white cell and platelet counts should be monitored.
- Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

► above

Filgrastim

24-Jul-2020

(Recombinant human granulocyte-colony stimulating factor; G-CSF)

• INDICATIONS AND DOSE

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - Adult: 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)

- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- Adult: 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)

- ► BY SUBCUTANEOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- Adult: 10 micrograms/kg daily for 5-7 days, to be administered over 24 hours if given by subcutaneous infusion

Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature

Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult 18-59 years: 10 micrograms/kg daily for 4-5 days, for timing of leucopheresis, consult product literature

Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

continued \rightarrow

Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Persistent neutropenia in HIV infection (specialist use only)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day
- CONTRA-INDICATIONS Severe congenital neutropenia who develop leukaemia or have evidence of leukaemic evolution
- CAUTIONS Osteoporotic bone disease (monitor bone density if given for more than 6 months) - secondary acute myeloid leukaemia
- SIDE-EFFECTS
- ► Common or very common Anaemia · diarrhoea · dysuria · haemorrhage · hepatomegaly · hyperuricaemia · hypotension · osteoporosis · rash
- Uncommon Fluid imbalance · graft versus host disease · peripheral vascular disease · pseudogout · rheumatoid arthritis aggravated · urine abnormalities
- MONITORING REQUIREMENTS Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use or subcutaneous use For subcutaneous or intravenous infusion, manufacturer advises give continuously or intermittently in Glucose 5%; for a filgrastim concentration of less than 1500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution.
- PRESCRIBING AND DISPENSING INFORMATION Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

F 1117

20-Jul-2020

Lenograstim

(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)

INDICATIONS AND DOSE

Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only) | Reduction in the duration of neutropenia and associated complications following peripheral stem cells transplantation for non-myeloid malignancy (specialist use only)

- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes

Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- ► Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy

Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: 10 micrograms/kg daily for 4-6 days (5-6 days in healthy donors)

Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy, for timing of leucopheresis, consult product literature

SIDE-EFFECTS

- ► Common or very common Abdominal pain · asthenia
- ► Rare or very rare Erythema nodosum pyoderma gangrenosum toxic epidermal necrolysis

• DIRECTIONS FOR ADMINISTRATION

▶ With intravenous use For intravenous infusion (Granocyte®), manufacturer advises give intermittently in Glucose 5% or Sodium chloride 0.9%; initially reconstitute with 1 mL water for injection provided (do not shake vigorously) then dilute with up to 50 mL infusion fluid for each vial of Granocyte-13 or up to 100 mL infusion fluid for Granocyte-34; give over 30 minutes.

- PRESCRIBING AND DISPENSING INFORMATION Granocyte® solution for injection contains 105 micrograms of lenograstim per 13.4 mega unit vial and 263 micrograms lenograstim per 33.6 mega unit vial.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

EXCIPIENTS: May contain Phenylalanine

Granocyte (Chugai Pharma UK Ltd)

Lenograstim 13.4 mega unit Granocyte 13million unit powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection Pom £40.11 DT = £40.11 | 5 pre-filled disposable injection Pom £200.55

F 1117

Lipegfilgrastim

10-Jun-2020

(Glycopegylated recombinant methionyl human granulocyte-colony stimulating factor)

INDICATIONS AND DOSE

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

- ► BY SUBCUTANEOUS INJECTION
- Adult (specialist use only): 6 mg, for each chemotherapy cycle, given approximately 24 hours after chemotherapy, dose expressed as filgrastim
- CAUTIONS Myelosuppressive chemotherapy
- SIDE-EFFECTS
- ➤ Common or very common Chest pain · hypokalaemia · skin eruption
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Lonquex (Teva UK Ltd)

Filgrastim (as Lipegfilgrastim) 10 mg per 1 ml Lonquex 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection Pom £652.06

Pegfilgrastim

F 1117

(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

• INDICATIONS AND DOSE

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 6 mg for each chemotherapy cycle, to be given at least 24 hours after chemotherapy, dose is expressed as filgrastim
- CAUTIONS Acute leukaemia · myelosuppressive chemotherapy
- SIDE-EFFECTS
- ► Common or very common Myalgia · nausea
- ▶ Uncommon Glomerulonephritis

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Neulasta (Amgen Ltd)

Filgrastim (as Pegfilgrastim) 10 mg per 1 ml Neulasta 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £686.38

Neulasta omg/0.6ml solution for injection pre-filled syringes with Onpro kit | 1 pre-filled disposable injection PoM £686.38 (Hospital only)

▶ Pelmeg (Napp Pharmaceuticals Ltd)

Filgrastim (as Pegfilgrastim) 10 mg per 1 ml Pelmeg 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £411.83 (Hospital only)

Ziextenzo (Sandoz Ltd)

Filgrastim (as Pegfilgrastim) 10 mg per 1 ml Ziextenzo 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £617.74

3.2 Stem cell mobilisation

IMMUNOSTIMULANTS > CHEMOKINE RECEPTOR ANTAGONISTS

Plerixafor

22-Oct-2020

 DRUG ACTION Plerixafor is a chemokine receptor antagonist.

• INDICATIONS AND DOSE

Mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 84 kg): 240 micrograms/kg daily, alternatively 20 mg daily usually for 2–4 days (and up to 7 days), to be administered 6–11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor; maximum 40 mg per day
- Adult (body-weight 84 kg and above): 240 micrograms/kg daily usually for 2-4 days (and up to 7 days), to be administered 6-11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor; maximum 40 mg per day

SIDE-EFFECTS

- ► Common or very common Arthralgia · constipation · diarrhoea · dizziness · dry mouth · erythema · fatigue · flatulence · gastrointestinal discomfort · headache · hyperhidrosis · malaise · musculoskeletal pain · nausea · oral hypoaesthesia · sleep disorders · vomiting
- ► Frequency not known Postural hypotension splenomegaly syncope
- CONCEPTION AND CONTRACEPTION Use effective contraception during treatment— teratogenic in animal studies
- PREGNANCY Manufacturer advises avoid unless essential—teratogenic in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT No information available if creatinine clearance less than 20 mL/minute.

Dose adjustments Manufacturer advises reduce dose to 160 micrograms/kg (maximum 27 mg) daily if creatinine clearance 20–50 mL/minute. See p. 21.

- MONITORING REQUIREMENTS Monitor platelets and white blood cell count.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness, fatigue, or vasovagal reactions.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

 Plerixafor (Mozobil®) combined with G-CSF to enhance mobilisation of haematopoietic stem cells to the peripheral blood for collection & subsequent autologous transplantation in patients with lymphoma and multiple myeloma (January 2010) SMC No. 594/09 Recommended

All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ Plerixafor (Mozobil®) in combination with G-CSF to enhance mobilisation of haematopoietic stem cells to the peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma and multiple myeloma whose cells mobilise poorly (April 2010) AWMSG No. 249 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Mozobil (Sanofi)

Plerixafor 20 mg per 1 ml Mozobil 24mg/1.2ml solution for injection vials \mid 1 vial \mid PoM £4,882.77

4 Platelet disorders

4.1 Essential thrombocythaemia

Other drugs used for Essential thrombocythaemia Hydroxycarbamide, p. 1008

ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

Anagrelide

07-Jul-2021

• INDICATIONS AND DOSE

Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)

- ► BY MOUTH
- Adult: Initially 500 micrograms twice daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day
- CAUTIONS Cardiovascular disease—assess cardiac function before and regularly during treatment · concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment · risk factors for QTinterval prolongation—assess cardiac function before and regularly during treatment
- INTERACTIONS → Appendix 1: anagrelide
- SIDE-EFFECTS
- Common or very common Anaemia · arrhythmias · asthenia · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · palpitations · skin reactions · vomiting

- ▶ Uncommon Alopecia · appetite decreased · arthralgia · chest pain · chills · confusion · congestive heart failure · constipation · depression · dry mouth · dyspnoea · erectile dysfunction · fever · haemorrhage · hypertension · insomnia · malaise · memory loss · myalgia · nervousness · oedema · pain · pancreatitis · pancytopenia · pneumonia · pulmonary hypertension · respiratory disorders · sensation abnormal · syncope · thrombocytopenia · weight changes
- ▶ Rare or very rare Angina pectoris · cardiomegaly · cardiomyopathy · coordination abnormal · drowsiness · dysarthria · influenza like illness · myocardial infarction · nocturia · pericardial effusion · postural hypotension · renal failure · tinnitus · vasodilation · vision disorders
- ► Frequency not known Hepatitis · nephritis tubulointerstitial
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment.
- PREGNANCY Manufacturer advises avoid (toxicity in animal studies).
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises use with caution in mild impairment; avoid in moderate-to-severe impairment or if serum transaminases exceed 5 times the upper limit of normal.
- RENAL IMPAIRMENT EVG Avoid if creatinine clearance less than 50 mL/minute, (M) see p. 21.
- MONITORING REQUIREMENTS
- Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
- ► Monitor liver function.
- ▶ Monitor serum creatinine.
- Monitor urea.
- Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

4.2 Thrombocytopenias

ANTIHAEMORRHAGICS > THROMBOPOIETIN RECEPTOR AGONISTS

Avatrombopag

10-Sep-202

 DRUG ACTION Avatrombopag is a thrombopoietin receptor agonist that binds to and activates the thrombopoietin (TPO) receptor, thereby increasing platelet production.

INDICATIONS AND DOSE

Thrombocytopenia [in patients with chronic liver disease undergoing invasive procedures and platelet count less than 40×10^9 /litre] (under expert supervision)

- ► BY MOUTH
- Adult: 60 mg once daily for 5 days, treatment to be started 10 to 13 days before procedure; procedures to

be carried out 5 to 8 days after the last dose of avatrombopag

Thrombocytopenia [in patients with chronic liver disease undergoing invasive procedures and platelet count between 40 to 50x10⁹/litre] (under expert supervision)

- ▶ BY MOUTH
- Adult: 40 mg once daily for 5 days, treatment to be started 10 to 13 days before procedure; procedures to be carried out 5 to 8 days after the last dose of avatrombopag

Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

- ► BY MOUTH
- Adult: 20 mg once daily, dose to be adjusted to achieve a platelet count of 50x10⁹/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose, or if platelet count more than 250x10⁹/litre after 2 weeks of dosing at 20 mg once weekly; maximum 40 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ When used for chronic immune (idiopathic) thrombocytopenic purpura [vor] Increase initial avatrombopag dose to 40 mg once daily in those already taking moderate CYP2C9 inducers. In those already taking avatrombopag, monitor platelet counts and adjust the avatrombopag dose as necessary when starting moderate CYP2C9 inducers. Decrease initial avatrombopag dose to 20 mg three times weekly in those already taking moderate CYP2C9 inhibitors. In those already taking avatrombopag, monitor platelet counts and adjust the avatrombopag dose as necessary when starting moderate CYP2C9 inhibitors. (♠)

CAUTIONS

GENERAL CAUTIONS Known genetic polymorphisms—consult product literature ⋅ risk factors for thromboembolism

SPECIFIC CAUTIONS

- When used for thrombocytopenia in patients with chronic liver disease undergoing invasive procedures. Administration before laparotomy, thoracotomy, open-heart surgery, craniotomy, or excision of organs (no clinical experience)
- INTERACTIONS → Appendix 1: avatrombopag
- SIDE-EFFECTS
- ► Common or very common Fatigue
- ► **Uncommon** Anaemia · bone pain · fever · myalgia · portal vein thrombosis
- PREGNANCY EVGF Avoid—limited information available.
- BREAST FEEDING EVGT Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT EVG: Caution in severe impairment (limited information available).
- MONITORING REQUIREMENTS
- ► Ever Peripheral blood smear and complete blood counts are recommended before starting, and during, treatment.
- When used for thrombocytopenia in patients with chronic liver disease undergoing invasive procedures [EvGr] Monitor platelet count before starting treatment and on the day of procedure.
- When used for chronic immune (idiopathic) thrombocytopenic purpura Ever Monitor platelet count at least once weekly until a stable platelet count of 50–150x10⁹/litre achieved; monitor twice weekly during the first weeks of treatment in patients receiving once or twice weekly dosing, or after dose adjustments. After platelet count has stabilised,

monitor platelet count at least monthly. After stopping treatment, monitor platelet counts weekly for at least 4 weeks (recurrence of thrombocytopenia likely).

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Avatrombopag for treating thrombocytopenia in people with chronic liver disease needing a planned invasive procedure (June 2020) NICE TA626 Recommended

Scottish Medicines Consortium (SMC) decisions

- Avatrombopag (Doptelet®) for the treatment of severe thrombocytopenia in adult patients with chronic liver disease who are scheduled to undergo an invasive procedure (December 2020) SMC No. SMC2296 Recommended
- Avatrombopag (Doptelet®) for the treatment of primary chronic immune thrombocytopenia in adult patients who are refractory to other treatments (such as corticosteroids or immunoglobulins) (August 2021) SMC No. SMC2345 Recommended with restrictions
 - MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 21

Lusutrombopag

27-Aug-2020

 DRUG ACTION Lusutrombopag is a thrombopoietin receptor agonist that binds to and activates the thrombopoietin (TPO) receptor, thereby increasing platelet production.

• INDICATIONS AND DOSE

Thrombocytopenia [in patients with chronic liver disease undergoing invasive procedures] (under expert supervision)

- ► BY MOUTH
- Adult: 3 mg once daily for 7 days, treatment to be started at least 8 days before procedure; in clinical trials procedures were carried out between 9 to 14 days after starting lusutrombopag
- CAUTIONS Administration before laparotomy, thoracotomy, open-heart surgery, craniotomy, or excision of organs (no clinical experience) body-weight less than 45kg (limited information available) history of splenectomy (no clinical experience) risk factors for thromboembolism

CAUTIONS, FURTHER INFORMATION

- Body-weight less than 45kg Monitor platelet count approximately 5 days after the first dose and as necessary thereafter; stop treatment if the platelet count reaches 50x10⁹/litre or more and has increased 20x10⁹/litre from baseline.
- SIDE-EFFECTS
- ► Common or very common Headache · nausea · rash
- ▶ Frequency not known Embolism and thrombosis
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (limited information available) monitor platelet count approximately 5 days after the first dose and as necessary thereafter. Stop treatment if the platelet count reaches 50x10⁹/litre or more and has increased 20x10⁹/litre from baseline.

- MONITORING REQUIREMENTS Manufacturer advises monitor platelet count prior to procedure; more frequent monitoring may be required in some patients—see Cautions and Hepatic Impairment for further information.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Lusutrombopag for treating thrombocytopenia in people with chronic liver disease needing a planned invasive procedure (January 2020) NICE TA617 Recommended

Scottish Medicines Consortium (SMC) decisions

- ► Lusutrombopag (Mulpleo®) for the treatment of severe thrombocytopenia in adult patients with chronic liver disease undergoing invasive procedures (December 2019) SMC No. SMC2227 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

4.2a Acquired thrombotic thrombocytopenic purpura

ANTITHROMBOTIC DRUGS

Caplacizumab

12-Jan-2021

 DRUG ACTION Caplacizumab is a monoclonal antibody fragment (nanobody) that binds to von Willebrand factor, thereby inhibiting platelet adhesion.

• INDICATIONS AND DOSE

Acquired thrombotic thrombocytopenic purpura (specialist use only)

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult (body-weight 40 kg and above): Initially 10 mg for 1 dose, given before plasma exchange, followed by (by subcutaneous injection) 10 mg once daily given after each plasma exchange during, and for 30 days after finishing, daily plasma exchange therapy, treatment may be continued after this if there is evidence of unresolved immunological disease
- CONTRA-INDICATIONS Active bleeding (interrupt treatment)
- CAUTIONS Increased risk of bleeding
- INTERACTIONS → Appendix 1: caplacizumab
- SIDE-EFFECTS
- ► Common or very common Cerebral infarction · dyspnoea · fatigue · fever · haemorrhage · headache · menorrhagia · myalgia · subarachnoid haemorrhage · urticaria
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises injection into the abdomen. Patients may self-administer Cablivi® after appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION
 Caplacizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

 HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be given and the next dose should be given at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Caplacizumab with plasma exchange and immunosuppression for treating acute acquired thrombotic thrombocytopenic purpura (December 2020) NICE TA667 Recommended

Scottish Medicines Consortium (SMC) decisions

- Caplacizumab (Cablivi®) for the treatment of adults experiencing an episode of acquired thrombotic thrombocytopenic purpura (aTTP), in conjunction with plasma exchange and immunosuppression (September 2020) SMC No. SMC2266 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection EXCIPIENTS: May contain Polysorbates

► Cablivi (Sanofi Genzyme) ▼

Caplacizumab 10 mg Cablivi 10mg powder and solvent for solution for injection vials | 1 vial PoM £4,143.00 (Hospital only)

4.2b Immune thrombocytopenia

Immune thrombocytopenic purpura

12-Apr-202

Overview

EvGr In adults with immune thrombocytopenic purpura, initial treatment is usually with a **corticosteroid**, such as prednisolone p. 747.

Intravenous normal immunoglobulin p. 1387, or intravenous anti-D (Rh₀) immunoglobulin [unlicensed use] may be appropriate in patients with immune thrombocytopenic purpura who are bleeding or at high-risk of bleeding, who require a surgical procedure, or who are unresponsive to corticosteroids. Immunoglobulin preparations may also be considered where a temporary rapid rise in platelets is needed, for example in pregnancy.

Treatment options for *persistent or chronic* immune thrombocytopenic purpura include thrombopoietin receptor agonists (avatrombopag p. 1120, eltrombopag p. 1123, and romiplostim p. 1125), rituximab [unlicensed use], or fostamatinib p. 1123.

Other therapies that have been tried in refractory immune thrombocytopenic purpura include: azathioprine, ciclosporin, cyclophosphamide, danazol, dapsone, mycophenolate mofetil, and vincristine sulfate.

Evgr Splenectomy can be considered as a treatment option only if drug therapy has failed; the patients age and comorbidities should also be taken into account.

ANTIHAEMORRHAGICS > HAEMOSTATICS

Fostamatinib

28-Jan-2022

• DRUG ACTION Fostamatinib, through its metabolite R406, blocks the activity of the spleen tyrosine kinase (SYK) enzyme, thereby reducing immune-mediated destruction of platelets.

INDICATIONS AND DOSE

Chronic immune thrombocytopenia in patients refractory to other treatments (under expert supervision)

- Adult: Initially 100 mg twice daily: increased if tolerated to 150 mg twice daily after 4 weeks, dose to be adjusted to achieve a platelet count of 50x109/litre or more, discontinue if inadequate response after 12 weeks of treatment, for dose reduction, interruption or treatment discontinuation due to side-effectsconsult product literature
- INTERACTIONS → Appendix 1: fostamatinib
- SIDE-FEEECTS
- ► Common or very common Chest pain · diarrhoea · dizziness · fatigue · frequent bowel movements · gastrointestinal discomfort · hypertension · increased risk of infection · influenza like illness · nausea · neutropenia · skin reactions taste altered
- ► Frequency not known Hyperbilirubinaemia hypoxia nephrolithiasis · pain in extremity · syncope · toothache
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 1 month after stopping treatment in females of childbearing potential.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid during and for at least 1 month after stopping treatment—metabolites present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment; caution in mild to moderate impairment—monitor liver function monthly during treatment.

Dose adjustments Manufacturer advises consider dose reduction, interruption or treatment discontinuation in mild to moderate impairment—consult product literature.

- MONITORING REQUIREMENTS
- ► Manufacturer advises monitor blood pressure every 2 weeks until stable, then monthly thereafter: antihypertensive therapy can be initiated or adjusted during treatment. If increased blood pressure persists, consider fostamatinib dose reduction, interruption or discontinuation—consult product literature.
- ► Manufacturer advises monitor full blood count, including neutrophils and platelet counts, monthly until a stable platelet count of at least 50x109/litre is reached; monitor full blood counts regularly thereafter.
- ► Manufacturer advises monitor for any effects on bone remodelling or formation, especially in patients with osteoporosis, fractures or young adults where epiphyseal fusion has not yet occurred—limited information available.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

► Fostamatinib for treating refractory chronic immune thrombocytopenia (January 2022) NICE TA759 Not recommended

Scottish Medicines Consortium (SMC) decisions

► Fostamatinib (Tavlesse®) for the treatment of chronic immune thrombocytopenia in adult patients who are

refractory to other treatments (January 2021) SMC No. SMC2300 Recommended with restrictions

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ANTIHAEMORRHAGICS >THROMBOPOIETIN RECEPTOR AGONISTS

Eltrombopag

29-Mar-2022

• DRUG ACTION Eltrombopag is a thrombopoietin receptor agonist that binds to and activates the thrombopoietin (TPO) receptor, thereby increasing platelet production.

INDICATIONS AND DOSE

Chronic immune (idiopathic) thrombocytopenic purpura in patients of East or Southeast Asian origin refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

- ► BY MOUTH
- Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50x109/litre or moreconsult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day

Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

- ▶ BY MOUTH
- Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50x109/litre or moreconsult product literature for dose adjustments. discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day

Treatment of thrombocytopenia associated with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy (under expert supervision)

- ► RV MOUTH
- Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of 50–75x10⁹/litre during antiviral therapy-consult product literature for dose adjustments, discontinue if inadequate response after 2 weeks treatment at maximum dose; maximum 100 mg per day

Acquired severe aplastic anaemia in patients of East or Southeast Asian origin either refractory to or heavily pretreated with prior immunosuppressive therapy and are unsuitable for haematopoietic stem cell transplantation (under expert supervision)

- ▶ BY MOUTH
- Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50x109/litre or moreconsult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day

continued →

Acquired severe aplastic anaemia in patients either refractory to or heavily pretreated with prior immunosuppressive therapy and are unsuitable for haematopoietic stem cell transplantation (under expert supervision)

- ► BY MOUTH
- Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50x10³/litre or more consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day

DOSE EQUIVALENCE AND CONVERSION

 Powder for oral suspension may lead to higher eltrombopag exposure than oral tablet; platelet counts should be monitored weekly for 2 weeks when switching between preparations.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ELTROMBOPAG ($REVOLADE^{\odot}$): REPORTS OF INTERFERENCE WITH BILIRUBIN AND CREATININE TEST RESULTS (JULY 2018)

See Effect on laboratory tests.

- CAUTIONS Patients of East or Southeast Asian origin risk factors for thromboembolism
- INTERACTIONS → Appendix 1: eltrombopag
- SIDE-FFFFCTS
- ► Common or very common Abnormal loss of weight alopecia · anaemia · anxiety · appetite abnormal · arthralgia · asthenia · cataract · chest discomfort · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dysphagia · dyspnoea · ear pain · electrolyte imbalance · embolism and thrombosis · eosinophilia · eye disorders · eye pain · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypoglycaemia · increased leucocytes · increased risk of infection · influenza like illness · iron overload · lymphopenia · malaise · memory impairment · menorrhagia · mood altered · muscle complaints · nasal complaints · nausea · neutropenia · oedema · oral disorders · oropharyngeal complaints · pain · palpitations · renal impairment · renal thrombotic microangiopathy · sensation abnormal · skin reactions · sleep disorder · splenic infarction · sweat changes · syncope · taste altered · urine abnormalities · urine discolouration · vasodilation · vertigo · vision disorders · vomiting · weight decreased
- ▶ Uncommon Anisocytosis · arrhythmias · balance impaired · cardiovascular disorder · confusion · cyanosis · eye inflammation · feeling hot · feeling jittery · food poisoning · gout · haemolytic anaemia · hemiparesis · lens opacity · muscle weakness · myocardial infarction · nephritis lupus · nerve disorders · QT interval prolongation · rectosigmoid cancer · retinal pigment epitheliopathy · sinus disorder · sleep apnoea · speech disorder · sunburn · tremor · urinary disorders · wound inflammation
- ► Frequency not known Cerebral infarction · sepsis
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid.
- HEPATIC IMPAIRMENT
- When used for Idiopathic thrombocytopenic purpura Manufacturer advises consider avoiding.
- When used for Severe aplastic anaemia Manufacturer advises caution.
- When used for Thrombocytopenia associated with chronic hepatitis
 C infection Manufacturer advises caution (increased risk of hepatic decompensation and thromboembolic events).

Dose adjustments

- When used for Idiopathic thrombocytopenic purpura Manufacturer advises initial dose reduction to 25 mg once daily and wait at least 3 weeks before upwards titration of dose.
- ▶ When used for Severe aplastic anaemia Manufacturer advises initial dose reduction to 25 mg once daily and wait at least 2 weeks before upwards titration of dose.
- When used for Thrombocytopenia associated with chronic hepatitis C infection Manufacturer advises initial dose reduction to 25 mg once daily in moderate to severe impairment and wait at least 2 weeks before upwards titration of dose.
- RENAL IMPAIRMENT [EVGr] Use with caution.
- PRE-TREATMENT SCREENING For severe aplastic anaemia, manufacturer advises do not initiate if patients have existing cytogenetic abnormalities of chromosome 7.

MONITORING REQUIREMENTS

- Manufacturer advises monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.
- Manufacturer advises regular ophthalmological examinations for cataract formation.
- Manufacturer advises peripheral blood smear prior to initiation to establish baseline level of cellular morphologic abnormalities; once stabilised, full blood count with white blood cell count differential should be performed monthly.
- For idiopathic thrombocytopenic purpura, manufacturer advises monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50x10³/litre or more for at least 4 weeks), then monthly thereafter; monitor platelet count weekly for 4 weeks following treatment discontinuation.
- For severe aplastic anaemia, manufacturer advises bone marrow examination with aspirations for cytogenetics prior to initiation, at 3 months of treatment and 6 months thereafter.
- ► For thrombocytopenia associated with chronic hepatitis C infection, manufacturer advises monitor platelet count every week before and during antiviral treatment until a stable platelet count is reached (50-75x10⁹/litre), then monitor full blood count including platelet count and peripheral blood smears monthly thereafter.
- e EFFECT ON LABORATORY TESTS Eltrombopag is highly coloured and can cause serum discolouration and interference with total bilirubin and creatinine testing. If laboratory results are inconsistent with clinical observations, manufacturer advises re-testing using another method to help determine the validity of the
- DIRECTIONS FOR ADMINISTRATION EVG! Each dose should be taken at least 2 hours before or 4 hours after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption. For powder for oral suspension, disperse dose in 20 mL of water and administer using an oral syringe. Discard suspension if not administered within 30 minutes of preparation.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer eltrombopag tablets and powder for oral suspension.

Romiplostim

22-Oct-2020

 DRUG ACTION Romiplostim is an Fc-peptide fusion protein that binds to and activates the thrombopoietin (TPO) receptor, thereby increasing platelet production.

tablets | 28 tablet PoM £2,310.00 DT = £2,310.00

• INDICATIONS AND DOSE

Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: Initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg once weekly (max. per dose 10 micrograms/kg once weekly) until a stable platelet count of 50x10³/litre or more is reached, consult product literature for further details of dose adjustments, discontinue treatment if inadequate response after 4 weeks at maximum dose
- CAUTIONS Risk factors for thromboembolism
- SIDE-EFFECTS
- Common or very common Anaemia · angioedema · arthralgia · asthenia · bone marrow disorders · chills · constipation · diarrhoea · dizziness · embolism and thrombosis · fever · flushing · gastrointestinal discomfort · headaches · hypersensitivity · increased risk of infection · influenza like illness · muscle complaints · nausea · pain · palpitations · peripheral oedema · sensation abnormal · skin reactions · sleep disorders
- ▶ Uncommon Alopecia · appetite decreased · chest pain · clonus · cough · dehydration · depression · dry throat · dysphagia · dyspnoea · erythromelalgia · eye disorders · eye pruritus · feeling hot · feeling jittery · gastrooesophageal reflux disease · gout · haemorrhage · hair growth abnormal · hypotension · irritability · leucocytosis · malaise · muscle weakness · myocardial infarction · nasal complaints · neoplasms · oral disorders · papilloedema · peripheral ischaemia · peripheral neuropathy · photosensitivity reaction · pleuritic pain · portal vein thrombosis · skin nodule · splenomegaly · taste altered · thrombocytosis · tooth discolouration · vertigo · vision disorders · vomiting · weight changes
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT Manufacturer advises caution; consider avoiding in moderate to severe impairment (risk of thromboembolic complications).
- RENAL IMPAIRMENT Manufacturer advises caution—no information available.

MONITORING REQUIREMENTS

- ➤ Manufacturer advises monitor full blood count and peripheral blood smears for morphological abnormalities before and during treatment.
- Manufacturer advises monitor platelet count weekly until platelet count reaches 50x10°/litre or more for at least 4 weeks without dose adjustment, then monthly thereafter.
- Manufacturer advises monitor platelet count following treatment discontinuation—risk of bleeding.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises that patients and their carers should be counselled on the effects on driving and the performance of skilled tasks—increased risk of dizziness.

Nutrition and metabolic disorders

1 Fluid and electrolyte imbalances

Fluids and electrolytes

04-Feb-2022

Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

Oral notassium

Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see warning on renal insufficiency). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are seldom required with the small doses of diuretics given to treat hypertension; potassium-sparing diuretics (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 247 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride daily (in divided doses) by mouth are suitable in patients taking a normal diet. *Smaller doses* must be used if there is *renal insufficiency (common in the elderly)* to reduce the **risk** of **hyperkalaemia**.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable.

When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasmapotassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia

Acute severe hyperkalaemia (plasma-potassium concentration 6.5 mmol/litre or greater, or in the presence of ECG changes) calls for urgent treatment with intravenous calcium chloride 10% p. 1138 [unlicensed] or calcium gluconate 10% p. 1139 [unlicensed], to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5-10 units) with 50 mL glucose 50% p. 1132 given over 5-15 minutes, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. Salbutamol p. 273 [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasmapotassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 1128 should be considered (important: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes.

Oral sodium and water

Sodium chloride p. 1131 is indicated in states of sodium depletion and usually needs to be given intravenously. In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate, according to the acid-base status of the patient, may be sufficient.

Oral rehydration therapy (ORT)

As a worldwide problem *diarrhoea* is by far the most important indication for fluid and electrolyte replacement.

Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na * 75 mmol, K * 20 mmol, Cl $^{-}$ 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children's fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

Oral bicarbonate

Sodium bicarbonate is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously.

Sodium bicarbonate may also be used to increase the pH of the urine; it is also used in dyspepsia.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where hyperchloraemic acidosis is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 1131 or glucose 5% p. 1132) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium,

Fluids and electrolytes

Electrolyte concentrations—intravenous fluids

	Millimoles per litre

Small bowel	-	120-140	5-15	20-40	90-130

phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

Intravenous sodium

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasmasodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

Compound sodium lactate (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloraemic acidosis.

Sodium chloride with glucose p. 1132 solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5%

glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na* remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

Intravenous glucose

Glucose solutions (5%) are used mainly to replace water deficit. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given in regimens with calcium and insulin for the emergency management of *hyperkalaemia*. They are also given, after correction of hyperglycaemia,

during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

Intravenous potassium

Potassium chloride with sodium chloride intravenous infusion p. 1131 is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Ínitial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

Bicarbonate and lactate

Sodium bicarbonate below is used to control severe *metabolic acidosis* (pH<7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For *chronic acidotic states*, sodium bicarbonate can be given by mouth.

Plasma and plasma substitutes

Plasma and plasma substitutes ('colloids') contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose ('crystalloids'), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Ålbumin solution p. 1140, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solution p. 1140 may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma substitutes

Dextran, gelatin p. 1140, and the hydroxyethyl starch, tetrastarch, are macromolecular substances which are

metabolised slowly. Dextran and gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicaemia; they may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Dextran and gelatin are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion.

Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

BICARBONATE

Sodium bicarbonate

19-Apr-2022

INDICATIONS AND DOSE

Alkalinisation of urine | Relief of discomfort in mild urinary-tract infections

- ► BY MOUTH
- Adult: 3 g every 2 hours until urinary pH exceeds 7, to be dissolved in water

Maintenance of alkaline urine

- ► BY MOUTH
- Adult: 5-10 g daily, to be dissolved in water

Chronic acidotic states such as uraemic acidosis or renal tubular acidosis

- ► BY MOUTH
- Adult: 4.8 g daily, (57 mmol each of Na⁺ and HCO₃⁻), higher doses may be required and should be adjusted according to response

Severe metabolic acidosis

- ► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFIISION
- Adult: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)

NEPHROTRANS®

Metabolic acidosis in patients with chronic renal impairment

- ► BY MOUTH
- Adult: 3-5 g daily in divided doses, adjusted according to response

CONTRA-INDICATIONS

- ▶ With systemic use Hypokalaemia · salt restricted diet
- With intravenous use for metabolic acidosis Conditions associated with sodium retention · history of urinary calculi
- With systemic use for metabolic acidosis Hypernatraemia · hypocalcaemia · hypochlorhydria · metabolic or respiratory alkalosis

CAUTIONS

- ▶ With intravenous use Respiratory acidosis
- With oral use for metabolic acidosis Conditions associated with sodium retention
- With systemic use for metabolic acidosis Hypoventilation
- INTERACTIONS → Appendix 1: sodium bicarbonate

SIDE-EFFECTS

- With intravenous use Skin exfoliation · soft tissue necrosis · ulcer
- With oral use Anxiety · appetite decreased · asthenia · dizziness · dyspnoea · flatulence · fluid retention · gastrointestinal discomfort · headache · hypertension · hypokalaemia · inflammation · metabolic alkalosis · mood altered · muscle complaints · nausea · nephrolithiasis (long term use) · pulmonary oedema · taste unpleasant · urinary frequency increased · vomiting
- ALLERGY AND CROSS-SENSITIVITY

NEPHROTRANS Contra-indicated in patients with hypersensitivity or allergy to peanuts or soya (contains soya lecithin and soya-bean oil).

- PREGNANCY Evgr Use with caution.
- HEPATIC IMPAIRMENT
- ▶ With oral use Manufacturer advises caution in cirrhosis.
- RENAL IMPAIRMENT
- With oral use Evgr Caution (risk of metabolic alkalosis, hypokalaemia and sodium retention).
- MONITORING REQUIREMENTS EVGT Monitor plasma-pH and electrolytes regularly during treatment.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use For slow intravenous injection use a small volume of hypertonic solution (such as 50 mL of 8.4%). For continuous intravenous infusion a weaker solution of 1.26% solution can be infused over 3-4 hours.
- With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.
- PRESCRIBING AND DISPENSING INFORMATION
- With oral use Sodium bicarbonate 500mg capsules contain approximately 6 mmol each of Na* and HCO₃; Sodium bicarbonate 600mg capsules contain approximately 7 mmol each of Na* and HCO₃. Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.
- With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na⁺ and HCO₃⁻/litre), various other strengths available.
- PATIENT AND CARER ADVICE
- With oral use Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection

ELECTROLYTES AND MINERALS > SODIUM CHIORIDE

Sodium chloride

25-Apr-2022

• INDICATIONS AND DOSE

Prophylaxis of sodium chloride deficiency

- ► BY MOUTH
- Adult: 4–8 tablets daily, to be taken with water, up to maximum 20 tablets daily in severe depletion

Chronic renal salt wasting

- ► BY MOUTH
- Adult: Up to 20 tablets daily, to be taken with appropriate fluid intake

Fluid and electrolyte replacement

- ► BY INTRAVENOUS INFUSION
- Adult: The volume of sodium chloride solution needed to replace deficits may vary (consult product literature)

Diabetic ketoacidosis (when systolic blood pressure below 90 mmHg)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 500 mL, sodium chloride 0.9% to be given over 10-15 minutes, repeat if blood pressure remains below 90 mmHg. Seek specialist or senior medical advice and consult local protocol for guidance on further management

CAUTIONS

 With intravenous use Avoid excessive administration cardiac failure - dilutional hyponatraemia especially in the elderly - hypertension - peripheral oedema - pulmonary oedema - restrict intake in impaired renal function toxaemia of pregnancy

SIDE-EFFECTS

- With intravenous use Chills · fever · hypervolaemia · hypotension · local reaction · localised pain · paraesthesia · skin reactions · tremor · vascular irritation · venous thrombosis
- With oral use Abdominal cramps acidosis hyperchloraemic - diarrhoea - generalised oedema - hypertension hypotension - irritability - muscle complaints - nausea vomiting

MONITORING REQUIREMENTS

 With intravenous use The jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

PRESCRIBING AND DISPENSING INFORMATION

With intravenous use Sodium chloride 0.9% intravenous infusion contains Na⁺ and Cl⁺ each 150 mmol/litre. The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%). With oral use Each Slow Sodium[®] tablet contains approximately 10 mmol each of Na⁺ and Cl⁻.

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Compound Sodium Chloride Mouthwash may be prescribed—see sodium bicarbonate with sodium chloride p. 1304.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

NUTRIENTS > SUGARS

Glucose

15-Sep-2021

(Dextrose Monohydrate)

• INDICATIONS AND DOSE

Establish presence of gestational diabetes

► BA WOULL

 Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Oral glucose tolerance test

- ► BY MOUTH
- Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Hypoglycaemia

- ► BY MOUTH
- Child up to 5 years: 5 g, repeated after 15 minutes if necessary, 5 g is available from 20 mL oral glucose liquid, 1.5 glucose tablets, or half a tube of glucose 40% oral gel. If oral glucose formulations are not available, the dose may be given using another fast-acting carbohydrate; 5 g is available from approximately 1 teaspoonful of sugar dissolved in an appropriate volume of water

- Child 5-11 years: 10 g, repeated after 15 minutes if necessary, 10 g is available from 40 mL oral glucose liquid, 3 glucose tablets, or 1 tube of glucose 40% oral gel. If oral glucose formulations are not available, the dose may be given using another fast-acting carbohydrate; 10 g is available from approximately 2 teaspoonfuls of sugar dissolved in an appropriate volume of water
- Child 12-17 years: 15 g, repeated after 15 minutes if necessary, 15 g is available from 60 mL oral glucose liquid, 4 glucose tablets, or 1.5 tubes of glucose 40% oral gel. If oral glucose formulations are not available, the dose may be given using another fast-acting carbohydrate; 15 g is available from approximately 3 teaspoonfuls of sugar dissolved in an appropriate volume of water
- Adult: 15–20 g, repeated after 15 minutes if necessary, 15–20 g is available from 60–80 mL oral glucose liquid, 4–5 glucose tablets, or 1.5–2 tubes of glucose 40% oral gel. If oral glucose formulations are not available, the dose may be given using another fast-acting carbohydrate; 15–20 g is available from approximately 3–4 teaspoonfuls of sugar dissolved in an appropriate volume of water, or 150–200 mL of pure fruit juice
- ► BY INTRAVENOUS INFUSION
- Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a largegauge needle; care is required since this concentration is irritant
- Adult: 15-20 g, to be administered over 15 minutes as Glucose 10% or 20% intravenous infusion into a large vein through a large-gauge needle; care is required since these concentrations are irritant

Hypoglycaemia [in conscious but uncooperative patients]

- ► BY BUCCAL ADMINISTRATION
- Child up to 5 years: 5 g, repeated after 15 minutes if necessary, to be given as half a tube of glucose 40% oral gel
- Child 5-11 years: 10 g, repeated after 15 minutes if necessary, to be given as 1 tube of glucose 40% oral gel
- Child 12-17 years: 15 g, repeated after 15 minutes if necessary, to be given as 1.5 tubes of glucose 40% oral
- Adult: 15–20 g, repeated after 15 minutes if necessary, to be given as 1.5–2 tubes of glucose 40% oral gel

Energy source

- ► BY INTRAVENOUS INFUSION
- Adult: 1–3 litres daily, solution concentration of 20–50% to be administered

Fluid and carbohydrate replacement

- **▶** BY INTRAVENOUS INFUSION
- Adult: The volume of glucose solution needed to replace deficits may vary (consult product literature)

Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)

- ► BY INTRAVENOUS INFUSION
- Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

Diabetic ketoacidosis

- ► BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

- 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.
- For hypoglycaemia, examples of glucose preparations which can be used to give oral doses are based on the use of oral liquid containing glucose 250 mg/mL and tablets containing glucose 4 g per tablet. Buccal dosing is based on tubes of 40% oral gel containing glucose 10 g per tube.

- CAUTIONS Do not give alone except when there is no significant loss of electrolytes - prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances
- SIDE-EFFECTS Chills · electrolyte imbalance · fever · fluid imbalance · hypersensitivity · local reaction · localised pain · polyuria · rash · venous thrombosis
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use in children [EvGr] Injections containing more than 10% glucose can be irritant and should generally be given into a central venous line.
- PRESCRIBING AND DISPENSING INFORMATION Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.

EXCEPTIONS TO LEGAL CATEGORY

- With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for injection, solution for infusion

ORAL REHYDRATION SALTS

Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride

19-0ct-2020

(Formulated as oral rehydration salts)

• INDICATIONS AND DOSE

Fluid and electrolyte loss in diarrhoea

- ► BY MOUTH
- ► Child 1-11 months: 1-1½ times usual feed volume to be given
- Child 1-11 years: 200 mL, to be given after every loose motion
- Child 12-17 years: 200-400 mL, to be given after every loose motion, dose according to fluid loss
- Adult: 200-400 mL, to be given after every loose motion, dose according to fluid loss
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises reconstitute 1 sachet with 200mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral powder formulations may include black currant, citrus, or natural.
- PATIENT AND CARER ADVICE After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

(Formulated as oral rehydration salts)

INDICATIONS AND DOSE

Fluid and electrolyte loss in diarrhoea

- ► BY MOUTH
- Adult: 200-400 mL, to be given after every loose motion, dose according to fluid loss
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 50 mmol and citrate 10 mmol.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral powder formulations may include apricot, black currant, or raspberry.
- PATIENT AND CARER ADVICE Patients and carers should be advised how to reconstitute *Dioralyte* ® Relief oral powder. After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder

EXCIPIENTS: May contain Aspartame

► Dioralyte Relief (Sanofi)

1.1 Calcium imbalance

Calcium imbalance

21-Mar-2022

Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of calcium gluconate injection 10% p. 1139 should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. Calcium chloride injection p. 1138 is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia. Concurrent hypomagnesaemia should be corrected with magnesium sulfate p. 1142.

For guidance on the role of calcium gluconate 10% injection [unlicensed] or calcium chloride 10% injection [unlicensed] in temporarily protecting the heart against the toxic effects of hyperkalaemia, see Fluids and electrolytes p. 1125.

Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 1131. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If severe hypercalcaemia persists drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and pamidronate disodium p. 730 is probably the most effective.

Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 733 can be used for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. Further treatment is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendroflumethiazide p. 181. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

Hyperparathyroidism

07-Jul-2020

Hyperparathyroidism, primary

Primary hyperparathyroidism is a disorder of the parathyroid glands—most commonly caused by a non-cancerous tumour (adenoma) in one of the glands. The resulting excess secretion of parathyroid hormone leads to hypercalcaemia, hypophosphataemia and hypercalciuria. The main symptoms are a result of hypercalcaemia and include thirst, increased urine output, constipation, fatigue and memory impairment. Long term effects include cardiovascular disease, kidney stones, osteoporosis, and fractures.

Primary hyperparathyroidism is one of the leading causes of hypercalcaemia, and one of the most common endocrine disorders. It affects twice as many women than men and can develop at any age—with diagnosis most common in women aged 50 to 60 years.

Aims of treatment

Treatment is focused on cure through surgery; other treatment options aim to reduce long-term complications and improve quality of life.

Non-drug treatment

[EvGr] Information regarding the advantages and disadvantages of available treatments, ongoing monitoring, and advice on how to reduce the symptoms of primary hyperparathyroidism, should be given to all patients.

Parathyroidectomy surgery is the recommended first-line treatment of primary hyperparathyroidism, with unsuccessful surgery requiring multidisciplinary team review at a specialist centre.

For all patients with primary hyperparathyroidism, Cardiovascular disease risk assessment and prevention p. 206, and assessment of Osteoporosis p. 725 and fracture risk should be carried out. For further information on fracture risk assessment, see NICE clinical guideline:

Osteoporosis (see *Useful resources*).

Women of childbearing age

Ever For women with primary hyperparathyroidism who are considering pregnancy, parathyroid surgery should be offered; and for pregnant women the management and monitoring of primary hyperparathyroidism should be discussed with a multidisciplinary team at a specialist centre.

Women with primary hyperparathyroidism are at increased risk of hypertensive disease in pregnancy. For information on diagnosis and management, see *Hypertension in pregnancy* in Hypertension p. 155.

Drug treatment

Ever Treatment with cinacalcet below may be considered for patients with primary hyperparathyroidism if surgery has been unsuccessful [unlicensed indication], is unsuitable, or has been declined; and they have an elevated albuminadjusted serum calcium level with or without symptoms of hypercalcaemia.

In secondary care, vitamin D levels should be measured and supplementation with vitamin D (see Vitamins p. 1172) offered for people with a probable diagnosis of primary hyperparathyroidism if needed.

To reduce fracture risk for people with primary hyperparathyroidism who have an increased fracture risk, a bisphosphonate can be considered. Do not offer bisphosphonates for chronic hypercalcaemia of primary hyperparathyroidism. (A)

1.1a Hypercalcaemia and hypercalciuria

CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Cinacalcet

22-Jan-2020

 DRUG ACTION Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

• INDICATIONS AND DOSE

Secondary hyperparathyroidism [in patients with endstage renal disease on dialysis] (under expert supervision)

- ► BY MOUTH
- Adult: Initially 30 mg once daily, dose to be adjusted every 2-4 weeks according to response; maximum 180 mg per day

Hypercalcaemia in parathyroid carcinoma | Primary hyperparathyroidism [in patients where parathyroidectomy is inappropriate]

- BY MOUTH
- Adult: Initially 30 mg twice daily (max. per dose 90 mg 4 times a day), dose to be adjusted every 2-4 weeks according to response
- CONTRA-INDICATIONS Hypocalcaemia

 CAUTIONS Conditions that may worsen with a decrease in serum-calcium concentrations - switching from etelcalcetide

CAUTIONS, FURTHER INFORMATION

- Conditions that may worsen with a decrease in serum-calcium concentrations Manufacturer advises caution with use in patients with conditions that may worsen with a decrease in serum-calcium concentrations, including predisposition to QT-interval prolongation, history of seizures, and history of impaired cardiac function—serum-calcium concentration should be closely monitored.
- Switching from etelcalcetide Manufacturer advises that in patients who have discontinued etelcalcetide, do not initiate cinacalcet until at least three subsequent haemodialysis sessions are completed, and serum-calcium concentration is confirmed within normal range.
- INTERACTIONS → Appendix 1: cinacalcet
- SIDE-EFFECTS
- ▶ Common or very common Appetite decreased · asthenia · back pain · constipation · cough · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · headache · hypersensitivity · hypotension · muscle complaints · nausea · paraesthesia · rash · seizure · upper respiratory tract infection · vomiting
- Frequency not known Heart failure aggravated QT interval prolongation • ventricular arrhythmia
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment.
- MONITORING REQUIREMENTS
- When used for Secondary hyperparathyroidism Manufacturer advises measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly thereafter.
 Measure parathyroid hormone concentration 1-4 weeks after starting treatment or adjusting dose, then every 1-3 months.
- When used for Primary hyperparathyroidism and parathyroid carcinoma Manufacturer advises measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then every 2–3 months.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises capsules containing granules should be opened and the granules sprinkled on to a small amount of soft food (apple sauce or yogurt) or liquid, then administered immediately. Capsules should not be swallowed whole. For administration advice via nasogastric or gastrostomy tube—consult product literature.
- PATIENT AND CARER ADVICE Manufacturer advises patients and their carers should be counselled on the symptoms of hypocalcaemia and importance of serumcalcium monitoring.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and seizures.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy (January 2007) NICE TAI17 Not recommended
- Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease

on maintenance dialysis therapy (January 2007) NICE TA117 Recommended with restrictions

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Etelcalcetide

26-Aug-2020

 DRUG ACTION Etelcalcetide reduces parathyroid hormone secretion, which leads to a decrease in serum calcium concentrations

• INDICATIONS AND DOSE

Secondary hyperparathyroidism in patients with chronic kidney disease on haemodialysis

- ► BY INTRAVENOUS INJECTION
- Adult: Initially 5 mg 3 times a week, then increased in steps of 2.5-5 mg if required, dose to be increased at intervals of at least 4 weeks; usual maintenance 2.5-15 mg 3 times a week, max. dose 15 mg 3 times a week; consult product literature for information on missed doses, and for dose adjustment due to parathyroid hormone levels or serum-calcium concentrations
- CAUTIONS Conditions that may worsen with hypocalcaemia · hypocalcaemia (do not initiate if serumcalcium concentration is less than the lower limit of normal range) · switching from cinacalcet (do not initiate until 7 days after the last dose of cinacalcet)

CAUTIONS, FURTHER INFORMATION

- Conditions that may worsen with hypocalcaemia Manufacturer advises caution with use in patients with conditions that may worsen with hypocalcaemia, including predisposition to QT-interval prolongation, history of seizures, and history of congestive heart failure—serum-calcium concentration should be closely monitored.
- INTERACTIONS → Appendix 1: etelcalcetide
- SIDE-EFFECTS
- Common or very common Diarrhoea · electrolyte imbalance · headache · heart failure aggravated · hypotension · muscle complaints · nausea · QT interval prolongation · sensation abnormal · vomiting
- ▶ Uncommon Seizure
- ▶ Frequency not known Anaphylactic reaction

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises if formation of anti-etelcalcetide antibodies with a clinically significant effect is suspected, contact manufacturer to discuss antibody testing.

- PREGNANCY Manufacturer advises avoid—limited information available.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- MONITORING REQUIREMENTS Manufacturer advises monitor parathyroid hormone level 4 weeks after treatment initiation or dose adjustment and approximately every 1–3 months during maintenance treatment; monitor serum-calcium concentration before treatment initiation, within 1 week of initiation or dose adjustment, and then approximately every 4 weeks during maintenance treatment.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.
- PATIENT AND CARER ADVICE Manufacturer advises
 patients and their carers should be told to seek medical
 advice if symptoms of hypocalcaemia occur.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Etelcalcetide for treating secondary hyperparathyroidism (June 2017) NICE TA448 Recommended with restrictions
 Scottish Medicines Consortium (SMC) decisions
- Etelcalcetide (Parsabiv®) for the treatment of secondary hyperparathyroidism (HPT) in adult patients with chronic kidney disease (CKD) on haemodialysis therapy (September 2017) SMC No. 1262/17 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Parsabiv (Amgen Ltd)

Etelcalcetide (as Etelcalcetide hydrochloride) 5 mg per 1 ml Parsabiv 2.5mg/0.5ml solution for injection vials | 6 vial PoM £136.87 (Hospital only)

Parsabiv 10mg/2ml solution for injection vials | 6 vial PoM £327.84 (Hospital only)

Parsabiv 5mg/1ml solution for injection vials | 6 vial PoM £163.92 (Hospital only)

1.1b Hypocalcaemia

CALCIUM REGULATING DRUGS > PARATHYROID HORMONES AND ANALOGUES

Parathyroid hormone

27-Feb-2019

(Human recombinant parathyroid hormone)

 DRUG ACTION Parathyroid hormone is produced by recombinant DNA technology; endogenous parathyroid hormone is involved in modulating serum calcium and phosphate levels, regulating renal calcium and phosphate excretion, activating vitamin D, and maintaining normal hone turnover.

• INDICATIONS AND DOSE

Chronic hypoparathyroidism (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Bone metastases · current or previous radiation therapy to skeleton · increased risk factors for osteosarcoma (including Paget's disease or hereditary disorders) · pseudohypoparathyroidism ·

- skeletal malignancy · unexplained raised levels of bonespecific alkaline phosphatase
- CAUTIONS Concomitant use of cardiac glycosides (hypercalcaemia may predispose to digitalis toxicity) monitor cardiac glycoside levels and check for signs and symptoms of digitalis toxicity · concomitant use of drugs that affect calcium levels · young adults with open epiphyses—increased risk of osteosarcoma
- INTERACTIONS → Appendix 1: parathyroid hormone
- SIDE-FFFFCTS
- ► Common or very common Abdominal pain upper · anxiety · arthralgia · asthenia · chest pain · cough · diarrhoea · drowsiness · electrolyte imbalance · headache · hypercalciuria · hypertension · insomnia · muscle complaints · nausea · pain · palpitations · sensation abnormal · tetany · thirst · urinary frequency increased · yomiting

SIDE-EFFECTS, FURTHER INFORMATION Hypercalcaemia is more likely during initial dose titration; if severe hypercalcaemia develops, hydrate and consider suspending treatment (including calcium supplement and active vitamin D).

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment—no information available.
- PRE-TREATMENT SCREENING Manufacturer advises confirm sufficient 25-hydroxyvitamin D stores and normal serum magnesium before treatment.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor serum calcium and assess for signs and symptoms of hypocalcaemia and hypercalcaemia—adjust active vitamin D and calcium supplement as necessary; consult product literature.
- Manufacturer advises periodic monitoring of the response of serum calcium to treatment (response may decrease over time—if 25-hydroxyvitamin D is low, supplementation may restore serum calcium response).
- TREATMENT CESSATION Abrupt interruption or discontinuation can result in severe hypocalcaemia manufacturer advises to monitor serum calcium and adjust calcium supplement and active vitamin D treatment.
- PRESCRIBING AND DISPENSING INFORMATION
 Manufacturer advises record the brand name and batch number after each administration.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8 °C); reconstituted solution may be stored for up to 14 days in a refrigerator, and up to 3 days outside of a refrigerator (below 25 °C), during the 14-day use period.
- PATIENT AND CARER ADVICE Patients may self-administer Natpar®, after appropriate training in subcutaneous injection technique.

Missed doses Manufacturer advises missed doses should be administered as soon as possible, and additional treatment with calcium and/or active vitamin D must be taken, based on symptoms of hypocalcaemia.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- CAUTIONS Correct dehydration when administering concentrated solution history of cardiovascular diseaseincreased capillary permeability-risk of haemodilution (e.g. severe anaemia or haemorrhagic disorders)-risk of hypervolaemia (e.g. oesophageal varices or pulmonary oedema)-vaccination against hepatitis A and hepatitis B may be required

CAUTIONS, FURTHER INFORMATION

- Volume status Manufacturer advises adjust dose and rate of infusion to avoid fluid overload.
- SIDE-EFFECTS
- ▶ Rare or very rare Fever flushing nausea shock urticaria
- MONITORING REQUIREMENTS Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.
- PRESCRIBING AND DISPENSING INFORMATION A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Albumin solution (Non-proprietary)

Albumin solution human 200 mg per 1 ml Human Albumin Grifols 20% solution for infusion 50ml vials | 1 vial Pom £27.00 (Hospital only)

Magnesium imbalance

Magnesium imbalance

05-May-2021

Overview

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate p. 1142 as an osmotic laxative.

Evgr Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, which can result in hypermagnesaemia (causing muscle weakness and arrhythmias). Calcium gluconate injection is used for the management of magnesium toxicity.

Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula can cause hypomagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia.

Symptomatic hypomagnesaemia is usually associated with severe magnesium depletion. Magnesium can be given by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful.

Patients with mild magnesium depletion are usually asymptomatic. Oral magnesium glycerophosphate below is licensed for hypomagnesaemia. Oral magnesium aspartate below is licensed for the treatment and prevention of magnesium deficiency.

1.3a Hypomagnesaemia

ELECTROLYTES AND MINERALS > MAGNESIUM

Magnesium aspartate

10-Aug-2021

INDICATIONS AND DOSE

Treatment and prevention of magnesium deficiency

- ► BY MOUTH
- ▶ Adult: 10-20 mmol daily, taken as 1-2 sachets of Magnaspartate® powder.
- CONTRA-INDICATIONS Disorders of cardiac conduction
- INTERACTIONS → Appendix 1: magnesium
- SIDE-EFFECTS
- ▶ Uncommon Diarrhoea · faeces soft
- ▶ Rare or very rare Fatigue hypermagnesaemia
- ▶ Frequency not known Gastrointestinal irritation SIDE-EFFECTS, FURTHER INFORMATION Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

Overdose Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

- RENAL IMPAIRMENT See p. 21. EvGr Avoid if eGFR less than 30 mL/minute/1.73 m².
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises dissolve sachet contents in 50-200 mL water, tea or orange juice and take immediately.
- PRESCRIBING AND DISPENSING INFORMATION Magnaspartate® contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.
- PATIENT AND CARER ADVICE Patients and carers should be given advice on how to administer magnesium aspartate powder.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

Powder

EXCIPIENTS: May contain Sucrose

Magnaspartate (Kora Healthcare)

Magnesium (as Magnesium aspartate) 243 mg Magnaspartate 243mg (magnesium 10mmol) oral powder sachets | 10 sachet PoM £9.45 DT = £9.45

Magnesium glycerophosphate

15-Dec-2021

INDICATIONS AND DOSE

Prevent recurrence of magnesium deficit

- ► BY MOUTH
- Adult: 24 mmol daily in divided doses, dose expressed as Mg²⁺

DOSE EQUIVALENCE AND CONVERSION

▶ Magnesium glycerophosphate 1 g is approximately equivalent to Mg²⁺ 4 mmol or magnesium 97 mg.

NEOMAG ® CHEWABLE TABLETS

Hypomagnesaemia

- ► BY MOUTH
- ▶ Adult: Initially 1–2 tablets 3 times a day, dose to be adjusted according to the serum total magnesium level
- DOSE EQUIVALENCE AND CONVERSION
- ► Each Neomag® chewable tablet contains Mg²⁺ 4 mmol or magnesium 97 mg.

- UNLICENSED USE Preparations other than Neomag® are not licensed for use.
- INTERACTIONS → Appendix 1: magnesium
- SIDE-EFFECTS Diarrhoea · hypermagnesaemia

Overdose Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

- RENAL IMPAIRMENT [EVG] Caution (risk of hypermagnesaemia); avoid if creatinine clearance less than 30 mL/minute. See p. 21.
- MONITORING REQUIREMENTS Manufacturer advises to monitor serum magnesium levels every 3–6 months.
- DIRECTIONS FOR ADMINISTRATION

NEOMAG CHEWABLE TABLETS Manufacturer advises that tablets may be broken into quarters and chewed or swallowed with water.

Magnesium sulfate

16-Nov-2021

• INDICATIONS AND DOSE

Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

- ► BY INTRAVENOUS INFUSION
- Child 2-17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes
- ▶ Adult: 1.2-2 g, to be given over 20 minutes

Prevention of seizures in pre-eclampsia

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 4 g, to be given over 5-15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours, if seizure occurs, give an additional dose of 2-4 g by intravenous injection over 5-15 minutes

Treatment of seizures and prevention of seizure recurrence in eclampsia

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 4 g, to be given over 5-15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours after seizure or delivery (whichever is later), if seizure recurs, give an additional dose of 2-4 g by intravenous injection over 5-15 minutes

Hypomagnesaemia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- Adult: Up to 40 g, given over a period of up to 5 days, dose given depends on the amount required to replace the deficit (allowing for urinary losses)

Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ► Adult: 2.5–5 g daily, usual dose 3 g daily

Emergency treatment of serious arrhythmias

- ► BY INTRAVENOUS INJECTION
- Adult: 2 g, to be given over 10-15 minutes, dose may be repeated once if necessary

Rapid bowel evacuation (acts in 2-4 hours)

- ► BY MOUTH
- Adult: 5-10 g, dose to be mixed in a glass of water, taken preferably before breakfast

DOSE EQUIVALENCE AND CONVERSION

- Magnesium sulfate heptahydrate 1 g equivalent to Mg²⁺ approx. 4 mmol.
- UNLICENSED USE Unlicensed indication in severe acute asthma and continuing respiratory deterioration in anaphylaxis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MAGNESIUM SULFATE: RISK OF SKELETAL ADVERSE EFFECTS IN THE NEONATE FOLLOWING PROLONGED OR REPEATED USE IN PREGNANCY (MAY 2019)

Maternal administration of magnesium sulfate for longer than 5–7 days in pregnancy has been associated with hypocalcaemia, hypermagnesaemia, and skeletal side-effects in neonates. Healthcare professionals are advised to consider monitoring neonates for abnormal calcium and magnesium levels, and skeletal side-effects if maternal treatment with magnesium sulfate during

pregnancy is prolonged or repeated beyond current recommendations.

CONTRA-INDICATIONS

- With oral use In rapid bowel evacuation—acute gastrointestinal conditions
- CAUTIONS
- With oral use In rapid bowel evacuation—elderly and debilitated patients
- INTERACTIONS → Appendix 1: magnesium
- SIDE-EFFECTS
- ► Rare or very rare
- With oral use Paralytic ileus
- ► Frequency not known
- With intravenous use Bone demineralisation (reported in neonates following prolonged or repeated use in pregnancy) · electrolyte imbalance · osteopenia (reported in neonates following prolonged or repeated use in pregnancy)
- With oral use Diarrhoea · gastrointestinal discomfort · hypermagnesaemia

Overdose Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

- PREGNANCY For information on the risk of side-effects in neonates following prolonged or repeated maternal use of magnesium sulfate during pregnancy, see *Important Safety Information*.
- When used for Hypomagnesaemia or Arrhythmias or Prevention of seizures in pre-eclampsia or Treatment of seizures and prevention of seizure recurrence in eclampsia or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis in adults Not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression. Sufficient amount may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns.
- HEPATIC IMPAIRMENT Avoid in hepatic coma if risk of renal failure.

RENAL IMPAIRMENT

- With intramuscular use or intravenous use EvG Caution in mild to moderate impairment; avoid in severe impairment (increased risk of toxicity).
- ▶ With oral use in adults Ever Avoid. ♠

Dose adjustments • With intramuscular use or intravenous use **EVGT** Reduce dose (consult product literature).

 MONITORING REQUIREMENTS Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump). For intravenous injection, in arrhythmias, hypomagnesaemia, eclampsia, and preeclampsia, give continuously in Glucose 5% or Sodium chloride 0.9%. Concentration of magnesium sulfate heptahydrate should not exceed 20% (200 mg/mL or 0.8 mmol/mL Mg²⁺); dilute 1 part of magnesium sulfate injection 50% with at least 1.5 parts of water for injections. Max. rate 150 mg/minute (0.6 mmol/minute Mg²⁺).
- PRESCRIBING AND DISPENSING INFORMATION
- With intramuscular use or intravenous use The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate

concentration of magnesium ions (Mg²⁺) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

- When used for Asthma For choice of therapy, see Asthma, acute p. 260 and Asthma, chronic p. 256.
- EXCEPTIONS TO LEGAL CATEGORY
- With oral use Magnesium sulfate is on sale to the public as Epsom Salts.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

Solution for injection

1.4 Phosphate imbalance

Phosphate supplements

Phosphate imbalance

15-Dec-2021

Oral phosphate supplements p. 1146 are licensed for the treatment of patients with vitamin D-resistant hypophosphataemic osteomalacia.

Phosphate deficiency may arise in patients with alcohol dependence. [EvG] Phosphate depletion may also occur in patients with severe diabetic ketoacidosis, however phosphate replacement is not routinely recommended.

Phosphate depletion in patients on total parenteral nutrition is common; for phosphate requirements in total parenteral nutrition regimens, see Intravenous nutrition p. 1167.

Phosphate-binding agents

Ever For the management of hyperphosphataemia in patients with stage 4 or 5 chronic kidney disease (CKD), dietary management and dialysis (for patients who are having this) should be optimised prior to starting phosphate-binding agents. Both calcium-based and non-calcium-based preparations are used as phosphate-binding agents.

Calcium acetate p. 1144 should be offered as the first-line phosphate binder. If calcium acetate is not tolerated or is

unsuitable (e.g. because of hypercalcaemia or low serum parathyroid hormone levels), sevelamer p. 1145 (a non-calcium-based phosphate binder) should be offered. For patients in whom sevelamer is unsuitable, consider calcium carbonate p. 1138 as an alternative if a calcium-based phosphate binder is needed, or sucroferric oxyhydroxide p. 1146 for patients who are on dialysis and do not need a calcium-based phosphate binder. Lanthanum p. 1145 (a non-calcium-based phosphate binder) should only be considered if other phosphate binders cannot be used.

For patients with stage 4 or 5 CKD who are on the maximum tolerated dose of a calcium-based phosphate binder but remain hyperphosphataemic, consider combining treatment with a non-calcium-based phosphate binder.

For further guidance on the management of hyperphosphataemia in patients with CKD, see NICE guideline: Chronic kidney disease: assessment and management (available at: www.nice.org.uk/guidance/ng203).

INDICATIONS AND DOSE

PHOSEX ® TABLETS

Hyperphosphataer

Hyperphosphataemia in patients with chronic renal failure on dialysis

- ► BY MOUTH
- Adult: Initially 1 tablet 3 times a day, to be taken with meals, dose to be adjusted according to serumphosphate concentration, usual dose 4–6 tablets daily in divided doses, (1 or 2 tablets with each meal); maximum 12 tablets per day

RENACET® TABLETS

Hyperphosphataemia in patients with chronic renal failure on dialysis

- ► BY MOUTH
- Adult: 475–950 mg, to be taken with breakfast and with a snack, 0.95–2.85 g, to be taken with a main meal and 0.95–1.9 g, to be taken with supper, dose to be adjusted according to serum-phosphate concentration; maximum 6.65 g per day
- INTERACTIONS → Appendix 1: calcium salts
- SIDE-EFFECTS
- ▶ Uncommon Vomiting
- DIRECTIONS FOR ADMINISTRATION

PHOSEX ® TABLETS Manufacturer advises *Phosex* ® tablets are taken with meals.

Tablets can be broken to aid swallowing, but not chewed (bitter taste).

RENACET TABLETS Manufacturer advises that other drugs should be taken 1 to 2 hours before or after *Renacet* to reduce the possible interference with absorption of other drugs.

Renacet® tablets are taken with meals.

PRESCRIBING AND DISPENSING INFORMATION

PHOSEX ® TABLETS Phosex® tablets contain calcium acetate 1 g (equivalent to calcium 250 mg or Ca²⁺ 6.2 mmol).

RENACET ® TABLETS Renacet ® tablets contain calcium acetate 475 mg (equivalent to calcium 120.25 mg or Ca $^{2+}$ 3 mmol).

PATIENT AND CARER ADVICE

PHOSEX ® TABLETS Patients or carers should be given advice on how to administer *Phosex* ® tablets.

RENACET ® TABLETS Patients or carers should be given

advice on how to administer *Renacet* ablets.

- INTERACTIONS → Appendix 1: lanthanum
- SIDE-FFFFCTS
- ► Common or very common Constipation · diarrhoea · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · vomiting
- ▶ Uncommon Alopecia · appetite abnormal · arthralgia · asthenia · burping · chest pain · dizziness · dry mouth · eosinophilia · hyperglycaemia · hyperhidrosis · hyperparathyroidism · increased risk of infection · irritable bowel syndrome · malaise · myalgia · oral disorders · osteoporosis · pain · peripheral oedema · taste altered · thirst · vertigo · weight decreased
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises caution—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (may be excreted in bile—possible risk of slower elimination and increased plasma concentrations in patients with reduced bile flow)—monitor liver function tests.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets are to be chewed. Manufacturer advises each sachet of powder to be mixed with soft food and consumed within 15 minutes.
- PATIENT AND CARER ADVICE Patient and carers should be given advice on how to administer lanthanum tablets and powder.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ► Lanthanum carbonate chewable tablets (Fosrenol®) for the control of hyperphosphataemia in chronic renal failure patients (May 2007) SMC No. 286/06 Recommended with restrictions
- ► Lanthanum carbonate chewable tablets (Fosrenol®) for the control of hyperphosphataemia in adult patients with chronic renal failure not on dialysis with serum phosphate levels ≥1.78 mmol/L (October 2010) SMC No. 640/10 Not recommended
- Lanthanum carbonate oral powder (Fosrenol®) for the treatment of hyperphosphataemia in chronic renal failure patients (December 2012) SMC No. 821/12 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Sevelamer

12-Nov-2020

INDICATIONS AND DOSE

PENAGEI ®

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

► BY MOUTH

 Adult: Initially 2.4-4.8 g daily in 3 divided doses, dose to be given with meals and adjusted according to serum-phosphate concentration; usual dose 2.4-12 g daily in 3 divided doses

RENVELA® 2.4G ORAL POWDER SACHETS

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

- ► BY MOUTH
- Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks consult product literature; usual dose 6 g daily in 3 divided doses

RENVELA® 800MG TABLETS

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

- ► BY MOUTH
- Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks; usual dose 6 g daily in 3 divided doses
- CONTRA-INDICATIONS Bowel obstruction
- CAUTIONS Gastro-intestinal disorders
- INTERACTIONS → Appendix 1: sevelamer
- SIDE-EFFECTS
- ► Common or very common Constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · nausea · vomiting
- ▶ Frequency not known Skin reactions
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING

RENAGEL Manufacturer advises use only if potential benefit outweighs risk.

RENVELA ® 800MG TABLETS, 2.4G ORAL POWDER SACHETS Unlikely to be present in milk (however, manufacturer advises avoid).

DIRECTIONS FOR ADMINISTRATION

RENVELA 2.4G ORAL POWDER SACHETS Manufacturer advises each sachet should be dispersed in 60 mL water, or mixed with a small amount of cool food (100 g), prior to administration and discarded if unused after 30 minutes.

PATIENT AND CARER ADVICE

RENVELA $^{\odot}$ **2.4G ORAL POWDER SACHETS** Patients and carers should be advised on how to administer powder for oral suspension.

NATIONAL FUNDING/ACCESS DECISIONS

Sucroferric oxyhydroxide

24-Jul-2020

• INDICATIONS AND DOSE

Hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis

- ► BY MOUTH
- Adult: Initially 1.5 g daily in 3 divided doses, dose to be taken with meals, then adjusted in steps of 500 mg every 2-4 weeks, dose adjusted according to serumphosphate concentration; maintenance 1.5-2 g daily in divided doses; maximum 3 g per day
- CONTRA-INDICATIONS Haemochromatosis · iron accumulation disorders
- CAUTIONS Gastric disorders · hepatic disorders · major gastrointestinal surgery · peritonitis in the last 3 months
- INTERACTIONS → Appendix 1: sucroferric oxyhydroxide
- SIDE-EFFECTS
- Common or very common Constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · nausea · product taste abnormal · tooth discolouration · vomiting
- ▶ Uncommon Dysphagia · dyspnoea · electrolyte imbalance · fatigue · headache · skin reactions · tongue discolouration SIDE-EFFECTS, FURTHER INFORMATION Discoloured faeces may mask the visual signs of gastrointestinal bleeding.
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises Velphoro® tablets must be chewed or crushed, not swallowed whole.

- PATIENT AND CARER ADVICE Patients or carers should be counselled on administration of sucroferric oxyhydroxide tablets and advised that this medication can cause discoloured black stools
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Chewable tablet

▶ Velphoro (Vifor Fresenius Medical Care Renal Pharma UK Ltd) Iron (as Sucroferric oxyhydroxide) 500 mg Velphoro 500mg chewable tablets | 90 tablet PoM £179.00 DT = £179.00

1.4b Hypophosphataemia

ELECTROLYTES AND MINERALS > PHOSPHATE

Phosphate

05-Oct-2021

• INDICATIONS AND DOSE

Treatment of moderate to severe hypophosphatemia

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

Established hypophosphataemia (with monobasic potassium phosphate)

- ► BY INTRAVENOUS INFUSION
- Adult: 9 mmol every 12 hours, increased if necessary up to 0.5 mmol/kg (max. per dose 50 mmol), increased dose to be used in critically ill patients; dose to be infused over 6–12 hours, according to severity

Vitamin D-resistant hypophosphataemic osteomalacia

- ► BY MOUTH USING EFFERVESCENT TABLETS
- Adult: 4–6 tablets daily, using Phosphate Sandoz[®].

IMPORTANT SAFETY INFORMATION

With intravenous use

Some phosphate injection preparations also contain potassium. Expert sources advise for peripheral intravenous administration the *concentration* of potassium should not usually exceed 40 mmol/litre; the infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium concentrate should be followed. The potassium content of some phosphate preparations may also limit the *rate* at which they may be administered.

CAUTIONS

GENERAL CAUTIONS Cardiac disease • dehydration • diabetes mellitus • sodium and potassium concentrations of preparations

SPECIFIC CAUTIONS

- With intravenous use Avoid extravasation · severe tissue necrosis
- INTERACTIONS → Appendix 1: phosphate
- SIDE-EFFECTS
- With intravenous use Electrolyte imbalance
- With oral use Abdominal distress · diarrhoea · nausea SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea is a common side-effect and should prompt a reduction in dosage.

RENAL IMPAIRMENT

Dose adjustments Reduce dose.

Monitoring Monitor closely in renal impairment.

- MONITORING REQUIREMENTS It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.
- PRESCRIBING AND DISPENSING INFORMATION Phosphate Sandoz® contains sodium dihydrogen phosphate

anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na* 20.4 mmol), potassium 123 mg (K* 3.1 mmol); *Polyfusor NA* © contains Na* 162 mmol/litre, K* 19 mmol/litre, PO₄ 3* 100 mmol/litre; non-proprietary *potassium dihydrogen phosphate injection* (potassium acid phosphate) 13.6% may contain 1 mmol/mL potassium.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13

Other drugs used for Hyperkalaemia Calcium chloride, p. 1138 · Calcium gluconate, p. 1139

ANTIDOTES AND CHELATORS > CATION EXCHANGE COMPOUNDS

Calcium polystyrene sulfonate

05-0ct-2021

• INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

- ► BY MOUTH
- Adult: 15 g 3-4 times a day
- ► BY RECTUM
- Adult: 30 g, retained for 9 hours followed by irrigation to remove resin from colon
- CONTRA-INDICATIONS Hyperparathyroidism metastatic carcinoma multiple myeloma obstructive bowel disease sarroidosis
- INTERACTIONS → Appendix 1: polystyrene sulfonate
- SIDE-EFFECTS Appetite decreased · constipation (discontinue—avoid magnesium-containing laxatives) · diarrhoea · electrolyte imbalance · epigastric discomfort · gastrointestinal disorders · gastrointestinal necrosis (in combination with sorbitol) · hypercalcaemia (in dialysed patients and occasionally in those with renal impairment) · increased risk of infection · nausea · vomiting
- PREGNANCY Manufacturers advise use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturers advise use only if potential benefit outweighs risk—no information available.

- MONITORING REQUIREMENTS Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
- DIRECTIONS FOR ADMINISTRATION
- With rectal use Manufacturer advises mix each 30 g of resin with 150 mL of water or 10% glucose.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

Powder

CAUTIONARY AND ADVISORY LABELS 13

- Calcium polystyrene sulfonate (Non-proprietary)
 Calcium polystyrene sulfonate 999 mg per 1 gram Calcium polystyrene sulfonate powder sugar free sugar-free | 300 gram Pom £77.58-£82.16 DT = £82.16
- ► Calcium Resonium (Sanofi)

Calcium polystyrene sulfonate 999 mg per 1 gram Calcium Resonium powder sugar-free | 300 gram P £82.16 DT = £82.16

Patiromer calcium

21-Sep-2021

- DRUG ACTION Patiromer is a non-absorbed cationexchange polymer that acts as a potassium binder in the gastro-intestinal tract.
- INDICATIONS AND DOSE

Hyperkalaemia

- ► BY MOUTH
- Adult: Initially 8.4 g once daily; adjusted in steps of 8.4 g as required, dose adjustments should be made at intervals of at least one week; maximum 25.2 g per day PHARMACOKINETICS
- ▶ Onset of action 4–7 hours.
- CAUTIONS Risk factors for hypercalcaemia (calcium partially released from counterion complex) · severe gastro-intestinal disorders (ischaemia, necrosis, and intestinal perforation reported with other potassium binders)
- INTERACTIONS → Appendix 1: patiromer
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · constipation · diarrhoea · flatulence · hypomagnesaemia
- ▶ Uncommon Nausea · vomiting
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available (although no effects on the infant are anticipated).
- MONITORING REQUIREMENTS Manufacturer advises monitor for electrolyte disturbances, particularly plasmapotassium (as clinically indicated) and plasma-magnesium (continue to monitor for at least 1 month after initiation of treatment).
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises Veltassa® should be mixed with approx. 40 mL of water, then stirred and mixed with a further approx. 40 mL of water; the powder will not dissolve. More water may be added as needed. The mixture should be taken within 1 hour of preparation. Apple juice or cranberry juice may be used instead of water, other liquids should be avoided as they may contain high amounts of potassium.
- HANDLING AND STORAGE Store in a refrigerator (2–8°C) prior to dispensing; once dispensed, patient may store below 25°C for up to 6 months.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

Patiromer for treating hyperkalaemia (February 2020)
 NICE TA623 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Patiromer sorbitex calcium (Veltassa®) for the treatment of hyperkalaemia in adults (August 2021) SMC No. SMC2381 Recommended with restrictions

Sodium zirconium cyclosilicate 04-Feb-2022

 DRUG ACTION Sodium zirconium cyclosilicate is a nonabsorbed cation-exchange compound that acts as a selective potassium binder in the gastro-intestinal tract.

INDICATIONS AND DOSE

Hyperkalaemia

- ► BY MOUTH
- Adult: Initially 10 g 3 times a day, for up to 72 hours, followed by maintenance 5 g once daily, adjusted according to serum-potassium concentrations. The usual maintenance dose range is 5 g once every other day to 10 g once daily

PHARMACOKINETICS

- ▶ Onset of action about 1 hour.
- CAUTIONS Abdominal X-ray (sodium zirconium cyclosilicate may be opaque to X-rays)
- INTERACTIONS → Appendix 1: sodium zirconium cyclosilicate
- SIDE-EFFECTS

05-0ct-2021

- ► Common or very common Fluid imbalance oedema peripheral swelling
- ► Frequency not known Constipation · nausea
- PREGNANCY Manufacturer advises avoid—limited information; animal studies do not indicate toxicity.
- MONITORING REQUIREMENTS Manufacturer advises monitor serum potassium as clinically indicated.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises mix the contents of each 5- or 10-g sachet of powder with approx. 45 mL of water and stir well. The powder will not dissolve and the suspension should be taken while it is cloudy; if the powder settles it should be stirred again.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

➤ Sodium zirconium cyclosilicate for treating hyperkalaemia (updated January 2022) NICE TA599 Recommended with restrictions

1.5b Hypokalaemia

ELECTROLYTES AND MINERALS > POTASSIUM

Potassium bicarbonate with potassium acid tartrate

03-Aug-2020

• INDICATIONS AND DOSE

Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastro-intestinal disorders)

- ► BY MOUTH
- Adult: (consult product literature)

- CONTRA-INDICATIONS Hypochloraemia plasmapotassium concentration above 5 mmol/litre
- CAUTIONS Cardiac disease elderly
- SIDE-EFFECTS Diarrhoea · flatulence · gastrointestinal discomfort · nausea · vomiting
- RENAL IMPAIRMENT Avoid in severe impairment. Monitoring Close monitoring required in renal impairment-high risk of hyperkalaemia.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets to be dissolved in water before administration.
- PRESCRIBING AND DISPENSING INFORMATION These tablets do not contain chloride.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

Potassium bicarbonate with potassium acid tartrate (Non-

Potassium acid tartrate 300 mg, Potassium bicarbonate 500 mg Potassium (potassium 6.5mmol) effervescent tablets BPC 1968 | 56 tablet GSL £91.91

Potassium chloride

29-Mar-2021

INDICATIONS AND DOSE

- Prevention of hypokalaemia (patients with normal diet) ► BY MOUTH
- ▶ Adult: 2-4 g daily in divided doses

Electrolyte imbalance

- ► BY INTRAVENOUS INFUSION
- Adult: Dose dependent on deficit or the daily maintenance requirements

IMPORTANT SAFETY INFORMATION

SAFE DRACTICE

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be thoroughly mixed. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

NHS NEVER EVENT: MIS-SELECTION OF A STRONG POTASSIUM SOLUTION (JANUARY 2018)

Patients should not be inadvertently given a strong potassium solution (≥10% potassium w/v) intravenously, rather than the intended medication.

- CONTRA-INDICATIONS Plasma-potassium concentration above 5 mmol/litre
- CAUTIONS
- With intravenous use Seek specialist advice in very severe potassium depletion or difficult cases
- ▶ With oral use Cardiac disease elderly hiatus hernia (with modified-release preparations) · history of peptic ulcer (with modified-release preparations) · intestinal stricture (with modified-release preparations)
- INTERACTIONS → Appendix 1: potassium chloride
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS Hyperkalaemia SPECIFIC SIDE-EFFECTS

- ▶ With oral use Abdominal cramps · diarrhoea · gastrointestinal disorders · nausea · vomiting
- RENAL IMPAIRMENT Avoid in severe impairment. Dose adjustments Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia.

Monitoring Close monitoring required in renal impairment-high risk of hyperkalaemia.

- MONITORING REQUIREMENTS
- ▶ Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
- With intravenous use ECG monitoring should be performed in difficult cases
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use Ready-mixed infusion solutions should be used where possible. Evgr If potassium chloride concentrate is used, it must be diluted and thoroughly mixed with Sodium Chloride 0.9% intravenous infusion. and given slowly. The maximum infusion rate is 20 mmol/hour. N For peripheral intravenous infusion, [EVGr] the concentration of potassium should not usually exceed 40 mmol/L. (**) Expert sources advise higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.
- PRESCRIBING AND DISPENSING INFORMATION Kay-Cee-L.® contains 1 mmol/mL each of K+ and Cl-. Potassium Tablets
- With oral use Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states.
- PATIENT AND CARER ADVICE Patient or carers should be given advice on how to administer potassium chloride modified-release tablets.
 - Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. LoSalt® and Ruthmol®). These should not be used by patients with renal failure as potassium intoxication may result.
- LESS SUITABLE FOR PRESCRIBING Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, solution for injection, infusion, solution

2 Metabolic disorders

2.1 Acute porphyrias

Acute porphyrias

05-May-2022

Overview

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 75 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Evor Where there is no safe alternative, drug treatment for serious or life-threatening conditions should not be withheld from patients with acute porphyria. Where possible, the clinical situation should be discussed with a porphyria specialist for advice on how to proceed and monitor the patient. In the UK clinical advice can be obtained from the National Acute Porphyria Service or from the UK Porphyria Medicines Information Service (UKPMIS) (see Useful resources).

Haem arginate p. 1151 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from two centres (Cardiff and Vale University Health Board and King's College Hospital) (see *Useful resources*).

Drugs unsafe for use in acute porphyrias

Ever The following list contains drugs that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available. (£)

An up-to-date list of drugs considered safe in acute porphyrias is available from the UKPMIS (see *Useful resources*).

Further information may be obtained from the European Porphyria Network (available at: porphyria.eu/) and UKPMIS (see *Useful resources*).

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Anabolic steroids
- Antidepressants, MAOIs (contact UKPMIS for advice)
- Antidepressants, Tricyclic and related (contact UKPMIS for advice)
- Barbiturates (includes primidone and thiopental)
- Contraceptives, hormonal (for detailed advice contact UKPMIS or a porphyria specialist)
- Hormone replacement therapy (for detailed advice contact UKPMIS or a porphyria specialist)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact UKPMIS for advice)

- Progestogens (for detailed advice contact UKPMIS or a porphyria specialist)
- Protease inhibitors (contact UKPMIS for advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonylureas (glipizide and glimepiride are thought to be safe)
 - Taxanes (contact UKPMIS for advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe Drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant
- · Artemether with lumefantrine
- Bexarotene
- Bosentan
- Busulfan
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clemastine
- Clindamycin
- Cocaine
- DanazolDapsone
- Diltiazem
- Disopvramide
- DisulfiramErgometrine
- Ergotiamine
- Ervthromycin
- Etamsylate
- Ethosuximide
- EtomidateFlutamide
- Fosaprepitant
- Fosphenytoin
- Griseofulvin
- HydralazineIfosfamide
- Indapamide
- Isometheptene mucate
- Isoniazid (safety uncertain, contact UKPMIS for advice)
 - Ketamine
- Mefenamic acid (safety uncertain, contact UKPMIS for advice)
- Meprobamate
- Methyldopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (safety uncertain, contact UKPMIS for advice)
- Mitotane
- Nalidixic acidNitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxvbutvnin
- Pentazocine

Haem arginate

05-Oct-2021

(Human hemin)

• INDICATIONS AND DOSE

Acute porphyrias | Acute intermittent porphyria | Porphyria variegata | Hereditary coproporphyria

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring: maximum 250 mg per day
- SIDE-EFFECTS
- ► Common or very common Poor venous access
- ► Rare or very rare Fever
- ► Frequency not known Headache · injection site necrosis · skin discolouration · venous thrombosis
- PREGNANCY Manufacturer advises avoid unless essential.
- BREAST FEEDING Manufacturer advises avoid unless essential-no information available.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Normosang®), manufacturer advises give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebrachial or central vein: administer within 1 hour after dilution.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Normosang (Recordati Rare Diseases UK Ltd) Haem arginate 25 mg per 1 ml Normosang 250mg/10ml solution for infusion ampoules | 4 ampoule PoM £1,737.00

DRUGS FOR METABOLIC DISORDERS > SMALL

INTERFERING RIBONIICI FIC ACID

Givosiran

 DRUG ACTION Givosiran is a small interfering RNA, which reduces production of the enzyme ALAS1 involved in haem synthesis in the liver, thereby reducing accumulation of neurotoxic intermediates that cause acute porphyria attacks and symptoms.

INDICATIONS AND DOSE

Acute hepatic porphyria (initiated under specialist supervision)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 2.5 mg/kg once a month, dosage based on actual body-weight
- INTERACTIONS → Appendix 1: givosiran
- SIDE-FFFFCTS
- ► Common or very common Fatigue hypersensitivity nausea · renal impairment · skin reactions
- PREGNANCY EVGT Use only if potential benefit outweighs risk—toxicity in animal studies. (M)
- BREAST FEEDING EvGr Avoid—present in milk in animal studies.
- RENAL IMPAIRMENT EVGT Monitor renal function during treatment-progression of impairment reported.
- MONITORING REQUIREMENTS EVGr Monitor liver function before treatment, every 4 weeks for the first 6 months of treatment, then as clinically indicated thereafter. For transaminase elevations consider discontinuing or interrupting treatment; restarting treatment at a reduced dose may be considered—consult product literature.
- DIRECTIONS FOR ADMINISTRATION [EVGr] Maximum 1.5 mL per injection site; inject into the abdomen, thigh or upper arm and rotate injection site. Avoid injecting into scar tissue or skin that is reddened, inflamed or swollen.
- PRESCRIBING AND DISPENSING INFORMATION FVGr The efficacy and safety data in acute hepatic porphyria (AHP) subtypes other than acute intermittent porphyria (hereditary coproporphyria, variegate porphyria and 5-aminolaevulinic acid dehydratase-deficient porphyria) are limited; this should be taken into consideration when assessing the individual benefit-risk in these rare AHP subtypes. (M)
- NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ► Givosiran for treating acute hepatic porphyria (November 2021) NICE HST16 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Givosiran (non-proprietary)

Givosiran (as Givosiran sodium) 189 mg per 1 ml Givlaari 189mg/1ml solution for injection vials | 1 vial Pom £41,884.43 (Hospital only)

2.2 Amyloidosis

NEUROPROTECTIVE DRUGS

Inotersen

27-Aug-2020

 DRUG ACTION Inotersen is an antisense oligonucleotide inhibitor which inhibits transthyretin production.

• INDICATIONS AND DOSE

Stage 1 or stage 2 polyneuropathy in patients with hereditary transthyretin amyloidosis (hATTR) (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 284 mg once weekly, for dose adjustments due to side-effects and information on Vitamin A supplementation—consult product literature
- CONTRA-INDICATIONS Patients undergoing liver transplantation (no information available) platelet count less than 100x10⁹/litre before starting treatment urine protein to creatinine ratio (UPCR) greater than or equal to 113 mg/mmol before starting treatment
- CAUTIONS Concomitant administration with nephrotoxic drugs elderly history of major bleeding
- INTERACTIONS → Appendix 1: inotersen
- SIDE-EFFECTS
- ► Common or very common Anaemia · appetite decreased · chills · eosinophilia · fever · glomerulonephritis · haematoma · headache · hypotension · influenza like illness · nausea · peripheral oedema · peripheral swelling · proteinuria · renal impairment · skin reactions · thrombocytopenia · vomiting
- Frequency not known Intracranial haemorrhage · vitamin A deficiency
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of childbearing potential should use effective contraception during treatment; if conception is planned, inotersen and vitamin A supplementation should be stopped and vitamin A levels monitored—consult product literature.
- PREGNANCY Manufacturer advises avoid unless essential (limited information available)—potential teratogenic risk due to unbalanced vitamin A levels, consult product literature.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises avoid if eGFR less than 45 mL/minute/1.73 m². See p. 21.
- PRE-TREATMENT SCREENING Manufacturer advises plasma vitamin A levels below the lower limit of normal should be corrected and any ocular symptoms or signs of vitamin A deficiency should have resolved before starting treatment.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor platelet count before starting treatment, every 2 weeks during treatment, and for 8 weeks after stopping treatment—consult product literature
- Manufacturer advises monitor UPCR and eGFR before starting treatment, every 3 months or more frequently as clinically indicated during treatment, and for 8 weeks after stopping treatment—consult product literature.
- Manufacturer advises monitor hepatic enzymes before starting treatment, then 4 months after starting treatment, and annually thereafter or more frequently as clinically indicated.

- DIRECTIONS FOR ADMINISTRATION Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration. Patients may selfadminister Tegsedi[®] after appropriate training in subcutaneous injection technique.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- PATIENT AND CARER ADVICE Manufacturer advises patients should immediately report any signs of unusual or prolonged bleeding, neck stiffness, or atypical severe headache
 - Self-administration Manufacturer advises patients and carers should be given training in subcutaneous injection technique

Missed doses If a dose is missed, the next dose should be administered as soon as possible, unless the next scheduled dose is within 2 days, in which case the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

► Inotersen for treating hereditary transthyretin amyloidosis (May 2019) NICE HST9 Recommended

Scottish Medicines Consortium (SMC) decisions

- Inotersen (Tegsedi®) for the treatment of stage 1 or stage 2 polyneuropathy in adult patients with hereditary transthyretin amyloidosis (hATTR) (August 2019)
 SMC No. SMC2188 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Tegsedi (Swedish Orphan Biovitrum Ltd) ▼ Inotersen (as Inotersen sodium) 189.33 mg per 1 ml Tegsedi 284mg/1.5ml solution for injection pre-filled syringes | 4 pre-filled disposable injection PoM £23,700.00 (Hospital only)

Patisiran

31-Aug-2020

 DRUG ACTION Patisiran is a double-stranded small interfering RNA which reduces transthyretin production.

• INDICATIONS AND DOSE

Stage 1 or stage 2 polyneuropathy in patients with hereditary transthyretin amyloidosis (hATTR) (initiated under specialist supervision)

- **▶** BY INTRAVENOUS INFUSION
- Adult: 300 micrograms/kg every 3 weeks (max. per dose 30 mg), dosage is based on actual body weight, for information on premedication, vitamin A supplementation, and missed doses—consult product literature

SIDE-EFFECTS

- ➤ Common or very common Arthralgia · dyspepsia · dyspnoea · erythema · increased risk of infection · infusion related reaction · muscle spasms · peripheral oedema · vertigo
- ► Frequency not known Vitamin A deficiency
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of childbearing potential should use effective contraception during treatment; if conception is planned, patisiran and vitamin A supplementation should be stopped and vitamin A levels monitored—consult product literature.
- PREGNANCY Manufacturer advises avoid unless essential (limited information available)—potential teratogenic risk due to unbalanced vitamin A levels, consult product literature.

- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate or severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).
- PRE-TREATMENT SCREENING Manufacturer advises plasma vitamin A levels below the lower limit of normal should be corrected and any ocular symptoms or signs of vitamin A deficiency should be evaluated before starting treatment.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intravenous infusion (Onpattro®), filter through 0.45-micron syringe filter and dilute requisite dose with Sodium Chloride 0.9% to final volume of 200 mL, use a DEHP-free infusion set and give over about 80 minutes through an in-line filter (1.2 micron) at a rate of about 1 mL/minute for the first 15 minutes, then increase to about 3 mL/minute for the remainder of the infusion.
- PRESCRIBING AND DISPENSING INFORMATION
 Manufacturer advises patients should receive premedication (to reduce the risk of infusion-related
 reactions)—consult product literature.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

► Patisiran for treating hereditary transthyretin amyloidosis (August 2019) NICE HST10 Recommended

Scottish Medicines Consortium (SMC) decisions

- Patisiran (Onpattro®) for the treatment of hereditary transthyretin-mediated amyloidosis (hATTR amyloidosis) in adult patients with stage 1 or stage 2 polyneuropathy (June 2019) SMC No. SMC2157 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ Onpattro (Alnylam UK Ltd) ▼

Patisiran (as Patisiran sodium) 2 mg per 1 ml Onpattro 10mg/5ml concentrate for solution for infusion vials | 1 vial Pom £7,676.47 (Hospital only)

Tafamidis

17-Jan-2022

 DRUG ACTION Tafamidis is a transthyretin stabiliser which inhibits amyloid formation, thereby delaying the development of nerve and cardiac muscle damage caused by transthyretin amyloidosis.

• INDICATIONS AND DOSE

Treatment of transthyretin amyloidosis in patients with stage 1 symptomatic polyneuropathy (ATTR-PN) [using 20 mg capsules] (initiated under specialist supervision)

- ► BY MOUTH
- Adult: 20 mg once daily

Treatment of wild-type transthyretin amyloidosis in patients with cardiomyopathy (ATTR-CM) [using 61 mg capsules] (initiated under specialist supervision) | Treatment of hereditary transthyretin amyloidosis in patients with cardiomyopathy (ATTR-CM) [using 61 mg capsules] (initiated under specialist supervision)

- ► BY MOUTH
- Adult: 61 mg once daily

DOSE EQUIVALENCE AND CONVERSION

 Each 20 mg capsule contains tafamidis meglumine equivalent to 12.2 mg tafamidis.

- Each 61 mg capsule contains tafamidis equivalent to 80 mg tafamidis meglumine.
- Tafamidis and tafamidis meglumine are not interchangeable on a milligram-for-milligram basis.

SIDE-EFFECTS

- ► Common or very common Abdominal pain upper · diarrhoea · increased risk of infection
- ► Frequency not known Flatulence
- CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment.
- PREGNANCY Avoid (toxicity in animal studies).
- BREAST FEEDING Avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises tafamidis should be prescribed in addition to standard treatment, but before organ transplantation; it should be discontinued in patients who undergo organ transplantation.

The manufacturer of *Vyndaqel* has provided a *Guide for Healthcare Professionals*.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if vomiting occurs after a dose is taken and the intact capsule is identified, another dose can be taken if possible; otherwise the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Tafamidis for treating transthyretin amyloidosis with cardiomyopathy (May 2021) NICE TA696 Not recommended Scottish Medicines Consortium (SMC) decisions
- Tafamidis (Vyndaqel®) for the treatment of wild type or hereditary transthyretin amyloidosis in adult patients with cardiomyopathy (December 2021) SMC No. SMC2426 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

EXCIPIENTS: May contain Sorbitol

▶ Vyndaqel (Pfizer Ltd)

Tafamidis meglumine 20 mg Vyndaqel 20mg capsules | 30 capsule PoM £10,685.00 (Hospital only)

2.3 Carnitine deficiency

AMINO ACIDS AND DERIVATIVES

Levocarnitine

29-Jun-2021

(Carnitine)

• INDICATIONS AND DOSE

Primary carnitine deficiency due to inborn errors of metabolism

- ► BY MOUTH
- Adult: Up to 200 mg/kg daily in 2-4 divided doses; maximum 3 g per day
- ▶ BY SLOW INTRAVENOUS INJECTION
- Adult: Up to 100 mg/kg daily in 2-4 divided doses, to be administered over 2-3 minutes continued →

Secondary carnitine deficiency in haemodialysis patients

- ► INITIALLY BY SLOW INTRAVENOUS INJECTION
- Adult: 20 mg/kg, to be administered over 2-3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course
- CAUTIONS Diabetes mellitus
- SIDE-EFFECTS
- ▶ Rare or very rare Abdominal cramps · diarrhoea · nausea · skin odour abnormal · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

- PREGNANCY Appropriate to use; no evidence of teratogenicity in animal studies.
- RENAL IMPAIRMENT Accumulation of metabolites may occur with chronic oral administration of high doses in severe impairment.
- MONITORING REQUIREMENTS
- Monitoring of free and acyl carnitine in blood and urine recommended.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Solution for injection

► Carnitor (Logixx Pharma Solutions Ltd)

L-Carnitine 200 mg per 1 ml Carnitor 1g/5ml solution for injection ampoules | 5 ampoule PoM £59.50 DT = £59.50

Oral solution

- ► Levocarnitine (Non-proprietary)
 - **L-Carnitine 300 mg per 1 ml** Levocarnitine 1.5g/5ml (30%) oral solution paediatric | 20 ml $\boxed{\text{PoM}}$ £71.40 DT = £71.40 | 40 ml $\boxed{\text{PoM}}$ £118.00
- ► Carnitor (Logixx Pharma Solutions Ltd)

Chewable tablet

► Carnitor (Logixx Pharma Solutions Ltd)

L-Carnitine 1 gram Carnitor 1g chewable tablets | 10 tablet PoM

£35 00 DT = £35 00

Capsule

Levocarnitine (Non-proprietary)

L-Carnitine 250 mg Bio-Carnitine 250mg capsules | 125 capsule £11.06

2.4 Cystinosis

2.4a Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine

01-0ct-2021

(Cysteamine)

• INDICATIONS AND DOSE

Corneal cystine crystal deposits in patients with cystinosis (specialist use only)

- ► TO THE EYE
- Adult: Apply 1 drop 4 times a day, to be applied to both eyes (minimum 4 hours between doses); dose may be reduced according to response (minimum daily dose 1 drop in each eye)

CYSTAGON®

Nephropathic cystinosis (specialist use only)

- ► BY MOUTH
- Adult (body-weight 50 kg and above): Initially one-sixth
 to one-quarter of the expected maintenance dose,
 increased gradually over 4-6 weeks to avoid
 intolerance, dose increased if there is adequate
 tolerance and the leucocyte-cystine concentration
 remains above 1 nanomol hemicystine/mg protein,
 maintenance 500 mg 4 times a day; maximum
 1.95 g/m² per day

PROCYSBI®

Nephropathic cystinosis (specialist use only)

- ▶ BY MOUTH
- Adult: Initially one-sixth to one-quarter of the expected maintenance dose, increased if there is adequate tolerance and the leucocyte-cystine concentration remains above 1 nanomol hemicystine/mg protein (measured using the mixed leucocyte assay), maintenance 650 mg/m² twice daily, administered every 12 hours; maximum 1.95 g/m² per day

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

CAUTIONS

- ▶ When used by eye Contact lens wearers
- With oral use Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine
- SIDE-EFFECTS
- ► Common or very common
- When used by eye Dry eye eye discomfort eye disorders vision blurred
- With oral use Appetite decreased · asthenia · breath odour · diarrhoea · drowsiness · encephalopathy · fever · gastroenteritis · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- Uncommon
- With oral use Compression fracture · gastrointestinal ulcer · hair colour changes · hallucination · joint hyperextension · leg pain · leucopenia · musculoskeletal disorders · nephrotic syndrome · nervousness · osteopenia · seizure
- ► Frequency not known
- With oral use Depression intracranial pressure increased papilloedema
- ALLERGY AND CROSS-SENSITIVITY EVGT Contra-indicated if history of hypersensitivity to penicillamine.
- PREGNANCY
- With oral use Manufacturer advises avoid—teratogenic and toxic in animal studies.
- BREAST FEEDING
- With oral use Manufacturer advises avoid—no information available.

• MONITORING REQUIREMENTS

- With oral use Manufacturer advises leucocyte-cystine concentration, liver function, and haematological monitoring required—consult product literature.
 Manufacturer advises monitor for skin and bone abnormalities; dose reduction or treatment discontinuation may be required—consult product literature.
- DIRECTIONS FOR ADMINISTRATION

PROCYSBI® Manufacturer advises capsules can be opened and contents sprinkled on food, water, acidic fruit juice or administered via an enteral feeding tube—consult product literature. Avoid dairy products and meals (rich in fats and protein) at least 1 hour before and after taking a dose.

PRESCRIBING AND DISPENSING INFORMATION
 Mercaptamine has a very unpleasant taste and smell,
 which can affect compliance.

HANDLING AND STORAGE

 When used by eye Manufacturer advises store in a refrigerator (2-8°C)—after opening store at room temperature up to 25°C for up to 7 days; protect from light.
 PROCYSBI[®] Manufacturer advises store in a refrigerator (2-8°C).

PATIENT AND CARER ADVICE

Driving and skilled tasks • With oral use Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of drowsiness.

 When used by eye Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of blurred vision and visual disturbances.

PROCYSBI® Missed doses Manufacturer advises if a dose is within 4 hours of the next dose, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Mercaptamine (Procysbi®) for the treatment of proven nephropathic cystinosis (September 2021) SMC No. SMC2374 Not recommended

2.5 Fabry's disease

ENZYMES

Agalsidase alfa

27-Jul-202

 DRUG ACTION Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alphagalactosidase A).

INDICATIONS AND DOSE

Fabry's disease (specialist use only)

- ► BY INTRAVENOUS INFUSION
- ▶ Adult: 200 micrograms/kg every 2 weeks
- INTERACTIONS → Appendix 1: agalsidase alfa
- SIDE-EFFECTS
- ▶ Common or very common Arrhythmias · asthenia · chest discomfort · chills · cough · diarrhoea · dizziness · dyspnoea · excessive tearing · fever · flushing · gastrointestinal discomfort · headache · hoarseness · hypersomnia · hypertension · increased risk of infection · influenza like illness · joint disorders · malaise · musculoskeletal discomfort · myalgia · nausea · ototoxicity · pain · palpitations · peripheral oedema · peripheral swelling · rhinorrhoea · sensation abnormal · skin reactions · taste altered · temperature sensation altered · throat complaints · tremor · vomiting
- Uncommon Altered smell sensation · angioedema · hypersensitivity · sensation of pressure
- ► Frequency not known Heart failure · hyperhidrosis · hypotension · myocardial ischaemia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions; manage by interrupting the infusion, or minimise by pre-treatment with an antihistamine or corticosteroid — consult product literature.

- PREGNANCY Use with caution
- BREAST FEEDING Use with caution—no information available.
- DIRECTIONS FOR ADMINISTRATION Administration for intravenous infusion, manufacturer advises give intermittently in sodium chloride 0.9%; dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Replagal (Takeda UK Ltd)
Agalsidase alfa 1 mg per 1 ml Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial PoM £1,049.94 (Hospital only)

Agalsidase beta

27-Jul-2020

 DRUG ACTION Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alphagalactosidase A).

• INDICATIONS AND DOSE

Fabry's disease (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 1 mg/kg every 2 weeks
- INTERACTIONS → Appendix 1: agalsidase beta
- SIDE-EFFECTS
- ► Common or very common Angioedema · arrhythmias · arthralgia · asthenia · chest discomfort · chills · cough ·

diarrhoea · dizziness · drowsiness · dyspnoea · eye disorders · fever · gastrointestinal discomfort · headache · hypertension · hyperthermia · hypotension · increased risk of infection · muscle complaints · musculoskeletal stiffness · nasal complaints · nausea · oedema · oral hypoaesthesia · pain · pallor · palpitations · respiratory disorders · sensation abnormal · skin reactions · syncope · temperature sensation altered · throat complaints · tinnitus · vasodilation · vertigo · vomiting

- ► Uncommon Dysphagia ear discomfort eye pruritus influenza like illness malaise peripheral coldness tremor
- ► Frequency not known Anaphylactoid reaction hypersensitivity vasculitis hypoxia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions; manage by slowing the infusion rate, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid — consult product literature.

- PREGNANCY Use with caution.
- BREAST FEEDING Use with caution—no information available.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion, manufacturer advises give intermittently in Sodium chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35−70 mg dilute with at least 100 mL; doses 70−100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

Fabrazyme (Sanofi Genzyme)

Agalsidase beta 5 mg Fabrazyme 5mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £315.08
Agalsidase beta 35 mg Fabrazyme 35mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £2,196.59

ENZYME STABILISER

Migalastat

09-Sen-2020

 DRUG ACTION Migalastat is a pharmacological chaperone that binds to the active sites of certain mutant forms of alpha-galactosidase A, thereby stabilising these mutant forms in the endoplasmic reticulum, and facilitating normal trafficking to lysosomes.

• INDICATIONS AND DOSE

Fabry's disease (specialist use only)

- ► BY MOUTH
- Adult: 123 mg once daily on alternate days, take at the same time of day, food should not be consumed at least 2 hours before and after taking migalastat to give a minimum 4 hours fast
- SIDE-EFFECTS
- ► Common or very common Constipation · defaecation urgency · depression · diarrhoea · dizziness · dry mouth · dyspnoea · epistaxis · fatigue · gastrointestinal discomfort · headache · muscle complaints · nausea · pain · palpitations · proteinuria · sensation abnormal · skin reactions · torticollis · vertigo · weight increased
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.

- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- RENAL IMPAIRMENT See p. 21. Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².
- MONITORING REQUIREMENTS Manufacturer advises monitor renal function, echocardiographic parameters and biochemical markers every 6 months.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 12 hours late or missed entirely for the day, the missed dose should not be taken and the next dose should be taken on the normal day and at the normal time (not to be taken on 2 consecutive days).

• NATIONAL FUNDING/ACCESS DECISIONS
For full details see funding body website

NICE decisions

Migalastat for treating Fabry disease (February 2017) NICE HST4 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ▶ Migalastat (Galafold®) for long-term treatment of adults and adolescents aged 16 years and older with a confirmed diagnosis of Fabry disease (x-galactosidase A deficiency) and who have an amenable mutation (November 2016) SMC No. 1196/16 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

► Galafold (Amicus UK Operations Ltd)

Migalastat (as Migalastat hydrochloride) 123 mg Galafold 123mg capsules | 14 capsule PoM £16,153.85

2.6 Gaucher's disease

Other drugs used for Gaucher's disease Miglustat, p. 1161

ENZYME INHIBITORS > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

Eliglustat

26-Aug-2020

 DRUG ACTION Eliglustat is an inhibitor of glucosylceramide synthase.

• INDICATIONS AND DOSE

Type 1 Gaucher disease (CYP2D6 poor metabolisers) (under expert supervision)

- ► BY MOUTH
- Adult: 84 mg once daily

Type 1 Gaucher disease (CYP2D6 intermediate or extensive metabolisers) (under expert supervision)

- ► BY MOUTH
- Adult: 84 mg twice daily
- CONTRA-INDICATIONS Cardiac disease (no information available) - concurrent use of Class IA and Class III antiarrhythmics - long QT syndrome (no information available)
- INTERACTIONS → Appendix 1: eliglustat
- SIDE-EFFECTS
- Common or very common Arthralgia · constipation · dry mouth · dry skin · dyspepsia · dysphagia · fatigue · gastrointestinal disorders · nausea · palpitations · taste altered · throat irritation
- PREGNANCY Manufacturer advises avoid—limited information available.
- BREAST FEEDING Manufacturer advises avoid—present in milk in *animal* studies.

 PRE-TREATMENT SCREENING Manufacturer advises CYP2D6 metaboliser status should be determined before initiation of treatment.

MONITORING REQUIREMENTS

- For treatment-naive patients showing less than 20% spleen volume reduction after 9 months of treatment, manufacturer advises monitor for further improvement or consider an alternative treatment.
- For patients with stable disease who have switched from enzyme replacement therapy, manufacturer advises monitor for disease progression—consider reinstitution of enzyme replacement therapy or an alternative treatment if response sub-optimal.
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Cerdelga® has provided a Prescriber Guide, which includes a prescriber checklist.
- PATIENT AND CARER ADVICE A patient alert card should be provided.
- NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

► Eliglustat for treating type 1 Gaucher disease (June 2017)

NICE HST5 Recommended

Scottish Medicines Consortium (SMC) decisions

- Eliglustat (Cerdelga®) for the long-term treatment of adult patients with Gaucher disease type 1 (GDI) who are CYP2D6 poor metabolisers, intermediate metabolisers or extensive metabolisers (December 2017) SMC No. 1277/17 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 10

▶ Cerdelga (Sanofi Genzyme)

Eliglustat (as Eliglustat tartrate) 84.4 mg Cerdelga 84mg capsules | 56 capsule PoM £19,164.96

ENZYMES

Imiglucerase

21-101-2020

 DRUG ACTION Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

• INDICATIONS AND DOSE

Non-neurological manifestations of type I Gaucher's disease (specialist use only) | Non-neurological manifestations of type III Gaucher's disease (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 60 units/kg every 2 weeks; maintenance, adjusted according to response, doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly

SIDE-EFFECTS

- ► Common or very common Angioedema · cough · dyspnoea · hypersensitivity · skin reactions
- Uncommon Abdominal cramps · arthralgia · back pain · chest discomfort · chills · cyanosis · diarrhoea · dizziness · fatigue · fever · flushing · headache · hypotension · nausea · paraesthesia · tachycardia · vomiting
- PREGNANCY Manufacturer advises use with caution limited information available.
- BREAST FEEDING No information available.
- MONITORING REQUIREMENTS
- ► Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.

- ► When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Cerezyme®), manufacturer advises give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100−200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

Cerezyme (Sanofi Genzyme)

Imiglucerase 400 unit Cerezyme 400unit powder for concentrate for solution for infusion vials | 1 vial Pom £1,071.29 (Hospital only)

Velaglucerase alfa

29-101-2020

 DRUG ACTION Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

• INDICATIONS AND DOSE

Type I Gaucher's disease (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 60 units/kg every 2 weeks; adjusted according to response to 15-60 units/kg every 2 weeks

SIDE-EFFECTS

► Common or very common Arthralgia · asthenia · chest discomfort · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hypersensitivity · hypertension · hypotension · infusion related reaction · nausea · pain · skin reactions · tachycardia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions are very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- PREGNANCY Manufacturer advises use with caution limited information available.
- BREAST FEEDING Manufacturer advises use with caution no information available.
- MONITORING REQUIREMENTS Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (VPRIV®), manufacturer advises give intermittently in Sodium chloride 0.9%; reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

2.7 Homocystinuria

METHYL DONORS

Betaine

03-Nov-2020

• INDICATIONS AND DOSE

Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)

- ► BY MOUTH
- Adult: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day
- SIDE-EFFECTS
- ► Uncommon Abdominal discomfort · agitation · alopecia · appetite decreased · brain oedema · diarrhoea · glossitis · irritability · nausea · skin reactions · urinary incontinence · vomiting
- PREGNANCY Manufacturer advises avoid unless essential—limited information available.
- BREAST FEEDING Manufacturer advises caution—no information available.
- MONITORING REQUIREMENTS Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane[®] powder.
- PRESCRIBING AND DISPENSING INFORMATION Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Betaine anhydrous (Cystadane®) for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase (CBS), 5,10-methylenetetrahydrofolate reductase (MTHFR) or cobalamin cofactor metabolism (cbl) (August 2010) SMC No. 407/07 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution

Powdei

► Cystadane (Recordati Rare Diseases UK Ltd)

Betaine 1 gram per 1 gram Cystadane oral powder |

180 gram PoM £347.00 DT = £347.00

2.8 Hypophosphatasia

ENZYMES

Asfotase alfa

04-Dec-2017

 DRUG ACTION Asfotase alfa is a human recombinant tissue-nonspecific alkaline phosphatase that promotes mineralisation of the skeleton.

INDICATIONS AND DOSE

Paediatric-onset hypophosphatasia (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 2 mg/kg 3 times a week, alternatively 1 mg/kg 6 times a week, dosing frequency depends on bodyweight—consult product literature for further information
- CAUTIONS Hypersensitivity reactions CAUTIONS, FURTHER INFORMATION
- Hypersensitivity reactions Reactions, including signs and symptoms consistent with anaphylaxis, have occurred within minutes of administration and can occur in patients on treatment for more than one year; if these reactions occur, manufacturer advises immediate discontinuation of treatment and initiation of appropriate medical treatment. For information on re-administration, consult product literature
- SIDE-EFFECTS
- Common or very common Bruising tendency · chills · cough · cutis laxa · fever · headache · hypersensitivity · hypocalcaemia · irritability · myalgia · nausea · nephrolithiasis · oral hypoaesthesia · pain · skin reactions · tachycardia · vasodilation · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION Injection-site reactions including hypertrophy, induration, skin discolouration, and cellulitis may occur, particularly in patients receiving treatment 6 times a week. Manufacturer advises rotation of injection sites to manage these reactions; interrupt treatment if severe reactions occur and administer appropriate medical therapy.
- PREGNANCY Manufacturer advises avoid—no information available
- BREAST FEEDING Manufacturer advises avoid—no information available.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor serum parathyroid hormone and calcium concentrations—supplements of calcium and oral vitamin D may be required.
- Manufacturer advises periodic ophthalmological examination and renal ultrasounds.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises max. 1 mL per injection site; administer multiple injections if more than 1 mL is required—consult product literature.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8 °C).
- PATIENT AND CARER ADVICE
 Injection guides The manufacturer has produced injection guides for patients and carers to support training given by health care professionals.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

Solution for injection

► Strensiq (Alexion Pharma UK Ltd)

Asfotase alfa 40 mg per 1 ml Strensiq 18mg/0.45ml solution for injection vials | 12 vial [PoM] £12,700.80 (Hospital only) Strensiq 28mg/0.7ml solution for injection vials | 12 vial [PoM] £19,756.80 (Hospital only)

Strensiq 40mg/1ml solution for injection vials | 12 vial PoM £28,224.00 (Hospital only)

Asfotase alfa 100 mg per 1 ml Strensiq 80mg/0.8ml solution for injection vials | 12 vial PoM £56,448.00 (Hospital only)

2.9 Leptin deficiency

DRUGS FOR METABOLIC DISORDERS > LEPTIN ANALOGUES

Metreleptin

16-Mar-2021

 DRUG ACTION Metreleptin is a recombinant human leptin analogue which binds to, and activates the leptin receptor to increase fat breakdown in the blood, muscles and liver, thereby correcting some abnormalities in patients with lipodystrophy.

• INDICATIONS AND DOSE

Leptin deficiency in lipodystrophy (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)
- CAUTIONS Autoimmune disease elderly (limited information available) • haematological abnormalities • severe infection
- INTERACTIONS → Appendix 1: metreleptin
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · appetite abnormal · fatigue · gastrointestinal discomfort · headache · hypoglycaemia · menorrhagia · nausea · weight changes
- Frequency not known Arthralgia · cough · deep vein thrombosis · diabetes mellitus · diarrhoea · dyspnoea · increased risk of infection · insulin resistance · malaise · myalgia · pancreatitis · peripheral swelling · pleural effusion · skin reactions · tachycardia · vomiting
- CONCEPTION AND CONTRACEPTION Evgr May increase fertility due to restoration of luteinising hormone release. Females of childbearing potential should use additional, effective non-hormonal contraception during treatment.
- PREGNANCY Evgr Avoid—toxicity in animal studies.
- BREAST FEEDING Specialist sources indicate use with caution—no information available. Large molecular weight and short half-life suggest limited excretion into milk, but monitor breast-fed infants for adverse reactions such as hypoglycaemia, decreased weight and abdominal pain.
- TREATMENT CESSATION EVGT Treatment should be withdrawn gradually over 2 weeks in conjunction with a low fat diet, to reduce the risk of increased hypertriglyceridaemia and pancreatitis—monitor triglyceride levels and consider the initiation or adjustment of lipid-lowering therapies as needed.
- DIRECTIONS FOR ADMINISTRATION Ever Inject into the thigh, abdomen, or upper arm; rotate injection site—max.
 1 mL per injection site. Patients may self-administer Myalepta after appropriate training in reconstitution and subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Myalepta® has provided a Healthcare Professional Guide and a Specialist Prescriber Guide.

Evgr Prescribe the appropriate dose in milligrams and in millilitres—dosage should be based on actual bodyweight.

 HANDLING AND STORAGE Store in a refrigerator (2-8°C) and protect from light—consult product literature about storage after reconstitution.

PATIENT AND CARER ADVICE

Self-administration Patients and their carers should be given training on reconstitution and subcutaneous injection technique if appropriate—a review of technique is recommended every 6 months.

Information for patients The manufacturer of Myalepta® has provided a Patient Care Guide and a Patient Dose Information Card.

Missed doses If a dose is missed, it should be injected when remembered and the next dose should be injected at the normal time.

Driving and skilled tasks Patients and their carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and dizziness.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Metreleptin for treating lipodystrophy [in patients aged 2 years and over with generalised lipodystrophy] (February 2021) NICE HST14 Recommended
- Metreleptin for treating lipodystrophy [in patients aged 12 years and over with partial lipodystrophy] (February 2021)
 NICE HST14 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

2.10 Mucopolysaccharidosis

ENZYMES

Elosulfase alfa

04-May-2022

 DRUG ACTION Elosulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylgalactosamine-6-sulfatase (GALNS) deficiency.

• INDICATIONS AND DOSE

Mucopolysaccharidosis IVA (specialist use only)

- ► BY INTRAVENOUS INFUSION
- ▶ Adult: 2 mg/kg once weekly
- CAUTIONS Elderly—no information available · infusionrelated reactions

CAUTIONS, FURTHER INFORMATION

• Infusion-related reactions Infusion-related reactions can occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30-60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during readministration following a severe reaction.

SIDE-FFFFCTS

- Common or very common Chills · diarrhoea · dizziness · dyspnoea · fever · gastrointestinal discomfort · headache · hypersensitivity · myalgia · nausea · oropharyngeal pain · vomiting
- ► Frequency not known Infusion related reaction
- PREGNANCY Manufacturer advises avoid unless essential—limited information available.
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Vimizim®), manufacturer advises give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 mL infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 mL/hour, then increase to a rate of 6 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 mL/hour to max. 36 mL/hour; body-weight 25 kg or over, dilute requisite dose to final volume of 250 mL and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 mL/hour, then increase to a rate of 12 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 mL/hour to max. 72 mL/hour.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator at 2-8°C. After dilution use immediately or, if necessary, store at 2-8°C for max. 24 hours, followed by up to 24 hours at 23-27°C.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.

NATIONAL FUNDING/ACCESS DECISIONS

2.11 Niemann-Pick type C disease

ENZYME INHIBITORS > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

Miglustat

22-Jan-2019

 DRUG ACTION Miglustat is an inhibitor of glucosylceramide synthase.

INDICATIONS AND DOSE

Mild to moderate type I Gaucher's disease for whom enzyme replacement therapy is unsuitable (under expert supervision)

- ► BY MOUTH
- Adult: 100 mg 3 times a day, reduced if not tolerated to 100 mg 1−2 times a day

Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)

- ► BY MOUTH
- Adult: 200 mg 3 times a day

• SIDE-EFFECTS

- ► Common or very common Appetite decreased · asthenia · chills · constipation · depression · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache · insomnia · libido decreased · malaise · muscle spasms · muscle weakness · nausea · peripheral neuropathy · sensation abnormal · thrombocytopenia · tremor · vomiting · weight decreased
- CONCEPTION AND CONTRACEPTION Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).
- RENAL IMPAIRMENT Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments For Gaucher's disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m 2 . Initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m 2 .

For Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m²

- MONITORING REQUIREMENTS
- ▶ Monitor cognitive and neurological function.
- Monitor growth and platelet count in Niemann-Pick type C disease.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

2.12 Pompe disease

ENZYMES

Alglucosidase alfa

17-Jul-2020

 DRUG ACTION Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alphaglucosidase.

INDICATIONS AND DOSE

Pompe disease (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 20 mg/kg every 2 weeks
- CAUTIONS Cardiac dysfunction infusion-related reactions—consult product literature • respiratory dysfunction
- SIDE-EFFECTS
- ► Common or very common Anxiety · arrhythmias · chest discomfort · chills · cough · cyanosis · diarrhoea · dizziness · fatigue · feeling hot · fever · flushing · hyperhidrosis · hypersensitivit · hypertension · irritability · local swelling · muscle complaints · nausea · oedema · pallor · paraesthesia · respiratory disorders · skin reactions · throat complaints · tremor · vomiting
- Frequency not known Abdominal pain · angioedema · apnoea · arthralgia · cardiac arrest · dyspnoea · excessive tearing · eye inflammation · headache · hypotension · nephrotic syndrome · peripheral coldness · proteinuria · vasoconstriction

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions are very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

- PREGNANCY Toxicity in animal studies, but treatment should not be withheld.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- MONITORING REQUIREMENTS
- Monitor closely if cardiac dysfunction.
- ▶ Monitor closely if respiratory dysfunction.
- ▶ Monitor immunoglobulin G (IgG) antibody concentration.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Myozyme®), manufacturer advises give intermittently in Sodium chloride 0.9%; reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5-4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ENZYME INHIBITORS > 4-

HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

Nitisinone

25-Oct-2021

(NTBC)

 DRUG ACTION Nitisinone is a competitive inhibitor of 4-hydroxyphenylpyruvate dioxygenase which inhibits catabolism of tyrosine and thereby prevents accumulation of harmful metabolites.

• INDICATIONS AND DOSE

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

- ► BY MOUTH
- Adult: Initially 1 mg/kg once daily, adjusted according to response: maximum 2 mg/kg per day

ORFADIN® CAPSULES

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

- ► BY MOUTH USING CAPSULES
- Adult: Initially 1 mg/kg once daily, adjusted according to response; maximum 2 mg/kg per day

Alkaptonuria (specialist use only)

- ▶ BY MOUTH USING CAPSULES
- Adult: 10 mg once daily

ORFADIN $^{\tiny{(\! R \!)}}$ ORAL SUSPENSION

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

- ► BY MOUTH USING ORAL SUSPENSION
- Adult: Initially 1 mg/kg once daily, adjusted according to response; maximum 2 mg/kg per day

Alkaptonuria (specialist use only)

- ► BY MOUTH USING ORAL SUSPENSION
- Adult: 10 mg once daily
- INTERACTIONS → Appendix 1: nitisinone
- SIDE-EFFECTS
- ➤ Common or very common Corneal opacity eye inflammation • eye pain • granulocytopenia • increased risk of infection • leucopenia • photophobia • skin reactions • thrombocytopenia
- ► Uncommon Leucocytosis
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—adverse effects in animal studies.
- MONITORING REQUIREMENTS
- When used for Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) [EvGr] Slit-lamp examination of eyes is recommended before treatment and at least once a year thereafter. Monitor plasma tyrosine levels—consult product literature. Monitor platelet and white blood cell count every 6 months. Monitor liver function regularly. (n)
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.
- HANDLING AND STORAGE Store in a refrigerator (2-8°C).

PATIENT AND CARER ADVICE Patients and carers should be advised to seek immediate medical attention if symptoms of visual disorders develop during treatment.

Driving and skilled tasks Patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of visual disorders.

ORFADIN © ORAL SUSPENSION Patients or carers should be given advice on how to administer *Orfadin* ® oral suspension.

DRUGS FOR METABOLIC DISORDERS >

AMMONIA LOWERING DRUGS

Glycerol phenylbutyrate

18-Nov-2020

 DRUG ACTION Glycerol phenylbutyrate is a nitrogenbinding agent that provides an alternative vehicle for waste nitrogen excretion.

INDICATIONS AND DOSE

Urea cycle disorders (specialist use only)

- ► BY MOUTH, OR BY GASTROSTOMY TUBE, OR BY NASOGASTRIC TUBE
- Adult (body surface area up to 1.3 m²): Initially 9.4 g/m² daily in divided doses, usual maintenance 5.3–12.4 g/m² daily in divided doses, each dose should be rounded up to the nearest 0.5 mL and given with each meal. For dose adjustments based on individual requirements—consult product literature
- Adult (body surface area 1.3 m² and above): Initially 8 g/m² daily in divided doses, usual maintenance 5.3–12.4 g/m² daily in divided doses, each dose should be rounded up to the nearest 0.5 mL and given with each meal. For dose adjustments based on individual requirements—consult product literature

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 mL of liquid contains 1.1 g of glycerol phenylbutyrate.
- ► For patients switching from sodium phenylbutyrate or sodium benzoate—consult product literature.

IMPORTANT SAFETY INFORMATION

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

2.15 Wilson's disease

Other drugs used for Wilson's disease Penicillamine, p. 1192

ANTIDOTES AND CHELATORS > COPPER

ABSORPTION INHIBITORS

Zinc acetate

23-Jul-2020

 DRUG ACTION Zinc prevents the absorption of copper in Wilson's disease.

INDICATIONS AND DOSE

Wilson's disease (initiated under specialist supervision)

- ► BY MOUTH
- Adult: 50 mg 3 times a day (max. per dose 50 mg 5 times a day), adjusted according to response

DOSE EQUIVALENCE AND CONVERSION

▶ Doses expressed as elemental zinc.

PHARMACOKINETICS

- Symptomatic Wilson's disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.
- CAUTIONS Portal hypertension (risk of hepatic decompensation when switching from chelating agent)
- INTERACTIONS → Appendix 1: zinc
- SIDE-EFFECTS
- Common or very common Epigastric discomfort (usually transient)
- ▶ Uncommon Leucopenia · sideroblastic anaemia
- ► Frequency not known Condition aggravated

 SIDE-EFFECTS, FURTHER INFORMATION Transient gastric irritation may be reduced if first dose is taken midmorning or with a little protein.

PREGNANCY

Dose adjustments Reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.

- BREAST FEEDING Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.
- MONITORING REQUIREMENTS Monitor full blood count and serum cholesterol
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

250 capsule PoM £242.00 DT = £242.00

250 capsule FoM £132.00 DT = £132.00
Zinc (as Zinc acetate) 50 mg Wilzin 50mg capsules |

ANTIDOTES AND CHELATORS > COPPER CHELATORS

Trientine

17-San-202

 DRUG ACTION Trientine is a chelating agent that binds to copper, forming a complex that is readily excreted by the kidneys; it may also inhibit the absorption of copper from the gastro-intestinal tract.

INDICATIONS AND DOSE

Wilson's disease in patients intolerant of penicillamine [using Tillomed generic capsules] (initiated by a specialist)

- ► BY MOUTH
- Adult: Initially 1000–2000 mg daily in 2–4 divided doses, dose should then be adjusted according to response and serum-copper concentrations

DOSE EQUIVALENCE AND CONVERSION

- For Tillomed generic: each capsule contains trientine base equivalent to 250 mg trientine dihydrochloride; doses expressed as trientine dihydrochloride.
- Preparations are not interchangeable on a milligramfor-milligram basis due to differences in bioavailability.

THEFNOT ®

Wilson's disease in patients intolerant of penicillamine (initiated by a specialist)

- ► BY MOUTH
- Adult: Initially 800–1600 mg daily in 2–4 divided doses, dose should then be adjusted according to response and serum-copper concentrations

DOSE EQUIVALENCE AND CONVERSION

- For Cufence®: each capsule contains trientine dihydrochloride equivalent to 200 mg trientine base; doses expressed as trientine base.
- Preparations are not interchangeable on a milligramfor-milligram basis due to differences in bioavailability.

CUPRIOR ®

Wilson's disease in patients intolerant of penicillamine (initiated by a specialist)

- ► BY MOUTH
- Adult: Initially 450–975 mg daily in 2–4 divided doses, dose should then be adjusted according to response and serum-copper concentrations

DOSE EQUIVALENCE AND CONVERSION

- ► For Cuprior[®]: each tablet contains trientine tetrahydrochloride equivalent to 150 mg of trientine base: doses expressed as trientine base.
- Preparations are not interchangeable on a milligramfor-milligram basis due to differences in bioavailability.
- INTERACTIONS → Appendix 1: trientine
- SIDE-EFFECTS
- ► Common or very common Nausea
- ▶ Uncommon Anaemia aplastic anaemia skin reactions
- ► Frequency not known Gastrointestinal disorders neurological deterioration in Wilson's Disease
- PREGNANCY EvGr Teratogenic in animal studies—use only if benefit outweighs risk. Monitor maternal and neonatal serum-copper concentrations.
- BREAST FEEDING EVGT Specialist sources indicate caution—limited information available; effect on copper levels in milk conflicting and impact on infant unknown.
- DIRECTIONS FOR ADMINISTRATION

CUPRIOR [®] Tablets can be divided into 2 equal halves.

 PRESCRIBING AND DISPENSING INFORMATION Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

HANDLING AND STORAGE

CUFENCE [®] After opening, store in a refrigerator (2–8°C).

3.2 Zinc deficiency

Zinc deficiency

22-Mar-2021

Overview

Zinc is an essential trace element, involved in a number of body enzyme systems, and is found in a variety of foods. Patients with malnutrition, alcoholism, inflammatory bowel disease, and malabsorption syndromes are at an increased risk of zinc deficiency.

Zinc supplements can be given for zinc deficiency or in zinc-losing conditions. Continuous zinc supplementation is generally safe, however higher doses should be limited to short-term use due to an increased risk of gastro-intestinal adverse effects, copper deficiency, reduced immunity, anaemia, and genitourinary complications with long-term use.

Zinc is used in the treatment of Wilson's disease, and in acrodermatitis enteropathica—a rare inherited disorder characterised by impaired zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc, see also Intravenous nutrition p. 1167. Further zinc can be added to intravenous feeding regimens if required.

ELECTROLYTES AND MINERALS > ZINC

Zinc sulfate

21-Apr-2021

• INDICATIONS AND DOSE

Zinc deficiency or supplementation in zinc-losing conditions

- ► BY MOUTH USING EFFERVESCENT TABLETS
- Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- Child (body-weight 10-30 kg): 22.5 mg 1-3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- Child (body-weight 31 kg and above): 45 mg 1-3 times a day, dose to be adjusted as necessary, to be dissolved in

- water and taken after food, dose expressed as elemental zinc
- Adult (body-weight 31 kg and above): 45 mg 1-3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

Additional elemental zinc for intravenous nutrition

- ► BY INTRAVENOUS INJECTION
- Adult: 6.5 mg daily (Zn²⁺ 100 micromol)
- INTERACTIONS → Appendix 1: zinc
- SIDE-EFFECTS Diarrhoea · gastritis · gastrointestinal discomfort · nausea · vomiting
- PREGNANCY Crosses placenta; risk theoretically minimal, but no information available.
- BREAST FEEDING Present in milk; risk theoretically minimal, but no information available.
- RENAL IMPAIRMENT EVGT Use with caution (accumulation may occur in renal failure).
- PRESCRIBING AND DISPENSING INFORMATION Each Solvazinc® tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Effervescent tablet

4 Nutrition (intravenous)

Intravenous nutrition

Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Proprietary Infusion Fluids for Parenteral Feeding p. 1169.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B_{12} , as hydroxocobalamin p. 1114, is given by intramuscular injection; regular vitamin B_{12} injections are not usually required unless total parenteral nutrition continues for many months. Folic acid p. 1112 is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions.

Alternatively, infusion through a peripheral vein may be

used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of nonessential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose p. 1132) and electrolytes.

Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcals) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphatemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

Fat emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. Additives should not be mixed with fat emulsions unless compatibility is known.

Administration

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases product literature and other specialist literature should be consulted.

NUTRIENTS > PARENTERAL NUTRITION

Parenteral nutrition supplements

phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg.

CERNEVIT® POWDER FOR SOLUTION FOR INJECTION

VIALS Cernevit® powder for reconstitution contains dlalpha tocopherol 10.2 mg, ascorbic acid 125 mg, biotin 69 micrograms, colecalciferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, nicotinamide 46 mg, pantothenic acid (as dexpanthenol) 17.25 mg. pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg. For adults and children over 11 years.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion Solution for infusion
 - Parenteral nutrition supplements (Non-proprietary) Sodium glycerophosphate (as Sodium glycerophosphate pentahydrate) 216 mg per 1 ml Sodium glycerophosphate 4.32g/20ml concentrate for solution for infusion ampoules 1 ampoule PoM £6.42 | 20 ampoule PoM £128.40 Sodium glycerophosphate 4.32g/20ml concentrate for solution for infusion vials | 1 vial Pom £6.42 | 10 vial Pom £64.20
 - Additrace (Fresenius Kabi Ltd) Sodium molybdate dihydrate 4.85 microgram per 1 ml. Chromic chloride hexahydrate 5.33 microgram per 1 ml, Sodium selenite anhydrous 6.9 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Manganese chloride tetrahydrate 99 microgram per 1 ml. Sodium fluoride 210 microgram per 1 ml. Copper chloride dihydrate 340 microgram per 1 ml, Ferric chloride hexahydrate 540 microgram per 1 ml, Zinc chloride 1.36 mg per 1 ml Additrace concentrate for solution for infusion 10ml ampoules | 1 ampoule PoM £1.96 | 20 ampoule PoM £39.20 Dipeptiven (Fresenius Kabi Ltd)
 - N(2)-L-alanyl-L-glutamine 200 mg per 1 ml Dipeptiven 20g/100ml concentrate for solution for infusion bottles | 1 bottle Pom £25.93 | 10 bottle PoM £259.30 Dipeptiven 10g/50ml concentrate for solution for infusion bottles
 - 1 bottle Pom £13.94 | 10 bottle Pom £139.40 Peditrace (Fresenius Kabi Ltd)
 - Manganese (as Manganese chloride) 1 microgram per 1 ml, Iodine (as Potassium iodide) 1 microgram per 1 ml, Selenium (as Sodium selenite) 2 microgram per 1 ml. Copper (as Copper chloride) 20 microgram per 1 ml, Fluoride (as Sodium fluoride) 57 microgram per 1 ml. Zinc (as Zinc chloride) 250 microgram per 1 ml Peditrace solution for infusion 10ml vials | 1 vial Pom £3.55 | 10 vial [PoM] £35.50
 - Tracutil (B.Braun Medical Ltd)

Sodium molybdate dihydrate 2.42 microgram per 1 ml, Chromic chloride 5.3 microgram per 1 ml, Sodium selenite pentahydrate 7.89 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Sodium fluoride 126 microgram per 1 ml, Manganese chloride 197.9 microgram per 1 ml, Copper chloride 204.6 microgram per 1 ml, Zinc chloride 681.5 microgram per 1 ml, Ferrous chloride 695.8 microgram per 1 ml Tracutil concentrate for solution for infusion 10ml ampoules | 5 ampoule PoM £7.96 (Hospital only)

Powder for solution for infusion

Solivito N (Fresenius Kabi Ltd)

Cyanocobalamin 5 microgram, Biotin 60 microgram, Folic acid 400 microgram, Thiamine nitrate 3.1 mg, Pyridoxine hydrochloride 4.9 mg, Riboflavin sodium phosphate 4.9 mg, Sodium pantothenate 16.5 mg, Nicotinamide 40 mg, Sodium ascorbate 113 mg Solivito N powder for concentrate for solution for infusion vials | 1 vial Pom £1.97 | 10 vial Pom £19.70

Powder for solution for injection EXCIPIENTS: May contain Glycocholic acid

► Cernevit (Baxter Healthcare Ltd)

Cyanocobalamin 6 microgram, Biotin 69 microgram, Folic acid 414 microgram, Thiamine 3.51 mg, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Pantothenic acid (as Dexpanthenol) 17.25 mg, Nicotinamide 46 mg, Ascorbic acid 125 mg, Alpha tocopherol 11.2 unit, Colecalciferol 220 unit, Retinol 3500 unit Cernevit powder for solution for injection vials 10 vial PoM S

Nutrition (oral)

Enteral nutrition

Overview

The body's reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds.

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have

diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

Enteral nutrition in children

Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought.

Special diets

Nutrition in special diets

06-Apr-2021

Overview

In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS).

Cooline diconce

Coeliac disease is caused by an abnormal immune response to gluten. For further information, see Coeliac disease p. 37.

Phenylketonuria

Phenylketonuria results from the inability to metabolise phenylalanine. Ever The treatment of phenylketonuria usually involves restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair, in addition to phenylalanine-free L-amino acid supplementation.

A subset of patients with phenylketonuria may be responsive to sapropterin dihydrochloride below (a), a synthetic form of tetrahydrobiopterin. It is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Aspartame (used as a sweetener in some foods and medicines) contributes to phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame in a preparation is specified in the product literature, it is listed as an excipient against the preparation in individual drug monographs. The patient should be informed the preparation contains aspartame.

5.1a Phenylketonuria

DRUGS FOR METABOLIC DISORDERS >

TETRAHYDROBIOPTERIN AND DERIVATIVES

Sapropterin dihydrochloride

18-Oct-2021

 DRUG ACTION Sapropterin is synthetic 6Rtetrahydrobiopterin (6R-BH4), a cofactor for phenylalanine hydroxylase, and therefore restores the activity of phenylalanine hydroxylase and reduces phenylalanine concentration in the blood.

• INDICATIONS AND DOSE

Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)

- ► BY MOUTH
- Adult: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning

Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)

- ▶ BY MOUTH
- Adult: Initially 2-5 mg/kg daily in 2-3 divided doses, adjusted according to response; maximum 20 mg/kg per day
- CAUTIONS History of convulsions
- INTERACTIONS → Appendix 1: sapropterin
- SIDE-EFFECTS
- ➤ Common or very common Cough · diarrhoea · gastrointestinal discomfort · headache · laryngeal pain · nasal complaints · nausea · vomiting
- ► Frequency not known Gastrointestinal disorders · rash
- PREGNANCY Manufacturer advises caution—consider only if strict dietary management inadequate.
- BREAST FEEDING Manufacturer advises avoid—no information available
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).
- RENAL IMPAIRMENT Manufacturer advises caution—no information available.
- MONITORING REQUIREMENTS
- Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response

- increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.
- ► Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets should be dissolved in water and taken within 20 minutes.
- PATIENT AND CARER ADVICE Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

➤ Sapropterin for treating hyperphenylalaninaemia in phenylketonuria (September 2021) NICE TA729 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ➤ Sapropterin (Kuvan®) for the treatment of hyperphenylalaninaemia (HPA) in adults and paediatric patients of all ages with phenylketonuria (PKU) who have been shown to be responsive to such treatment (August 2018) SMC No. 558/09 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

6 Vitamin deficiency

Vitamins Overview

21-May-2021

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general 'pick-me-ups' is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 1177 and pyridoxine hydrochloride p. 1175, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. Report on Health and Social Subjects 41. London: HMSO. 1991.

Dental patients

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

Vitamin A

Deficiency of vitamin A p. 1174 (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin B group

Deficiency of the B vitamins, other than vitamin B_{12} , is rare in the UK and is usually treated by preparations containing thiamine p. 1175 (B₁), riboflavin (B₂), and nicotinamide, which is used in preference to nicotinic acid p. 218, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate p. 252, and pantothenic acid or panthenol may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke's encephalopathy and Korsakoff's psychosis, especially as seen in chronic alcoholism, are best treated initially by the parenteral administration of B vitamins (*Pabrinex*®), followed by oral administration of thiamine in the longer term. Anaphylaxis has been reported with parenteral B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride ($B_{\rm b}$) deficiency is rare, but it may occur during isoniazid p. 639 therapy or penicillamine p. 1192 treatment in Wilson's disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia. There is evidence to suggest that pyridoxine hydrochloride may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

Nicotinic acid inhibits the synthesis of cholesterol and triglyceride. Folic acid p. 1112 and vitamin $\rm B_{12}$ are used in the treatment of megaloblastic anaemia. Folinic acid p. 1015 (available as calcium folinate) is used in association with cytotoxic therapy.

Vitamin C

Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proven.

Vitamin D

The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets. They include ergocalciferol p. 1182 (calciferol, vitamin D_2), colecalciferol p. 1179 (vitamin D_3), dihydrotachysterol, alfacalcidol p. 1178 (1α -hydroxycholecalciferol), and calcitriol p. 1178 (1α -dihydroxycholecalciferol).

Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. Specific populations at risk of vitamin D deficiency may include individuals with dark skin (such as those of African, African-Caribbean or South Asian origin) as their skin is less efficient at synthesising vitamin D, individuals aged over 65 years, individuals who have low or no exposure to the sun (such as those who are housebound or confined indoors, or who cover their skin for cultural reasons), pregnant and breastfeeding women (particularly teenagers and young women), and children aged under 4 years. Simple vitamin D deficiency can be prevented by taking an oral supplement of ergocalciferol (calciferol,

vitamin D₂) or colecalciferol (vitamin D₃) daily. EvGT Supplements containing vitamin D (e.g. Healthy Start) should be considered for all pregnant and breastfeeding women, and children aged under 4 years, to prevent vitamin D deficiency (if clinically appropriate); information on the Healthy Start scheme can be found at: www.healthystart.

Ergocalciferol or colecalciferol daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for *severe* deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing colecalciferol with calcium carbonate p. 1181 are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency.

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfacalcidol or calcitriol should be prescribed if patients with severe renal impairment require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis.

Paricalcitol p. 1182, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic kidney disease.

For recommendations on the use of vitamin D during the COVID-19 pandemic, see the National Institute for Health and Care Excellence rapid guideline: **Vitamin D** (available at: www.nice.org.uk/guidance/ng187).

Vitamin E

The daily requirement of vitamin E (tocopherol) has not been well defined but is probably 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestasis. In young children with congenital cholestasis, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities, which usually respond only to the parenteral administration of vitamin E

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Menadiol sodium phosphate p. 1184 is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K.

Other compounds

Potassium aminobenzoate p. 1175 has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma and Peyronie's disease. In Peyronie's disease there is some evidence to support efficacy in reducing progression when given early in the disease; however, there is no evidence for reversal of the condition. The therapeutic value of potassium aminobenzoate in scleroderma is doubtful.

VITAMINS AND TRACE ELEMENTS >

Vitamins A and D

07-Sep-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A below, colecalciferol p. 1179.

INDICATIONS AND DOSE

Prevention of vitamin A and D deficiency (using 4500 units vitamin A/450 units vitamin D₃ capsules)

- ► BY MOUTE
- Child 7-17 years: 1 capsule daily, increased if necessary to 2 capsules daily, dose increase to be guided by serum values
- Adult: 1 capsule daily, increased if necessary to 2 capsules daily, dose increase to be guided by serum values

Prevention of vitamin A and D deficiency (using 4000 units vitamin A/400 units vitamin D capsules)

- ► BY MOUTH
- ▶ Child 1-17 years: 1 capsule daily
- ► Adult: (consult product literature or local protocols)

 DOSE EQUIVALENCE AND CONVERSION
- ► Each 4500 units vitamin A/450 units vitamin D₃ capsule contains the equivalent of 11 micrograms vitamin D₃.
- ► Each 4000 units vitamin A/400 units vitamin D capsule (vitamins A and D capsules BPC 1973) contains the equivalent of 10 micrograms vitamin D.
- INTERACTIONS → Appendix 1: vitamin A · vitamin D substances
- SIDE-EFFECTS

Overdose Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

- BREAST FEEDING Manufacturer advises avoid—present in milk.
- PRESCRIBING AND DISPENSING INFORMATION This drug contains vitamin D; consult individual vitamin D monographs.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

EXCIPIENTS: May contain Gelatin

► Vitamins a and d (Non-proprietary)

Vitamin D 400 unit, Vitamin A 4000 unit Vitamins A and D capsules BPC 1973 | 28 capsule £2.81 | 84 capsule £6.75-£8.42 DT = £8.42

Vitamins A, C and D

05-May-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A below, ascorbic acid p. 1177.

• INDICATIONS AND DOSE

Prevention of vitamin deficiency

- ► BY MOUTH
- Child 1 month-4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx.
 300 units (7.5 micrograms), ascorbic acid approx. 20 mg
- INTERACTIONS → Appendix 1: ascorbic acid vitamin A
- PRESCRIBING AND DISPENSING INFORMATION This drug contains vitamin D; consult individual vitamin D monographs.

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may

be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral drops

Healthy Start Children's Vitamin (Secretary of State for Health) Vitamin A and D3 concentrate.55 mg per 1 ml, Sodium ascorbate 18.58 mg per 1 ml, Ascorbic acid 150 mg per 1 ml, Vitamin D 2000 iu per 1 ml, Vitamin A 5000 iu per 1 ml Healthy Start Children's Vitamin drops | 10 ml \(\frac{1}{2} \)

VITAMINS AND TRACE ELEMENTS > VITAMIN A

Vitamin A (Retinol)

INDICATIONS AND DOSE

Vitamin A deficiency

- ► BY MOUTH
- Child 1-11 months: 5000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
- Child 1-17 years: 10 000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
- UNLICENSED USE Preparations containing only vitamin A are not licensed.
- INTERACTIONS → Appendix 1: vitamin A
- SIDE-EFFECTS

Overdose Massive overdose can cause rough skin, dry hair, an enlarged liver, and increases in erythrocyte sedimentation rate, serum calcium and serum alkaline phosphatase concentration.

- PREGNANCY Excessive doses may be teratogenic. In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver paté or liver sausage.
- BREAST FEEDING Theoretical risk of toxicity in infants of mothers taking large doses.
- MONITORING REQUIREMENTS Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral drops

Oral drops

► Vitamin a (Non-proprietary)

Vitamin A 150000 unit per 1 ml Arovit 150,000units/ml drops | 7.5 ml PoM 🖫

Combinations available: Vitamins A and D, above · Vitamins A, C and D, above

VITAMINS AND TRACE ELEMENTS > VITAMIN B

Potassium aminobenzoate

INDICATIONS AND DOSE

Peyronie's disease | Scleroderma

BY MOUTH
 Adult: 12 g daily in divided doses, to be taken after food

- CONTRA-INDICATIONS Hyperkalaemia · severe liver damage
- CAUTIONS Interrupt treatment during periods of low food intake (such as fasting, anorexia and nausea)—increased risk of hypoglycaemia
- INTERACTIONS → Appendix 1: potassium aminobenzoate
- SIDE-EFFECTS Hepatitis · hypoglycaemia
- PREGNANCY Manufacturer advises avoid—limited information available.
- BREAST FEEDING Manufacturer advises unknown if excreted in milk—risk to infant cannot be excluded.
- RENAL IMPAIRMENT EVGT Caution (increased risk of hyperkalaemia); avoid if eGFR less than 45 mL/minute/1.73 m².
- MONITORING REQUIREMENTS Manufacturer advises liver function tests should be performed monthly—discontinue immediately if elevated.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Adult: 25-100 mg daily

Severe deficiency

▶ BY MOUTH

▶ Adult: 200-300 mg daily in divided doses

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (SEPTEMBER 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.
- CAUTIONS Anaphylaxis may occasionally follow injection, see Important safety information
- BREAST FEEDING Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet

Athiam (Essential-Healthcare Ltd)
 Thiamine hydrochloride 100 mg

Vitamin B complex

21-May-2021

• INDICATIONS AND DOSE

Treatment of deficiency

▶ BY MOUTH USING TABLETS

 Adult: 1-2 tablets 3 times a day, this dose is for vitamin B compound strong tablets

Prophylaxis of deficiency

- ► BY MOUTH USING TABLETS
- Adult: 1-3 tablets daily, this dose is for vitamin B compound tablets
- LESS SUITABLE FOR PRESCRIBING Vitamin B compound tablets and vitamin B compound strong tablets are less suitable for prescribing.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Vitamin b complex (Non-proprietary)

Riboflavin 1 mg, Thiamine hydrochloride 1 mg, Nicotinamide 15 mg Vitamin B compound tablets | 28 tablet P £21.30 DT = £20.63

Vitamin B substances with ascorbic

The properties listed below are those particular to the combination only. For the properties of the components please consider, thiamine p. 1175, ascorbic acid p. 1177.

INDICATIONS AND DOSE

Severe depletion or malabsorption of vitamins B and C postoperatively

- ▶ BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: (consult product literature)

Treatment of suspected or established Wernicke's encephalopathy

- ► BY INTRAVENOUS INFUSION
- Adult: 2-3 pairs 3 times a day for 3-5 days, followed by 1 pair once daily for a further 3-5 days or for as long as improvement continues

Prophylaxis of Wernicke's encephalopathy [assisted alcohol withdrawal in an inpatient setting]

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- Adult: 1 pair once daily for at least 5 days and up to 7 days if required, give into the gluteal muscle

Severe depletion or malabsorption of vitamins B and C in psychosis following narcosis or electroconvulsive therapy | Severe depletion or malabsorption of vitamins B and C following toxicity from acute infections

- ▶ BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 1 pair twice daily for up to 7 days, give deep intramuscular injection into the gluteal muscle

Severe depletion or malabsorption of vitamins B and C in haemodialysis

- ► BY INTRAVENOUS INFUSION
- Adult: 1 pair every 2 weeks

DOSE EQUIVALENCE AND CONVERSION

- Dose is expressed in pairs of ampoules.
- For intravenous administration, 1 pair is one 5 mL ampoule containing thiamine 250 mg, riboflavin 4 mg and pyridoxine 50 mg, and one 5 mL ampoule containing ascorbic acid 500 mg, nicotinamide 160 mg and glucose 1000 mg.
- For intramuscular administration, 1 pair is one 5 mL ampoule containing thiamine 250 mg, riboflavin 4 mg and pyridoxine 50 mg, and one 2 mL ampoule containing ascorbic acid 500 mg and nicotinamide 160 mg.
- UNLICENSED USE Vitamin B substances with ascorbic acid may be used as detailed below, although these situations are considered outside the scope of its licence:
 - Ever durations and further dosing for treatment of suspected or established Wernicke's encephalopathy
 - prophylaxis of Wernicke's encephalopathy
- INTERACTIONS → Appendix 1: ascorbic acid
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises give (Pabrinex® I/V High Potency) intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.
 Manufacturer advises ampoules contents should be mixed, diluted, and administered without delay; give over 30 minutes. See MHRA/CHM advice in thiamine p. 1175.
- PRESCRIBING AND DISPENSING INFORMATION Pabrinex® I/M High Potency injection is for intramuscular use only. Pabrinex® I/V High Potency injection is for intravenous use only.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

Vitamin D and analogues (systemic)

- CONTRA-INDICATIONS Hypercalcaemia · metastatic calcification
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · headache · hypercalcaemia · hypercalciuria · nausea · skin reactions
- Uncommon Appetite decreased · arrhythmia (frequency not known in children) · asthenia · constipation · diarrhoea · myalgia · vomiting · weight decreased (frequency not known in children)

Overdose Symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.

- PREGNANCY High doses teratogenic in animals but therapeutic doses unlikely to be harmful.
- BREAST FEEDING Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.
- MONITORING REQUIREMENTS Important: all patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

Alfacalcidol

F 1177 16-Feh-2021

(1\alpha-Hvdroxvcholecalciferol)

• INDICATIONS AND DOSE

Patients with severe renal impairment requiring vitamin D therapy

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION
- Adult: Initially 1 microgram daily, dose to be adjusted to avoid hypercalcaemia; maintenance 0.25-1 microgram daily
- ▶ Elderly: Initially 500 nanograms daily, dose adjusted to avoid hypercalcaemia; maintenance 0.25-1 microgram

Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism

- ► BY MOUTH, OR BY INTRAVENOUS INJECTION
- ► Child 1 month-11 years: 25–50 nanograms/kg once daily. dose to be adjusted as necessary; maximum 1 microgram per day
- ▶ Child 12-17 years: 1 microgram once daily, dose to be adjusted as necessary

Prevention of vitamin D deficiency in renal or cholestatic liver disease

- ► BY MOUTH, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month-11 years (body-weight up to 20 kg): 15-30 nanograms/kg once daily (max. per dose 500 nanograms)
- ► Child 1 month-11 years (body-weight 20 kg and above): 250-500 nanograms once daily, dose to be adjusted as
- ► Child 12-17 years: 250-500 nanograms once daily, dose to be adjusted as necessary

DOSE EQUIVALENCE AND CONVERSION

- ▶ One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.
- CAUTIONS Granulomatous diseases (risk of increased sensitivity to vitamin D) · nephrolithiasis · take care to ensure correct dose in infants
- INTERACTIONS → Appendix 1: vitamin D substances
- SIDE-FFFFCTS
- Common or very common Abdominal discomfort . hvperphosphataemia · rash pustular
- ▶ Uncommon Malaise urolithiases
- ► Rare or very rare Dizziness
- ▶ Frequency not known Confusion renal impairment
- RENAL IMPAIRMENT

Monitoring Monitor plasma-calcium concentration in renal impairment.

- MONITORING REQUIREMENTS Monitor plasma-calcium concentration in patients receiving high doses.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use For injection, manufacturer advises shake ampoule for at least 5 seconds before use, and give over 30 seconds

Colecalciferol

F 1177 05-May-2022

(Cholecalciferol: Vitamin D₃)

INDICATIONS AND DOSE

Prevention of vitamin D deficiency

▶ BY MOUTH

Adult: 400 units daily

Treatment of vitamin D deficiency

► BY MOUTH

- Adult: 800 units daily, higher doses may be necessary for severe deficiency; maximum 4000 units per day
- CAUTIONS Sarcoidosis
- INTERACTIONS → Appendix 1: vitamin D substances
- RENAL IMPAIRMENT

Monitoring Monitor plasma-calcium concentration in renal impairment.

- MONITORING REQUIREMENTS Monitor plasma-calcium concentration in patients receiving high doses.
- DIRECTIONS FOR ADMINISTRATION

INVITA D3 ® ORAL SOLUTION Manufacturer advises may be mixed with a small amount of cold or lukewarm food immediately before administration.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, oral drops

(Calciferol; Vitamin D₂)

• INDICATIONS AND DOSE

Prevention of vitamin D deficiency

► BY MOUTH

Adult: 400 units daily

Treatment of vitamin D deficiency

► BY MOUTH

 Adult: 800 units daily, higher doses may be necessary for severe deficiency; maximum 4000 units per day

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease

► BY MOUTH

Adult: Up to 40 000 units daily

Hypocalcaemia of hypoparathyroidism to achieve normocalcaemia

► BY MOUTH

Adult: Up to 100 000 units daily

INTERACTIONS → Appendix 1: vitamin D substances

RENAL IMPAIRMENT

Monitoring Monitor plasma-calcium concentration in renal impairment.

- MONITORING REQUIREMENTS Monitor plasma-calcium concentration in patients receiving high doses.
- PRESCRIBING AND DISPENSING INFORMATION The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied.

When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Ergocalciferol with calcium lactate and calcium phosphate 06-Aug.

06-Aug-202

(Calcium and vitamin D)

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol above, calcium lactate p. 1139.

• INDICATIONS AND DOSE

Prevention of calcium and vitamin D deficiency Treatment of calcium and vitamin D deficiency

► BY MOUTH

- ► Adult: (consult product literature)
- INTERACTIONS → Appendix 1: calcium salts · vitamin D substances
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets may be crushed before administration, or may be chewed
- PRESCRIBING AND DISPENSING INFORMATION Each tablet contains calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca²⁺ 2.4 mmol), ergocalciferol 10 micrograms (400 units).
- PATIENT AND CARER ADVICE Patient or carers should be given advice on how to administer calcium and ergocalciferol tablets.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

 Ergocalciferol with calcium lactate and calcium phosphate (Nonproprietary)

Ergocalciferol 10 microgram, Calcium phosphate 150 mg, Calcium lactate 300 mg Calcium and Ergocalciferol tablets | 28 tablet P £49.88 DT = £34.29

F 1177 24-Jul-2018

Paricalcitol

INDICATIONS AND DOSE

Prevention and treatment of secondary hyperparathyroidism associated with chronic kidney disease

- ► BY MOUTH
- Adult: (consult product literature)

Prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure in patients on haemodialysis

- Adult: To be administered via haemodialysis access (consult product literature)
- INTERACTIONS → Appendix 1: vitamin D substances
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Electrolyte imbalance hypoparathyroidism taste altered
- ▶ Uncommon Dizziness · dry mouth · malaise · pain
- ► Frequency not known Angioedema · laryngeal oedema SPECIFIC SIDE-EFFECTS
- ▶ Uncommon
- With oral use Breast tenderness · gastrointestinal discomfort · gastrooesophageal reflux disease · muscle spasms · palpitations · peripheral oedema · pneumonia
- With parenteral use Alopecia · anaemia · anxiety · asthma · atrial flutter · breast cancer · breast pain · cardiac arrest · cerebrovascular insufficiency · chest pain · coma · condition aggravated · confusion · conjunctivitis · cough · delirium · depersonalisation · dyspepsia · dysphagia · dyspnoea · ear disorder · erectile dysfunction · fever · gait abnormal · gastrointestinal disorders · glaucoma ·

haemorrhage · hirsutism · hyperhidrosis · hyperparathyroidism · hypertension · hypotension · increased risk of infection · insomnia · joint disorders · leucopenia · lymphadenopathy · muscle twitching · myoclonus · oedema · pulmonary oedema · sensation abnormal · sepsis · syncope · thirst

- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- MONITORING REQUIREMENTS
- ▶ Monitor plasma calcium and phosphate during dose titration and at least monthly when stabilised.
- ▶ Monitor parathyroid hormone concentration.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Ethanol, propylene glycol

Zemplar (AbbVie Ltd)

Paricalcitol 5 microgram per 1 ml Zemplar 5micrograms/1ml solution for injection vials | 5 vial Pom £62.00 (Hospital only)

VITAMINS AND TRACE ELEMENTS > VITAMIN E

Alpha tocopherol

04-Feh-2021

(Tocopherol)

INDICATIONS AND DOSE

Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis

- ► BY MOUTH USING ORAL SOLUTION
- Child: 17 mg/kg daily, dose to be adjusted as necessary
- CAUTIONS Predisposition to thrombosis
- INTERACTIONS → Appendix 1: vitamin E substances
- SIDE-FFFFCTS
- ► Common or very common Diarrhoea
- ▶ Uncommon Alopecia asthenia headache skin reactions
- ► Frequency not known Abdominal pain
- PREGNANCY Manufacturer advises caution, no evidence of harm in animal studies
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk-no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
- RENAL IMPAIRMENT Manufacturer advises caution. Risk of renal toxicity due to polyethylene glycol content. Monitoring Manufacturer advises monitor closely in renal impairment.
- PRESCRIBING AND DISPENSING INFORMATION Tocofersolan is a water-soluble form of D-alpha tocopherol.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral solution

Vedrop (Recordati Rare Diseases UK Ltd) ▼ D-alpha tocopherol (as Tocofersolan) 50 mg per 1 ml Vedrop 50mg/ml oral solution sugar-free | 20 ml PoM £54.55 DT = £54.55 sugar-free | 60 ml PoM £163.65

Alpha tocopheryl acetate

04-Feh-2021

(Tocopherol)

INDICATIONS AND DOSE

Vitamin E deficiency

- ▶ BY MOUTH
- ► Child: 2-10 mg/kg daily, increased if necessary up to 20 mg/kg daily

Malabsorption in cystic fibrosis

- ► BY MOUTH
- ▶ Child 1-11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic
- ▶ Child 1-11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic
- ▶ Child 12-17 years: 100-200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Adult: 100-200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic

Vitamin E deficiency in cholestasis and severe liver disease

- ▶ BY MOUTH
- ▶ Child 1 month-11 years: Initially 100 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily
- Child 12-17 years: Initially 200 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily

Malabsorption in abetalipoproteinaemia

- ▶ BY MOUTH
- ▶ Adult: 50-100 mg/kg once daily
- CAUTIONS Predisposition to thrombosis • INTERACTIONS → Appendix 1: vitamin E substances
- SIDE-EFFECTS Abdominal pain (more common at high doses) · bleeding tendency · diarrhoea (more common at high doses) · increased risk of thrombosis
- PREGNANCY No evidence of safety of high doses.
- BREAST FEEDING Excreted in milk; minimal risk, although caution with large doses.
- MONITORING REQUIREMENTS Increased bleeding tendency in vitamin-K deficient patients or those taking anticoagulants (prothrombin time and INR should be monitored).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: chewable tablet

VITAMINS AND TRACE ELEMENTS > VITAMIN K

Menadiol sodium phosphate

24-May-2021

• INDICATIONS AND DOSE

Prevention of Vitamin K deficiency in malabsorption syndromes

- ► BY MOUTH
- ▶ Adult: 10–40 mg daily, dose to be adjusted as necessary
- CAUTIONS G6PD deficiency (risk of haemolysis) vitamin E deficiency (risk of haemolysis)
- PREGNANCY Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Menadiol sodium phosphate (Non-proprietary)
 Menadiol phosphate (as Menadiol sodium phosphate)
 10 mg Menadiol 10mg tablets | 100 tablet P £225.45 DT = £225.45

Phytomenadione

04-Feb-2021

(Vitamin K₁)

• INDICATIONS AND DOSE

Major bleeding in patients on warfarin (in combination with dried prothrombin complex or fresh frozen plasma)

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: 5 mg for 1 dose, stop warfarin treatment

INR > 8.0 with minor bleeding in patients on warfarin

- **▶** BY SLOW INTRAVENOUS INJECTION
- Adult: 1-3 mg, stop warfarin treatment, dose may be repeated if INR still too high after 24 hours, restart warfarin treatment when INR <5

${\ensuremath{\mathsf{INR}}}\xspace>8.0$ with no bleeding in patients on warfarin

- ► BY MOUTH
- Adult: 1–5 mg, intravenous preparation to be used orally, stop warfarin treatment, repeat dose if INR still too high after 24 hours, restart warfarin treatment when INR < 5

INR 5.0-8.0 with minor bleeding in patients on warfarin

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: 1–3 mg, stop warfarin treatment, restart warfarin treatment when INR <5

Reversal of anticoagulation prior to elective surgery (after warfarin stopped)

- ▶ BY MOUTH
- Adult: 1–5 mg, intravenous preparation to be used orally, dose to be given the day before surgery if INR
 1 5

Reversal of anticoagulation prior to emergency surgery (when surgery can be delayed 6-12 hours)

- ► BY INTRAVENOUS INJECTION
- Adult: 5 mg as a single dose, if surgery cannot be delayed, dried prothrombin complex can be given in addition to phytomenadione and the INR checked before surgery
- UNLICENSED USE Oral use of intravenous preparations is unlicensed.
- CAUTIONS Intravenous injections should be given very slowly—reports of anaphylactoid reactions
 KONAKION ® MM Reduce dose in elderly
- PREGNANCY Use if potential benefit outweighs risk.
- BREAST FEEDING Present in milk.
- HEPATIC IMPAIRMENT

KONAKION MM Manufacturer advises caution—monitor INR in patients with severe impairment (contains glycocholic acid which may displace bilirubin).

DIRECTIONS FOR ADMINISTRATION

KONAKION MM Konakion MM may be administered by slow intravenous injection or by intravenous infusion in glucose 5%; not for intramuscular injection. For intravenous infusion (Konakion MM), give intermittently in Glucose 5%; dilute with 55 mL; may be injected into lower part of infusion apparatus.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Solution for injection

EXCIPIENTS: May contain Glycocholic acid, lecithin

Neural tube defects (prevention in pregnancy)

Neural tube defects (prevention in pregnancy) 01-Oct-2021

Description of condition

Neural tube defects represent a group of congenital defects, caused by incomplete closure of the neural tube within 28 days of conception. The most common forms are anencephaly, spina bifida and encephalocele.

The main risk factors are maternal folate deficiency, maternal vitamin B₁₂ deficiency, previous history of having an infant with a neural tube defect, smoking, diabetes, obesity, and use of antiepileptic drugs. For information on smoking cessation see Smoking cessation p. 531.

Prevention in pregnancy

[EvGr] Pregnant women or women who wish to become pregnant should be advised to take supplementation with folic acid p. 1112 before conception and until week 12 of pregnancy.

A higher daily dose (see folic acid) is recommended for women at a high risk of conceiving a child with a neural tube defect, including women who have previously had an infant with a neural tube defect, who are receiving antiepileptic medication (see Epilepsy p. 330), or who have diabetes or sickle-cell disease. (A)

Healthy Start vitamins for women (containing folic acid, ascorbic acid, and vitamin D) are available for pregnant women through the Healthy Start scheme. For further information, see www.healthystart.nhs.uk/. Vitamins for children are also available through the scheme.

1 Arthritis

Osteoarthritis

05-Jan-2021

Overview

Ever Patients diagnosed with osteoarthritis should receive an individualised management plan that may include selfcare strategies and drug treatment options for symptom relief

For pain relief in osteoarthritis, simple analgesia such as paracetamol p. 477 or a topical NSAID (particularly for hand or knee involvement) is first-line treatment and may need to be used regularly if pain remains uncontrolled. If treatment with simple analgesia is ineffective, consider use of an oral NSAID when required (topical NSAID use should be discontinued), or a weak opioid analgesic (such as codeine phosphate p. 487) when required, or topical capsaicin 0.025% p. 516, particularly in knee or hand osteoarthritis. In patients taking low-dose aspirin, other analgesic treatment ontions should be considered before using a NSAID.

Intra-articular corticosteroid injections can be considered as an adjunctive treatment for relief of moderate to severe pain associated with osteoarthritis.

Non-drug measures, such as weight reduction (in overweight or obese patients) and exercise including local muscle strengthening and aerobic exercise, should also be encouraged.

If self-management and drug treatment strategies are ineffective or unsuitable, consider referral to a specialist multidisciplinary team.

Glucosamine p. 1190, chondroitin, and topical rubefacients (which may contain nicotinate compounds, salicylate compounds, essential oils, and camphor) are not recommended for the treatment of osteoarthritis. Intra-articular preparations of hyaluronic acid and its derivatives are also available for osteoarthritis of the knee, but are not recommended.

Rheumatoid arthritis

12-Nov-2021

Description of condition

Rheumatoid arthritis is a chronic systemic inflammatory disease that causes persistent symmetrical joint synovitis (inflammation of the synovial membrane) typically of the small joints of the hands and feet, although any synovial joint can be affected. Synovitis presents as pain and prolonged stiffness that tends to be worse at rest or

following periods of inactivity, swelling, tenderness, and heat in the affected joints. Other symptoms of rheumatoid arthritis include rheumatoid nodules and non-specific symptoms such as malaise, fatigue, fever, and weight loss.

As the disease progresses, it can cause joint deformity and affect different organs of the body, such as the heart, lungs, and eyes; therefore early diagnosis and treatment of rheumatoid arthritis is essential to reduce the impact of the disease.

Palindromic rheumatism is a rare form of inflammatory arthritis which causes attacks of joint pain and swelling similar to rheumatoid arthritis, but the joints return to normal in between attacks. Patients with palindromic rheumatism may later develop rheumatoid arthritis.

Aims of treatment

The aims of treatment are to relieve the symptoms of rheumatoid arthritis, achieve disease remission or low disease activity if remission cannot be achieved, and to improve the patient's ability to perform daily activities.

Non-drug treatment

Evsi Patients with rheumatoid arthritis should have access to a multidisciplinary team, and may benefit from physiotherapy to encourage exercise, enhance flexibility of joints and strengthen muscles. Psychological interventions such as relaxation, stress management, and cognitive coping skills to support patients with their perception and management of their disease can also be offered.

Drug treatment

Ever All patients with suspected persistent synovitis of unknown cause should be referred to a specialist for advice as soon as possible to confirm diagnosis and evaluate disease activity.

In patients with newly diagnosed active rheumatoid arthritis, monotherapy with a conventional disease-modifying antirheumatic drug (DMARD) (oral methotrexate p. 987, leflunomide p. 1191, or sulfasalazine p. 44) should be given as first-line treatment; hydroxychloroquine sulfate p. 1190, a weak conventional DMARD, is an alternative in patients with mild rheumatoid arthritis or those with palindromic rheumatism. Treatment should be started as soon as possible, ideally within 3 months of onset of persistent symptoms, and the dose should be titrated to the maximum tolerated effective dose.

Conventional DMARDs have a slow onset of action and can take 2–3 months to take effect. [EvGr] Consider short-term bridging treatment with a corticosteroid (by oral, intramuscular, or intra-articular administration) when starting treatment with a new conventional DMARD to

provide rapid symptomatic control, while waiting for the new DMARD to take effect. Short-term corticosteroids should also be given to rapidly decrease inflammation during flare-ups.

If the treatment target (remission or low disease activity) has not been achieved despite dose escalation on conventional DMARD monotherapy, offer combination therapy with additional conventional DMARDs (oral methotrexate p. 987, leflunomide p. 1191, sulfasalazine p. 44, or hydroxychloroquine sulfate p. 1190).

Treatment with a tumour necrosis factor (TNF) alpha inhibitor (adalimumab p. 1204, certolizumab pegol p. 1205, etanercept p. 1206, golimumab p. 1208, or infliximab p. 1209), other biological DMARD (abatacept p. 1203, sarilumab p. 1193, or tocilizumab p. 1195), or targeted synthetic DMARD (baricitinib p. 1198, filgotinib p. 1199, tofacitinib p. 1200, or upadacitinib p. 1202) is recommended if there has been an inadequate response to combination therapy with conventional DMARDs. For further information on their use, see NICE pathway: Rheumatoid arthritis (available at: pathways.nice.org.uk/pathways/rheumatoid-arthritis).

Ever Rituximab p. 955 in combination with methotrexate p. 987 is an option for patients with severe active rheumatoid arthritis who have had an inadequate response to, or are intolerant of other DMARDs, including at least one TNF alpha inhibitor. A For guidance on treatment options if rituximab is unsuitable, or there is an inadequate response to rituximab and other biological DMARDs, see NICE pathway: Rheumatoid arthritis (available at: pathways.nice. org.uk/pathways/rheumatoid-arthritis).

[EvG] In patients with established rheumatoid arthritis, the long-term use of corticosteroids should only be continued if all other treatments options (including biological and targeted synthetic DMARDs) have been offered.

Patients with active rheumatoid arthritis should be monitored monthly until the treatment target (either remission or low disease activity) has been achieved, and all patients with rheumatoid arthritis should be reviewed annually. In patients who have maintained the treatment target for at least 1 year without corticosteroids, cautiously reducing drug doses to the lowest that are clinically effective, or tapering and stopping at least one drug if the patient is being treated with two or more DMARDs should be considered. (A)

Older conventional DMARDs such as sodium aurothiomalate (gold), azathioprine p. 902, ciclosporin p. 904 and penicillamine p. 1192 are no longer commonly used in practice due to the availability of newer, more effective drugs.

Pain relief

Faint electives. Short-term use of an oral non-steroidal anti-inflammatory drug (NSAID) or a selective cyclo-oxygenase-2 inhibitor should be considered for additional control of pain and stiffness associated with rheumatoid arthritis. Patients should be offered a proton pump inhibitor to minimise associated gastrointestinal adverse effects. In patients already taking low-dose aspirin p. 133, other treatments should be considered before giving a NSAID. NSAIDs should be used at the lowest effective dose, and if possible, withdrawn when a good response to DMARDs is achieved.

Surgery

Ever Surgery may be an option for some patients if drug treatment has failed to adequately manage persistent pain due to joint damage or other identifiable soft tissue causes, if there is worsening of joint function, progressive deformity, or persistent localised synovitis. (A)

Rheumatoid arthritis in adults: management. National Institute for Health and Care Excellence. NICE guideline 100. October 2020.

www.nice.org.uk/guidance/ng100

Spondyloarthritis

05-Aug-2021

Description of condition

Spondyloarthritis refers to a group of inflammatory musculoskeletal conditions with shared features which affect both axial and peripheral joints. Most people with these conditions have either axial spondyloarthritis (which includes ankylosing spondylitis and non-radiographic axial spondyloarthritis) or psoriatic arthritis. Axial spondyloarthritis primarily affects the spine, in particular the sacroiliac joint.

Psoriatic arthritis may present in several forms, including involvement of small joints (in the hands and feet), large joints (particularly in the knees), or combinations of both. Psoriatic arthritis may also involve the axial joints, finger and toe joints, and inflammation of the connective tissue between tendon/ligament and bone.

Less common subgroups are enteropathic spondyloarthritis, which is associated with inflammatory bowel disease (Crohn's disease p. 38 and Ulcerative colitis p. 39), and reactive arthritis (a form of peripheral arthritis), which can occur following gastro-intestinal or genitourinary infections.

Aims of treatment

The aims of treatment are to relieve symptoms, slow the progression of the condition, and improve quality of life.

Non-drug treatment

Ever Patients who have difficulties with everyday activities should be referred to a specialist therapist (such as a physiotherapist, occupational therapist, hand therapist, orthotist or podiatrist). Hydrotherapy can be considered as an adjunctive therapy to manage pain and maintain or improve function for people with axial spondyloarthritis.

Drug treatment

Axial spondyloarthritis

Ever For pain associated with axial spondyloarthritis, start one of the Non-steroidal anti-inflammatory drugs p. 1222 (NSAIDs) at the lowest effective dose. Clinical assessment, monitoring of risk factors, and the use of gastroprotective treatment should be considered. If an NSAID taken at the maximum tolerated dose for 2–4 weeks does not provide adequate pain relief, consider switching to a different NSAID.

A tumour necrosis factor (TNF) alpha inhibitor is recommended as an option for treating severe active ankylosing spondylitis or severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs. The choice of treatment should depend on factors such as patient preference and extra-articular involvement.

Treatment with another TNF-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

Ixekizumab p. 1351 and secukinumab p. 1194 are recommended as options for treating active ankylosing spondylitis or non-radiographic axial spondyloarthritis in patients who have responded inadequately to NSAIDs and/or TNF-alpha inhibitors.

The response to treatment should be assessed after 12 to 20 weeks (depending on the treatment used) and should only be continued if there is clear evidence of response.

For further guidance on biological therapies for the treatment of axial spondyloarthritis, see NICE pathway: Spondyloarthritis (available at: pathways.nice.org.uk/pathways/spondyloarthritis).

Psoriatic arthritis and other peripheral spondyloarthritides [EvGr] Monotherapy with local corticosteroid injections should be considered for non-progressive **monoarthritis** (see Corticosteroids, inflammatory disorders p. 1245).

Standard disease-modifying antirheumatic drugs (DMARDs), such as methotrexate p. 987, leflunomide p. 1191 or sulfasalazine p. 44, can be used for patients with peripheral polyarthritis, oligoarthritis, or persistent or progressive monoarthritis associated with peripheral spondyloarthritis.

Standard DMARDs, such as methotrexate p. 987 or leflunomide p. 1191 can also be used for patients with **psoriatic arthritis**.

The choice of DMARD will depend on numerous factors such as the patient's circumstances (such as pregnancy planning and alcohol consumption), comorbidities (such as uveitis, psoriasis and inflammatory bowel disease), and potential side-effects.

If a standard DMARD taken at the maximum tolerated dose for at least 3 months does not provide adequate relief from symptoms, a switch to, or the addition of, another standard DMARD can be considered.

An NSAID can be used as an adjunct to standard DMARDs or biological DMARDs to manage symptoms. If NSAIDs do not provide adequate relief from symptoms, consider corticosteroid injections or short-term oral corticosteroid therapy as an adjunct to standard DMARDs or biological DMARDs to manage symptoms.

If extra-articular disease is adequately controlled by an existing standard DMARD but peripheral spondyloarthritis is not, consider adding another standard DMARD.

Further options for psoriatic arthritis

For guidance on further treatment options for patients with active or active and progressive psoriatic arthritis, such as targeted synthetic DMARDs and biological DMARDs, see NICE pathway: **Spondyloarthritis** (available at: pathways. nice.org.uk/pathways/spondyloarthritis).

Reactive arthritis

Evgr After treating the initial infection, do not offer longterm (4 weeks or longer) treatment with an antibacterial solely to manage reactive arthritis caused by a gastrointestinal or genito-urinary infection.

Useful Resources

Spondyloarthritis in over 16s: diagnosis and management. National Institute for Health and Care Excellence. Clinical Guideline NG65. February 2017. www.nice.org.uk/guidance/ng65

Rheumatic disease, suppressing drugs 12-Nov-2021

Overview

Certain drugs such as those affecting the immune response can suppress the disease process in *rheumatoid arthritis* and *psoriatic arthritis*, see Rheumatoid arthritis p. 1186 or Spondyloarthritis p. 1187. *Systemic* and *discoid lupus erythematosus* are sometimes treated with chloroquine p. 669 or hydroxychloroquine sulfate p. 1190.

The choice of a disease-modifying antirheumatic drug (DMARD) should take into account co-morbidity and patient preference. Methotrexate p. 987, sulfasalazine p. 44,

intramuscular gold, and penicillamine p. 1192 are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

Gold

Gold, given as sodium aurothiomalate, is licensed for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose must be given followed by doses at weekly intervals until there is definite evidence of remission. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

Penicillamine

Penicillamine has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Sulfasalazine

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints [unlicensed]. Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

Antimalarials

The antimalarial hydroxychloroquine sulfate is used to treat rheumatoid arthritis of mild inflammatory activity; chloroquine is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed.

Chloroquine and hydroxychloroquine sulfate are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis. Chloroquine and hydroxychloroquine sulfate are better tolerated than gold or penicillamine. Retinopathy rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of againg

Mepacrine hydrochloride p. 540 is sometimes used in discoid lupus erythematosus [unlicensed].

Drugs affecting the immune response

Methotrexate is a DMARD used in active rheumatoid arthritis. Methotrexate is usually given by mouth once a week, adjusted according to response. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid p. 1112 given every week [unlicensed], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Leflunomide p. 1191 acts on the immune system as a DMARD. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months.

Drugs that affect the immune response are also used in the management of severe cases of systemic lupus erythematosus and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of

polymyositis that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine p. 902 is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide, methotrexate, or azathioprine [unlicensed] may be used.

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Ådalimumab p. 1204, certolizumab pegol p. 1205, etanercept p. 1206, golimumab p. 1208, and infliximab p. 1209 inhibit the activity of tumour necrosis factor alpha (TNF-∞).

Adalimumab is licensed for moderate to severe active rheumatoid arthritis when response to other DMARDs (including methotrexate) has been inadequate; it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive psoriatic arthritis and severe active ankylosing spondylitis that have not responded adequately to other DMARDs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. Adalimumab also has a role in inflammatory bowel disease and plaque psoriasis.

Certolizumab pegol is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to DMARDs (including methotrexate) has been inadequate. Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

Etanercept is licensed for the treatment of moderate to severe active *rheumatoid arthritis* either alone or in combination with methotrexate when the response to other DMARDs is inadequate and in severe, active and progressive *rheumatoid arthritis* in patients not previously treated with methotrexate. It is also licensed for the treatment of active and progressive *psoriatic arthritis* inadequately responsive to other DMARDs, and for severe *ankylosing spondylitis* inadequately responsive to conventional therapy. Etanercept also has a role in plaque psoriasis.

Golimumab is licensed in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* when response to DMARD therapy (including methotrexate) has been inadequate; it is also licensed in combination with methotrexate for patients with severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive *psoriatic arthritis*, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate; it is also licensed for the treatment of severe active *ankylosing spondylitis* when there is an inadequate response to conventional treatment.

Infliximab p. 1209 is licensed for the treatment of active rheumatoid arthritis in combination with methotrexate p. 987 when the response to other DMARDs, including methotrexate, is inadequate; it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of *ankylosing spondylitis*, in patients with severe axial symptoms who have not responded adequately to conventional therapy, and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive *psoriatic arthritis* which has not responded adequately to DMARDs.

Arthritis 1189

Rituximab p. 955 is licensed in combination with methotrexate for the treatment of severe active *rheumatoid arthritis* in patients whose condition has not responded adequately to other DMARDs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them. Rituximab has a role in malignant disease.

Abatacept p. 1203 prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active *rheumatoid arthritis* in combination with methotrexate, in patients unresponsive to other DMARDs (including methotrexate or a tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors

Anakinra p. 1193 inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of *rheumatoid arthritis* which has not responded to methotrexate alone. Anakinra is not recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop. Anakinra may also be appropriate for the treatment of systemic juvenile idiopathic arthritis and adult-onset Still's disease in certain individuals.

The Janus kinase inhibitors baricitinib p. 1198, filgotinib p. 1199, tofacitinib p. 1200, and upadacitinib p. 1202 are licensed for use as monotherapy or in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis in patients who have had an inadequate response to, or who are intolerant to, one or more DMARDs.

Belimumab p. 911 inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy.

Sarilumab p. 1193 is a recombinant human monoclonal antibody that specifically binds to interleukin-6 receptors and blocks the activity of pro-inflammatory cytokines; it is licensed alone or in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to one or more DMARDs.

Secukinumab p. 1194 inhibits the activity of interleukin-17A. Secukinumab is licensed for the treatment of active psoriatic arthritis, in combination with methotrexate or alone, which has not responded adequately to DMARDs; it is also licensed for the treatment of ankylosing spondylitis, in patients who have not responded adequately to conventional therapy. Secukinumab also has a role in plaque psoriasis.

Tocilizumab p. 1195 antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to at least one DMARD or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated.

Ustekinumab p. 1197 inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active *psoriatic arthritis* (in combination with methotrexate or alone) in

patients who have had an inadequate response to one or more DMARDs.

Juvenile idiopathic arthritis

Some children with *juvenile idiopathic arthritis* (juvenile chronic arthritis) do not require DMARDs. Methotrexate is effective; sulfasalazine [unlicensed] is an alternative but it should be avoided in *systemic-onset juvenile idiopathic arthritis*. Gold and penicillamine are no longer used. Cytokine modulators have a role in some forms of *juvenile idiopathic arthritis*.

Other drugs used for Arthritis Aceclofenac, p. 1224 · Celecoxib, p. 1225 · Cyclophosphamide, p. 968 · Diclofenac potassium, p. 1226 · Diclofenac sodium, p. 1227 · Etodolac, p. 1230 · Etoricoxib, p. 1230 · Flurbiprofen, p. 1231 · Guselkumab, p. 1350 · Ibuprofen, p. 1232 · Indometacin, p. 1235 · Ixekizumab, p. 1351 · Ketoprofen, p. 1236 · Mefenamic acid, p. 1238 · Meloxicam, p. 1238 · Nabumetone, p. 1239 · Naprosen, p. 1240 · Piroxicam, p. 1241 · Risankizumab, p. 1352 · Sulindac, p. 1242 · Tenoxicam, p. 1243 · Tiaprofenic acid, p. 1244

CHONDROPROTECTIVE DRUGS

Glucosamine

24-Nov-2020

 DRUG ACTION Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin.

• INDICATIONS AND DOSE

ALATERIS ®

Symptomatic relief of mild to moderate osteoarthritis of the knee

- ► BY MOUTH
- Adult: 1250 mg once daily, review treatment if no benefit after 2–3 months

DOLENIO ®

Symptomatic relief of mild to moderate osteoarthritis of the knee

- ► BY MOUTH
- Adult: 1500 mg once daily, review treatment if no benefit after 2-3 months

GLUSARTEL G

Symptomatic relief of mild to moderate osteoarthritis of the knee

- ▶ BY MOUTH
- Adult: 1500 mg once daily, dose to be dissolved in at least 250 mL of water, review treatment if no benefit after 2-3 months
- CAUTIONS Asthma · impaired glucose tolerance · predisposition to cardiovascular disease
- INTERACTIONS → Appendix 1: glucosamine
- SIDE-EFFECTS
- ➤ Common or very common Constipation · diarrhoea · fatigue · gastrointestinal discomfort · headache · nausea
- ▶ Uncommon Flushing skin reactions
- ► Rare or very rare Jaundice
- ► Frequency not known Angioedema · asthma · diabetes mellitus · dizziness · hypercholesterolaemia · oedema · vomiting
- ALLERGY AND CROSS-SENSITIVITY EVGF Contra-indicated if patient has a shellfish allergy.
- PREGNANCY Manufacturers advise avoid—no information available.
- BREAST FEEDING Manufacturers advise avoid—no information available.

MONITORING REQUIREMENTS

- Monitor blood-glucose concentration before treatment and periodically thereafter in patients with impaired glucose tolerance.
- Monitor cholesterol in patients with predisposition to cardiovascular disease.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Glucosamine (Alateris®) for relief of symptoms in mild to moderate osteoarthritis of the knee (June 2008)
 SMC No. 471/08 Not recommended
- Glucosamine (Glusartel®) for the relief of symptoms in mild to moderate osteoarthritis of the knee (August 2011)
 SMC No. 647/10 Not recommended
- LESS SUITABLE FOR PRESCRIBING Less suitable for prescribing—the mechanism of action is not understood and there is limited evidence to show it is effective.
- MEDICINAL FORMS No licensed medicines listed.

DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS

Hydroxychloroguine sulfate

16-Mar-2022

• INDICATIONS AND DOSE

Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice) | Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

- ► BY MOUTH
- Adult: 200-400 mg daily, daily maximum dose to be based on ideal body-weight; maximum 6.5 mg/kg per day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HYDROXYCHLOROQUINE, CHLOROQUINE: INCREASED RISK OF CARDIOVASCULAR EVENTS WHEN USED WITH MACROLIDE ANTIBIOTICS; REMINDER OF PSYCHIATRIC REACTIONS (FEBRUARY 2022)

An observational study has shown that co-administration of azithromycin with hydroxychloroquine in patients with rheumatoid arthritis was associated with an increased risk of cardiovascular events (including angina or chest pain and heart failure) and mortality. Healthcare professionals are reminded to consider the benefits and risks of co-prescribing systemic azithromycin, or other systemic macrolides, with hydroxychloroquine. If such use cannot be avoided, caution is recommended in patients with risk factors for cardiac events and they should be advised to seek urgent medical attention if any signs or symptoms develop.

A European safety review has reported that psychiatric reactions associated with hydroxychloroquine (including rare cases of suicidal behaviour) typically occurred within the first month of treatment; events have been reported in patients with no history of psychiatric disorders. Healthcare professionals are reminded to be vigilant for psychiatric reactions, and counsel patients and carers to seek medical advice if any new or worsening mental health symptoms develop.

- CAUTIONS Acute porphyrias p. 1150 · diabetes (may lower blood glucose) · G6PD deficiency · maculopathy · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders (especially in those with a history of epilepsy—may lower seizure threshold) · severe gastrointestinal disorders
- INTERACTIONS → Appendix 1: hydroxychloroquine

SIDE-EFFECTS

- ► Common or very common Abdominal pain · appetite decreased · diarrhoea · headache · mood altered · nausea · skin reactions · vision disorders · vomiting
- ▶ Uncommon Alopecia · anxiety · corneal oedema · dizziness · eye disorders · hair colour changes · neuromuscular dysfunction · retinopathy · seizure · tinnitus · vertigo
- ► Frequency not known Acute hepatic failure agranulocytosis anaemia angioedema bone marrow disorders bronchospasm cardiac conduction disorders cardiomyopathy confusion delusions depression hallucination hearing loss hypoglycaemia leucopenia movement disorders muscle weakness myopathy photosensitivity reaction psychiatric disorder psychosis QT interval prolongation reflexes absent severe cutaneous adverse reactions (SCARs) sleep disorder suicidal behaviour thrombocytopenia tremor ventricular hypertrophy

Overdose Hydroxychloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- PREGNANCY It is not necessary to withdraw an
 antimalarial drug during pregnancy if the rheumatic
 disease is well controlled; however, the manufacturer of
 hydroxychloroquine advises avoiding use.
- BREAST FEEDING Manufacturer advises use with caution present in milk in small amounts. Specialist sources indicate risk of accumulation in infant due to long halflife; monitor infant for symptoms of uveitis e.g. eye redness or sensitivity to light.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
 Dose adjustments Manufacturer advises consider dose adjustment in severe impairment.
- RENAL IMPAIRMENT EVGT Caution—monitor plasmahydroxychloroquine concentration in severe impairment. (N)

Dose adjustments Ever Consider dose adjustment in severe impairment.

MONITORING REQUIREMENTS

- A review group convened by the Royal College of Ophthalmologists has updated guidelines on monitoring for chloroquine and hydroxychloroquine retinopathy (Hydroxychloroquine and Chloroquine Retinopathy: Recommendations on Monitoring 2020). Recent data has highlighted that hydroxychloroquine retinopathy is more common than previously reported. Annual monitoring (including fundus autofluorescence and spectral domain optical coherence tomography) is recommended in all patients who have taken hydroxychloroquine for longer than 5 years.
- ► Annual monitoring may be started before 5 years of treatment if additional risk factors for retinotoxicity exist, such as concomitant tamoxifen therapy, impaired renal function (eGFR less than 60 mL/minute/1.73 m²), or highdose therapy (more than 5 mg/kg/day of hydroxychloroquine sulfate.
- PRESCRIBING AND DISPENSING INFORMATION To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

► Hydroxychloroquine sulfate (Non-proprietary)

Hydroxychloroquine sulfate 200 mg Hydroxychloroquine 200mg tablets | 60 tablet Pom £32.49 DT = £3.41

Hydroxychloroquine sulfate 300 mg Hydroxychloroquine 300mg

tablets | 30 tablet Pom £9.50 DT = £9.50

Quinoric (Bristol Laboratories Ltd)

Hydroxychloroquine sulfate 200 mg Quinoric 200mg tablets | 60 tablet PoM £5.10 DT = £3.41

Leflunomide

19-May-2021

INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis (specialist use only)

- ► BY MOUTH
- Adult: Initially 100 mg once daily for 3 days, then reduced to 10–20 mg once daily

Active psoriatic arthritis (specialist use only)

- ► BY MOUTH
- Adult: Initially 100 mg once daily for 3 days, then reduced to 20 mg once daily
- CONTRA-INDICATIONS Serious infection · severe hypoproteinaemia · severe immunodeficiency
- CAUTIONS Anaemia (avoid if significant and due to causes
 other than rheumatoid or psoriatic arthritis) · history of
 tuberculosis · impaired bone-marrow function (avoid if
 significant and due to causes other than rheumatoid or
 psoriatic arthritis) · leucopenia (avoid if significant and due
 to causes other than rheumatoid or psoriatic arthritis) ·
 thrombocytopenia (avoid if significant and due to causes
 other than rheumatoid or psoriatic arthritis)
- INTERACTIONS → Appendix 1: leflunomide

SIDE-EFFECTS

- ► Common or very common Abdominal pain · accelerated hair loss · appetite decreased · asthenia · diarrhoea · dizziness · gastrointestinal disorders · headache · leucopenia · nausea · oral disorders · paraesthesia · peripheral neuropathy · skin reactions · tendon disorders · vomiting · weight decreased
- ► **Uncommon** Anaemia · anxiety · electrolyte imbalance · hyperlipidaemia · taste altered · thrombocytopenia
- ▶ Rare or very rare Agranulocytosis · eosinophilia · hepatic disorders · infection · pancreatitis · pancytopenia · respiratory disorders · sepsis · severe cutaneous adverse reactions (SCARs) · vasculitis
- ► Frequency not known Cutaneous lupus erythematosus hypouricaemia pulmonary hypertension renal failure SIDE-EFFECTS, FURTHER INFORMATION Discontinue treatment and institute washout procedure in case of serious side-effect (consult product literature).

Hepatotoxicity Potentially life-threatening hepatotoxicity reported usually in the first 6 months. Discontinue treatment (and institute washout procedure—consult product literature) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure.

• CONCEPTION AND CONTRACEPTION Effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature). The concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2

- occasions 14 days apart) in men or women before conception—consult product literature.
- PREGNANCY Avoid—active metabolite teratogenic in animal studies.
- BREAST FEEDING Present in milk in animal studies manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises avoid—active metabolite may accumulate.
- RENAL IMPAIRMENT Manufacturer advises avoid in moderate or severe impairment—no information available.
- PRE-TREATMENT SCREENING Exclude pregnancy before treatment.
- MONITORING REQUIREMENTS
- Monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks.
- Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks.
- ▶ Monitor blood pressure.
- TREATMENT CESSATION

Washout Procedure The active metabolite persists for a long period; to aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception, stop treatment and give *either* colestyramine p. 215 *or* charcoal, activated p. 1481. Procedure may be repeated as necessary.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Penicillamine

19-May-2021

 DRUG ACTION Penicillamine aids the elimination of copper ions in Wilson's disease (hepatolenticular degeneration).

• INDICATIONS AND DOSE

Severe active rheumatoid arthritis (administered on expert advice)

- ► BY MOUTH
- Adult: Initially 125–250 mg daily for 1 month, then increased in steps of 125–250 mg, at intervals of not less than 4 weeks; maintenance 500–750 mg daily in divided doses, then reduced in steps of 125–250 mg every 12 weeks, dose reduction attempted only if remission sustained for 6 months; maximum 1.5 g per day
- ► Elderly: Initially up to 125 mg daily for 1 month, then increased in steps of up to 125 mg, at intervals of at least 4 weeks; maximum 1 g per day

Wilson's disease

- ► BY MOUTH
- Adult: 1.5-2 g daily in divided doses, adjusted according to response, to be taken before food; maintenance 0.75-1 g daily, a dose of 2 g daily should not be continued for more than one year; maximum 2 g per day

 Elderly: 20 mg/kg daily in divided doses, adjusted according to response

Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids)

- ► BY MOUTH
- Adult: Initially 500 mg daily in divided doses, to be increased slowly over 3 months; maintenance 1.25 g daily

Cystinuria, therapeutic

- ► BY MOUTH
- Adult: 1-3 g daily in divided doses, to be adjusted to maintain urinary cystine below 200 mg/litre, to be taken before food

Cystinuria, prophylactic

- ► BY MOUTH
- Adult: 0.5-1 g daily, maintain urinary cystine below 300 mg/litre and adequate fluid intake (at least 3 litres daily), to be taken at bedtime
- ► Elderly: Minimum dose to maintain urinary cystine below 200 mg/litre is recommended
- CONTRA-INDICATIONS Lupus erythematosus
- CAUTIONS Neurological involvement in Wilson's disease
- INTERACTIONS → Appendix 1: penicillamine
- SIDE-EFFECTS
- ► Common or very common Proteinuria thrombocytopenia
- Rare or very rare Alopecia · breast enlargement (males and females) · connective tissue disorders · haematuria (discontinue immediately if cause unknown) · hypersensitivity · oral disorders · skin reactions
- ► Frequency not known Agranulocytosis · aplastic anaemia · appetite decreased · ſever · glomerulonephritis · Goodpasture's syndrome · haemolytic anaemia · increased risk of infection · jaundice cholestatic · leucopenia · lupus-like syndrome · myasthenia gravis · nausea · nephrotic syndrome · neurological deterioration in Wilson's Disease · neutropenia · pancreatitis · polymyositis · pulmonary haemorrhage · rash (consider dose reduction) · respiratory disorders · Stevens Johnson syndrome · taste loss (mineral supplements not recommended) · vomiting · yellow nail syndrome

SIDE-EFFECTS, FURTHER INFORMATION Proteinuria occurs in up to 30% of patients—can be a sign of immunemediated nephropathy. Discontinue immediately if nephrotoxicity occurs.

Nausea and rash more common early in treatment if full dose used from initiation. Delayed rash can occur after months or years of treatment—manufacturer advises reduce dose.

- ALLERGY AND CROSS-SENSITIVITY Patients who are hypersensitive to penicillin may react rarely to penicillamine.
- PREGNANCY Fetal abnormalities reported rarely; avoid if nossible
- BREAST FEEDING Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- RENAL IMPAIRMENT Ever Caution in mild impairment; avoid in moderate to severe impairment.
 Dose adjustments Ever Dose reduction may be required in mild impairment depending on indication (consult product literature).

MONITORING REQUIREMENTS

► Consider withdrawal if platelet count falls below 120 000/mm³ or white blood cells below 2500/mm³ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).

- ▶ Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose
- ▶ A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase.
- ▶ Longer intervals may be adequate in cystinuria and Wilson's disease.
- PATIENT AND CARER ADVICE Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

Anakinra

04-May-2021

• INDICATIONS AND DOSE

Rheumatoid arthritis (in combination with methotrexate) which has not responded to methotrexate alone (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 100 mg once daily

Cryopyrin-associated periodic syndromes (specialist use only)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: 1-2 mg/kg daily, for severe cryopyrin-associated periodic syndromes, usual maintenance is 3-4 mg/kg daily, up to a maximum of 8 mg/kg daily

Still's disease (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 49 kg): 1-2 mg/kg daily
- Adult (body-weight 50 kg and above): 100 mg daily
- CONTRA-INDICATIONS Active infection neutropenia (absolute neutrophil count less than 1.5×10^9 /litre)—do not initiate · pre-existing malignancy
- CAUTIONS Elderly · history of asthma (increased risk of serious infection) · history of recurrent infection · predisposition to infection
- INTERACTIONS → Appendix 1: anakinra
- SIDE-EFFECTS
- ► Common or very common Headache · infection · neutropenia · thrombocytopenia
- ► Uncommon Skin reactions

information available.

► Frequency not known Hepatitis

SIDE-EFFECTS, FURTHER INFORMATION Neutropenia reported commonly—discontinue if neutropenia develops.

- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Manufacturer advises avoid—no.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.
- RENAL IMPAIRMENT Manufacturer advises caution in moderate impairment.

Dose adjustments Manufacturer advises consider alternate day dosing in severe impairment.

 PRE-TREATMENT SCREENING Manufacturer advises patients should be screened for latent tuberculosis and viral hepatitis prior to initiation of treatment.

MONITORING REQUIREMENTS

- ► Manufacturer advises monitor neutrophil count before treatment, then every month for 6 months, then every 3 months thereafter.
- ▶ When used for Cryopyrin-associated periodic syndromes Manufacturer advises monitor for CNS inflammation (including ear and eye tests) 3 months after starting treatment, then every 6 months until effective treatment doses have been identified, then yearly thereafter.
- When used for Still's disease Manufacturer advises consider routine monitoring of hepatic enzymes during the first month of treatment.

PRESCRIBING AND DISPENSING INFORMATION

▶ When used for Cryopyrin-associated periodic syndromes or Still's disease The manufacturer of Kineret® has provided a Guide for Healthcare Professionals.

PATIENT AND CARER ADVICE

Blood disorders Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, bruising or, bleeding) develop.

- When used for Still's disease A patient card and patient booklet should be provided.
- ▶ When used for Cryopyrin-associated periodic syndromes A patient booklet should be provided.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

► Anakinra for treating Still's disease (March 2021) NICE TA685 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Anakinra (Kineret®) for rheumatoid arthritis (November 2002) SMC No. 05/02 Not recommended
- ► Anakinra (Kineret®) for the treatment of Still's disease, as monotherapy or in combination with other anti-inflammatory drugs and disease-modifying antirheumatic drugs (October 2018) SMC No. SMC2104 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Kineret (Swedish Orphan Biovitrum Ltd)

Anakinra 150 mg per 1 ml Kineret 100mg/0.67ml solution for injection pre-filled syringes | 7 pre-filled disposable injection [PoM] £183.61 DT = £183.61

Sarilumab

11-Nov-2020

 DRUG ACTION Sarilumab is a recombinant human monoclonal antibody that specifically binds to interleukin-6 receptors and blocks the activity of pro-inflammatory cytokines.

INDICATIONS AND DOSE

Moderate-to-severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to one or more disease-modifying antirheumatic drugs (as monotherapy or in combination with methotrexate) (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 200 mg every 2 weeks, for dose adjustments due to neutropenia, thrombocytopenia, or liver enzyme elevations—consult product literature
- CONTRA-INDICATIONS Do not initiate if absolute neutrophil count less than 2×10^9 /litre · do not initiate if

platelet count less than 150 \times 10³/microlitre · do not initiate if serum transaminases (ALT or AST) greater than 1.5 times the upper limit of normal · severe active infection

- CAUTIONS Chronic or recurrent infection elderly (increased risk of infection) • history of diverticulitis • history of intestinal ulceration • history of serious or opportunistic infection • predisposition to infection CAUTIONS, FURTHER INFORMATION
- Infection Manufacturer advises caution in patients who have been exposed to tuberculosis, or who have lived in or travelled to areas of endemic tuberculosis or mycoses. Patients with latent tuberculosis should complete antituberculosis therapy before initiation of sarilumab; consider anti-tuberculosis therapy before initiation of sarilumab in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed, and for those with a negative test for latent tuberculosis but have risk factors for tuberculosis consultation with a tuberculosis specialist may be appropriate.

Manufacturer advises patients should be brought up-todate with current immunisation schedule before initiating treatment.

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Dyslipidaemia increased risk of infection neutropenia thrombocytopenia
- ► Frequency not known Hypersensitivity skin reactions
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of childbearing potential during treatment and for up to 3 months after treatment.
- PREGNANCY Manufacturer advises avoid unless essential—limited information available.
- BREAST FEEDING Manufacturer advises avoid—no information available
- HEPATIC IMPAIRMENT Manufacturer advises avoid (no information available).
- PRE-TREATMENT SCREENING Manufacturer advises that patients should be evaluated for tuberculosis before treatment.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor for signs and symptoms of infection; monitor neutrophil count 4 to 8 weeks after treatment initiation and according to clinical judgement thereafter—discontinue if absolute neutrophil count less than 0.5 × 10⁹/litre.
- Manufacturer advises monitor platelet count 4 to 8 weeks after treatment initiation and according to clinical judgement thereafter—discontinue if platelet count less than 50 × 10³/microlitre.
- Manufacturer advises monitor hepatic transaminases (ALT and AST) 4 to 8 weeks after treatment initiation and every 3 months thereafter, and consider other liver function tests if clinically indicated—discontinue if ALT is greater than 5 times the upper limit of normal.
- Manufacturer advises monitor lipid profile approximately 4 to 8 weeks after treatment initiation and approximately every 6 months thereafter—hyperlipidaemia should be managed according to clinical guidelines.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises to avoid injecting into areas of the skin that are tender, damaged, or have bruises or scars; patients may selfadminister Kevzara[®], after appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION Sarilumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- PATIENT AND CARER ADVICE Manufacturer advises
 patients should be advised to seek immediate medical
 attention if symptoms of a hypersensitivity reaction occur.
 Self-administration Manufacturer advises patients and their
 carers should be given training in subcutaneous injection
 technique if appropriate.

Alert card An alert card should be provided.

Missed doses Manufacturer advises if a dose is more than 3 days late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Sarilumab for moderate-to-severe rheumatoid arthritis (November 2017) NICE TA485 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ➤ Sarilumab (Kevzara[®]) in combination with methotrexate, or as monotherapy for the treatment of moderately to severely active rheumatoid arthritis in adult patients who have responded inadequately to, or who are intolerant to one or more disease modifying anti rheumatic drugs (April 2018) SMC No. 1314/18 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

▶ Kevzara (Sanofi Genzyme)

Sarilumab 131.6 mg per 1 ml Kevzara 150mg/1.14ml solution for injection pre-filled syringes | 2 pre-filled disposable injection PoM 5912.25

Kevzara 150mg/1.14ml solution for injection pre-filled pens | 2 pre-filled disposable injection PoM £912.25

Sarilumab 175 mg per 1 ml Kevzara 200mg/1.14ml solution for injection pre-filled syringes | 2 pre-filled disposable injection PoM 6912 25

Kevzara 200mg/1.14ml solution for injection pre-filled pens | 2 pre-filled disposable injection FoM £912.25

Secukinumab

07-Nov-2021

 DRUG ACTION Secukinumab is a recombinant human monoclonal antibody that selectively binds to cytokine interleukin-17A (IL-17A) and inhibits the release of proinflammatory cytokines and chemokines.

• INDICATIONS AND DOSE

Ankylosing spondylitis (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 150 mg every week for 5 doses, then maintenance 150 mg every month, dose may be increased to 300 mg according to clinical response. Review treatment if no response within 16 weeks of initial dose

Non-radiographic axial spondyloarthritis (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 150 mg every week for 5 doses, then maintenance 150 mg every month, review treatment if no response within 16 weeks of initial dose

Psoriatic arthritis (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 150 mg every week for 5 doses, then maintenance 150 mg every month, dose may be increased to 300 mg according to clinical response. Review treatment if no response within 16 weeks of initial dose

Psoriatic arthritis with concomitant moderate to severe plaque psoriasis or if inadequate response to anti-TNF α treatment (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 300 mg every week for 5 doses, then maintenance 300 mg every month, review treatment if no response within 16 weeks of initial dose

Plaque psoriasis (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 300 mg every week for 5 doses, then maintenance 300 mg every month, review treatment if no response within 16 weeks of initial dose
- CONTRA-INDICATIONS Severe active infection
- CAUTIONS Chronic infection history of recurrent infection - Inflammatory bowel disease (discontinue if signs or symptoms develop, or an exacerbation occurs) predisposition to infection (discontinue if new serious infection develops)

CAUTIONS, FURTHER INFORMATION

- ► Tuberculosis [EvGr] Anti-tuberculosis therapy should be considered before starting secukinumab in patients with latent tuberculosis. ♠
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Diarrhoea · fatigue · headache · increased risk of infection · nausea · rhinorrhoea
- ► **Uncommon** Conjunctivitis inflammatory bowel disease neutropenia (usually mild and reversible) skin reactions
- ▶ Rare or very rare Anaphylactic reaction
- CONCEPTION AND CONTRACEPTION Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 20 weeks after stopping treatment.
- PREGNANCY Manufacturer advises avoid—no information available
- BREAST FEEDING Manufacturer advises avoid during treatment and for up to 20 weeks after discontinuing treatment—no information available.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises to take the syringe or pen out of the refrigerator 20 minutes before administration and to avoid injecting into areas of the skin that show psoriasis. Patients may self-administer Cosentyx ® pre-filled pen.
- PRESCRIBING AND DISPENSING INFORMATION
 - Secukinumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; [EVG] record the brand name and batch number after each administration.
- PATIENT AND CARER ADVICE
 - Self-administration Patients and their carers should be given training in subcutaneous injection technique. Infection Patients and their carers should be advised to seek immediate medical attention if symptoms of infection develop during treatment with secukinumab.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Secukinumab for treating moderate to severe plaque psoriasis (July 2015) NICE TA350 Recommended with restrictions
- Secukinumab for active ankylosing spondylitis after treatment with non-steroidal anti-inflammatory drugs or TNF-alpha inhibitors (September 2016) NICE TA407 Recommended with restrictions
- Secukinumab for treating non-radiographic axial spondyloarthritis (July 2021) NICE TA719 Recommended with restrictions

- Certolizumab pegol and secukinumab for treating active psoriatic arthritis after inadequate response to DMARDs (May 2017) NICE TA445 Recommended with restrictions
 Scottish Medicines Consortium (SMC) decisions
- Secukinumab (Cosentyx®) for treatment of moderate to severe plaque psoriasis in adults who are candidates for systemic therapy (June 2015) SMC No. 1054/15 Recommended with restrictions
- Secukinumab (Cosentyx®) for the treatment of active nonradiographic axial spondyloarthritis with objective signs of inflammation as indicated by elevated C-reactive protein and/or magnetic resonance imaging evidence in adults who have responded inadequately to non-steroidal antiinflammatory drugs (January 2021) SMC No. SMC2308 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates

➤ Cosentyx (Novartis Pharmaceuticals UK Ltd)

Secukinumab 150 mg per 1 ml Cosentyx 150mg/1ml solution for injection pre-filled pens | 2 pre-filled disposable injection [PoM]

Cosentyx 150mg/1ml solution for injection pre-filled syringes | 2 prefilled disposable injection [PoM] \$1,218.78 Cosentyx 300mg/2ml solution for injection pre-filled pens | 1 prefilled disposable injection [PoM] \$1,218.78

Cosentyx 75mg/0.5ml solution for injection pre-filled syringes | 1 prefilled disposable injection PoM £304.70 (Hospital only)

Tocilizumab

26-Apr-2022

 DRUG ACTION Tocilizumab is a recombinant humanised monoclonal antibody that binds to interleukin-6 receptors thereby blocking the activity of pro-inflammatory cytokines.

• INDICATIONS AND DOSE

Rheumatoid arthritis (initiated by a specialist)

- ► BY INTRAVENOUS INFUSION
- Adult: 8 mg/kg every 4 weeks (max. per dose 800 mg), for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature
- ► BY SUBCUTANEOUS INJECTION
- Adult: 162 mg once weekly, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature

Giant cell arteritis (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 162 mg once weekly, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, not to be used alone for acute relapses; review need for treatment beyond 52 weeks

COVID-19 in hospitalised patients who are receiving systemic corticosteroids and require oxygen supplementation or mechanical ventilation (initiated by a specialist)

- ► BY INTRAVENOUS INFUSION
- Adult: 8 mg/kg (max. per dose 800 mg) for 1 dose

Cytokine release syndrome (initiated by a specialist)

- ► BY INTRAVENOUS INFUSION
- Adult (body-weight up to 30 kg): 12 mg/kg (max. per dose 800 mg), if no improvement in symptoms after the first dose, up to 3 additional doses may be administered.
 The interval between the infusions should be at least 8 hours continued →

 Adult (body-weight 30 kg and above): 8 mg/kg (max. per dose 800 mg), if no improvement in symptoms after the first dose, up to 3 additional doses may be administered. The interval between the infusions should be at least 8 hours

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: TOCILIZUMAB (*ROACTEMRA* [®]): RARE RISK OF SERIOUS LIVER INJURY INCLUDING CASES REQUIRING TRANSPLANTATION (JULY 2019)

There have been reports of rare but serious cases of drug-induced liver injury, including acute liver failure and hepatitis, in patients treated with tocilizumab; some cases required liver transplantation. Serious liver injury was reported from 2 weeks to more than 5 years after initiation of tocilizumab. Healthcare professionals are advised to initiate tocilizumab treatment with caution in patients with active hepatic disease or hepatic impairment. Patients and their carers should be advised to seek immediate medical attention if signs and symptoms of liver injury, such as tiredness, abdominal pain, and jaundice, occur. For further information see Cautions, Contra-indications and Monitoring requirements.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Severe active infection (unless used for the treatment of COVID-19)

SPECIFIC CONTRA-INDICATIONS

- When used for covid-19 Do not initiate if absolute neutrophil
 count less than 1 × 10⁹/litre · do not initiate if hepatic
 enzymes more than 10 times the upper limit of normal · do
 not initiate if platelet count less than 50 × 10⁵/microlitre
- When used for giant cell arteritis Do not initiate if hepatic enzymes more than 5 times the upper limit of normal do not initiate in patients not previously treated with RoActemra[®] if absolute neutrophil count less than 2 × 10⁹/litra
- When used for rheumatoid arthritis Do not initiate if hepatic enzymes more than 5 times the upper limit of normal · do not initiate in patients not previously treated with RoActemra® if absolute neutrophil count less than 2 × 10⁹/litre

CAUTIONS

- When used for covid-19 History of recurrent or chronic infection (interrupt treatment if serious infection occurs) predisposition to infection (interrupt treatment if serious infection occurs)
- When used for giant cell arteritis Hepatic enzymes more than 1.5 times the upper limit of normal history of diverticulitis history of intestinal ulceration history of recurrent or chronic infection (interrupt treatment if serious infection occurs) low absolute neutrophil count (discontinue treatment if neutrophil count less than 0.5 × 10⁹/litre) platelet count less than 100 × 10⁵/microlitre (discontinue treatment if platelet count less than 50 × 10³/microlitre) predisposition to infection (interrupt treatment if serious infection occurs)
- when used for rheumatoid arthritis Hepatic enzymes more than 1.5 times the upper limit of normal · history of diverticulitis · history of intestinal ulceration · history of recurrent or chronic infection (interrupt treatment if serious infection occurs) · low absolute neutrophil count (discontinue treatment if neutrophil count less than 0.5 × 10°/litre) · platelet count less than 100 × 10³/microlitre (discontinue treatment if platelet count less than 50 × 10³/microlitre) · predisposition to infection (interrupt treatment if serious infection occurs)

CAUTIONS, FURTHER INFORMATION

- Tuberculosis
- When used for rheumatoid arthritis or giant cell arteritis
 Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · anxiety · conjunctivitis · constipation · cough · diarrhoea · dizziness · dyslipidaemia · dyspnoea · gastrointestinal disorders · headache · hypersensitivity · hypertension · hypofibrinogenaemia · hypokalaemia · increased risk of infection · insomnia · leucopenia · nausea · neutropenia · oral disorders · peripheral oedema · skin reactions · weight increased
- ▶ Uncommon Hypothyroidism nephrolithiasis
- Rare or very rare Hepatic disorders · Stevens-Johnson syndrome
- Frequency not known Infusion related reaction pancytopenia · respiratory disorders · sepsis
- CONCEPTION AND CONTRACEPTION Effective contraception required during and for 3 months after treatment
- PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies.
- BREAST FEEDING Specialist sources indicate use with caution. Monitor breast-fed infants for adequate feeding, fever, frequent infections, diarrhoea, or unusual behaviour.
- HEPATIC IMPAIRMENT Manufacturer advises caution consult product literature.

RENAL IMPAIRMENT

- With intravenous use Manufacturer advises monitor renal function closely in moderate-to-severe impairment—no information available.
- With subcutaneous use Manufacturer advises monitor renal function closely in severe impairment—no information available

PRE-TREATMENT SCREENING

Tuberculosis

 When used for rheumatoid arthritis or giant cell arteritis Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS

▶ When used for rheumatoid arthritis or giant cell arteritis world Monitor lipid profile 4–8 weeks after starting treatment and then as indicated. Monitor for demyelinating disorders. Monitor hepatic transaminases before starting treatment, every 4–8 weeks for first 6 months of treatment, then every 12 weeks thereafter. Monitor neutrophil and platelet count before starting treatment, 4–8 weeks after starting treatment and then as indicated.

DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion, manufacturer advises give intermittently in Sodium chloride 0.9%; dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour.
- With subcutaneous use For subcutaneous injection, manufacturer advises rotate injection site and avoid skin that is tender, damaged or scarred. Patients may selfadminister RoActentra®, after appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION Tocilizumab
 is a biological medicine. Biological medicines must be
 prescribed and dispensed by brand name, see Biological
 medicines and Biosimilar medicines, under Guidance on
 prescribing p. 1; record the brand name and batch number
 after each administration..
- HANDLING AND STORAGE Manufacturer advises protect from light and store in a refrigerator (2–8 °C)—consult

product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

 PATIENT AND CARER ADVICE Patients and carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

An alert card and patient information brochure highlighting important safety information should be provided.

Missed doses • With subcutaneous use If an injection administered once every 2 weeks or once every 3 weeks is missed and it is within 7 days of the scheduled dose, it should be administered as soon as possible and the next dose taken at the normal time.

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375 Recommended with restrictions
- ► Tocilizumab for the treatment of rheumatoid arthritis (February 2012) NICE TA247 Recommended with restrictions
- Tocilizumab for treating giant cell arteritis (April 2018)
 NICE TA518 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Tocilizumab (*RoActemra*®) for the treatment of Giant Cell Arteritis (GCA) in adult patients (September 2018) SMC No. SMC2014 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates

► RoActemra (Roche Products Ltd)

Tocilizumab 180 mg per 1 ml RoActemra 162mg/0.9ml solution for injection pre-filled syringes | 4 pre-filled disposable injection PoM £913.12 DT = £913.12 (Hospital only) RoActemra 162mg/0.9ml solution for injection pre-filled pens | 4 pre-filled disposable injection PoM £913.12 DT = £913.12

Solution for infusion

EXCIPIENTS: May contain Polysorbates ELECTROLYTES: May contain Sodium

► RoActemra (Roche Products Ltd)

Tocilizumab 20 mg per 1 ml RoActemra 400mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £512.00 (Hospital only) RoActemra 200mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £256.00 (Hospital only)

RoActemra 80mg/4ml concentrate for solution for infusion vials | 1 vial Pom £102.40 (Hospital only)

Ustekinumab

25-Nov-2020

• INDICATIONS AND DOSE

Plaque psoriasis (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, consider discontinuation if no response within 28 weeks
- Adult (body-weight 100 kg and above): Initially 90 mg, then 90 mg after 4 weeks, then 90 mg every 12 weeks, consider discontinuation if no response within 28 weeks

Psoriatic arthritis (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, consider discontinuation if no response within 28 weeks, higher doses of 90 mg may be used in patients with body-weight over 100 kg

Crohn's disease (specialist use only) | Ulcerative colitis (specialist use only)

- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult (body-weight up to 56 kg): 260 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or response is lost, dosing frequency may be increased—consult product literature; consider discontinuation if no response within 16 weeks of initial dose or increase in dosing frequency
- Adult (body-weight 56-85 kg): 390 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or response is lost, dosing frequency may be increased—consult product literature; consider discontinuation if no response within 16 weeks of initial dose or increase in dosing frequency
- Adult (body-weight 86 kg and above): 520 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or response is lost, dosing frequency may be increased—consult product literature; consider discontinuation if no response within 16 weeks of initial dose or increase in dosing frequency
- CONTRA-INDICATIONS Active infection
- CAUTIONS Development of malignancy · elderly · history of malignancy · predisposition to infection · start appropriate treatment if widespread erythema and skin exfoliation develop, and stop ustekinumab treatment if exfoliative dermatitis suspected

CAUTIONS, FURTHER INFORMATION

- Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab.
- INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

- Common or very common Arthralgia · asthenia · back pain · diarrhoea · dizziness · headache · increased risk of infection · myalgia · nausea · oropharyngeal pain · skin reactions · vomiting
- ► **Uncommon** Depression · facial paralysis · hypersensitivity (may be delayed) · nasal congestion
- ▶ Rare or very rare Respiratory disorders
- ► Frequency not known Increased risk of cancer
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment.
- PREGNANCY Avoid.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

■ PRF-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS

- Monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immunosuppressant therapy, or those over 60 years of age.
- Monitor for signs and symptoms of exfoliative dermatitis or erythrodermic psoriasis.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intravenous infusion (Stelara[®]), give intermittently in Sodium Chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and give over at least 1 hour through an in-line low-protein binding filter (pore size 0.2 micron); use within 4 hours of dilution.

PATIENT AND CARER ADVICE

Exfoliative dermatitis Patients should be advised to seek prompt medical attention if symptoms suggestive of exfoliative dermatitis or erythrodermic psoriasis (such as increased redness and shedding of skin over a larger area of the body) develop.

Tuberculosis Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Ustekinumab for the treatment of adults with moderate to severe psoriasis (updated March 2017) NICE TA180
 Recommended with restrictions
- Ustekinumab for treating active psoriatic arthritis (updated March 2017) NICE TA340 Recommended with restrictions
- Ustekinumab for moderately to severely active Crohn's disease after previous treatment (July 2017) NICE TA456 Recommended
- ► Ustekinumab for treating moderately to severely active ulcerative colitis (June 2020) NICE TA633 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Ustekinumab (Stelara®) alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adult patients when the response to previous non-biological disease-modifying anti-rheumatic drug therapy has been inadequate (March 2014) SMC No. 944/14 Recommended with restrictions
- ➤ Ustekinumab (Stelara®) for the treatment of adult patients with moderately to severely active Crohn's disease who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a tumour necrosis factor-alpha antagonist or have medical contra-indications to such therapies (July 2017) SMC No. 1250/17 Recommended
- ► Ustekinumab (Stelara®) for the treatment of adult patients with moderately to severely active ulcerative colitis who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a biologic or have medical contra-indications to such therapies (April 2020) SMC No. SMC2250 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

Ustekinumab 5 mg per 1 ml Stelara 130mg/26ml concentrate for solution for infusion vials | 1 vial Pom £2,147.00 (Hospital only)

IMMUNOSUPPRESSANTS > JAK INHIBITORS

Baricitinib

25-Jun-202

 DRUG ACTION Baricitinib selectively and reversibly inhibits the Janus-associated tyrosine kinases JAK1 and JAK2.

• INDICATIONS AND DOSE

Moderate-to-severe active rheumatoid arthritis (initiated by a specialist)

- ► BY MOUTH
- Adult 18-74 years: 4 mg once daily, for dose adjustments or treatment interruption due to side-effects, or dose reduction due to history of infection or sustained control of disease activity—consult product literature
- Adult 75 years and over: 2 mg once daily, for dose adjustments or treatment interruption due to sideeffects—consult product literature

Moderate-to-severe atopic eczema (initiated by a specialist)

- ► BY MOUTH
- Adult 18-74 years: 4 mg once daily, for dose adjustments or treatment interruption due to side-effects, or dose reduction due to history of infection or sustained control of disease activity—consult product literature, consider discontinuation of treatment if no response after 8 weeks
- Adult 75 years and over: 2 mg once daily, for dose adjustments or treatment interruption due to sideeffects—consult product literature, consider discontinuation of treatment if no response after 8 weeks

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BARICITINIB (*OLUMIANT*®): RISK OF VENOUS THROMBOEMBOLISM (MARCH 2020)

Clinical trial data have shown that baricitinib is associated with an increased frequency of venous thromboembolism (VTE) compared with placebo. Healthcare professionals are advised to use baricitinib with caution in patients with additional risk factors for VTE. Patients should be informed of the signs and symptoms of VTE before starting treatment and advised to seek urgent medical attention if these develop. Baricitinib should be permanently discontinued if clinical features of VTE occur.

MHRA/CHM ADVICE: BARICITINIB (*OLUMIANT®*): INCREASED RISK OF DIVERTICULITIS, PARTICULARLY IN PATIENTS WITH RISK FACTORS (AUGUST 2020)

A European review of worldwide data concluded that baricitinib is associated with an increased risk of diverticulitis. The MHRA recommends healthcare professionals use baricitnib with caution in patients with pre-exisiting diverticular disease, and in patients on long-term concomitant medicines associated with an increased risk of diverticulitis (including non-steroidal anti-inflammatory drugs, corticosteroids, and opioids). Patients should be advised to seek immediate medical attention if they experience severe abdominal pain especially accompanied with fever, nausea and vomiting, or other symptoms of diverticulitis. Prompt evaluation is needed of any patients treated with baricitnib who present with new-onset abdominal signs and symptoms to identify early diverticulitis or gastrointestinal perforation.

- CONTRA-INDICATIONS Absolute lymphocyte count less than 0.5×10^9 cells /litre (do not initiate) absolute neutrophil count less than 1×10^9 cells/litre (do not initiate) haemoglobin less than 8 g/dL (do not initiate) tuberculosis (active)
- CAUTIONS 75 years and older ∙ active, chronic, or recurrent infection (interrupt treatment if no response to standard therapy) • risk factors for deep-vein thrombosis or pulmonary embolism • risk of diverticulitis • risk of viral reactivation (consult product literature)

CAUTIONS, FURTHER INFORMATION

- ► Tuberculosis Ever Consider anti-tuberculosis therapy prior to initiation of baricitinib in patients with previously untreated latent tuberculosis.
- Immunisation EvGr Patients should receive all recommended vaccinations before starting treatment; live vaccines are not recommended immediately before, or during, treatment. ♠
- INTERACTIONS → Appendix 1: baricitinib
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · dyslipidaemia · headache · herpes zoster (interrupt treatment) · increased risk of infection · nausea · skin reactions · thrombocytosis
- ► **Uncommon** Deep vein thrombosis (discontinue permanently) · facial swelling · neutropenia · pulmonary embolism (discontinue permanently) · weight increased
- Frequency not known Gastrointestinal perforation hypersensitivity (discontinue) - lymphoproliferative disorder - reactivation of infections - venous thromboembolism (discontinue permanently)
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 1 week after treatment in women of child-bearing potential.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.
 Dose adjustments Manufacturer advises reduce dose to 2 mg once daily if creatinine clearance 30–60 mL/minute.
 See p. 21.
- PRE-TREATMENT SCREENING Manufacturer advises patients should be evaluated for tuberculosis and viral hepatitis before treatment.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor patients with hepatitis B surface antibody and hepatitis B core antibody, without hepatitis B surface antigen, for expression of hepatitis B virus (HBV) DNA—if HBV DNA detected, consult liver specialist for advice.
- Manufacturer advises monitor lipid profile 12 weeks after treatment initiation—hyperlipidaemia should be managed according to international clinical guidelines; monitor hepatic transaminases routinely—interrupt treatment if drug-induced liver injury suspected.
- ► Manufacturer advises monitor for haematological abnormalities; interrupt treatment if absolute neutrophil count less than 1 × 10⁹ cells/litre, absolute lymphocyte count less than 0.5 × 10⁹ cells/litre, or haemoglobin less than 8 g/dL—treatment may be restarted when levels return above these values.
- NATIONAL FUNDING/ACCESS DECISIONS

Filgotinib

06-0ct-2021

 DRUG ACTION Filgotinib is a selective inhibitor of the Janus-associated tyrosine kinase JAK1.

INDICATIONS AND DOSE

Rheumatoid arthritis (initiated by a specialist)

- BY MOUTH
- Adult 18-74 years: 200 mg once daily
- Adult 75 years and over: Initially 100 mg once daily, any further dose increase to 200 mg once daily should be based on the particular clinical circumstances of the patient
- CONTRA-INDICATIONS Absolute lymphocyte count less than 0.5×10^9 cells/litre · absolute neutrophil count less than 1×10^9 cells/litre · haemoglobin less than 8 g/dL · serious infection (active) · tuberculosis (active)
- CAUTIONS 75 years and older history of serious or opportunistic infection infection (chronic or recurrent) malignancy predisposition to infection risk factors for venous thromboembolism risk of viral reactivation tuberculosis exposure

CAUTIONS, FURTHER INFORMATION

- ► Tuberculosis EvGr Anti-tuberculosis therapy should be initiated in patients with latent tuberculosis before starting filgotinib. Use filgotinib with caution in patients who have travelled or resided in areas of endemic tuberculosis or endemic mycoses, or who have had previous exposure to tuberculosis.
- Immunisation EvGr Patients should receive all recommended vaccinations before starting treatment; live vaccines are not recommended immediately before, or during, treatment.
- Venous thromboembolism EvGr Use with caution in patients with risk factors for deep-vein thrombosis or pulmonary embolism—discontinue and initiate appropriate treatment promptly.
- INTERACTIONS → Appendix 1: filgotinib

SIDE-EFFECTS

- ► Common or very common Dizziness increased risk of infection nausea
- ▶ Uncommon Hypercholesterolaemia · neutropenia
- ► Frequency not known Embolism and thrombosis malignancy non-melanoma skin cancer reactivation of infections
- CONCEPTION AND CONTRACEPTION EVG: Females of childbearing potential should use effective contraception

during and for at least 1 week after stopping treatment. Impaired sperm production, decreased fertility and effects on male reproductive organs were observed in animal studies; the effect on humans is unknown (including if reversible)—male patients should be informed of the potential risk of reduced fertility or infertility before initiating treatment. No effects on female fertility were observed in animal studies. (A)

- PREGNANCY Ever Avoid—toxicity in animal studies.
- BREAST FEEDING EVGr Avoid—no information available.
- HEPATIC IMPAIRMENT EVGT Avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Ever Caution in moderate or severe impairment; avoid in end-stage renal disease (no information available).

Dose adjustments Fvor A dose of 100 mg once daily is recommended in moderate or severe impairment.

- PRE-TREATMENT SCREENING [EVGr] Patients should be evaluated for tuberculosis and viral hepatitis before treatment.
- MONITORING REQUIREMENTS
- Ever Monitor for signs and symptoms of infections (including tuberculosis) during and after treatment consider treatment interruption until the infection is controlled
- Monitor for haematological abnormalities before and during treatment; interrupt treatment if absolute neutrophil count less than 1 × 10⁹ cells/litre, absolute lymphocyte count less than 0.5 × 10⁹ cells/litre, or haemoglobin less than 8 g/dL—treatment may be restarted when levels return above these values.
- Monitor lipid profile 12 weeks after treatment initiation and as needed thereafter—hyperlipidaemia should be managed according to international clinical guidelines.
- Monitor for viral reactivation (including viral hepatitis and herpes zoster) during treatment; interrupt treatment if herpes zoster infection develops and resume once resolved.
- ► Periodic skin examination is recommended in patients at increased risk for skin cancer. ♠
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Jyseleca[®] has provided a guide for healthcare professionals.
- PATIENT AND CARER ADVICE For Jyseleca®, a patient alert card should be provided.
- NATIONAL FUNDING/ACCESS DECISIONS

Tofacitinib

16-Nov-2021

 DRUG ACTION Tofacitinib selectively inhibits the Janusassociated tyrosine kinases JAK1 and JAK3.

INDICATIONS AND DOSE

Moderate to severe rheumatoid arthritis (specialist use only) | Psoriatic arthritis (specialist use only)

- ► BY MOUTH USING FILM-COATED TABLETS
- Adult: 5 mg twice daily, for dose interruption or treatment discontinuation due to side-effects—consult product literature
- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- Adult: 11 mg once daily, for dose interruption or treatment discontinuation due to side-effects—consult product literature

Moderate to severe ulcerative colitis (specialist use only)

- ► BY MOUTH USING FILM-COATED TABLETS
- Adult: Initially 10 mg twice daily for 8 weeks, then maintenance 5 mg twice daily, if an adequate therapeutic response is not achieved after 8 weeks, the initial dose can be extended for an additional 8 weeks, discontinue treatment if no response after 16 weeks, for dose adjustments due to side-effects, decreased response during maintenance treatment, or following treatment interruption—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► EVGT Reduce total daily dose by half with concurrent use of potent CYP3A4 inhibitors, or concurrent use of a moderate CYP3A4 inhibitor and a potent CYP2C19 inhibitor, or concurrent use of drugs which are both moderate CYP3A4 and potent CYP2C19 inhibitors. ♠

DOSE EQUIVALENCE AND CONVERSION

► A twice-daily dose of Xeljanz[®] 5 mg film-coated tablets is equivalent to a once-daily dose of Xeljanz[®] 11 mg modified-release tablets—they may be switched between each other on the day after the last dose of

IMPORTANT SAFETY INFORMATION

either tablet

MHRA/CHM ADVICE: TO FACITINIB (XELJANZ®): NEW MEASURES TO MINIMISE RISK OF VENOUS THROMBOEMBOLISM AND OF SERIOUS AND FATAL INFECTIONS (MARCH 2020)

New recommendations have been issued following a European safety review that found a dose-dependent increased risk of serious venous thromboembolism (VTE) associated with tofacitinib. Healthcare professionals are advised to use tofacitinib with caution in any patients with known risk factors for VTE, in addition to the underlying disease. In patients with risk factors being treated for ulcerative colitis, the use of tofacitinib 10 mg twice daily as maintenance treatment is not recommended, unless no suitable alternative is available. In all patients being treated for rheumatoid or psoriatic arthritis, the recommended daily dose of tofacitinib should not be exceeded— see Indications and Dose. Patients should be informed of the signs and symptoms of VTE before starting treatment and advised to seek urgent medical attention if these develop. Tofacitinib should be permanently discontinued if signs of VTE occur.

Tofacitinib was also found to increase the risk of serious and fatal infections, with higher rates of infections in the elderly. Use of tofacitinib in patients older than 65 years is **not** recommended, unless no suitable alternative is available.

MHRA/CHM ADVICE: TOFACITINIB (*XELJANZ*®): NEW MEASURES TO MINIMISE RISK OF MAJOR ADVERSE CARDIOVASCULAR EVENTS AND MALIGNANCIES (OCTOBER 2021)

Data from a clinical trial of patients aged 50 years or older with rheumatoid arthritis and at least one cardiovascular risk factor showed an increased incidence

Arthritis 1201

10

of major adverse cardiovascular events and malignancies, particularly lung cancer and lymphoma (excluding non-melanoma skin cancer), when comparing tofacitinib with tumour necrosis factor alpha inhibitors. Healthcare professionals are advised to inform patients of the risks associated with tofacitinib treatment and should only use tofacitinib in patients over 65 years of age, in patients who are current or past smokers, patients with other cardiovascular risk factors (such as diabetes or coronary artery disease), and patients with other malignancy risk factors if no suitable alternatives are available.

- CONTRA-INDICATIONS Absolute lymphocyte count less than 750 cells/mm³ (do not initiate) absolute neutrophil count less than 1000 cells/mm³ (do not initiate) active infection including localised infection active tuberculosis haemoglobin less than 9 g/dL (do not initiate) risk factors for venous thromboembolism (high doses)
- CAUTIONS Elderly (over 65 years) predisposition to infection previous or current malignancy raised serum transaminases (particularly in combination with potentially hepatotoxic drugs) recurrent infection or history of serious infection risk factors for venous thromboembolism risk of diverticulitis risk of gastrointestinal perforation (new onset abdominal signs and symptoms should be evaluated promptly) risk of viral reactivation (consult product literature) tuberculosis exposure

CAUTIONS, FURTHER INFORMATION

- ▶ Immunisation EvGr Patients should receive all recommended vaccinations before starting treatment (consider prophylactic varicella zoster vaccination); live vaccines should be given at least 2 weeks, but preferably 4 weeks, before treatment initiation—consult product literature. ♠
- ► Tuberculosis Ever Anti-tuberculosis therapy should be initiated in patients with latent tuberculosis before starting tofacitinib. Consider anti-tuberculosis therapy prior to initiation of tofacitinib in patients with a history of previously untreated latent or active tuberculosis or in patients at risk of tuberculosis infection. Use tofacitinib with caution in patients who have travelled or resided in areas of endemic mycoses, or who have had previous exposure to tuberculosis.
- INTERACTIONS → Appendix 1: tofacitinib

SIDE-EFFECTS

- ▶ Common or very common Abdominal pain (more common in patients with juvenile idiopathic arthritis) anaemia cough (more common in patients with juvenile idiopathic arthritis) diarrhoea dyspepsia fatigue fever (more common in patients with juvenile idiopathic arthritis) gastrointestinal disorders headache (more common in patients with juvenile idiopathic arthritis) hypertension increased risk of infection influenza (more common in patients with juvenile idiopathic arthritis) joint disorders nausea (more common in patients with juvenile idiopathic arthritis) peripheral oedema pharyngitis (more common in patients with juvenile idiopathic arthritis) sinusitis (more common in patients with juvenile idiopathic arthritis) sinusitis (more common in patients with juvenile idiopathic arthritis) skin reactions vomiting (more common in patients with juvenile idiopathic arthritis)
- Uncommon Decreased leucocytes · deep vein thrombosis (discontinue permanently) · dehydration · dyslipidaemia · dyspnoea · hepatic steatosis · insomnia · ligament sprain · muscle strain · musculoskeletal pain · myocardial infarction · neoplasms · neutropenia · paraesthesia · pulmonary embolism (discontinue permanently) · sinus congestion · tendinitis · venous thromboembolism (discontinue permanently) · viral infection (more common

- in patients with juvenile idiopathic arthritis) · weight increased
- ▶ Rare or very rare Meningitis cryptococcal sepsis
- ► Frequency not known Angioedema BK virus infection interstitial lung disease (including fatal cases) malignancy reactivation of infections ulcerative colitis aggravated
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 4 weeks after treatment in women of child-bearing potential.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment; avoid in severe impairment.
 Dose adjustments Manufacturer advises dose reduction in moderate impairment—consult product literature.
- RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose in severe impairment—consult product literature.

- PRE-TREATMENT SCREENING Manufacturer advises patients should be evaluated for tuberculosis and viral hepatitis before treatment.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor for signs and symptoms of infection during and after treatment.
- Manufacturer advises periodic skin examination in patients at increased risk for skin cancer.
- Manufacturer advises monitor liver function routinely; monitor lipid profile 8 weeks after treatment initiation.
- Manufacturer advises monitor lymphocytes at baseline and every 3 months thereafter; neutrophils and haemoglobin should be monitored at baseline, after 4 to 8 weeks of treatment and every 3 months thereafter.
- DIRECTIONS FOR ADMINISTRATION EVGT Xeljanz® film-coated tablets may be crushed and taken with water.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ➤ Tofacitinib for moderate-to-severe rheumatoid arthritis (October 2017) NICE TA480 Recommended with restrictions
- ► Tofacitinib for treating active psoriatic arthritis after inadequate response to DMARDs (October 2018) NICE TA543 Recommended with restrictions
- ➤ Tofacitinib for moderately to severely active ulcerative colitis (November 2018) NICE TA547 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Tofacitinib citrate (Xeljanz®) in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis in adult patients who have responded inadequately to, or who are intolerant to one or more diseasemodifying anti-rheumatic drugs (DMARDs). Tofacitinib can be given as monotherapy in case of intolerance to methotrexate or when treatment with methotrexate is inappropriate (February 2018) SMC No. 1298/18 Recommended with restrictions
- ► Tofacitinib (Xeljanz®) in combination with methotrexate for the treatment of active psoriatic arthritis in adult patients who have had an inadequate response or who have been intolerant to a prior disease-modifying antirheumatic drug (DMARD) therapy (January 2019) SMC No. SMC2116 Recommended with restrictions
- Tofacitinib (Xeljanz®) for the treatment of adult patients with moderately to severely active ulcerative colitis who have had an inadequate response, lost response, or were intolerant to either conventional therapy or a biologic agent (February 2019) SMC No. SMC2122 Recommended

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Upadacitinib

05-May-2022

 DRUG ACTION Upadacitinib is a selective and reversible inhibitor of the Janus-associated tyrosine kinase JAK1.

INDICATIONS AND DOSE

Rheumatoid arthritis (specialist use only) | Psoriatic arthritis (specialist use only)

► BY MOUTH

 Adult: 15 mg once daily, for treatment interruption due to side-effects—consult product literature, consider discontinuation of treatment if no response after 12 weeks

Ankylosing spondylitis (specialist use only)

- ► BY MOUTH
- Adult: 15 mg once daily, for treatment interruption due to side-effects—consult product literature, consider discontinuation of treatment if no response after 16 weeks

Atopic eczema (specialist use only)

- ► BY MOUTH
- Adult: 15 mg once daily, for treatment interruption due to side-effects—consult product literature, consider discontinuation of treatment if no response after 12 weeks, alternatively 30 mg once daily, for treatment interruption due to side-effects—consult product literature, consider discontinuation of treatment if no response after 12 weeks
- Elderly: 15 mg once daily, for treatment interruption due to side-effects—consult product literature, consider discontinuation of treatment if no response after 12 weeks

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: UPADACITINIB (RINVOQ®): ADVICE FOR VENOUS THROMBOEMBOLISM (MARCH 2020)

Cases of deep vein thrombosis and pulmonary embolism have been reported in patients taking upadacitinib. Healthcare professionals are advised to use upadacitinib with caution in patients with risk factors for VTE. Patients should be informed of the signs and symptoms of VTE before starting treatment and advised to seek urgent medical attention if these develop. Upadacitinib should be discontinued if clinical features of VTE occur.

- CONTRA-INDICATIONS Absolute lymphocyte count less than 0.5×10^9 cells/litre · absolute neutrophil count less than 1×10^9 cells/litre · active serious infection including localised infection · active tuberculosis · haemoglobin less than $8 \, \text{g/dL}$
- CAUTIONS 65 years and over chronic or recurrent infection diverticular disease (including patients with increased risk of diverticulitis) history of serious or opportunistic infection known malignancy patients at high risk for deep-vein thrombosis or pulmonary embolism predisposition to infection risk of viral reactivation (consult product literature) tuberculosis exposure

CAUTIONS, FURTHER INFORMATION

- Immunisation EvGr Patients should receive all recommended vaccinations, including prophylactic varicella-zoster vaccination, before starting treatment; live vaccines are not recommended. ♠
- ▶ Tuberculosis Ever Consider anti-tuberculosis therapy prior to initiation of upadacitinib in patients with previously untreated latent tuberculosis or in patients at risk of tuberculosis infection. Use upadacitinib with caution in patients who have travelled or resided in areas of endemic tuberculosis or endemic mycoses. ♠
- INTERACTIONS → Appendix 1: upadacitinib
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · anaemia · cough · dyslipidaemia · fatigue · fever · headache · increased risk of infection · nausea · neutropenia · skin reactions · weight increased
- ► Frequency not known Deep vein thrombosis (discontinue and initiate treatment promptly) malignancy meningitis bacterial non-melanoma skin cancer pulmonary embolism (discontinue and initiate treatment promptly) reactivation of infections venous thromboembolism (discontinue and initiate treatment promptly)
- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential should use effective contraception during and for 4 weeks after treatment.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT EVGF Avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Ever Caution in severe impairment (limited information available). Dose adjustments
 - ▶ When used for Atopic eczema Evgr Reduce dose to 15 mg once daily in severe impairment. ♠
- PRE-TREATMENT SCREENING Manufacturer advises patients should be evaluated for tuberculosis and viral hepatitis before treatment.
- MONITORING REQUIREMENTS
- ► EvGr Monitor for signs and symptoms of infection during and after treatment.
- Periodic skin examination is recommended in patients at increased risk of skin cancer.
- Monitor neutrophils, lymphocytes, and haemoglobin before and during treatment (no later than 12 weeks after initiation), and as clinically indicated thereafter; interrupt treatment if absolute neutrophil count less than 1 × 10⁹ cells/litre, absolute lymphocyte count less than 0.5 × 10⁹ cells/litre, or haemoglobin less than 8 g/dL—treatment may be restarted when levels return above these values.
- Monitor hepatic transaminases before starting treatment, and as clinically indicated thereafter—interrupt treatment if drug-induced liver injury suspected; monitor lipids 12 weeks after starting treatment, and then as clinically indicated.
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Rinvoq® has provided a guide for healthcare professionals.
- PATIENT AND CARER ADVICE A patient alert card should be provided.
- NATIONAL FUNDING/ACCESS DECISIONS

Abatacept

10-Aug-2021

• INDICATIONS AND DOSE

Moderate-to-severe active rheumatoid arthritis (specialist use only) | Active psoriatic arthritis (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult (body-weight up to 60 kg): 500 mg every 2 weeks for 3 doses, then 500 mg every 4 weeks, review treatment if no response within 6 months
- Adult (body-weight 60-100 kg): 750 mg every 2 weeks for 3 doses, then 750 mg every 4 weeks, review treatment if no response within 6 months
- Adult (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses, then 1 g every 4 weeks, review treatment if no response within 6 months

Moderate-to-severe active rheumatoid arthritis (specialist use only) | Active psoriatic arthritis (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 125 mg once weekly, review treatment if no response within 6 months, subcutaneous dosing may be initiated with or without an intravenous loading dose—consult product literature
- CONTRA-INDICATIONS Severe infection
- CAUTIONS Do not initiate until active infections are controlled elderly (increased risk of side-effects) predisposition to infection (screen for latent tuberculosis and viral hepatitis) progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)
- INTERACTIONS → Appendix 1: abatacept
- SIDE-EFFECTS
- Common or very common Asthenia cough diarrhoea dizziness - gastrointestinal discomfort - headaches hypertension - increased risk of infection - nausea - oral ulceration - skin reactions - vomiting

- ▶ Uncommon Alopecia · anxiety · arrhythmias · arthralgia · bruising tendency · conjunctivitis · depression · dry eye · dyspnoea · gastritis · hyperhidrosis · hypotension · influenza like illness · leucopenia · menstrual cycle irregularities · neoplasms · pain in extremity · palpitations · paraesthesia · respiratory disorders · sepsis · sleep disorders · throat tightness · thrombocytopenia · vasculitis · vasodilation · vertigo · visual acuity decreased · weight increased
- ▶ Rare or very rare Pelvic inflammatory disease
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment and for 14 weeks after last dose.
- PREGNANCY Manufacturer advises avoid unless essential.
- BREAST FEEDING Present in milk in animal studies manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion, manufacturer advises give intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

IMMUNOSUPPRESSANTS > TUMOR NECROSIS FACTOR ALPHA (TNF-α) INHIBITORS

Adalimumab

12-Apr-2022

• INDICATIONS AND DOSE

Plaque psoriasis (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

 Adult: Initially 80 mg, then 40 mg every 2 weeks, to be started 1 week after initial dose, review treatment if no response within 16 weeks—consult product literature

Rheumatoid arthritis (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

 Adult: 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, dose to be increased only in patients receiving adalimumab alone, review treatment if no response within 12 weeks

Psoriatic arthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist) | Axial spondyloarthritis (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

 Adult: 40 mg every 2 weeks, review treatment if no response within 12 weeks

Crohn's disease (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

 Adult: Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, review treatment if no response within 12 weeks

Crohn's disease (accelerated regimen) (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, review treatment if no response within 12 weeks

Ulcerative colitis (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

 Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks, then maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, review treatment if no response within 8 weeks

Hidradenitis suppurativa (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

 Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, followed by 80 mg after 2 weeks, then maintenance 40 mg once weekly, after 2 weeks, alternatively 80 mg every 2 weeks, after 2 weeks, review treatment if no response within 12 weeks; if treatment interrupted—consult product literature

Uveitis (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

 Adult: Initially 80 mg, then 40 mg after 1 week; maintenance 40 mg every 2 weeks

- CONTRA-INDICATIONS Moderate or severe heart failure severe infections
- CAUTIONS Demyelinating disorders (risk of exacerbation)
 development of malignancy · do not initiate until active
 infections are controlled (discontinue if new serious
 infection develops) · hepatitis B virus—monitor for active
 infection · history of malignancy · mild heart failure

(discontinue if symptoms develop or worsen) • predisposition to infection

CAUTIONS, FURTHER INFORMATION

- Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.
- INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

- ➤ Common or very common Agranulocytosis · alopecia · anaemia · anxiety · arrhythmias · asthma · broken nails · chest pain · coagulation disorder · connective tissue disorders · cough · dehydration · depression · dyspnoea · electrolyte imbalance · eye inflammation · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · healing impaired · hyperglycaemia · hypersensitivity · hypertension · increased risk of infection · insomnia · leucocytosis · leucopenia · mood altered · muscle spasms · merve disorders · neutropenia · oedema · renal impairment · seasonal allergy · sensation abnormal · sepsis · skin reactions · sweat changes · thrombocytopenia · vertigo · vision disorders · vomiting
- Uncommon Aortic aneurysm · arterial occlusion · congestive heart failure · deafness · dysphagia · embolism and thrombosis · erectile dysfunction · gallbladder disorders · hepatic disorders · inflammation · lupus erythematosus · meningitis viral · myocardial infarction · nocturia · pancreatitis · respiratory disorders · rhabdomyolysis · sarcoidosis · solid organ neoplasm · stroke · tinnitus · tremor · vasculitis
- ▶ Rare or very rare Bone marrow disorders · cardiac arrest · demyelinating disorders · reactivation of infections · Stevens-Johnson syndrome
- ► Frequency not known Weight increased

 SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises can be used excreted in breast milk at very low concentrations (limited information available).

• PRE-TREATMENT SCREENING

Tuberculosis Manufacturer advises patients should be evaluated for active and latent tuberculosis before treatment

• MONITORING REQUIREMENTS

- Manufacturer advises monitor for infection before, during, and for 4 months after treatment.
- Manufacturer advises monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.
- For uveitis, manufacturer advises patients should be assessed for pre-existing or developing central demyelinating disorders before and at regular intervals during treatment.

PRESCRIBING AND DISPENSING INFORMATION

Adalimumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

 PATIENT AND CARER ADVICE When used to treat hidradenitis suppurativa, patients and their carers should be advised to use a daily topical antiseptic wash on lesions during treatment with adalimumab.

Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding)

Alert card An alert card should be provided.

• NATIONAL FUNDING/ACCESS DECISIONS
For full details see funding body website

NICE decisions

- Infliximab and adalimumab for Crohn's disease (May 2010)
 NICE TA187 Recommended
- Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329 Recommended with restrictions
- Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) NICE TA199 Recommended with restrictions
- Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195 Recommended with restrictions
- Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375 Recommended with restrictions
- Adalimumab, etanercept, infliximab and abatacept for treating moderate rheumatoid arthritis after conventional DMARDs have failed (July 2021) NICE TA715 Recommended with restrictions
- TNF-alpha inhibitors for ankylosing spondylitis and nonradiographic axial spondyloarthritis (February 2016)
 NICE TA383 Recommended
- Adalimumab for treating moderate-to-severe hidradenitis suppurativa (June 2016) NICE TA392 Recommended with restrictions
- ► Adalimumab for plaque psoriasis in adults (June 2008) NICE TA146 Recommended with restrictions
- Adalimumab and dexamethasone for treating non-infectious uveitis (July 2017) NICE TA460 Recommended

Scottish Medicines Consortium (SMC) decisions

- Adalimumab (Humira®) for moderate to severe chronic plaque psoriasis in adult patients (June 2008) SMC No. 468/08 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Certolizumab pegol

11-Nov-2020

INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (as monotherapy or in combination with methotrexate) | Severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate or other disease-modifying antirheumatic drugs (in combination with methotrexate) | Active psoriatic arthritis when response to disease-modifying antirheumatic drugs has been inadequate (as monotherapy or in combination with methotrexate)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, once clinical response is confirmed, an alternative maintenance dosing of 400 mg every 4 weeks can be considered, review treatment if no response within 12 weeks

Treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs! Treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, alternatively maintenance 400 mg every 4 weeks, review treatment if no response within 12 weeks

Moderate to severe plaque psoriasis

- ► BY SUBCUTANEOUS INJECTION
- Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, an alternative maintenance dosing of 400 mg every 2 weeks can be considered in patients with insufficient response, review treatment if no response within 16 weeks

- CONTRA-INDICATIONS Moderate to severe heart failure severe active infection
- CAUTIONS Demyelinating CNS disorders (risk of exacerbation) · do not initiate until active infections are controlled (discontinue if new serious infection develops and until infection controlled) · hepatitis B virus (monitor for active infection) · history or development of malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection

CAUTIONS, FURTHER INFORMATION

- ▶ Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with certolizumab pegol.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- Common or very common Abscess · asthenia · decreased leucocytes · eosinophilic disorders · fever · headaches · hepatic disorders · hypertension · increased risk of infection · nausea · neoplasms · neutropenia · pain · sensory disorder · skin reactions
- ▶ Uncommon Alopecia anaemia anxiety appetite disorder ·arrhythmias · ascites · asthma · breast disorder · cardiomyopathy · chills · coronary artery disease · cough · cyst · dizziness · dyslipidaemia · electrolyte imbalance · embolism and thrombosis · eye inflammation · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · healing impaired · heart failure · hypercoagulation · hypersensitivity · influenza like illness · lacrimation disorder • lymphadenopathy • menstrual cycle irregularities · mood disorder · muscle disorder · nail disorder · nerve disorders · oedema · oral disorders · oropharyngeal dryness · palpitations · photosensitivity reaction · renal impairment · respiratory disorders · sepsis · skin ulcer · solid organ neoplasm · sweat changes · syncope · systemic lupus erythematosus (SLE) · temperature perception abnormal · thrombocytopenia · thrombocytosis · tinnitus · tremor · urinary tract disorder · vasculitides · vertigo · vision disorders · weight change
- ▶ Rare or very rare Angioedema : atherosclerosis : atrioventricular block · cholelithiasis · cognitive impairment · delirium · fistula · haemosiderosis · hair texture abnormal · movement disorders · nephritis · nephropathy · odynophagia · pancytopenia · panniculitis · pericarditis · polycythaemia · Raynaud's phenomenon · sarcoidosis · seizure · sexual dysfunction · splenomegaly · stroke · suicide attempt · telangiectasia · thyroid disorder
- Frequency not known Multiple sclerosis
 SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.
- CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception in women of childbearing potential during treatment and for 5 months after last dose.
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—limited information available.
- PRE-TREATMENT SCREENING
- Tuberculosis Patients should be evaluated for tuberculosis before treatment
- MONITORING REQUIREMENTS Monitor for infection before, during, and for 5 months after treatment.

PATIENT AND CARER ADVICE

Blood disorders Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop. Tuberculosis Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss and fever) develop. Alert card An alert card should be provided.

Golimumab

06-Nov-2020

INDICATIONS AND DOSE

Ulcerative colitis (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 80 kg): Initially 200 mg, then 100 mg after 2 weeks; maintenance 50 mg every 4 weeks, alternatively maintenance 100 mg every 4 weeks, if inadequate response, review treatment if no response after 4 doses
- Adult (body-weight 80 kg and above): Initially 200 mg, then 100 mg after 2 weeks; maintenance 100 mg every 4 weeks, review treatment if no response after 4 doses

Rheumatoid arthritis (initiated by a specialist) | Psoriatic arthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist) | Non-radiographic axial spondyloarthritis (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 100 kg): 50 mg once a month, on the same date each month, review treatment if no response after 3-4 doses
- Adult (body-weight 100 kg and above): Initially 50 mg once a month for 3–4 doses, on the same date each month, dose may be increased if inadequate response, increased to 100 mg once a month, review treatment if inadequate response to this higher dose after 3–4 doses
- CONTRA-INDICATIONS Moderate or severe heart failure severe active infection
- CAUTIONS Active infection (do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled) · demyelinating disorders (risk of exacerbation) · hepatitis B virus—monitor for active infection · history or development of malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection · risk factors for dysplasia or carcinoma of the colon—screen for dysplasia regularly CAUTIONS, FURTHER INFORMATION
- Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start golimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with golimumab. Patients who have tested negative for latent tuberculosis, and those who are receiving or who have completed treatment for latent tuberculosis, should be monitored closely for symptoms of active infection.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ➤ Common or very common Abscess · alopecia · anaemia · asthenia · asthenia · bone fracture · chest discomfort · depression · dizziness · fever · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal inflammatory disorders · headache · hypersensitivity · hypertension · increased risk of infection · insomnia · nausea · paraesthesia · respiratory disorders · skin reactions · stomatitis
- Uncommon Arrhythmia · balance impaired · bone marrow disorders · breast disorder · cholelithiasis · constipation · eye inflammation · eye irritation · flushing · goitre · hyperthyroidism · hypothyroidism · leucopenia · liver disorder · menstrual disorder · myocardial ischaemia ·

- $neoplasms \cdot sepsis \cdot thrombocytopenia \cdot thrombosis \cdot thyroid disorder \cdot vision disorders$
- ► Rare or very rare Bladder disorder · congestive heart failure · demyelination · healing impaired · hepatitis B reactivation · lupus-like syndrome · Raynaud's phenomenon · renal disorder · sarcoidosis · taste altered · vasculitis
 - SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.
- CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception during treatment and for at least 6 months after last dose.
- PREGNANCY Use only if essential.
- BREAST FEEDING Manufacturer advises avoid during and for at least 6 months after treatment—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).

PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

- MONITORING REQUIREMENTS Monitor for infection before, during, and for 5 months after treatment.
- DIRECTIONS FOR ADMINISTRATION For doses requiring multiple injections, each injection should be administered at a different site.

Missed dose If dose administered more than 2 weeks late, manufacturer advises subsequent doses should be administered on the new monthly due date.

PATIENT AND CARER ADVICE

Tuberculosis All patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develon.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Alert card An alert card should be provided.

Infliximab

25-Feb-2022

• INDICATIONS AND DOSE

Active Crohn's disease (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, then 5 mg/kg, to be taken at 6 weeks after initial dose if condition has responded; discontinue if no response within 6 weeks of initial infusion (after 2 doses), then maintenance 5 mg/kg every 8 weeks, maintenance treatment can be restarted after a drug-free interval if symptoms recur within 16 weeks of the last infusion. Consult product literature for dose escalation in selected patients
- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, then (by intravenous infusion)
 5 mg/kg after 2 weeks; (by subcutaneous injection)
 maintenance 120 mg every 2 weeks, subcutaneous
 maintenance dosing to be started 4 weeks after the
 second of the initial intravenous infusions if a response
 has been seen. Discontinue if no response within
 6 weeks of the initial infusion (after 2 doses).
 Treatment can be restarted after a drug-free interval if
 symptoms recur within 16 weeks of the last dose—
 consult product literature

Fistulating Crohn's disease (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, then 5 mg/kg, to be taken at week 2 and 6 after initial dose, discontinue if no response after initial 3 doses, then maintenance
 5 mg/kg every 8 weeks, maintenance treatment can be restarted after a drug-free interval if symptoms recur within 16 weeks of the last infusion
- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, followed by (by intravenous infusion) 5 mg/kg after 2 weeks; (by subcutaneous injection) maintenance 120 mg every 2 weeks, subcutaneous maintenance dosing to be started 4 weeks after the second of the initial intravenous infusions. Discontinue if no response after 6 doses in total. Treatment can be restarted after a drug-free interval if symptoms recur within 16 weeks of the last dose—consult product literature

Active ulcerative colitis (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, then 5 mg/kg, to be taken at week 2 and 6 after initial dose, then 5 mg/kg every 8 weeks, consider discontinuation if no response within 14 weeks after initial infusion (3 doses)
- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, then (by intravenous infusion)
 5 mg/kg after 2 weeks; (by subcutaneous injection)
 maintenance 120 mg every 2 weeks, subcutaneous

maintenance dosing to be started 4 weeks after the second of the initial intravenous infusions. Consider discontinuation if no response within 14 weeks (after 6 doses in total)

Rheumatoid arthritis (in combination with methotrexate) (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 3 mg/kg, then 3 mg/kg, to be taken at week 2 and 6 after initial dose, then 3 mg/kg every 8 weeks, dose to be increased only if response is inadequate after 12 weeks of initial treatment; increased if necessary to 3 mg/kg every 4 weeks, alternatively increased in steps of 1.5 mg/kg every 8 weeks (max. per dose 7.5 mg/kg every 8 weeks), consider discontinuation if no response within 12 weeks of initial infusion (after 3 doses) or after dose adjustment. Maintenance treatment can be restarted after a drug-free interval if symptoms recur within 16 weeks of the last infusion
- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 3 mg/kg, then (by intravenous infusion) 3 mg/kg after 2 weeks; (by subcutaneous injection) maintenance 120 mg every 2 weeks, subcutaneous maintenance dosing to be started 4 weeks after the second of the initial intravenous infusions. Consider discontinuation if no response within 12 weeks of the initial infusion. Treatment can be restarted after a drug-free interval if symptoms recur within 16 weeks of the last dose—consult product literature

Ankylosing spondylitis (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, then 5 mg/kg, to be taken at week 2 and 6 after initial dose, then 5 mg/kg every 6–8 weeks, discontinue if no response by 6 weeks of initial infusion (after 2 doses)
- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, followed by (by intravenous infusion) 5 mg/kg after 2 weeks; (by subcutaneous injection) maintenance 120 mg every 2 weeks, subcutaneous maintenance dosing to be started 4 weeks after the second of the initial intravenous infusions. Discontinue if no response within 6 weeks of the initial infusion (after 2 doses)

Psoriatic arthritis (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, then 5 mg/kg, to be taken at week 2 and 6 after initial dose, followed by 5 mg/kg every 8 weeks
- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, followed by (by intravenous infusion) 5 mg/kg after 2 weeks; (by subcutaneous injection) maintenance 120 mg every 2 weeks, subcutaneous maintenance dosing to be started 4 weeks after the second of the initial intravenous infusions

Plaque psoriasis (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, then 5 mg/kg, to be taken at week 2 and 6 after initial dose, then 5 mg/kg every 8 weeks, discontinue if no response after 14 weeks of initial infusion (after 4 doses)
- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg, followed by (by intravenous infusion) 5 mg/kg after 2 weeks; (by subcutaneous injection) maintenance 120 mg every 2 weeks, subcutaneous maintenance dosing to be started 4 weeks after the second of the initial intravenous

continued →

infusions. Discontinue if no response after 14 weeks of the initial infusion (after 7 doses in total)

IMPORTANT SAFETY INFORMATION

Adequate resuscitation facilities must be available when infliximab is used.

- CONTRA-INDICATIONS Moderate or severe heart failure severe infections
- CAUTIONS Demyelinating disorders (risk of exacerbation) dermatomyositis · development of malignancy · hepatitis B virus—monitor for active infection · history of colon carcinoma (in inflammatory bowel disease) · history of dysplasia (in inflammatory bowel disease) · history of malignancy · history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection (discontinue if new serious infection develops) · risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks (readministration after interval exceeding 16 weeks not recommended)

CAUTIONS, FURTHER INFORMATION

- Infection Manufacturer advises patients should be up-todate with current immunisation schedule before initiating treatment
- Tuberculosis Manufacturer advises to evaluate patients for active and latent tuberculosis before treatment. Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. If latent tuberculosis is diagnosed, treatment should be started before commencing treatment with infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis develop (e.g. persistent cough, weight loss and fever).
- Hypersensitivity reactions Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). Manufacturer advises prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Abscess alopecia anaemia arrhythmias arthralgia chest pain chills constipation decreased leucocytes depression diarrhoea dizziness dyspnoea eye inflammation fatigue fever gastrointestinal discomfort gastrointestinal disorders haemorrhage headache hepatic disorders hypertension hypotension increased risk of infection infusion related reaction insomnia lymphadenopathy myalgia nausea neutropenia oedema pain palpitations respiratory disorders sensation abnormal sepsis skin reactions vasodilation vertigo
- Uncommon Anxiety · cheilitis · cholecystitis · confusion · drowsiness · healing impaired · heart failure · hypersensitivity · lupus erythematosus · lymphocytosis · memory loss · neoplasms · nerve disorders · pancreatitis · peripheral ischaemia · pulmonary oedema · seborrhoea · seizure · syncope · thrombocytopenia · thrombophlebitis

- ▶ Rare or very rare Agranulocytosis · circulatory collapse · cyanosis · demyelinating disorders · granuloma · haemolytic anaemia · hepatitis B reactivation · meningitis · pancytopenia · pericardial effusion · sarcoid-like reaction · severe cutaneous adverse reactions (SCARs) · transverse myelitis · vasculitis · vasospasm
- Frequency not known Dermatomyositis exacerbated hepatosplenic T-cell lymphoma (increased risk in inflammatory bowel disease) - myocardial infarction myocardial ischaemia - sarcoidosis - stroke - vision loss
- CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception during and for at least 6 months after last dose.
- PREGNANCY Use only if essential.
- BREAST FEEDING Specialist sources indicate amount present in milk probably too small to be harmful.
- PRE-TREATMENT SCREENING

Tuberculosis Manufacturer advises patients should be evaluated for tuberculosis before treatment.

- MONITORING REQUIREMENTS
- Monitor for infection before, during, and for 6 months after treatment.
- All patients should be observed carefully for 1-2 hours after infusion and resuscitation equipment should be available for immediate use (risk of hypersensitivity reactions).
- Monitor for symptoms of delayed hypersensitivity if readministered after a prolonged period.
- Manufacturer advises periodic skin examination for nonmelanoma skin cancer, particularly in patients with risk factors.
- DIRECTIONS FOR ADMINISTRATION Every For intermittent intravenous infusion, dilute reconstituted solution with Sodium Chloride 0.9%. Reconstitute each 100 mg vial with 10 mL. Water for Injections using a 21-gauge or smaller needle and gently swirl vial without shaking to dissolve; allow to stand for 5 minutes. Dilute requisite dose with infusion fluid to a usual final volume of 250 mL (maximum concentration 4 mg/mL). Give over 2 hours through a low protein-binding filter (1.2 micron or less); adults who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour. Start infusion within 3 hours of reconstitution. ♠
- PRESCRIBING AND DISPENSING INFORMATION Infliximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.
- HANDLING AND STORAGE Store in a refrigerator (2–8°C) consult product literature for further information regarding storage outside refrigerator.
- PATIENT AND CARER ADVICE

Tuberculosis Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop. Blood disorders Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Hypersensitivity reactions Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

Self-administration Manufacturer advises patients may selfadminister *Remsima* *pre-filled syringes or pens following training in subcutaneous injection technique. Alert card An alert card should be provided.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

PHOSPHODIESTERASE TYPE-4 INHIBITORS

Apremilast

Ω2-Δμg-2Ω21

 DRUG ACTION Apremilast inhibits the activity of phosphodiesterase type-4 (PDE4) which results in suppression of pro-inflammatory mediator synthesis and promotes anti-inflammatory mediators.

• INDICATIONS AND DOSE

Active psoriatic arthritis (in combination with diseasemodifying antirheumatic drugs or alone) in patients who have had an inadequate response or who have been intolerant to a prior disease-modifying antirheumatic drug therapy | Moderate to severe chronic plaque psoriasis that has not responded to standard systemic treatments or photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications

- ▶ BY MOUTH
- Adult: Initially 10 mg daily on day 1, then 10 mg twice daily on day 2, then 10 mg in the morning and 20 mg in the evening on day 3, then 20 mg twice daily on day 4, then 20 mg in the morning and 30 mg in the evening on day 5, then maintenance 30 mg twice daily, doses should be taken approximately 12 hours apart; review treatment if no response within 24 weeks of initiation

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JANUARY 2017): APREMILAST ($\it OTEZLA^{\otimes}$): RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR

A review of evidence from clinical trials and postmarketing cases has suggested a causal association between apremilast and suicidal thoughts and behaviour.

- CAUTIONS Concomitant use of drugs likely to cause psychiatric symptoms · history of psychiatric illness · low body-weight—consider discontinuation if weight loss is unexplained or clinically significant
- INTERACTIONS → Appendix 1: phosphodiesterase type-4 inhibitors
- SIDE-EFFECTS
- Common or very common Appetite decreased · back pain cough · depression · diarrhoea · fatigue · gastrointestinal discomfort · gastrointestinal disorders · headaches · increased risk of infection · insomnia · nausea · vomiting
- ► Uncommon Gastrointestinal haemorrhage · rash · suicidal behaviours · weight decreased
- CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment and ensure effective contraception during treatment.
- PREGNANCY Avoid—teratogenic in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- RENAL IMPAIRMENT

Dose adjustments EvG: Reduce dose if eGFR less than 30 mL/minute/1.73 m²; consult product literature for initial dose titration. See p. 21.

MONITORING REQUIREMENTS

- Manufacturer advises monitor body-weight regularly in patients underweight at the start of treatment.
- Manufacturer advises monitor for psychiatric symptoms (including depression, suicidal ideation and behaviour) discontinue treatment if new or worsening psychiatric symptoms are identified.
- PATIENT AND CARER ADVICE Manufacturer advises
 patients and carers should be instructed to notify the
 prescriber of any changes in behaviour or mood, and of any
 suicidal ideation.

2 Hyperuricaemia and gout

Gout 08-Aug-2020

Overview

Gout is a common form of inflammatory arthritis characterised by raised uric acid concentration in the blood (hyperuricaemia) and the deposition of urate crystals in joints and other tissues. It occurs in three distinct phases—asymptomatic hyperuricaemia, a period of acute attacks followed by variable intervals (months to years) with no symptoms, and a final period of chronic tophaceous gout, where people have nodules affecting joints. [EVGT] The management of gout in those under 30 years of age requires specialist supervision. (A)

Acute attacks of gout

EvGr Treatment for an acute attack of gout should be started as soon as possible. Acute attacks of gout are usually treated with either colchicine below or high doses of an NSAID (excluding aspirin). The choice of drug depends on factors such as patient preference, renal function, and comorbidities. A gastro-protective drug (such as a proton pump inhibitor) should be co-prescribed in patients using NSAIDs.

The use of colchicine is limited by the development of toxicity at higher doses. However unlike NSAIDs, it does not induce fluid retention; moreover, it can be co-administered with anticoagulants.

Evgr Combination treatment can be considered for acute attacks of gout in patients with inadequate response to monotherapy.

Joint aspiration and intra-articular injection of a corticosteroid can be used in acute monoarticular gout

[unlicensed indication]. A short course of oral corticosteroid or a single injection of intramuscular corticosteroid are effective alternatives in those who cannot tolerate NSAIDs or colchicine, and when intra-articular injection is uncustable.

An interleukin-1 inhibitor, such as canakinumab p. 909, can be considered for treatment of frequent gouty arthritis attacks (at least 3 in the previous 12 months) in patients who have an inadequate response to standard treatment.

Long-term control of gout

Ever All patients with gout should be offered urate-lowering therapy, particularly in those with frequent recurrence of acute attacks of gout (2 or more in a year), the presence of tophi, or signs of chronic gouty arthritis.

For long-term control of gout, the formation of uric acid from purines may be reduced with xanthine-oxidase inhibitors, allopurinol p. 1213 or febuxostat p. 1214. Allopurinol is recommended as first-line urate-lowering therapy where renal function allows. Febuxostat can be used as an alternative when allopurinol is contra-indicated or not tolerated. Uricosuric drugs, such as sulfinpyrazone or benzbromarone (specialist use-available from 'specialorder' manufacturers or specialist importing companies), may be used as urate-lowering therapy in patients who are resistant to or are intolerant of xanthine-oxidase inhibitors; they increase the excretion of uric acid in the urine. Uricosuric drugs may also be used in combination with xanthine-oxidase inhibitors in patients who have an inadequate response to monotherapy.

Urate-lowering therapy is ideally started after the inflammation in an acute attack has settled. The initiation or up-titration of urate-lowering therapy may precipitate an acute attack, and therefore colchicine should be considered as prophylaxis and continued for up to 6 months. A low-dose NSAID with gastro-protection is an alternative in patients who have contra-indications to colchicine. If an acute attack develops during treatment, the urate-lowering therapy should continue at the same dosage and the acute attack treated separately.

Patients with gout and a history of urolithiasis should be advised to ensure adequate daily fluid intake and avoid dehydration. Alkalinisation of the urine with potassium citrate can be considered in recurrent stone formers.

Other drugs used for Hyperuricaemia and gout Diclofenac potassium, p. 1226 · Diclofenac sodium, p. 1227 · Etoricoxib, p. 1230 · Indometacin, p. 1235 · Ketoprofen, p. 1236 · Naproxen, p. 1240 · Naproxen with esomeprazole, p. 1241 · Sulindac, p. 1242

ALKALOIDS > PLANT ALKALOIDS

Colchicine

19-Aug-2021

• INDICATIONS AND DOSE

Acute gout

- ► BY MOUTH
- Adult: 500 micrograms 2-4 times a day until symptoms relieved, maximum 6 mg per course, do not repeat course within 3 days

Short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs

- ► BY MOUTH
- Adult: 500 micrograms twice daily

Prophylaxis of familial Mediterranean fever (recurrent polyserositis)

- ► BY MOUTH
- Adult: 0.5–2 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose by half with concurrent use of moderate inhibitors of CYP3A4.
- Manufacturer advises reduce dose by 75% (to one quarter of usual dose) with concurrent use of potent inhibitors of CYP3A4 or P-glycoprotein inhibitors; avoid concurrent use in patients with hepatic or renal impairment.
- UNLICENSED USE BNF doses may differ from those in the product literature. Use of colchicine for prophylaxis of familial Mediterranean fever (recurrent polyserositis) is an unlicensed indication.
- CONTRA-INDICATIONS Blood disorders
- CAUTIONS Cardiac disease elderly gastro-intestinal disease

CAUTIONS, FURTHER INFORMATION

- Elderly Prescription potentially inappropriate (STOPP criteria):
 - if eGFR less than 10 mL/minute/1.73 m² (risk of toxicity)
 - for chronic treatment of gout where there is no contraindication to a xanthine-oxidase inhibitor (xanthineoxidase inhibitors are first choice prophylactic drugs in gout)

See also Prescribing in the elderly p. 29.

- INTERACTIONS → Appendix 1: colchicine
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · diarrhoea · nausea · vomiting
- Frequency not known Agranulocytosis · alopecia · bone marrow disorders · gastrointestinal haemorrhage · kidney injury · liver injury · menstrual cycle irregularities · myopathy · nerve disorders · rash · sperm abnormalities · thrombocytopenia
- PREGNANCY Avoid—teratogenicity in animal studies.
- BREAST FEEDING Present in milk but no adverse effects reported. Manufacturers advise caution.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- RENAL IMPAIRMENT [vor] Avoid if eGFR less than 10 mL/minute/1.73 m².
 Dose adjustments [vor] Reduce dose or increase dosage interval if eGFR 10−50 mL/minute/1.73 m².
 See p. 21.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

► Colchicine (Non-proprietary)

Colchicine 500 microgram Colchicine 500microgram tablets | 28 tablet PoM £2.54 | 100 tablet PoM £21.95 DT = £3.74

XANTHINE OXIDASE INHIBITORS

Allopurinol

16-Feb-2022

• INDICATIONS AND DOSE

Prophylaxis of gout and of uric acid and calcium oxalate renal stones | Prophylaxis of hyperuricaemia associated with cancer chemotherapy

- ► BY MOUTH
- Adult: Initially 100 mg daily, for maintenance adjust dose according to plasma or urinary uric acid concentration, dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in mild conditions) | Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in mild conditions)

- ► BY MOUTH
- Adult: 100-200 mg daily, dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in moderately severe conditions) | Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in moderately severe conditions)

- ► BY MOUTH
- Adult: 300-600 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in severe conditions) Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in severe conditions)

- BY MOU
- Adult: 700–900 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food
- CONTRA-INDICATIONS Not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately
- CAUTIONS Ensure adequate fluid intake (2–3 litres/day) for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy · thyroid disorders

CAUTIONS, FURTHER INFORMATION Initiation or uptitration of treatment may precipitate an acute attack of gout—for information on prophylaxis see Gout p. 1212

- INTERACTIONS → Appendix 1: allopurinol
- SIDE-EFFECTS
- Common or very common Rash (discontinue therapy; if rash mild re-introduce cautiously but discontinue immediately if recurrence)
- ▶ Uncommon Hypersensitivity nausea vomiting
- ▶ Rare or very rare Agranulocytosis · alopecia · angina pectoris · angioedema · angioimmunoblastic T-cell lymphoma · aplastic anaemia · asthenia · ataxia · boil · bradycardia · cataract · coma · depression · diabetes mellitus · drowsiness · erectile dysfunction · fever · gastrointestinal disorders · gynaecomastia · haemorrhage · hair colour changes · headache · hepatic disorders · hyperlipidaemia · hypertension · infertility male · maculopathy · malaise · oedema · paraesthesia · paralysis · peripheral neuropathy · severe cutaneous adverse reactions (SCARs) · skin reactions · stomatitis · taste altered · thrombocytopenia · vertigo · visual impairment
- PREGNANCY Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child
- BREAST FEEDING Present in milk—not known to be harmful.
- HEPATIC IMPAIRMENT Manufacturer advises monitor liver function periodically during early stages of therapy.
 Dose adjustments Manufacturer advises reduce dose.
- RENAL IMPAIRMENT EVGT Use with caution (risk of accumulation).
 Increased risk of hypersensitivity skin reactions.

Dose adjustments EvGr Max. initial dose 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

DT = £1.18

Febuxostat

09-Aug-2021

• INDICATIONS AND DOSE

Treatment of chronic hyperuricaemia in gout

► BY MOUTH

 Adult: Initially 80 mg once daily, if after 2-4 weeks of initial dose, serum uric acid greater than 6 mg/100 mL then increase dose; increased if necessary to 120 mg once daily

Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematologic malignancies

- ► BY MOUTH
- Adult: 120 mg once daily, to be started 2 days before start of cytotoxic therapy and continued for 7–9 days, according to chemotherapy duration

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS (JUNE 2012)

There have been rare but serious reports of hypersensitivity reactions, including Stevens-Johnson syndrome and acute anaphylactic shock with febuxostat. Patients should be advised of the signs and symptoms of severe hypersensitivity; febuxostat must be stopped immediately if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

MHRA/CHM ADVICE: FEBUXOSTAT (*ADENURIC®*): INCREASED RISK OF CARDIOVASCULAR DEATH AND ALL-CAUSE MORTALITY IN CLINICAL TRIAL IN PATIENTS WITH A HISTORY OF MAJOR CARDIOVASCULAR DISEASE (JULY 2019)

Results from the clinical study (CARES) in patients with gout and a history of major cardiovascular disease showed an increased risk of cardiovascular-related death and all-cause mortality associated with febuxostat compared with allopurinol. Healthcare professionals are advised to avoid treatment with febuxostat in patients with pre-existing major cardiovascular disease (e.g. myocardial infarction, stroke, or unstable angina), unless no other therapy options are appropriate; clinical guidelines for gout recommend treatment with febuxostat only when allopurinol is not tolerated or is contra-indicated.

- CONTRA-INDICATIONS Not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately
- CAUTIONS Major cardiovascular disease, see *Important* safety information · thyroid disorders · transplant recipients CAUTIONS, FURTHER INFORMATION [EVG] Administer prophylactic NSAID (not aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack. ⟨♠⟩
- INTERACTIONS → Appendix 1: febuxostat

SIDE-EFFECTS

- ► Common or very common Diarrhoea · gout aggravated · headache · hepatic disorders · nausea · oedema · skin reactions
- ▶ Uncommon Altered smell sensation · appetite abnormal · arrhythmias · arthritis · bundle branch block · chest discomfort · cholelithiasis · constipation · cough · diabetes mellitus · dizziness · drowsiness · dry mouth · dyspnoea · fatigue · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hemiparesis · hyperlipidaemia · hypertension · increased risk of infection · insomnia · joint disorders · muscle complaints · muscle weakness · musculoskeletal pain · nephrolithiasis · palpitations · proteinuria · renal failure · sensation abnormal · sexual dysfunction · taste altered · urinary disorders · vasodilation · vomiting · weight changes

3 Neuromuscular disorders

Neuromuscular disorders

17-Dec-2019

Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 902 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 1445.

Neostigmine p. 1218 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 92 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine bromide p. 1218 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

Immunosuppressant therapy

Corticosteroids are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis.

In generalised myasthenia gravis prednisolone p. 747 is given. About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Smaller doses of corticosteroid are usually required in ocular myasthenia. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose.

In generalised myasthenia gravis azathioprine is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used. Ciclosporin p. 904, methotrexate p. 987, or mycophenolate mofetil p. 911 can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

Acetylcholine-release enhancers

Amifampridine p. 1218 is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

Fampridine p. 915 is licensed for the improvement of walking in patients with Multiple sclerosis p. 913 who have a walking disability.

Skeletal muscle relaxants

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with Multiple sclerosis p. 913 or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen p. 1219 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

Dantrolene sodium p. 1460 acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

Diazepam p. 375 can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses.

Tizanidine p. 1221 is an alpha₂-adrenoceptor agonist indicated for spasticity associated with Multiple sclerosis p. 913 or spinal cord injury.

Evsr Cannabis extract p. 1219 can be trialled as an adjunct treatment for moderate to severe spasticity in multiple sclerosis if other pharmacological treatments are not effective. Treatment must be initiated and supervised by a specialist. For further information see Multiple sclerosis p. 913.

Other muscle relaxants

The clinical efficacy of methocarbamol p. 1221 and meprobamate as muscle relaxants is **not** well established, although they have been included in compound analgesic preparations.

NEUROPROTECTIVE DRUGS

Riluzole

15-Jun-2021

INDICATIONS AND DOSE

To extend life in patients with amyotrophic lateral sclerosis, initiated by specialist experienced in the management of motor neurone disease

- ► BY MOUTH
- Adult: 50 mg twice daily
- CONTRA-INDICATIONS Acute porphyrias p. 1150
- CAUTIONS History of abnormal hepatic function (consult product literature for details) interstitial lung disease

CAUTIONS, FURTHER INFORMATION

- Interstitial lung disease EvGr Perform chest radiography if symptoms such as dry cough or dyspnoea develop; discontinue if interstitial lung disease is diagnosed.
- INTERACTIONS → Appendix 1: riluzole
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · asthenia · diarrhoea · dizziness · drowsiness · headache · nausea · oral paraesthesia · pain · tachycardia · vomiting
- ► Uncommon Anaemia · angioedema · interstitial lung disease · pancreatitis
- Frequency not known Hepatitis neutropenia
 SIDE-EFFECTS, FURTHER INFORMATION White blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole.
- PREGNANCY Avoid—no information available.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid (risk of increased exposure).
- RENAL IMPAIRMENT EVGr Avoid—no information available.
- PATIENT AND CARER ADVICE

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur.

Driving and skilled tasks Dizziness or vertigo may affect performance of skilled tasks (e.g. driving).

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Guidance on the use of Riluzole (Rilutek®) for the treatment of Motor Neurone Disease (January 2001) NICE TA20 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

Oral suspension

Tablet

► Riluzole (Non-proprietary)

Riluzole 50 mg Rilutek 50mg tablets | 56 tablet PoM £320.33 DT = £8.02

3.1 Muscular dystrophy

DRUGS FOR NEUROMUSCULAR DISORDERS

Ataluren

02-Nov-2020

 DRUG ACTION Ataluren restores the synthesis of dystrophin by allowing ribosomes to read through premature stop codons that cause incomplete dystrophin synthesis in nonsense mutation Duchenne muscular dystrophy.

• INDICATIONS AND DOSE

Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients (initiated by a specialist)

- ► BY MOUTH
- Adult: (consult product literature)
- INTERACTIONS → Appendix 1: ataluren

SIDE-EFFECTS

- Common or very common Appetite decreased · constipation · cough · enuresis · fever · flatulence · gastrointestinal discomfort · haemorrhage · headache · hypertension · hypertriglyceridaemia · nausea · pain · skin reactions · vomiting · weight decreased
- ▶ Frequency not known Ear infection malaise
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises discontinue breastfeeding—present in milk in animal studies.
- RENAL IMPAIRMENT Manufacturer advises close monitoring—safety and efficacy not established.
- MONITORING REQUIREMENTS Manufacturer advises monitor renal function at least every 6–12 months, and cholesterol and triglyceride concentrations at least annually.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises the contents of each sachet should be mixed with at least 30 mL of liquid (water, milk, fruit juice), or 3 tablespoons of semi-solid food (yoghurt or apple sauce).
- PATIENT AND CARER ADVICE Manufacturer advises patients should maintain adequate hydration during treatment.

Missed doses Manufacturer advises if a morning or midday dose is more than 3 hours late, or an evening dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Ataluren for treating Duchenne muscular dystrophy with a nonsense mutation in the dystrophin gene (July 2016)
 NICE HST3 Recommended

Scottish Medicines Consortium (SMC) decisions

- Ataluren (Translarna®) for the treatment of Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients aged 5 years and older (April 2016) 5MC No. 1131/16 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Granule

► Translarna (PTC Therapeutics Ltd) ▼
Ataluren 125 mg Translarna 125mg granules for oral suspension sachets | 30 sachet [PoM] £2,532.00 (Hospital only)
Ataluren 250 mg Translarna 250mg granules for oral suspension sachets | 30 sachet [PoM] £5,064.00 (Hospital only)
Ataluren 1 gram Translarna 1,000mg granules for oral suspension

sachets 30 sachet PoM £20,256.00 (Hospital only)

Nusinersen

11-Nov-2020

 DRUG ACTION Nusinersen is an antisense oligonucleotide that increases the production of survival motor neurone (SMN) protein, thereby helping to compensate for the defect in the SMN1 gene found in 5q spinal muscular atrophy.

INDICATIONS AND DOSE

5q spinal muscular atrophy (initiated by a specialist)

- ► BY INTRATHECAL INJECTION
- Adult: Initially 12 mg for 4 doses, on days 0, 14, 28 and 63, then 12 mg every 4 months, for advice on missed doses—consult product literature

IMPORTANT SAFFTY INFORMATION

MHRA/CHM ADVICE: NUSINERSEN (SPINRAZA®): REPORTS OF COMMUNICATING HYDROCEPHALUS NOT RELATED TO MENINGITIS OR BLEEDING (JULY 2018)

Communicating hydrocephalus not related to meningitis or bleeding has been reported in patients treated with Spinraza®. Patients and caregivers should be informed about the signs and symptoms of hydrocephalus before Spinraza® is started and should be instructed to seek medical attention in case of: persistent vomiting or headache, unexplained decrease in consciousness, and in children increase in head circumference. Patients with signs and symptoms suggestive of hydrocephalus should be further investigated by a physician with expertise in its management.

- CAUTIONS Risk factors for renal toxicity—monitor urine protein (preferably using a first morning urine specimen). risk factors for thrombocytopenia and coagulation disorders-monitor platelet and coagulation profile before
- PREGNANCY Manufacturer advises avoid—no information available
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT Manufacturer advises close monitoring-safety and efficacy not established.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8 °C); may be stored (in the original carton, protected from light) at or below 30 °C, for up to 14 days.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

- ► Nusinersen for treating spinal muscular atrophy (July 2019) NICE TASSS Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Spinraza (Biogen Idec Ltd)

Nusinersen (as Nusinersen sodium) 2.4 mg per 1 ml Spinraza 12mg/5ml solution for injection vials | 1 vial Pom £75,000.00 (Hospital only)

Risdiplam

01-Mar-2022

• DRUG ACTION Risdiplam is a survival motor neurone 2 (SMN2) pre-mRNA splicing modifier that increases the production of SMN protein, thereby helping to compensate for the defect in the SMN1 gene found in 5q spinal muscular atrophy.

INDICATIONS AND DOSE

5q spinal muscular atrophy (initiated by a specialist)

- ▶ BY MOUTH
- Adult: 5 mg once daily, to be taken after a meal at the same time each day
- INTERACTIONS → Appendix 1: risdiplam
- SIDE-EFFECTS
- ► Common or very common Arthralgia · cystitis · diarrhoea · fever · headache · hyperpyrexia · increased risk of infection nausea · oral ulceration · skin reactions
- CONCEPTION AND CONTRACEPTION EVGr Females of childbearing potential should use highly effective contraception during treatment and for at least 1 month after last treatment; male patients should use highly effective contraception during treatment and for at least 4 months after last treatment if their partner is of childbearing potential. Male fertility may be impaired

- during treatment; sperm degeneration and reduced sperm numbers in animal studies.
- PREGNANCY EVGr Avoid—toxicity in animal studies.
- BREAST FEEDING EvGr Avoid—present in milk in animal studies. (M)
- DIRECTIONS FOR ADMINISTRATION Evrysdi® must be reconstituted by a healthcare professional before dispensing. It should be administered orally with the reusable oral syringe provided; the patient should drink water after a dose to ensure that it has been completely swallowed. If a dose is not taken within 5 minutes of being drawn, it should be discarded and a new dose prepared. The solution can also be administered via nasogastric or gastrostomy tube.
- PRESCRIBING AND DISPENSING INFORMATION Patients or their carers should be counselled on the administration of the oral solution
- PATIENT AND CARER ADVICE If Evrysdi® oral solution spills or gets on the skin, the area should be washed with soap and water. Store in a refrigerator (2-8°C); any unused portion must be discarded 64 days after reconstitution. Vomiting If a dose is not fully swallowed or vomiting occurs after taking a dose, no additional dose should be taken on that day and the next dose should be taken at the usual

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should he taken at the usual time

 NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

► Risdiplam for treating spinal muscular atrophy (December 2021) NICE TA755 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Risdiplam (Evrysdi®) for the treatment of 5q spinal muscular atrophy (SMA) in patients two months of age and older, with a clinical diagnosis of SMA type 1, type 2 or type 3 or with one to four survival of motor neuron 2 copies (February 2022) SMC No. SMC2401 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 8 EXCIPIENTS: May contain Disodium edetate

Evrysdi (Roche Products Ltd)

Risdiplam 750 microgram per 1 ml Evrysdi 0.75mg/ml oral solution sugar-free | 80 ml PoM £7,900.00 (Hospital only)

3.2 Myasthenia gravis and **Lambert-Eaton myasthenic** syndrome

Other drugs used for Myasthenia gravis and Lambert-Eaton myasthenic syndrome Eculizumab, p. 1104

ANTICHOLINESTERASES

Anticholinesterases

- DRUG ACTION They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.
- CONTRA-INDICATIONS Intestinal obstruction urinary obstruction
- CAUTIONS Arrhythmias · asthma (extreme caution) · atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by

injection) but not given routinely because it may mask signs of overdosage · bradycardia · epilepsy · hyperthyroidism · hypotension · parkinsonism · peptic ulceration · recent myocardial infarction · vagotonia CAUTIONS. FURTHER INFORMATION

- ▶ Elderly Prescription potentially inappropriate (STOPP criteria) in patients with a known history of persistent bradycardia (heart rate less than 60 beats per minute), heart block, or recurrent unexplained syncope, or concurrent treatment with drugs that reduce heart rate (risk of cardiac conduction failure, syncope and injury). See also Prescribing in the elderly p. 29.
- SIDE-EFFECTS Abdominal cramps · diarrhoea · excessive tearing · hypersalivation · nausea · vomiting

Overdose Signs of overdosage include

bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Amount probably too small to be harmful.

F 1217

Neostigmine

(Neostigmine methylsulfate)

INDICATIONS AND DOSE

Treatment of myasthenia gravis

- ► BY MOUTH
- Adult: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily
- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 1-2.5 mg, dose repeated at suitable intervals throughout the day (usual total daily dose 5-20 mg)

Reversal of non-depolarising (competitive) neuromuscular blockade

- ► BY INTRAVENOUS INJECTION
- Adult: 2.5 mg (max. per dose 5 mg), repeated if necessary after or with glycopyrronium or atropine, to be given over 1 minute

CAUTIONS

- With intravenous use Glycopyrronium or atropine should also be given when reversing neuromuscular blockade
- INTERACTIONS → Appendix 1: neostigmine
- SIDE-EFFECTS
- With parenteral use Intestinal hypermotility muscle spasms
- RENAL IMPAIRMENT

Dose adjustments May need dose reduction.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection

► Neostigmine (Non-proprietary)

Neostigmine metilsulfate 2.5 mg per 1 ml Neostigmine 2.5 mg/lml solution for injection ampoules | 10 ampoule $\boxed{\text{PoM}}$ £7.50-£13.00 DT = £7.75

Pyridostigmine bromide

F 1217

 DRUG ACTION Pyridostigmine bromide has weaker muscarinic action than neostigmine.

INDICATIONS AND DOSE

Mvasthenia gravis

- ► BY MOUTH
- Adult: 30-120 mg, doses to be given at suitable intervals throughout day; usual dose 0.3-1.2 g daily in divided doses, it is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service.

Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily

- INTERACTIONS → Appendix 1: pyridostigmine
- SIDE-EFFECTS Gastrointestinal hypermotility muscle cramps rash
- RENAL IMPAIRMENT

Dose adjustments Ever Consider dose reduction (excreted renally).

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Oral solution

EXCIPIENTS: May contain Propylene glycol, sorbitol ELECTROLYTES: May contain Sodium

► Pyridostigmine bromide (Non-proprietary)

CHOLINERGIC RECEPTOR STIMULATING DRUGS

Amifampridine

28-Jun-2021

• INDICATIONS AND DOSE

Symptomatic treatment of Lambert-Eaton myasthenic syndrome (specialist use only)

- ► BY MOUTH
- Adult: Initially 15 mg daily in 3 divided doses, then increased in steps of 5 mg every 4–5 days, increased to up to 60 mg daily in 3–4 divided doses (max. per dose 20 mg); maximum 60 mg per day
- CONTRA-INDICATIONS Congenital QT syndromes epilepsy uncontrolled asthma
- CAUTIONS Risk factors for schwannomas
- INTERACTIONS → Appendix 1: amifampridine
- SIDE-EFFECTS
- ► Common or very common Dizziness gastrointestinal discomfort nausea oral disorders peripheral coldness sensation abnormal sweat changes
- Frequency not known Anxiety · arrhythmia · asthenia · asthmatic attack · bronchial secretion increased · cough · diarrhoea · drowsiness · gastrointestinal disorder · headache · movement disorders · palpitations · Raynaud's phenomenon · seizures · sleep disorder · vision blurred
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment in men and women.

- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Manufacturer advises avoid—no information available
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure).

Dose adjustments Manufacturer advises initial dose reduction to 5 mg twice daily in mild impairment, titrate in steps of 5 mg every 7 days.

Manufacturer advises initial dose reduction to 5 mg once daily in moderate to severe impairment, titrate in steps of 5 mg every 7 days.

• RENAL IMPAIRMENT EVGT Use with caution (risk of increased exposure).

Dose adjustments Every Reduce initial dose to 5 mg twice daily in mild impairment, titrate in steps of 5 mg every 7 days.

Reduce initial dose to 5 mg once daily in moderate to severe impairment, titrate in steps of 5 mg every 7 days.

- MONITORING REQUIREMENTS Clinical and ECG monitoring required at treatment initiation and yearly thereafter.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Amifampridine (Firdapse®) for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS) in adults (August 2012) SMC No. 660/10 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 21

► Firdapse (SERB) ▼

Amifampridine (as Amifampridine phosphate) 10 mg Firdapse 10mg tablets | 100 tablet | PoM | £1,815.00 (Hospital only)

3.3 Nocturnal leg cramps

Nocturnal leg cramps

03-May-2021

Quinine salts

Ouinine salts p. 673, such as quinine sulfate, may reduce the frequency of nocturnal leg cramps. Evgr However, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Ouinine should only be considered when cramps are very painful or frequent, when other treatable causes of cramp have been excluded, and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). (A) EvGr It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. MEVGI In patients taking quinine long term, a trial discontinuation may be considered. A Quinine is toxic in overdosage and fatalities have occurred.

3.4 Spasticity

Other drugs used for Spasticity Dantrolene sodium, p. 1460 • Diazepam, p. 375

CANNABINOIDS

Cannabis extract

26-Jan-2022

The properties listed below are those particular to the combination only. For the properties of the components please consider, cannabidiol p. 336.

INDICATIONS AND DOSE

Adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)

- ► BY BUCCAL ADMINISTRATION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Family history of psychosis · history of other severe psychiatric disorder · personal history of psychosis
- CAUTIONS History of epilepsy · significant cardiovascular disease
- INTERACTIONS → Appendix 1: cannabidiol dronabinol
- SIDE-FFFFCTS
- ► Common or very common Appetite abnormal balance impaired concentration impaired constipation depression diarrhoea disorientation dizziness drowsiness dry mouth dysarthria euphoric mood feeling drunk malaise memory loss nausea oral disorders perception altered taste altered vertigo vision blurred vomiting
- ► Uncommon Abdominal pain upper · delusions · hallucinations · hypertension · palpitations · paranoia · pharyngitis · suicidal ideation · syncope · tachycardia · throat irritation · tooth discolouration
- CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception during and for 3 months after treatment in men and women.
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risks.
- BREAST FEEDING Avoid—present in milk.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in moderate to severe impairment (risk of accumulation with chronic dosing)—no information available.
- RENAL IMPAIRMENT Manufacturer advises more frequent monitoring in significant impairment (no information available; possible risk of prolonged or enhanced effect).
- MONITORING REQUIREMENTS Monitor oral mucosa interrupt treatment if lesions or persistent soreness.
- PATIENT AND CARER ADVICE

Driving and skilled tasks For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see Drugs and driving under Guidance on prescribing p. 1.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Sprav

CAUTIONARY AND ADVISORY LABELS 2

► Sativex (GW Pharma Ltd)

MUSCLE RELAXANTS > CENTRALLY ACTING

Baclofen

05-0ct-2021

• INDICATIONS AND DOSE

Pain of muscle spasm in palliative care

- ► BY MOUTH
- ▶ Adult: 5–10 mg 3 times a day

continued →

Hiccup due to gastric distension in palliative care

- ► BY MOUTH
- Adult: 5 mg twice daily

Chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal

- ▶ BY MOUTH
- Adult: Initially 5 mg 3 times a day, gradually increased; maintenance up to 60 mg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 100 mg per day

Severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures (specialist use only)

- ► BY INTRATHECAL INJECTION
- Adult: Test dose 25-50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not given more often than every 24 hours to determine appropriate dose, then dosetitration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis

IMPORTANT SAFETY INFORMATION

Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pumpadministered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

CONTRA-INDICATIONS

- With intrathecal use Local infection systemic infection
- With oral use Active peptic ulceration
- CALITIONS

GENERAL CAUTIONS Cerebrovascular disease · diabetes · elderly · epilepsy · history of peptic ulcer · history of substance abuse · hypertonic bladder sphincter · Parkinson's disease · psychiatric illness · respiratory impairment

SPECIFIC CAUTIONS

- ▶ With intrathecal use Coagulation disorders malnutrition (increased risk of post-surgical complications) • previous spinal fusion procedure
- INTERACTIONS → Appendix 1: baclofen
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Confusion constipation depression · diarrhoea · dizziness · drowsiness · dry mouth · euphoric mood · hallucination · headache · hyperhidrosis · hypotension · nausea · paraesthesia · skin reactions · urinary disorders · vision disorders · vomiting
- ▶ Uncommon Bradycardia · hypothermia
- ▶ Rare or very rare Withdrawal syndrome

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- ▶ With intrathecal use Anxiety appetite decreased asthenia chills · dyspnoea · fever · hypersalivation · insomnia · neuromuscular dysfunction · oedema · pain · pneumonia · respiratory disorders · seizure · sexual dysfunction

- ▶ With oral use Fatigue gastrointestinal disorder muscle weakness · myalgia · respiratory depression · sleep disorders
- ► Uncommon
- With intrathecal use Alopecia · deep vein thrombosis · dehydration · flushing · hypertension · hypogeusia · ileus · memory loss · pallor · paranoia · suicidal behaviours
- ▶ Rare or very rare
- With oral use Abdominal pain erectile dysfunction hepatic function abnormal · taste altered
- ► Frequency not known
- With intrathecal use Scoliosis
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies).
- BREAST FEEDING Present in milk—amount probably too small to be harmful.

• HEPATIC IMPAIRMENT

- With oral use Manufacturer advises use with caution—no information available.
- RENAL IMPAIRMENT See p. 21. EvGr Use with caution.
- ▶ With oral use EvGr Only use if potential benefit outweighs risk if eGFR less than 15 mL/minute/1.73 m². **Dose adjustments** With oral use Evgr Use smaller doses (e.g. 5 mg daily) and if necessary increase dosage intervalmonitor for signs and symptoms of toxicity.
- TREATMENT CESSATION Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1-2 weeks (longer if symptoms occur)).
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include raspberry. Palliative care For further information on the use of baclofen in palliative care, see www.medicinescomplete.com/ #/content/palliative/baclofen.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Methocarbamol

11-Jun-2021

• INDICATIONS AND DOSE

Short-term symptomatic relief of muscle spasm

- ► BY MOUTH
- Adult: 1.5 g 4 times a day; reduced to 750 mg 3 times a day if required
- Elderly: Up to 750 mg 4 times a day, dose may be sufficient
- CONTRA-INDICATIONS Brain damage · coma · epilepsy · myasthenia gravis · pre-coma
- INTERACTIONS → Appendix 1: methocarbamol
- SIDE-EFFECTS Angioedema · anxiety · bradycardia · confusion · conjunctivitis · dizziness · drowsiness · dyspepsia · fever · flushing · headache · hepatic disorders · hypotension · insomnia · leucopenia · memory loss · nasal congestion · nausea · seizures · skin reactions · syncope · taste metallic · vertigo · vision disorders · vomiting
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.
- BREAST FEEDING Present in milk in animal studies manufacturer advises caution.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased half-life).

Dose adjustments Manufacturer advises consider increasing dose interval in chronic impairment.

- RENAL IMPAIRMENT Manufacturer advises caution.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

- LESS SUITABLE FOR PRESCRIBING Less suitable for prescribing.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Pridinol

17-Nov-2020

 DRUG ACTION Pridinol is a centrally acting muscle relayant

INDICATIONS AND DOSE

Central and peripheral muscle spasms

- ► BY MOUTH
- ▶ Adult: 1.5-3 mg 3 times a day
- CONTRA-INDICATIONS Arrhythmia · gastrointestinal obstruction · glaucoma · prostatic hypertrophy · urinary retention
- CAUTIONS Elderly (higher or longer-lasting blood levels expected) · hypotension (increased risk of circulatory problems)—take dose after meals
- INTERACTIONS → Appendix 1: pridinol
- SIDE-EFFECTS
- ► Uncommon Abdominal pain anxiety arrhythmias asthenia circulatory collapse dizziness dry mouth headache hypotension nausea speech disorder
- ▶ Rare or very rare Concentration impaired · coordination abnormal · depression · diarrhoea · taste altered · vision disorders · vomiting
- ► Frequency not known Constipation feeling hot hallucination muscle weakness mydriasis paraesthesia skin reactions thirst tremor urinary disorder
- PREGNANCY Evg: Avoid in the first trimester; thereafter, use only if potential benefit outweighs risk (no information available).
- BREAST FEEDING [EVGr] Avoid—no information available.
- HEPATIC IMPAIRMENT [EVG] Caution in severe impairment (no information available)—higher or longer-lasting blood levels expected.
- RENAL IMPAIRMENT Ever Caution in severe impairment (no information available)—higher or longer-lasting blood levels expected.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Table

► Myopridin (Mibe Pharma UK Ltd) Pridinol (as Pridinol mesilate) 3 mg Myopridin 3mg tablets | 20 tablet PoM £5.36 DT = £5.36 | 100 tablet PoM £26.16 DT = £26.16

Tizanidine

09-Jul-2021

INDICATIONS AND DOSE

Spasticity associated with multiple sclerosis or spinal cord injury or disease

- ► BY MOUTH
- Adult: Initially 2 mg daily, then increased in steps of 2 mg daily in divided doses, increased at intervals of at least 3-4 days and adjust according to response; usual dose up to 24 mg daily in 3-4 divided doses; maximum 36 mg per day
- CAUTIONS Elderly
- INTERACTIONS → Appendix 1: tizanidine
- SIDE-EFFECTS
- ► Common or very common Arrhythmias · dizziness · drowsiness · dry mouth · fatigue · hypotension · rebound hypertension
- ► Rare or very rare Gastrointestinal disorder hallucination hepatic disorders muscle weakness nausea sleep
- Frequency not known Abdominal pain accommodation disorder - anxiety - appetite decreased - confusion headache - QT interval prolongation - skin reactions vomiting - withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION Treatment should be discontinued if liver enzymes are persistently raised—consult product literature.

- PREGNANCY Avoid (toxicity in animal studies).
- BREAST FEEDING Avoid (present in milk in animal studies).
- HEPATIC IMPAIRMENT Manufacturer advises avoid in significant impairment.
- RENAL IMPAIRMENT EVGT Use with caution if creatinine clearance less than 25 mL/minute.
 ★Dose adjustments EvGT Consider slower dose titration if creatinine clearance less than 25 mL/minute (consult
- MONITORING REQUIREMENTS Monitor liver function monthly for first 4 months for daily doses of 12 mg or higher, and in those who develop unexplained nausea, anorexia or fatigue.
- TREATMENT CESSATION Avoid abrupt withdrawal (risk of rebound hypertension and tachycardia); to minimise risk, discontinue gradually and monitor blood pressure.
- PATIENT AND CARER ADVICE

4 Pain and inflammation in musculoskeletal disorders

Low back pain and sciatica

09-Aug-2021

Description of condition

Low back pain is pain in the lumbosacral area of the back. It can be described as non-specific, mechanical, musculoskeletal, or simple (if it is not associated with serious or potentially serious causes). Episodes of back pain do not usually last long, with rapid improvements in pain and disability seen within a few weeks to months.

Sciatica (radicular pain or radiculopathy) is neuropathic leg pain secondary to compressive lumbosacral nerve root pathology. Sciatica can also be present in about 5–10% of individuals with non-specific back pain, and where they coexist, the symptoms of sciatica tend to predominate.

Non-drug treatment

Ever Exercise programmes, manual therapy (spinal manipulation, mobilisation, or soft-tissue techniques such as massage), and psychological therapies should be considered for managing low back pain with or without sciatica.

Spinal decompression may be considered in patients with sciatica when pain and function has not improved with non-surgical treatment (including drug treatment).

Drug treatment

Evgr An oral NSAID (see Non-steroidal anti-inflammatory drugs below) should be considered for managing acute low back pain, taking into consideration the risks associated with

NSAIDs, the need for continued monitoring, and the possible need for gastroprotective treatment (for further information, see Peptic ulcer disease p. 76).

A weak opioid, either alone or with paracetamol p. 477, can be used to manage acute low back pain only if an NSAID is contra-indicated, not tolerated or ineffective (see *Opioid analgesics* under Analgesics p. 474). Paracetamol alone is ineffective for managing low back pain.

Evgr Benzodiazepines are sometimes used to manage acute low back pain (particularly in loss of lordosis); however evidence to support their use is very weak.

Evgr In patients with chronic low back pain who have had an inadequate response to non-drug treatment, NSAIDs should be considered as first-line therapy. Opioids should be the last treatment option considered and should be considered only in patients for whom other therapies have failed and only if the potential benefits outweigh the risks for individual patients. If indicated, opioids should only be prescribed for a limited period of time. Long term opioid therapy should be avoided.

Selective serotonin re-uptake inhibitors (SSRIs), serotonin and noradrenaline re-uptake inhibitors (SNRIs), tricyclic antidepressants, gabapentinoids, and antiepileptic drugs should **not** be offered for managing low back pain.

When non-surgical treatment is ineffective in patients with moderate or severe localised back pain arising from structures supplied by the medial branch nerve, referral for radiofrequency denervation can be considered.

Sciatica

If prescribing NSAIDs for sciatica, take into consideration the limited evidence of benefit and the risks associated with their use.

EVGT Patients with acute and severe sciatica may benefit from treatment with epidural injections of a local anaesthetic and/or corticosteroid.

Non-steroidal anti-inflammatory drugs 144

14-Dec-2020

Therapeutic effects

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 477, but paracetamol is preferred, particularly in the elderly.

In regular full dosage NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the inflammatory arthritides (e.g. rheumatoid arthritis) and in some cases of advanced osteoarthritis. NSAIDs can also be of benefit in the less well defined conditions of back pain and soft-tissue disorders.

Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week,

whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 (COX-2) is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastrointestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen p. 1232 is a propionic acid derivative with antiinflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. It is unsuitable for conditions where inflammation is prominent. Dexibuprofen is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

Naproxen p. 1240 is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen).

Flurbiprofen p. 1231 may be slightly more effective than naproxen, and is associated with slightly more gastro-intestinal side-effects than ibuprofen.

Ketoprofen p. 1236 has anti-inflammatory properties similar to ibuprofen and has more side-effects. Dexketoprofen p. 1226, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

Tiaprofenic acid p. 1244 is as effective as naproxen; it has more side-effects than ibuprofen.

Drugs with properties similar to those of propionic acid derivatives:

Diclofenac sodium p. 1227 and aceclofenac p. 1224 are similar in efficacy to naproxen.

Etodolac p. 1230 is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

Indometacin p. 1235 has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances.

Mefenamic acid p. 1238 has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Meloxicam p. 1238 is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

Nabumetone p. 1239 is comparable in effect to naproxen.

Phenylbutazone is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

Piroxicam p. 1241 is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Sulindac p. 1242 is similar in tolerance to naproxen.

Tenoxicam p. 1243 is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Tolfenamic acid p. 508 is licensed for the treatment of migraine.

Ketorolac trometamol p. 1268 and the selective inhibitor of cyclo-oxygenase-2, parecoxib p. 1455, are licensed for the short-term management of postoperative pain.

The selective inhibitors of COX-2, etoricoxib p. 1230 and celecoxib p. 1225, are as effective as non-selective NSAIDs such as diclofenac sodium and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Aspirin p. 133 has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

Dental and orofacial pain

Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen, diclofenac sodium, and diclofenac potassium p. 1226.

Considerations in the elderly

The use of NSAIDs in elderly patients is potentially inappropriate (STOPP criteria) if prescribed:

- with a vitamin K antagonist, direct thrombin inhibitor or factor Xa inhibitor in combination (risk of major gastrointestinal bleeding);
- with concurrent antiplatelet agent(s) without proton pump inhibitor (PPI) prophylaxis (increased risk of peptic ulcer disease);
- in a history of peptic ulcer disease or gastrointestinal bleeding, unless with concurrent PPI or H₂-receptor antagonist (risk of peptic ulcer relapse)—not including COX-2 selective NSAIDs;
- with concurrent corticosteroids without PPI prophylaxis (increased risk of peptic ulcer disease);
- in patients with an eGFR less than 50 mL/minute/1.73 m² (risk of deterioration in renal function);
- in severe hypertension or severe heart failure (risk of exacerbation);
- for long-term (longer than 3 months) symptom relief of osteoarthritis pain where paracetamol has not been tried (simple analgesics are preferable and usually as effective for pain relief);
- for chronic treatment of gout where there is no contraindication to a xanthine-oxidase inhibitor (xanthineoxidase inhibitors are first choice prophylactic drugs in gout):
- a COX-2 selective NSAID in concurrent cardiovascular disease (increased risk of myocardial infarction and stroke).

For further information, see *STOPP/START criteria* in Prescribing in the elderly p. 29.

Δsthma

Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen **and** others) purchased over the counter.

NSAIDs and cardiovascular events

All NSAID use (including COX-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

COX-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen p. 1232 (2.4 g daily) are associated with an increased risk of thrombotic events. Although there are limited data regarding the thrombotic effects of aceclofenac p. 1224, treatment advice has been updated in line with diclofenac, based on aceclofenac's structural similarity to

diclofenac and its metabolism to diclofenac. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib p. 1230. Naproxen p. 1240 (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

NSAIDs and gastro-intestinal events

All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam p. 1241, ketoprofen p. 1236, and ketorolac trometamol p. 1268 are associated with the highest risk; indometacin p. 1235, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of COX-2 are associated with a *lower risk* of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are generally preferred, to start at the lowest recommended dose and not to use more than one oral NSAID at a time

The combination of a NSAID **and** low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary **and** the patient should be monitored closely.

While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases are usually dependent on NSAIDs for effective relief of pain and stiffness

Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment.

Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

NSAIDs and alcohol

Alcohol increases the risk of gastro-intestinal haemorrhage associated with NSAIDs. Specialist sources recommend that concurrent use need not be avoided with moderate alcohol intake, but greater caution is warranted in those who drink more than the recommended daily limits.

Some cases of acute kidney injury have been attributed to use of NSAIDs and acute excessive alcohol consumption.

Advanced Pharmacy Services

Patients taking NSAIDs may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Medicines optimisation p. 16.

Other drugs used for Pain and inflammation in musculoskeletal disorders Tramadol with dexketoprofen, p. 505

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Aceclofenac

22-Nov-2021

• INDICATIONS AND DOSE

Pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

- ► BY MOUTH
- Adult: 100 mg twice daily
- CONTRA-INDICATIONS Active bleeding · active gastrointestinal bleeding · active gastro-intestinal ulceration · bleeding disorders · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastrointestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease · varicella infection
- CAUTIONS Allergic disorders · avoid in Acute porphyrias p. 1150 · cardiac impairment (NSAIDs may impair renal function) · connective-tissue disorders · dehydration (risk of renal impairment) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · history of cerebrovascular bleeding · history of gastro-intestinal disorders (e.g. ulcerative colitis, Crohn's disease) · hypertension · may mask symptoms of infection · oedema · risk factors for cardiovascular events
- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-EFFECTS
- ► Common or very common Diarrhoea · dizziness ·
- gastrointestinal discomfort · nausea
- ► Uncommon Constipation · gastrointestinal disorders · oral disorders · skin reactions · vomiting
- ▶ Rare or very rare Anaemia · angioedema · bone marrow disorders · depression · drowsiness · dyspnoea · fatigue · haemolytic anaemia · haemorrhage · headach · heart failure · hepatic disorders · hyperkalaemia · hypersensitivity · hypertension · inflammatory bowel disease · leg cramps · nephrotic syndrome · neutropenia · oedema · palpitations · pancreatitis · paraesthesia · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · severe cutaneous adverse reactions (SCARs) · sleep disorders · taste altered · thrombocytopenia · tinnitus · tremor · vasculitis · vasodilation · vertigo · visual impairment · weight increased
- ► Frequency not known Acute coronary syndrome agranulocytosis asthma confusion hallucination increased risk of arterial thromboembolism increased risk of ischaemic stroke malaise meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) nephritis tubulointerstitial optic neuritis photosensitivity reaction platelet aggregation inhibition respiratory tract reaction SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Nonsteroidal anti-inflammatory drugs p. 1222
- ALLERGY AND CROSS-SENSITIVITY Evg: Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- PREGNANCY Most manufacturers advise avoiding the use
 of NSAIDs during pregnancy or avoiding them unless the
 potential benefit outweighs the risk. NSAIDs should be
 avoided during the third trimester because use is
 associated with a risk of closure of fetal ductus arteriosus
 in utero and possibly persistent pulmonary hypertension of
 the newborn. In addition, the onset of labour may be
 delayed and its duration may be increased.
- BREAST FEEDING Use with caution during breast-feeding.
 Manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in hepatic failure.
 Dose adjustments Manufacturer advises consider initial dose reduction to 100 mg daily in mild to moderate impairment.
- RENAL IMPAIRMENT In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure). Ever For aceclofenac, avoid in renal failure.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

- ► Frequency not known Acute kidney injury (more common in patients with pre-existing renal impairment) • agranulocytosis • anaemia • aplastic anaemia • haemolytic anaemia • inflammatory bowel disease • meningitis aseptic • oral ulceration • platelet aggregation inhibition • renal papillary necrosis
 - SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Nonsteroidal anti-inflammatory drugs p. 1222
- ALLERGY AND CROSS-SENSITIVITY Evg! Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent

- pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING Use with caution during breast-feeding. Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
 Dose adjustments Manufacturer advises initial dose reduction to max. 50 mg daily in mild to moderate impairment.
- RENAL IMPAIRMENT In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure). EvGr For dexketoprofen, avoid if creatinine clearance 59 mL/minute or less. ♠
 - **Dose adjustments** Ever Reduce initial total daily dose to 50 mg if creatinine clearance 60–89 mL/minute. See p. 21.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 22

Combinations available: Tramadol with dexketoprofen, p. 505

Diclofenac potassium

25-Nov-2021

• INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders

- ► BY MOUTH
- ► Child 14-17 years: 75-100 mg daily in 2-3 divided doses
- ▶ Adult: 75–150 mg daily in 2–3 divided doses

Acute gout

- ► BY MOUTH
- Adult: 75–150 mg daily in 2–3 divided doses

Postoperative pain

- ► BY MOUTH
- Child 9-13 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day
- ► Child 14-17 years: 75-100 mg daily in 2-3 divided doses
- Adult: 75–150 mg daily in 2–3 divided doses

Migraine

- ► BY MOUTH
- Adult: 50 mg, to be given at onset of migraine, then 50 mg after 2 hours if required, then 50 mg after 4-6 hours; maximum 200 mg per day

Fever in ear, nose, or throat infection

- ► BY MOUTH
- Child 9-17 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day
- UNLICENSED USE Voltarol® Rapid not licensed for use in children under 14 years or in fever.
- CONTRA-INDICATIONS Active gastro-intestinal bleeding active gastro-intestinal ulceration cerebrovascular disease history of gastro-intestinal bleeding related to previous NSAID therapy history of gastro-intestinal perforation related to previous NSAID therapy history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) history of recurrent gastro-intestinal ulceration (two or more distinct episodes) ischaemic heart disease mild to severe heart failure peripheral arterial disease

• CAUTIONS Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • coagulation defects • connective-tissue disorders • dehydration (risk of renal impairment) • elderly (risk of serious side-effects and fatalities) • history of cardiac failure • history of gastrointestinal disorders (e.g. ulcerative colitis, Crohn's disease) • hypertension • may mask symptoms of infection • oedema • risk factors for cardiovascular events

- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-FFFFCTS
- Common or very common Appetite decreased · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · skin reactions · vertigo · vomiting
- ► **Uncommon** Chest pain heart failure myocardial infarction palpitations
- ▶ Rare or very rare Acute kidney injury agranulocytosis alopecia · anaemia · angioedema · anxiety · aplastic anaemia · asthma · confusion · constipation · depression · drowsiness · dyspnoea · erectile dysfunction · fatigue · haemolytic anaemia · haemorrhage · hearing impairment · hepatic disorders · hypersensitivity · hypertension · hypotension · inflammatory bowel disease · irritability · leucopenia · memory loss · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nephritis tubulointerstitial · nephrotic syndrome · oedema · oesophageal disorder · oral disorders · pancreatitis · photosensitivity reaction · pneumonitis · proteinuria · psychotic disorder · renal papillary necrosis · seizure · sensation abnormal · severe cutaneous adverse reactions (SCARs) · shock · sleep disorders · stroke · taste altered · thrombocytopenia · tinnitus · tremor · vasculitis · vision disorders
- ► Frequency not known Hallucination malaise optic

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs.

- ALLERGY AND CROSS-SENSITIVITY EvG: Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. ♠
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING Use with caution during breast-feeding.
 Amount in milk too small to be harmful.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- RENAL IMPAIRMENT In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure). Evor For diclofenac potassium, avoid in severe impairment. ♠

INDICATIONS AND DOSE

Pain and inflammation in musculoskeletal disorders | Acute gout

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 75–150 mg daily in 2–3 divided doses
- ▶ BY RECTUM
- ▶ Adult: 75-150 mg daily in divided doses

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ► Adult: 75–150 mg daily in 2–3 divided doses
- ► BY RECTUM
- ▶ Adult: 75–150 mg daily in divided doses

Postoperative pain

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 75–150 mg daily in 2–3 divided doses
 - ► BY RECTUM
 - ▶ Adult: 75–150 mg daily in divided doses

DICLOMAX RETARD®

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ► BY MOUTH
- Adult: 1 capsule once daily

DICLOMAX SR®

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ► BY MOUTH
- ► Adult: 1 capsule 1–2 times a day, alternatively 2 capsules once daily

MOTIFENE®

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

- ► BY MOUTH
- ▶ Adult: 1 capsule 1–2 times a day

VOLTAROL ® **EMULGEL**

Pain and inflammation in musculoskeletal conditions (using 1.16% gel) | Osteoarthritis of the knee or hand (using 1.16% gel)

- ► TO THE SKIN
- Adult: Apply 3-4 times a day, review after 14 days for pain and inflammation in musculoskeletal conditions, or after 28 days for osteoarthritis

DOSE EQUIVALENCE AND CONVERSION

 Voltarol[®] 1.16% Emulgel contains 1.16% diclofenac diethylammonium equivalent to diclofenac sodium 1%.

VOLTAROL ® **SOLUTION FOR INJECTION**

Postoperative pain

- ► BY DEEP INTRAMUSCULAR INJECTION
- Adult: 75 mg 1-2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

Acute exacerbations of pain

- ► BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg 1-2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

Ureteric colic

- ► BY DEEP INTRAMUSCULAR INJECTION
- Adult: 75 mg, then 75 mg after 30 minutes if required

Acute postoperative pain (in hospital setting)

- ► BY INTRAVENOUS INFUSION
- Adult: 75 mg, then 75 mg after 4–6 hours if required for maximum 2 days; maximum 150 mg per day

Prevention of postoperative pain (in hospital setting)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 25-50 mg, to be given after surgery over 15-60 minutes, then 5 mg/hour for maximum 2 days; maximum 150 mg per day

CONTRA-INDICATIONS

- With intravenous use Dehydration · history of asthma · history of confirmed or suspected cerebrovascular bleeding · history of haemorrhagic diathesis · hypovolaemia · operations with high risk of haemorrhage
- With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · avoid suppositories in proctitis · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease

CAUTIONS

- With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · dehydration (risk of renal impairment) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · history of gastro-intestinal disorders (e.g. ulcerative colitis, Crohn's disease) · hypertension · may mask symptoms of infection · oedema · risk factors for cardiovascular events
- With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)
- INTERACTIONS → Appendix 1: NSAIDs

SIDE-EFFECTS

- ► Common or very common
- With systemic use Appetite decreased · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · oedema · rash (discontinue) · skin reactions · vertigo · vomiting
- With topical use Conjunctivitis · muscle tone increased · oedema · rash (discontinue) · sensation abnormal · skin reactions · skin ulcer
- ► Uncommon
- With systemic use Chest pain · heart failure · myocardial infarction · palpitations
- With topical use Abdominal pain · alopecia · diarrhoea · eye pain · haemorrhage · lacrimation disorder · nausea · seborrhoea

► Rare or very rare

- With rectal use Ulcerative colitis aggravated
- With systemic use Acute kidney injury · agranulocytosis · alopecia · anaemia · angioedema · anxiety · aplastic anaemia · asthma · confusion · constipation · depression · drowsiness · dyspnoea · erectile dysfunction · fatigue · haemolytic anaemia · haemorrhage · hearing impairment · hepatic disorders · hypersensitivity · hypertension · hypotension · irritability · leucopenia · memory loss · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nephritis tubulointerstitial · nephrotic syndrome · oesophageal disorder · oral disorders · pancreatitis · photosensitivity reaction · pneumonitis · proteinuria · psychotic disorder · renal papillary necrosis · seizure · sensation abnormal · severe cutaneous adverse reactions (SCARs) · shock · sleep disorders · stroke · taste altered · thrombocytopenia · tinnitus · tremor · vasculitis · vision disorders
- With topical use Acute kidney injury · angioedema · asthma · hypersensitivity · photosensitivity reaction · rash pustular

► Frequency not known

- With systemic use Fertility decreased female · fluid retention · hallucination · malaise · optic neuritis · platelet aggregation inhibition
- With parenteral use Injection site necrosis
- With topical use Hair colour changes

SIDE-EFFECTS, FURTHER INFORMATION Topical application of large amounts of diclofenac can result in systemic effects.

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1222

 ALLERGY AND CROSS-SENSITIVITY Evg: Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

• CONCEPTION AND CONTRACEPTION

 With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

• BREAST FEEDING

- With systemic use Use with caution during breast-feeding.
 Amount in milk too small to be harmful.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

HEPATIC IMPAIRMENT

 With systemic use Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

• RENAL IMPAIRMENT

- With systemic use In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure). For diclofenac sodium, manufacturers advise avoid in severe impairment.
- With topical use In general, manufacturers advise caution (deterioration in renal function has also been reported after topical use).
- With intravenous use Manufacturers advise avoid in moderate to severe impairment.

DIRECTIONS FOR ADMINISTRATION

BNF 84

- ▶ With intravenous use For intravenous infusion (Voltarol®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 75 mg with 100-500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution). For intermittent infusion give 25-50 mg over 15-60 minutes or 75 mg over 30-120 minutes. For continuous infusion give at a rate of 5 mg/hour.
- With topical use For topical preparations, apply with gentle massage only.
- PRESCRIBING AND DISPENSING INFORMATION Voltarol® dispersible tablets are more suitable for short-term use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months).
- PATIENT AND CARER ADVICE For topical preparations, patients and their carers should be advised to wash hands immediately after use.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Diclofenac Sodium Tablets may be prescribed.

- EXCEPTIONS TO LEGAL CATEGORY
- ▶ When used for Relief of pain in musculoskeletal conditions and adjunctive treatment in knee or hand osteoarthritis Various pack sizes of gel preparations may be available on sale to the public.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispersible tablet. oral suspension, oral solution

Felbinac

07-Dec-2020

 DRUG ACTION Felbinac is an active metabolite of the NSAID fenbufen.

INDICATIONS AND DOSE

Relief of pain in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- ► TO THE SKIN
- Adult: Apply 2-4 times a day, therapy should be reviewed after 14 days; maximum 25 g per day
- CAUTIONS Avoid contact with eyes avoid contact with inflamed or broken skin - avoid contact with mucous membranes - not for use with occlusive dressings - topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)
- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-EFFECTS Bronchospasm · gastrointestinal disorder · hypersensitivity · paraesthesia · photosensitivity reaction · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Nonsteroidal anti-inflammatory drugs p. 1222

- ALLERGY AND CROSS-SENSITIVITY EVGT Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- PREGNANCY Patient packs for topical preparations carry a warning to avoid during pregnancy.
- BREAST FEEDING Patient packs for topical preparations carry a warning to avoid during breast-feeding.
- RENAL IMPAIRMENT Deterioration in renal function has also been reported after topical use.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for topical preparations, apply with gentle massage only.
- PATIENT AND CARER ADVICE For topical preparations patients and carers should be advised to wash hands immediately after use.

Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

• MEDICINAL FORMS No licensed medicines listed.

Flurbiprofen

30-Nov-2021

• INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

- ► BY MOUTH
- Child 12-17 years: 150-200 mg daily in 2-4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions
- Adult: 150-200 mg daily in 2-4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

Dysmenorrhoea

- ► BY MOUTH
- Child 12-17 years: Initially 100 mg, then 50-100 mg every 4-6 hours; maximum 300 mg per day
- Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day
- CONTRA-INDICATIONS Active gastro-intestinal bleeding active gastro-intestinal ulceration - Crohn's disease (may

be exacerbated) · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure · ulcerative colitis (may be exacerbated)

- CAUTIONS Allergic disorders cardiac impairment (NSAIDs may impair renal function) cerebrovascular disease coagulation defects connective-tissue disorders dehydration (risk of renal impairment) elderly (risk of serious side-effects and fatalities) heart failure history of gastro-intestinal disorders ischaemic heart disease may mask symptoms of infection peripheral arterial disease risk factors for cardiovascular events uncontrolled hypertension
- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-EFFECTS Agranulocytosis · angioedema · aplastic anaemia · asthma · bronchospasm · confusion · constipation · Crohn's disease · depression · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · fertility decreased female · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral ulceration · pancreatitis · paraesthesia · photosensitivity reaction · platelet aggregation inhibition · renal failure (more common in patients with pre-existing renal impairment) · respiratory tract reaction · severe cutaneous adverse reactions (SCARs) · skin reactions · stroke · thrombocytopenia · tinnitus · vertigo · visual impairment · vomiting

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Nonsteroidal anti-inflammatory drugs p. 1222

- ALLERGY AND CROSS-SENSITIVITY Evg! Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING Use with caution during breast-feeding.
 Small amount present in milk—manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- RENAL IMPAIRMENT In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure). Ever For flurbiprofen, avoid in severe impairment. ♠>

Ibuprofen

07-Dec-2021

• INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Mild to moderate pain including dysmenorrhoea | Postoperative analgesia | Dental pain

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 300-400 mg 3-4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200-400 mg 3 times a day, may be adequate
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 1.6 g once daily, dose to be taken in the early evening, increased if necessary to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Acute migraine

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 400-600 mg for 1 dose, to be taken as soon as migraine symptoms develop

Mild to moderate pain | Pain and inflammation of softtissue injuries | Pyrexia with discomfort

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3-5 months: 50 mg 3 times a day, maximum daily dose to be given in 3-4 divided doses; maximum 30 mg/kg per day
- Child 6-11 months: 50 mg 3-4 times a day, maximum daily dose to be given in 3-4 divided doses; maximum 30 mg/kg per day
- Child 1-3 years: 100 mg 3 times a day, maximum daily dose to be given in 3-4 divided doses; maximum 30 mg/kg per day
- Child 4-6 years: 150 mg 3 times a day, maximum daily dose to be given in 3-4 divided doses; maximum 30 mg/kg per day
- Child 7-9 years: 200 mg 3 times a day, maximum daily dose to be given in 3-4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 10-11 years: 300 mg 3 times a day, maximum daily dose to be given in 3-4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 12-17 years: Initially 300-400 mg 3-4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200-400 mg 3 times a day, may be adequate

Pain and inflammation

- ► BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12-17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ► Child 3 months-17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

Pain and inflammation in systemic juvenile idiopathic

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3 months-17 years: Up to 60 mg/kg daily in 4-6 divided doses; maximum 2.4 g per day

Post-immunisation pyrexia in infants (on doctor's advice only)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 2-3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- ► TO THE SKIN
- Adult: Apply up to 3 times a day, ibuprofen gel 5% gel to be administered

Pain and inflammation in rheumatic disease and other musculoskeletal disorders (dose approved for use by community practitioner nurse prescribers) | Mild to moderate pain including dysmenorrhoea (dose approved for use by community practitioner nurse prescribers) Migraine (dose approved for use by community practitioner nurse prescribers) | Dental pain (dose approved for use by community practitioner nurse prescribers) | Headache (dose approved for use by community practitioner nurse prescribers) | Fever (dose approved for use by community practitioner nurse prescribers) | Symptoms of colds and influenza (dose approved for use by community practitioner nurse prescribers) | Neuralgia (dose approved for use by community practitioner nurse prescribers)

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12-17 years: 200-400 mg 3 times a day, if symptoms worsen or persist for more than 3 days refer to doctor
- Adult: 200-400 mg 3 times a day, if symptoms worsen or persist for more than 10 days refer to doctor

Mild to moderate pain (dose approved for use by community practitioner nurse prescribers) | Pain and inflammation of soft-tissue injuries (dose approved for use by community practitioner nurse prescribers) Pyrexia with discomfort (dose approved for use by community practitioner nurse prescribers)

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3-5 months (body-weight 5 kg and above): 20-30 mg/kg daily in divided doses, alternatively 50 mg 3 times a day for maximum of 24 hours, refer to doctor if symptoms persist for more than 24 hours
- ▶ Child 6-11 months: 50 mg 3-4 times a day, refer to doctor if symptoms persist for more than 3 days
- ► Child 1-3 years: 100 mg 3 times a day, refer to doctor if symptoms persist for more than 3 days
- ▶ Child 4-6 years: 150 mg 3 times a day, refer to doctor if symptoms persist for more than 3 days
- ▶ Child 7-9 years: 200 mg 3 times a day, refer to doctor if symptoms persist for more than 3 days
- ▶ Child 10-11 years: 300 mg 3 times a day, refer to doctor if symptoms persist for more than 3 days

Post-immunisation pyrexia in infants (dose approved for use by community practitioner nurse prescribers) (on doctor's advice only)

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required, if pyrexia persists refer to

Acute moderate pain (in hospital setting) | Pyrexia (in hospital setting)

- ► BY INTRAVENOUS INFUSION
- Adult: 400 mg every 6-8 hours if required for maximum 3 days; maximum 1.2 g per day

FENRID ® FORTE

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- Adult: Apply up to 4 times a day, therapy should be reviewed after 14 days

IBUGEL ® FORTE

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- Adult: Apply up to 3 times a day

UNLICENSED USE

 With oral use in children Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

CONTRA-INDICATIONS

▶ With systemic use Active gastro-intestinal bleeding • active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure · varicella infection

CAUTIONS

- ▶ With systemic use Allergic disorders cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · dehydration (risk of renal impairment) · elderly (risk of serious side-effects and fatalities) · heart failure · history of gastro-intestinal disorders (e.g. ulcerative colitis, Crohn's disease) · ischaemic heart disease · may mask symptoms of infection · peripheral arterial disease · risk factors for cardiovascular events · uncontrolled hypertension
- With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

CAUTIONS, FURTHER INFORMATION

- High-dose ibuprofen
- ▶ With oral use A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose ibuprofen (> 2.4 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II-III), and uncontrolled hypertension.
- Masking of symptoms of underlying infections
- With systemic use Ibuprofen can mask symptoms of infection, which may lead to delayed initiation of appropriate treatment and thereby worsen infection outcome. This has been observed in bacterial communityacquired pneumonia and bacterial complications to varicella. When administered for fever or pain relief in relation to infection, monitoring of infection is advised.
- INTERACTIONS → Appendix 1: NSAIDs

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Gastrointestinal discomfort skin
- ▶ Uncommon Asthma · hypersensitivity
- ▶ Rare or very rare Dyspnoea

SPECIFIC SIDE-EFFECTS

► Common or very common

With intravenous use Constipation · diarrhoea · dizziness · fatigue · gastrointestinal disorders · haemorrhage ·

headache • inflammatory bowel disease • insomnia • nausea • oral disorders • vertigo • vomiting

- ▶ Uncommon
- With intravenous use Acute kidney injury · anxiety · nephritis tubulointerstitial · nephrotic syndrome · oedema · tinnitus · vision disorders
- With oral use Headache nausea rash (discontinue)
- ► Rare or very rare
- With intravenous use Agranulocytosis · alopecia · anaemia · auditory disorder · confusion · depression · heart failure · hepatic disorders · hypersensitivity vasculitis · hypertension · hypotension · infection exacerbated · irritability · leucopenia · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · myocardial infarction · neck stiffness · palpitations · pancreatitis · pancytopenia · photosensitivity reaction · psychotic disorder · renal papillary necrosis · respiratory disorders · severe cutaneous adverse reactions (SCARs) · shock · systemic lupus erythematosus (SLE) · thrombocytopenia
- With oral use Acute kidney injury agranulocytosis anaemia angioedema constipation diarrhoea gastrointestinal disorders haemorrhage leucopenia liver disorder meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) oedema oral ulceration pancytopenia renal papillary necrosis severe cutaneous adverse reactions (SCARs) shock thrombocytopenia vomiting

► Frequency not known

- With oral use Crohn's disease · fertility decreased female · fluid retention · heart failure · hypertension · increased risk of arterial thromboembolism · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · respiratory tract reaction
- With topical use Angioedema · bronchospasm · rash (discontinue) · renal impairment · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Nonsteroidal anti-inflammatory drugs p. 1222

With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

Overdose Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour.

For details on the management of poisoning, see Emergency treatment of poisoning p. 1473.

 ALLERGY AND CROSS-SENSITIVITY Evg: Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

 With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

BREAST FEEDING

- With oral use Use with caution during breast-feeding.
 Amount too small to be harmful but some manufacturers advise avoid.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.
- HEPATIC IMPAIRMENT
- ► With systemic use for indications relating to pain or pyrexia Ever Caution in mild to moderate impairment; avoid in severe impairment. (♠)

Dose adjustments • With systemic use for indications relating to pain or pyrexia [EVG] The lowest effective dose should be used for the shortest possible duration.

RENAL IMPAIRMENT

- With systemic use for indications relating to pain or pyrexia In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure). Ever For ibuprofen, avoid in severe impairment.
- With topical use EvGr Caution (deterioration in renal function has also been reported after topical use).
 Dose adjustments > With systemic use for indications relating to pain or pyrexia EvGr The lowest effective dose should be used for the shortest possible duration.

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use EvGr For intravenous infusion, give over 30 minutes.
- With topical use Ever For topical preparations, apply with gentle massage only.

• PRESCRIBING AND DISPENSING INFORMATION

With oral use Flavours of syrup may include orange.

• PATIENT AND CARER ADVICE

 With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.

Photosensitivity

 With topical use For topical preparations, patients or their carers should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

Medicines for Children leaflet: Ibuprofen for pain and inflammation www.medicinesforchildren.org.uk/medicines/ibuprofen-forpain-and-inflammation/

• PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Ibuprofen Oral Suspension Sugar-free may be prescribed. Ibuprofen Tablets may be prescribed.

• EXCEPTIONS TO LEGAL CATEGORY

- With topical use Smaller pack sizes of gel preparations may be available on sale to the public.
- With oral use Oral preparations can be sold to the public in certain circumstances.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

(Indomethacin)

• INDICATIONS AND DOSE

Pain and moderate to severe inflammation in rheumatic disease and other musculoskeletal disorders

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 50-200 mg daily in divided doses
- ► BY RECTUM
- Adult: 100 mg 1-2 times a day, dose to be administered at night and in the morning if required, combined oral and rectal treatment maximum total daily dose 150-200 mg
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 75 mg 1-2 times a day

Acute gout

- $\,\blacktriangleright\,$ By mouth using immediate-release medicines
- ▶ Adult: 150-200 mg daily in divided doses
- ► BY RECTUM
- Adult: 100 mg 1-2 times a day, dose to be administered at night and in the morning if required, combined oral and rectal treatment maximum total daily dose 150-200 mg
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 75 mg 1–2 times a day

Dysmenorrhoea

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Up to 75 mg daily
- ► BY RECTUM
- Adult: 100 mg 1–2 times a day, dose to be administered at night and in the morning if required, combined oral and rectal treatment maximum total daily dose 150–200 mg
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 75 mg daily

CONTRA-INDICATIONS Active gastro-intestinal bleeding active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

CAUTIONS

GENERAL CAUTIONS Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · dehydration (risk of renal impairment) · elderly (risk of serious side-effects and fatalities) · epilepsy · heart failure · history of gastro-intestinal disorders (e.g. ulcerative colitis, Crohn's disease) · ischaemic heart disease · may mask symptoms of infection · parkinsonism · peripheral arterial disease · psychiatric disturbances · risk factors for cardiovascular events · uncontrolled hypertension

- With rectal use Avoid rectal administration in proctitis avoid rectal administration in recent rectal bleeding
- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS Agranulocytosis · alopecia · anaphylactic reaction · angioedema · anxiety · appetite decreased · arrhythmias · asthma · blood disorder · bone marrow disorders · breast abnormalities · chest pain · coma · confusion · congestive heart failure · constipation · corneal deposits · depression · diarrhoea · disseminated intravascular coagulation · dizziness · drowsiness · dysarthria · erythema nodosum · eye disorder · eye pain · fatigue · fluid retention · flushing · gastrointestinal discomfort · gastrointestinal disorders · gynaecomastia · haemolytic anaemia · haemorrhage · hallucination · headache · hearing impairment · hepatic disorders · hyperglycaemia · hyperhidrosis · hyperkalaemia · hypotension · inflammatory bowel disease · insomnia · leucopenia · movement disorders · muscle weakness · nausea · nephritis tubulointerstitial · nephrotic syndrome · oedema · oral disorders · palpitations · pancreatitis · paraesthesia · peripheral neuropathy · photosensitivity reaction · platelet aggregation inhibition · psychiatric disorders · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · seizures · severe cutaneous adverse reactions (SCARs) · skin reactions · syncope · thrombocytopenia · tinnitus · urine abnormalities · vasculitis · vertigo · vision disorders · vomiting

SPECIFIC SIDE-EFFECTS

- With oral use Dyspnoea · malaise · pulmonary oedema · sigmoid lesion perforation
- SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Nonsteroidal anti-inflammatory drugs p. 1222
- ALLERGY AND CROSS-SENSITIVITY Evg: Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- BREAST FEEDING Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (increased risk of gastro-intestinal bleeding and fluid retention).
- RENAL IMPAIRMENT In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure). [EVGF] For indometacin, avoid in severe impairment. ♠⟩
- MONITORING REQUIREMENTS During prolonged therapy ophthalmic and blood examinations particularly advisable.

PATIENT AND CARER ADVICE

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

Ketoprofen

29-Nov-2021

INDICATIONS AND DOSE

Pain and mild inflammation in rheumatic disease and musculoskeletal conditions | Dysmenorrhoea | Acute gout

- ▶ BY MOUTH
- Adult: 100–200 mg once daily

Relief of pain in rheumatic disease and musculoskeletal conditions

- ► TO THE SKIN
- Adult: Apply 2-4 times a day for up to 7 days, ketoprofen 2.5% gel to be administered; maximum 15 g per day

OWERGEL®

Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis

- ► TO THE SKIN
- ▶ Adult: Apply 2–3 times a day for up to max. 10 days

CONTRA-INDICATIONS

 With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · coagulation disorders · history of gastro-intestinal bleeding · history of gastrointestinal perforation · history of gastro-intestinal ulceration · severe heart failure

CAUTIONS

- With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · connective-tissue disorders · dehydration (risk of renal impairment) · elderly (risk of serious side-effects and fatalities) · heart failure · history of gastro-intestinal disorders (e.g. ulcerative colitis, Crohn's disease) · ischaemic heart disease · may mask symptoms of infection · peripheral arterial disease · risk factors for cardiovascular events · uncontrolled hypertension
- With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous

membranes - not for use with occlusive dressings - topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

CAUTIONS, FURTHER INFORMATION

- Masking of symptoms of underlying infections
- With systemic use Ketoprofen can mask symptoms of infection, which may lead to delayed initiation of appropriate treatment and thereby worsen infection outcome. This has been observed in bacterial communityacquired pneumonia and bacterial complications to varicella. When administered for fever or pain relief in relation to infection, monitoring of infection is advised.
- INTERACTIONS → Appendix 1: NSAIDs

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ Uncommon Diarrhoea paraesthesia skin reactions
- ► Rare or very rare Hypersensitivity photosensitivity reaction renal impairment
- ► Frequency not known Angioedema

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With oral use Gastrointestinal discomfort nausea vomiting
- ▶ IIncommon
- ▶ With oral use Constipation · dizziness · drowsiness · fatigue · gastrointestinal disorders · headache · oedema · rash (discontinue)
- With topical use Increased risk of infection
- ► Rare or very rare
- With oral use Asthma · haemorrhagic anaemia · hepatic disorders · pancreatitis · shock · stomatitis · tinnitus · vision disorders · weight increased
- ► Frequency not known
- With oral use Acute kidney injury (more common in patients with pre-existing renal impairment) · agranulocytosis · alopecia · appetite decreased · bone marrow failure · bronchospasm · confusion · Crohn's disease aggravated · depression · dyspnoea · fertility decreased female · haemorrhage · hallucination · hearing impairment · heart failure · hypertension · increased risk of arterial thromboembolism · increased risk of ischaemic stroke · increased risk of myocardial infarction · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · menometrorrhagia · mood altered · nephritic syndrome · nephritis tubulointerstitial · nephrotic syndrome · neutropenia · optic neuritis · rhinitis · seizure · severe cutaneous adverse reactions (SCARs) · taste altered · thrombocytopenia · vasodilation · vertigo
- With topical use Eosinophilia eyelid oedema fever gastrointestinal haemorrhage lip swelling peptic ulcer vasculitis wound complications
 - SIDE-EFFECTS, FURTHER INFORMATION Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal antiinflammatory drugs p. 1222

 ALLERGY AND CROSS-SENSITIVITY Ever Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

 With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

BREAST FEEDING

- With systemic use Use with caution during breast-feeding.
 Amount probably too small to be harmful but manufacturers advise avoid.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.
- HEPATIC IMPAIRMENT
- With systemic use Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- With topical use Manufacturer advises caution.
- RENAL IMPAIRMENT
- With systemic use In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure). [Suc For ketoprofen, avoid in severe renal insufficiency.
- With topical use Evgr Caution (deterioration in renal function has also been reported after topical use).
- DIRECTIONS FOR ADMINISTRATION
- With topical use For topical preparations, manufacturer advises apply with gentle massage only.

PATIENT AND CARER ADVICE

 With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.

Photosensitivity

• With topical use Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity. Patients should be advised not to expose area treated to sunbeds or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

EXCEPTIONS TO LEGAL CATEGORY

- With topical use Smaller pack sizes of gel preparations may be available on sale to the public.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: gel

Mefenamic acid

26-Nov-2021

• INDICATIONS AND DOSE

Pain and inflammation in rheumatoid arthritis and osteoarthritis | Postoperative pain | Mild to moderate pain

- ► BY MOUTH
- Adult: 500 mg 3 times a day

Acute pain including dysmenorrhoea | Menorrhagia

BY MOUTH

- ▶ Child 12-17 years: 500 mg 3 times a day
- Adult: 500 mg 3 times a day
- CONTRA-INDICATIONS Active gastro-intestinal bleeding active gastro-intestinal ulceration following coronary artery bypass graft (CABG) surgery history of gastro-intestinal bleeding related to previous NSAID therapy history of gastro-intestinal perforation related to previous NSAID therapy history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) history of recurrent gastro-intestinal ulceration (two or more distinct episodes) inflammatory bowel disease severe heart failure
- CAUTIONS Acute porphyrias p. 1150 · allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective tissue disorders · dehydration (risk of renal impairment) · elderly (risk of serious side-effects and fatalities) · epilepsy · heart failure · history of gastro-intestinal disorders (e.g. ulcerative colitis, Crohn's disease) · ischaemic heart disease · may mask symptoms of infection · peripheral arterial disease · risk factors for cardiovascular events · uncontrolled hypertension
- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-EFFECTS Agranulocytosis · anaemia · angioedema · appetite decreased · asthma · bone marrow disorders · confusion · constipation · Crohn's disease · depression · diarrhoea (discontinue) · disseminated intravascular coagulation · dizziness · drowsiness · dyspnoea · dysuria · ear pain · eosinophilia · eye irritation · fatigue · fertility decreased female · gastrointestinal discomfort · gastrointestinal disorders · glomerulonephritis · glucose tolerance impaired · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hyperhidrosis · hypersensitivity · hypertension · hyponatraemia · hypotension · insomnia · leucopenia · malaise · meningitis aseptic (patients with connectivetissue disorders such as systemic lupus erythematosus may be especially susceptible) · multi organ failure · nausea · nephritis acute interstitial · nephrotic syndrome · nervousness · neutropenia · oedema · optic neuritis · oral ulceration · palpitations · pancreatitis · paraesthesia · photosensitivity reaction • proteinuria • rash (discontinue) • renal failure (more common in patients with pre-existing renal impairment) · renal failure non-oliguric · renal papillary necrosis · respiratory disorders · seizure · sepsis · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · vertigo · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Nonsteroidal anti-inflammatory drugs p. 1222

Overdose Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent, require treatment.

For details on the management of poisoning, see Emergency treatment of poisoning p. 1473, in particular, Convulsions.

 ALLERGY AND CROSS-SENSITIVITY [EVGT] Contra-indicated in patients with a history of hypersensitivity to aspirin or

- any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- RENAL IMPAIRMENT In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure). EvGr For mefenamic acid, avoid in severe impairment. (♠)

Meloxicam

22-Nov-2021

• INDICATIONS AND DOSE

Exacerbation of osteoarthritis (short-term)

- ▶ BY MOUTH
- Child 16-17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily
- Adult: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

Pain and inflammation in rheumatic disease | Ankylosing spondylitis

- ► BY MOUTH
- Child 16-17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required
- Adult: 15 mg once daily, then reduced to 7.5 mg once daily if required
- Elderly: 7.5 mg once daily

Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs

- ► BY MOUTH
- Child 12-17 years (body-weight up to 50 kg): 7.5 mg once daily

 Child 12-17 years (body-weight 50 kg and above): 15 mg once daily

UNLICENSED USE

- In children Expert sources advise that meloxicam may be used from the age of 12 years for the treatment of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDS, but it is not licensed for this age group.
- CONTRA-INDICATIONS Active gastro-intestinal bleeding active gastro-intestinal ulceration following coronary artery bypass graft surgery history of gastro-intestinal bleeding related to previous NSAID therapy history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) history of recurrent gastro-intestinal ulceration (two or more distinct episodes) severe heart failure
- CAUTIONS Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective · tissue disorders · dehydration (risk of renal impairment) · elderly (risk of serious side-effects and fatalities) · heart failure · history of gastro-intestinal disorders (e.g. ulcerative colitis, Crohn's disease) · ischaemic heart disease · may mask symptoms of infection · peripheral arterial disease · risk factors for cardiovascular events · uncontrolled hypertension
- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-EFFECTS
- ► Common or very common Constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · vomiting
- ▶ Uncommon Anaemia · angioedema · burping · dizziness · drowsiness · electrolyte imbalance · fluid retention · flushing · haemorrhage · hepatic disorders · hypersensitivity · oedema · skin reactions · stomatitis · vertigo
- ▶ Rare or very rare Acute kidney injury · asthma · conjunctivitis · leucopenia · mood altered · nightmare · palpitations · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tinnitus · vision disorders
- Frequency not known Agranulocytosis · confusion · fertility decreased female · heart failure · increased risk of arterial thromboembolism · nephritis tubulointerstitial · nephrotic syndrome · photosensitivity reaction · renal necrosis SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Nonsteroidal anti-inflammatory drugs p. 1222
- ALLERGY AND CROSS-SENSITIVITY EvG: Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. ♠
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING Use with caution during breast-feeding.
 Present in milk in animal studies—manufacturer advises avoid
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- RENAL IMPAIRMENT In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal

impairment, including renal failure). [EVG] For *meloxicam*, avoid if creatinine clearance less than 25 mL/minute; see p. 21.

Piroxicam

30-Nov-2021

INDICATIONS AND DOSE

Rheumatoid arthritis (initiated by a specialist) | Osteoarthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist)

- ► BY MOUTH
- Adult: Up to 20 mg once daily

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- ► TO THE SKII
- Adult: Apply 3-4 times a day, 0.5% gel to be applied; review treatment after 4 weeks

IMPORTANT SAFETY INFORMATION

CHMP ADVICE-PIROXICAM (JUNE 2007)

With systemic use

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- · piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent should be considered.

Topical preparations containing piroxicam are not affected by these restrictions.

CONTRA-INDICATIONS

 With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · inflammatory bowel disease · severe heart failure

CAUTIONS

- With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · dehydration (risk of renal impairment) · elderly (risk of serious side-effects and fatalities) · heart failure · history of gastro-intestinal disorders · ischaemic heart disease · may mask symptoms of infection · peripheral arterial disease · risk factors for cardiovascular events · uncontrolled hypertension
- With topical use Avoid contact with eyes avoid contact with inflamed or broken skin - avoid contact with mucous membranes - not for use with occlusive dressings - topical application of large amounts can result in systemic effects,

including hypersensitivity and asthma (renal disease has also been reported)

- INTERACTIONS → Appendix 1: NSAIDs
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Gastrointestinal discomfort gastrointestinal disorders nausea skin reactions
- Rare or very rare Severe cutaneous adverse reactions (SCARs)
- ► Frequency not known Bronchospasm · dyspnoea · photosensitivity reaction
- SPECIFIC SIDE-EFFECTS
- ► Common or very common
- With oral use Anaemia appetite decreased constipation diarrhoea dizziness drowsiness eosinophilia headache hyperglycaemia leucopenia oedema rash (discontinue) thrombocytopenia tinnitus vertigo vomiting weight changes
- ▶ Uncommon
- With oral use Hypoglycaemia · palpitations · stomatitis · vision blurred
- ► Rare or very rare
- With oral use Nephritis tubulointerstitial nephrotic syndrome • renal failure • renal papillary necrosis
- ► Frequency not known
- With oral use Alopecia · angioedema · aplastic anaemia · confusion · depression · embolism and thrombosis · eye irritation · eye swelling · fertility decreased female · fluid retention · haemolytic anaemia · haemorrhage · hallucination · hearing impairment · heart failure · hepatic disorders · hypersensitivity · hypertension · malaise · mood altered · nervousness · onycholysis · pancreatitis · paraesthesia · sleep disorders · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Nonsteroidal anti-inflammatory drugs p. 1222

Topical application of large amounts can result in systemic effects.

 ALLERGY AND CROSS-SENSITIVITY Evg: Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

 With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.
- BREAST FEEDING
- With systemic use Use with caution during breast-feeding.
 Amount too small to be harmful.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.
- HEPATIC IMPAIRMENT
- With oral use Manufacturer advises caution.
- RENAL IMPAIRMENT
- With systemic use In general, for NSAIDs the MHRA advises to avoid where possible; if necessary, use with caution (risk of fluid retention and further renal impairment, including renal failure).
- With topical use EvG Caution (deterioration in renal function has also been reported after topical use).

- DIRECTIONS FOR ADMINISTRATION Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing.
- With topical use For topical preparations, manufacturer advises apply with gentle massage only.
- PATIENT AND CARER ADVICE
- With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.

Photosensitivity

- With topical use Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.
- LESS SUITABLE FOR PRESCRIBING
 - With oral use Piroxicam is less suitable for prescribing.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tiaprofenic acid

26-Nov-2021

• INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders

- ► BY MOUTH
- Adult: 300 mg twice daily

IMPORTANT SAFETY INFORMATION

CSM ADVICE

Following reports of **severe cystitis** the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop.

Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine).

- CONTRA-INDICATIONS Active bladder disease (or symptoms) active gastro-intestinal bleeding active gastro-intestinal ulceration active prostate disease (or symptoms) history of gastro-intestinal bleeding related to previous NSAID therapy history of gastro-intestinal perforation related to previous NSAID therapy history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) history of recurrent gastro-intestinal ulceration (two or more distinct episodes) history of recurrent urinary-tract disorders (if urinary symptoms develop discontinue immediately and perform urine tests and culture) severe heart failure

5 Soft tissue and joint disorders

5.1 Local inflammation of joints and soft tissue

Other drugs used for Local inflammation of joints and soft tissue Prednisolone, p. 747

CORTICOSTEROIDS

Corticosteroids, inflammatory disorders

18-Sep-2020

Systemic corticosteroids

Short-term treatment with corticosteroids can help to rapidly decrease inflammatory symptoms of rheumatoid arthritis. [vs] Long-term treatment in patients with established rheumatoid arthritis should only be continued after evaluating the risks and all other treatments have been considered, see Rheumatoid arthritis p. 1186. (A)

Polymyalgia rheumatica and giant cell (temporal) arteritis are always treated with corticosteroids. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

 $Polyar terit is \ nodos a \ and \ polymyosit is \ are \ usually \ treated \\ with \ corticosteroids.$

Systemic lupus erythematosus is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis. Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine p. 669 or hydroxychloroquine sulfate p. 1190, should be considered.

Ankylosing spondylitis should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

For further information on corticosteroid use, see Corticosteroids, general use p. 737.

Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by intra-articular injection to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for disease-modifying antirheumatic drugs (DMARDs) to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer's elbow or compression neuropathies. In tendinitis, injections should be made into the

tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone acetate p. 744 or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

For further information on corticosteroid use, see Corticosteroids, general use p. 737.

Dexamethasone

F 740

 DRUG ACTION Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

INDICATIONS AND DOSE

Local inflammation of joints

- ► BY INTRA-ARTICULAR INJECTION
- Adult: 0.3-3.3 mg, where appropriate, dose may be repeated at intervals of 3-21 days according to response, dose given according to size—consult product literature

Local inflammation of soft tissues

- ► BY LOCAL INFILTRATION
- Adult: 1.7-5 mg, dose given according to size—consult product literature, where appropriate may be repeated at intervals of 3-21 days, use the 3.3 mg/mL injection preparation for this dose
- INTERACTIONS → Appendix 1: corticosteroids
- PREGNANCY Dexamethasone readily crosses the placenta.
- PRESCRIBING AND DISPENSING INFORMATION

Dexamethasone 3.8 mg/mL Injection has replaced dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

5.2 Soft tissue disorders

Soft-tissue disorders

07-Jul-2020

Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent

administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

Extravasation prevention

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trinitrate patch p. 237 distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

Extravasation management

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 744 or dexamethasone p. 1245 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury.

Antihistamines and analgesics may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.

The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase below. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). Dexrazoxane p. 1014 is licensed for the treatment of anthracycline-induced extravasation.

Enzymes used in soft-tissue disorders

ollagenase

Collagenases are proteolytic enzymes that are derived from the fermentation of *Clostridium histolyticum* and have the ability to break down collagen.

Hyaluronidase

Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

Rubefacients

Rubefacients act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotinate and salicylate compounds, essential oils, capsicum, and camphor.

Topical NSAIDs

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. Topical NSAIDs (e.g. felbinac p. 1231, ibuprofen p. 1232, ketoprofen p. 1236, and piroxicam p. 1241) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis.

ENZYMES

Hyaluronidase

24-Feb-2020

INDICATIONS AND DOSE

Enhance permeation of subcutaneous or intramuscular injections

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 1500 units, to be dissolved directly into the solution to be injected (ensure compatibility)

Enhance permeation of local anaesthetics

- ► BY LOCAL INFILTRATION
- Adult: 1500 units, to be mixed with the local anaesthetic solution

Enhance permeation of ophthalmic local anaesthetic

- ► TO THE EYE
- Adult: 15 units/mL, to be mixed with the local anaesthetic solution

Hypodermoclysis

- ► BY SUBCUTANEOUS INJECTION
- Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid

Extravasation

- ► BY LOCAL INFILTRATION
- Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area as soon as possible after extravasation

Haematoma

- ► BY LOCAL INFILTRATION
- Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area
- CONTRA-INDICATIONS Avoid sites where infection is present - avoid sites where malignancy is present • do not apply direct to cornea • not for anaesthesia in unexplained premature labour • not for intravenous administration • not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists • not to be used to reduce swelling of bites • not to be used to reduce swelling of stings
- CAUTIONS
- When used for hypodermoclysis Elderly (control speed and total volume and avoid overhydration especially in renal impairment)
- SIDE-EFFECTS Oedema · periorbital oedema
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eve

30-Nov-2020

Eye treatment: drug administration

The structure of the eye is divided into two main parts: the anterior segment and the posterior segment. Drugs are most commonly administered to the anterior segment of the eye by topical application in the form of eye drops or ointments. When a higher drug concentration is required, and when wanting to achieve therapeutic drug concentrations to the posterior segment of the eye, administration by intravitreal injection, periocular injection, or by the systemic route may be necessary.

Eve drops and eve ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid, blinking a few times to ensure even spread, and then closing the eye; in neonates and infants it may be more appropriate to administer the drop in the inner angle of the open eye. A small amount of eye ointment is applied similarly; blinking helps to spread it. [Ever] Eye drops and ointments may cause temporary blurring of vision. If affected, patients should be warned not to drive or perform other skilled tasks until vision is clear.

When two different eye preparations are used at the same time of day, the patient should leave an interval of at least 5 minutes between the two, to allow the first to be fully absorbed; eve ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation either directly from the conjunctival sac or after the excess preparation has drained down through the tear ducts into the nasal cavity. The extent of systemic absorption following ocular administration is highly variable due to a number of factors (e.g. drainage, blink rate, tear turnover). Nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Applying pressure on the lacrimal punctum for at least a minute after administering eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Part IXA - Appliances). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful in patients with poor manual dexterity (e.g. due to arthritis) or reduced vision

Eye irrigation solutions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution p. 1258 is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye

The intravitreal route is used to administer drug into the posterior segment of the eye for conditions such as macular oedema and age-related macular degeneration. The intracameral route can be used to deliver certain drugs to the anterior chamber, for example antibacterials after cataract surgery. These injections should only be used under specialist supervision.

Ophthalmic Specials

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Special Order Products guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product is not suitable for a patient's needs. The Ophthalmic Special Order Products guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk).

Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in Medicinal form entries—see individual drug monographs. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Eye preparations: control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye preparations in multiple-application containers for use by the patient *at home* are normally discarded 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye preparations for use in hospital general wards are also normally discarded 4 weeks after first opening (unless otherwise stated by the manufacturer)—local practice may vary. Individual containers should be

provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Patients admitted with an eye infection should be supplied with a fresh container on admission. On discharge from hospital, eye preparations used during the hospital stay should be assessed for suitability (e.g. period of use, risk of contamination); if unsuitable, a fresh supply should be provided.

During formal eye examinations and in eye surgery, singleapplication containers should be used if possible to reduce the risk of contamination. There is a high-risk of crosscontamination in areas such as operating theatres, eye disease clinics, and ophthalmic accident and emergency departments, therefore all containers should be discarded after single patient use whether they are single- or multipleapplication containers.

Compared to eye preparations containing a preservative, unpreserved eye preparations may have a shorter period of safe use; consult packaging and see Guidance on the in-use shelf life for eye drops and ointments for more information (www.sps.nhs.uk/articles/guidance-on-in-use-shelf-life-for-eyedrops-and-ointments/).

Contact lenses

Contact lenses are usually worn for their visual corrective function (e.g. myopia, astigmatism). There are two main types of lenses; hard (rigid or gas-permeable rigid) lenses or soft (hydrogel or hydrophilic) lenses. Soft lenses are the most popular type because they tend to be more comfortable, but they may not give the best vision.

Lenses are usually worn for a specified number of hours each day and removed for sleeping unless specifically designed for overnight wear. The risk of infectious and noninfectious keratitis is increased by extended continuous contact lens wear, and poor compliance with directions for use, daily cleaning, and disinfection.

Acanthamoeba keratitis, a painful and severe sightthreatening infection of the cornea, can be associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition, which is treated promptly by specialists, is especially associated with the use of soft lenses (particularly reusable or extended wear lenses).

Contact lenses and drug treatment

Unless medically indicated, soft lenses should be removed before instillation of the eye preparation. Alternatively, unpreserved drops can be used, as preservatives accumulate in soft lenses and can cause irritation. Eye drops, however, may be instilled while patients are wearing hard contact lenses but removal prior to instillation is still generally advised. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops can cause lens deposits and should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include drugs which can cause corneal oedema (e.g. oral contraceptives-particularly those with a higher oestrogen content), drugs which reduce eye movement and blink reflex (e.g. anxiolytics, sedative hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. older generation antihistamines, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 294 and hydralazine hydrochloride p. 196). Other drugs that may affect contact lens wear include isotretinoin p. 1365 (can decrease tolerance to contact lens), aspirin p. 133 (can cause irritation), and rifampicin p. 634 and sulfasalazine p. 44 (can discolour lenses).

Allergic and inflammatory 1 eve conditions

Eye, allergy and inflammation

Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

Topical corticosteroids are applied frequently for the first 24-48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' can follow prolonged use. Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of

combination products is otherwise rarely justified. Systemic corticosteroids may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

Intravitreal corticosteroids

An intravitreal implant containing dexamethasone p. 1252 (Ozurdex®) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious

An intravitreal implant containing fluocinolone acetonide p. 1282 (Iluvien®) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies; it is also licensed for the prevention of relapse in recurrent non-infectious uveitis affecting the posterior segment of the eye. It should be administered by specialists experienced in the use of intravitreal injections.

Eve care, other anti-inflammatory preparations

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide p. 1251, and sodium cromoglicate p. 1251.

Eye drops containing antihistamines, such as antazoline with xylometazoline p. 1250, azelastine hydrochloride p. 1250, epinastine hydrochloride p. 1250, ketotifen p. 1250, and olopatadine p. 1251, can be used for allergic conjunctivitis.

Sodium cromoglicate (sodium cromoglycate) and nedocromil sodium eve drops can be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Diclofenac sodium eve drops p. 1267 are also licensed for seasonal allergic conjunctivitis.

Non-steroidal anti-inflammatory eye drops are used for the prophylaxis and treatment of inflammation of the eye following surgery or laser treatment.

Ciclosporin eye drops p. 1255 are licensed for severe keratitis in patients with dry eye disease, which has not improved despite treatment with tear substitutes.

1.1 Allergic conjunctivitis

Other drugs used for Allergic conjunctivitis Diclofenac sodium, p. 1267

ANTIHISTAMINES

Antazoline with xylometazoline

06-Apr-2020

• INDICATIONS AND DOSE

Allergic conjunctivitis

- ► TO THE EYE
- Child 12-17 years: Apply 2-3 times a day for maximum 7 days
- ▶ Adult: Apply 2–3 times a day for maximum 7 days
- CAUTIONS Angle-closure glaucoma · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism · phaeochromocytoma · urinary retention
- INTERACTIONS → Appendix 1: antihistamines, sedating · sympathomimetics, vasoconstrictor
- SIDE-EFFECTS Drowsiness eye irritation headache hyperhidrosis hypertension mydriasis nausea palpitations vascular disorders vision blurred SIDE-EFFECTS, FURTHER INFORMATION Absorption of antazoline and xylometazoline may result in systemic side-effects.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Otrivine Antistin (Thea Pharmaceuticals Ltd)

Xylometazoline hydrochloride 500 microgram per 1 ml, Antazoline sulfate 5 mg per 1 ml Otrivine Antistin 0.5%/0.05% eye drops | 10 ml | P| £3.35 DT = £3.35

Azelastine hydrochloride

11-May-2020

• INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

- ► TO THE EYE
- Child 4-17 years: Apply twice daily, increased if necessary to 4 times a day
- Adult: Apply twice daily, increased if necessary to 4 times a day

Perennial conjunctivitis

- ► TO THE EYE
- Child 12-17 years: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks
- Adult: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks
- INTERACTIONS → Appendix 1: antihistamines, nonsedating
- SIDE-EFFECTS
- ► Common or very common Eye irritation taste bitter (if applied incorrectly)

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Azelastine hydrochloride (Non-proprietary)

Azelastine hydrochloride 500 microgram per 1 ml Azelastine 0.05% eye drops | 8 ml [PoM] £6.40 DT = £6.40

F 740

Dexamethasone

17-May-2022

 DRUG ACTION Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

• INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- ► TO THE EYE USING EYE DROP
- ▶ Child: Apply 4-6 times a day
- Adult: Apply every 30-60 minutes until controlled, then reduced to 4-6 times a day

Short term local treatment of inflammation (severe conditions)

- ► TO THE EYE USING EYE DROP
- Child: Apply every 30–60 minutes until controlled, reduce frequency when control achieved

Macular oedema following either branch retinal vein occlusion or central retinal vein occlusion (specialist use only) | Visual impairment due to diabetic macular oedema in adults who are pseudophakic, or who are insufficiently responsive to, or unsuitable for noncorticosteroid therapy (specialist use only) | For the treatment of inflammation of the posterior segment of the eye presenting as non-infectious uveitis (specialist use only)

- ► BY INTRAVITREAL INJECTION
- Adult: 700 micrograms, to be administered into the affected eye, concurrent administration to both eyes not recommended. For further information on pretreatment, administration and repeat dosing, consult product literature
- UNLICENSED USE Maxidex[®] not licensed for use in children under 2 years. Dropodex[®] not licensed for use in children.
- CONTRA-INDICATIONS
- With intravitreal use Active ocular herpes simplex · active or suspected ocular infection · active or suspected periocular infection · rupture of the posterior lens capsule in patients

with aphakia, iris or transscleral fixated intra-ocular lens or anterior chamber intra-ocular lens • uncontrolled advanced glaucoma

- CAUTIONS
- With intravitreal use History of ocular viral infection (including herpes simplex) - posterior capsule tear or iris defect (risk of implant migration into the anterior chamber which may cause corneal oedema and, in persistent severe cases, the need for corneal transplantation) - retinal vein occlusion with significant retinal ischaemia
- INTERACTIONS → Appendix 1: corticosteroids
- SIDE-EFFECTS
- ► Common or very common Eye discomfort
- ▶ Uncommon
- When used by eye (topical) Photophobia · taste altered
- With intravitreal use Necrotising retinitis
- PREGNANCY Dexamethasone readily crosses the placenta.
- With intravitreal use Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

BREAST FEEDING

 With intravitreal use Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

MONITORING REQUIREMENTS

 With intravitreal use Monitor intra-ocular pressure and for signs of ocular infection. In patients with posterior capsule tear or iris defect monitor for implant migration to allow for early diagnosis and management.

PRESCRIBING AND DISPENSING INFORMATION

- When used by eye Although multi-dose dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- NATIONAL FUNDING/ACCESS DECISIONS

08-Mar-2022

INDICATIONS AND DOSE

Local treatment of inflammation (short term)

- ► TO THE EYE
- Child 2-17 years: Apply every 1 hour for 24-48 hours. then reduced to 2-4 times a day
- Adult: Apply every 1 hour for 24-48 hours, then reduced to 2-4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC **ADMINISTRATION (AUGUST 2017)**

See Corticosteroids, general use p. 737.

NHS IMPROVEMENT PATIENT SAFETY ALERT: STEROID **EMERGENCY CARD TO SUPPORT EARLY RECOGNITION AND** TREATMENT OF ADRENAL CRISIS IN ADULTS (AUGUST 2020) See Adrenal insufficiency p. 738.

PAEDIATRIC STEROID TREATMENT CARD FOR CHILDREN WITH **ADRENAL INSUFFICIENCY (NOVEMBER 2020)**

The British Society for Paediatric Endocrinology and Diabetes (BSPED) has developed a Paediatric Steroid Treatment Card which should be issued to children with adrenal insufficiency and steroid dependence. The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients. The BSPED Paediatric Steroid Treatment Card is available at: www.endocrinology.org/adrenal-crisis.

• SIDE-EFFECTS Cataract • eye discomfort • eye disorders • eye infection · eye inflammation · rash · taste altered · vision disorders

PATIENT AND CARER ADVICE

- ▶ In adults If systemic absorption occurs following topical and local use, side-effects applicable to systemic corticosteroids may apply; a patient information leaflet should be supplied and the need for a Steroid Treatment Card and a Steroid Emergency Card considered, see Corticosteroids, general use p. 737.
- In children If systemic absorption occurs following topical and local use, side-effects applicable to systemic corticosteroids may apply; a patient information leaflet should be supplied and the need for a Steroid Treatment Card considered, see Corticosteroids, general use p. 737.

Prednisolone sodium phosphate 5 mg per 1 ml Prednisolone sodium phosphate 0.5% ear/eye drops | 10 ml Pom £2.57 DT = £2.57

CORTICOSTEROIDS > COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin 28-May-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1252.

INDICATIONS AND DOSE

Local treatment of eye inflammation and bacterial infection (short-term)

- ► TO THE EYE USING EYE DROP
- Adult: Apply up to 6 times a day
- INTERACTIONS → Appendix 1: corticosteroids · neomycin
- SIDE-EFFECTS Eye disorders · glaucoma · posterior subcapsular cataract · punctate keratitis · vision blurred
- LESS SUITABLE FOR PRESCRIBING Betamethasone with neomycin eye-drops are less suitable for prescribing.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ Betnesol-N (RPH Pharmaceuticals AB)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops \mid 10 ml \mid PoM \mid £2.39 DT = £2.39

Dexamethasone with framycetin sulfate and gramicidin

02-Mar-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1252, framycetin sulfate p. 1285.

• INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- ► TO THE EYE
- Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency
- Adult: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency
- CAUTIONS Avoid prolonged use
- INTERACTIONS → Appendix 1: corticosteroids
- LESS SUITABLE FOR PRESCRIBING Sofradex[®] is less suitable for prescribing.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

► Sofradex (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml Sofradex ear/eye drops | 8 ml | PoM| £7.50

Dexamethasone with hypromellose, neomycin and polymyxin B sulfate

14-Dec-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1252, neomycin sulfate p. 562.

• INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- ► TO THE EYE USING EYE DROP
- Adult: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

Local treatment of inflammation (short-term)

- ► TO THE EYE USING EYE OINTMENT
- Adult: Apply 3-4 times a day, alternatively, apply at night when used with eye drops
- INTERACTIONS → Appendix 1: corticosteroids neomycin polymyxin b
- LESS SUITABLE FOR PRESCRIBING Dexamethasone with neomycin and polymixin B sulfate is less suitable for prescribing.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

EXCIPIENTS: May contain Hydroxybenzoates (parabens), woolfat and related substances (including lanolin)

➤ Maxitrol (Novartis Pharmaceuticals UK Ltd)
Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram Maxitrol eye ointment | 3.5 gram PoM £1.44

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

Dexamethasone with tobramycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1252, tobramycin p. 563.

• INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- ► TO THE EYE
- ► Adult: (consult product literature)
- INTERACTIONS → Appendix 1: aminoglycosides · corticosteroids
- LESS SUITABLE FOR PRESCRIBING Dexamethasone with tobramycin eye-drops are less suitable for prescribing.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Tobradex (Novartis Pharmaceuticals UK Ltd)

Dexamethasone 1 mg per 1 ml, Tobramycin 3 mg per 1 ml Tobradex 3mg/ml / 1mg/ml eye drops | 5 ml PoM £5.37 DT = £5.37

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin (Cvclosporin)

17-Sep-2021

• DRUG ACTION Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

INDICATIONS AND DOSE

IKERVIS®

Severe keratitis in dry eye disease that has not responded to treatment with tear substitutes (initiated by a specialist)

- ► TO THE EYE
- Adult: Apply 1 drop once daily, to be applied to the affected eye(s) at bedtime, review treatment at least every 6 months
- CONTRA-INDICATIONS Active or suspected ocular or periocular infection · ocular or peri-ocular malignancies or premalignant conditions
- CAUTIONS Glaucoma—limited information available history of ocular herpes-no information available
- INTERACTIONS → Appendix 1: ciclosporin
- · SIDE-FEEFCTS
- ► Common or very common Eve discomfort eve disorders eye inflammation · vision blurred
- ▶ Uncommon Eye deposit · increased risk of infection
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk-no information available.
- BREAST FEEDING Manufacturer advises avoid—limited
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises keep eves closed for 2 minutes after using eye drops to increase local drug action and reduce systemic absorption.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks-increased risk of blurred

2 Dry eye conditions

Dry eye

08-Feb-2020

Description of condition

Dry eye presents as chronic soreness and inflammation of ocular surface associated with reduced or abnormal tear secretion (e.g. in Sjögren's syndrome). It often responds to tear replacement therapy in the form of eye drops (preferably preservative-free), eye ointment (used at night), or gels. Choice of preparation is based on the type of dry eye (e.g. aqueous-deficient or evaporative), symptoms, and patient preference.

Drug treatment

Evor Hypromellose p. 1257 is the most frequently used treatment for tear deficiency in patients with mild dry eye. ♠ Initially, it may need to be instilled frequently (e.g. hourly) for adequate symptom relief, then at a reduced frequency. Evor Carbomers below and polyvinyl alcohol p. 1258 are suitable alternatives. ♠ The ability of carbomers below and polyvinyl alcohol to cling to the eye surface and their higher viscosity may help reduce frequency of application to 4 times daily. Carbomers below can be less tolerated than hypromellose due to their impact on vision. Evor Preservative-free tear replacement is preferred in cases of frequent and chronic application.

Ocular lubricants containing sodium hyaluronate p. 1259, hydroxypropyl guar, or carmellose sodium p. 1257 can be used for moderate to severe dry eye following a suitable trial (6–8 weeks) of treatment options for mild dry eye.

Eye ointments containing a paraffin (e.g. liquid paraffin with white soft paraffin and wool alcohols p. 1258) can be used in addition to other options to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion.

They may cause temporary visual disturbance and are

best suited for application before sleep. Ointments should not be used during contact lens wear.

Other drugs used for Dry eye conditions Pilocarpine, p. 1273

OCULAR LUBRICANTS

Acetylcysteine

05-Oct-2020

INDICATIONS AND DOSE

Tear deficiency | Impaired or abnormal mucus production

Eye ointment

 Liquid paraffin with white soft paraffin and wool alcohols (Nonproprietary)

Xailin Night eye ointment preservative free | 5 gram £2.60

Paraffin, yellow, soft

05-0ct-2021

• INDICATIONS AND DOSE

Eye surface lubrication

- ► TO THE EYE
- Child: Apply as required
- Adult: Apply as required

- PATIENT AND CARER ADVICE Ophthalmic preparations may cause temporary visual disturbance. Should not be used during contact lens wear.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

Paraffin, yellow, soft (Non-proprietary)

Liquid paraffin 100 mg per 1 gram, Wool fat 100 mg per 1 gram, Yellow soft paraffin 800 mg per 1 gram | Simple eye ointment | 4 gram | £53.28 DT = £53.28

Polyvinyl alcohol

17-Apr-2020

INDICATIONS AND DOSE

Tear deficiency

- ► TO THE EYE
- Child: Apply as required
- Adult: Apply as required
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose polyvinyl alcohol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- Liquifilm Tears (Allergan Ltd)
- Polyvinyl alcohol 14 mg per 1 ml Liquifilm Tears 1.4% eye drops | 15 ml f 1 93
- Liquifilm Tears 1.4% eye drops 0.4ml unit dose preservative free | 30 unit dose £5.35
- Refresh Ophthalmic (Allergan Ltd)

Polyvinyl alcohol 14 mg per 1 ml Refresh Ophthalmic 1.4% eye drops 0.4ml unit dose | 30 unit dose £2.25

Sno Tears (Bausch & Lomb UK Ltd)

Polyvinyl alcohol 14 mg per 1 ml Sno Tears 1.4% eye drops | 10 ml f1.06

Retinol palmitate with white soft paraffin, light liquid paraffin, liquid paraffin and wool fat

(Formulated as an ocular lubricant)

• INDICATIONS AND DOSE

Dry eye conditions

- ► TO THE EYE
- Adult: (consult product literature)
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eve ointment

VitA-POS (Scope Ophthalmics Ltd)
 Hylo Night eye ointment preservative free | 5 gram £2.75

Sodium chloride

25-Apr-2022

• INDICATIONS AND DOSE

Tear deficiency | Ocular lubricants and astringents | Irrigation, including first-aid removal of harmful substances | Intra-ocular or topical irrigation during surgical procedures

- ► TO THE EYE
- ▶ Child: Apply as required, use 0.9% eye preparations
- Adult: Apply as required, use 0.9% eye preparations

Corneal oedema

- ► TO THE EVE
- Adult: Use 5% eye preparations (consult product literature)
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose sodium chloride eye drops commonly contain preservatives, preservative-free unit dose vials may be available
- In adults Some sodium chloride 5% eye drop preparations may also contain sodium hyaluronate—consult product literature.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment

Emustil eye drops 0.3ml unit dose preservative free | 20 unit dose

3 Eye infections

Eye, infections

07-Jun-2020

Overview

Most acute superficial eye infections can be treated topically with eye drops or ointment. Blepharitis is often caused by staphylococci. Bacterial conjunctivitis is commonly caused by Streptococcus pneumoniae, Staphylococcus aureus, or Haemophilus influenzae. Keratitis may be bacterial, viral, or fungal; it can also be caused by Acanthamoeba (parasite). Endophthalmitis is usually either bacterial or fungal; it can also be non-infective (retention of foreign material).

Evgr Anterior bacterial blepharitis is treated by application of an antibacterial eye ointment (such as chloramphenicol p. 1262) to the conjunctival sac or rubbed into the lid margins, if blepharitis is not controlled by eyelid hygiene alone. Systemic treatment (e.g. tetracyclines in patients over 12 years of age) may be required in patients with posterior blepharitis. Treatments can be intermittently

stopped and restarted, based on the severity of the blepharitis and drug tolerance.

Most cases of acute bacterial conjunctivitis are selflimiting and resolve within 5–7 days without treatment. [vor] In severe infection or where rapid resolution is required, treatment with antibacterial eye drops or ointments are used. Ongoing symptoms despite treatment may indicate viral conjunctivitis or the need for a different antibacterial; cultures or referral to a specialist may be required.

Corneal ulcer and keratitis require specialist treatment and may call for hospital admission for intensive therapy.

Endophthalmitis is a medical emergency which also calls for specialist management and may require treatment with antibacterial drugs and steroids. Surgical intervention, such as vitrectomy, is sometimes indicated. (A)

Trachoma which results from chronic infection with Chlamydia trachomatis can be treated with azithromycin p. 583 by mouth [unlicensed indication] as recommended by the World Health Organisation.

For information on the management of ocular herpes, see Herpesvirus infections p. 686.

Fungal infections of the cornea (e.g. fungal keratitis) are rare but can occur particularly in agricultural areas and tropical climates. Antifungal preparations for the eye are not generally available. For information about supply of preparations not commercially available, contact the local Clinical Commissioning Group (CCG), or equivalent in Scotland, Wales, or Northern Ireland, or the nearest hospital ophthalmology unit, or Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk.

ANTIBACTERIALS > OTHER

Chloramphenicol

04-Jan-2022

 DRUG ACTION Chloramphenicol is a potent broadspectrum antibiotic.

INDICATIONS AND DOSE

Superficial eve infections

- ► TO THE EYE USING EYE DROP
- Child: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the

11

severity of the infection. For less severe infection 3–4 times daily is generally sufficient

- Adult: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient
- ► TO THE EYE USING EYE OINTMENT
- Child: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3-4 times a day, if ointment used alone
- Adult: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CHLORAMPHENICOL EYE DROPS CONTAINING BORAX OR BORIC ACID BUFFERS: USE IN CHILDREN YOUNGER THAN 2 YEARS (1111) 2021)

Some licences for chloramphenicol eye drops containing borax or boric acid buffers were updated to restrict use in children younger than 2 years of age to reflect warnings on maximum daily limits for boron exposure. The MHRA has reviewed the available evidence and consulted independent expert advice and has concluded that the benefits of chloramphenicol eye drops containing borax or boric acid outweigh the potential risks, as the potential exposure from topical application to both eyes, in children aged 0 to 2 years old, was well below the safety limit. Healthcare professionals should advise parents and carers that these products can be safely used in children younger than 2 years as advised by a doctor or other prescriber.

- INTERACTIONS → Appendix 1: chloramphenicol
- SIDE-EFFECTS Angioedema · bone marrow disorders · eye stinging · fever · paraesthesia · skin reactions
- PREGNANCY Avoid unless essential—no information on topical use but risk of 'neonatal grey-baby syndrome' with oral use in third trimester.
- BREAST FEEDING Avoid unless essential—theoretical risk of bone-marrow toxicity.
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose chloramphenicol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- PATIENT AND CARER ADVICE

Medicines for Children leaflet: Chloramphenicol for eye infections www.medicinesforchildren.org.uk/medicines/chloramphenicol-for-eye-infections/

- EXCEPTIONS TO LEGAL CATEGORY Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Phenylmercuric acetate

Chloramphenicol (Non-proprietary)

Chloramphenicol 5 mg per 1 ml Minims chloramphenicol 0.5% eye drops 0.5ml unit dose | 20 unit dose $\boxed{\text{PoM}}$ £11.43 DT = £11.43 Chloramphenicol 0.5% eye drops | 10 ml $\boxed{\text{PoM}}$ £8.15 DT = £8.15

➤ Eykappo (Aspire Pharma Ltd)

Chloramphenicol 5 mg per 1 ml Eykappo 5mg/ml eye drops |
10 ml PoM £10.12 DT = £10.12

Eve ointment

Chloramphenicol (Non-proprietary)

Chloramphenicol 10 mg per 1 gram Chloramphenicol 1% eye ointment | 4 gram PoM £2.56 DT = £1.74

Fusidic acid

05-0ct-2021

 DRUG ACTION Fusidic acid and its salts are narrowspectrum antibiotics used for staphylococcal infections.

• INDICATIONS AND DOSE

Staphylococcal eye infections

- ► TO THE EYE
- Child: Apply twice daily
- Adult: Apply twice daily
- INTERACTIONS → Appendix 1: fusidate
- SIDE-EFFECTS
- ► Common or very common Dry eye eye discomfort vision blurred
- Uncommon Crying on application · skin reactions · watering eve
- ► Frequency not known Angioedema eye inflammation
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Modified-release drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Fusidic acid (Non-proprietary)

Fusidic acid 10 mg per 1 gram Fusidic acid 1% modified-release eye drops | 5 gram Pom £35.00 DT = £32.29

ANTIPROTOZOALS

Propamidine isetionate

INDICATIONS AND DOSE

Acanthamoeba keratitis infections (specialist use only) | Local treatment of eye infections

- ► TO THE EYE USING EYE OINTMENT
- ▶ Adult: Apply 1-2 times a day
- ▶ TO THE EYE USING EYE DROP▶ Adult: Apply up to 4 times a day
- UNLICENSED USE Not licensed for acanthamoeba keratitis
- SIDE-EFFECTS Eve discomfort · vision blurred
- PREGNANCY Manufacturer advises avoid unless essential—no information available.
- BREAST FEEDING Manufacturer advises avoid unless essential—no information available
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

infections

► Golden Eye (dibrompropamidine) (Cambridge Healthcare Supplies

Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride
- ► Golden Eye (propamidine) (Cambridge Healthcare Supplies Ltd)

 Propamidine isetionate 1 mg per 1 ml Golden Eye 0.1% drops |
 10 ml P £3.95 DT = £2.80

3.2 Viral eye infection

3.2a Ophthalmic herpes simplex

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Aciclovir (Acyclovir)

27-Apr-2022

• INDICATIONS AND DOSE

Herpes simplex infection (local treatment)

- ► TO THE EYE USING EYE OINTMENT
- Adult: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing
- INTERACTIONS → Appendix 1: aciclovir
- SIDE-EFFECTS
- ► Common or very common Eye inflammation eye pain
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

► Aciclovir (Non-proprietary)
Aciclovir 30 mg per 1 gram Aciclovir 3% eye ointment |
4.5 gram PoM £45.00 DT = £45.00

Ganciclovir

15-Dec-2020

INDICATIONS AND DOSE

Acute herpetic keratitis

- ► TO THE EYE
- Adult: Apply 5 times a day until healing complete, then apply 3 times a day for a further 7 days, treatment does not usually exceed 21 days
- INTERACTIONS → Appendix 1: ganciclovir
- SIDE-EFFECTS
- ► Common or very common Eye stinging punctate keratitis
- ALLERGY AND CROSS-SENSITIVITY Ever Contra-indicated in patients hypersensitive to valganciclovir.

Caution in patients hypersensitive to aciclovir, valaciclovir, or famciclovir.

- CONCEPTION AND CONTRACEPTION As teratogenicity and impaired fertility observed in animal studies with oral and intravenous ganciclovir, manufacturer advises women of childbearing potential should use effective contraception during treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment.
- PREGNANCY Manufacturer advises avoid unless no suitable alternative—limited information available.
- BREAST FEEDING Manufacturer advises avoid unless no suitable alternative—limited information available.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye gel

EXCIPIENTS: May contain Benzalkonium chloride

Virgan (Thea Pharmaceuticals Ltd)

Ganciclovir 1.5 mg per 1 gram Virgan 0.15% eye gel | 5 gram [PoM £19.99 DT = £19.99

4 Eye procedures

Mydriatics and cycloplegics

25-Apr-2020

Overview

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide below (action lasts for up to 6 hours), facilitate the examination of the fundus of the eye. Longer-acting options include cyclopentolate hydrochloride p. 1255 (complete recovery can take up to 24 hours) or atropine sulfate p. 1255 (action up to 7 days).

Phenylephrine hydrochloride p. 1265 is a sympathomimetic licensed for mydriasis in diagnostic or therapeutic procedures. Mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Evgr Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate or cyclopentolate hydrochloride can prevent posterior synechiae and relieve ciliary spasm when used for anterior uveitis.

Other drugs used for Eye procedures Apraclonidine, p. 1277 · Atropine sulfate, p. 1255 · Cyclopentolate hydrochloride, p. 1255

ANTIMUSCARINICS

F 1255

Tropicamide

• INDICATIONS AND DOSE

Funduscopy

- ► TO THE EYE
- Child: 0.5% eye drops to be applied 20 minutes before examination
- Adult: (consult product literature)
- INTERACTIONS → Appendix 1: tropicamide
- SIDE-EFFECTS Eye erythema eye irritation (on prolonged administration) • eye pain • headache • hypotension • nausea • syncope • vision blurred
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eve drops

EXCIPIENTS: May contain Benzalkonium chloride, edetic acid (edta)

- ► Mydriacyl (Alcon Eye Care UK Ltd)

MIOTICS > PARASYMPATHOMIMETICS

Acetylcholine chloride

22-Feb-2021

INDICATIONS AND DOSE

Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis

- ► TO THE EVE
- Adult: (consult product literature)
- SIDE-EFFECTS Bradycardia · corneal decompensation · corneal oedema · dyspnoea · flushing · hyperhidrosis · hypotension

- PREGNANCY Avoid unless potential benefit outweighs risk-no information available.
- BREAST FEEDING Avoid unless potential benefit outweighs risk-no information available.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Irrigation

- ▶ Miochol-E (Bausch & Lomb UK Ltd) Acetylcholine chloride 20 mg Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 1 vial Pom £7.28
- Miphtel (Farmigea S.p.A.)

Acetylcholine chloride 20 mg Miphtel 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoule Pom £43.68

SYMPATHOMIMETICS > VASOCONSTRICTOR

Phenylephrine hydrochloride

INDICATIONS AND DOSE

Mydriasis

- ► TO THE EYE
- Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging
- Adult: Apply 1 drop, to be administered before procedure, then apply 1 drop after 60 minutes if required, a drop of topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging
- CONTRA-INDICATIONS 10% strength eve drops in children 10% strength eye drops in elderly aneurysms. cardiovascular disease · hypertension · thyrotoxicosis
- CAUTIONS Asthma · cerebral arteriosclerosis (in adults) · corneal epithelial damage · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · diabetes (avoid eye drops in long standing diabetes) · mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber (in adults) · mydriasis can precipitate acute angleclosure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber · ocular hyperaemia · susceptibility to angleclosure glaucoma
- INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor
- SIDE-EFFECTS Arrhythmias · conjunctivitis allergic · eye discomfort · hypertension · myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease) · palpitations · periorbital pallor (in children) · vision disorders
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Use only if potential benefit outweighs risk—no information available.
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose phenylephrine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

PATIENT AND CARER ADVICE

Driving and skilled tasks Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Disodium edetate, sodium metabisulfite

Phenylephrine hydrochloride (Bausch & Lomb UK Ltd) Phenylephrine hydrochloride 25 mg per 1 ml Minims phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose [P] £11.87 DT = £11.87

Phenylephrine with tropicamide

12-Aug-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, phenylephrine hydrochloride p. 1265, tropicamide p. 1264.

• INDICATIONS AND DOSE

Pre-operative mydriasis | Diagnostic procedures when monotherapy insufficient

- ► TO THE EYE
- Adult: One insert to be applied into the lower conjunctival sac up to max. 2 hours before procedure; remove insert within 30 minutes of satisfactory mydriasis, and within 2 hours of application
- INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor • tropicamide
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises patients with severe dry eyes may require a drop of saline to improve insert tolerance.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Ophthalmic insert

Tropicamide with phenylephrine and lidocaine 17-AUS-2017

17-Au

• INDICATIONS AND DOSE

Mydriasis and intraocular anaesthesia during cataract surgery

- ► BY INTRACAMERAL INJECTION
- Adult: 0.2 mL for 1 dose, to be injected slowly at the start of the surgical procedure

DOSE EQUIVALENCE AND CONVERSION

- Each 0.2 mL dose of Mydrane® solution for injection contains 0.04 mg of tropicamide, 0.62 mg of phenylephrine hydrochloride and 2 mg of lidocaine hydrochloride.
- CONTRA-INDICATIONS Cataract surgery combined with vitrectomy · history of acute, narrow-angle glaucoma · shallow anterior chamber
- CAUTIONS Conditions where systemic exposure to phenylephrine or lidocaine could be harmful (consult product literature) - risk of floppy iris syndrome (consult product literature)
- INTERACTIONS → Appendix 1: antiarrhythmics · sympathomimetics, vasoconstrictor · tropicamide
- SIDE-EFFECTS
- ▶ Uncommon Headache hyperaemia hypertension keratitis

- ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with known hypersensitivity to amide-type anaesthetics or atropine derivatives.
- PREGNANCY Manufacturer advises avoid (systemic uptake after administration cannot be excluded)—insufficient data available for phenylephrine and tropicamide in pregnancy; lidocaine crosses the placenta but is not known to be harmful in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no data available for phenylephrine or tropicamide; lidocaine present in milk in small amount.
- PRE-TREATMENT SCREENING Manufacturer advises patients must have demonstrated, at a previous visit, a satisfactory pupil dilation with topical mydriatic treatment.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients should be counselled about the effects on driving and skilled tasks.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

5 Glaucoma and ocular hypertension

Glaucoma and ocular hypertension

18-Feb-2022

Description of condition

Glaucoma is a group of eye disorders characterised by a loss of visual field associated with pathological cupping of the optic disc and optic nerve damage. While glaucoma is generally linked to raised intra-ocular pressure (IOP), which is the main treatable risk factor, it can also occur when the IOP is within the normal range. Other risk factors include age, family history, ethnicity, corticosteroid use, myopia, type 2 diabetes mellitus, cardiovascular disease, and hypertension.

The most common form of glaucoma is chronic openangle glaucoma (also known as primary open-angle glaucoma) where drainage of the aqueous humour through the trabecular meshwork is restricted, and the angle between the iris and the cornea is normal. Initially, this condition tends to be asymptomatic, however, as glaucoma progresses, patients may present with irreversible sight loss or visual field defects. Patients with ocular hypertension (an IOP greater than 21 mmHg) are at high risk of developing chronic open-angle glaucoma. The diagnosis, monitoring, and management of patients with ocular hypertension, suspected chronic open-angle glaucoma, or chronic openangle glaucoma should be carried out by a specialist; patients with suspected optic nerve damage or repeatable visual field defect, or both, should be referred to a consultant ophthalmologist.

Acute angle-closure glaucoma is less common and occurs when the outflow of aqueous humour from the eye is totally obstructed by bowing of the iris against the trabecular meshwork. It is characterised by its abrupt onset of symptoms, and is a sight-threatening medical emergency that requires urgent reduction of IOP to prevent loss of vision.

Aims of treatment

Treatment aims to control intra-ocular pressure to prevent the development or progression of glaucoma, and subsequent visual field damage or sight loss.

Ocular hypertension

Ever Patients with ocular hypertension who are not at risk of visual impairment in their lifetime do not require treatment, but they should be monitored regularly.

Patients newly diagnosed with ocular hypertension with an intra-ocular pressure (IOP) of 24 mmHg or more and who are at risk of visual impairment within their lifetime (excluding cases associated with pigment dispersion syndrome), should be offered 360° selective laser trabeculoplasty (SLT) as first-line treatment. Patients suitable for 360° SLT should be referred to and discussed with a consultant ophthalmologist regarding the decision to offer it, and how it will be performed. A second 360° SLT procedure can be considered if the effect of an initial successful SLT has subsequently reduced over time. Patients in whom 360° SLT does not reduce intra-ocular pressure to a satisfactory level, should be referred to a consultant ophthalmologist to discuss other treatment options.

A topical prostaglandin analogue, such as latanoprost p. 1274, tafluprost p. 1274, travoprost p. 1275, or bimatoprost p. 1276 (a synthetic prostamide), is recommended as first-line pharmacological treatment in patients who require treatment but choose not to have 360° SLT or it is unsuitable, or if they are waiting for 360° SLT and need interim treatment, or have previously had 360° SLT but need additional treatment to reduce their IOP sufficiently to prevent the risk of visual impairment.

If initial treatment with a topical prostaglandin analogue is not tolerated, an alternative prostaglandin analogue should be tried before switching to a topical beta-blocker such as betaxolol below, levobunolol hydrochloride p. 1270, or timolol maleate p. 1270. If treatment is still not tolerated, alternative options include carbonic anhydrase inhibitors such as brinzolamide p. 1271 or dorzolamide p. 1272, a topical sympathomimetic such as apraclonidine p. 1277 [unlicensed use] or brimonidine tartrate p. 1277, or a topical miotic such as pilocarpine p. 1273 [unlicensed use], given either as monotherapy or as combination therapy.

Alternative options as either monotherapy or combination therapy with drugs from different therapeutic classes (topical beta-blockers, carbonic anhydrase inhibitors, or topical sympathomimetics), should also be offered to patients with an IOP of 24 mmHg or more whose current treatment is not reducing IOP sufficiently to prevent the risk of progression to sight loss. The patient's adherence and drop instillation technique should also be checked. If drug treatment still does not reduce their IOP to a satisfactory level, patients should be referred to a consultant ophthalmologist to discuss other treatment options.

Preservative free eye drops should be used in patients who are allergic to preservatives, or in those who have clinically significant ocular surface disease and are at high risk of conversion to chronic open-angle glaucoma.

Note: based on cost-effective analysis, NICE guideline 81 recommends generic prostaglandin analogues as first-line pharmacological treatment, and non-generic prostaglandin analogues as third-line pharmacological treatment if topical beta-blocker treatment is ineffective.

Suspected chronic open-angle glaucoma

Evgr Patients with suspected chronic open-angle glaucoma and an intra-ocular pressure (IOP) below 24 mmHg do not require drug treatment unless they are at risk of visual impairment within their lifetime, but they should be regularly monitored for changes in IOP and visual impairment. (A)

Chronic open-angle glaucoma

Ever Patients with newly diagnosed chronic open-angle glaucoma (excluding cases associated with pigment dispersion syndrome), should be offered 360° selective laser trabeculoplasty (SLT) as first-line treatment. Patients suitable for 360° SLT should be referred to and discussed with a consultant ophthalmologist regarding the decision to offer it, and how it will be performed. A second 360° SLT procedure can be considered if the effect of an initial successful SLT has subsequently reduced over time.

Topical prostaglandin analogues such as latanoprost p. 1274, tafluprost p. 1274, travoprost p. 1275, or bimatoprost p. 1276 (a synthetic prostamide), are recommended as first-line pharmacological treatment

options for patients who choose not to have 360° SLT or it is unsuitable, or if they are waiting for 360° SLT and need interim treatment, or have previously had 360° SLT but need additional treatment to reduce their intra-ocular pressure (IOP) sufficiently to prevent the risk of visual impairment.

If a topical prostaglandin analogue does not sufficiently reduce IOP and the patient's adherence to treatment and eye drop instillation technique are both satisfactory, treatment with either a topical beta-blocker such as betaxolol below, levobunolol hydrochloride p. 1270, or timolol maleate p. 1270, a carbonic anhydrase inhibitor such as brinzolamide p. 1271 or dorzolamide p. 1272, a topical sympathomimetic such as apraclonidine p. 1277 or brimonidine tartrate p. 1277, or a combination of these, should be offered. When a particular drug is not tolerated, another drug from a different therapeutic class can be tried. Preservative free eye drops should be used in patients who are allergic to preservatives, or those who have clinically significant ocular surface disease. Alternative treatment options are 360° SLT or glaucoma surgery with pharmacological augmentation (with mitomycin p. 994 [unlicensed use]).

Patients with advanced chronic open-angle glaucoma should be offered glaucoma surgery with pharmacological augmentation (with mitomycin p. 994 [unlicensed use]). Treatment with a topical prostaglandin analogue should be initiated and continued until surgery takes place.

If glaucoma surgery fails to adequately reduce the IOP in patients with chronic open-angle glaucoma, alternative options include pharmacological treatment (a combination of topical drugs from different therapeutic classes may be needed), further surgery, 360° SLT, or cyclodiode laser treatment.

Pharmacological treatment, 360° SLT, or cyclodiode laser treatment may also be offered to patients with chronic openangle glaucoma (including advanced chronic open-angle glaucoma) who prefer not to have glaucoma surgery, or for whom surgery is unsuitable.

BETA-ADRENOCEPTOR BLOCKERS

Betaxolol

03-Apr-2020

• INDICATIONS AND DOSE

Chronic open-angle glaucoma | Ocular hypertension

- ► TO THE EYE
- Adult: Apply twice daily
- CONTRA-INDICATIONS Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block
- CAUTIONS Patients with corneal disease
 CAUTIONS, FURTHER INFORMATION Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.
- INTERACTIONS → Appendix 1: beta blockers, selective
- SIDE-FFFFCTS
- ➤ Common or very common Eye discomfort eye disorders vision disorders
- ▶ Uncommon Dry eye eye inflammation rhinitis
- ► Rare or very rare Cataract · rhinorrhoea · skin reactions
- Frequency not known Angioedema · hypersensitivity
 SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose bextaxolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Betaxolol (Non-proprietary)

Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betaxolol 0.5% eye drops | 5 ml PoM S DT = £1.90

▶ Betoptic (Novartis Pharmaceuticals UK Ltd)

Betaxolol (as Betaxolol hydrochloride) 2.5 mg per 1 ml Betoptic 0.25% suspension eye drops | 5 ml [PoM] £2.66 DT = £2.66 Betoptic 0.25% eye drops suspension 0.25ml unit dose | 50 unit dose | FoM] £13.77 DT = £13.77

Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betoptic 0.5% eye drops | 5 ml \nearrow DM £1.90 DT = £1.90

Levobunolol hydrochloride

03-Apr-2020

INDICATIONS AND DOSE

Chronic open-angle glaucoma | Ocular hypertension

- ► TO THE EYE
- ▶ Adult: Apply 1-2 times a day
- CONTRA-INDICATIONS Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block
- CAUTIONS Patients with corneal disease
 CAUTIONS, FURTHER INFORMATION Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.
- INTERACTIONS → Appendix 1: beta blockers, non-selective
- SIDE-EFFECTS
- ► Common or very common Eye discomfort eye inflammation
- ► Frequency not known Dry eye eye disorders eyelid eczema • vision blurred
 - SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered heta blockers
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose (Levobunolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Disodium edetate

► Betagan (AbbVie Ltd)

Levobunolol hydrochloride 5 mg per 1 ml Betagan Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit dose | \$\overline{PoM}\$ \$\overline{\text{\$5.98}}\$ DT = \$\overline{\text{\$5.98}}\$

Timolol maleate

F 163

05-May-2021

• INDICATIONS AND DOSE

Chronic open-angle glaucoma | Ocular hypertension

- ► TO THE EYE
- Adult: Apply twice daily

TIMOPTOL-LA

Reduction of intra-ocular pressure in primary open-angle glaucoma

- ► TO THE EYE
- Adult: Apply once daily

TIOPEX ®

Reduction of intra-ocular pressure in primary open-angle glaucoma

- ► TO THE EYE
- Adult: Apply once daily, to be applied in the morning
- CONTRA-INDICATIONS Also consider contra-indications listed for systemically administered beta blockers bradycardia - heart block
- CAUTIONS Consider also cautions listed for systemically administered beta blockers, nationts with corneal disease
- administered beta blockers · patients with corneal disease
 INTERACTIONS → Appendix 1: beta blockers, non-selective
- SIDE-EFFECTS
- ► Common or very common Eye discomfort eye disorders eye inflammation vision disorders

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

- BREAST FEEDING Manufacturer advises avoidance.
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- NATIONAL FUNDING/ACCESS DECISIONS

TIOPEX ® For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Timolol eye gel (*Tiopex*®) for the reduction of the elevated intra-ocular pressure in patients with ocular hypertension or chronic open angle glaucoma.(February 2014) SMC No. 941/14 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye gel

EXCIPIENTS: May contain Benzododecinium bromide

► Timoptol-LA (Santen UK Ltd)

Timolol (as Timolol maleate) 1 mg per 1 gram Tiopex 1mg/g eye gel 0.4g unit dose | 30 unit dose | PoM £7.49 DT = £7.49

Combinations available: Bimatoprost with timolol, p. 1276 · Brimonidine with timolol, p. 1278 · Brinzolamide with timolol, p. 1278 · Brinzolamide with timolol, p. 1272 · Dorzolamide with timolol, p. 1273 · Latanoprost with timolol, p. 1274 · Tafluprost with timolol, p. 1275 · Travoprost with timolol, p. 1276

CARBONIC ANHYDRASE INHIBITORS

Acetazolamide

05-Feb-2021

• INDICATIONS AND DOSE

Reduction of intra-ocular pressure in open-angle glaucoma | Reduction of intra-ocular pressure in secondary glaucoma | Reduction of intra-ocular pressure perioperatively in angle-closure glaucoma

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION. OR BY INTRAMUSCULAR INJECTION
- ► Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: 250-500 mg daily

Epilepsy

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ANTIEPILEPTICS: RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR (AUGUST 2008)

See Epilepsy p. 330.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS: UPDATED ADVICE ON SWITCHING BETWEEN DIFFERENT MANUFACTURERS' PRODUCTS (NOVEMBER 2017)

See Epilepsy p. 330.

MHRA/CHM ADVICE: ANTIEPILEPTIC DRUGS IN PREGNANCY: UPDATED ADVICE FOLLOWING COMPREHENSIVE SAFETY REVIEW (JANUARY 2021)

See Epilepsy p. 330.

- CONTRA-INDICATIONS Adrenocortical insufficiency hyperchloraemic acidosis · hypokalaemia · hyponatraemia · long-term administration in chronic angle-closure
- CAUTIONS Avoid extravasation at injection site (risk of necrosis) · diabetes mellitus · elderly · impaired alveolar ventilation (risk of acidosis) · long-term use · pulmonary obstruction (risk of acidosis) · renal calculi
- INTERACTIONS → Appendix 1: acetazolamide
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Haemorrhage metabolic acidosis nephrolithiasis - sensation abnormal
- ▶ Uncommon Bone marrow disorders depression dizziness · electrolyte imbalance · hearing impairment · hepatic disorders · leucopenia · nausea · renal colic · renal impairment · renal lesions · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · urinary tract discomfort · urine abnormalities ·
- ▶ Rare or very rare Anaphylactic reaction appetite disorder · confusion · diarrhoea · fatigue · fever · flushing · headache · irritability · libido decreased · paralysis · photosensitivity reaction · seizure
- ► Frequency not known Agranulocytosis · drowsiness · myopia · polyuria · suicidal behaviours · taste altered · thirst

SPECIFIC SIDE-EFFECTS

- ► Uncommon
- With oral use Osteomalacia
- ► Rare or very rare
- ▶ With oral use Ataxia hyperglycaemia hypoglycaemia renal tubular necrosis
- ► Frequency not known
- ▶ With oral use Agitation

SIDE-EFFECTS, FURTHER INFORMATION, Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally patients should be told to report any unusual skin rash.

If electrolyte disturbances and metabolic acidosis occur. these can be corrected by administering bicarbonate.

- ALLERGY AND CROSS-SENSITIVITY EVGr Contra-indicated if history of sulfonamide hypersensitivity.
- PREGNANCY Manufacturer advises avoid, especially in first trimester (toxicity in animal studies). See also Pregnancy in Epilepsy p. 330.
- BREAST FEEDING Amount too small to be harmful.
- HEPATIC IMPAIRMENT Manufacturer advises avoid.
- RENAL IMPAIRMENT Avoid—risk of metabolic acidosis.
- MONITORING REQUIREMENTS Monitor blood count and plasma electrolyte concentrations with prolonged use.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Acetazolamide 250 mg Diamox SR 250mg capsules 30 capsule PoM £16.66 DT = £16.66

Brinzolamide

23-Jul-2021

• INDICATIONS AND DOSE

Reduction of intra-ocular pressure in ocular hypertension and open-angle glaucoma either as adjunct to betablockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if betablockers contra-indicated

- ► TO THE EYE
- Adult: Apply twice daily, then increased if necessary up to 3 times a day
- CONTRA-INDICATIONS Hyperchloraemic acidosis
- CAUTIONS Renal tubular immaturity or abnormality—risk of metabolic acidosis · systemic absorption follows topical application
- INTERACTIONS → Appendix 1: brinzolamide
- SIDE-EFFECTS
- ► Common or very common Eye discomfort eye disorders taste altered · vision disorders
- ► Uncommon Arrhythmias asthenia cardio-respiratory distress · chest discomfort · cough · depression · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · epistaxis · eye deposit · eye inflammation · feeling abnormal · foreign body in eye · gastrointestinal discomfort · gastrointestinal disorders · headache · increased risk of infection · memory loss · motor dysfunction · muscle complaints · nasal complaints · nausea · nervousness · oral disorders · oropharyngeal pain · pain · palpitations · renal pain · scleral discolouration · sensation abnormal · sexual dysfunction · skin reactions · sleep disorders · throat complaints ·
- ▶ Rare or very rare Alopecia · angina pectoris · drowsiness · irritability · optic nerve disorder · respiratory disorders · tinnitus

- ► Frequency not known Appetite decreased · arthralgia · asthma · hypertension · malaise · peripheral oedema · tremor · urinary frequency increased · vertigo

 SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.
- ALLERGY AND CROSS-SENSITIVITY [EVG] Contra-indicated if history of sulfonamide hypersensitivity.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Use only if benefit outweighs risk.
- HEPATIC IMPAIRMENT Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT [EVG] Avoid if creatinine clearance less than 30 mL/minute (no information available). See p. 21.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

MIOTICS > PARASYMPATHOMIMETICS

Pilocarpine

11-May-2021

 DRUG ACTION Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

• INDICATIONS AND DOSE

Primary angle-closure glaucoma | Some secondary glaucomas

- ► TO THE EYE
- Adult: Apply up to 4 times a day
- CONTRA-INDICATIONS Acute iritis anterior uveitis conditions where pupillary constriction is undesirable some forms of secondary glaucoma (where pupillary constriction is undesirable)
- CAUTIONS A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage · asthma · cardiac disease · care in conjunctival damage · care in corneal damage · epilepsy · gastro-intestinal spasm · hypertension · hyperthyroidism · hypotension · marked vasomotor instability · Parkinson's disease · peptic ulceration · retinal detachment has occurred in susceptible individuals and those with retinal disease · urinary-tract obstruction
- INTERACTIONS → Appendix 1: pilocarpine
- SIDE-EFFECTS
- ► Common or very common Diarrhoea · headache · hyperhidrosis · hypersalivation · nausea · skin reactions · vision disorders · vomiting
- ► Frequency not known Bradycardia · bronchospasm · conjunctival vascular congestion · eye disorder (long term use) · eye disorders · hypotension · lens changes (long term use) · pain · paraesthesia · pulmonary oedema · sensitisation · vitreous haemorrhage
- PREGNANCY Avoid unless the potential benefit outweighs risk—limited information available.
- BREAST FEEDING Avoid unless the potential benefit outweighs risk—no information available.
- PRE-TREATMENT SCREENING Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).
- MONITORING REQUIREMENTS Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
 Eve drops

EXCIPIENTS: May contain Benzalkonium chloride

► Pilocarpine (Non-proprietary)

Pilocarpine hydrochloride 10 mg per 1 ml Pilocarpine hydrochloride 19 eye drops | 10 ml [PoM] £24.50 DT = £24.24 Pilocarpine hydrochloride 20 mg per 1 ml Pilocarpine hydrochloride 2% eye drops | 10 ml [PoM] £24.91 DT = £24.91 Pilocarpine hydrochloride 40 mg per 1 ml Pilocarpine hydrochloride 40 mg per 1 ml Pilocarpine hydrochloride 4% eye drops | 10 ml [PoM] £31.24 DT = £30.89

▶ Pilocarpine nitrate (Bausch & Lomb UK Ltd)
Pilocarpine nitrate 20 mg per 1 ml Minims pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose | № £12.47 DT = £12.47

PROSTAGLANDINS AND ANALOGUES

Latanoprost

16-Nov-2020

INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension

- ► TO THE EYE
- Adult: Apply once daily, to be administered preferably in the evening

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015)

Following reformulation of *Xalatan*[®], to allow for long-term storage at room temperature, there has been an increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.

- CONTRA-INDICATIONS Active herpes simplex keratitis history of recurrent herpetic keratitis associated with prostaglandin analogues
- CAUTIONS Angle-closure glaucoma · aphakia · asthma · contact lens wearers · do not use within 5 minutes of thiomersal-containing preparations · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · peri-operative period of cataract surgery · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis
- SIDE-EFFECTS
- ▶ Common or very common Eye discolouration eye discomfort • eye disorders • eye inflammation • vision disorders
- ▶ Uncommon Dry eye rash
- ► Rare or very rare Asthma · chest pain · dyspnoea · unstable angina
- ▶ Frequency not known Arthralgia · dizziness · headache · myalgia · ophthalmic herpes simplex · palpitations
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING May be present in milk—manufacturer advises avoid.
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- PATIENT AND CARER ADVICE

Changes in eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

 MONOPOST [®] For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

 Latanoprost (Monopost®) for the reduction of elevated intraocular pressure in patients with open-angle glaucoma and ocular hypertension (July 2013) SMC No. 879/13 Recommended with restrictions

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► Latanoprost (Non-proprietary)

▶ Medizol (Medicom Healthcare Ltd)

Latanoprost 50 microgram per 1 ml Medizol 0.005% eye drops | 2.5 ml Pom £10.00 DT = £1.60

Monopost (Thea Pharmaceuticals Ltd)

Latanoprost 50 microgram per 1 ml Monopost 50micrograms/ml eye drops 0.2ml unit dose | 30 unit dose | FoM | \$8.49 DT = \$8.49 | 90 unit dose | FoM | \$25.47 DT = \$25.47

Xalatan (Viatris UK Healthcare Ltd)

Latanoprost 50 microgram per 1 ml Xalatan 50micrograms/ml eye drops | 2.5 ml PoM £12.48 DT = £1.60

Latanoprost with timolol

10-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, latanoprost above, timolol maleate p. 1270.

INDICATIONS AND DOSE

Raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate

- ► TO THE EYE
- Adult: Apply once daily
- INTERACTIONS → Appendix 1: beta blockers, non-selective
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ► Latanoprost with timolol (Fixapost®) for the reduction of intraocular pressure (IOP) in patients with open-angle glaucoma and ocular hypertension who are insufficiently responsive to topical beta-blockers or prostaglandin analogues (May 2019) SMC No. SMC2159 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ► Latanoprost with timolol (Non-proprietary)
- Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate)
 5 mg per 1 ml Latanoprost 50micrograms/ml / Timolol 5mg/ml eye
 drops | 2.5 ml Pom £14.32 DT = £2.74
- ► Fixapost (Thea Pharmaceuticals Ltd)

Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml Fixapost 50micrograms/ml / 5mg/ml eye drops 0.2ml unit dose | 30 unit dose Pom £13.49 DT = £13.49

Medox (Medicom Healthcare Ltd)

Xalacom (Viatris UK Healthcare Ltd)

Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml Xalacom eye drops | 2.5 ml PoM £14.32 DT = £2.74

Tafluprost

28-May-2021

• INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension

- ► TO THE EYE
- Adult: Apply once daily, to be administered preferably in the evening

• CAUTIONS Angle-closure glaucoma (no experience of use)
• aphakia - asthma · congenital glaucoma (no experience of
use) · contact lens wearers · inflammatory ocular
conditions (no experience of use) · narrow-angle glaucoma
(no experience of use) · neovascular glaucoma (no
experience of use) · pseudophakia with torn posterior lens
capsule or anterior chamber lenses · risk factors for cystoid
macular oedema · risk factors for iritis · risk factors for
uveitis

SIDE-EFFECTS

- ➤ Common or very common Dry eye · eye discolouration · eye discomfort · eye disorders · eye inflammation · headache · vision disorders
- ► Uncommon Hypertrichosis
- ► Frequency not known Asthma exacerbated dyspnoea
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).
- RENAL IMPAIRMENT EVGT Use with caution (no information available).
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose tafluprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

PATIENT AND CARER ADVICE

Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eve drops

EXCIPIENTS: May contain Disodium edetate

- ► Tafluprost (Non-proprietary)

 Tafluprost 15 microgram per 1 ml Taflotan 15micrograms/ml eye drops | 2.5 ml [PoM] [\subseteq]
- ► Saflutan (Santen UK Ltd)

Tafluprost 15 microgram per 1 ml Saflutan 15micrograms/ml eye drops 0.3ml unit dose | 30 unit dose | PoM £12.20 DT = £12.20 Saflutan 15micrograms/ml eye drops | 3 ml | PoM £11.39 DT = £11.39

Tafluprost with timolol

16-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, tafluprost p. 1274, timolol maleate p. 1270.

• INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma and ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate

- ► TO THE EYE
- Adult: Apply 1 drop once daily
- INTERACTIONS → Appendix 1: beta blockers, non-selective
- PATIENT AND CARER ADVICE

Driving and skilled tasks Blurred vision may affect performance of skilled tasks (e.g. driving or operating machinery).

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Tafluprost with timolol (Taptiqom®) for reduction of intraocular pressure in adult patients with open angle glaucoma or ocular hypertension who are insufficiently responsive to topical monotherapy with beta-blockers or prostaglandin analogues and require a combination therapy, and who would benefit from preservative-free eye drops (September 2015) SMC No. 1085/15 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eve drops

EXCIPIENTS: May contain Disodium edetate

► Taptigom (Santen UK Ltd)

Tafluprost 15 microgram per 1 ml, Timolol (as Timolol maleate)
5 mg per 1 ml Taptiqom 15micrograms/ml / 5mg/ml eye drops 0.3ml
unit dose | 30 unit dose | PoM £14.50 DT = £14.50

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Apraclonidine

11-May-2021

 DRUG ACTION Apraclonidine is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

• INDICATIONS AND DOSE

Control or prevention of postoperative elevation of intraocular pressure after anterior segment laser surgery

- ► TO THE EYE
- Adult: Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug

- ► TO THE EYE
- Adult: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour
- CONTRA-INDICATIONS History of severe or unstable and uncontrolled cardiovascular disease
- CAUTIONS Cerebrovascular disease · depression · heart failure · history of angina · hypertension · loss of effect may occur over time · Parkinson's syndrome · Raynaud's syndrome · recent myocardial infarction · reduction in vision in end-stage glaucoma (suspend treatment) · severe coronary insufficiency · thromboangiitis obliterans · vasovagal attack
- INTERACTIONS → Appendix 1: apraclonidine
- SIDE-EFFECTS
- ► Common or very common Eye disorders
- Uncommon Bradycardia · conjunctival haemorrhage · diarrhoea · dry eye · eye discomfort · eye inflammation · gastrointestinal discomfort · irritability · libido decreased · nasal dryness · palpitations · postural hypotension · sensation abnormal · sleep disorders · syncope · vision disorders · vomiting

► Rare or very rare Chest pain · dry mouth · fatigue · headache · hyperhidrosis · pain in extremity · pruritus · taste altered · temperature sensation altered SIDE-EFFECTS, FURTHER INFORMATION Since absorption may follow topical application, systemic effects may occur—see clonidine hydrochloride p. 161.

Ocular intolerance Manufacturer advises withdrawal if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.

- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises use with caution and monitor, including close monitoring of cardiovascular parameters—no information available.
- RENAL IMPAIRMENT EVGT Use with caution in chronic renal failure.
- MONITORING REQUIREMENTS
- ▶ Monitor intra-ocular pressure and visual fields.
- Monitor for excessive reduction in intra-ocular pressure following peri-operative use.
- PATIENT AND CARER ADVICE
 Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

Iopidine (Novartis Pharmaceuticals UK Ltd) Apraclonidine (as Apraclonidine hydrochloride) 5 mg per 1 ml lopidine 5mg/ml eye drops | 5 ml [₱₱m] £10.88 DT = £10.88 Apraclonidine (as Apraclonidine hydrochloride) 10 mg per 1 ml lopidine 1% eye drops 0.25ml unit dose | 24 unit dose [₱₱m] £77.85 DT = £77.85

Brimonidine tartrate

11-May-2021

 DRUG ACTION Brimonidine, an alpha₂-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

• INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma in patients for whom beta-blockers are inappropriate | Ocular hypertension in patients for whom beta-blockers are inappropriate | Adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy

- ► TO THE EYE
- Adult: Apply twice daily
- CAUTIONS Cerebral insufficiency · coronary insufficiency · depression · postural hypotension · Raynaud's syndrome · severe cardiovascular disease · thromboangiitis obliterans
- INTERACTIONS → Appendix 1: brimonidine
- SIDE-EFFECTS
- ► Common or very common Asthenia · dizziness · drowsiness · dry eye · dry mouth · eye discomfort · eye disorders · eye inflammation · gastrointestinal disorder · headache · hyperaemia · hypersensitivity · pulmonary reaction · sensation of foreign body · skin reactions · taste altered · vision disorders
- ▶ Uncommon Arrhythmias nasal dryness palpitations
- ▶ Rare or very rare Dyspnoea hypertension hypotension insomnia syncope
- ► Frequency not known Face oedema · vasodilation
- PREGNANCY Manufacturer advises use only if benefit outweighs risk—limited information available.

- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).
- RENAL IMPAIRMENT Manufacturer advises use with caution.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness or blurred vision may affect performance of skilled tasks (e.g. driving).

6 Retinal disorders6.1 Macular degeneration

Age-related macular degeneration

25-Apr-2018

Description of condition

Age-related macular degeneration is a progressive eye condition that affects the central area of the retina (macula). It occurs mainly in people aged 55 years and over and is a common cause of vision loss. The progressive loss of central vision affects the patient's ability to see well enough to

recognise faces, drive, and to read and write. Although the exact cause is unknown, known risk factors in addition to increasing age include smoking and a family history of agerelated macular degeneration.

There are two types of age-related macular degeneration—dry and wet. Dry (non-neovascular) age-related macular degeneration progresses slowly as extensive wasting of macula cells occurs. Whereas, with wet (neovascular) age-related macular degeneration, new blood vessels develop beneath and within the retina, and can lead to a rapid deterioration of vision. Wet age-related macular degeneration is further classified as wet-active (neovascular lesions that may benefit from treatment) and wet-inactive (neovascular disease with irreversible structural change).

Aims of treatment

The aim of treatment is to slow down the progression of agerelated macular degeneration and central vision loss; treatment is initiated under specialist care.

Treatment

Treatment is dependent on the stage and type of age-related macular degeneration, with drug treatment only recommended in patients with wet-active age-related macular degeneration. Counselling and support, advice on Smoking cessation p. 531, and use of visual aids is recommended in all patients with age related macular degeneration as appropriate.

[EvG] An intravitreal anti-vascular endothelial growth factor (anti-VEGF), such as aflibercept p. 1279, ranibizumab p. 1280, or bevacizumab p. 933 [unlicensed use], is first-line treatment for patients with wet-active age-related macular degeneration who have a visual acuity between 6/12 and 6/96. If visual acuity is less than 6/96, anti-VEGF treatment should only be given if the patient's overall visual function is likely to improve (e.g. if the affected eye is the patient's better-seeing eye). Anti-VEGF treatment should only be administered by healthcare professionals experienced in the use of intravitreal injections. See also National funding/access decisions for aflibercept p. 1279 and ranibizumab p. 1280.

Treatment should be stopped if the patient develops severe, progressive loss of visual acuity despite treatment, or if the patient's age-related macular degeneration develops into wet-inactive with no prospect of visual function improvement. A treatment-free period can be considered in patients whose age-related macular degeneration appears to be stable.

Photodynamic therapy alone should not be given to patients with wet-active age-related macular degeneration. It can be given as an adjunct to anti-VEGF treatment as a second-line option in the context of a randomised controlled trial. Intravitreal corticosteroids are not recommended in combination with anti-VEGF treatment because there is limited evidence of benefit to a patient's visual acuity.

Patients should be advised to attend routine sight tests, self-monitor, and to report any changes in vision such as appearance of grey patches or blurred vision, straight lines appearing distorted, and objects appearing smaller than normal.

Age-related macular degeneration. National Institute for Health and Care Excellence. NICE guideline 82. January 2018.

www.nice.org.uk/guidance/ng82

ANTINEOVASCULARISATION DRUGS >

VASCIII AR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Aflibercept

28-Jun-2021

• DRUG ACTION Aflibercept is a recombinant fusion protein that acts as a soluble decov receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PIGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels.

INDICATIONS AND DOSE

Neovascular (wet) age-related macular degeneration (specialist use only)

- ► BY INTRAVITREAL INJECTION
- Adult: Initially 2 mg once a month for 3 months, then 2 mg every 2 months, review treatment frequency after 12 months

Macular oedema secondary to retinal vein occlusion (specialist use only)

- ► BY INTRAVITREAL INJECTION
- Adult: Initially 2 mg once a month until maximum visual acuity is achieved or there are no signs of disease activity (discontinue treatment if no improvement in visual and anatomic outcomes)

Diabetic macular oedema (specialist use only)

- ► BY INTRAVITREAL INJECTION
- Adult: Initially 2 mg once a month for 5 months, then maintenance 2 mg every 2 months, review treatment frequency after 12 months (discontinue treatment if no improvement in visual and anatomic outcomes)

Myopic choroidal neovascularisation (specialist use only)

- ► BY INTRAVITREAL INJECTION
- Adult: 2 mg for 1 dose, if visual or anatomic outcomes indicate that disease persists, additional doses may be administered; the interval between 2 doses should be greater than 1 month

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: EYLEA® 40 MG/ML (AFLIBERCEPT SOLUTION FOR INTRAVITREAL INJECTION): HIGHER RISK OF INTRAOCULAR PRESSURE INCREASE WITH THE PRE-FILLED SYRINGE (APRIL

Cases of increased intra-ocular pressure have been reported more frequently when using the Eylea® prefilled syringe compared with a luer-lock syringe used with Eylea® solution for injection in a vial. Incorrect handling in the preparation and injection is suspected as the cause of the observed cases of increased intra-ocular pressure with the $Eylea^{\otimes}$ prefilled syringe. Injections should be performed by healthcare professionals familiar with the handling of this presentation; the manufacturer has provided educational materials which include a Prescriber Guide and a training video on how to prepare and administer the intravitreal injection. The patient's vision and intra-ocular pressure should be evaluated and monitored immediately after the intravitreal injection.

- CONTRA-INDICATIONS Clinical signs of irreversible ischaemic visual function loss · ocular or periocular infection · severe intra-ocular inflammation
- CAUTIONS Active systemic infection diabetic patients with uncontrolled hypertension · discontinue treatment if stage 3 or 4 macular holes develop—consult product literature for full details · discontinue treatment in the event of a retinal break—consult product literature for full details · discontinue treatment in the event of rhegmatogenous retinal detachment-consult product

literature for full details · patients at risk of retinal pigment epithelial tear · poorly controlled glaucoma · recent history of myocardial infarction • recent history of stroke • recent history of transient ischaemic attack

CAUTIONS, FURTHER INFORMATION Aflibercept is given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections patients should be advised to report any signs of infection immediately.

- INTERACTIONS → Appendix 1: aflibercept
- ► Common or very common Cataract eye discomfort eye disorders · eye inflammation · haemorrhage · retinal pigment epithelial tear · vision disorders
- ► Uncommon Lens opacity
- CONCEPTION AND CONTRACEPTION Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- MONITORING REQUIREMENTS Monitor intra-ocular pressure following injection.
- DIRECTIONS FOR ADMINISTRATION For further information on administration, consult product literature.

NICE decisions

- ► Aflibercept solution for injection for treating wet age-related macular degeneration (July 2013) NICE TA294 Recommended with restrictions
- ► Aflibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014) NICE TA305 Recommended
- ► Aflibercept for treating diabetic macular oedema (July 2015) NICE TA346 Recommended with restrictions
- ► Aflibercept for treating visual impairment caused by macular oedema after branch retinal vein occlusion (September 2016) NICE TA409 Recommended with restrictions
- ► Aflibercept for treating choroidal neovascularisation (November 2017) NICE TA486 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Aflibercept (Evlea®) for adults for the treatment of visual impairment due to myopic choroidal neovascularisation (myopic CNV) (October 2016) SMC No. 1186/16 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Evlea (Baver Plc)

Aflibercept 40 mg per 1 ml Eylea 3.6mg/90microlitres solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £816.00 (Hospital only)

Eylea 4mg/100microlitres solution for injection vials | 1 vial Pom £816.00 (Hospital only)

Brolucizumab

15-Feb-2022

 DRUG ACTION Brolucizumab is a monoclonal antibody that inhibits vascular endothelial growth factor A (VEGF-A), thereby suppressing endothelial cell proliferation and inhibiting the growth of new vessels and decreasing vascular permeability.

• INDICATIONS AND DOSE

Neovascular (wet) age-related macular degeneration (specialist use only)

- ► BY INTRAVITREAL INJECTION
- Adult: Initially 6 mg once a month for the first three doses, to be administered into the affected eye, for continued treatment and subsequent dose intervals consult product literature, discontinue treatment if no improvement in visual and anatomic outcomes

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BROLUCIZUMAB (BEOVU®): RISK OF INTRAOCULAR INFLAMMATION AND RETINAL VASCULAR OCCLUSION INCREASED WITH SHORT DOSING INTERVALS (IANIIARY 2022)

Cases of intra-ocular inflammation, including retinal vasculitis and/or retinal vascular occlusion have been reported during treatment with brolucizumab, occurring more frequently early on during treatment. Intra-ocular inflammation events were seen more frequently among patients who developed antibodies against brolucizumab during treatment; female sex and Japanese origin were also identified as additional risk factors. Healthcare professionals are reminded that maintenance doses of brolucizumab (after the first 3 doses) should not be administered at intervals of less than 8 weeks.

Brolucizumab should be discontinued if these events occur and patients with a medical history of intra-ocular inflammation and/or retinal vascular occlusion in the year prior to treatment should be closely monitored. Healthcare professionals should advise patients on how to identify early signs and symptoms of intra-ocular inflammation, retinal vasculitis and retinal vascular occlusion and to seek medical attention without delay, if these side-effects are suspected.

- CONTRA-INDICATIONS Active intra-ocular inflammation see also Important safety information · active or suspected ocular or periocular infection
- CAUTIONS History of myocardial infarction within the past 3 months · history of stroke within the past 3 months · history of transient ischaemic attack within the past 3 months · patients at risk of retinal pigment epithelial tear · poorly controlled glaucoma (do not use while intra-ocular pressure is 30 mmHg or higher) · retinal detachment or macular hole (discontinue treatment if rhegmatogenous retinal detachment or stage 3 or 4 macular holes develop) CAUTIONS, FURTHER INFORMATION Brolucizumab is given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections patients should be advised to report any signs of infection immediately.
- SIDE-EFFECTS
- ► Common or very common Cataract · eye discomfort · eye disorders · haemorrhage · hypersensitivity · retinal pigment epithelial tear · skin reactions · vision disorders
- ► Uncommon Retinal occlusion (discontinue) retinal vasculitis (discontinue)
- ► Frequency not known Arterial thromboembolism myocardial infarction stroke

SIDE-EFFECTS, FURTHER INFORMATION Eye inflammation, including retinal vasculitis and/or retinal occlusion, may occur at any time of treatment. These events were observed more frequently at the beginning of the treatment. Discontinue treatment if patients develop these side-effects.

- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential to use effective contraception during treatment and for 1 month after treatment.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—limited information available.
- BREAST FEEDING Manufacturer advises avoid during and for 1 month after treatment—no information available.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor intra-ocular pressure, perfusion of the optic nerve head, and for signs of ocular infection following injection.
- ► Manufacturer advises monitor visual acuity.
- DIRECTIONS FOR ADMINISTRATION For further information on administration, consult product literature.
- PRESCRIBING AND DISPENSING INFORMATION

Brolucizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8°C)—may be stored unopened at room temperature (below 25°C) for up to 24 hours before use; protect from light.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

► Brolucizumab for treating wet age-related macular degeneration (February 2021) NICE TA672 Recommended with restrictions

- ► Brolucizumab (*Beovu*®) for the treatment of neovascular (wet) age-related macular degeneration (wAMD) (September 2020) SMC No. SMC2272 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- EXCIPIENTS: May contain Polysorbates, sucrose

 Beovu (Novartis Pharmaceuticals UK Ltd)
- Brolucizumab 120 mg per 1 ml Beovu 19.8mg/0.165ml solution for injection pre-filled syringes | 1 pre-filled disposable injection PoM £816.00 (Hospital only)

Ranibizumab

20-Oct-2020

• INDICATIONS AND DOSE

Neovascular (wet) age-related macular degeneration (specialist use only) | Diabetic macular oedema (specialist use only) | Macular oedema secondary to retinal vein occlusion (specialist use only) | Choroidal neovascularis

- ► BY INTRAVITREAL INJECTION
- Adult: Initially 500 micrograms once a month, to be administered into the affected eye, until maximum visual acuity is achieved or there are no signs of disease activity, for continued treatment and subsequent dose intervals—consult product literature, discontinue treatment if no improvement in visual and anatomic outcomes

Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photocoagulation (specialist use only)

- ► BY INTRAVITREAL INJECTION
- Adult: 500 micrograms, to be administered at least 30 minutes after laser photocoagulation
- CONTRA-INDICATIONS Ocular or periocular infection severe intra-ocular inflammation - signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion (no information available)
- CAUTIONS Active systemic infection diabetic macular oedema due to type 1 diabetes (limited information available) diabetic patients with HbA1c over 12% history of stroke history of transient ischaemic attack patients at risk of retinal pigment epithelial tear previous intravitreal injections retinal detachment or macular hole (discontinue treatment if rhegmatogenous retinal detachment or stage 3 or 4 macular holes develop) uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION Ranibizumab is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

PHOTOSENSITISERS

Verteporfin

02-Sep-202

 DRUG ACTION Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives.

• INDICATIONS AND DOSE

Photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (specialist use only)

- **▶** BY INTRAVENOUS INFUSION
- ▶ Adult: 6 mg/m², dose to be given over 10 minutes
- CONTRA-INDICATIONS Acute porphyrias p. 1150
- CAUTIONS Avoid extravasation biliary obstruction photosensitivity
- INTERACTIONS → Appendix 1: verteporfin
- SIDE-EFFECTS
- ► Common or very common Asthenia · dizziness · dyspnoea · headache · hypercholesterolaemia · hypersensitivity · infusion related chest pain · infusion related reaction · nausea · photosensitivity reaction · syncope · vision disorders
- ► Uncommon Eye inflammation fever haemorrhage hyperaesthesia hypertension pain retinal detachment skin reactions
- ▶ Rare or very rare Malaise · retinal ischaemia
- ► Frequency not known Myocardial infarction retinal pigment epithelial tear
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk (teratogenic in animal studies).
- BREAST FEEDING No information available—manufacturer advises avoid breast-feeding for 48 hours after administration.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment and avoid in severe impairment (no information available).
- DIRECTIONS FOR ADMINISTRATION For information on administration and light activation, consult product literature.

For intravenous infusion (Visudyne®), manufacturer advises give intermittently in Glucose 5%; reconstitute each 15 mg with 7 mL water for injections to produce a 2 mg/mL solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours

of reconstitution. Incompatible with sodium chloride infusion

- PATIENT AND CARER ADVICE Photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

Ear

Ear 23-Mar-2022

Otitis externa

Otitis externa refers to inflammation of the external ear canal which in some cases may involve oedema. It is primarily caused by bacterial infection. [EvGr] It is important to consider underlying otitis media as otitis externa may be secondary to otorrhoea from otitis media.

Any precipitating factors should be managed and cleaning the external ear canal should be considered (using dry swabbing, microsuction, or irrigation techniques) if ear wax or debris are blocking passage of topical medicine (may require specialist referral).

A solution of **acetic acid** 2% acts as an astringent in the external ear canal by reducing the pH and reducing bacterial and fungal cell growth. It may be used to treat mild otitis externa and is comparable to an anti-infective combined with a corticosteroid; efficacy is reduced if treatment extends beyond 1 week.

If infection is present, a topical anti-infective with or without a corticosteroid may be considered. These are used for a minimum of one week but if symptoms persist they can be used until they resolve, up to a maximum of 2 weeks. Prolonged and extensive use of topical anti-infective or corticosteroid treatment may affect the flora in the ear canal, increasing the risk of fungal infections. If a mild to moderate, uncomplicated fungal infection is suspected in the context of chronic otitis externa, a topical antifungal such as clotrimazole 1% solution p. 1287, acetic acid 2% spray [unlicensed indication], or clioquinol and a corticosteroid such as flumetasone pivalate with clioquinol p. 1287 can be offered. Sensitivity to topical ear preparations may also occur, especially with prolonged or recurrent use. Astringent agents such as aluminium acetate ear drops p. 1291 are also available.

In view of reports of ototoxicity, treatment with topical aminoglycosides is contra-indicated in patients with a perforated tympanic membrane (eardrum). Evor However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic suppurative otitis media and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics:
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

Ever For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 477 or ibuprofen p. 1232, is usually sufficient; codeine phosphate p. 487 may be used for severe pain. Oral antibacterials are rarely indicated but if they are required, consider seeking specialist advice. A systemic antibacterial may be considered if the infection is spreading outside the ear canal, the patient is systemically unwell, or in a high risk group (e.g. diabetics, immunocompromised patients, patients with severe infection or at high-risk of severe infection such as pseudomonal infections). Referral should be considered if there is extensive swelling of the auditory canal. For further information, see Otitis externa in Ear infections, antibacterial therapy p. 547.

Otitis media

Acute otitis media

Acute otitis media is a self-limiting condition that mainly affects children. It is characterised by inflammation in the middle ear associated with effusion and accompanied by the rapid onset of signs and symptoms of an ear infection. The infection can be caused by viruses or bacteria; often both are present simultaneously.

Children with acute otitis media usually present with symptoms such as ear pain, rubbing of the ear, fever, irritability, crying, poor feeding, restlessness at night, cough, or rhinorrhoea. Symptoms usually resolve within 3 to 7 days without antibacterial drugs and they make little difference to the development of complications such as short-term hearing loss, perforated eardrum or recurrent infection. Acute complications such as mastoiditis, meningitis, intracranial abscess, sinus thrombosis, and facial nerve paralysis. are rare.

Ever Children and their carers should be given advice about the usual duration of acute otitis media, self-care of symptoms such as pain and fever with paracetamol or ibuprofen p. 1232, and when to seek medical help. In addition to oral analgesics for pain relief, consider offering

an ear drop containing an anaesthetic and an analgesic such as phenazone with lidocaine p. 1291, if immediate antibacterial treatment is not given and there is no eardrum perforation or otorrhoea. Children and their carers should be reassured that antibacterial drugs are usually not required.

An immediate antibacterial drug should be given if the child is systemically very unwell, has signs or symptoms of a more serious illness, or is at high risk of complications such as significant heart, lung, renal, liver or neuromuscular disease, immunosuppression, cystic fibrosis, or young children who were born prematurely. An immediate antibacterial drug can also be considered if otorrhoea (discharge following perforation of the eardrum) is present, or in children under 2 years of age with bilateral otitis media. A For further information, see Otitis media in Ear infections, antibacterial therapy p. 547.

[EvGr] Children with acute otitis media associated with a severe systemic infection or acute complications should be referred to hospital.

Otitis media with effusion

Otitis media with effusion (glue ear) is characterised by the collection of fluid within the middle ear without any signs of inflammation. It occurs most frequently in children, often in those aged 2 to 5 years; it is the most common cause of hearing impairment in children. It is more common in children with cleft palate, Down's syndrome, primary ciliary dyskinesia, and allergic rhinitis. Evgr Children with otitis media with effusion should be observed (for 6-12 weeks) as it commonly resolves spontaneously. Systemic antibacterials, antihistamines, mucolytics, decongestants, and corticosteroids are not recommended due to lack of evidence supporting their use. Referral to a specialist in certain circumstances (including in children with Down's syndrome and cleft palate) are warranted to avoid complications such as severe hearing impairment, and communication and developmental difficulties.

Chronic suppurative otitis media

Chronic suppurative otitis media is a chronic inflammation of the middle ear and mastoid cavity, and is thought to be a complication of acute otitis media. The usual presentation is otorrhoea through a tympanic perforation and can involve infection due to a number of different bacteria or fungi. EvGr Referral to an ear, nose and throat specialist is required and treatment is likely to involve antibacterials, corticosteroids (usually topical), and intensive aural cleaning. (A)

Removal of ear wax

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the lining of the ear canal and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax can be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops p. 1291 are also effective, but may cause dryness of the ear canal. The drops can be used three to four times daily for several days. Lying down with the affected ear uppermost, ear drops are instilled before waiting for 5 minutes.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in some cases including in young children (under 12 years of age), in patients unable to co-operate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage may lead to permanent deafness.

Otitis externa

Other drugs used for Otitis externa Hydrocortisone with miconazole, p. 1344

ANTIBACTERIALS > AMINOGLYCOSIDES

Framvcetin sulfate

INDICATIONS AND DOSE

Bacterial infection in otitis externa

- ► TO THE EAR
- Adult: (consult product literature)
- CONTRA-INDICATIONS Perforated tympanic membrane
- CAUTIONS Avoid prolonged use
- MEDICINAL FORMS No licensed medicines listed.

Combinations available: Dexamethasone with framycetin sulfate and gramicidin, p. 1289

Gentamicin

F 559

25-Oct-2021

INDICATIONS AND DOSE

Bacterial infection in otitis externa

- ► TO THE EAR
- Child: Apply 2-3 drops 4-5 times a day, (including a dose at bedtime)
- Adult: Apply 2-3 drops 4-5 times a day, (including a dose at bedtime)
- UNLICENSED USE Gentamicin doses in BNF Publications may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: AMINOGLYCOSIDES (GENTAMICIN, AMIKACIN, TOBRAMYCIN. AND NEOMYCIN): INCREASED RISK OF DEAFNESS IN PATIENTS WITH MITOCHONDRIAL MUTATIONS (JANUARY 2021) The use of aminoglycosides is associated with rare cases of ototoxicity. A safety review found an increased risk of deafness in patients with mitochondrial mutations (particularly the m.1555A>G mutation), including cases where the patient's aminoglycoside serum levels were within the recommended range. Nevertheless, these mitochondrial mutations are considered rare and penetrance is uncertain. No cases were identified with topical preparations but, based on a shared mechanism of effect, there is a potential risk with gentamicin and other aminoglycosides administered at the site of toxicity i.e. the ear.

Healthcare professionals are advised to consider the need for aminoglycoside treatment versus alternative options in patients with susceptible mutations. The need for genetic testing especially in those requiring recurrent or long-term treatment with aminoglycosides should also be considered, however, urgent treatment should not be delayed. To minimise the risks of adverse effects. continuous monitoring of renal and auditory function, as well as hepatic and laboratory parameters, is recommended for all patients. Those with known mitochondrial mutations or a family history of ototoxicity are advised to inform their doctor or pharmacist before using an aminoglycoside.

- CONTRA-INDICATIONS Patent grommet (although may be used by specialists, see Ear p. 1284) · perforated tympanic membrane (although may be used by specialists, see Ear p. 1284)
- CAUTIONS Avoid prolonged use

- INTERACTIONS → Appendix 1: aminoglycosides
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Gentamicin with hydrocortisone

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

- ▶ Child: Apply 2-4 drops 4-5 times a day, (including a dose at bedtime)
- ▶ Adult: Apply 2-4 drops 4-5 times a day, (including a dose at bedtime)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC **ADMINISTRATION (AUGUST 2017)**

See Corticosteroids, general use p. 737.

NHS IMPROVEMENT PATIENT SAFETY ALERT: STEROID **EMERGENCY CARD TO SUPPORT EARLY RECOGNITION AND** TREATMENT OF ADRENAL CRISIS IN ADULTS (AUGUST 2020) See Adrenal insufficiency p. 738.

PAEDIATRIC STEROID TREATMENT CARD FOR CHILDREN WITH ADRENAL INSUFFICIENCY (NOVEMBER 2020)

The British Society for Paediatric Endocrinology and Diabetes (BSPED) has developed a Paediatric Steroid Treatment Card which should be issued to children with adrenal insufficiency and steroid dependence. The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients. The BSPED Paediatric Steroid Treatment Card is available at: www.endocrinology.org/adrenal-crisis.

MHRA/CHM ADVICE: AMINOGLYCOSIDES (GENTAMICIN, AMIKACIN, TOBRAMYCIN, AND NEOMYCIN): INCREASED RISK OF DEAFNESS IN PATIENTS WITH MITOCHONDRIAL MUTATIONS (JANUARY 2021)

The use of aminoglycosides is associated with rare cases of ototoxicity. A safety review found an increased risk of deafness in patients with mitochondrial mutations (particularly the m.1555A>G mutation), including cases where the patient's aminoglycoside serum levels were within the recommended range. Nevertheless, these mitochondrial mutations are considered rare and penetrance is uncertain. No cases were identified with topical preparations but, based on a shared mechanism of effect, there is a potential risk with gentamicin and other aminoglycosides administered at the site of toxicity i.e. the ear.

Healthcare professionals are advised to consider the need for aminoglycoside treatment versus alternative options in patients with susceptible mutations. The need for genetic testing especially in those requiring recurrent or long-term treatment with aminoglycosides should also be considered, however, urgent treatment should not be delayed. To minimise the risks of adverse effects, continuous monitoring of renal and auditory function, as well as hepatic and laboratory parameters, is recommended for all patients. Those with known mitochondrial mutations or a family history of ototoxicity are advised to inform their doctor or pharmacist before using an aminoglycoside.

- CONTRA-INDICATIONS Patent grommet (although may be used by specialists, see Ear p. 1284) • perforated tympanic membrane (although may be used by specialists, see Ear
- CAUTIONS Avoid prolonged use
- SIDE-EFFECTS Local reaction
- PATIENT AND CARER ADVICE
- In adults If systemic absorption occurs following topical and local use, side-effects applicable to systemic corticosteroids may apply; a patient information leaflet should be supplied and the need for a Steroid Treatment Card and a Steroid Emergency Card considered, see Corticosteroids, general use p. 737.
- In children If systemic absorption occurs following topical and local use, side-effects applicable to systemic corticosteroids may apply; a patient information leaflet should be supplied and the need for a Steroid Treatment Card considered, see Corticosteroids, general use p. 737. Nose

Nose

0/4-Nov-2021

Rhinitis

Rhinitis may be acute or chronic, allergic or non-allergic. Nasal spray and drop preparations often carry indications for the management of allergic rhinitis and perennial rhinitis. Many nasal preparations contain sympathomimetic drugs which may irritate the nasal mucosa.

Patients with nasal congestion and obstructive sleep apnoea/hypopnoea syndrome or obesity hypoventilation syndrome may have underlying allergic or vasomotor rhinitis. For guidance on the management of rhinitis in these patients, see NICE guideline: Obstructive sleep apnoea/hypopnoea syndrome and obesity hypoventilation syndrome in over 16s (available at: www.nice.org.uk/guidance/ng202).

Drugs used in nasal allergy

[EvGr] Sodium chloride 0.9% solution p. 1131 may be used as nasal irrigation in allergic rhinitis for modest symptom reduction, and to reduce the need for other drug treatment.

Mild allergic rhinitis is controlled by antihistamines (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 299) or topical nasal corticosteroids. Topical antihistamines (e.g. azelastine hydrochloride p. 1296) are faster acting than oral antihistamines and therefore useful for controlling breakthrough symptoms in allergic rhinitis: they are less effective than topical nasal corticosteroids. Topical nasal decongestants can be used for a short period to provide quick relief from congestion and allow penetration of a topical nasal corticosteroid. Systemic nasal decongestants are weakly effective in reducing nasal obstruction but have considerable potential for side-effects. and therefore are not recommended. Sodium cromoglicate is a weakly effective alternative in patients with mild symptoms, sporadic seasonal problems, or limited allergen exposure.

Moderate to severe allergic rhinitis can be relieved by topical nasal corticosteroids during periods of allergen exposure. Severe allergic rhinitis causing very disabling symptoms despite conventional treatment may justify the use of **oral corticosteroids** for short periods. In severe cases, oral corticosteroids may also be used in combination with nasal corticosteroids during treatment initiation to relieve severe mucosal oedema and allow the spray to penetrate the

Nasal ipratropium bromide p. 1296 may be added to allergic rhinitis treatment when watery rhinorrhoea persists despite treatment with topical nasal corticosteroids and antihistamines; it has no effect on other nasal symptoms.

In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and/or exposure to the allergen.

Montelukast p. 292 is less effective than topical nasal corticosteroids but can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Corticosteroids

EvGr Topical nasal corticosteroid preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. The extent of absorption varies between steroids; mometasone furgate p. 1299 and fluticasone p. 1298 have negligible systemic absorption. others have modest absorption, whilst betamethasone p. 1297 has high systemic absorption and should only be

used short-term. The growth of children receiving treatment with corticosteroids should be monitored; especially in those receiving corticosteroids via multiple routes.

Nasal polyps

Ever Patients presenting with nasal polyps should initially be reviewed by an ear, nose and throat specialist. Nasal polyps may be treated with topical nasal corticosteroids (drops or spray). There may be a higher risk of side-effects with use of nasal drops compared to nasal spray due to greater systemic absorption and incorrect administration of drops. To reduce the risk, the drops must be administered with the patient in the 'head down' position. A short course of a systemic corticosteroid can provide symptomatic relief but effects may be temporary and its use is rare due to concerns of systemic side-effects. If systemic corticosteroids are given, they should be used in combination with topical nasal corticosteroids.

Pregnancy

Ever If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment may be given. Although the safety of nasal corticosteroids in pregnancy has not been established through clinical trials, only minimal amounts of nasal corticosteroids are systemically absorbed. Beclometasone dipropionate p. 1297, budesonide p. 1298, and fluticasone are widely used in asthmatic pregnant women; fluticasone has the lowest systemic absorption when used intra-nasally. Ever Decongestants are not recommended however, some antihistamines and sodium cromoglicate may be used.

Topical nasal decongestants

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. [Ever Sodium chloride 0.9% given as nasal drops, spray, or irrigation may relieve nasal congestion.

Steam inhalation may help to relieve congestion but care should be taken to avoid scalding (see under Aromatic inhalations, cough preparations and systemic nasal decongestants p. 320).

Symptoms of nasal congestion associated with allergic rhinitis, the common cold, and sinusitis may be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. Their use, especially with longer durations, can give rise to rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events; tolerance with reduced effect may also be seen with excessive use.

Evgr Non-allergic watery rhinorrhoea often responds to treatment with nasal antimuscarinic ipratropium bromide.

Nasal preparations for infection

Nasal staphylococci

Evgr Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of antimicrobial preparations such as chlorhexidine with neomycin cream $(Naseptin^{\odot})$ p. 1295. A nasal ontment containing mupirocin p. 1295 is available if $Naseptin^{\odot}$ is unsuitable or ineffective.

In hospitals or in care establishments, mupirocin nasal ointment can be used for the eradication of nasal carriage of meticillin-resistant *Staphylococcus aureus* (MRSA).

For information on eradication of MRSA, consult local infection control policy. See also management of MRSA p. 630.

1 Nasal congestion

SYMPATHOMIMETICS > VASOCONSTRICTOR

Ephedrine hydrochloride

29-Mar-2022

INDICATIONS AND DOSE

Nasal congestion | Sinusitis affecting the maxillary antrum

- ► BY INTRANASAL ADMINISTRATION
- ► Child 12-17 years: Apply 1-2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops
- Adult: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril

IMPORTANT SAFETY INFORMATION

CHM/MHRA ADVICE

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- CAUTIONS Avoid excessive or prolonged use cardiovascular disease (in children) diabetes mellitus elderly hypertension hyperthyroidism ischaemic heart disease (in adults) prostatic hypertrophy (risk of acute urinary retention) (in adults)
- INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor
- SIDE-EFFECTS
- ► Common or very common Anxiety headache insomnia •
- ► Frequency not known Appetite decreased · arrhythmia · circulation impaired · dermatitis · dizziness · drug dependence · dry mouth · dyspnoea · hallucination · hyperglycaemia · hyperhidrosis · hypersalivation · hypertension · hypokalaemia · hypotension · irritability · muscle weakness · mydriasis · pain · palpitations · paranoia · piloerection · rebound congestion · syncope · thirst · tremor · urinary disorders · vasoconstriction · vasodilation · vomiting
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- PRESCRIBING AND DISPENSING INFORMATION For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Ephedrine nasal drops may be prescribed.

- EXCEPTIONS TO LEGAL CATEGORY Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: nasal drops

Nasal drops ► Ephedrine hydrochloride (Non-proprietary)

Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops | 10 ml [P] £1.90 DT = £1.90

Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml | P £1.94 DT = £1.94

Pseudoephedrine hydrochloride

11-May-2021

• INDICATIONS AND DOSE

Congestion of mucous membranes of upper respiratory tract

- ▶ BY MOUTH
- ► Child 6-11 years: 30 mg 3-4 times a day
- ▶ Child 12-17 years: 60 mg 3-4 times a day
- ▶ Adult: 60 mg 3-4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN (APRIL 2009)

Children under 6 years should not be given over-thecounter cough and cold medicines containing pseudoephedrine.

- CAUTIONS Diabetes · heart disease · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (in adults) · raised intra-ocular pressure (in children) · susceptibility to angle-closure glaucoma (in adults)
- INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor
- SIDE-EFFECTS Angle closure glaucoma · anxiety · arrhythmias · circulation impaired · dry mouth · hallucination · headache · hypertension · irritability · nausea · palpitations · psychotic disorder · skin reactions · sleep disorders · tremor · urinary retention · vomiting
- PREGNANCY Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.
- BREAST FEEDING May suppress lactation; avoid if lactation not well established or if milk production insufficient.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.
- RENAL IMPAIRMENT EVGT Use with caution in mild to moderate impairment; avoid in severe impairment.
- LESS SUITABLE FOR PRESCRIBING Pseudoephedrine hydrochloride is less suitable for prescribing.
- EXCEPTIONS TO LEGAL CATEGORY Galpseud and Sudafed can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Xylometazoline hydrochloride

13-Feb-2020

• DRUG ACTION Xylometazoline is a sympathomimetic.

• INDICATIONS AND DOSE

Nasal congestion

- ► BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- Child 6-11 years: 1-2 drops 1-2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril
- Child 12-17 years: 2-3 drops 2-3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril
- Adult: 2-3 drops 2-3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each postril
- ► BY INTRANASAL ADMINISTRATION USING NASAL SPRAY
- Child 12-17 years: 1 spray 1-3 times a day as required for maximum duration of 7 days, to be administered into each nostril
- Adult: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

IMPORTANT SAFETY INFORMATION

The CHM/MHRA has stated that non-prescription cough and cold medicines containing oxymetazoline or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- CAUTIONS Angle-closure glaucoma · avoid excessive or prolonged use · cardiovascular disease (in children) · diabetes mellitus · elderly · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (risk of acute retention) (in adults) · rebound congestion
 CAUTIONS, FURTHER INFORMATION
- Rebound congestion Sympathomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.
- INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor
- SIDE-EFFECTS Cardiovascular effects · headache · hypersensitivity · nasal dryness · nausea · paraesthesia · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Use of decongestants in infants and children under 6 years has been associated with agitated psychosis, ataxia, hallucinations, and even death—avoid.

- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Manufacturer advises caution—no information available.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

2 Nasal infection

Sinusitis (acute)

31-Oct-2017

Description of condition

Sinusitis is an inflammation of the mucosal lining of the paranasal sinuses. Acute sinusitis (rhinosinusitis) is a self-limiting condition usually triggered by a viral upper-respiratory tract infection such as the 'common cold'. Occasionally, acute sinusitis may become complicated by a bacterial infection (see Antibacterial therapy for acute sinusitis in Nose infections, antibacterial therapy p. 550).

Patients with acute sinusitis usually present with symptoms of nasal blockage or congestion, nasal discharge, dental or facial pain or pressure, and reduction or loss of the sense of smell.

Symptoms usually improve within 2 to 3 weeks without requiring treatment.

Rarely, acute sinusitis may lead to orbital, intracranial or skeletal complications (e.g. periorbital cellulitis, symptoms or signs of meningitis).

Aims of treatment

Treatment is aimed at managing symptoms including pain, fever, and nasal congestion as well as treatment of bacterial infection if present.

Treatment

Ever Patients presenting with symptoms for around 10 days or less, should be given advice about the usual duration of acute sinusitis, self-care of pain or fever with paracetamol p. 477 or ibuprofen p. 1232, and when to seek medical help. Patients should be reassured that antibiotics are usually not required. Some patients may try nasal saline or nasal decongestants, however there is limited evidence to show they help to relieve nasal conception.

Patients presenting with symptoms for around 10 days or more with no improvement could be considered for treatment with a high-dose nasal corticosteroid, such as mometasone furoate p. 1299 [unlicensed use] or fluticasone p. 1298 [unlicensed use] for 14 days. Supply of a back-up antibiotic prescription could be considered and used if symptoms do not improve within 7 days, or if they worsen rapidly or significantly.

If the patient is systemically very unwell, has signs and symptoms of a more serious illness or condition, or is at high-risk of complications, an immediate antibiotic should be given. (See Antibacterial therapy for acute sinusitis in Nose infections, antibacterial therapy p. 550).

Evor Patients presenting with symptoms of acute sinusitis associated with a severe systemic infection or with orbital or intracranial complications should be referred to hospital.

CORTICOSTEROIDS

Corticosteroids (intranasal)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and

intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

NHS IMPROVEMENT PATIENT SAFETY ALERT: STEROID EMERGENCY CARD TO SUPPORT EARLY RECOGNITION AND TREATMENT OF ADRENAL CRISIS IN ADULTS (AUGUST 2020)

A patient-held **Steroid Emergency Card** has been developed for patients with adrenal insufficiency and steroid dependence who are at risk of adrenal crisis. It aims to support healthcare staff with the early recognition of patients at risk of adrenal crisis and the emergency treatment of adrenal crisis. All eligible patients should be issued a Steroid Emergency Card. Providers that treat patients with acute physical illness or trauma, or who may require emergency treatment, elective surgery, or other invasive procedures, should establish processes to check for risk of adrenal crisis and confirm if the patient has a Steroid Emergency Card.

PAEDIATRIC STEROID TREATMENT CARD FOR CHILDREN WITH ADRENAL INSUFFICIENCY (NOVEMBER 2020)

The British Society for Paediatric Endocrinology and Diabetes (BSPED) has developed a Paediatric Steroid Treatment Card which should be issued to children with adrenal insufficiency and steroid dependence. The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients. The BSPED Paediatric Steroid Treatment Card is available at: www.endocrinology.org/adrenal-crisis.

 CAUTIONS Avoid after nasal surgery (until healing has occurred) · avoid in pulmonary tuberculosis · avoid in the presence of untreated nasal infections · patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

CAUTIONS, FURTHER INFORMATION

Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

SIDE-EFFECTS

- ► Common or very common Altered smell sensation epistaxis headache nasal complaints taste altered throat irritation
- ▶ Rare or very rare Glaucoma · nasal septum perforation (more common following nasal surgery) · vision blurred SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids.

MONITORING REQUIREMENTS

- In children The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered
- PATIENT AND CARER ADVICE If systemic absorption occurs following intranasal use, side-effects applicable to systemic corticosteroids may apply.

Beclometasone dipropionate

08-Mar-2022

F 1296

(Beclomethasone dipropionate)

• INDICATIONS AND DOSE

Prophylaxis and treatment of allergic and vasomotor rhinitis

- ► BY INTRANASAL ADMINISTRATION
- Child 6-17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to
 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day
- Adult: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day
- INTERACTIONS → Appendix 1: corticosteroids
- EXCEPTIONS TO LEGAL CATEGORY
- ▶ In adults Preparations of beclometasone dipropionate can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Spray

F 1296

Betamethasone

08-Mar-2022

 DRUG ACTION Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

INDICATIONS AND DOSE

BETNESOL ®

Non-infected inflammatory conditions of nose

- ► BY INTRANASAL ADMINISTRATION
- Adult: Apply 2-3 drops 2-3 times a day, dose to be applied into each nostril

VISTAMETHASONE ®

Non-infected inflammatory conditions of nose

- ► BY INTRANASAL ADMINISTRATION
- Adult: Apply 2-3 drops twice daily, dose to be applied into each nostril
- INTERACTIONS → Appendix 1: corticosteroids

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Ear/eve/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Betnesol (RPH Pharmaceuticals AB)

- Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml PoM £2.32 DT = £2.32

F 1296

Budesonide

08-Mar-2022

 DRUG ACTION Budesonide is a glucocorticoid, which exerts significant local anti-inflammatory effects.

• INDICATIONS AND DOSE

Allergic rhinitis | Nasal polyps

- ► BY INTRANASAL ADMINISTRATION
- Child 6-17 years: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered to each nostril, reduce dose when control achieved
- Adult: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered to each nostril, reduce dose when control achieved

Prophylaxis and treatment of allergic and vasomotor rhinitis

- ► BY INTRANASAL ADMINISTRATION
- Child 12-17 years: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved
- Adult: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved

Nasal polyps

- ► BY INTRANASAL ADMINISTRATION
- Child 12-17 years: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril
- Adult: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril

RHINOCORT AQUA®

Rhinitis

- ► BY INTRANASAL ADMINISTRATION
- Adult: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered into each nostril; reduced to 64 micrograms once daily when control achieved. Use for maximum 3 months, doses to be administered into each nostril

Nasal polyps

- ► BY INTRANASAL ADMINISTRATION
- Adult: 64 micrograms twice daily for up to 3 months, dose to be administered into each nostril
- INTERACTIONS → Appendix 1: corticosteroids

SIDE-EFFECTS

- ▶ Rare or very rare Adrenal suppression
- EXCEPTIONS TO LEGAL CATEGORY
- In adults Preparations of budesonide can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to max. single dose of 200 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. period of 3 months, and a pack size of 10 mg.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Disodium edetate, polysorbates, potassium sorbate

► Budesonide (Non-proprietary)

Budesonide 64 microgram per 1 dose Budesonide 64micrograms/dose nasal spray | 120 dose [PoM] £5.65 DT = £5.65 Budesonide 100 microgram per 1 dose Budeflam Aquanase 100micrograms/dose nasal spray | 150 dose [PoM] Salaricort 100micrograms/dose nasal spray | 200 dose [PoM] Sala

F 1296

Fluticasone

08-Mar-2022

• INDICATIONS AND DOSE

Prophylaxis and treatment of allergic rhinitis and perennial rhinitis

- ► BY INTRANASAL ADMINISTRATION USING NASAL SPRAY
- Child 4-11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
- Child 12-17 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved
- Adult: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved

Nasal polyps

- ► BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- Child 16-17 years: 200 micrograms 1-2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4-6 weeks, (200 micrograms is equivalent to approximately 6 drops)
- Adult: 200 micrograms 1–2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops)

AVAMYS ® SPRAY

Prophylaxis and treatment of allergic rhinitis

- ► BY INTRANASAL ADMINISTRATION
- Child 6-11 years: 27.5 micrograms once daily, dose to be sprayed into each nostril, then increased if necessary to 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose
- Child 12-17 years: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

F 1296

09-Mar-2022

 Adult: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

DOSE EQUIVALENCE AND CONVERSION

- ► For Avamys ® spray: 1 spray equivalent to 27.5 micrograms.
- INTERACTIONS → Appendix 1: corticosteroids
- SIDE-EFFECTS Adrenal suppression

SIDE-EFFECTS, FURTHER INFORMATION Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

- EXCEPTIONS TO LEGAL CATEGORY
- In adults Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oropharynx

Dry mouth

Dry mouth

14-Dec-2020

Overview

Dry mouth (xerostomia) resulting from reduced saliva secretion may be caused by drugs such as antimuscarinics, antihistamines, tricyclic antidepressants, and some diuretics. It can also be caused by irradiation of the head and neck region, dehydration, anxiety, or Sjögren's syndrome. Patients with dry mouth may be at greater risk of developing dental caries, periodontal disease, and oral infections (particularly candidiasis).

EvGr Underlying causes of dry mouth such as dehydration, anxiety, infection, or drugs causing dry mouth should be managed if appropriate. Dry mouth may be relieved in many patients by simple measures that stimulate salivation such as frequent sips of cold unsweetened drinks, or sucking pieces of ice or sugar-free fruit pastilles, or chewing sugarfree gum.

An artificial saliva substitute can be considered if simple stimulatory measures are inadequate. (A) The acidic pH of some artificial saliva products may be inappropriate for some patients as it may damage the enamel of natural teeth. Artificial saliva products below are available in oral lozenges, oral gel, oral spray, and pastille forms.

Pilocarpine tablets p. 1302 are licensed for the treatment of xerostomia following irradiation for head and neck cancer, and dry mouth and dry eyes (xerophthalmia) in Sjögren's syndrome. EvGr They may take up to 3 months to be effective; treatment should be withdrawn if there is no response within this time.

PARASYMPATHOMIMETICS

Pilocarpine

11-May-2021

INDICATIONS AND DOSE

Xerostomia following irradiation for head and neck cancer

► BY MOUTH

Adult: 5 mg 3 times a day for 4 weeks, then increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with or immediately after meals (last dose always with evening meal), maximum therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months

Dry mouth and dry eyes in Sjögren's syndrome

- ► BY MOUTH
- Adult: 5 mg 4 times a day; increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with meals and at bedtime, discontinue if no improvement after 2-3 months
- CONTRA-INDICATIONS Acute iritis · uncontrolled asthma (increased bronchial secretions and increased airways resistance) · uncontrolled cardiorenal disease · uncontrolled chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance)
- CAUTIONS Asthma (avoid if uncontrolled) · biliary-tract disease · cardiovascular disease (avoid if uncontrolled) · cholelithiasis · chronic obstructive pulmonary disease (avoid if uncontrolled) · cognitive disturbances · maintain adequate fluid intake to avoid dehydration associated with excessive sweating · peptic ulceration · psychiatric disturbances · risk of increased renal colic · risk of increased urethral smooth muscle tone · susceptibility to angle-closure glaucoma
- INTERACTIONS → Appendix 1: pilocarpine
- SIDE-EFFECTS
- ► Common or very common Asthenia · conjunctivitis · constipation · diarrhoea · dizziness · excessive tearing · eye pain · flushing · gastrointestinal discomfort · headache · hyperhidrosis · hypersalivation · hypersensitivity · hypertension · increased risk of infection · nausea ·

- palpitations skin reactions urinary disorders vision disorders vomiting
- ► Uncommon Gastrointestinal disorders
- ► Frequency not known Affective disorder · agitation · arrhythmias · atrioventricular block · chills · confusion · hallucination · hypotension · memory loss · psychiatric disorder · respiratory distress · shock · tremor
- PREGNANCY Avoid—smooth muscle stimulant; toxicity in animal studies
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe cirrhosis.
 Dose adjustments Manufacturer advises initial dose reduction in moderate to severe cirrhosis.
- RENAL IMPAIRMENT Manufacturer advises caution with tablets

PATIENT AND CARER ADVICE

Driving and skilled tasks Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution Tablet

2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

01-Sep-2020

Lozenges and sprays

Evgr Lozenges containing either a local anaesthetic, an antiseptic, or a non-steroidal anti-inflammatory drug may be trialled but may only lead to a small reduction in pain. However, there is no evidence that non-medicated lozenges and local anaesthetic sprays have a beneficial action on their own in treating sore throat.

Mouthwashes, gargles, and dentifrices

Expert sources advise that a saline mouthwash may be used for cleaning or freshening the mouth and can be prepared by dissolving half a teaspoonful of salt in a glassful of warm water.

Evgr Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 1303, may be useful in the treatment of acute ulcerative gingivitis whilst awaiting to be seen by a dentist.

Chlorhexidine p. 1303 can be used as a mouthwash, spray, or gel and is licensed for the management of gingivitis and maintenance of oral hygiene, particularly where there is a painful periodontal condition or if the patient is unable to adequately brush their teeth (e.g. following dental procedures or due to disability). It is also licensed for the management of denture stomatitis, aphthous ulcers, oral candidiasis, and following post-periodontal treatment to promote healing. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth but there is limited evidence to demonstrate efficacy in preventing dental caries. Public Health England advise to use other treatments for preventing dental caries, such as fluoride-based products.

Chlorhexidine is incompatible with anionic agents present in some toothpastes; it has therefore been suggested to wait 30 minutes between using these two preparations.

ANTISEPTICS AND DISINFECTANTS > OTHER

Chlorhexidine

23-Feb-2022

INDICATIONS AND DOSE

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

- ► BY MOUTH USING MOUTHWASH
- Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)
- Adult: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

Denture stomatitis

- ► MOUTHWASH
- Adult: Cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

Oral hygiene and plaque inhibition and gingivitis

- ► BY MOUTH USING DENTAL GEL
- Child: Apply 1–2 times a day, to be brushed on the teeth
- Adult: Apply 1–2 times a day, to be brushed on the teeth

Oral candidiasis | Management of aphthous ulcers

- ► BY MOUTH USING DENTAL GEL
- ▶ Child: Apply 1–2 times a day, to affected areas
- ▶ Adult: Apply 1-2 times a day, to affected areas

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

- ► BY MOUTH USING OROMUCOSAL SPRAY
- Child: Apply up to 12 sprays twice daily as required, to be applied on tooth, gingival, or ulcer surfaces
- Adult: Apply up to 12 sprays twice daily as required, to be applied on tooth, gingival, or ulcer surfaces

DOSE EQUIVALENCE AND CONVERSION

- Mouthwashes and oromucosal sprays contain chlorhexidine gluconate 0.2% w/v.
- UNLICENSED USE Corsodyl[®] not licensed for use in children under 12 years (unless on the advice of a healthcare professional).
- SIDE-EFFECTS
- ► Common or very common
- With oromucosal use Dry mouth · hypersensitivity · oral disorders · taste altered · tongue discolouration · tooth discolouration

SIDE-EFFECTS, FURTHER INFORMATION If desquamation occurs with mucosal irritation, discontinue treatment.

PRESCRIBING AND DISPENSING

INFORMATION Chlorhexidine digluconate is a synonym for chlorhexidine gluconate.

 PATIENT AND CARER ADVICE Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Corsodyl[®] dental gel may be prescribed as Chlorhexidine Gluconate Gel; Corsodyl[®] mouthwash may be prescribed as Chlorhexidine Mouthwash; Corsodyl[®] oral spray may be prescribed as Chlorhexidine Oral Spray.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Dental gel

Spray

► Corsodyl (GlaxoSmithKline Consumer Healthcare UK Ltd)
Chlorhexidine gluconate 2 mg per 1 ml Corsodyl 0.2% oral spray

Hexetidine

06-Aug-2018

INDICATIONS AND DOSE

Oral hygiene

- ► BY MOUTH USING MOUTHWASH
- Child 12-17 years: Rinse or gargle 15 mL 2-3 times a day, to be used undiluted
- Adult: Rinse or gargle 15 mL 2-3 times a day, to be used undiluted

• SIDE-EFFECTS

- ▶ Rare or very rare Anaesthesia · taste altered
- ▶ Frequency not known Cough · dry mouth · dysphagia · dyspnoea · nausea · salivary gland enlargement · vomiting
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Mouthwash

➤ Oraldene (McNeil Products Ltd)

Hexetidine 1 mg per 1 ml Oraldene 0.1% mouthwash peppermint sugar-free | 200 ml | GSL | £2.92 DT = £2.92

Hydrogen peroxide

03-Mar-2020

DRUG ACTION Hydrogen peroxide is an oxidising agent.

INDICATIONS AND DOSE

Oral hygiene (with hydrogen peroxide 6%)

- ► BY MOUTH USING MOUTHWASH
- Child: Rinse or gargle 15 mL 2-3 times a day for 2-3 minutes, to be diluted in half a tumblerful of warm water
- Adult: Rinse or gargle 15 mL 2-3 times a day for 2-3 minutes, to be diluted in half a tumblerful of warm water

PEROXYL®

Oral hygiene

- ► BY MOUTH USING MOUTHWASH
- Child 6-17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime
- Adult: Rinse or gargle 10 mL up to 4 times a day for about 1 minute, to be used after meals and at bedtime

- PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.
- HANDLING AND STORAGE Hydrogen peroxide bleaches fabric
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Hydrogen Peroxide Mouthwash may be prescribed.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Mouthwash

Peroxyl (Colgate-Palmolive (UK) Ltd)
Hydrogen peroxide 15 mg per 1 ml Peroxyl 1.5% mouthwash sugar-free | 300 ml | GSL | £2.94 DT = £2.94

Sodium bicarbonate with sodium

25-Apr-2022

• INDICATIONS AND DOSE

Oral hygiene

- ► BY MOUTH USING MOUTHWASH
- Adult: Rinse or gargle as required
- DIRECTIONS FOR ADMINISTRATION To be diluted with an equal volume of warm water prior to use.
- PRESCRIBING AND DISPENSING INFORMATION Compound Sodium Chloride Mouthwash BP consists of sodium bicarbonate 1% and sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL.

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Compound sodium chloride mouthwash may be prescribed.

 MEDICINAL FORMS Forms available from special-order manufacturers include: mouthwash

2.1 Dental caries

Fluoride

24-Anr-2020

Overview

Fluoride is a naturally occurring mineral found in water supplies in varying amounts and in some foods; it has beneficial topical effects on teeth. Public Health England advise that all adults and children brush their teeth with fluoridated toothpaste at least twice daily to help prevent tooth decay.

Individuals who are either particularly caries prone or medically compromised may be given additional protection. Public Health England recommends the daily use of a fluoride mouthwash in adults and children aged 7 years and over who are causing concern to their dentist (e.g. those with active caries, dry mouth, or special needs). They should be used at a different time to brushing to avoid removal of the beneficial effects of fluoride in toothpaste.

Fluoride varnish is also available and can be applied topically to both primary or permanent teeth. Public Health England recommends that all children aged 3 years and over have fluoride varnish applied (usually twice a year) regardless of their risk of caries. Application of fluoride varnish at least twice a year may also be considered in adults

and children aged under 3 years who are causing concern to their dentist.

VITAMINS AND TRACE ELEMENTS

Sodium fluoride

25-Nov-2020

• INDICATIONS AND DOSE

Prophylaxis of dental caries for water content less than 300micrograms/litre (0.3 parts per million) of fluoride

- ► BY MOUTH USING TABLETS
- Child 6 months-2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
- Child 3-5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
- Child 6-17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)
- Adult: 1 mg daily, doses expressed as fluoride ion (F)

Prophylaxis of dental caries for water content between 300 and 700micrograms/litre (0.3-0.7 parts per million) of fluoride ion

- ► BY MOUTH USING TABLETS
- Child 3-5 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
- Child 6-17 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
- Adult: 500 micrograms daily, doses expressed as fluoride ion (F)

Prophylaxis of dental caries

- ► BY MOUTH USING MOUTHWASH
- ▶ Adult: Rinse or gargle 5-10 mL daily

DOSE EQUIVALENCE AND CONVERSION

 Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE

Prophylaxis of dental caries

- ► BY MOUTH USING PASTE
- Child 10-17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush
- Adult: Apply 1 centimetre twice daily, to be applied using a toothbrush

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE

Prophylaxis of dental caries

- ► BY MOUTH USING PASTE
- ► Child 16-17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush
- Adult: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

EN-DE-KAY® FLUORINSE

Prophylaxis of dental caries

- ► BY MOUTH USING MOUTHWASH
- Adult: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL
- SIDE-EFFECTS Dental fluorosis
- DIRECTIONS FOR ADMINISTRATION
- With oral use Manufacturer advises tablets should be sucked or dissolved in the mouth at a different time of day to tooth brushing.
- With oral (topical) use Manufacturer advises for mouthwash, rinse mouth for 1 minute and then spit out.

COLGATE DURAPHAT ® 5000PPM ELUORIDE

TOOTHPASTE Manufacturer advises brush teeth for 3 minutes before spitting out.

COLGATE DURAPHAT [®] 2800PPM FLUORIDE
TOOTHPASTE Manufacturer advises brush teeth for
1 minute before spitting out.

 PRESCRIBING AND DISPENSING INFORMATION Flavours of oral tablet formulations may include orange.

PATIENT AND CARER ADVICE

Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.

COLGATE DURAPHAT ® 5000PPM FLUORIDE

TOOTHPASTE Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.

COLGATE DURAPHAT ® 2800PPM FLUORIDE

TOOTHPASTE Patients or carers should be given advice on how to administer sodium fluoride toothpaste.

Avoid drinking or rinsing mouth for 30 minutes after

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Tablets may be prescribed as Sodium Fluoride Tablets.

Oral drops may be prescribed as Sodium Fluoride Oral Drops.

Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%. Dental information Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales.

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

COLGATE DURAPHAT® 5000PPM FLUORIDE

TOOTHPASTE Dental practitioners' formulary May be prescribed as Sodium Fluoride Toothpaste 1.1%.

3 Oral ulceration and inflammation

Oral ulceration and inflammation

09-Dec-2020

Ulceration and inflammation

Ulceration of the oral mucosa is common and usually transient but may require treatment in some cases. Causes include mechanical trauma, infections, malignant lesions, inflammatory conditions, nutritional deficiencies (e.g. iron, folic acid, vitamin B12), immunodeficiency states, gastrointestinal disease, and drug therapy (see also Chemotherapy induced mucositis and myelosuppression under Cytotoxic drugs p. 962).

Aphthous ulcers are often recurrent and are not associated with an underlying systemic disease; they are small, round or ovoid mouth ulcers with defined margins. Aphthous ulcers may be precipitated by triggers such as certain food and drinks, allergies, anxiety, or hormonal changes. It is important to consider and exclude any possible systemic disease; treatment may include correcting the underlying cause. Treatment aims to relieve pain, reduce ulcer duration, and reduce the frequency of recurrent episodes. Secondary bacterial infections may occur with mucosal ulceration; it can increase discomfort and delay healing.

Evgr Patients with an unexplained mouth ulcer of more than 3 weeks' duration should be referred urgently to a specialist to exclude oral cancer.

Treatment of aphthous ulcers

EvGr Advise patients to avoid known triggers for ulceration, such as oral trauma (e.g. biting during chewing, ill-fitting dentures) or certain food and drinks (e.g. coffee, glutencontaining products). If the ulcers are mild, infrequent, and do not interfere with daily activities (such as eating), treatment may not be required.

Corticosteroids

Evor Topical corticosteroids are usually considered to be first-line treatment. A Expert sources advise that hydrocortisone oromucosal tablets p. 1308, beclometasone dipropionate inhaler p. 278 [unlicensed indication] sprayed onto the oral mucosa, and betamethasone soluble tablets p. 1307 [unlicensed indication] used as a mouthwash are suitable options.

Evgr A short course of systemic corticosteroids may be prescribed for patients with severe recurrent aphthous ulcers.

Other therapies

EvGr Other therapies that may be used alone or in combination with topical corticosteroids include topical anaesthetics (e.g. lidocaine hydrochloride p. 1306), topical analgesics/anti-inflammatory agents (e.g. benzydamine hydrochloride p. 1306), and topical antimicrobial agents (e.g. chlorhexidine mouthwash p. 1303).

expelled, may be considered for recurrent aphthous ulceration when other treatments are unsuccessful or unsuitable. **(£)**

Expert sources advise that a saline (with or without sodium bicarbonate) mouthwash may soothe ulcers, help to maintain oral hygiene, and prevent secondary infection. Tepid water appears to be more soothing than cold or warm water.

Expert sources advise that local anaesthetics have a short duration of action; there is limited evidence for their use in the management of oral ulceration. Lidocaine hydrochloride 5% ointment or lozenges containing the local anaesthetic may be applied to the ulcer. Lidocaine hydrochloride 10% solution [unlicensed indication] as spray can be applied thinly to the ulcer using a cotton bud. When local anaesthetics are used in the mouth, care must be taken to avoid causing anaesthesia of the pharynx before meals, as this might lead to choking.

Benzydamine hydrochloride and flurbiprofen p. 1307 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzydamine hydrochloride mouthwash and spray are licensed for the relief of painful inflammatory conditions associated with a variety of ulcerative conditions, as well as for discomfort of tonsillectomy and post-irradiation mucositis. Benzydamine hydrochloride mouthwash should generally be used undiluted; it can be diluted with an equal volume of water if a stinging sensation occurs. Flurbiprofen lozenges are licensed for the relief of sore throat.

Choline salicylate p. 1308 is a derivative of salicylic acid and has some analgesic properties. The dental gel is licensed for pain relief in mouth ulcers including ulcers due to dentures and orthodontic devices.

Ever Consider offering or advising the use of a vitamin B12 supplement regardless of serum vitamin B12 levels.

ANAESTHETICS, LOCAL

Lidocaine hydrochloride (Lignocaine hydrochloride)

17-Aug-2020

• INDICATIONS AND DOSE

Dental practice

- ► BY BUCCAL ADMINISTRATION USING OINTMENT
- Adult: Rub gently into dry gum

Relief of pain in oral lesions

- ► TO THE LESION USING OINTMENT
- Adult: Apply as required, rub sparingly and gently on affected areas

XYLOCAINE ®

Bronchoscopy | Laryngoscopy | Oesophagoscopy | Endotracheal intubation

► TO MUCOUS MEMBRANES ► Adult: Up to 20 doses

Dental practice

- ► TO MUCOUS MEMBRANES
- ▶ Adult: 1-5 doses

Maxillary sinus puncture

- ► TO MUCOUS MEMBRANES
- Adult: 3 doses

Relief of pain in oral lesions

- ► TO THE LESION
- Adult: Apply thinly to the ulcer using a cotton bud
- UNLICENSED USE Spray not licensed for the relief of pain in oral lesions
- CAUTIONS Avoid anaesthesia of the pharynx before meals—risk of choking · can damage plastic cuffs of endotracheal tubes
- INTERACTIONS → Appendix 1: antiarrhythmics

ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk.
 When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.
- BREAST FEEDING Present in milk but amount too small to be harmful.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure).
- RENAL IMPAIRMENT Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%

XYLOCAINE Dental practitioners' formulary May be prescribed as lidocaine spray 10%.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

➤ Xylocaine (Aspen Pharma Trading Ltd)

Hydrocortisone

17-May-2022

 DRUG ACTION Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

• INDICATIONS AND DOSE

Oral and perioral lesions

- ► TO THE LESION USING BUCCAL TABLET
- ▶ Child 1 month-11 years: Only on medical advice
- Child 12-17 years: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer
- Adult: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer
- UNLICENSED USE Hydrocortisone mucoadhesive buccal tablets licensed for use in children (under 12 years—on medical advice only).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HYDROCORTISONE MUCO-ADHESIVE BUCCAL TABLETS: SHOULD NOT BE USED OFF-LABEL FOR ADRENAL INSUFFICIENCY IN CHILDREN DUE TO SERIOUS RISKS (DECEMBER 2018)

The MHRA has received reports of off-label use of hydrocortisone muco-adhesive buccal tablets for adrenal insufficiency in children. Healthcare professionals are advised that:

- hydrocortisone muco-adhesive buccal tablets are indicated only for local use in the mouth for aphthous ulceration and should not be used to treat adrenal insufficiency;
- substitution of licensed oral hydrocortisone formulations with muco-adhesive buccal tablets can result in insufficient cortisol absorption and, in stress situations, life-threatening adrenal crisis;
- only hydrocortisone products licensed for adrenal replacement therapy should be used.
- CONTRA-INDICATIONS Untreated local infection
- INTERACTIONS → Appendix 1: corticosteroids
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Mucoadhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Muco-adhesive buccal tablet

SALICYLIC ACID AND DERIVATIVES

Choline salicylate

23-Nov-2020

• INDICATIONS AND DOSE

Mild oral and perioral lesions

- ► TO THE LESION
- Child 16-17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours
- Adult: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours
- CONTRA-INDICATIONS Children under 16 years

CONTRA-INDICATIONS, FURTHER INFORMATION

- Reye's syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reve's syndrome.
- CAUTIONS Frequent application, especially in children, may give rise to salicylate poisoning · not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures (in adults)
- INTERACTIONS → Appendix 1: choline salicylate
- SIDE-EFFECTS Bronchospasm
- PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Choline Salicylate Dental Gel may be prescribed.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Salicylic acid with rhubarb extract

3-Nov-2020

• INDICATIONS AND DOSE

Mild oral and perioral lesions

- ► TO THE LESION
- Child 16-17 years: Apply 3-4 times a day maximum duration 7 days
- ▶ Adult: Apply 3–4 times a day maximum duration 7 days
- CONTRA-INDICATIONS Children under 16 years CONTRA-INDICATIONS, FURTHER INFORMATION
- Reye's syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.
- CAUTIONS Frequent application, especially in children, may give rise to salicylate poisoning · not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures (in adults)
- SIDE-EFFECTS
- ► Common or very common Oral discolouration tooth discolouration
- PATIENT AND CARER ADVICE May cause temporary discolouration of teeth and oral mucosa.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oropharyngeal bacterial infections

Oropharyngeal infections. antibacterial therapy

17-May-2022

Pericoronitis

Public Health England advises antibacterial use only in the presence of systemic features of infection, or persistent swelling

- Metronidazole p. 590, or alternatively, amoxicillin p. 597
- Suggested duration of treatment 3 days or until pain reduction allows for oral hygiene.

Gingivitis (acute necrotising ulcerative)

Public Health England advises antibacterial use only in the presence of systemic features of infection.

- Metronidazole
- Suggested duration of treatment 3 days.

[EVGr] If metronidazole is contra-indicated, use alternative, amoxicillin.

Abscess (periapical or periodontal)

Public Health England advises antibacterial use only if there are signs of severe infection, systemic symptoms, or a high risk of complications.

- Phenoxymethylpenicillin p. 596, or alternatively,
- Alternative in penicillin allergy: clarithromycin p. 584 ▶ If signs of spreading infection (e.g. lymph node
- involvement, systemic signs), add metronidazole Suggested duration of treatment up to 5 days; review at 3 days.

Periodontitis

[EVGr] Antibacterials may be used as an adjunct to effective mechanical debridement in severe disease or disease unresponsive to local treatment alone on the advice of a specialist.

Sore throat (acute)

Acute sore throat is usually triggered by a viral infection and is self-limiting. Symptoms can last for around 1 week, and most people will improve within this time without treatment with antibacterials, regardless of the cause.

EvGr Antibacterial therapy is required only in patients with severe systemic symptoms, signs and symptoms of a more serious illness or condition, or those at high risk of complications. Patients with severe systemic infection or severe suppurative complications (such as peri-tonsillar abscess (quinsy) or cellulitis) should be referred to hospital.

- Phenoxymethylpenicillin p. 596 (A)
- ▶ EvGr Suggested duration of treatment 5 to 10 days. ♠
- Evgr Alternative in penicillin allergy: clarithromycin p. 584 or erythromycin p. 587 (in pregnancy)
- ▶ EvGr Suggested duration of treatment 5 days. (♠)

Other infections

For further information on antibacterial treatment used in oropharyngeal infections, see Oral bacterial infections p. 550.

Doxycycline

INDICATIONS AND DOSE Treatment of recurrent aphthous ulceration

- ► BY MOUTH USING SOLUBLE TABLETS
- ► Child 12-17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2-3 minutes, it should preferably not be swallowed
- Adult: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2-3 minutes, it should preferably not be swallowed
- UNLICENSED USE Doxycycline may be used as detailed below, although considered outside the scope of its licence:
- · recurrent aphthous ulceration.
- CAUTIONS Alcohol dependence
- INTERACTIONS → Appendix 1: tetracyclines
- ► Common or very common Dyspnoea · hypotension · peripheral oedema · tachycardia
- ▶ Uncommon Gastrointestinal discomfort
- Rare or very rare Antibiotic associated colitis · anxiety · arthralgia · flushing · intracranial pressure increased with papilloedema · Jarisch-Herxheimer reaction · myalgia · photoonycholysis · severe cutaneous adverse reactions (SCARs) · skin hyperpigmentation (long term use) · tinnitus · vision disorders
- PATIENT AND CARER ADVICE Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oropharyngeal fungal 5 infections

Oropharyngeal fungal infections

19-May-2022

Overview

Fungal infections of the mouth are usually caused by Candida spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

Pseudomembranous candidiasis (thrush) is usually an acute infection but it may persist in chronic forms. Those at greater risk of candidal infections include patients receiving inhaled corticosteroids, chemotherapy, or broad-spectrum antibacterials, and in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. EvGr Any predisposing

condition should be managed appropriately. A The risk of oral candidiasis associated with corticosteroid inhaler use can be reduced by rinsing the mouth with water (or cleaning teeth) immediately after using the inhaler, use of a spacer, or using an inhaler at its lowest effective dose.

Ever For mild and localised infections, treatment with miconazole oral gel below is recommended; if this is unsuitable, oral nystatin p. 1311 may be given. Oral antifungal treatment with fluconazole p. 649 can be considered for patients that have extensive or severe infection, or when miconazole or nystatin treatment is unsuitable or ineffective. If the infection fails to respond to treatment after 1 week, consider extending the course for another week or referring to a specialist as appropriate.

Patients with moderate to severe infections may be considered for referral to a specialist; patients with evidence of a systemic disease or widespread infections should be admitted to hospital. For immunocompromised patients receiving treatment with ciclosporin, oral tacrolimus, or chemotherapy, seek specialist advice before starting antifungal treatment. (A)

Acute erythematous candidiasis

Acute erythematous (atrophic) candidiasis is usually associated with a burning sensation of the mouth or tongue and may be caused by corticosteroid or broad-spectrum antibacterial use. Ever Treatment of acute erythematous candidiasis is the same as for pseudomembranous candidiasis. —for further information, see Thrush. Denture-related problems should be managed prior to antifungal treatment initiation.

Denture stomatitis

Ever Patients with denture stomatitis (chronic atrophic candidiasis) should cleanse their dentures thoroughly, soak them overnight in disinfectant solution, and allow to air dry. Dentures should not be worn for 6 hours or more in each 24-hour period to promote gum healing. Refer to a dentist for ill-fitting dentures. Patients should also brush the mucosal surface regularly with a soft brush.

Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or allergy to the denture material, may be the cause. Evg Miconazole oral gel may be used as treatment if needed.

Chronic hyperplastic candidiasis

Ever Patients with chronic hyperplastic candidiasis (plaquelike candidiasis) should be referred to a specialist due to the increased risk of malignancy and potential need for a biopsy. The specialist may suggest treatment with a systemic antifungal to eliminate candidal overlay.

Angular cheilitis

Angular cheilitis (angular stomatitis) is characterised by soreness, erythema, and fissuring at the angles of the mouth. It may be associated with ill-fitting dentures, nutritional deficiency, or immunosuppression. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and streptococci) are commonly involved as interacting, infective factors. [Ever Angular cheilitis is normally self-limiting. While the underlying cause is being identified and treated, it may be helpful to apply topical emollients, miconazole cream or ointment for mild candida infection, or fusidic acid ointment p. 623 if there is evidence of bacterial infection. If the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment can be used. ﴿

Drugs used in oropharyngeal candidiasis

Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed systemically so potential interactions need to be considered. Miconazole

also has some activity against Gram-positive bacteria including streptococci and staphylococci. Oral itraconazole p. 651 is licensed for the treatment of fluconazole-resistant oral candidiasis.

For further information on systemic antifungal treatment, see Antifungals, systemic use p. 645.

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Miconazole

09-Feb-2022

• INDICATIONS AND DOSE

Oral candidiasis

- ► BY MOUTH USING ORAL GEL
- Child 2-17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
- Adult: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

Prevention and treatment of oral candidiasis (dose approved for use by community practitioner nurse prescribers)

- ► BY MOUTH USING ORAL GEL
- Child 4-23 months: 1.25 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be smeared around the inside of the mouth after feeds
- Child 2-17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
- Adult: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

DOSE EQUIVALENCE AND CONVERSION

- One 5-mL spoonful of oral gel equivalent to 124 mg miconazole.
- UNLICENSED USE Not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term.
- CONTRA-INDICATIONS Infants with impaired swallowing reflex
- CAUTIONS Avoid in Acute porphyrias p. 1150
- INTERACTIONS → Appendix 1: antifungals, azoles
- SIDE-EFFECTS
- ► Common or very common Skin reactions
- ► Frequency not known Angioedema
- PREGNANCY Manufacturer advises avoid if possible toxicity at high doses in animal studies.
- BREAST FEEDING Manufacturer advises caution—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises oral gel should be held in mouth, after food.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral gel may include orange.

Oropharyngeal viral 6 infections

Oropharyngeal viral infections

Management

Viral infections are the most common cause of a sore throat. They do not benefit from anti-infective treatment.

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzydamine hydrochloride p. 1306. The use of chlorhexidine mouthwash p. 1303 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir p. 687 is required. Valaciclovir p. 690 and famciclovir p. 689 are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme.

Skin conditions, management

Vehicles

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk/specials.

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they

have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution

The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

Suitable quantities for prescribing

Suitable quantities of dermatological preparations to be prescribed for specific areas of the body

Area of body	Creams and Ointments	Lotions
Face	15-30 g	100 mL
Both hands	25-50 g	200 mL
Scalp	50-100 g	200 mL
Both arms or both legs	100-200 g	200 mL
Trunk	400 g	500 mL
Groins and genitalia	15-25 g	100 mL

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations. For suitable quantities of corticosteroid preparations, see relevant table.

Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided. The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products.

- Beeswax
- · Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- · Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- · Sodium metabisulfite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

1 Dry and scaling skin disorders

Emollient and barrier preparations

04-Sep-2020

Borderline substances

The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated.

Emollients

Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis. The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as **aqueous cream** and **emulsifying ointment** can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Emollient bath and shower preparations

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for children reflect this.

MHRA/CHM advice (updated December 2018): Emollients: new information about risk of severe and fatal burns with paraffin-containing and paraffin-free emollients

Emollients are an important and effective treatment for chronic dry skin disorders and people should continue to use these products. However, healthcare professionals must ensure that patients and their carers understand the fire risk associated with the build-up of residue on clothing and bedding and can take action to minimise the risk. There is a fire risk with all paraffin-containing emollients, regardless of paraffin concentration, and it cannot be excluded with paraffin-free emollients. A similar risk may apply to products that are applied to the skin over large body areas, or in large volumes for repeated use for more than a few days.

Healthcare professionals should advise patients not to smoke or go near naked flames because clothing, bedding, dressings, and other fabrics that have been in contact with an emollient or emollient-treated skin can rapidly ignite. Washing these materials at high temperature may reduce emollient build-up but not totally remove it.

The MHRA/CHM (August 2020) have released a toolkit of resources for health and social care professionals to support the safe use of emollients, available at: www.gov.uk/drugsafety-update/emollients-and-risk-of-severe-and-fatal-burns-new-resources-available.

Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone (see barrier creams and ointments p. 1314) or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

Nappy rash

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 1339 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids. If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream p. 1324 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

- ► TO THE SKIN
- Child 6-11 months: 1 mL/bath, not to be used undiluted
- ► Child 1-17 years: 1-2 capfuls/bath, not to be used undiluted
- ▶ Adult: 1-2 capfuls/bath, not to be used undiluted

IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery particular care is needed when bathing.

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS See Emollient and barrier preparations p. 1313.

- DIRECTIONS FOR ADMINISTRATION Emollient bath additives should be added to bath water; [EVGr] hydration can be improved by soaking in the bath for 5-20 minutes (consult product literature). Some bath emollients can be applied to wet skin undiluted and rinsed off. (M) Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.
- PRESCRIBING AND DISPENSING INFORMATION

Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Bath additive

Emollient bath and shower products, paraffin-containing 19-NOV-20

• INDICATIONS AND DOSE

Dry skin conditions (using Aqueous Cream BP)

- ► TO THE SKIN
- ▶ Child: To be used as a soap substitute
- Adult: To be used as a soap substitute

AQUAMAX ® WASH

Dry skin conditions

- ► TO THE SKIN
- ▶ Child: To be applied to wet or dry skin and rinse
- Adult: To be applied to wet or dry skin and rinse

CETRABEN® BATH

Dry skin conditions, including eczema

- ► TO THE SKIN
- Child 1 month-11 years: 0.5-1 capful/bath, alternatively, to be applied to wet skin and rinse
- Child 12-17 years: 1-2 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Adult: 1-2 capfuls/bath, alternatively, to be applied to wet skin and rinse

DERMALO ®

Dermatitis | Dry skin conditions, including ichthyosis

- ► TO THE SKIN
- Child 1 month-11 years: 5-10 mL/bath, alternatively, to be applied to wet skin and rinse
- Child 12-17 years: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse
- Adult: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse

Pruritus of the elderly

- ► TO THE SKIN
- Elderly: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse

DOUBLEBASE ® EMOLLIENT BATH ADDITIVE

Dry skin conditions including dermatitis and ichthyosis

- ► TO THE SKIN
- ▶ Child 1 month-11 years: 5-10 mL/bath
- ▶ Child 12-17 years: 15-20 mL/bath
- ▶ Adult: 15-20 mL/bath

Pruritus of the elderly

- ► TO THE SKIN
- ▶ Elderly: 15-20 mL/bath

DOUBLEBASE ® EMOLLIENT SHOWER GEL

Dry, chapped, or itchy skin conditions

- ► TO THE SKIN
- Child: To be applied to wet or dry skin and rinse, or apply to dry skin after showering
- Adult: To be applied to wet or dry skin and rinse, or apply to dry skin after showering

DOUBLEBASE ® EMOLLIENT WASH GEL

Dry, chapped, or itchy skin conditions

- ► TO THE SKIN
- ▶ Child: To be used as a soap substitute
- Adult: To be used as a soap substitute

45 ® RATH OIL

Endogenous and exogenous eczema, xeroderma, and ichthyosis

- ► TO THE SKIN
- ► Child 1 month-11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
- Child 12-17 years: 15 mL/bath, alternatively, to be applied to wet skin and rinse
- Adult: 15 mL/bath, alternatively, to be applied to wet skin and rinse

Pruritus of the elderly associated with dry skin

- ► TO THE SKIN
- Elderly: 15 mL/bath, alternatively, to be applied to wet skin and rinse

E45 ® WASH CREAM

Endogenous and exogenous eczema, xeroderma, and ichthyosis

- ► TO THE SKIN
- ▶ Child: To be used as a soap substitute
- Adult: To be used as a soap substitute

Pruritus of the elderly associated with dry skin

- ► TO THE SKIN
- ▶ Elderly: To be used as a soap substitute

HYDROMOL ® BATH AND SHOWER EMOLLIENT Dry skin conditions | Eczema | Ichthyosis

- ► TO THE SKIN
- Child 1 month-11 years: 0.5-2 capfuls/bath, alternatively apply to wet skin and rinse
- Child 12-17 years: 1-3 capfuls/bath, alternatively apply to wet skin and rinse
- Adult: 1-3 capfuls/bath, alternatively apply to wet skin and rinse

Pruritus of the elderly

- ► TO THE SKIN
- Elderly: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

LPI 63.4

Dry skin conditions

- ► TO THE SKIN
- ▶ Child 1 month-11 years: 0.5-2 capfuls/bath,
- alternatively, to be applied to wet skin and rinse
- ► Child 12-17 years: 1-3 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Adult: 1-3 capfuls/bath, alternatively, to be applied to wet skin and rinse

OILATUM ® EMOLLIENT BATH ADDITIVE

Dry skin conditions including dermatitis and ichthyosis

- ► TO THE SKIN
- Child 1 month-11 years: 0.5-2 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Child 12-17 years: 1-3 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Adult: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

Pruritus of the elderly

- ► TO THE SKIN
- ▶ Elderly: 1-3 capfuls/bath, alternatively, to be applied to wet skin and rinse

OILATUM ® JUNIOR BATH ADDITIVE

Dry skin conditions including dermatitis and ichthyosis

- ► TO THE SKIN
- ▶ Child 1 month-11 years: 0.5-2 capfuls/bath, alternatively, apply to wet skin and rinse
- ► Child 12-17 years: 1-3 capfuls/bath, alternatively, apply to wet skin and rinse
- ▶ Adult: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse

Pruritus of the elderly

- ► TO THE SKIN
- ▶ Elderly: 1-3 capfuls/bath, alternatively, apply to wet skin and rinse

OV ® BATH OIL

Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus

- ► TO THE SKIN
- ▶ Child 1-11 months: 5 mL/bath, alternatively, to be applied to wet skin and rinse
- Child 1-17 years: 10 mL/bath, alternatively, to be applied to wet skin and rinse
- Adult: 10 mL/bath, alternatively, to be applied to wet skin and rinse

OV ® GENTLE WASH

Dry skin conditions including eczema, psoriasis. ichthyosis, and pruritus

- ► TO THE SKIN
- ▶ Child: To be used as a soap substitute
- Adult: To be used as a soap substitute

7FROLATIIM

Dry skin conditions | Dermatitis | Ichthyosis

- ► TO THE SKIN
- ▶ Child 1 month-11 years: 5-10 mL/bath
- Child 12-17 years: 15-20 mL/bath
- ▶ Adult: 15-20 mL/bath

Pruritus of the elderly

- ► TO THE SKIN
- ▶ Elderly: 15-20 mL/bath

Emollients, urea-containing

• DRUG ACTION Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis).

• INDICATIONS AND DOSE

AOUADRATE

Dry, scaling, and itching skin

- ► TO THE SKIN
- ▶ Child: Apply twice daily, to be applied thinly
- Adult: Apply twice daily, to be applied thinly

BALNEUM ® CREAM

Dry skin conditions

- ► TO THE SKIN
- Child: Apply twice daily
- Adult: Apply twice daily

BALNEUM ® PLUS CREAM

Dry, scaling, and itching skin

- ► TO THE SKIN
- Child: Apply twice daily
- Adult: Apply twice daily

CALMURID

Dry, scaling, and itching skin

- ► TO THE SKIN
- Child: Apply twice daily, apply a thick layer for 3-5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs
- Adult: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

DERMATONICS ONCE HEEL BALM®

Dry skin on soles of feet

- ► TO THE SKIN
- ▶ Child 12-17 years: Apply once daily
- Adult: Apply once daily

E45 ® ITCH RELIEF CREAM

Dry, scaling, and itching skin

- ► TO THE SKIN
- Child: Apply twice daily
- Adult: Apply twice daily

EUCERIN® INTENSIVE CREAM

Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis

- ► TO THE SKIN
- · Child: Apply twice daily, to be applied thinly and rubbed into area
- Adult: Apply twice daily, to be applied thinly and rubbed into area

FLEXITOL ®

Dry skin on soles of feet and heels

- ► TO THE SKIN
- ▶ Child 12-17 years: Apply 1-2 times a day
- ▶ Adult: Apply 1–2 times a day

HYDROMOL ® INTENSIVE

Dry, scaling, and itching skin

- ► TO THE SKIN
- Child: Apply twice daily, to be applied thinly
- Adult: Apply twice daily, to be applied thinly

IMUDERM ® EMOLLIENT

Dry skin conditions including eczema, psoriasis or dermatitis

- ► TO THE SKIN
- Adult: Apply to skin or use as a soap substitute

NUTRAPLUS

Dry, scaling, and itching skin

- ► TO THE SKIN
- ▶ Child: Apply 2-3 times a day
- Adult: Apply 2-3 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS See Emollient and barrier preparations p. 1313.

- DIRECTIONS FOR ADMINISTRATION Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

2 Infections of the skin

Skin infections

22-Mar-2020

Antibacterial preparations for the skin

Cellulitis, erysipelas, and leg ulcer infections require systemic antibacterial treatment, see Skin infections, antibacterial therapy p. 554.

Impetigo requires topical antiseptic/antibacterial or systemic antibacterial treatment, see Skin infections, antibacterial therapy p. 554.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin sulfate p. 1322, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin p. 561. If large areas of skin are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics, particularly in children, in the elderly, and in those with renal impairment. Resistant organisms are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Mupirocin p. 1323 is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid p. 623 should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocinresistant MRSA infection, a topical antiseptic such as povidone-iodine p. 1372, chlorhexidine p. 1372, or alcohol can be used; their use should be discussed with the local microbiologist.

Tedizolid p. 625 is licensed for the treatment of acute bacterial skin and skin structure infections.

Silver sulfadiazine p. 1323 is used in the treatment of infected burns.

Antibacterial preparations also used systemically Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 1309 for further information on angular cheilitis.

Metronidazole p. 1322 is used topically for rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

Antifungal preparations for the skin

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

Dermatophytoses

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete's foot), or nail (tinea unguium). Scalp infection requires systemic treatment; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos). The imidazole antifungals clotrimazole p. 1324, econazole nitrate p. 1324, ketoconazole p. 1324, and miconazole p. 1325 are all effective. Terbinafine cream p. 1326 is also effective but it is more expensive. Other topical antifungals include griseofulvin p. 1326 and the undecenoates. Compound benzoic acid ointment (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete's foot containing tolnaftate are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing reinfection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of amorolfine p. 1325 or tioconazole p. 1325 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

Pityriasis versicolor

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo. Alternatively, **selenium sulfide** shampoo [unlicensed indication] can be used as a lotion (diluting with a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as clotrimazole, econazole nitrate, ketoconazole, and miconazole, or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal. Relapse is common, especially in the immunocompromised.

Candidiasis

Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole, econazole nitrate, ketoconazole, or miconazole; topical terbinafine is an alternative. Topical application of nystatin p. 1311 is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 649; systemic treatment with terbinafine is not appropriate for refractory candidiasis.

Angular cheilitis

Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*.

Compound topical preparations

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 1339) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm.

Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of intertrigo associated with candida.

Antiviral preparations for the skin

Aciclovir cream p. 1329 is licensed for the treatment of initial and recurrent labial and genital *herpes simplex infections*; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for *herpes zoster* (*shingles*).

Herpes labialis

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream p. 1329.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth.

Parasiticidal preparations for the skin

Suitable quantities of parasiticidal preparations			
Area of body	Skin creams	Lotions	Cream rinses
Scalp (head lice)		50-100 mL	50-100 mL
Body (scabies)	30-60 g	100 mL	
Body (crab lice)	30-60 g	100 mL	
These amounts are usually suitable for an adult for single			

These amounts are usually suitable for an adult for single application.

Scabies

Permethrin p. 1329 is used for the treatment of *scabies* (*Sarcoptes scabiei*); malathion p. 1328 can be used if permethrin is inappropriate.

Benzyl benzoate p. 1328 is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 1368 (available on a named patient basis from 'special-order' manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone; further doses may be required.

Applicatio

Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching

The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 1360 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a **sedating antihistamine** at night may also be useful.

Head lice

Dimeticone p. 1328 is effective against head lice (*Pediculus humanus capitis*). It coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs and not recommended for use in children. Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

MHRA/CHM advice: Head lice eradication products: risk of serious burns if treated hair is exposed to open flames or other sources of ignition (March 2018)

Some products for the eradication of head lice infestations are combustible/flammable when on the hair and can ignite and cause serious harm in the presence of an open flame or other source of ignition such as when lighting cigarettes.

Patients and carers should be advised on the safe and correct use of head lice eradication treatments and if appropriate, should be advised that they should not smoke around treated hair and that it should be kept away from open flames or other sources of ignition, including in the morning after overnight application until hair is washed.

Wet combina methods

Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-topics/ Prescribing-and-Medicines/Scottish-Drug-Tariff/

Crab lice

Permethrin and malathion are used to eliminate *crab lice* (*Pthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

2.1 Bacterial skin infections

ANTIBACTERIALS > AMINOGLYCOSIDES

Neomycin sulfate

01-Jun-2021

• INDICATIONS AND DOSE

Bacterial skin infections

- ► TO THE SKIN
- Child: Apply up to 3 times a day, for short-term use only
- Adult: Apply up to 3 times a day, for short-term use only
- UNLICENSED USE
- ▶ In children Neomycin Cream BPC—no information available.
- CONTRA-INDICATIONS Neonates
- CAUTIONS
- Large areas
- In adults If large areas of skin are being treated ototoxicity may be a hazard, particularly in the elderly, and in those with renal impairment.
- In children If large areas of skin are being treated ototoxicity may be a hazard in children, particularly in those with renal impairment.
- INTERACTIONS → Appendix 1: neomycin
- SIDE-EFFECTS Sensitisation (cross sensitivity with other aminoglycosides may occur)
- RENAL IMPAIRMENT Ototoxicity may be a hazard if large areas of skin are treated.
- LESS SUITABLE FOR PRESCRIBING Neomycin sulfate cream is less suitable for prescribing.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), edetic acid (edta)

ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

Metronidazole

10-Nov-20

 DRUG ACTION Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

INDICATIONS AND DOSE

ACEA ®

Acute inflammatory exacerbation of rosacea

- ► TO THE SKIN
- Adult: Apply twice daily for 8 weeks, to be applied thinly

ANABACT

Malodorous fungating tumours and malodorous gravitational and decubitus ulcers

- ► TO THE SKIN
- Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

METROGEL®

Acute inflammatory exacerbation of rosacea

- ► TO THE SKIN
- Adult: Apply twice daily for 8–9 weeks, to be applied thinly

Malodorous fungating tumours

- ► TO THE SKIN
- Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

METROSA ^e

Acute exacerbation of rosacea

- ► TO THE SKIN
- Adult: Apply twice daily for up to 8 weeks, to be applied thinly

ROSICED [®]

Inflammatory papules and pustules of rosacea

- ► TO THE SKIN
- Adult: Apply twice daily for 6 weeks (longer if necessary)

ROZEX® CREAM

Inflammatory papules, pustules and erythema of rosacea

- ► TO THE SKIN
- ▶ Adult: Apply twice daily for 3-4 months

ROZEX® GEL

Inflammatory papules, pustules and erythema of rosacea

- ► TO THE SKIN
- ▶ Adult: Apply twice daily for 3-4 months

ZYOMET

Acute inflammatory exacerbation of rosacea

- ► TO THE SKIN
- Adult: Apply twice daily for 8–9 weeks, to be applied thinly
- CAUTIONS Avoid exposure to strong sunlight or UV light
- INTERACTIONS → Appendix 1: metronidazole
- SIDE-EFFECTS
- ► Common or very common Skin reactions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ANTIBACTERIALS > SULFONAMIDES

Silver sulfadiazine

14-Dec-2020

• INDICATIONS AND DOSE

Prophylaxis and treatment of infection in burn wounds

- ► TO THE SKIN
- Child: Apply daily, may be applied more frequently if very exudative
- Adult: Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries

- ► TO THE SKIN
- Child: Apply every 2-3 days, consult product literature for details
- Adult: Apply every 2–3 days, consult product literature for details

Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions

- ► TO THE SKIN
- Adult: (consult product literature)

Adjunct to short-term treatment of infection in pressure sores

- ► TO THE SKIN
- Adult: Apply once daily or on alternate days

As an adjunct to short-term treatment of infection in leg

- ► TO THE SKIN
- Adult: Apply once daily or on alternate days, not recommended if ulcer is very exudative
- UNLICENSED USE
- In children No age range specified by manufacturer.
- CONTRA-INDICATIONS Not recommended for neonates
- CAUTIONS G6PD deficiency

CAUTIONS, FURTHER INFORMATION

- Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with side-effects and interactions as for sulfonamides if large areas of skin are treated.
- INTERACTIONS → Appendix 1: silver sulfadiazine
- SIDE-EFFECTS
- ► Common or very common Leucopenia · skin reactions
- ► Rare or very rare Argyria (following treatment of large areas of skin or long term use) renal failure

SIDE-EFFECTS, FURTHER INFORMATION Leucopenia developing 2—3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided

- blood counts are monitored carefully to ensure return to normality within a few days.
- ALLERGY AND CROSS-SENSITIVITY Every Caution in patients with sensitivity to sulfonamides.
 See, Cautions, further information.
- PREGNANCY Risk of neonatal haemolysis and methaemoglobinaemia in third trimester.
- BREAST FEEDING Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- HEPATIC IMPAIRMENT Manufacturer advises caution in significant hepatic impairment.
- RENAL IMPAIRMENT Manufacturer advises caution if significant impairment.
- MONITORING REQUIREMENTS Monitor for leucopenia.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises apply with sterile applicator.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Griseofulvin 10 mg per 1 gram Grisol 1% spray | 20 ml GSL £9.60 DT = £9.60

Terbinafine

16-Aug-2021

• INDICATIONS AND DOSE

Tinea nedis

- ► TO THE SKIN USING CREAM
- ▶ Adult: Apply 1–2 times a day for up to 1 week, to be applied thinly

- ▶ BY MOUTH USING TABLETS
- Adult: 250 mg once daily for 2-6 weeks

Tinea corporis

- ► TO THE SKIN USING CREAM
- ▶ Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
- ▶ BY MOUTH USING TABLETS
- Adult: 250 mg once daily for 4 weeks

Tinea cruris

- ► TO THE SKIN USING CREAM
- ▶ Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
- ► BY MOUTH USING TABLETS
- Adult: 250 mg once daily for 2-4 weeks

Dermatophyte infections of the nails

- ► BY MOUTH USING TABLETS
- Adult: 250 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

Cutaneous candidiasis | Pityriasis versicolor

- ► TO THE SKIN USING CREAM
- ▶ Adult: Apply 1-2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

CAUTIONS

- ▶ With oral use Psoriasis (risk of exacerbation) risk of lupus erythematosus
- With topical use Contact with eyes and mucous membranes should be avoided
- INTERACTIONS → Appendix 1: terbinafine
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Skin reactions
- SPECIFIC SIDE-EFFECTS ► Common or very common
- ▶ With oral use Appetite decreased arthralgia diarrhoea gastrointestinal discomfort · gastrointestinal disorder · headache · myalgia · nausea
- ▶ Uncommon
- With oral use Taste altered
- With topical use Pain
- ► Rare or very rare
- ▶ With oral use Agranulocytosis alopecia cutaneous lupus erythematosus · dizziness · hepatic disorders · malaise · neutropenia · photosensitivity reaction · sensation abnormal · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thrombocytopenia ·
- ► Frequency not known
- With oral use Anaemia · anxiety · depressive symptom · fatigue · fever · hearing impairment · influenza like illness · pancreatitis · pancytopenia · rhabdomyolysis · serum sickness-like reaction · smell altered · tinnitus · vasculitis · vision disorders
- With topical use Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION Liver toxicity With oral use; discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).

Serious skin reactions With oral use; discontinue treatment in progressive skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis).

PREGNANCY

- ▶ With topical use Manufacturer advises use only if potential benefit outweighs risk- animal studies suggest no adverse
- With oral use Manufacturer advises use only if potential benefit outweighs risk-no information available.
- BREAST FEEDING
- ▶ With topical use Manufacturer advises avoid—present in milk. Less than 5% of the dose is absorbed after topical

application of terbinafine; avoid application to mother's chest

With oral use Avoid—present in milk.

HEPATIC IMPAIRMENT

 With oral use Manufacturer advises avoid (risk of increased exposure).

RENAL IMPAIRMENT

 With oral use Evor Caution if creatinine clearance less than 50 mL/minute or serum creatinine concentration greater than 300 micromol/litre (limited information available).
 ♠ See p. 21.

• MONITORING REQUIREMENTS

 With oral use Monitor hepatic function before treatment and then periodically after 4–6 weeks of treatment discontinue if abnormalities in liver function tests.

PATIENT AND CARER ADVICE

With oral use Manufacturer advises that patients should immediately report any signs or symptoms suggestive of liver dysfunction such as pruritus, unexplained persistent nausea, decreased appetite, anorexia, jaundice, vomiting, fatigue, right upper abdominal pain, dark urine, or pale stools. Patients with these symptoms should discontinue taking terbinafine and the patient's liver function should be immediately evaluated.

EXCEPTIONS TO LEGAL CATEGORY

With topical use Preparations of terbinafine hydrochloride (maximum 1%) can be sold to the public for use in those over 16 years for external use for the treatment of tinea pedis as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing maximum 30 mL spray or as a gel in a pack containing maximum 30 g gel.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

3 Inflammatory skin conditions

3.1 Eczema and psoriasis

Eczema

06-May-2021

Types and management

Eczema (dermatitis) refers to a variety of skin conditions characterised by epidermal inflammation and itching. The main types of eczema are irritant, allergic contact, atopic, venous and discoid. Lichenification, due to scratching and rubbing, often presents in chronic eczema. Atopic eczema is one of the most common types and it usually involves itchy, red, dry skin which can become infected and lichenified.

Evgr Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

[Evos] Frequent and liberal use of emollients is advised for dry skin and itching associated with eczema. The choice of emollient is dependent on the dryness of the skin, and patient preference; this can be supplemented with bath or shower emollients. Emollients increase the efficacy of topical corticosteroids and have a steroid sparing action. The use of emollients should continue even if the eczema improves or if other treatment is being used. Aqueous cream is generally not recommended due to the high risk of developing skin reactions

Topical corticosteroids are also often required in the management of eczema; the potency of the corticosteroid should be used in accordance to the severity and site of the condition. For eczema on the face, genitals, or axillae, consider a mild potency topical corticosteroid and only increase to a moderate potency topical corticosteroid if necessary. Moderate to potent topical corticosteroids are generally required for use in adults with moderate or severe eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent topical corticosteroid is required. In patients with frequent flares, a topical corticosteroid can be applied to prevent further flares using various regimens (e.g. on 2 consecutive days each week). Emollient therapy should be continued during treatment with topical corticosteroids.

Under the care of a specialist, bandages (including those containing ichthammol with zinc oxide p. 1345) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. See Wound management products and elasticated garments p. 1767 for details of elasticated viscose stockinette tubular bandages and garments, and silk clothing.

Topical pimecrolimus p. 1347 is licensed for the treatment of mild to moderate atopic eczema. Tacrolimus p. 1347 is licensed for topical use in the treatment of moderate to severe atopic eczema. [EvG] Both are calcineurin inhibitors and should be considered as a second-line treatment option only, unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated by a specialist.

Antihistamines are not recommended for routine use in the management of atopic eczema. However, if there is severe itching or urticaria, consider a non-sedating antihistamine. A sedating antihistamine can be considered if itching causes sleep disturbance.

nfection

Evor Breaks in the skin caused by eczema are susceptible to bacterial infection (commonly with Staphylococcus aureus and occasionally with Streptococcus pyogenes) and may require treatment with a topical or systemic antibacterial. For further information, see Secondary bacterial infection of common skin conditions in Skin infections, antibacterial therapy p. 554. Episodes of infected eczema usually co-exist with a flare and will require management with treatments such as emollients and topical corticosteroids. (A)

Eczema can also be infected with herpes simplex virus.

[EvGr] Immediate referral to secondary care is required in patients presenting with suspected eczema herpeticum.

Severe refractory eczema

Ever Systemic drugs acting on the immune system (such as ciclosporin p. 904, azathioprine p. 902 [unlicensed indication], and mycophenolate mofetil p. 911 [unlicensed indication]) and phototherapy are available for the management of some cases of severe refractory eczema; they are used under specialist supervision. Dupilumab p. 1349 and baricitinib p. 1198 are options for the treatment of moderate to severe atopic eczema. (A)

Alitretinoin p. 1356 is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

Seborrhoeic dermatitis

Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast Malassezia and affects the scalp, paranasal areas, and eyebrows. [EVG] Shampoos active against the yeast (including those containing ketoconazole p. 1324 or coal tar p. 1345) and combinations of mild topical corticosteroids with suitable antimicrobials are used. (A)

Psoriasis Overview

07-Oct-2021

Psoriasis is an inflammatory skin disease that usually follows a relapsing and remitting course and may have nail or joint involvement. Different forms of psoriasis exist; chronic plaque psoriasis is the most common, and is characterised by epidermal thickening and scaling, usually affecting extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

Treatment

Evgr Offer topical treatment first-line to all patients with psoriasis. Topical treatment options include emollients, topical corticosteroids, coal tar preparations, and topical vitamin D or vitamin D analogues. When choosing topical treatment, consider patient preference, practical aspects of application, extent of psoriasis, and the variety of preparation forms available.

Emollients are widely used in psoriasis; they moisturise dry skin, reduce scaling, and relieve itching. They also soften cracked areas and help other topical treatments absorb through the skin to work more effectively. Some cases of mild psoriasis may settle with the use of emollients alone.

[vor Emollients may also be useful adjuncts to other more specific treatment.

Continuous long-term use of potent or very potent topical corticosteroids may cause psoriasis to become unstable, and

lead to irreversible skin atrophy and striae. Widespread use (greater than 10% of body surface area affected) can also lead to systemic and local side-effects. [FuGr] Patients who have been on intermittent or short courses of potent or very potent topical corticosteroids should be offered a review of treatment at least annually.

Consecutive use of potent topical corticosteroids should not be used for more than 8 weeks at any one site; 4 weeks for very potent topical corticosteroids. Application may be restarted after a 4-week 'treatment break'; non-steroid treatments, such as topical vitamin D and vitamin D analogues, may be continued during this time.

Coal tar p. 1345 has anti-inflammatory, antipruritic, and anti-scaling properties and is often combined with other topical treatments for psoriasis. Several coal tar preparations are available including ointments, shampoos, and bath additives. Fuel Newer products are preferred to older products containing crude coal tar (coal tar BP), which is malodorous and usually messier to apply.

Topical vitamin D and vitamin D analogue preparations are available as ointments, gels, scalp solutions, and lotions. Tacalcitol p. 1358 and calcitriol p. 1358 may be less irritating than calcipotriol p. 1357.

Psoriasis of the trunk and limbs

[EVGr] Offer a potent topical corticosteroid and a topical vitamin D or vitamin D analogue applied once daily (at different times of the day) for up to 4 weeks as initial treatment. If satisfactory control is not achieved after a maximum of 8 weeks, offer a topical vitamin D or vitamin D analogue alone applied twice daily. If satisfactory control is not achieved after 8–12 weeks of twice-daily topical vitamin D or vitamin D analogue, offer either a potent topical corticosteroid applied twice daily for up to 4 weeks, or a coal tar preparation. A combination product containing calcipotriol with betamethasone p. 1336 for up to 4 weeks is an alternative in patients unable to use twice-daily potent topical corticosteroids, a coal tar preparation, or in patients where a once-daily application would improve adherence. A very potent topical corticosteroid can be offered under specialist supervision for a maximum of 4 weeks when other topical treatments have failed.

In patients with treatment-resistant psoriasis of the trunk or limbs, consider treatment with short-contact dithranol p. 1345. Treatment should be given in a specialist setting or the patient should be provided with educational support for self-use.

Scalp psoriasis

EvGr Offer a potent topical corticosteroid applied once daily for up to 4 weeks as initial treatment. If satisfactory control is not achieved after 4 weeks, consider a different formulation of the potent topical corticosteroid (e.g. a shampoo or mousse) and/or topical agents to remove or soften adherent scale (e.g. agents containing salicylic acid, emollients, oils). These agents should be used prior to applying the potent topical corticosteroid to allow effective penetration. If response to potent topical corticosteroid treatment remains unsatisfactory after a further 4 weeks of treatment, offer a combination product containing calcipotriol with betamethasone for up to 4 weeks. If treatment with calcipotriol with betamethasone for up to 4 weeks does not give a satisfactory response, offer either a very potent corticosteroid applied twice daily for 2 weeks, or a coal tar preparation, or refer the patient to a specialist.

In patients with mild to moderate scalp psoriasis who cannot use topical corticosteroids, offer treatment with a topical vitamin D or vitamin D analogue only. If treatment with a vitamin D or vitamin D analogue for up to 8 weeks does not give a satisfactory response, either offer a coal tar preparation or refer the patient to a specialist. The use of coal tar-based shampoos alone for the treatment of severe scalp psoriasis is not recommended. (A)

Facial, flexural, and genital psoriasis

Ever Offer a mild or moderate potency topical corticosteroid as initial treatment. The face, flexures, and genitals are particularly vulnerable to steroid atrophy therefore topical corticosteroids should only be used short-term (e.g. 1–2 weeks per month). If response to a moderate potency topical corticosteroid is inadequate, or there is serious risk of side-effects from continuous use, offer a topical calcineurin inhibitor, such as pimecrolimus p. 1347 or tacrolimus p. 1347 unlicensed indications], for up to 4 weeks (initiated under specialist supervision).

Pustular or erythrodermic psoriasis

EvGr Widespread unstable psoriasis of erythrodermic or generalised pustular types requires urgent same-day specialist assessment and should be managed as a medical emergency. (A)

Phototherapy

Phototherapy is available under the supervision of an appropriately trained healthcare professional. Ever Narrowband ultraviolet B (UVB) phototherapy can be offered to patients with plaque or guttate psoriasis in whom topical treatment has failed to achieve control. (A)

Photochemotherapy combining psoralen with ultraviolet A (PUVA) is available in specialist centres, given under the supervision of an appropriately trained healthcare professional. Psoralen enhances the effects of UVA and is administered either by mouth or topically. [EVGF] PUVA irradiation can be considered for the treatment of localised palmoplantar pustulosis and plaque-type psoriasis. (A) Cumulative doses increase the risk of dysplastic and neoplastic skin lesions, especially squamous cell cancer.

Evgr Topical adjunctive therapy may be considered in patients receiving broadband or narrowband UVB phototherapy who have plaques that are resistant, or show an inadequate response to phototherapy alone, or are at difficult-to-treat sites, or in patients unable to take systemic treatment. Concomitant treatment of actiretin and PUVA is not routinely recommended.

Systemic treatment

Non-biological treatment

Evsi Under the supervision of a specialist, systemic nonbiological treatment with methotrexate p. 987 or ciclosporin p. 904 may be offered to some patients with psoriasis that cannot be controlled with topical treatment *and* if the psoriasis has a significant impact on physical, psychological or social well-being. In addition, the psoriasis would have to be extensive, or localised with significant distress or functional impairment, or have failed phototherapy treatment.

Ciclosporin can be considered first-line in patients who need rapid or short-term disease control, have palmoplantar pustulosis, or who are considering conception (both men and women).

Only consider acitretin p. 1355 in patients where methotrexate and ciclosporin are not appropriate or have failed, or in patients with pustular forms of psoriasis.

Apremilast p. 1211 is licensed for the treatment of moderate to severe chronic plaque psoriasis in patients who failed to respond to other systemic treatments including ciclosporin, methotrexate, or PUVA, or in those who have contra-indications to or intolerance to these treatments.

Biological treatment

Ever Biological drugs should be initiated and supervised only by specialists experienced in the diagnosis and management of psoriasis. For guidance on biological therapies for the treatment of psoriasis, see NICE pathway: Psoriasis (available at: pathways.nice.org.uk/pathways/psoriasis).

CORTICOSTEROIDS

Topical corticosteroids

28-Oct-2021

Overview

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema, contact dermatitis, insect stings, and eczema of scabies. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective. Corticosteroids suppress the inflammatory reaction during use: they are not curative and on discontinuation a withdrawal reaction (rebound or flare) may occur. Withdrawal reactions are thought to occur after longterm continuous or inappropriate use of topical corticosteroids (particularly those of moderate to high potency). Signs and symptoms are reported to happen within days to weeks of stopping long-term topical corticosteroid treatment. A flare of the underlying skin disorder is the most common withdrawal reaction. Rarely, a specific type of withdrawal reaction may occur in which skin redness extends beyond the initial area of treatment, with burning or stinging that is worse than the original condition. For further information on topical corticosteroid withdrawal reactions, see Important safety information in the individual drug monograph).

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are **not** recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). See the role of topical corticosteroids in the treatment of psoriasis.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as *chronic discoid lupus erythematosus*, *lichen simplex chronicus*, *hypertrophic lichen planus*, and *palmoplantar pustulosis*. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as keloid scars, hypertrophic lichen planus, or localised alopecia areata.

Perioral lesions

Hydrocortisone cream 1% p. 1339 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole cream or ointment p. 1344 is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including streptococci and staphylococci.

Choice of formulation

Water-miscible corticosteroid *creams* are suitable for moist or weeping lesions whereas *ointments* are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. *Lotions* may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. *Occlusive polythene* or *hydrocolloid dressings* increase absorption, but also increase the risk of side effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF publications topical corticosteroids for the skin are categorised as 'mild', 'moderately potent', 'potent' or 'very potent'; the **least potent** preparation which is effective should be chosen but dilution should be avoided whenever possible.

Absorption through the skin

Mild and moderately potent topical corticosteroids are associated with few side-effects but care is required in the use of potent and very potent corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing's syndrome, depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion.

For further information on side-effects that may occur from absorption through the skin, see Corticosteroids, general use p. 737.

Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

Area of body	Creams and Ointments
Face and neck	15 to 30 g
Both hands	15 to 30 g
Scalp	15 to 30 g
Both arms	30 to 60 g
Both legs	100 g
Trunk	100 g
Groins and genitalia	15 to 30 g

These amounts are usually suitable for an adult for a single daily application for 2 weeks

Compound preparations

The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid p. 1381 facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

Topical corticosteroid preparation potencies

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

Hydrocortisone 0.1–2.5%

- Dioderm
- Mildison
- Synalar 1 in 10 dilution

Mild with antimicrobials

- Canesten HC
- Daktacort
- Econacort Fucidin H
- · Hydrocortisone with chlorhexidine hydrochloride and nystatin
- Terra-Cortril
- Timodine

Moderate

- Betnovate-RD
- Eumovate
- Haelan
- Modrasone
- Synalar 1 in 4 Dilution
- Ultralanum Plain

Moderate with antimicrobials

Trimovate

Moderate with urea

Alphaderm

- Beclometasone dipropionate 0.025%
- Betamethasone valerate 0.1%
- Betacan

Potent

- Betesil
- Bettamousse
- Betnovate
- Cutivate Diprosone
- Elocon
- Hvdrocortisone butvrate
- Locoid
- · Locoid Crelo
- Metosyn
- Mometasone furoate 0.1%
- Nerisone
- Synalar

Potent with antimicrobials

- Aureocort
- Betamethasone and clioquinol
- · Betamethasone and neomycin
- Fucibet
- Lotriderm
- Synalar C
- Synalar N

Potent with salicylic acid

Diprosalic

Very potent

- Clarelux
- Dermovate
- Etrivex
- Nerisone Forte

Very potent with antimicrobials

• Clobetasol with neomycin and nystatin

Use in children

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 1339 is useful for treating nappy rash and hydrocortisone 1% for atopic eczema in childhood. A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for

1-2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Carers of young children should be advised that treatment should not necessarily be reserved to 'treat only the worst areas' and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient's condition.

Corticosteroids (topical)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

NHS IMPROVEMENT PATIENT SAFETY ALERT: STEROID EMERGENCY CARD TO SUPPORT EARLY RECOGNITION AND TREATMENT OF ADRENAL CRISIS IN ADULTS (AUGUST 2020)

A patient-held Steroid Emergency Card has been developed for patients with adrenal insufficiency and steroid dependence who are at risk of adrenal crisis. It aims to support healthcare staff with the early recognition of patients at risk of adrenal crisis and the emergency treatment of adrenal crisis. All eligible patients should be issued a Steroid Emergency Card. Providers that treat patients with acute physical illness or trauma, or who may require emergency treatment, elective surgery, or other invasive procedures, should establish processes to check for risk of adrenal crisis and confirm if the patient has a Steroid Emergency Card.

PAEDIATRIC STEROID TREATMENT CARD FOR CHILDREN WITH ADRENAL INSUFFICIENCY (NOVEMBER 2020)

The British Society for Paediatric Endocrinology and Diabetes (BSPED) has developed a Paediatric Steroid Treatment Card which should be issued to children with adrenal insufficiency and steroid dependence. The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients. The BSPED Paediatric Steroid Treatment Card is available at: www.endocrinology.org/adrenal-crisis.

MHRA/CHM ADVICE: TOPICAL CORTICOSTEROIDS: INFORMATION ON THE RISK OF TOPICAL STEROID WITHDRAWAL REACTIONS (SEPTEMBER 2021)

Rarely, long-term continuous or inappropriate use of topical corticosteroids, particularly those of moderate to high potency, can result in the development of rebound flares, reported as dermatitis with intense redness, stinging, and burning that can spread beyond the initial treatment area.

The MHRA advises that the lowest potency topical corticosteroid needed should be used. For patients who are currently on long-term topical corticosteroid treatment, consider reducing potency or frequency of application (or both). Healthcare professionals should also be vigilant for the signs and symptoms of topical corticosteroid withdrawal reactions and review the position statement from the National Eczema Society

and British Association of Dermatologists eczema.org/wp-content/uploads/Topical-Steroid-Withdrawal-position-statement.pdf.

Healthcare professionals should inform patients:

- how much should be applied, as under-use can prolong treatment duration;
- how long they should use a topical corticosteroid for, especially on sensitive areas such as the face and genitals;
- to always apply topical corticosteroids as instructed and consult the patient information leaflet provided;
- to seek medical advice before using a topical corticosteroid on a new body area, as some areas of the body are more prone to side-effects;
- to return for medical advice if their skin condition worsens while using topical corticosteroid, and advise them when it would be appropriate to re-treat without a consultation and:
- if their skin worsens within 2 weeks of stopping a topical corticosteroid, treatment should not be started again without consulting their doctor unless they have previously been advised to do so

The MHRA advises healthcare professionals to report any suspected adverse effects, via the Yellow Card Scheme, even when the adverse affects occur after stopping corticosteroid treatment.

- CONTRA-INDICATIONS Acne · perioral dermatitis · potent corticosteroids in widespread plaque psoriasis · rosacea · untreated bacterial, fungal or viral skin lesions
- CAUTIONS Avoid prolonged use (particularly on the face) cautions applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use dermatoses of infancy, including nappy rash (extreme caution required—treatment should be limited to 5–7 days) (in children) · infection · keep away from eyes · use potent or very potent topical corticosteroids under specialist supervision (in children) · use potent or very potent topical corticosteroids under specialist supervision in psoriasis (can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity) (in adults)
- SIDE-EFFECTS
- ► Common or very common Skin reactions telangiectasia
- Rare or very rare Adrenal suppression · hypertrichosis · skin depigmentation (may be reversible)
- ► Frequency not known Local reaction · vasodilation SIDE-EFFECTS, FURTHER INFORMATION Side-effects applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use. In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.
- DIRECTIONS FOR ADMINISTRATION [SUGT] Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. (♣) Topical corticosteroids should be applied in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a fingertip unit (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). [Sugr Several minutes should elapse between application of topical corticosteroids and emollients. (♣)

- In children 'Wet-wrap bandaging' increases absorption into the skin, but should be initiated under the supervision of a trained healthcare professional.
- PRESCRIBING AND DISPENSING INFORMATION The potency
 of each topical corticosteroid should be included on the
 label with the directions for use. The label should be
 attached to the container (for example, the tube) rather
 than the outer packaging.
- PATIENT AND CARER ADVICE If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

If systemic absorption occurs following topical and local use, side-effects applicable to systemic corticosteroids may apply.

Alclometasone dipropionate

Inflammatory skin disorders such as eczemas

► TO THE SKIN

INDICATIONS AND DOSE

- ▶ Child: Apply 1–2 times a day, to be applied thinly
- ► Adult: Apply 1–2 times a day, to be applied thinly
- ▶ Alclometasone dipropionate cream 0.05%: moderate
- UNLICENSED USE Licensed for use in children (age range not specified by manufacturer).
- PATIENT AND CARER ADVICE Patients or carers should be counselled on the application of alclometasone dipropionate cream.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 28
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol

Alclometasone dipropionate (Non-proprietary)

• INDICATIONS AND DOSE

DOVOBET ® GEL

Scalp psoriasis

- ► TO THE SKIN
- Adult: Apply 1-4 g once daily usual duration of therapy 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, shampoo off after leaving on scalp overnight or during day, when different preparations containing calcipotriol used together, maximum total calcipotriol 5 mg in any one week

Mild to moderate plaque psoriasis

- ► TO THE SKIN
- Adult: Apply once daily for 8 weeks; if necessary, treatment may be continued beyond 8 weeks or repeated, on the advice of a specialist, apply to maximum 30% of body surface, when different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week; maximum 15 g per day

DOVOBET ® OINTMENT

Stable plaque psoriasis

- ► TO THE SKIN
- Adult: Apply once daily for 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, apply to a maximum 30% of body surface, when different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week; maximum 15 g per day

ENSTILAR®

Psoriasis [flare treatment]

- ► TO THE SKIN
- Adult: Apply once daily for 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, apply to a maximum 30% of body surface; maximum 15 g per day

Psoriasis [maintenance treatment]

- ► TO THE SKIN
- Adult: Apply twice weekly if adequate response is achieved after 4 weeks of once-daily treatment, apply on 2 non-consecutive days to previously affected areas and to a maximum 30% of body surface, once-daily treatment should be restarted if relapse occurs; maximum 15 g per day
- CONTRA-INDICATIONS Erythrodermic psoriasis · pustular psoriasis
- INTERACTIONS → Appendix 1: corticosteroids · vitamin D substances

Clobetasol propionate

INDICATIONS AND DOSE

Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids |

- ► TO THE SKIN
- ► Child 1-17 years: Apply 1-2 times a day for up to 4 weeks, to be applied thinly
- Adult: Apply 1–2 times a day for up to 4 weeks, to be applied thinly, maximum 50 g of 0.05% preparation per week

POTENCY

 Clobetasol propionate 0.05% cream, foam, ointment, scalp application, and shampoo: very potent.

ETRIVEX [©]

Moderate scalp psoriasis

- ► TO THE SKIN
- Adult: Apply once daily maximum duration of treatment 4 weeks, to be applied thinly then rinsed off after 15 minutes; frequency of application should be reduced after clinical improvement
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer clobetasol propionate foam, liquid (scalp application), cream, ointment and shampoo.

Scalp application Patients or carers should be advised to apply foam directly to scalp lesions (foam begins to subside immediately on contact with skin).

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, paste
