▶ Neonate 7 days to 28 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

▶ Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

Cystic fibrosis (treatment of asymptomatic *Haemophilus influenzae* carriage or mild exacerbation)

▶ BY MOUTH

▶ Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).

▶ Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day

▶ Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day

▶ Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)

▶ Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection.

▶ Neonate 7 days to 28 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection.

▶ Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

Lyme disease (under expert supervision)

▶ BY MOUTH

▶ Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg 3 times a day) usual duration 2–4 weeks.

▶ Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day usual duration 2–4 weeks

▶ Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day usual duration 2–4 weeks

▶ Child 5-17 years: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)

Anthrax (treatment and post-exposure prophylaxis)

▶ BY MOUTH

▶ Child (body-weight up to 20 kg): 80 mg/kg daily in 3 divided doses

▶ Child (body-weight 20 kg and above): 500 mg 3 times a day

Listerial meningitis (in combination with another antibiotic)

▶ BY INTRAVENOUS INFUSION

▶ Neonate up to 7 days: 50–100 mg/kg every 12 hours.

▶ Neonate 7 days to 28 days: 50–100 mg/kg every 8 hours.

▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

Group B streptococcal infection | Enterococcal endocarditis (in combination with another antibiotic)

▶ BY INTRAVENOUS INFUSION

▶ Neonate up to 7 days: 50 mg/kg every 12 hours.

▶ Neonate 7 days to 28 days: 50 mg/kg every 8 hours.

▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours) continued →

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease—if cover also needed for *Haemophilus influenzae*

- BY MOUTH
- Child 1 month–4 years: 125 mg twice daily
- Child 5–11 years: 250 mg twice daily
- Child 12–17 years: 500 mg twice daily

***Helicobacter pylori* eradication in combination with clarithromycin and omeprazole**

- BY MOUTH
- Child 1–5 years: 250 mg twice daily
- Child 6–11 years: 500 mg twice daily
- Child 12–17 years: 1 g twice daily

***Helicobacter pylori* eradication in combination with metronidazole and omeprazole**

- BY MOUTH
- Child 1–5 years: 125 mg 3 times a day
- Child 6–11 years: 250 mg 3 times a day
- Child 12–17 years: 500 mg 3 times a day

- **UNLICENSED USE** Amoxicillin doses in BNF Publications may differ from those in product literature.

● **CAUTIONS**

GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)

SPECIFIC CAUTIONS

- With intravenous use Accumulation of sodium can occur with high parenteral doses
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
- **Common or very common** Nausea · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
- **Rash** If rash occurs, discontinue treatment.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Reduce dose in severe impairment; rashes more common. Risk of crystalluria with high doses (particularly during parenteral therapy). Accumulation of sodium from injection can occur in patients with renal failure.
- **DIRECTIONS FOR ADMINISTRATION** Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50 mg/mL (100 mg/mL for neonates). May be further diluted with Glucose 5% or Glucose 10% or Sodium chloride 0.9% or 0.45% for intravenous infusion. Give intravenous infusion over 30 minutes when using doses over 30 mg/kg.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations and sachets may include peach, strawberry, or lemon.

● **PATIENT AND CARER ADVICE**

Patient counselling is advised for Amoxicillin (Amoxil®) paediatric suspension (use of pipette). Medicines for Children leaflet: Amoxicillin for bacterial infections www.medicinesforchildren.org.uk/amoxicillin-bacterial-infections-0

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Amoxicillin capsules may be prescribed. Amoxicillin sachets may be prescribed as Amoxicillin Oral Powder. Amoxicillin Oral Suspension may be prescribed.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

ELECTROLYTES: May contain Sodium

Ampicillin

● **INDICATIONS AND DOSE**

Susceptible infections (including bronchitis, urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)

► BY MOUTH

- Neonate 7 days to 20 days: 30 mg/kg 3 times a day (max. per dose 125 mg).

- Neonate 21 days to 28 days: 30 mg/kg 4 times a day (max. per dose 125 mg).

- Child 1–11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

- Child 1–4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

- ▶ Child 5–11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)
- ▶ Child 12–17 years: 500 mg 4 times a day; increased if necessary to 1 g 4 times a day, use increased dose in severe infection
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

- ▶ Neonate 7 days to 20 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

- ▶ Neonate 21 days to 28 days: 30 mg/kg every 6 hours, increased if necessary to 60 mg/kg every 6 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.
- ▶ Child: 25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours), increased if necessary to 50 mg/kg every 6 hours (max. per dose 1 g every 6 hours), increased dose used in severe infection

Group B streptococcal infection | Enterococcal endocarditis (in combination with another antibacterial)

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 50 mg/kg every 12 hours.
- ▶ Neonate 7 days to 20 days: 50 mg/kg every 8 hours.
- ▶ Neonate 21 days to 28 days: 50 mg/kg every 6 hours.
- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

Listerial meningitis

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 100 mg/kg every 12 hours.
- ▶ Neonate 7 days to 20 days: 100 mg/kg every 8 hours.
- ▶ Neonate 21 days to 28 days: 100 mg/kg every 6 hours.
- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

● CAUTIONS

GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
 - ▶ Common or very common Nausea · vomiting
- ▶ **SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ Rash If rash occurs, discontinue treatment.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **RENAL IMPAIRMENT** If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common. Accumulation of electrolytes

contained in parenteral preparations can occur in patients with renal failure.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Administer at least 30 minutes before food.
- ▶ With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50–100 mg/mL. May be further diluted with glucose 5% or 10% or sodium chloride 0.9% or 0.45% for infusion. Give over 30 minutes when using doses of greater than 50 mg/kg to avoid CNS toxicity including convulsions.

Co-fluapicil

● INDICATIONS AND DOSE

Mixed infections involving beta-lactamase-producing staphylococci

▶ BY MOUTH

- ▶ Child 1 month–9 years: 125/125 mg every 6 hours
- ▶ Child 10–17 years: 250/250 mg every 6 hours
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child 1 month–1 year: 62.5/62.5 mg every 6 hours
- ▶ Child 2–9 years: 125/125 mg every 6 hours
- ▶ Child 10–17 years: 250/250 mg every 6 hours

Severe mixed infections involving beta-lactamase-producing staphylococci

▶ BY MOUTH

- ▶ Child 1 month–9 years: 250/250 mg every 6 hours
- ▶ Child 10–17 years: 500/500 mg every 6 hours
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child 1 month–1 year: 125/125 mg every 6 hours
- ▶ Child 2–9 years: 250/250 mg every 6 hours
- ▶ Child 10–17 years: 500/500 mg every 6 hours

IMPORTANT SAFETY INFORMATION

HEPATIC DISORDERS

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;

- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

● CAUTIONS

GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses · risk of kernicterus in jaundiced neonates when high doses given parenterally

● INTERACTIONS → Appendix 1: penicillins

● SIDE-EFFECTS

- ▶ **Common or very common** Gastro-intestinal disturbances · nausea · vomiting
- ▶ **Very rare** Cholestatic jaundice · hepatitis

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Rash If rash occurs, discontinue treatment.

● PREGNANCY Not known to be harmful.

● BREAST FEEDING Trace amount in milk, but appropriate to use.

● HEPATIC IMPAIRMENT Use with caution.

● RENAL IMPAIRMENT Reduce dose or frequency if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; rashes more common. Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

● EFFECT ON LABORATORY TESTS False-positive urinary glucose (if tested for reducing substances).

● PRESCRIBING AND DISPENSING INFORMATION Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

ANTIBACTERIALS > PENICILLINS, BROAD-SPECTRUM WITH BETA-LACTAMASE INHIBITOR

F 322

Co-amoxiclav

● INDICATIONS AND DOSE

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites

▶ BY MOUTH USING TABLETS

- ▶ Child 12–17 years: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate: 30 mg/kg every 12 hours.

- ▶ Child 1–2 months: 30 mg/kg every 12 hours
- ▶ Child 3 months–17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 125/31 suspension)

▶ BY MOUTH USING ORAL SUSPENSION

- ▶ Neonate: 0.25 mL/kilogram 3 times a day.

- ▶ Child 1–11 months: 0.25 mL/kilogram 3 times a day, dose doubled in severe infection
- ▶ Child 1–5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 250/62 suspension)

▶ BY MOUTH USING ORAL SUSPENSION

- ▶ Child 6–11 years: 0.15 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 400/57 suspension)

▶ BY MOUTH USING ORAL SUSPENSION

- ▶ Child 2 months–1 year: 0.15 mL/kilogram twice daily, doubled in severe infection
- ▶ Child 2–6 years (body-weight 13–21 kg): 2.5 mL twice daily, doubled in severe infection
- ▶ Child 7–12 years (body-weight 22–40 kg): 5 mL twice daily, doubled in severe infection
- ▶ Child 12–17 years (body-weight 41 kg and above): 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection

Severe dental infection with spreading cellulitis | Dental infection not responding to first-line antibacterial

▶ BY MOUTH USING TABLETS

- ▶ Child 12–17 years: 250/125 mg every 8 hours for 5 days

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses are expressed as co-amoxiclav.
- ▶ A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- **CONTRA-INDICATIONS** History of co-amoxiclav-associated jaundice or hepatic dysfunction · history of penicillin-associated jaundice or hepatic dysfunction

CAUTIONS

GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

CAUTIONS, FURTHER INFORMATION

- ▶ **Cholestatic jaundice** Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

- **INTERACTIONS** → Appendix 1: penicillins

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Cholestatic jaundice · hepatitis · nausea · vomiting
- ▶ **Rare** Dizziness · headache · prolongation of bleeding time
- ▶ **Frequency not known** Exfoliative dermatitis · Steven-Johnson syndrome · toxic epidermal necrolysis · vasculitis

SPECIFIC SIDE-EFFECTS

- ▶ **Rare**
- ▶ With intravenous use Phlebitis at injection site
- ▶ With oral use Superficial staining of teeth with suspension

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** If rash occurs, discontinue treatment.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amount in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT** Monitor liver function in liver disease.

RENAL IMPAIRMENT

- ▶ With oral use *Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets* : use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

Co-amoxiclav 400/57 suspension : avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- ▶ With intravenous use *Co-amoxiclav injection* : use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². Risk of crystalluria with high doses (particularly during parenteral therapy).

Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give

intermittently over 30–40 minutes. For intravenous injection, administer over 3–4 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

Flavours of oral liquid formulations may include raspberry and orange.

ANTIBACTERIALS > PENICILLINS, MECILLINAM-TYPE

F 322

Pivmecillinam hydrochloride

● INDICATIONS AND DOSE

Acute uncomplicated cystitis

► BY MOUTH

- Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days

Chronic or recurrent bacteriuria

► BY MOUTH

- Child (body-weight 40 kg and above): 400 mg every 6–8 hours

Urinary-tract infections

► BY MOUTH

- Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses

- **UNLICENSED USE** Not licensed for use in children under 3 months.
- **CONTRA-INDICATIONS** Carnitine deficiency · gastro-intestinal obstruction · infants under 3 months · oesophageal strictures
- **CAUTIONS** Avoid in acute porphyrias p. 577
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · dizziness · headache · nausea · vomiting
 - **Frequency not known** Mouth ulcers · oesophagitis · reduced serum and total body carnitine (especially with long-term or repeated use)
- **PREGNANCY** Not known to be harmful, but manufacturer advises avoid.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **MONITORING REQUIREMENTS** Liver and renal function tests required in long-term use.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.
- **PATIENT AND CARER ADVICE** Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).

Flucloxacillin

● INDICATIONS AND DOSE

Infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia | Adjunct in impetigo | Adjunct in cellulitis

► BY MOUTH

- Neonate up to 7 days: 25 mg/kg twice daily.

- Neonate 7 days to 20 days: 25 mg/kg 3 times a day.

- Neonate 21 days to 28 days: 25 mg/kg 4 times a day.

- Child 1 month–1 year: 62.5–125 mg 4 times a day

- Child 2–9 years: 125–250 mg 4 times a day

- Child 10–17 years: 250–500 mg 4 times a day

► BY INTRAMUSCULAR INJECTION

- Child: 12.5–25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours)

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Neonate up to 7 days: 25 mg/kg every 12 hours.

- Neonate 7 days to 20 days: 25 mg/kg every 8 hours.

- Neonate 21 days to 28 days: 25 mg/kg every 6 hours.

- Child: 12.5–25 mg/kg every 6 hours (max. per dose 1 g every 6 hours)

Severe infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia (severe infection) | Adjunct in impetigo (severe infection) | Adjunct in cellulitis (severe infection)

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Neonate up to 7 days: 50 mg/kg every 12 hours.

- Neonate 7 days to 20 days: 50 mg/kg every 8 hours.

- Neonate 21 days to 28 days: 50 mg/kg every 6 hours.

- Child: 25–50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Endocarditis (in combination with other antibacterial if necessary)

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Osteomyelitis

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Neonate up to 7 days: 50–100 mg/kg every 12 hours.

- Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.

- Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.

- Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Cerebral abscess | Staphylococcal meningitis

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 50–100 mg/kg every 12 hours.

► Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.

► Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.

► Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Staphylococcal lung infection in cystic fibrosis

► BY MOUTH

► Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—primary prevention

► BY MOUTH

► Neonate: 125 mg twice daily.

► Child 1 month–3 years: 125 mg twice daily

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—secondary prevention

► BY MOUTH

► Child: 50 mg/kg twice daily (max. per dose 1 g twice daily)

IMPORTANT SAFETY INFORMATION**HEPATIC DISORDERS**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin
- flucloxacillin should be used with caution in patients with hepatic impairment
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials

● CAUTIONS

► With intravenous use Accumulation of electrolytes can occur with high doses • risk of kernicterus in jaundiced neonates when high doses given parenterally

● **INTERACTIONS** → Appendix 1: penicillins

● SIDE-EFFECTS

► **Common or very common** Gastrointestinal disturbances

► **Very rare** Cholestatic jaundice • hepatitis

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

● **HEPATIC IMPAIRMENT** Use with caution.

● **RENAL IMPAIRMENT** Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

► With intravenous use Accumulation of electrolytes can occur in patients with renal failure.

● **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute reconstituted solution in Glucose 5% or

Sodium Chloride 0.9% and give intermittently over 30–60 minutes.

ANTIBACTERIALS > POLYMYXINS**Colistimethate sodium**

18-Dec-2016

(Colistin sulfomethate sodium)

- **DRUG ACTION** The polymyxin antibiotic, **colistimethate sodium** (colistin sulfomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

● INDICATIONS AND DOSE

Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii* and *Klebsiella pneumoniae*

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child (body-weight up to 60 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection

► Child (body-weight 60 kg and above): 1–2 million units 3 times a day, to be administered into a totally implantable venous access device when giving via slow intravenous injection; maximum 6 million units per day

continued →

Adjunct to standard antibacterial therapy for *Pseudomonas aeruginosa* infection in cystic fibrosis

► BY INHALATION OF NEBULISED SOLUTION

- Child 1 month–1 year: 0.5–1 million units twice daily, adjusted according to response, increased to 1 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*
- Child 2–17 years: 1–2 million units twice daily, adjusted according to response, increased to 2 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*

► BY INHALATION OF POWDER

- Child 6–17 years: 1.66 million units twice daily

PROMIXIN® INJECTION

Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, *Klebsiella pneumoniae*

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child (body-weight up to 40 kg): 75 000–150 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection
- Child (body-weight 40 kg and above): 9 million units daily in 2–3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection

PROMIXIN® NEBULISER SOLUTION

Management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis

► BY INHALATION OF NEBULISED SOLUTION

- Child 1 month–1 year: 0.5–1 million units twice daily, for specific advice on administration using nebulisers—consult product literature; maximum 2 million units per day
- Child 2–17 years: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day

- **CONTRA-INDICATIONS** Myasthenia gravis

● CAUTIONS

GENERAL CAUTIONS

Acute porphyrias p. 577

SPECIFIC CAUTIONS

- When used by inhalation Severe haemoptysis—risk of further haemorrhage

- **INTERACTIONS** → Appendix 1: colistimethate

● SIDE-EFFECTS

- Common or very common
- When used by inhalation Bronchospasm · cough · dysphonia · nausea · sore mouth · Sore throat · taste disturbances · vomiting
- Uncommon
- When used by inhalation Hypersalivation · thirst
- Rare
- With intravenous use Vasomotor instability
- Frequency not known
- With intravenous use Apnoea · confusion · headache · muscle weakness · nephrotoxicity · neurotoxicity reported especially with excessive doses · perioral paraesthesia · peripheral paraesthesia · psychosis · rash · slurred speech · vertigo · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- Dose-related side-effects The major adverse effects are dose-related neurotoxicity and nephrotoxicity.

● PREGNANCY

- When used by inhalation Clinical use suggests probably safe.

- With intravenous use Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

● RENAL IMPAIRMENT

- With intravenous use Reduce dose. Monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended 'peak' plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre; pre-dose ('trough') concentration 2–6 mg/litre.

● MONITORING REQUIREMENTS

- With intravenous use Monitor renal function.
- When used by inhalation Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

● DIRECTIONS FOR ADMINISTRATION

- When used by inhalation Other inhaled drugs should be administered before colistimethate sodium. For nebulisation administer required dose in 2–4 mL of sodium chloride 0.9% (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.
- With intravenous use For intravenous infusion, dilute to a concentration of 40 000 units/mL with Sodium Chloride 0.9%; give over 30 minutes. For slow intravenous injection into a totally implantable venous access device, dilute to a concentration of 90 000 units/mL with Sodium Chloride 0.9% for child under 12 years (200 000 units/mL for child over 12 years).

COLOMYCIN® Colomycin® Injection may be used for nebulisation; administer required dose in 2–4 mL of sodium chloride 0.9%, (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.

● PRESCRIBING AND DISPENSING INFORMATION

Colistimethate sodium is included in some preparations for topical application.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, confusion and visual disturbances.

- When used by inhalation Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Colistimethate sodium by dry powder inhalation for pseudomonas lung infection in cystic fibrosis (March 2013) NICE TA276

Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA276

ANTIBACTERIALS > QUINOLONES

Quinolones

Overview

Ciprofloxacin below is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin is licensed in children over 1 year of age for pseudomonal infections in cystic fibrosis, for complicated urinary-tract infections, and for treatment and prophylaxis of inhalation anthrax. When the benefits of treatment outweigh the risks, ciprofloxacin is licensed in children over 1 year of age for severe infections of the respiratory tract and of the gastro-intestinal system (including typhoid fever). It is also used in the treatment of septicemia caused by multi-resistant organisms (usually hospital acquired) and gonorrhoea (although resistance is increasing). Ciprofloxacin is also used in the prophylaxis of meningococcal disease.

Nalidixic acid p. 335 may be used in uncomplicated urinary-tract infections that are resistant to other antibiotics in children over 3 months of age.

Many staphylococci are resistant to quinolones and their use should be avoided in MRSA infections.

Olofloxacin eye drops p. 648 are used in ophthalmic infections.

There is much less experience of the other quinolones in children; expert advice should be sought.

Quinolones

IMPORTANT SAFETY INFORMATION

The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

TENDON DAMAGE

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

- **CONTRA-INDICATIONS** History of tendon disorders related to quinolone use

- **CAUTIONS** Can prolong the QT interval · children or adolescents (arthropathy has developed in weight-bearing joints in young *animals*) · conditions that predispose to seizures · diabetes (may affect blood glucose) · exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs) · G6PD deficiency · history of epilepsy · myasthenia gravis (risk of exacerbation)

CAUTIONS, FURTHER INFORMATION Quinolones cause arthropathy in the weight-bearing joints of immature *animals* and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children.

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · dizziness · headache · nausea · vomiting
- ▶ **Uncommon** Abdominal pain · anorexia · anxiety · arthralgia · asthenia · blood disorders · confusion · depression · disturbances in taste · disturbances in vision · dyspepsia · eosinophilia · hallucinations · leucopenia · myalgia · rash · sleep disturbances · thrombocytopenia · tremor
- ▶ **Rare** Antibiotic-associated colitis · convulsions · disturbances in hearing · disturbances in smell · dyspnoea · hepatic dysfunction · hepatitis · hypotension · interstitial nephritis · jaundice · photosensitivity · psychoses · renal failure · symptoms of peripheral neuropathy (sometimes irreversible) · tendon damage · tendon inflammation · vasculitis
- ▶ **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

The drug should be **discontinued** if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

- **ALLERGY AND CROSS-SENSITIVITY** Use of quinolones contra-indicated in quinolone hypersensitivity.
- **PREGNANCY** Avoid in pregnancy—shown to cause arthropathy in *animal* studies; safer alternatives are available.

▮ above

Ciprofloxacin

● INDICATIONS AND DOSE

Fistulating Crohn's disease

- ▶ BY MOUTH
- ▶ Child: 5 mg/kg twice daily

Severe respiratory-tract infections, gastro-intestinal infection

- ▶ BY MOUTH
- ▶ Neonate: 15 mg/kg twice daily.
- ▶ Child: 20 mg/kg twice daily (max. per dose 750 mg)

continued →

► BY INTRAVENOUS INFUSION

- Neonate: 10 mg/kg every 12 hours, to be given over 60 minutes.

- Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes

Pseudomonal lower respiratory-tract infection in cystic fibrosis

► BY MOUTH

- Child: 20 mg/kg twice daily (max. per dose 750 mg)

► BY INTRAVENOUS INFUSION

- Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes

Complicated urinary-tract infections

► BY MOUTH

- Neonate: 10 mg/kg twice daily.

- Child: 10 mg/kg twice daily, dose to be doubled in severe infection (max. 750 mg twice daily)

► BY INTRAVENOUS INFUSION

- Neonate: 6 mg/kg every 12 hours, to be given over 60 minutes.

- Child: 6 mg/kg every 8 hours; increased to 10 mg/kg every 8 hours (max. per dose 400 mg), in severe infection

Gonorrhoea

► BY MOUTH

- Child 12–17 years: 500 mg for 1 dose

Anthrax (treatment and post-exposure prophylaxis)

► BY MOUTH

- Child: 15 mg/kg twice daily (max. per dose 500 mg)

► BY INTRAVENOUS INFUSION

- Child: 10 mg/kg every 12 hours (max. per dose 400 mg)

Prevention of secondary case of meningococcal meningitis

► BY MOUTH

- Neonate: 30 mg/kg (max. per dose 125 mg) for 1 dose.

- Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose

- Child 5–11 years: 250 mg for 1 dose

- Child 12–17 years: 500 mg for 1 dose

- **UNLICENSED USE** Not licensed for use in children under 1 year of age. Licensed for use in children over 1 year for complicated urinary-tract infections, for pseudomonal lower respiratory-tract infections in cystic fibrosis, for prophylaxis and treatment of inhalational anthrax. Licensed for use in children over 1 year for other infections where the benefit is considered to outweigh the potential risks. Not licensed for use in children for gastro-intestinal anthrax. Not licensed for use in children for prophylaxis of meningococcal meningitis.

- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · avoid excessive alkalinity of urine (risk of crystalluria) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · ensure adequate fluid intake (risk of crystalluria) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)

- **INTERACTIONS** → Appendix 1: quinolones

● **SIDE-EFFECTS**

- **Common or very common** Flatulence

- **With intravenous use** Pain at injection site · phlebitis at injection site

- **Rare** Abnormal dreams · chest pain · dysphagia · dyspnoea · erythema nodosum · hot flushes · hyperglycaemia ·

hypoglycaemia · oedema · pancreatitis · sweating · syncope · tachycardia

- **Very rare** Intracranial hypertension · movement disorders · tenosynovitis · tinnitus · vasculitis

- **Frequency not known** Peripheral neuropathy · polyneuropathy

- **PREGNANCY** A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.

- **BREAST FEEDING** Amount too small to be harmful but manufacturer advises avoid.

- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

● **PATIENT AND CARER ADVICE****Driving and skilled tasks**

May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

Nalidixic acid● **INDICATIONS AND DOSE****Treatment of urinary tract infection resistant to other antibiotics**► **BY MOUTH**

- Child 3 months–11 years: 12.5 mg/kg 4 times a day for 7 days, then reduced to 7.5 mg/kg 4 times a day for prolonged therapy in chronic infections
- Child 12–17 years: 900 mg 4 times a day for 7 days, then reduced to 600 mg 4 times a day for prolonged therapy in chronic infections

Prophylaxis of urinary tract infections resistant to other antibiotics► **BY MOUTH**

- Child 3 months–11 years: 15 mg/kg twice daily

- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · avoid in acute porphyrias p. 577 · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)

- **INTERACTIONS** → Appendix 1: quinolones

- **SIDE-EFFECTS** Cranial nerve palsy · increased intracranial pressure · metabolic acidosis · peripheral neuropathy · toxic psychosis

- **BREAST FEEDING** Risk to infant very small but one case of haemolytic anaemia reported.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in liver disease.

- **RENAL IMPAIRMENT** Use with caution; avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor blood counts, renal and liver function if treatment exceeds 2 weeks.

- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry and strawberry.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

ANTIBACTERIALS > SULFONAMIDES**Co-trimoxazole**

- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as **co-trimoxazole**) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

● **INDICATIONS AND DOSE****Treatment of susceptible infections**► **BY MOUTH**

- Child 6 weeks–5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily
- Child 6 months–5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
- Child 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
- Child 12–17 years: 960 mg twice daily
- **BY INTRAVENOUS INFUSION**
- Child 6 weeks–17 years: 18 mg/kg every 12 hours; increased to 27 mg/kg every 12 hours (max. per dose 1.44 g), increased dose used in severe infection

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)► **BY MOUTH, OR BY INTRAVENOUS INFUSION**

- Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections► **BY MOUTH**

- Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines

DOSE EQUIVALENCE AND CONVERSION

- 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

- **UNLICENSED USE** Not licensed for *Burkholderia cepacia* infections in cystic fibrosis. Not licensed for *Stenotrophomonas maltophilia* infections. Not licensed for use in children under 6 weeks.

IMPORTANT SAFETY INFORMATION**RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE**

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiasis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

- **CONTRA-INDICATIONS** Acute porphyrias p. 577
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency

- **INTERACTIONS** → Appendix 1: sulfamethoxazole, trimethoprim
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · headache · hyperkalaemia · nausea · rash
 - ▶ **Uncommon** Vomiting
 - ▶ **Rare** Agranulocytosis · bone marrow depression
 - ▶ **Very rare** Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · leucopenia · liver damage · megaloblastic anaemia · myalgia · myocarditis · pancreatitis · peripheral neuropathy · photosensitivity · pulmonary infiltrates · renal disorders · shortness of breath · Stevens-Johnson syndrome · stomatitis · systemic lupus erythematosus · thrombocytopenia · tinnitus · toxic epidermal necrolysis · uveitis · vasculitis · vertigo
 - ▶ **Frequency not known** Rhabdomyolysis reported in HIV-infected patients

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Blood disorders or rash Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.
- **PREGNANCY** Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease.
- **RENAL IMPAIRMENT** Use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored. Plasma concentration monitoring may be required in patients with moderate to severe renal impairment; seek expert advice.
- **MONITORING REQUIREMENTS**
 - ▶ Plasma concentration monitoring may be required with high doses; seek expert advice.
 - ▶ Monitor blood counts on prolonged treatment.
- **DIRECTIONS FOR ADMINISTRATION** For intermittent intravenous infusion, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.
- **PRESCRIBING AND DISPENSING INFORMATION** Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.
 - Flavours of oral liquid formulations may include banana, or vanilla.

Sulfadiazine

(Sulphadiazine)

- **DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

INDICATIONS AND DOSE

Toxoplasmosis in pregnancy (in combination with pyrimethamine and folic acid)

▶ BY MOUTH

▶ Child 12–17 years: 1 g 3 times a day until delivery

Congenital toxoplasmosis (in combination with pyrimethamine and folic acid)

▶ BY MOUTH

▶ Neonate: 50 mg/kg twice daily for 12 months.

- **UNLICENSED USE** Not licensed for use in toxoplasmosis.

- **CONTRA-INDICATIONS** Acute porphyrias p. 577

- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks (except for treatment or prophylaxis of *pneumocystis pneumonia*) because of the risk of kernicterus · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency

- **INTERACTIONS** → Appendix 1: sulfonamides

SIDE-EFFECTS

ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

Tetracyclines

Overview

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. In children over 12 years of age they are useful for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 338 with either streptomycin p. 299 or rifampicin p. 349), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic respiratory diseases (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 316).

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 339 which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines have a role in the management of meticillin-resistant *Staphylococcus aureus* (MRSA) infections.

Tetracyclines

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) • systemic lupus erythematosus (may be exacerbated)
- **SIDE-EFFECTS**
 - **Rare** Anaphylaxis • angioedema • blood disorders • exfoliative dermatitis • hepatotoxicity • hypersensitivity reactions • pancreatitis • pericarditis • photosensitivity (particularly with demeclocycline) • rash • Stevens-Johnson syndrome • urticaria
 - **Frequency not known** Antibiotic-associated colitis • benign intracranial hypertension • bulging fontanelles (in infants) • diarrhoea • dysphagia • headache • nausea • oesophageal irritation • visual disturbances • vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
 - **Benign intracranial hypertension** Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment).
- **PREGNANCY** Should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Should **not** be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **HEPATIC IMPAIRMENT** Should be avoided or used with caution in patients with hepatic impairment.

► above

Demeclocycline hydrochloride

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- **BY MOUTH**
- **Child 12-17 years:** 150 mg 4 times a day, alternatively 300 mg twice daily

- **CAUTIONS** Photosensitivity more common than with other tetracyclines
- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS** Acute renal failure • reversible nephrogenic diabetes insipidus
- **HEPATIC IMPAIRMENT** Max. 1 g daily in divided doses.
- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.
- **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight or sun lamps.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Doxycycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily

Severe infections (including refractory urinary-tract infections)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 200 mg daily

Acne

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg once daily

Early syphilis

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg twice daily for 14 days

Late latent syphilis

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg twice daily for 28 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg twice daily for 7 days

Pelvic inflammatory disease

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg twice daily for 14 days

Lyme disease (under expert supervision)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)

Anthrax (treatment or post-exposure prophylaxis)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 1 month–11 years: 2.5 mg/kg twice daily (max. per dose 100 mg twice daily), only to be used in children under 12 years if alternative antibacterial cannot be given
- Child 12–17 years: 100 mg twice daily

Prophylaxis of malaria

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

Adjunct to quinine in treatment of *Plasmodium falciparum* malaria

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 200 mg daily for 7 days

Periodontitis (as an adjunct to gingival scaling and root planing)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 20 mg twice daily for 3 months

- **UNLICENSED USE** Not licensed for use in children under 12 years. Doxycycline doses in BNF Publications may differ from those in product literature. Not licensed for severe recurrent aphthous ulceration. Not licensed for malaria prophylaxis during pregnancy. Not licensed for treatment or post-exposure prophylaxis of anthrax.

- **CAUTIONS** Alcohol dependence

- **INTERACTIONS** → Appendix 1: tetracyclines

- **SIDE-EFFECTS** Anorexia · anxiety · dry mouth · flushing · fungal superinfection (when used for periodontitis) · tinnitus

- **PREGNANCY** When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable,

and if the entire course of doxycycline can be completed before 15 weeks' gestation.

- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.
- **DIRECTIONS FOR ADMINISTRATION** Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.
- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture). Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

- **Tetralysal** (Galderma (UK) Ltd)

Lymecycline 408 mg Tetralysal 300 capsules | 28 capsule (PoM) £6.95 DT price = £5.14 | 56 capsule (PoM) £11.53

Minocycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg twice daily

Acne

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg once daily, alternatively 50 mg twice daily
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 100 mg daily

● **CAUTIONS** Systemic lupus erythematosus

● **INTERACTIONS** → Appendix 1: tetracyclines

● SIDE-EFFECTS

- **Rare** Acute renal failure · alopecia · anorexia · hyperaesthesia · impaired hearing · paraesthesia · pigmentation (sometimes irreversible) · tinnitus
- **Very rare** Discoloration of conjunctiva · discoloration of sweat · discoloration of tears · systemic lupus erythematosus
- **Frequency not known** Dizziness (more common in women) · vertigo (more common in women)

● **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).

● **MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

● **DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.

● **PATIENT AND CARER ADVICE** Counselling on administration advised (posture).

● **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

Oxytetracycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- BY MOUTH
- Child 12–17 years: 250–500 mg 4 times a day

Acne

- BY MOUTH
- Child 12–17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

● **INTERACTIONS** → Appendix 1: tetracyclines

● **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Oxytetracycline Tablets may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 23

► Oxytetracycline (Non-proprietary)

Oxytetracycline (as Oxytetracycline dihydrate)

250 mg Oxytetracycline 250mg tablets | 28 tablet [PoM] £3.45 DT price = £1.07 | 1000 tablet [PoM] no price available

Tetracycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia, mycoplasma)

- BY MOUTH
- Child 12–17 years: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections

Acne

- BY MOUTH
- Child 12–17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

Non-gonococcal urethritis

► BY MOUTH

- Child 12–17 years: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)

● **INTERACTIONS** → Appendix 1: tetracyclines

● **SIDE-EFFECTS** Acute renal failure · skin discoloration

● **HEPATIC IMPAIRMENT** Max. 1 g daily in divided doses.

● **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

● **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid while sitting or standing.

● **PATIENT AND CARER ADVICE** Counselling on administration advised.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Tetracycline Tablets may be prescribed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 23

► Tetracycline (Non-proprietary)

Tetracycline hydrochloride 250 mg Tetracycline 250mg tablets | 28 tablet [PoM] £13.90 DT price = £1.82

ANTIBACTERIALS > OTHER

Chloramphenicol

- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

● INDICATIONS AND DOSE

Life threatening infections particularly those caused by *Haemophilus influenzae* | Typhoid fever

► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child: 12.5 mg/kg every 6 hours, dose may be doubled in severe infections such as septicaemia, meningitis and epiglottitis providing plasma-chloramphenicol concentrations are measured and high doses reduced as soon as indicated

► BY INTRAVENOUS INJECTION

► Neonate up to 14 days: 12.5 mg/kg twice daily, doses should be checked carefully as overdosage can be fatal.

► Neonate 14 days to 28 days: 12.5 mg/kg 2–4 times a day, doses should be checked carefully as overdosage can be fatal.

Cystic fibrosis for the treatment of respiratory *Burkholderia cepacia* infection resistant to other antibacterials

► BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

► Child: (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 577

- **CAUTIONS** Avoid repeated courses and prolonged treatment

- **INTERACTIONS** → Appendix 1: chloramphenicol

● SIDE-EFFECTS

Blood disorders · depression · diarrhoea · dry mouth · erythema multiforme · glossitis · grey syndrome (in neonates) · headache · nausea · nocturnal haemoglobinuria · optic neuritis · peripheral neuritis · reversible and irreversible aplastic anaemia (with reports of resulting leukaemia) · stomatitis · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

- With intravenous use in neonates Grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism.

- **PREGNANCY** Manufacturer advises avoid; neonatal 'grey-baby syndrome' if used in third trimester.

- **BREAST FEEDING** Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause 'grey syndrome'.

- **HEPATIC IMPAIRMENT** Reduce dose. Avoid if possible—increased risk of bone-marrow depression. Monitor plasma-chloramphenicol concentration in hepatic impairment.

- **RENAL IMPAIRMENT** Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.

● MONITORING REQUIREMENTS

- Plasma concentration monitoring preferred in those under 4 years of age.

- Plasma concentration monitoring required in neonates. Grey baby syndrome may follow excessive doses in neonates with immature hepatic metabolism.

- Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre.

- Blood counts required before and periodically during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Displacement value may be significant for injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

ELECTROLYTES: May contain Sodium

► Chloramphenicol (Non-proprietary)

Chloramphenicol (as Chloramphenicol sodium succinate)

1 gram Chloramphenicol 1g powder for solution for injection vials | 1 vial [PoM] £22.00

Capsule

► Chloramphenicol (Non-proprietary)

Chloramphenicol 250 mg Chloramphenicol 250mg capsules | 60 capsule [PoM] £377.00 DT price = £377.00

Fosfomycin

22-Mar-2017

- **DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and Enterobacteriaceae.

● INDICATIONS AND DOSE

Acute uncomplicated lower urinary-tract infections (in females)

► BY MOUTH USING GRANULES

► Child 12–17 years (female): 3 g for 1 dose.

Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

► BY INTRAVENOUS INFUSION

► Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.

► Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.

► Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

► Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

► Child 12–17 years (body-weight 40 kg and above): 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

► BY INTRAVENOUS INFUSION

- Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.
- Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- Child 12–17 years (body-weight 40 kg and above): 12–16 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Bacterial meningitis when first-line treatment ineffective or inappropriate

► BY INTRAVENOUS INFUSION

- Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.
- Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- Child 12–17 years (body-weight 40 kg and above): 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

CAUTIONS

- With intravenous use Cardiac insufficiency · hyperaldosteronism · hypernatraemia · hypertension · pulmonary oedema

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- Common or very common Gastro-intestinal disturbances
- Uncommon Diarrhoea · nausea · rash · vomiting
- Frequency not known Abdominal pain · antibiotic-associated colitis

SPECIFIC SIDE-EFFECTS

- Common or very common
 - With oral use Diarrhoea · dizziness · headache
- Uncommon
 - With intravenous use Decreased appetite · dyspnoea · fatigue · headache · hypernatraemia · hypokalaemia · taste disturbances · vertigo
- Rare
 - With intravenous use Aplastic anaemia · blood disorders · eosinophilia
- Very rare
 - With intravenous use Fatty liver · visual impairment

Frequency not known

- With intravenous use Bronchospasm · confusion · hepatitis · jaundice · tachycardia
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.
- **RENAL IMPAIRMENT**
 - With oral use Avoid oral treatment if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
 - With intravenous use Age under 12 years (body-weight under 40 kg)—no information available. Age 12–18 years (body-weight over 40 kg)—use with caution if estimated glomerular filtration rate 40–80 mL/minute/1.73 m², and consult product literature for dose if estimated glomerular filtration rate less than 40 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - With intravenous use Monitor electrolytes and fluid balance.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. Reconstitute each 2-g vial with 50 mL Glucose 5% or Glucose 10% or Water for Injections; do not exceed infusion rate of 133 mg/minute.
 - With oral use Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.
- **PRESCRIBING AND DISPENSING INFORMATION** Doses expressed as fosfomycin base.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2015) that fosfomycin (*Fomicyt*®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

The *Scottish Medicines Consortium* has advised (September 2016) that fosfomycin trometamol (*Monuril*®) is accepted for use within NHS Scotland for the treatment of acute lower uncomplicated urinary tract infections, caused by pathogens sensitive to fosfomycin in adult and adolescent females and for prophylaxis in diagnostic and surgical transurethral procedures.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

► **Fomicyt** (Nordic Pharma Ltd)

Fosfomycin (as Fosfomycin sodium) 2 gram Fomicyt 2g powder for solution for infusion vials | 10 vial [PoM] £150.00

Fosfomycin (as Fosfomycin sodium) 4 gram Fomicyt 4g powder for solution for infusion vials | 10 vial [PoM] £300.00

Granules

CAUTIONARY AND ADVISORY LABELS 9, 13, 23

EXCIPIENTS: May contain Sucrose

► **Fosfomycin (Non-proprietary)**

Fosfomycin (as Fosfomycin trometamol) 3 gram Fosfomycin 3g granules sachets | 1 sachet [PoM] £75.45

► **Monuril** (Zambon S.p.A.)

Fosfomycin (as Fosfomycin trometamol) 3 gram Monuril 3g granules sachets | 1 sachet [PoM] £4.86

Capsule► **Fosfomycin (Non-proprietary)**

Fosfomycin calcium 500 mg Fosfocina 500mg capsules | 24 capsule [PoM] no price available

Fusidic acid

16-Jun-2017

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

● INDICATIONS AND DOSE

Staphylococcal skin infection

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate
- ▶ TO THE SKIN
- ▶ Child: Apply 3–4 times a day usually for 7 days

Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials

- ▶ BY MOUTH USING ORAL SUSPENSION

- ▶ Neonate: 15 mg/kg 3 times a day.

- ▶ Child 1–11 months: 15 mg/kg 3 times a day
- ▶ Child 1–4 years: 250 mg 3 times a day
- ▶ Child 5–11 years: 500 mg 3 times a day
- ▶ Child 12–17 years: 750 mg 3 times a day
- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections, dose expressed as sodium fusidate

Staphylococcal infections due to susceptible organisms

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate
- ▶ Child (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

DOSE EQUIVALENCE AND CONVERSION

- ▶ Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets. 500 mg of sodium fusidate is equivalent to 480 mg fusidic acid.

● CAUTIONS

- ▶ With systemic use Impaired transport and metabolism of bilirubin
- ▶ With topical use Avoid contact of cream or ointment with eyes

CAUTIONS, FURTHER INFORMATION

- ▶ Avoiding resistance
- ▶ With topical use To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

- **INTERACTIONS** → Appendix 1: fusidic acid

● SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Hepatic disorders · venous intolerance (reduced if given via central vein)
- ▶ With oral use Abdominal pain · diarrhoea · dyspepsia · nausea · vomiting
- ▶ With systemic use Dizziness · drowsiness
- ▶ **Uncommon**
- ▶ With systemic use Anorexia · headache · malaise · pruritus · rash · urticaria
- ▶ **Rare**
- ▶ With topical use Hypersensitivity reactions
- ▶ **Frequency not known**
- ▶ With oral use Hepatic disorders
- ▶ With systemic use Acute renal failure (usually with jaundice) · blood disorders · cholestasis · hepatorenal syndrome

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Hepatic disorders
- ▶ With systemic use Elevated liver enzymes, hyperbilirubinaemia and jaundice can occur—these effects are usually reversible following withdrawal of therapy.

● PREGNANCY

- ▶ With systemic use Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

● BREAST FEEDING

- ▶ With systemic use Present in milk—manufacturer advises caution.

● HEPATIC IMPAIRMENT

- ▶ With systemic use Manufacturer advises caution—monitor liver function periodically during treatment.

● MONITORING REQUIREMENTS

- ▶ With systemic use Manufacturer advises monitor liver function with high doses or on prolonged therapy; monitoring also advised for patients with biliary tract obstruction, those taking potentially hepatotoxic medication, or those taking concurrent medication with a similar excretion pathway.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intravenous infusion, give intermittently in Sodium chloride 0.9% or Glucose 5%; reconstitute each vial with 10 mL buffer solution, then add contents of vial to 500 mL infusion fluid to give a solution containing approximately 1 mg/mL. Give requisite dose via a central line over 2 hours (give over at least 6 hours if administered via a large peripheral vein).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and orange.

● PROFESSIONAL SPECIFIC INFORMATION

Dental practitioners' formulary

May be prescribed as Sodium Fusidate ointment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Fucidin (Sodium fusidate)** (LEO Pharma)

Sodium fusidate 250 mg Fucidin 250mg tablets | 10 tablet [PoM]
£6.02 DT price = £6.02 | 100 tablet [PoM] £54.99

Oral suspension

Fusidic acid 50 mg per 1 mL Fucidin 250mg/5ml oral suspension | 50 mL [PoM] £6.73 DT price = £6.73

Powder and solvent for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Fusidic acid (Non-proprietary)**

Sodium fusidate 500 mg Sodium fusidate 500mg powder and solvent for solution for infusion vials | 1 vial [PoM] £38.00

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Fusidic acid (Non-proprietary)**

Fusidic acid 20 mg per 1 gram Fusidic acid 2% cream | 15 gram [PoM] £1.92 DT price = £1.80 | 30 gram [PoM] £3.60 DT price = £3.60

- ▶ **Fucidin (Fusidic acid)** (LEO Pharma)

Fusidic acid 20 mg per 1 gram Fucidin 20mg/g cream | 15 gram [PoM] £1.92 DT price = £1.80 | 30 gram [PoM] £3.59 DT price = £3.60

Ointment

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), wool fat and related substances including lanolin

- ▶ **Fucidin (Sodium fusidate)** (LEO Pharma)

Sodium fusidate 20 mg per 1 gram Fucidin 20mg/g ointment | 15 gram [PoM] £2.68 DT price = £2.68 | 30 gram [PoM] £4.55 DT price = £4.55

Linezolid

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

● INDICATIONS AND DOSE

Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Neonate up to 7 days: 10 mg/kg every 12 hours, increased if necessary to 10 mg/kg every 8 hours, increased dose can be used if poor response.
- Neonate 7 days to 28 days: 10 mg/kg every 8 hours.
- Child 1 month–11 years: 10 mg/kg every 8 hours (max. per dose 600 mg)
- Child 12–17 years: 600 mg every 12 hours

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

CHM ADVICE (OPTIC NEUROPATHY)

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

BLOOD DISORDERS

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
 - have pre-existing myelosuppression;
 - are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
 - have severe renal impairment.
- If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

- **CAUTIONS** Acute confusional states · bipolar depression · carcinoid tumour · phaeochromocytoma · schizophrenia · thyrotoxicosis · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- Close observation Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma,

carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

- **INTERACTIONS** → Appendix 1: linezolid

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Diarrhoea · eosinophilia · headache · nausea · taste disturbances · vomiting
- **Uncommon** Abdominal pain · blurred vision · constipation · diaphoresis · dizziness · dry mouth · dyspepsia · electrolyte disturbances · fatigue · fever · gastritis · glossitis · hypertension · hypoaesthesia · insomnia · leucopenia · pancreatitis · paraesthesia · polyuria · pruritus · rash · stomatitis · thirst · thrombocytopenia · tinnitus · tongue discoloration
- **Rare** Renal failure · tachycardia · transient ischaemic attacks
- **Frequency not known** Anaemia · antibiotic-associated colitis · convulsions · hyponatraemia · lactic acidosis · optic neuropathy reported on prolonged therapy · pancytopenia · peripheral neuropathy reported on prolonged therapy · Stevens-Johnson syndrome · tooth discoloration · toxic epidermal necrolysis

SPECIFIC SIDE-EFFECTS

- **Uncommon**
 - With intravenous use Injection-site reactions
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** No dose adjustment necessary but in severe hepatic impairment use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** No dose adjustment necessary but metabolites may accumulate if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.
- **DIRECTIONS FOR ADMINISTRATION** Infusion to be administered over 30–120 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
There is limited information on use in children and expert advice should be sought.
- **PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

EXCIPIENTS: May contain Glucose

Trimethoprim

● INDICATIONS AND DOSE

Urinary-tract infections | Respiratory tract infections

► BY MOUTH

- Neonate: Initially 3 mg/kg for 1 dose, then 1–2 mg/kg twice daily.
- Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
- Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
- Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
- Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
- Child 12–17 years: 200 mg twice daily

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or essential kidney damage)

► BY MOUTH

- Neonate: 2 mg/kg once daily, dose to be taken at night.

- Child 4–5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night
- Child 6 weeks–5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night
- Child 6 months–5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night
- Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
- Child 12–17 years: 100 mg once daily, dose to be taken at night

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)

► BY MOUTH

- Child: 5 mg/kg every 6–8 hours

Shigellosis | Invasive salmonella infection

► BY MOUTH

- Child: (consult product literature)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis pneumonia. Not licensed for use in children under 6 weeks.
- **CONTRA-INDICATIONS** Blood dyscrasias
- **CAUTIONS** Acute porphyrias p. 577 · neonates (specialist supervision required) · predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1: trimethoprim
- **SIDE-EFFECTS**
 - Rare Allergic reactions · anaphylaxis · angioedema · erythema multiforme · photosensitivity · toxic epidermal necrolysis
 - Frequency not known Aseptic meningitis · depression of haematopoiesis · gastro-intestinal disturbances · hyperkalaemia · nausea · pruritus · rashes · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.
- **PREGNANCY** Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.
- **BREAST FEEDING** Present in milk—short-term use not known to be harmful.
- **RENAL IMPAIRMENT** Use half normal dose after 3 days if estimated glomerular filtration rate

15–30 mL/minute/1.73 m². Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m². Monitor plasma-trimethoprim concentration if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).
- **PATIENT AND CARER ADVICE**

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

Trimethoprim 200 mg Trimethoprim 200mg tablets | 6 tablet [PoM] £2.15 DT price = £0.49 | 14 tablet [PoM] £9.99 DT price = £1.15

Combinations available: **Co-trimoxazole**, p. 335

2.1 Anthrax

Anthrax

Treatment and post-exposure prophylaxis

Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin p. 333 or, in patients over 12 years, doxycycline p. 338 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 325, benzylpenicillin sodium p. 323, chloramphenicol p. 340, clarithromycin p. 315, clindamycin p. 313, imipenem with cilastatin p. 302, rifampicin p. 349 [unlicensed indication], and vancomycin p. 312). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against

anthrax may allow the duration of antibacterial prophylaxis to be shortened.

2.2 Lyme disease

Lyme disease

Treatment

Amoxicillin p. 325 [unlicensed indication], cefuroxime p. 306 (as cefuroxime axetil) or doxycycline p. 338 are the antibacterials of choice for *early Lyme disease* or *Lyme arthritis* but doxycycline should only be used in children over 12 years of age. If these antibacterials are contra-indicated, a **macrolide** (e.g. clarithromycin p. 315) can be used for early Lyme disease. Intravenous administration of ceftriaxone p. 308, cefotaxime p. 307, or benzylpenicillin sodium p. 323 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

2.3 Methicillin-resistant staphylococcus aureus

MRSA

Management

Infection from *Staphylococcus aureus* strains resistant to meticillin [now discontinued] (meticillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 330 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 349 or fusidic acid p. 342 should **not** be used alone because resistance may develop rapidly. Clindamycin p. 313 alone or a combination of rifampicin and fusidic acid can be used for *skin and soft-tissue infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** (e.g. vancomycin p. 312) can be used for severe skin and soft-tissue infections associated with MRSA. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial. Linezolid p. 343 should be reserved for skin and soft-tissue infections that have not responded to other antibacterials or for children who cannot tolerate other antibacterials.

A **glycopeptide** can be used for *pneumonia* associated with MRSA. Linezolid should be reserved for hospital-acquired pneumonia that has not responded to other antibacterials or for children who cannot tolerate other antibacterials.

Trimethoprim p. 344 or nitrofurantoin p. 354 can be used for *urinary-tract infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for septicæmia associated with MRSA.

See the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 311 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;

- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

It is important that hospitals have infection control guidelines to minimise MRSA transmission, including policies on isolation and treatment of MRSA carriers and on hand hygiene. See eradication of nasal carriage of MRSA in Nose p. 665.

2.4 Tuberculosis

Tuberculosis

16-Mar-2017

Treatment phases, overview

Active tuberculosis is treated in two phases—an *initial phase* using four drugs and a *continuation phase* using two drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should **not** be used concurrently. Compliance with therapy is a major determinant of its success. Treatment needs to be carefully monitored in families in whom concordance may be problematic.

Initial phase

The concurrent use of four drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as fixed dose combination preparations unless the child is unable to swallow the tablets or one of the components cannot be given because of resistance, intolerance or an inappropriate dose combination. The treatment of choice for the initial phase is the daily use of rifampicin p. 349, ethambutol hydrochloride p. 351, pyrazinamide p. 353 and isoniazid p. 352 (with pyridoxine hydrochloride p. 600 for prophylaxis of isoniazid-induced neuropathy); modified according to drug susceptibility testing. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for two months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after two months, treatment with rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride) should be continued until full susceptibility is confirmed, even if this is for longer than two months.

Streptomycin p. 299 is rarely used in the UK although it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced and ethambutol hydrochloride is contra-indicated, or when patients cannot tolerate standard treatment.

Continuation phase

After the initial phase, daily treatment is continued for a further 4 months with rifampicin and isoniazid (preferably given as a combination preparation) with pyridoxine hydrochloride. Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment

The unsupervised treatment regimen should be used for children who are likely to take antituberculosis drugs reliably

Recommended dosage for standard unsupervised 6-month treatment

Isoniazid	Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
Rifampicin	Child: ► body-weight up to 50 kg: 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day; ► body-weight 50 kg and above: 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day
Pyrazinamide	Child: ► body-weight up to 50 kg: 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day; ► body-weight 50 kg and above: 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
Ethambutol hydrochloride	Child: 20 mg/kg once daily for 2 months (initial phase)

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (*Rifater*®, *Rifinah*®) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

Recommended dosage for intermittent supervised 6-month treatment

Isoniazid	Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
Rifampicin	Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
Pyrazinamide	Child: ► body-weight up to 50 kg: 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase); ► body-weight 50 kg and above: 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
Ethambutol hydrochloride	Child: 30 mg/kg 3 times a week for 2 months (initial phase)

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (*Rifater*®, *Rifinah*®) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

without supervision by a healthcare worker. Children and families who are unable or unlikely to comply with daily administration of therapy should be treated with the regimen described under Supervised Treatment.

Pregnancy and breast-feeding

The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

Neonates

Congenital tuberculosis is acquired from maternal extrapulmonary sites at birth, particularly the genital tract; if infection is suspected, the baby will require treatment with rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride). This regimen is used for 2 months during the initial phase of treatment. After the initial phase, rifampicin and isoniazid with pyridoxine hydrochloride is continued for a further 4 months.

Supervised treatment

Drug administration should be **fully supervised** by a healthcare worker (directly observed therapy, DOT) in children or families who cannot comply reliably with the treatment regimen. If daily directly observed therapy is not possible, a supervised dosing schedule of three times a week should be considered. Regimens with a dosing schedule of fewer than three times a week should not be used.

Directly observed therapy should be offered to children or to children whose carers:

- have a history of non-adherence;
- have previously been treated for tuberculosis;
- are in denial of the tuberculosis diagnosis;
- have multidrug-resistant tuberculosis;
- have a major psychiatric or cognitive disorder;

- have a history of homelessness, drug or alcohol misuse;
- are in prison, or have been in the past 5 years;
- are too ill to self-administer treatment;
- request directly observed therapy.

Advice and support should be offered to these children and their carers to assist with treatment completion.

Immunocompromised patients

Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised children. The organism should always be cultured to confirm its type and drug sensitivity.

Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard six month regimen; after completing treatment, children should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a child who is HIV-positive (see also *Latent tuberculosis* below); care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first two months of antituberculosis treatment increases the risk of immune reconstitution syndrome. Treatment for tuberculosis should not routinely exceed 6 months in children who are HIV-positive, unless the tuberculosis has central nervous system involvement, in which case treatment should not routinely extend beyond 12 months.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex, in which case specialist advice on management is needed.

Extrapulmonary tuberculosis**Central nervous system tuberculosis**

Children with central nervous system tuberculosis should be offered rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride) for two months. After completion of the initial treatment phase,

rifampicin and isoniazid (with pyridoxine hydrochloride) should be continued for a further 10 months. Treatment for tuberculosis meningitis should be offered if clinical signs and laboratory findings are consistent with the diagnosis, even if a rapid diagnostic test is negative.

An initial high dose dexamethasone p. 419 or prednisolone p. 421 should be started at the same time as antituberculosis therapy and then slowly withdrawn over 4–8 weeks.

Referral for surgery should be considered only in children who have raised intracranial pressure.

Pericardial tuberculosis

An initial high dose of oral prednisolone should be offered to children with active pericardial tuberculosis at the same time as initiation of antituberculosis therapy; it should then be slowly withdrawn over 2–3 weeks.

Latent tuberculosis

Clinicians should be aware that some groups of children with latent tuberculosis are at increased risk of developing active tuberculosis (such as children who are HIV-positive, diabetic or receiving treatment with a tumour necrosis factor alpha inhibitor). These children and their carers should be advised of the risks and symptoms of active tuberculosis.

Close contacts

All children who are a close contact (prolonged, frequent or intense contact, e.g. household contacts or relations) of a person with confirmed pulmonary or laryngeal tuberculosis should be tested for latent tuberculosis. Children under 2 years should be assessed by a specialist.

Immunocompromised

Children in whom latent tuberculosis is suspected and who are anticipated to be, or who are currently immunocompromised (for example, if they are from a high incidence country or have been in close contact with people with suspected infectious or confirmed pulmonary or laryngeal tuberculosis), should be referred to a tuberculosis specialist.

Chemoprophylaxis for latent tuberculosis

Neonates who have been in close contact with a person with tuberculosis which has not yet been treated for at least two weeks, should be treated with isoniazid p. 352 (with pyridoxine hydrochloride p. 600) followed by a Mantoux test after six weeks of treatment. If the test is positive (and active tuberculosis is not present) treatment should be continued for six months; if negative (and confirmed by a negative interferon-gamma release assay), the treatment should be stopped and a BCG vaccination given.

Children aged 4 weeks to 2 years who have been in close contact with a person with tuberculosis which has not been treated for at least two weeks, should be treated with either isoniazid (with pyridoxine hydrochloride) alone for six months (preferred regimen if interactions with rifamycins are a concern) or rifampicin p. 349 and isoniazid (with pyridoxine hydrochloride) for three months (recommended when hepatotoxicity is a concern); and then have a Mantoux test. If the test is positive (and active tuberculosis is not present), the treatment course should be completed. If the test is negative, treatment should be continued and reassessed after 6 weeks. If the results are then negative (and confirmed by a negative interferon-gamma release assay), the treatment should be stopped and a BCG vaccination given (if the child has not already had one). If the result is positive (and active tuberculosis is not present), the course of treatment should be continued.

Children aged over 2 years should be offered a Mantoux test, and if positive (and active tuberculosis is not present), then treated as above for children aged 4 weeks to 2 years. If the test is negative, reassess after 6 weeks.

Testing for hepatitis B and hepatitis C should be considered before starting treatment for tuberculosis as this

may affect the choice of therapy. Children with severe liver disease should be treated under the care of a specialist team; careful monitoring of liver function is necessary in children with non-severe liver disease, abnormal liver function, or who misuse alcohol or drugs.

See advice on immunisation against tuberculosis and tuberculin testing under Vaccines p. 747.

Treatment failure

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the child or their carer. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be specialised by a specialist paediatrician.

Treatment interruptions

A break in antituberculosis treatment of at least two weeks (during the initial phase), or missing more than 20% of prescribed doses is classified as treatment interruption. Re-establishing treatment appropriately following interruptions is key to ensuring treatment success without relapse, drug resistance or further adverse events. If an adverse reaction recurs upon re-introducing a particular drug, do not give that drug in future regimens and consider extending the total regimen accordingly.

Treatment interruptions due to drug-induced hepatotoxicity

Following treatment interruption due to drug-induced hepatotoxicity, all potential causes of hepatotoxicity should be investigated. Once hepatic function has recovered, antituberculosis therapy should be sequentially re-introduced at previous full doses over a period of no more than ten days, initially with ethambutol hydrochloride p. 351 and either isoniazid (with pyridoxine hydrochloride) or rifampicin.

In children with severe or highly infectious tuberculosis who need to interrupt the standard regimen, consider continuing treatment with at least two drugs with low risk of hepatotoxicity, such as ethambutol hydrochloride and streptomycin p. 299 (with or without a quinolone, such as levofloxacin p. 648 or moxifloxacin p. 648), and with ongoing monitoring by a liver specialist.

Treatment interruptions due to cutaneous reactions

If a child with severe or highly infectious tuberculosis has a cutaneous reaction, consider continuing treatment with a combination of at least two drugs with a low risk of causing cutaneous reactions, such as ethambutol hydrochloride and streptomycin with monitoring by a dermatologist.

Antituberculosis drugs

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculosis regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculosis regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20–30% of patients.

Rifabutin p. 348 is licensed in adults for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis. There is limited experience in children.

Pyrazinamide p. 353 is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium*

tuberculosis; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*.

Ethambutol hydrochloride is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms.

Drug-resistant tuberculosis

Drug-resistant tuberculosis should be treated by a specialist paediatrician with experience in such cases, and where appropriate facilities for infection-control exist. Multidrug-resistant tuberculosis (*resistance to isoniazid and rifampicin, with or without any other resistance*) requires treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive. Testing for resistance to second-line drugs is recommended and treatment should be modified according to susceptibility. The risk of resistance is minimised by ensuring therapy is administered in the correct dose and combination for the prescribed duration.

Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin p. 298, capreomycin, cycloserine p. 351, newer macrolides (e.g. azithromycin p. 314 and clarithromycin p. 315), moxifloxacin p. 648 and prothionamide (prothionamide; no longer on UK market). Availability of suitable formulations may limit choice in children.

Single drug-resistant tuberculosis

For single drug-resistance the following treatment regimen is recommended:

Resistance to isoniazid p. 352:

- First two months (initial phase): rifampicin p. 349, pyrazinamide p. 353 and ethambutol hydrochloride p. 351
- Continue with (continuation phase): rifampicin and ethambutol hydrochloride for seven months (up to ten months for extensive disease)

Resistance to pyrazinamide:

- First two months (initial phase): rifampicin, ethambutol hydrochloride and isoniazid (with pyridoxine hydrochloride p. 600)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for seven months

Resistance to ethambutol hydrochloride:

- First two months (initial phase): rifampicin, pyrazinamide and isoniazid (with pyridoxine hydrochloride)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for four months

Resistance to rifampicin:

- Offer treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive.

ANTIMYCOBACTERIALS > RIFAMYCINS

Rifabutin

● INDICATIONS AND DOSE

Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count

► BY MOUTH

- Child 1 month–11 years: 5 mg/kg once daily (max. per dose 300 mg), also consult product literature
- Child 12–17 years: 300 mg once daily, also consult product literature

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs

► BY MOUTH

- Child 1 month–11 years: 5 mg/kg once daily for up to 6 months after cultures negative
- Child 12–17 years: 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs

► BY MOUTH

- Child 12–17 years: 150–450 mg once daily for at least 6 months

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Acute porphyrias p. 577 · discolours soft contact lenses
- **INTERACTIONS** → Appendix 1: rifabutin
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · blood disorders · leucopenia · myalgia · nausea · pyrexia · rash · thrombocytopenia
 - **Uncommon** Arthralgia · body secretions coloured orange-red · bronchospasm · corneal deposits · eosinophilia · hypersensitivity reactions · jaundice · raised liver enzymes · saliva coloured orange-red · skin coloured orange-red · urine coloured orange-red · uveitis (especially following high doses or concomitant use with drugs that increase plasma concentration) · vomiting
 - **Rare** Haemolysis
 - **Frequency not known** Chest pain · dyspnoea · hepatitis · influenza-like symptoms
- **SIDE-EFFECTS, FURTHER INFORMATION** Discontinue permanently if serious side-effects develop.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Reduce dose in severe impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.
- **RENAL IMPAIRMENT** Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - **Renal function** should be checked before treatment.
 - **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.
 - Blood counts should be monitored on prolonged therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.
- **PATIENT AND CARER ADVICE** Soft contact lenses Patients or their carers should be advised that rifabutin discolours soft contact lenses. Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical

attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 8, 14

Rifabutin 150 mg Mycobutin 150mg capsules | 30 capsule **Ⓟ**
£90.38

Rifampicin

● INDICATIONS AND DOSE

Brucellosis in combination with other antibacterials | Legionnaires disease in combination with other antibacterials | Serious staphylococcal infections in combination with other antibacterials

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Neonate: 5–10 mg/kg twice daily.

► Child 1–11 months: 5–10 mg/kg twice daily
► Child 1–17 years: 10 mg/kg twice daily (max. per dose 600 mg)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

► BY MOUTH

► Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

► BY MOUTH

► Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
► Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day

Congenital tuberculosis

► BY MOUTH

► Neonate: 15 mg/kg once daily for 6 months (initial and continuation phases).

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid

► BY MOUTH

► Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
► Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
► Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 3 months
► Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

► BY MOUTH

► Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
► Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day

► Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 6 months
► Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of *Haemophilus influenzae* type b disease

► BY MOUTH

► Child 1–2 months: 10 mg/kg once daily for 4 days
► Child 3 months–11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
► Child 12–17 years: 600 mg once daily for 4 days

Prevention of secondary case of meningococcal meningitis

► BY MOUTH

► Neonate: 5 mg/kg every 12 hours for 2 days.

► Child 1–11 months: 5 mg/kg every 12 hours for 2 days
► Child 1–11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
► Child 12–17 years: 600 mg every 12 hours for 2 days

Pruritus due to cholestasis

► BY MOUTH

► Child: 5–10 mg/kg once daily (max. per dose 600 mg)

● **UNLICENSED USE** Not licensed for use in children for pruritus due to cholestasis.

● **CONTRA-INDICATIONS** Acute porphyrias p. 577 · jaundice

● **CAUTIONS** Discolours soft contact lenses

● **INTERACTIONS** → Appendix 1: rifampicin

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Acute renal failure · adrenal insufficiency · alterations of liver function · anorexia · antibiotic-associated colitis · body secretions coloured orange-red · collapse and shock · diarrhoea · disseminated intravascular coagulation · drowsiness · eosinophilia · exfoliative dermatitis · flushing · gastro-intestinal symptoms · haemolytic anaemia · headache · influenza-like symptoms (with chills, fever, dizziness, bone pain) · jaundice · leucopenia · menstrual disturbances · muscular weakness · myopathy · nausea · oedema · pemphigoid reactions · psychoses · rashes · respiratory symptoms · saliva coloured orange-red · shortness of breath · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis · urine coloured orange-red · urticaria · vomiting

SPECIFIC SIDE-EFFECTS

► With intravenous use Thrombophlebitis reported if infusion used for prolonged period

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue permanently if serious side-effects develop.

► Intermittent therapy Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.

● **CONCEPTION AND CONTRACEPTION**

Important Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

● **PREGNANCY** Manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

● **BREAST FEEDING** Amount too small to be harmful.

● **HEPATIC IMPAIRMENT** Avoid or do not exceed 8 mg/kg daily. Impaired elimination. In patients with pre-existing liver disease or hepatic impairment, monitor liver function

regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

- **RENAL IMPAIRMENT** Use with caution if doses above 10 mg/kg daily.
- **MONITORING REQUIREMENTS**
 - ▶ *Renal function* should be checked before treatment.
 - ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
 - ▶ Blood counts should be monitored in patients on prolonged therapy.
- **DIRECTIONS FOR ADMINISTRATION** Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.
- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.
 - ▶ With oral use In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children. Flavours of syrup may include raspberry.
- **PATIENT AND CARER ADVICE**

Soft contact lenses Patients or their carers should be advised that rifampicin discolours soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Powder and solvent for solution for injection

▶ Rifampicin (Non-proprietary)

Rifampicin 300 mg RIFA parenteral 300mg powder and solvent for solution for injection vials | 1 vial [PoM](#) no price available

Oral suspension

CAUTIONARY AND ADVISORY LABELS 8, 14, 23

EXCIPIENTS: May contain Sucrose

▶ Rifadin (Sanofi)

Rifampicin 20 mg per 1 ml Rifadin 100mg/5ml syrup | 120 ml [PoM](#) £4.27

Capsule

CAUTIONARY AND ADVISORY LABELS 8, 14, 23

▶ Rifampicin (Non-proprietary)

Rifampicin 150 mg Rifampicin 150mg capsules | 100 capsule [PoM](#) £44.83 DT price = £44.83

Rifampicin 300 mg Rifampicin 300mg capsules | 100 capsule [PoM](#) £103.25 DT price = £103.22

▶ Rifadin (Sanofi)

Rifampicin 150 mg Rifadin 150mg capsules | 100 capsule [PoM](#) £18.32 DT price = £44.83

Rifampicin 300 mg Rifadin 300mg capsules | 100 capsule [PoM](#) £36.63 DT price = £103.22

▶ Rimactane (Sandoz Ltd)

Rifampicin 300 mg Rimactane 300mg capsules | 60 capsule [PoM](#) £21.98

Powder and solvent for solution for infusion

ELECTROLYTES: May contain Sodium

▶ Rifadin (Sanofi)

Rifampicin 600 mg Rifadin 600mg powder and solvent for solution for infusion vials | 1 vial [PoM](#) £9.20

Rifampicin with isoniazid

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 349, isoniazid p. 352.

● INDICATIONS AND DOSE

Treatment of tuberculosis (continuation phase)

▶ BY MOUTH

- ▶ Child: Although not licensed in children, consideration may be given to use of *Rifinah*® in older children, provided the respective dose of each drug is appropriate for the weight of the child (consult local protocol).

DOSE EQUIVALENCE AND CONVERSION

- ▶ *Rifinah*® Tablets contain rifampicin and isoniazid; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of rifampicin and isoniazid respectively.
- ▶ Each *Rifinah*® 150/100 Tablet contains rifampicin 150 mg and isoniazid 100 mg.
- ▶ Each *Rifinah*® 300/150 Tablet contains rifampicin 300 mg and isoniazid 150 mg.

- **UNLICENSED USE** Not licensed for use in children.

- **INTERACTIONS** → Appendix 1: isoniazid, rifampicin

ANTIMYCOBACTERIALS > OTHER

Cycloserine

● INDICATIONS AND DOSE

Tuberculosis resistant to first-line drugs, in combination with other drugs

- ▶ BY MOUTH

- ▶ Child 2–11 years: Initially 5 mg/kg twice daily (max. per dose 250 mg), then increased if necessary up to 10 mg/kg twice daily (max. per dose 500 mg), dose to be increased according to blood concentration and response
- ▶ Child 12–17 years: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

PHARMACOKINETICS

Cycloserine penetrates the CNS.

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS** Alcohol dependence · depression · epilepsy · psychotic states · severe anxiety

- **INTERACTIONS** → Appendix 1: cycloserine

- **SIDE-EFFECTS** Allergic dermatitis · changes in liver function tests · confusion · convulsions · depression · dizziness · drowsiness · headache · heart failure at high doses · megaloblastic anaemia · psychosis · rashes · tremor · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ CNS toxicity Discontinue or reduce dose if symptoms of CNS toxicity occur.
- ▶ Rashes or allergic dermatitis Discontinue or reduce dose if rashes or allergic dermatitis develops.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Present in milk—amount too small to be harmful.
- **RENAL IMPAIRMENT** Increase interval between doses if creatinine clearance less than 50 mL/minute/1.73 m². Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Blood concentration should not exceed a peak concentration of 30 mg/litre (measured 3–4 hours after the dose).
 - ▶ Monitor haematological, renal, and hepatic function.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 2, 8

- ▶ **Cycloserine (Non-proprietary)**

Cycloserine 250 mg Cycloserine 250mg capsules | 100 capsule **PoM** £402.63 DT price = £402.63

Ethambutol hydrochloride

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- ▶ BY MOUTH

- ▶ Child: 20 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- ▶ BY MOUTH

- ▶ Child: 30 mg/kg 3 times a week for 2 months (initial phase)

Congenital tuberculosis, in combination with other drugs

- ▶ BY MOUTH

- ▶ Neonate: 20 mg/kg once daily for 2 months (initial phase).

- **CONTRA-INDICATIONS** Optic neuritis · poor vision

- **CAUTIONS** Young children

CAUTIONS, FURTHER INFORMATION

- ▶ Understanding warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

- **INTERACTIONS** → Appendix 1: ethambutol

● SIDE-EFFECTS

- ▶ **Rare** Pruritus · rash · thrombocytopenia · urticaria
- ▶ **Frequency not known** Colour blindness · loss of visual acuity · optic neuritis · peripheral neuritis · red/green colour blindness · restriction of visual fields · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Ocular toxicity Ocular toxicity is more common where excessive dosage is used or if the patient's renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount too small to be harmful.

- **RENAL IMPAIRMENT** If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week. Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment. If creatinine clearance less than 30 mL/minute/1.73 m², monitor plasma-ethambutol concentration.

● MONITORING REQUIREMENTS

- ▶ 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
- ▶ Renal function should be checked before treatment.
- ▶ Visual acuity should be tested by Snellen chart before treatment with ethambutol.
- ▶ In young children, routine ophthalmological monitoring recommended.

● PATIENT AND CARER ADVICE

Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

Medicines for Children leaflet: Ethambutol for the treatment of tuberculosis www.medicinesforchildren.org.uk/ethambutol-for-the-treatment-of-tuberculosis

Tablet

CAUTIONARY AND ADVISORY LABELS 8

► Ethambutol hydrochloride (Non-proprietary)

Ethambutol hydrochloride 100 mg Ethambutol 100mg tablets | 56 tablet [PoM] £11.51 DT price = £11.51

Ethambutol hydrochloride 400 mg Ethambutol 400mg tablets | 56 tablet [PoM] £42.74 DT price = £42.74

Isoniazid

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Congenital tuberculosis, in combination with other drugs

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Neonate: 10 mg/kg daily for 6 months (initial and continuation phases).

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Neonate: 10 mg/kg daily for 6 months.

► Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin

► Child 12–17 years: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin

● **CONTRA-INDICATIONS** Drug-induced liver disease

● **CAUTIONS** Acute porphyrias p. 577 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)

CAUTIONS, FURTHER INFORMATION

► **Peripheral neuropathy** Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 600 should be given prophylactically from the start of treatment.

● **INTERACTIONS** → Appendix 1: isoniazid

● SIDE-EFFECTS

► **Common or very common** Peripheral neuropathy

► **Rare** Hepatitis · psychotic episodes

► **Frequency not known** Agranulocytosis · aplastic anaemia · blood disorders · constipation · convulsions · difficulty with micturition · dry mouth · fever · gynaecomastia · haemolytic anaemia · hearing loss (in patients with end-stage renal impairment) · hyperglycaemia · hyperreflexia · hypersensitivity reactions · interstitial pneumonitis ·

nausea · optic neuritis · pancreatitis · pellagra · peripheral neuritis with high doses · purpura · Stevens-Johnson syndrome · systemic lupus erythematosus-like syndrome · tinnitus (in patients with end-stage renal impairment) · vertigo · vomiting

● **PREGNANCY** Not known to be harmful; prophylactic pyridoxine recommended.

● **BREAST FEEDING** Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. Monitor infant for possible toxicity.

● **HEPATIC IMPAIRMENT** Use with caution. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

● **RENAL IMPAIRMENT** Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 600 recommended.

● MONITORING REQUIREMENTS

► **Renal function** should be checked before treatment.

► **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.

● PRESCRIBING AND DISPENSING INFORMATION

Doses may need to be recalculated to allow for weight gain in younger children.

► With oral use In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet.

● PATIENT AND CARER ADVICE

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Pyrazinamide

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

► BY MOUTH

- Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
- Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

► BY MOUTH

- Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
- Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)

Congenital tuberculosis, in combination with other drugs

► BY MOUTH

- Neonate: 35 mg/kg once daily for 2 months (initial phase).

● CAUTIONS Diabetes

● INTERACTIONS → Appendix 1: pyrazinamide

● SIDE-EFFECTS Anorexia · arthralgia · dysuria · fever · hepatomegaly · hepatotoxicity · jaundice · liver failure · nausea · photosensitivity · rash · sideroblastic anaemia · splenomegaly · thrombocytopenia · vomiting

● PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

● BREAST FEEDING Amount too small to be harmful.

● HEPATIC IMPAIRMENT Idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

● RENAL IMPAIRMENT If estimated glomerular filtration rate less than 30 mL/minute/1.73 m², use 25–30 mg/kg 3 times a week.

● MONITORING REQUIREMENTS

- Renal function should be checked before treatment.
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.

● PRESCRIBING AND DISPENSING INFORMATION In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

2.5 Urinary tract infections

Urinary-tract infections

Overview

Urinary-tract infection is more common in adolescent girls than in boys; when it occurs in adolescent boys there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

Escherichia coli is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include *Proteus* and *Klebsiella* spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in children under 3 years of age;
- in children with suspected upper urinary-tract infection, complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing;
- in pregnant women.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Antibacterial therapy for urinary-tract infections

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterials such as amoxicillin p. 325 (or ampicillin p. 326) with gentamicin p. 299, or a cephalosporin (such as cefotaxime p. 307) alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Children over 3 months of age with uncomplicated lower urinary-tract infection, can be treated with trimethoprim p. 344 or nitrofurantoin p. 354. Suggested duration of treatment 3 days. Re-assess child if they remain unwell 24–48 hours after initial assessment.

Alternatively, children over 3 months of age, with uncomplicated lower urinary-tract infection, may be treated with amoxicillin (or ampicillin) or oral first generation cephalosporin (e.g. cefalexin p. 304). Use amoxicillin only if

micro-organism sensitive. *Suggested duration of treatment* 3 days. Re-assess child if unwell 24–48 hours after initial assessment.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav p. 328 for 7–10 days.

If the patient is severely ill, then the infection is best treated initially by intravenous injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Resistant infections

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav (amoxicillin with clavulanic acid), an oral cephalosporin, pivmecillinam hydrochloride p. 330, or a quinolone.

Antibacterial prophylaxis

Recurrent episodes of infection are an indication for imaging tests. *Antibacterial prophylaxis* with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage. Nitrofurantoin is contra-indicated in children under 3 months of age because of the theoretical possibility of haemolytic anaemia.

Pregnancy

Urinary-tract infection *in pregnancy* may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides, quinolones, and tetracyclines should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment

In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

ANTIBACTERIALS

Nitrofurantoin

● INDICATIONS AND DOSE

Acute uncomplicated urinary-tract infections

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
- ▶ Child 12–17 years: 50 mg 4 times a day for 3–7 days
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily, dose to be taken with food

Severe chronic recurrent urinary-tract infections

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg 4 times a day for 3–7 days

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
- ▶ Child 12–17 years: 50–100 mg once daily, dose to be taken at night

Genito-urinary surgical prophylaxis

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12–17 years: 100 mg twice daily on day of procedure and for 3 days after

- **CONTRA-INDICATIONS** Acute porphyrias p. 577 • G6PD deficiency • infants less than 3 months old
- **CAUTIONS** Anaemia • diabetes mellitus • electrolyte imbalance • folate deficiency • pulmonary disease • susceptibility to peripheral neuropathy • urine may be coloured yellow or brown • vitamin B deficiency
- **INTERACTIONS** → Appendix 1: nitrofurantoin
- **SIDE-EFFECTS**
 - ▶ **Rare** Agranulocytosis • aplastic anaemia • arthralgia • benign intracranial hypertension • blood disorders • cholestatic jaundice • erythema multiforme • exfoliative dermatitis • hepatitis • pancreatitis • thrombocytopenia • transient alopecia
 - ▶ **Frequency not known** Acute pulmonary reactions • anaphylaxis • angioedema • anorexia • chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome) • diarrhoea • hypersensitivity reactions • nausea • peripheral neuropathy • pruritus • rash • sialadenitis • urticaria • vomiting
- **PREGNANCY** Avoid at term—may produce neonatal haemolysis.
- **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution; cholestatic jaundice and chronic active hepatitis reported.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract. Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
- **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms (discontinue if deterioration in lung function).
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).
- **PATIENT AND CARER ADVICE**

3 Fungal infection

Antifungals, systemic use

Common fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 361 is the treatment of choice for aspergillosis; liposomal amphotericin p. 357 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 361 or itraconazole p. 360 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis

Many superficial candidal infections, including infections of the skin, are treated locally. Systemic antifungal treatment is required in widespread or intractable infection. Vaginal candidiasis can be treated with locally acting antifungals; alternatively, fluconazole p. 358 can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy. Fluconazole is given by mouth for unresponsive infections; it is reliably absorbed and is effective. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, either amphotericin by intravenous infusion or an **echinocandin** can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable children who have not received an azole antifungal recently. Amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in children intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 363 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients,

can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons.

Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis).

Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 696 are used more frequently than griseofulvin p. 363 because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain. Fluconazole or itraconazole are alternatives in the treatment of tinea capitis caused by *T. tonsurans* or *Microsporum* spp. [both unlicensed indications].

Pityriasis versicolor may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; they should be used under specialist advice in children. Although terbinafine is not licensed for use in children, it is considered to be the drug of choice for onychomycosis. Itraconazole can be administered as intermittent 'pulse' therapy. Topical antifungals also have a role in the treatment of onychomycosis.

Immunocompromised children

Immunocompromised children are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Micafungin p. 357 can be used for prophylaxis of candidiasis in patients undergoing

haematopoietic stem cell transplantation when fluconazole or itraconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections in immunocompromised children; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. There is limited information available on use in children. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Voriconazole is a broad-spectrum antifungal drug which is licensed in adults for use in life-threatening infections.

Imidazole antifungals

The imidazole antifungals include clotrimazole p. 492, econazole nitrate p. 492, ketoconazole p. 695, and tioconazole p. 696. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 493 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

Polyene antifungals

The polyene antifungals include amphotericin and nystatin p. 680; neither drug is absorbed when given by mouth. Nystatin p. 680 is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin p. 357 by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*® and *AmBisome*®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include caspofungin below and micafungin p. 357. They are only active against *Aspergillus* spp. and *Candida* spp.; however, micafungin is not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. Echinocandin antifungals have a role in the prevention and systemic treatment of fungal infections.

Other antifungals

Flucytosine p. 363 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment.

Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 363 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. Griseofulvin is used in the treatment of tinea capitis. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 696 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

Caspofungin

• INDICATIONS AND DOSE

Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

► BY INTRAVENOUS INFUSION

► Neonate: 25 mg/m² once daily.

- Child 1-2 months: 25 mg/m² once daily
- Child 3-11 months: 50 mg/m² once daily
- Child 1-17 years: 70 mg/m² once daily (max. per dose 70 mg) for 1 day, then 50 mg/m² once daily (max. per dose 70 mg); increased to 70 mg/m² once daily (max. per dose 70 mg), dose may be increased if lower dose tolerated but inadequate response

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises increase dose to 70 mg/m² daily (max. 70 mg daily) with concurrent use of some enzyme inducers (such as carbamazepine, dexamethasone, phenytoin, and rifampicin).

• **INTERACTIONS** → Appendix 1: caspofungin

• SIDE-EFFECTS

- **Common or very common** Arthralgia · diarrhoea · dyspnoea · flushing · headache · hypokalaemia · hypomagnesaemia · hypotension · injection-site reactions · nausea · pruritus · rash · sweating · tachycardia · vomiting
- **Uncommon** Abdominal pain · anaemia · anorexia · anxiety · arrhythmia · ascites · blurred vision · bronchospasm · chest pain · cholestasis · constipation · cough · disorientation · dizziness · dry mouth · dyspepsia · dysphagia · erythema multiforme · fatigue · flatulence · heart failure · hepatic dysfunction · hyperglycaemia · hypertension · hypoaesthesia · hypocalcaemia · leucopenia · metabolic acidosis · muscular weakness · myalgia · palpitation · paraesthesia · renal failure · sleep disturbances · taste disturbances · thrombocytopenia · thrombophlebitis · tremor
- **Frequency not known** Acute respiratory distress syndrome · anaphylaxis · hypercalcaemia
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.
- **BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Usual initial dose, then use 70% of normal maintenance dose in moderate impairment. No information available for severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Candidas*®), allow vial to reach room temperature; initially reconstitute 50 mg with 10.5 mL Water for Injections to produce a 5.2 mg/mL solution, or reconstitute 70 mg with 10.5 mL Water for Injections to produce a 7.2 mg/mL solution; mix gently to dissolve; dilute requisite dose to a final concentration not exceeding

500 micrograms/mL with Sodium Chloride 0.9%; give over 60 minutes; incompatible with glucose solutions.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► **Candidas** (Merck Sharp & Dohme Ltd)

Caspofungin (as Caspofungin acetate) 50 mg Candidas 50mg powder for solution for infusion vials | 1 vial [PoM] £327.67

Caspofungin (as Caspofungin acetate) 70 mg Candidas 70mg powder for solution for infusion vials | 1 vial [PoM] £416.78

Micafungin

• INDICATIONS AND DOSE

Invasive candidiasis

► BY INTRAVENOUS INFUSION

- Neonate (administered on expert advice): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate.
- Child (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
- Child (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

Oesophageal candidiasis

► BY INTRAVENOUS INFUSION

- Child 16–17 years (body-weight up to 40 kg): 3 mg/kg once daily
- Child 16–17 years (body-weight 40 kg and above): 150 mg once daily

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days

► BY INTRAVENOUS INFUSION

- Neonate: 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range.
- Child (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
- Child (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

• INTERACTIONS → Appendix 1: micafungin

• SIDE-EFFECTS

- **Common or very common** Abdominal pain · anaemia · blood pressure changes · diarrhoea · fever · headache · hepatomegaly · hypocalcaemia · hypokalaemia · hypomagnesaemia · leucopenia · nausea · phlebitis · rash · renal failure · tachycardia · thrombocytopenia · vomiting
- **Uncommon** Anorexia · anxiety · bradycardia · cholestasis · confusion · constipation · dizziness · dyspepsia · dyspnoea · eosinophilia · flushing · hepatitis · hyperhidrosis · hyperkalaemia · hyponatraemia · hypophosphataemia · palpitation · pancytopenia · pruritus · sleep disturbances · tachycardia · taste disturbances · tremor
- **Rare** Haemolytic anaemia
- **Frequency not known** Disseminated intravascular coagulation · hepatotoxicity (potentially life-threatening; more common in children under 1 year) · Stevens-Johnson syndrome · toxic epidermal necrolysis

• PREGNANCY

Manufacturer advises avoid unless essential—toxicity in *animal* studies.

• BREAST FEEDING

Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

• HEPATIC IMPAIRMENT

Use with caution in mild to moderate impairment. Avoid in severe impairment.

• RENAL IMPAIRMENT

Use with caution; renal function may deteriorate.

• MONITORING REQUIREMENTS

- Monitor renal function.
- Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

• DIRECTIONS FOR ADMINISTRATION

For *intravenous infusion* reconstitute each vial with 5 mL Glucose 5% or Sodium Chloride 0.9%; gently rotate vial, without shaking, to dissolve; dilute requisite dose to a concentration of 0.5–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; protect infusion from light; give over 60 minutes.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► **Mycamine** (Astellas Pharma Ltd)

Micafungin (as Micafungin sodium) 50 mg Mycamine 50mg powder for solution for infusion vials | 1 vial [PoM] £196.08

Micafungin (as Micafungin sodium) 100 mg Mycamine 100mg powder for solution for infusion vials | 1 vial [PoM] £341.00

ANTIFUNGALS > POLYENE ANTIFUNGALS

Amphotericin

(Amphotericin B)

• INDICATIONS AND DOSE

ABELCET®

Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients

► BY INTRAVENOUS INFUSION

- Child: Test dose 100 micrograms/kg (max. per dose 1 mg), then 5 mg/kg once daily

AMBISOME®

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

► BY INTRAVENOUS INFUSION

- Neonate: 1 mg/kg once daily, increased if necessary to 3 mg/kg once daily; maximum 5 mg/kg per day.
- Child: Test dose 100 micrograms/kg (max. per dose 1 mg), to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Visceral leishmaniasis (unresponsive to the antimonial alone)

► BY INTRAVENOUS INFUSION

- Child: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

FUNGIZONE®

Systemic fungal infections

► BY INTRAVENOUS INFUSION

- Neonate: 1 mg/kg once daily, increased if necessary to 1.5 mg/kg daily for 7 days, then reduced to 1–1.5 mg/kg once daily on alternate days if required.

continued →

- ▶ Child: Test dose 100 micrograms/kg (max. per dose 1 mg), included as part of first dose of 250 micrograms/kg daily, then increased if tolerated to 1 mg/kg daily, dose is gradually increased over 2–4 days; in severe infection max. 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

● UNLICENSED USE

AMBISOME® *AmBisome®* not licensed for use in children under 1 month.

FUNGIZONE® Intravenous conventional formulation amphotericin (*Fungizone®*) is licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Avoid rapid infusion (risk of arrhythmias) • when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

CAUTIONS, FURTHER INFORMATION

- ▶ Anaphylaxis Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion in children over 1 month of age; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

- **INTERACTIONS** → Appendix 1: amphotericin

● SIDE-EFFECTS

- ▶ Common or very common Abdominal pain • abnormal liver function (discontinue treatment) • anaemia • arrhythmias • blood disorders • blood pressure changes • cardiovascular effects • chest pain • diarrhoea • disturbances in renal function • dyspnoea • electrolyte disturbances • febrile reactions • headache • hypokalaemia • hypomagnesaemia • nausea • rash • renal tubular acidosis • thrombocytopenia • vomiting
- ▶ Uncommon Anaphylactoid reactions • bronchospasm • convulsions • diplopia • encephalopathy • hearing loss • neurological disorders • peripheral neuropathy • tremor
- ▶ Frequency not known Anorexia • arthralgia • myalgia • Stevens-Johnson syndrome • toxic epidermal necrolysis

- **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

● DIRECTIONS FOR ADMINISTRATION

ABELCET® Amphotericin (lipid complex)

For intravenous infusion, allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute in Glucose 5% to a concentration of 2 mg/mL; preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions—flush existing intravenous line with Glucose 5% or use separate line.

AMBISOME® Amphotericin (liposomal)

For intravenous infusion, reconstitute each vial with 12 mL Water for Injections and shake vigorously to

produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into Glucose 5% or 10% through the 5-micron filter provided, to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose given over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions—flush existing intravenous line with Glucose 5% or 10%, or use separate line.

FUNGIZONE® Amphotericin (as sodium deoxycholate complex)

For intravenous infusion, reconstitute each vial with 10 mL Water for Injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in Glucose 5% to a concentration of 100 micrograms/mL (in fluid-restricted children, up to 400 micrograms/mL given via a central line); pH of glucose solution must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 4–6 hours, or if tolerated over a minimum of 2 hours (initial test dose given over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with Sodium Chloride solutions—flush existing intravenous line with Glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

- **PRESCRIBING AND DISPENSING INFORMATION** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Abelcet** (Teva UK Ltd)

Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 mL Abelcet 100mg/20mL concentrate for suspension for infusion vials | 10 vial [PoM] £775.04 (Hospital only)

Powder for solution for infusion

EXCIPIENTS: May contain Sucrose

ELECTROLYTES: May contain Sodium

- ▶ **AmBisome** (Gilead Sciences International Ltd)

Amphotericin B liposomal 50 mg AmBisome 50mg powder for solution for infusion vials | 10 vial [PoM] £821.87

- ▶ **Fungizone** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Amphotericin B 50 mg Fungizone Intravenous 50mg powder for solution for infusion vials | 1 vial [PoM] £3.88

ANTIFUNGALS > TRIAZOLE ANTIFUNGALS

Fluconazole

● INDICATIONS AND DOSE

Candidal balanitis

- ▶ BY MOUTH
- ▶ Child 16–17 years: 150 mg for 1 dose

Vaginal candidiasis

- ▶ BY MOUTH
- ▶ Child 1 month–15 years: 150 mg for 1 dose, for use in patients who are post-puberty
- ▶ Child 16–17 years: 150 mg for 1 dose

Vulvovaginal candidiasis (recurrent)

- ▶ BY MOUTH
- ▶ Child: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months, for use in patients who are post-puberty

Mucosal candidiasis (except genital)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Neonate up to 14 days: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 72 hours.

- Neonate 14 days to 28 days: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 48 hours.

- Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)
- Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

Tinea capitis

► BY MOUTH

- Child 1–17 years: 6 mg/kg daily (max. per dose 300 mg) for 2–4 weeks

Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis

► BY MOUTH

- Child: 3 mg/kg daily (max. per dose 50 mg) for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Neonate up to 14 days: 6–12 mg/kg every 72 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).
- Neonate 14 days to 28 days: 6–12 mg/kg every 48 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).
- Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)

Prevention of fungal infections in immunocompromised patients

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Neonate up to 14 days: 3–12 mg/kg every 72 hours, dose given according to extent and duration of neutropenia.
- Neonate 14 days to 28 days: 3–12 mg/kg every 48 hours, dose given according to extent and duration of neutropenia.
- Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia

Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 6 mg/kg daily (max. per dose 200 mg)

- **UNLICENSED USE** Not licensed for tinea infections in children, or for vaginal candidiasis in girls under 16 years, or for prevention of relapse of cryptococcal meningitis after completion of primary therapy in children with AIDS.

- **CONTRA-INDICATIONS** Acute porphyrias p. 577

- **CAUTIONS** Susceptibility to QT interval prolongation

- **INTERACTIONS** → Appendix 1: antifungals, azoles

● SIDE-EFFECTS

- **Common or very common** Abdominal discomfort · diarrhoea · flatulence · headache · nausea · rash
- **Uncommon** Alopecia · anaphylaxis · angioedema · dizziness · dyspepsia · hepatic disorders · hyperlipidaemia · pruritus · seizures · Stevens-Johnson syndrome · taste disturbance · toxic epidermal necrolysis · vomiting
- **Frequency not known** Hypokalaemia · leucopenia · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

- **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Toxicity with related drugs.
- **RENAL IMPAIRMENT** Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Fluconazole Capsules 50 mg may be prescribed.
Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

► Child 12–17 years: 100 mg once daily for 15 days

Oropharyngeal candidiasis in patients with AIDS or neutropenia► **BY MOUTH**

► Child 1 month–11 years: 3–5 mg/kg once daily for 15 days; maximum 200 mg per day

► Child 12–17 years: 200 mg once daily for 15 days

Systemic candidiasis where other antifungal drugs inappropriate or ineffective► **BY MOUTH**

► Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)

► **BY INTRAVENOUS INFUSION**

► Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

Pityriasis versicolor► **BY MOUTH**

► Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 7 days

► Child 12–17 years: 200 mg once daily for 7 days

Tinea pedis | Tinea manuum► **BY MOUTH**

► Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 30 days

► Child 12–17 years: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

Tinea corporis | Tinea cruris► **BY MOUTH**

► Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 15 days

► Child 12–17 years: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

Tinea capitis► **BY MOUTH**

► Child 1–17 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 2–6 weeks

Onychomycosis► **BY MOUTH**

► Child 1–11 years: 5 mg/kg daily (max. per dose 200 mg) for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

► Child 12–17 years: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

Systemic aspergillosis where other antifungal drugs inappropriate or ineffective► **BY INTRAVENOUS INFUSION**

► Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

► **BY MOUTH**

► Child: 5 mg/kg once daily (max. per dose 200 mg), increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis

Histoplasmosis► **BY MOUTH**

► Child: 5 mg/kg 1–2 times a day (max. per dose 200 mg)

Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective► **BY MOUTH**

► Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)

► **BY INTRAVENOUS INFUSION**

► Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate► **BY MOUTH**

► Child: 5 mg/kg once daily (max. per dose 200 mg), then increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased only if low plasma-itraconazole concentration

Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic► **BY MOUTH USING ORAL SOLUTION**

► Child: 2.5 mg/kg twice daily, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established

- **UNLICENSED USE** Not licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION**HEART FAILURE**

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older adults and those with cardiac disease;

- patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
 - patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.
- Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

- **CONTRA-INDICATIONS** Acute porphyrias p. 577
- **CAUTIONS** Active liver disease · history of hepatotoxicity with other drugs · susceptibility to congestive heart failure
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · blood pressure changes · cough · diarrhoea · dyspnoea · headache · hepatitis · hypokalaemia · nausea · rash · taste disturbances · vomiting
- ▶ **Uncommon** Constipation · dizziness · dyspepsia · flatulence · menstrual disorder · myalgia · oedema · peripheral neuropathy (discontinue treatment)
- ▶ **Rare** Alopecia · deafness · erectile dysfunction · heart failure · hypertriglyceridaemia · leucopenia · pancreatitis · photosensitivity · Stevens-Johnson syndrome · tinnitus · toxic epidermal necrolysis · urinary frequency · visual disturbances
- ▶ **Frequency not known** Arthralgia · confusion · drowsiness · hepatotoxicity · renal impairment · thrombocytopenia · tremor

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Hyperglycaemia

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

- **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in *animal* studies).

- **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary. Use only if potential benefit outweighs risk of hepatotoxicity.

- **RENAL IMPAIRMENT** Risk of congestive heart failure.

- ▶ With oral use Bioavailability of oral formulations possibly reduced.

- ▶ With intravenous use Use intravenous infusion with caution if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² (monitor renal function); avoid intravenous infusion if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

• MONITORING REQUIREMENTS

- ▶ Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
- ▶ Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

• DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, dilute 250 mg with 50 mL Sodium Chloride 0.9% and give requisite dose through an in-line filter (0.2 micron) over 60 minutes.
- ▶ With oral use For *oral liquid*, do not take with food; swish around mouth and swallow, do not rinse afterwards.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.

- ▶ With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for infusion

EXCIPIENTS: May contain Propylene glycol

- ▶ **Sporanox** (Janssen-Cilag Ltd)

Voriconazole

• INDICATIONS AND DOSE

Invasive aspergillosis | Serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

- ▶ BY MOUTH

- ▶ Child 2–11 years: Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required
- ▶ Child 12–14 years (body-weight up to 50 kg): Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required
- ▶ Child 12–14 years (body-weight 50 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours
- ▶ Child 15–17 years (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
- ▶ Child 15–17 years (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

continued →

► BY INTRAVENOUS INFUSION

- Child 2–11 years: Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months
- Child 12–14 years (body-weight up to 50 kg): Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months
- Child 12–14 years (body-weight 50 kg and above): Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months
- Child 15–17 years: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises increasing the maintenance dose with concurrent use of fosphenytoin, phenytoin, or rifabutin—no specific recommendations made for children.

- **CONTRA-INDICATIONS** Acute porphyrias p. 577

- **CAUTIONS** Avoid exposure to sunlight · bradycardia · cardiomyopathy · electrolyte disturbances · history of QT interval prolongation · patients at risk of pancreatitis · symptomatic arrhythmias

- **INTERACTIONS** → Appendix 1: antifungals, azoles

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- **Common or very common** Abdominal pain · acute renal failure · agitation · alopecia · altered perception · anaemia · anxiety · asthenia · blood disorders · blurred vision · cheilitis · chest pain · confusion · depression · diarrhoea · dizziness · haematuria · hallucinations · headache · hypoglycaemia · hypokalaemia · hypotension · influenza-like symptoms · jaundice · leucopenia · nausea · oedema · pancytopenia · paraesthesia · photophobia · photosensitivity · pruritus · rash · respiratory distress syndrome · sinusitis · thrombocytopenia · tremor · visual disturbances · vomiting
- **Uncommon** Adrenocortical insufficiency · arrhythmias · arthritis · ataxia · blepharitis · cholecystitis · constipation · duodenitis · dyspepsia · flushing · fulminant hepatic failure · gingivitis · glossitis · hepatitis · hypersensitivity reactions · hyposensitivity · hyponatraemia · nystagmus · optic neuritis · pancreatitis · psoriasis · QT interval prolongation · raised serum cholesterol · scleritis · Stevens-Johnson syndrome · syncope
- **Rare** Convulsions · discoid lupus erythematosus · extrapyramidal effects · hearing disturbances · hyperthyroidism · hypertonia · hypothyroidism · insomnia · optic atrophy · pseudomembranous colitis · pseudoporphyria · retinal haemorrhage · taste disturbances (more common with oral suspension) · tinnitus · toxic epidermal necrolysis
- **Frequency not known** On long term treatment, squamous cell carcinoma of skin (particularly in presence of phototoxicity) · periostitis (particularly in transplant patients)

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With intravenous use Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION

- **Hepatotoxicity** Hepatitis, cholestasis, and fulminant hepatic failure usually occur in the first 10 days; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.
- **Phototoxicity** Phototoxicity occurs commonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin

lesions and squamous cell carcinoma, and discontinue treatment if they occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT**
Child 12–17 years In mild to moderate hepatic cirrhosis use usual initial dose then halve subsequent doses. No information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT**
Child 2–12 years No information available.
Child 12–17 years Intravenous vehicle may accumulate if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).
- **MONITORING REQUIREMENTS**
► Monitor renal function.
► Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to keep the alert card with them at all times.

Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

ANTIFUNGALS > OTHER**Flucytosine**● **INDICATIONS AND DOSE**

Systemic yeast and fungal infections | Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

► BY INTRAVENOUS INFUSION, OR BY MOUTH

► Neonate: 50 mg/kg every 12 hours.

► Child: Usual dose 50 mg/kg every 6 hours usually for not more than 7 days, alternatively 25–37.5 mg/kg every 6 hours usually for not more than 7 days, lower dose may be sufficient for sensitive organisms

Cryptococcal meningitis (adjunct to amphotericin)

► BY INTRAVENOUS INFUSION, OR BY MOUTH

► Neonate: 50 mg/kg every 12 hours.

► Child: 25 mg/kg every 6 hours for 2 weeks

● **UNLICENSED USE** Tablets not licensed.

● **CAUTIONS** Blood disorders

● **INTERACTIONS** → Appendix 1: flucytosine

● **SIDE-EFFECTS**

► **Common or very common** Diarrhoea · nausea · rashes · vomiting

► **Uncommon** Alterations in liver function tests · cardiotoxicity · confusion · convulsions · hallucinations · headache · sedation · toxic epidermal necrolysis · vertigo

► **Frequency not known** Aplastic anaemia · blood disorders · hepatic necrosis · hepatitis · leucopenia · thrombocytopenia

● **PREGNANCY** Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid.

● **RENAL IMPAIRMENT** Use normal dose every 12 hours if creatinine clearance 20–40 mL/minute; use normal dose every 24 hours if creatinine clearance 10–20 mL/minute; use initial normal dose if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration. In renal impairment liver- and kidney-function tests and blood counts required weekly.

● **MONITORING REQUIREMENTS**

► For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).

► Liver- and kidney-function tests and blood counts required (weekly in blood disorders).

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 20–40 minutes.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Ancotil** (Meda Pharmaceuticals Ltd)

Flucytosine 10 mg per 1 ml Ancotil 2.5g/250ml solution for infusion bottles | 5 bottle [PoM] £151.67 (Hospital only)

Griseofulvin● **INDICATIONS AND DOSE**

Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate

► BY MOUTH

► Child 1 month–11 years: Usual dose 10 mg/kg daily (max. per dose 500 mg), increased if necessary to 20 mg/kg daily (max. per dose 1 g), for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

► Child 12–17 years: 500 mg daily, increased if necessary to 1 g daily, for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

Tinea capitis caused by *Trichophyton tonsurans*

► BY MOUTH

► Child 1 month–11 years: 15–20 mg/kg once daily (max. per dose 1 g), alternatively 15–20 mg/kg daily in divided doses (max. per dose 1 g)

► Child 12–17 years: 1 g once daily, alternatively 1 g daily in divided doses

● **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

● **CONTRA-INDICATIONS** Acute porphyrias p. 577 · systemic lupus erythematosus (risk of exacerbation)

● **INTERACTIONS** → Appendix 1: griseofulvin

● **SIDE-EFFECTS**

► **Rare** Erythema multiforme · toxic epidermal necrolysis

► **Very rare** Headache

► **Frequency not known** Abdominal pain · agitation · confusion · depression · diarrhoea · dizziness · dyspepsia · fatigue · glossitis · hepatotoxicity · impaired coordination · impaired hearing · leucopenia · menstrual disturbances · nausea · peripheral neuropathy · photosensitivity · rash · renal failure · sleep disturbances · systemic lupus erythematosus · taste disturbances · vomiting

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration

● **PREGNANCY** Avoid (fetotoxicity and teratogenicity in *animals*).

● **BREAST FEEDING** Avoid—no information available.

● **HEPATIC IMPAIRMENT** Avoid in severe liver disease.

3.1 Pneumocystis pneumonia

Pneumocystis pneumonia

Overview

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

The recommended duration of treatment is generally 14–21 days.

Mild to moderate disease

Co-trimoxazole p. 335 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone below or a combination of dapsone p. 365 with trimethoprim p. 344 is given by mouth for the treatment of mild to moderate disease [unlicensed indication] in children who cannot tolerate co-trimoxazole.

A combination of clindamycin p. 313 and primaquine p. 381 may be used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 365 given by intravenous infusion is an alternative for children who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion. If there is clinical improvement after 7–10 days of intravenous therapy with pentamidine isetionate, patients can be switched to oral treatment (e.g. atovaquone) to complete 21 days treatment.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy

In moderate to severe pneumocystis infections associated with HIV infection, prednisolone p. 421 is given by mouth for 5 days (alternatively, hydrocortisone p. 420 may be given parenterally); the dose is then reduced over the next 16 days and then stopped. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all children with a history of this infection, and to all HIV-infected infants aged 1 month–1 year. Prophylaxis against pneumocystis pneumonia should also be considered

for severely immunocompromised children. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the child has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Prophylaxis should also be given to infants aged 1 month–1 year who are suspected to be HIV-positive, or whose mothers had a viral load greater than 1000 HIV RNA copies/mL between 36 weeks' gestation and delivery; prophylaxis should be continued until HIV infection is excluded or until immunity recovers.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. Co-trimoxazole may be used in infants born to mothers with a high risk of transmission of infection.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in children unable to tolerate co-trimoxazole. It is effective but children may be prone to extrapulmonary infection. Alternatively, dapsone can be used.

ANTIPROTOZOALS

Atovaquone

● INDICATIONS AND DOSE

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

► BY MOUTH

- Child 1–2 months: 15–20 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
- Child 3 months–1 year: 22.5 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
- Child 2–17 years: 15–20 mg/kg twice daily (max. per dose 750 mg) for 14–21 days, dose to be taken with food, particularly high fat food

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Other causes of pulmonary disease should be sought and treated · initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy)

- **INTERACTIONS** → Appendix 1: antimalarials

- **SIDE-EFFECTS** Anaemia · diarrhoea · fever · headache · hyponatraemia · insomnia · nausea · neutropenia · pruritus · rash · Stevens-Johnson syndrome · vomiting

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Monitor more closely in hepatic impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution. Monitor more closely in renal impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

► Wellvone (GlaxoSmithKline UK Ltd)

Atovaquone 150 mg per 1 ml Wellvone 750mg/5ml oral suspension sugar-free | 226 ml **[PoM]** £486.37

Dapsone

● INDICATIONS AND DOSE

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 2 mg/kg once daily (max. per dose 100 mg)
- ▶ Child 12–17 years: 100 mg once daily

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia

- ▶ BY MOUTH
- ▶ Child: 2 mg/kg once daily (max. per dose 100 mg)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia. Monotherapy not licensed for children for prophylaxis of *P. jirovecii* pneumonia.

- **CAUTIONS** Anaemia (treat severe anaemia before starting) · avoid in acute porphyrias p. 577 · cardiac disease · G6PD deficiency · pulmonary disease · susceptibility to haemolysis

- **INTERACTIONS** → Appendix 1: dapsone

● SIDE-EFFECTS

- ▶ **Rare** Stevens-Johnson syndrome · toxic epidermal necrolysis
- ▶ **Frequency not known** Agranulocytosis · allergic dermatitis · anorexia · dapsone syndrome · haemolysis · headache · hepatitis · insomnia · methaemoglobinemia · nausea · neuropathy · psychosis · tachycardia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Dapsone syndrome** If dapsone syndrome occurs (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death).
- **PREGNANCY** Folic acid p. 546 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinemia reported in third trimester.
- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.
- **PATIENT AND CARER ADVICE**
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 8

▶ Dapsone (Non-proprietary)

Dapsone 50 mg Dapsone 50mg tablets | 28 tablet [PoM] £51.00 DT price = £40.77

Dapsone 100 mg Dapsone 100mg tablets | 28 tablet [PoM] £105.07 DT price = £105.07

Pentamidine isetionate

● INDICATIONS AND DOSE

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 4 mg/kg once daily for at least 7–10 days

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 5–17 years: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

Visceral leishmaniasis (specialist use only)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1–17 years: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

Cutaneous leishmaniasis (specialist use only)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1–17 years: 3–4 mg/kg 1–2 times a week until condition resolves

Trypanosomiasis (specialist use only)

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child 1–17 years: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for prevention of pneumocystis pneumonia in children.
- **CAUTIONS** Anaemia · bradycardia · coronary heart disease · history of ventricular arrhythmias · hyperglycaemia · hypertension · hypoglycaemia · hypokalaemia · hypomagnesaemia · hypotension · leucopenia · risk of severe hypotension following administration · thrombocytopenia
- **INTERACTIONS** → Appendix 1: pentamidine
- **SIDE-EFFECTS**
GENERAL SIDE-EFFECTS
Abnormal liver-function tests · acute renal failure · anaemia · arrhythmias (can be severe and sometimes fatal) · azotaemia · dizziness · flushing · hyperglycaemia · hyperkalaemia · hypocalcaemia · hypoglycaemia (can be severe and sometimes fatal) · hypotension (can be severe and sometimes fatal) · leucopenia · nausea · pancreatitis (can be severe and sometimes fatal) · rash · Stevens-Johnson syndrome · syncope · taste disturbances · thrombocytopenia · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ When used by inhalation Bronchoconstriction (may be prevented by prior use of bronchodilators) · cough · shortness of breath
- ▶ With intramuscular use or intravenous use Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses.
- **MONITORING REQUIREMENTS**
Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
- ▶ Carry out laboratory monitoring according to product literature.
- **DIRECTIONS FOR ADMINISTRATION** Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion*,

reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.

Powder for injection (dissolved in water for injection) may be used for nebulisation.

- **HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

● **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Pentacarinat** (Sanofi)

Pentamidine isetionate 300 mg Pentacarinat 300mg powder for solution for injection vials | 5 vial [PoM] £158.86

4 Helminth infection

Helminth infections

Specialist centres

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

Birmingham	(0121) 424 0357
Scotland	Contact local Infectious Diseases Unit
Liverpool	(0151) 705 3100
London	0845 155 5000 (treatment)

Drugs for threadworms

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 368 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Ascaricides (common roundworm infections)

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 367 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

Drugs for tapeworm infections

Tenidases

Niclosamide [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia*

solium infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 368 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole p. 367 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

Drugs for hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative. Levamisole is also is also effective in children.

Schistosomicides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (Cysticide[®]) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Filaricides

Diethylcarbamazine [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin p. 367 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

Drugs for cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or **tiabendazole** (tiabendazole) by mouth [all unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Drugs for strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

ANTHELMINTICS

Albendazole

● INDICATIONS AND DOSE

Chronic *Strongyloides* infection

► BY MOUTH

- Child 2–17 years: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases

► BY MOUTH

- Child 2–17 years: 7.5 mg/kg twice daily (max. per dose 400 mg twice daily) for 28 days followed by 14-day break, repeated for up to 2–3 cycles

Hookworm infections

► BY MOUTH

- Child 2–17 years: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.

- **INTERACTIONS** → Appendix 1: albendazole

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9

► Albendazole (Non-proprietary)

Albendazole 400 mg Eskazole 400mg tablets | 60 tablet [PoM] no price available

Chewable tablet

Albendazole 200 mg Zentel 200mg chewable tablets | 6 tablet [PoM] no price available

Albendazole 400 mg Zentel 400mg chewable tablets | 1 tablet [PoM] no price available | 3 tablet [PoM] no price available

Diethylcarbamazine

● INDICATIONS AND DOSE

Wuchereria bancrofti infections | *Brugia malayi* infections

► BY MOUTH

- Child 1 month–9 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 3 mg/kg daily in divided doses, dose to be increased gradually over 3 days

- Child 10–17 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

Loa loa infections

► BY MOUTH

- Child 1 month–9 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 3 mg/kg daily in divided doses, dose to be increased gradually over 3 days
- Child 10–17 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

- **UNLICENSED USE** Diethylcarbamazine is an unlicensed drug.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

Ivermectin

17-May-2017

● INDICATIONS AND DOSE

Chronic *Strongyloides* infection

► BY MOUTH

- Child 5–17 years: 200 micrograms/kg daily for 2 days

Onchocerciasis

► BY MOUTH

- Child 5–17 years: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months, depending on symptoms, must be given until adult worms die out

Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone

► BY MOUTH

- Child: (consult product literature)

- **UNLICENSED USE** Ivermectin is unlicensed.

- **INTERACTIONS** → Appendix 1: ivermectin

- **SIDE-EFFECTS** Aggravation of itching · aggravation of rash

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

► Ivermectin (Non-proprietary)

Ivermectin 3 mg Stromectol 3mg tablets | 4 tablet [PoM] no price available | 20 tablet [PoM] no price available

Levamisole

● INDICATIONS AND DOSE

Roundworm infections

► BY MOUTH

- Child: 2.5–3 mg/kg (max. per dose 150 mg) for 1 dose

Hookworm infections

► BY MOUTH

- Child: 2.5 mg/kg (max. per dose 150 mg) for 1 dose, dose to be repeated after 7 days if severe

Nephrotic syndrome (initiated under specialist supervision)

► BY MOUTH

- Child: 2.5 mg/kg once daily on alternate days (max. per dose 150 mg)

- **UNLICENSED USE** Not licensed.

- **CONTRA-INDICATIONS** Blood disorders
- **CAUTIONS** Epilepsy • juvenile idiopathic arthritis • Sjögren's syndrome
- **INTERACTIONS** → Appendix 1: levamisole
- **SIDE-EFFECTS** Arthralgia (on *prolonged treatment*) • blood disorders (on *prolonged treatment*) • convulsions (on *prolonged treatment*) • diarrhoea • dizziness • headache • influenza-like syndrome (on *prolonged treatment*) • insomnia (on *prolonged treatment*) • myalgia (on *prolonged treatment*) • nausea • rash (on *prolonged treatment*) • taste disturbances (on *prolonged treatment*) • vasculitis (on *prolonged treatment*) • vomiting
- **PREGNANCY** Embryotoxic in *animal* studies, avoid if possible.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Use with caution—dose adjustment may be necessary.
- **PATIENT AND CARER ADVICE**

Tablet

CAUTIONARY AND ADVISORY LABELS 4

► **Ergamisol** (Imported (Belgium))

Levamisole (as Levamisole hydrochloride) 50 mg Ergamisol 50mg tablets | 20 tablet [PoM] no price available

Mebendazole

INDICATIONS AND DOSE

Threadworm infections

► BY MOUTH

► Child 6 months–17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

Whipworm infections | Hookworm infections

► BY MOUTH

► Child 1–17 years: 100 mg twice daily for 3 days

Roundworm infections

► BY MOUTH

► Child 1 year: 100 mg twice daily for 3 days

► Child 2–17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

- **UNLICENSED USE** Not licensed for use as a single dose of 500 mg in roundworm infections. Not licensed for use in children under 2 years.

- **INTERACTIONS** → Appendix 1: mebendazole

SIDE-EFFECTS

- **Common or very common** Abdominal pain
- **Uncommon** Diarrhoea • flatulence
- **Rare** Alopecia • convulsions • dizziness • hepatitis • neutropenia • rash • Stevens–Johnson syndrome • toxic epidermal necrolysis • urticaria

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Amount present in milk too small to be harmful but manufacturer advises avoid.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Mebendazole for worm infections
www.medicinesforchildren.org.uk/mebendazole-for-worm-infections

- **EXCEPTIONS TO LEGAL CATEGORY** Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

► **Oxev** (McNeil Products Ltd)

Mebendazole 20 mg per 1 ml Oxev 100mg/5ml oral suspension | 30 ml [P] £6.03 DT price = £1.55

Praziquantel 500 mg Cysticide 500mg tablets | 90 tablet [PoM] no price available

5 Protozoal infection

Antiprotozoal drugs

Amoebicides

Metronidazole p. 319 is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers. Tinidazole p. 320 is

also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate p. 287.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with large volumes of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Tinidazole may be used as an alternative to metronidazole.

Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Skin lesions can also be treated with sodium stibogluconate.

Amphotericin p. 357 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*®). *Abelcet*®, a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isethionate p. 365 (pentamidine isethionate) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Drugs for toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of

pyrimethamine p. 382 and sulfadiazine p. 336, given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 313 or clarithromycin p. 315 or azithromycin p. 314. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus. When there is evidence of placental or fetal infection, pyrimethamine may be given with sulfadiazine and folinic acid p. 528 after the first trimester.

In neonates without signs of toxoplasmosis, but born to mothers known to have become infected, spiramycin is given while awaiting laboratory results. If toxoplasmosis is confirmed in the infant, pyrimethamine and sulfadiazine are given for 12 months, together with folinic acid.

5.1 Leishmaniasis

ANTIPROTOZOALS

Sodium stibogluconate

• INDICATIONS AND DOSE

Visceral leishmaniasis (specialist use only)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 20 mg/kg daily for at least 20 days

• UNLICENSED USE

- ▶ With intravenous use Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) • mucocutaneous disease • predisposition to QT interval prolongation • treat intercurrent infection (e.g. pneumonia)

CAUTIONS, FURTHER INFORMATION

- ▶ Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.

- **INTERACTIONS** → Appendix 1: sodium stibogluconate

• SIDE-EFFECTS

- ▶ **Rare** Bleeding from gums • bleeding from nose • fever • flushing • jaundice • rash • substernal pain • sweating • vertigo
- ▶ **Frequency not known** Abdominal pain • anaphylaxis • anorexia • arthralgia • coughing • diarrhoea • ECG changes • headache • lethargy • myalgia • nausea • pain on intramuscular injection • pain on intravenous administration • pancreatitis • thrombosis on intravenous administration • vomiting

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** Avoid in significant impairment.

- **MONITORING REQUIREMENTS** Monitor ECG before and during treatment.

• **DIRECTIONS FOR ADMINISTRATION** Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Pentostam** (GlaxoSmithKline UK Ltd)

Antimony pentavalent (as Sodium stibogluconate) 100 mg per 1 ml Pentostam 10g/100ml solution for injection vials | 1 vial [PoM] £66.43

5.2 Malaria

Antimalarials

Artemether with lumefantrine

Artemether with lumefantrine p. 377 is licensed for the treatment of acute non-complicated falciparum malaria.

Chloroquine

Chloroquine p. 379 is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil hydrochloride p. 381 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see Recommended regimens for prophylaxis against malaria p. 372).

Chloroquine is **no longer recommended** for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine p. 382, Malarone®, or Riamet®. It is still recommended for the treatment of non-falciparum malaria.

Mefloquine

Mefloquine p. 380 is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine resistant falciparum malaria (for details, see Recommended regimens for prophylaxis against malaria p. 372).

Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

Piperaquine with arteminimol

Arteminimol with piperaquine phosphate p. 377 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

Primaquine

Primaquine p. 381 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

Proguanil

Proguanil hydrochloride is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 372).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil hydrochloride p. 378) is licensed

for the treatment of acute uncomplicated falciparum malaria. Malarone® is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline p. 338. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine

Pyrimethamine p. 382 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine p. 382 is not recommended for the prophylaxis of malaria, but can be used in the treatment of falciparum malaria with (or following) quinine.

Quinine

Quinine is not suitable for the prophylaxis of malaria.

Quinine is used for the treatment of falciparum malaria or if the infective species is *not known* or if the infection is mixed (for details see Malaria, treatment p. 371).

Tetracyclines

Doxycycline is used in adults and children over 12 years for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or Malarone® (for details, see Recommended regimens for prophylaxis against malaria p. 372).

Malaria, prophylaxis

Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. **Weight is a better guide than age.** If in doubt obtain advice from specialist centre (see under Malaria, treatment p. 371).

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin p. 699 provide the most effective barrier protection against insects (infants should sleep with a mosquito net stretched over the cot or baby carrier); mats and vaporised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis

In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 380) before travel into an endemic area; *Malarone*® or doxycycline p. 338 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for *Malarone*® prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine p. 379 and proguanil hydrochloride p. 381 may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. *Malarone*® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or *Malarone*® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region

It is important to be aware that **any illness** that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be **warned** of this and told that if they develop any illness **particularly within 3 months** of their return they should go **immediately** to a doctor and specifically mention their exposure to malaria.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas *without chloroquine resistance* proguanil alone is recommended; in areas *with chloroquine resistance*, doxycycline or *Malarone*® may be considered.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment

Avoidance (or dosage reduction) of proguanil hydrochloride is recommended since it is excreted by the kidneys. *Malarone*® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73m². Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 546 (in doses greater than standard pregnancy prophylaxis) should be given for at least the first trimester. The centres listed (see Malaria, treatment, below) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated

during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. *Malarone*® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding

Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin sodium p. 94 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment

Children and their carers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be **avoided** if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with **written instructions** that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Specific recommendations

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See also *Recommended regimens for prophylaxis against malaria*.

Important

Settled immigrants (or long-term visitors) to the UK may be unaware that **any immunity they may have acquired while living in malarious areas is lost rapidly** after migration to the UK, or that any non-malarious areas where they lived previously **may now be malarious**.

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
-	No risk
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine
5	Atovaquone with proguanil hydrochloride or doxycycline

Specific recommendations

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Risk below 2000 m from May–November	3
	Low risk below 2000 m from December–April	1
Algeria	Very low risk in Illizi department only	1
Andaman and Nicobar Islands (India)	Risk present	1
Angola	High risk	4
Argentina	Low risk in low altitude areas of Salta provinces bordering Bolivia and in Chaco, Corrientes, and Misiones provinces close to border with Paraguay and Brazil	2
	No risk in Iguazu Falls and areas other than those above	1
Armenia	No risk	1
Azerbaijan	Low to no risk	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Low to no risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	2
	No risk in Belize district (including Belize city and islands)	1
Benin	High risk	4
Bhutan	Risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	3
	Low to no risk in areas other than those above	1
Bolivia	High risk in Amazon basin	4
	Risk in rural areas below 2500 m (other than above)	2
	No risk above 2500 m	1
Botswana	High risk from November–June in northern half, including Okavango Delta area	4
	Low risk from July–October in northern half; low to no risk all year in southern half	1
Brazil	Risk in Amazon basin, including city of Manaus	4
	Very low risk in areas other than those above, and no risk in Iguazu Falls	1
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4
Cambodia	High risk, with widespread chloroquine and mefloquine resistance, in western provinces bordering Thailand	5
	High risk in areas other than those above and below	4
	Very low risk in Angkor Wat and Lake Tonle Sap, including Siem Reap; no risk in Phnom Penh	1
Cameroon	High risk	4
Cape Verde	Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4
China	High risk in Yunnan and Hainan provinces	4
	Very low risk in areas other than those above and below	1
	No risk in Hong Kong	-
Colombia	High risk in rural areas below 1600 m	4
	Low to no risk above 1600 m and in Cartagena	1

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Comoros	High risk	4
Congo	High risk	4
Costa Rica	Risk in Limon province (but not city of Limon)	2
	Very low risk in areas other than those above	1
Cote d'Ivoire (Ivory Coast)	High risk	4
Democratic Republic of the Congo	High risk	4
Djibouti	High risk	4
Dominican Republic	Risk in all areas except cities of Santiago and Santo Domingo	2
	Cities of Santiago and Santo Domingo	1
East Timor (Timor-Leste)	High risk	4
Ecuador	Risk in areas below 1500 m including coastal provinces and Amazon basin (no risk in Galapagos islands or city of Guayaquil)	4
Egypt	No risk	1
El Salvador	Low risk in rural areas of Santa Ana, Ahuachapán, and La Unión provinces in western part of country; low to no risk in other areas	1
Equatorial Guinea	High risk	4
Eritrea	High risk below 2200 m	4
Ethiopia	High risk below 2000 m	4
French Guiana	High risk (particularly in border areas) except city of Cayenne or Devil's Island (Ile du Diable)	4
	No risk in city of Cayenne or Devil's Island (Ile du Diable)	1
Gabon	High risk	4
Gambia	High risk	4
Georgia	Very low risk in rural south east from June–October	1
Ghana	High risk	4
Guatemala	Low risk below 1500 m	2
	No risk in Guatemala City, Antigua, or Lake Atitlan	-
Guinea	High risk	4
Guinea-Bissau	High risk	4
Guyana	High risk in all interior regions	4
	Very low risk in Georgetown and coastal region	1
Haiti	Risk present	2
Honduras	Risk below 1000 m and in Roatán and other Bay Islands (no risk in San Pedro Sula or Tegucigalpa)	2
India	High risk in states of Assam and Orissa, districts of East Godavari, Srikakulam, Vishakhapatnam, and Vizianagaram in the state of Andhra Pradesh, and districts of Balaghat, Dindori, Mandla, and Seoni in the state of Madhya Pradesh	4
	Risk in areas other than those above or below (including Goa, Andaman and Nicobar islands)	1
	No risk in Lakshadweep islands	-
Indonesia	High risk in Lombok and Irian Jaya (Papua)	4
	Risk in areas other than those above or below	3
	Very low risk in Bali, and cities on islands of Java and Sumatra	1
	No risk in city of Jakarta	-
Indonesia (Borneo)	High risk	4
Iran	Risk from March–November in rural south eastern provinces and in north, along Azerbaijan border in Ardabil, and near Turkmenistan border in North Khorasan	3
	Low to no risk in areas other than those above	1
Iraq	Very low risk from May–November in rural northern area below 1500 m	1
Kenya	High risk below 2500 m (except city of Nairobi)	4
	Very low risk in the highlands above 2500 m and in city of Nairobi	1
Kyrgyzstan	Very low risk from June–October in southwest areas bordering Tajikistan and Uzbekistan	1

Key to recommended regimens for prophylaxis against malaria

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Laos	High risk along the border with Myanmar in the provinces of Bokeo and Louang Namtha, and along the border with Thailand in the province of Champasak and Saravan	5
	High risk in areas other than those above or below	4
	Low to no risk in city of Vientiane	1
Liberia	High risk	4
Libya	No risk	1
Madagascar	High risk	4
Malawi	High risk	4
Malaysia	Risk in inland forested areas of peninsular Malaysia	4
	Very low risk in rest of peninsular Malaysia, including Cameron Highlands and city of Kuala Lumpur	1
Malaysia (Borneo)	High risk in inland areas of eastern Sabah and in inland, forested areas of Sarawak	4
	Very low risk in areas other than those above, including coastal areas of Sabah and Sarawak	1
Mali	High risk	4
Mauritania	High risk all year in southern provinces, and from July–October in the northern provinces	4
	Low risk from November–June in the northern provinces	1
Mauritius	No risk	1
Mayotte	Risk present	4
Mexico	Low risk in Oaxaca and Chiapas	2
	Very low risk in areas other than those above	1
Mozambique	High risk	4
Myanmar	High risk (but not in cities of Mandalay and Yangon)	5
	No risk in cities of Mandalay and Yangon	1
Namibia	High risk all year in regions of Caprivi Strip, Kavango, and Kunene river, and from November–June in northern third of country	4
	Low to no risk in areas other than those above; low risk from July–October in northern third of country	1
Nepal	Risk below 1500 m, particularly in Terai district	3
	No risk in city of Kathmandu and on typical Himalayan treks	1
Nicaragua	Low risk (except Managua)	2
	Very low risk in Managua	1
Niger	High risk	4
Nigeria	High risk	4
North Korea	Very low risk in some southern areas	1
Pakistan	Risk below 2000 m	3
	Low to no risk above 2000 m	1
Panama	Risk east of Canal Zone	3
	Low risk west of Canal Zone	2
	No risk in Panama City or Canal Zone itself	1
Papua New Guinea	High risk below 1800 m	4
	Low to no risk above 1800 m	1

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Paraguay	Low risk in departments of Alto Paraná and Caaguazú	2
	Very low risk in areas other than those above	1
Peru	High risk in Amazon basin along border with Brazil, particularly in Loreto province	4
	Risk in rural areas below 2000 m (other than those above and below) including in Amazon basin along border with Bolivia	2
	No risk in city of Lima and coastal region south of Chiclayo	1
Philippines	Risk in rural areas below 600 m and on islands of Luzon, Mindanao, Mindoro, and Palawan	3
	No risk in cities or on islands of Boracay, Bohol, Catanduanes, Cebu, or Leyte	1
Rwanda	High risk	4
São Tomé and Príncipe	High risk	4
Saudi Arabia	Risk in south-western provinces along border with Yemen, including below 2000 m in Asir province	3
	No risk in cities of Jeddah, Makkah (Mecca), Medina, Riyadh, or Ta'if, or above 2000 m in Asir province	1
Senegal	High risk	4
Sierra Leone	High risk	4
Solomon Islands	High risk	4
Somalia	High risk	4
South Africa	Moderate risk from September–May in low altitude areas of Mpumalanga and Limpopo, which border Mozambique and Zimbabwe (including Kruger National Park)	4
	Low risk in north-east KwaZulu-Natal	1
	Low risk in areas bordering those above	1
South Korea	Very low risk in northern areas, in Gangwon-do and Gyeonggi-do provinces, and Incheon city (towards Demilitarized Zone)	1
South Sudan	High risk	4
Sri Lanka	Low risk north of Vavuniya	1
	Very low risk in areas other than those above and below	1
	No risk in Colombo or Kandy	-
Sudan	High risk in central and southern areas; risk also present in rest of country (except Khartoum)	4
	Very low risk in Khartoum	1
Suriname	High risk (except coastal districts or city of Paramaribo)	4
	Very low risk in coastal districts; no risk in city of Paramaribo	1
Swaziland	High risk in northern and eastern regions bordering Mozambique and South Africa, including all of Lubombo district and Big Bend, Mhlume, Simunye, and Tshaneni regions	4
	Very low risk in the areas other than those above	1
Syria	Very low risk in small, remote foci of El Hasakah	1
Tajikistan	Risk below 2000 m from June–October	3
	Low risk below 2000 m from November–May	1
Tanzania	High risk below 1800 m; risk also in Zanzibar	4
Thailand	High risk, with chloroquine and mefloquine resistance, in rural forested borders with Cambodia, Laos, and Myanmar	5
	Very low risk in areas other than those above, including Kanchanaburi (Kwai Bridge); no risk in cities of Bangkok, Chiang Mai, Chiang Rai, Koh Phangan, Koh Samui, and Pattaya	1
Togo	High risk	4
Turkey	Low risk from May–October along the border plain with Syria, around Adana and east of Adana	2
	Very low risk from November–April along the border plain with Syria, around Adana and east of Adana; very low risk all year in rest of country	1
Uganda	High risk	4
Uzbekistan	Very low risk in extreme south-east	1
Vanuatu	Risk present	4

Treatment

Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists. Choice will depend on the age of the child.

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for *falciparum malaria* with quinine p. 382, *Malarone*® (atovaquone with proguanil hydrochloride p. 378), or *Riamet*® (artemether with lumefantrine p. 377). *Falciparum malaria* can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine p. 379 which should not therefore be given for treatment. Quinine, *Malarone*® (atovaquone with proguanil hydrochloride), or *Riamet*® (artemether with lumefantrine) can be given by mouth if the child can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the child is seriously ill or unable to take tablets. Mefloquine p. 380 is now rarely used for treatment because of concerns about resistance.

Oral quinine is well tolerated by children although the salts are bitter. Quinine is given by mouth together with or followed by clindamycin p. 313 [unlicensed indication] or, in children over 12 doxycycline p. 338.

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine p. 382 as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, *Malarone*®, or *Riamet*® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*® or *Riamet*® treatment.

If the child is seriously ill or unable to swallow tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by *intravenous infusion* [unlicensed] (until patient can swallow tablets to complete the 7-day course *together with or followed by either* doxycycline in children over 12 years, or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous *artesunate* may be available for 'named-patient' use.

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The treatment doses of oral and intravenous quinine (including the loading dose) can safely be given in pregnancy. Clindamycin [unlicensed indication] should be given for 7 days with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development in fetus); pyrimethamine with sulfadoxine, *Malarone*®, and *Riamet*® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired

in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named patient' use.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region. Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, *Malarone*® [unlicensed indication], quinine, or *Riamet*® [unlicensed indication] can be used; with chloroquine, primaquine p. 381 should be given for radical cure.

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine.

For a radical cure, primaquine [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age.

Parenteral

If the child is unable to take oral therapy, quinine can be given by intravenous infusion, changed to oral chloroquine as soon as the patient's condition permits.

Pregnancy

Treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be postponed until the pregnancy is over; instead chloroquine should be continued, given weekly, during the pregnancy.

ANTIPROTOZOALS > ANTIMALARIALS

Artemether with lumefantrine

● INDICATIONS AND DOSE

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

► BY MOUTH

- Child (body-weight 5–14 kg): Initially 1 tablet, followed by 1 tablet for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours)
- Child (body-weight 15–24 kg): Initially 2 tablets, followed by 2 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours)
- Child (body-weight 25–34 kg): Initially 3 tablets, followed by 3 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)
- Child 12–17 years (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)

- **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.
- **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction
- **CAUTIONS** Avoid in acute porphyrias p. 577 · electrolyte disturbances
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anorexia · arthralgia · asthenia · cough · diarrhoea · dizziness ·

headache · myalgia · nausea · palpitation · paraesthesia · prolonged QT interval · pruritus · rash · sleep disturbances · vomiting

- **Uncommon** Ataxia · clonus · hypoaesthesia
- **PREGNANCY** Toxicity in animal studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment. In severe renal impairment monitor ECG and plasma potassium concentration.
- **MONITORING REQUIREMENTS** Monitor patients unable to take food (greater risk of recrudescence).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed just before administration.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks
Dizziness may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Artemether 20 mg, Lumefantrine 120 mg Riamet tablets | 24 tablet (PoM) £22.50

Arteminol with piperazine phosphate

(Piperazine tetraphosphate with dihydroartemisinin)

● INDICATIONS AND DOSE

Treatment of uncomplicated falciparum malaria

► BY MOUTH

- Child 6 months–17 years (body-weight 7–12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months–17 years (body-weight 13–23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months–17 years (body-weight 24–35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months–17 years (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months–17 years (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

- **CONTRA-INDICATIONS** Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anaemia · blood disorders · conjunctivitis · cough · diarrhoea · irregular

heart rate · leucopenia · malaise · QT interval prolonged · rash · thrombocytopenia · vomiting

- ▶ **Uncommon** Acanthosis · arrhythmias · arthralgia · convulsions · headache · heart murmur · hepatitis · hepatomegaly · influenza-like symptoms · jaundice · nausea · stomatitis
- **PREGNANCY** Teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QT_c interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
 - ▶ Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperquine concentration, in children who are vomiting or in females.
- **DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperquine phosphate with artemimol.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Eurartesim** (Logixx Pharma Solutions Ltd) ▼
Artemimol 40 mg, Piperquine phosphate 320 mg Eurartesim 320mg/40mg tablets | 12 tablet [PoM] £40.00

Atovaquone with proguanil hydrochloride

● INDICATIONS AND DOSE

MALARONE®

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

- ▶ **BY MOUTH**
- ▶ Child (body-weight 41 kg and above): 1 tablet daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

Treatment of acute uncomplicated falciparum malaria |

Treatment of non-falciparum malaria

- ▶ **BY MOUTH**
- ▶ Child (body-weight 11–20 kg): 1 tablet once daily for 3 days
- ▶ Child (body-weight 21–30 kg): 2 tablets once daily for 3 days
- ▶ Child (body-weight 31–40 kg): 3 tablets once daily for 3 days
- ▶ Child (body-weight 41 kg and above): 4 tablets once daily for 3 days

MALARONE® PAEDIATRIC

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

▶ BY MOUTH

- ▶ Child (body-weight 5–8 kg): 0.5 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
- ▶ Child (body-weight 9–10 kg): 0.75 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
- ▶ Child (body-weight 11–20 kg): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
- ▶ Child (body-weight 21–30 kg): 2 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
- ▶ Child (body-weight 31–40 kg): 3 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
- ▶ Child (body-weight 41 kg and above): Use Malarone® (standard) tablets.

Treatment of acute uncomplicated falciparum malaria |

Treatment of non-falciparum malaria

▶ BY MOUTH

- ▶ Child (body-weight 5–8 kg): 2 tablets once daily for 3 days
- ▶ Child (body-weight 9–10 kg): 3 tablets once daily for 3 days
- ▶ Child (body-weight 11 kg and above): Use Malarone® (standard) tablets.

- **UNLICENSED USE** Not licensed for treatment of non-falciparum malaria. Not licensed for prophylaxis of malaria in children under 11 kg.
- **CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) · efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · abnormal dreams · anorexia · cough · depression · diarrhoea · dizziness · fever · headache · insomnia · nausea · pruritus · rash · vomiting
 - ▶ **Uncommon** Anxiety · blood disorders · hair loss · hyponatraemia · palpitation · stomatitis
 - ▶ **Frequency not known** Cholestasis · hallucinations · hepatitis · mouth ulcers · photosensitivity · seizures · Stevens-Johnson syndrome · tachycardia · vasculitis
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Use only if no suitable alternative available.
- **RENAL IMPAIRMENT** Avoid for malaria prophylaxis and, if possible, for treatment if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ **MALARONE® PAEDIATRIC** Tablets may be crushed and mixed with food or milky drink just before administration.
- **PATIENT AND CARER ADVICE** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
Medicines for Children leaflet: Malarone for prevention of malaria www.medicinesforchildren.org.uk/malarone-for-prevention-of-malaria
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - ▶ **NHS restrictions** Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

Chloroquine

INDICATIONS AND DOSE

Prophylaxis of malaria

► INITIALLY BY MOUTH USING SYRUP

- Child 4–5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 1–2 years (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 3–4 years (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 5–7 years (body-weight 16.5–24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 8–13 years (body-weight 25–44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

► INITIALLY BY MOUTH USING TABLETS

- Child 14–17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Treatment of non-falciparum malaria

► BY MOUTH

- Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days

P. vivax or *P. ovale* infection during pregnancy while radical cure is postponed

► BY MOUTH

- Child: 10 mg/kg once weekly (max. per dose 310 mg)

DOSE EQUIVALENCE AND CONVERSION

- Doses expressed as chloroquine base. Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx).

● **UNLICENSED USE** Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

● **CAUTIONS** Acute porphyrias p. 577 • diabetes (may lower blood glucose) • G6PD deficiency • long-term therapy (regular ophthalmic examination recommended by manufacturers) • may aggravate myasthenia gravis • may exacerbate psoriasis • neurological disorders, especially epilepsy (avoid for prophylaxis of malaria if history of epilepsy) • severe gastro-intestinal disorders

● **INTERACTIONS** → Appendix 1: antimalarials

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Gastro-intestinal disturbances • headache • pruritus • rashes • skin reactions
- **Uncommon** Convulsions • discoloration of mucous membranes • discoloration of nails • discoloration of skin • ECG changes • hair depigmentation • hair loss • keratopathy • ototoxicity • retinal damage • visual changes
- **Rare** Acute generalised exanthematous pustulosis • agranulocytosis • angioedema • aplastic anaemia • blood disorders • bone marrow suppression • cardiomyopathy • emotional disturbances • exfoliative dermatitis • hepatic damage • hypersensitivity reactions • mental changes • myopathy • neuromyopathy • photosensitivity • psychosis • Stevens-Johnson syndrome • thrombocytopenia • urticaria
- **Frequency not known** Bronchospasm • diffuse parenchymal lung disease • drug rash with eosinophilia and systemic symptoms • extrapyramidal symptoms (associated with use in malaria) • hypotension • visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- **Malaria prophylaxis and treatment** Serious skin reactions, ECG changes, visual effects, ototoxicity, blood disorders, mental changes, myopathies and hepatic damage are not usually associated with malaria prophylaxis or treatment.

Overdose

Chloroquine is very toxic in overdose; overdose is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.
- **BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment.
- **RENAL IMPAIRMENT** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose. Manufacturers advise caution.
- **MONITORING REQUIREMENTS** Ophthalmic examination with long-term therapy.
- **PATIENT AND CARER ADVICE** Warn travellers going to malarious areas about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

Prophylaxis of malaria

► BY MOUTH

- Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

● **UNLICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature. Not licensed for use in children under 5 kg body-weight and under 3 months.

● **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions · avoid for standby treatment if history of convulsions · history of blackwater fever

● **CAUTIONS** Cardiac conduction disorders · epilepsy (avoid for prophylaxis) · not recommended in infants under 3 months (5 kg) · traumatic brain injury

CAUTIONS, FURTHER INFORMATION

► Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for

a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the *Guide for Healthcare Professionals* provided by the manufacturer.

● **INTERACTIONS** → Appendix 1: antimalarials**● SIDE-EFFECTS**

- **Common or very common** Abdominal pain · diarrhoea · dizziness · headache · nausea · neuropsychiatric reactions · pruritus · visual disturbances · vomiting
- **Very rare** Optic neuropathy
- **Frequency not known** Alopecia · amnesia · anorexia · arrhythmias · arthralgia · ataxia · blood disorders · bradycardia · cataract · chest pain · confusion · drowsiness · dyspepsia · dyspnoea · encephalopathy · fever · flushing · hepatic failure · hyperhidrosis · hypertension · hypotension · leucocytosis · leucopenia · malaise · motor neuropathies · muscle weakness · myalgia · oedema · palpitation · panic attacks · pneumonitis · rash · seizures · sensory neuropathies · speech disturbances · Stevens-Johnson syndrome · syncope · tachycardia · thrombocytopenia · tremor · vestibular disorders

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal studies*).

● **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

● **BREAST FEEDING** Present in milk but risk to infant minimal.

● **HEPATIC IMPAIRMENT** Elimination may be prolonged; avoid in severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises caution.

● **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.

● **PATIENT AND CARER ADVICE** A patient alert card should be provided. Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

Driving and skilled tasks

Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

MEDICINAL FORMS

Tablet

CAUTIONARY AND ADVISORY LABELS 10, 21, 27

► **Lariam** (Roche Products Ltd)

Mefloquine (as Mefloquine hydrochloride) 250 mg Lariam 250mg tablets | 8 tablet [PoM] £14.53

Primaquine

INDICATIONS AND DOSE

Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection

► BY MOUTH

► Child 6 months–17 years: 500 micrograms/kg daily (max. per dose 30 mg) for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P.ovale* infection

► BY MOUTH

► Child 6 months–17 years: 250 micrograms/kg daily (max. per dose 15 mg) for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection in patients with mild G6PD deficiency (administered on expert advice) | Adjunct in the treatment of non-falciparum malaria caused by *P.ovale* infection in patients with mild G6PD deficiency (administered on expert advice)

► BY MOUTH

► Child: 750 micrograms/kg once weekly for 8 weeks; maximum 45 mg per week

Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)

► BY MOUTH

► Child: This combination is associated with considerable toxicity (consult product literature)

● **UNLICENSED USE** Not licensed.

● **CAUTIONS** G6PD deficiency · systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

● **INTERACTIONS** → Appendix 1: antimalarials

SIDE-EFFECTS

► **Common or very common** Abdominal pain · anorexia · nausea · vomiting

► **Uncommon** Haemolytic anaemia especially in G6PD deficiency · leucopenia · methaemoglobinemia

● **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

● **BREAST FEEDING** No information available; theoretical risk of haemolysis in G6PD-deficient infants.

● **PRE-TREATMENT SCREENING** Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.

MEDICINAL FORMS

INDICATIONS AND DOSE

Prophylaxis of malaria

► BY MOUTH

- Child 4–11 weeks (body-weight up to 6 kg): 25 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 3–11 months (body-weight 6–9 kg): 50 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 1–3 years (body-weight 10–15 kg): 75 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 4–7 years (body-weight 16–24 kg): 100 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 8–12 years (body-weight 25–44 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 13–17 years (body-weight 45 kg and above): 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

● **UNLICENSED USE** Proguanil doses in BNF Publications may differ from those in product literature.

● **INTERACTIONS** → Appendix 1: antimalarials

SIDE-EFFECTS

► **Common or very common** Constipation · diarrhoea · mild gastric intolerance

► **Very rare** Cholestasis · hair loss · skin reactions · vasculitis

► **Frequency not known** Mouth ulcers · stomatitis

● **PREGNANCY** Benefit of prophylaxis in malaria outweighs risk. Adequate folate supplements should be given to mother.

● **BREAST FEEDING** Amount in milk probably too small to be harmful when used for malaria prophylaxis.

● **RENAL IMPAIRMENT** Use half normal dose if estimated glomerular filtration rate 20–60 mL/minute/1.73m². Use one-quarter normal dose on alternate days if estimated glomerular filtration rate 10–20 mL/minute/1.73m². Use one-quarter normal dose once weekly if estimated glomerular filtration rate less than 10 mL/minute/1.73m²; increased risk of haematological toxicity in severe impairment.

● **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as milk, jam, or honey just before administration.

● **PATIENT AND CARER ADVICE** Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.

Pyrimethamine

• INDICATIONS AND DOSE

Toxoplasmosis in pregnancy (in combination with sulfadiazine and folic acid)

- BY MOUTH
- Child 12–17 years: 50 mg once daily until delivery

Congenital toxoplasmosis (in combination with sulfadiazine and folic acid)

- BY MOUTH

- Neonate: 1 mg/kg twice daily for 2 days, then 1 mg/kg once daily for 6 months, then 1 mg/kg 3 times a week for 6 months.

Malaria

- BY MOUTH
- Child: No dose stated because not recommended alone

- **UNLICENSED USE** Not licensed for use in children under 5 years.
- **CAUTIONS** History of seizures—avoid large loading doses • predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia (with high doses) • blood disorders (with high doses) • diarrhoea • dizziness • headache • leucopenia (with high doses) • nausea • rash • thrombocytopenia (with high doses) • vomiting
 - **Uncommon** Abnormal skin pigmentation • fever
 - **Very rare** Buccal ulceration • colic • convulsions
- **PREGNANCY** Theoretical teratogenic risk in *first trimester* (folate antagonist). Adequate folate supplements should be given to the mother.
- **BREAST FEEDING** Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **MONITORING REQUIREMENTS** Blood counts required with prolonged treatment.
- **LESS SUITABLE FOR PRESCRIBING** Pyrimethamine should not be used alone for malaria, but is used with sulfadoxine.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

Pyrimethamine with sulfadoxine

• INDICATIONS AND DOSE

Adjunct to quinine in treatment of *Plasmodium falciparum* malaria

- BY MOUTH
- Child 1 month–4 years (body-weight 5 kg and above): 12.5/250 mg for 1 dose
- Child 5–6 years: 25/500 mg for 1 dose
- Child 7–9 years: 37.5/750 mg for 1 dose
- Child 10–13 years: 50/1000 mg for 1 dose
- Child 14–17 years: 75/1500 mg for 1 dose

Malaria prophylaxis

- BY MOUTH
- Child: Not recommended by UK malaria experts

DOSE EQUIVALENCE AND CONVERSION

- Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of pyrimethamine and sulfadoxine respectively.
- **UNLICENSED USE** Not licensed for use in children of body-weight under 5 kg.
- **CONTRA-INDICATIONS** Acute porphyrias p. 577
- **CAUTIONS** Asthma • avoid in blood disorders (unless under specialist supervision) • avoid in infants under 6 weeks • G6PD deficiency • history of seizures—avoid large loading doses • not recommended for prophylaxis (severe side-effects on long-term use) • predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea • headache • hyperkalaemia • nausea • rash
 - **Uncommon** Vomiting
 - **Very rare** Anorexia • antibiotic-associated colitis • arthralgia • aseptic meningitis • ataxia • blood disorders • convulsions • cough • depression • eosinophilia • glossitis • hallucinations • hepatic necrosis • hypoglycaemia • hyponatraemia • interstitial nephritis • jaundice • leucopenia • liver damage • megaloblastic anaemia • myalgia • myocarditis • pancreatitis • peripheral neuropathy • photosensitivity • renal disorders • rhabdomyolysis reported in HIV-infected patients • shortness of breath • Stevens-Johnson syndrome • stomatitis • systemic lupus erythematosus • thrombocytopenia • tinnitus • toxic epidermal necrolysis • uveitis • vasculitis • vertigo
 - **Frequency not known** Allergic alveolitis • eosinophilic alveolitis • pulmonary infiltrates
- SIDE-EFFECTS, FURTHER INFORMATION**
Discontinue immediately if blood disorders or rash occur.
Discontinue if cough or shortness of breath occur.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sulfonamide allergy.
- **PREGNANCY** Possible teratogenic risk in *first trimester* (pyrimethamine a folate antagonist); in *third trimester*—risk of neonatal haemolysis and methaemoglobinemia. Fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants; risk of haemolysis in G6PD-deficient infants (due to sulfadoxine).
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Also known as *Fansidar*®.
- **PATIENT AND CARER ADVICE** Patients should be advised to maintain adequate fluid intake.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

Quinine

• INDICATIONS AND DOSE

Non-falciparum malaria

- BY INTRAVENOUS INFUSION

- Child: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Changed to oral chloroquine as soon as the patient's condition permits

Falciparum malaria

► BY MOUTH

- Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, together with or followed by either doxycycline (in children over 12 years), or clindamycin

► BY INTRAVENOUS INFUSION

- Neonate: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can tolerate oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by clindamycin.

- Child: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline (in children over 12 years), or clindamycin

Falciparum malaria (in intensive care unit)

► BY INTRAVENOUS INFUSION

- Neonate: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by clindamycin.

- Child: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline (in children over 12 years), or clindamycin

DOSE EQUIVALENCE AND CONVERSION

- When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine.
- Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

- **UNLICENSED USE** Injection not licensed.

- **CONTRA-INDICATIONS** Haemoglobinuria · myasthenia gravis · optic neuritis · tinnitus

- **CAUTIONS** Atrial fibrillation (monitor ECG during parenteral treatment) · cardiac disease (monitor ECG during parenteral treatment) · conduction defects (monitor ECG during parenteral treatment) · G6PD deficiency · heart block (monitor ECG during parenteral treatment)

- **INTERACTIONS** → Appendix 1: antimalarials

- **SIDE-EFFECTS** Agitation · tinnitus · abdominal pain · acute renal failure · angioedema · blood disorders · cardiovascular

effects · cinchonism · confusion · diarrhoea · dyspnoea · flushed skin · headache · hearing impairment · hot skin · hypersensitivity reactions · hypoglycaemia (especially after parenteral administration) · intravascular coagulation · muscle weakness · nausea · photosensitivity · rashes · temporary blindness · thrombocytopenia · vertigo · visual disturbances · vomiting

Overdose

Quinine is very toxic in overdosage; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 803.

- **PREGNANCY** High doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk.

- **BREAST FEEDING** Present in milk but not known to be harmful.

- **HEPATIC IMPAIRMENT** For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

- **RENAL IMPAIRMENT** For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

- **MONITORING REQUIREMENTS** Monitor blood glucose and electrolyte concentration during parenteral treatment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute to a concentration of 2 mg/mL (max. 30 mg/mL in fluid restriction) with Glucose 5% or Sodium Chloride 0.9% and give over 4 hours.

- **PRESCRIBING AND DISPENSING INFORMATION** Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion

Tablet► **Quinine (Non-proprietary)**

Quinine sulfate 200 mg Quinine sulfate 200mg tablets | 28 tablet (PoM) £2.90 DT price = £1.61

Quinine bisulfate 300 mg Quinine bisulfate 300mg tablets | 28 tablet (PoM) £4.80 DT price = £1.82

Quinine sulfate 300 mg Quinine sulfate 300mg tablets | 28 tablet (PoM) £5.05 DT price = £1.86 | 500 tablet (PoM) no price available

5.3 Toxoplasmosis

Other drugs used for Toxoplasmosis Pyrimethamine, p. 382

ANTIBACTERIALS > MACROLIDES

Spiramycin

● **INDICATIONS AND DOSE****Toxoplasmosis in pregnancy**

► BY MOUTH

- Child 12–17 years: 1.5 g twice daily until delivery

Chemoprophylaxis of congenital toxoplasmosis

► BY MOUTH

- Neonate: 50 mg/kg twice daily.

DOSE EQUIVALENCE AND CONVERSION

- 3000 units = 1 mg spiramycin.

- **UNLICENSED USE** Not licensed.

- **CAUTIONS** Arrhythmias · cardiac disease · predisposition to QT interval prolongation
- **SIDE-EFFECTS**
 - ▶ Rare Prolongation of QT interval · thrombocytopenia · vasculitis
 - ▶ **Frequency not known** Diarrhoea · dizziness · gastro-intestinal disturbances · headache · hepatotoxicity · nausea · rash · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Sensitivity to other macrolides.
- **BREAST FEEDING** Present in breast milk.
- **HEPATIC IMPAIRMENT** Use with caution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ Spiramycin (Non-proprietary)

Spiramycin (as Spiramycin adipate) 1.5 mega u Rovamycine 1.5million unit powder for solution for infusion vials | 1 vial [PoM] no price available

Tablet

▶ Spiramycin (Non-proprietary)

Spiramycin 1.5 mega u Rovamycine 1.5million unit tablets | 16 tablet [PoM] no price available

Spiramycin 3 mega u Rovamycine 3million unit tablets | 10 tablet [PoM] no price available | 16 tablet [PoM] no price available

6 Viral infection

6.1 Hepatitis

Hepatitis

Overview

Treatment for viral hepatitis should be initiated by a specialist in hepatology or infectious diseases. The management of uncomplicated acute viral hepatitis is largely symptomatic. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Chronic hepatitis B

Interferon alfa p. 529, peginterferon alfa-2a, lamivudine p. 401, adefovir dipivoxil, entecavir, and tenofovir disoproxil p. 402 have a role in the treatment of chronic hepatitis B in adults, but their role in children has not been well established. Specialist supervision is required for the management of chronic hepatitis B.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 400 or lamivudine, may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' in children who require treatment for both HIV and chronic hepatitis B. If children infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV. Management of these children should be co-ordinated between HIV and hepatology specialists.

Chronic hepatitis C

Treatment should be considered for children with moderate or severe liver disease. Specialist supervision is required and the regimen is chosen according to the genotype of the infecting virus and the viral load. A combination of ribavirin below with either interferon alfa or peginterferon alfa-2b is licensed for use in children over 3 years with chronic hepatitis C. A combination of peginterferon alfa p. 386 and ribavirin is preferred.

6.2 Hepatitis infections

6.2a Chronic hepatitis C

Other drugs used for Chronic hepatitis C Interferon alfa, p. 529

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ribavirin

(Tribavirin)

● INDICATIONS AND DOSE

Bronchiolitis

▶ BY INHALATION OF AEROSOL, OR BY INHALATION OF NEBULISED SOLUTION

▶ Child 1–23 months: Inhale a solution containing 20 mg/mL for 12–18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator

Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (administered on expert advice)

▶ BY INTRAVENOUS INFUSION

▶ Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

REBETOL® CAPSULES

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation

▶ BY MOUTH

▶ Child 3–17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses

▶ Child 3–17 years (body-weight 47–49 kg): 200 mg, dose to be given in the morning and 400 mg, dose to be given in the evening

▶ Child 3–17 years (body-weight 50–64 kg): 400 mg twice daily

▶ Child 3–17 years (body-weight 65–80 kg): 400 mg, dose to be given in the morning and 600 mg, dose to be given in the evening

▶ Child 3–17 years (body-weight 81–104 kg): 600 mg twice daily

▶ Child 3–17 years (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

REBETOL® ORAL SOLUTION

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation

▶ BY MOUTH

▶ Child 3–17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses

▶ Child 3–17 years (body-weight 47–49 kg): 200 mg daily, dose to be given in the morning and 400 mg daily, dose to be given in the evening

▶ Child 3–17 years (body-weight 50–64 kg): 400 mg twice daily

▶ Child 3–17 years (body-weight 65–80 kg): 400 mg daily, dose to be given in the morning and 600 mg daily, dose to be given in the evening

▶ Child 3–17 years (body-weight 81–104 kg): 600 mg twice daily

▶ Child 3–17 years (body-weight 105 kg and above): 600 mg daily, dose to be given in the morning and 800 mg daily, dose to be given in the evening

● **UNLICENSED USE** Inhalation licensed for use in children (age range not specified by manufacturer). Intravenous preparation not licensed.

● **CONTRA-INDICATIONS**

▶ With systemic use Active severe psychiatric condition · autoimmune disease · autoimmune hepatitis · consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products · haemoglobinopathies · history of severe psychiatric condition · severe debilitating medical conditions · severe, uncontrolled cardiac disease in children with chronic hepatitis C

● **CAUTIONS**

▶ When used by inhalation Maintain standard supportive respiratory and fluid management therapy

▶ With systemic use Cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) · consult product literature for specific cautions when ribavirin used in combination with other medicinal products · patients with a transplant—risk of rejection · risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

● **INTERACTIONS** → Appendix 1: ribavirin

● **SIDE-EFFECTS**

▶ When used by inhalation Bacterial pneumonia · haemolysis · non-specific anaemia · pneumothorax · worsening respiration

▶ With oral use Abdominal pain · abnormal dreams · acne · alopecia · anxiety · aplastic anaemia · arrhythmias · arthralgia · asthenia · asthenia · ataxia · breast pain · cardiomyopathy · changes in blood pressure · cheilitis · chest pain · colitis · constipation · cough · dehydration · depression · diarrhoea · dizziness · dry eyes · dry mouth · dry skin · dyspepsia · dysphagia · dysphonia · dyspnoea · earache · epistaxis · eye pain · flatulence · flushing · gastro-intestinal bleeding · gastroesophageal reflux · gingivitis · glossitis · growth retardation (including decrease in height and weight) · haemolytic anaemia (anaemia may be improved by epoetin) · hallucination · headache · hearing impairment · hyperaesthesia · hyperglycaemia · hyperkinesia · hypertonia · hypertriglyceridaemia · hyperuricaemia · hypoaesthesia · hypocalcaemia · impaired concentration and memory · increased sweating · influenza-like symptoms · interstitial pneumonitis · leucopenia · loose stools · lymphadenopathy · menstrual disturbance · micturition disorders · mood disorders · mouth ulcers · musculoskeletal pain · myalgia · myocardial infarction · nasal congestion · nausea · neutropenia · optic neuropathy · oral candidiasis · pallor · palpitation · pancreatitis · panic attack · paraesthesia · peptic ulcer · pericarditis · peripheral ischaemia · peripheral neuropathy · peripheral oedema · photosensitivity · pruritus · psoriasis · psychotic disorders · pulmonary embolism · rash · renal failure · respiratory infections · retinal haemorrhage · rheumatoid arthritis · sarcoidosis · seizures · sexual dysfunction · sinus congestion · skin discoloration · sleep disturbances · sore throat · Stevens-Johnson syndrome · stomatitis · stroke · suicidal ideation (more frequent in children) · syncope · systemic lupus erythematosus · tachycardia · tachypnoea · taste disturbance · testicular pain · thrombocytopenia · thyroid disorders · tinnitus · tooth disorder · toxic epidermal necrolysis · urinary tract infections · vertigo · virilism · visual disturbances · vomiting · weight loss · wheezing

● **SIDE-EFFECTS, FURTHER INFORMATION**

▶ With oral use Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

● **CONCEPTION AND CONTRACEPTION**

▶ With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).

▶ When used by inhalation Women planning pregnancy should avoid exposure to aerosol.

● **PREGNANCY** Avoid; teratogenicity in *animal* studies.

▶ When used by inhalation Pregnant women should avoid exposure to aerosol.

● **BREAST FEEDING** Avoid—no information available.

● **HEPATIC IMPAIRMENT** No dosage adjustment required. Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.

● **RENAL IMPAIRMENT** Plasma-ribavirin concentration increased. Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.

Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS**

▶ When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.

▶ With systemic use Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature). Test thyroid function before treatment and then every 3 months.

▶ With oral use Eye examination recommended before treatment. Eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

▶ **Peginterferon alfa and ribavirin for chronic hepatitis C (November 2013)** NICE TA300
Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children.
www.nice.org.uk/TA300

● **LESS SUITABLE FOR PRESCRIBING** Ribavirin inhalation is less suitable for prescribing.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

Ribavirin 40 mg per 1 mL Rebetol 40mg/mL oral solution | 100 mL [PoM] £67.08

Capsule

CAUTIONARY AND ADVISORY LABELS 21

▶ **Rebetol** (Merck Sharp & Dohme Ltd)

Ribavirin 200 mg Rebetol 200mg capsules | 84 capsule [PoM] £160.69 | 140 capsule [PoM] £267.81 | 168 capsule [PoM] £321.38

Solution for injection

▶ **Virazole** (Meda Pharmaceuticals Ltd)

Ribavirin 100 mg per 1 mL Virazole 1.2g/12mL solution for injection vials | 5 vial [PoM] £3600.00

IMMUNOSTIMULANTS > INTERFERONS

Peginterferon alfa

- **DRUG ACTION** Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (peginterferon alfa-2a and peginterferon alfa-2b) are available; pegylation increases the persistence of the interferon in the blood.

● INDICATIONS AND DOSE

PEGASYS®

Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation

- BY SUBCUTANEOUS INJECTION
- Child 5–17 years: (consult product literature)

VIRAFERONPEG®

Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation

- BY SUBCUTANEOUS INJECTION
- Child 3–17 years: (consult product literature)

- **CONTRA-INDICATIONS** Severe psychiatric illness

CONTRA-INDICATIONS, FURTHER INFORMATION

For contra-indications consult product literature.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

For cautions consult product literature.

- **INTERACTIONS** → Appendix 1: interferons

● SIDE-EFFECTS

- **Common or very common** Anorexia · influenza-like symptoms · lethargy · nausea
- **Frequency not known** Alopecia · arrhythmias · cardiovascular problems · coma · confusion · depression · hepatotoxicity · hyperglycaemia · hypersensitivity reactions · hypertension · hypertriglyceridaemia (sometimes severe) · hypotension · myelosuppression (particularly affecting granulocyte counts) · nephrotoxicity · ocular side-effects · pneumonia · pneumonitis · psoriasisiform rash · pulmonary infiltrates · reversible motor problems in young children · seizures · suicidal behaviour · thyroid abnormalities

SIDE-EFFECTS, FURTHER INFORMATION

For information on side effects consult product literature.

- **Respiratory symptoms** Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of peginterferon alfa should be considered.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

- **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).

- **BREAST FEEDING** Manufacturers advise avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Reduce dose in moderate to severe impairment. For information on peginterferon alfa use in renal impairment consult product literature. Close monitoring required in renal impairment.

● MONITORING REQUIREMENTS

- Monitoring of lipid concentration is recommended.
- Monitoring of hepatic function is recommended.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

6.3 Herpesvirus infections

Herpesvirus infections

Herpes simplex and varicella-zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella-zoster virus.

Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. After completing parenteral treatment of neonatal herpes simplex encephalitis, oral suppression therapy with aciclovir p. 387 for 6 months can be considered on specialist advice. Primary or recurrent genital herpes simplex infection is treated with

an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

In pregnancy severe chickenpox may cause complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Neonates and children who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease-specific Immunoglobulins). Prophylactic intravenous aciclovir should be considered for neonates whose mothers develop chickenpox 4 days before to 2 days after delivery.

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice

Aciclovir is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed in adults for use in herpes zoster and genital herpes; there is limited information available on use in children.

Valaciclovir p. 389 is an ester of aciclovir, licensed in adults for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed in children over 12 years for preventing cytomegalovirus disease following solid organ transplantation. Valaciclovir may be used for the treatment of mild herpes zoster in immunocompromised children over 12 years; treatment should be initiated under specialist supervision.

Cytomegalovirus infection

Ganciclovir p. 390 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed under specialist supervision and only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV

infection. The use of ganciclovir may also be considered for symptomatic congenital CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 403; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for use in children over 12 years for prevention of cytomegalovirus disease following renal transplantation.

Foscarnet sodium p. 390 is also active against cytomegalovirus; it is toxic and can cause renal impairment. It is deposited in teeth, bone and cartilage, and *animal* studies have shown that deposition is greater in young animals. Its effect on skeletal development in children is not known. Foscarnet sodium should be prescribed under specialist supervision.

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Aciclovir

(Acyclovir)

● INDICATIONS AND DOSE

Herpes simplex, suppression

► BY MOUTH

- Child 12–17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, prophylaxis in the immunocompromised

► BY MOUTH

- Child 1–23 months: 100–200 mg 4 times a day
- Child 2–17 years: 200–400 mg 4 times a day

Herpes Simplex, treatment

► BY MOUTH

- Child 1–23 months: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- Child 2–17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

► BY INTRAVENOUS INFUSION

- Neonate: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment).
- Child 1–2 months: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)
- Child 3 months–11 years: 250 mg/m² every 8 hours usually for 5 days
- Child 12–17 years: 5 mg/kg every 8 hours usually for 5 days

Herpes Simplex, treatment, in immunocompromised or if absorption impaired

► BY MOUTH

- Child 1–23 months: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- Child 2–17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

continued →

Herpes Simplex, treatment, in immunocompromised or in simplex encephalitis

► BY INTRAVENOUS INFUSION

- Child 3 months–11 years: 500 mg/m² every 8 hours usually for 5 days (given for at least 21 days in encephalitis—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)
- Child 12–17 years: 10 mg/kg every 8 hours usually for 5 days (given for at least 14 days in encephalitis and for at least 21 days if also immunocompromised—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment

► BY MOUTH

- Child 1–23 months: 200 mg 4 times a day for 5 days
- Child 2–5 years: 400 mg 4 times a day for 5 days
- Child 6–11 years: 800 mg 4 times a day for 5 days
- Child 12–17 years: 800 mg 5 times a day for 7 days

► BY INTRAVENOUS INFUSION

- Neonate: 10–20 mg/kg every 8 hours for at least 7 days.

- Child 1–2 months: 10–20 mg/kg every 8 hours for at least 7 days

- Child 3 months–11 years: 250 mg/m² every 8 hours usually for 5 days

- Child 12–17 years: 5 mg/kg every 8 hours usually for 5 days

Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised

► BY INTRAVENOUS INFUSION

- Child 3 months–11 years: 500 mg/m² every 8 hours usually for 5 days
- Child 12–17 years: 10 mg/kg every 8 hours usually for 5 days

Herpes zoster (shingles), treatment in immunocompromised

► BY MOUTH

- Child 1–23 months: 200 mg 4 times a day continued for 2 days after crusting of lesions
- Child 2–5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions
- Child 6–11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
- Child 12–17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions

Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis

► BY INTRAVENOUS INFUSION

- Neonate: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised.

- Child 1–2 months: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised
- Child 3 months–11 years: 500 mg/m² every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised
- Child 12–17 years: 10 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised

Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated

► BY MOUTH

- Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

Varicella zoster (chickenpox), prophylaxis after delivery

► BY INTRAVENOUS INFUSION

- Neonate: 10 mg/kg every 8 hours continued until serological tests confirm absence of virus.

DOSES AT EXTREMES OF BODY-WEIGHT

- With intravenous use To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

● UNLICENSED USE

- With oral use Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer). Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.

- With intravenous use Intravenous infusion not licensed for herpes zoster in children under 18 years.

- **CAUTIONS** Maintain adequate hydration (especially with infusion or high doses)

- **INTERACTIONS** → Appendix 1: aciclovir

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · diarrhoea · fatigue · headache · nausea · photosensitivity · pruritus · rash · urticaria · vomiting

- **Very rare** Acute renal failure · anaemia · ataxia · confusion · convulsions · dizziness · drowsiness · dysarthria · dyspnoea · hallucinations · hepatitis · jaundice · leucopenia · neurological reactions · thrombocytopenia

- With intravenous use Agitation · fever · psychosis · severe local inflammation (sometimes leading to ulceration) · tremors

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

● RENAL IMPAIRMENT

- With intravenous use Use *normal intravenous dose* every 12 hours if estimated glomerular filtration rate 25–50 mL/minute/1.73 m² (every 24 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m². Consult product literature for intravenous dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²).

- With oral use For *herpes zoster*, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². For *herpes simplex*, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²).

- With systemic use Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute to 25 mg/mL with Water for Injections or Sodium Chloride 0.9% then dilute to concentration of 5 mg/mL with Sodium Chloride 0.9% or Sodium Chloride and Glucose and give over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and central venous access and given over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid preparations may include banana, or orange.

Herpes simplex, treatment of first infective episode

- BY MOUTH
- Child 12–17 years: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients

- BY MOUTH
- Child 12–17 years: 1 g twice daily for 10 days

Herpes simplex, treatment of recurrent infections

- BY MOUTH
- Child 12–17 years: 500 mg twice daily for 3–5 days

Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients

- BY MOUTH
- Child 12–17 years: 1 g twice daily for 5–10 days

Herpes labialis treatment

- BY MOUTH
- Child 12–17 years: Initially 2 g, then 2 g after 12 hours

Herpes simplex, suppression of infections

- BY MOUTH
- Child 12–17 years: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients

- BY MOUTH
- Child 12–17 years: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

- BY MOUTH
- Child 12–17 years: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

- **UNLICENSED USE** Not licensed for treatment of herpes zoster in children. Not licensed for treatment or suppression of herpes simplex infection in immunocompromised or HIV-positive children.

- **CAUTIONS** Maintain adequate hydration (especially with high doses)

- **INTERACTIONS** → Appendix 1: valaciclovir

● SIDE-EFFECTS

- **Very rare** Acute renal failure · anaemia · ataxia · confusion · convulsions · dizziness · drowsiness · dysarthria · dyspnoea · hallucinations · hepatitis · jaundice · leucopenia · neurological reactions · thrombocytopenia
- **Frequency not known** Abdominal pain · diarrhoea · fatigue · headache · nausea · photosensitivity · pruritus · rash · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Neurological reactions** Neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness) more frequent with higher doses.
- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution with high doses used for preventing cytomegalovirus disease—no information available in children.
- **RENAL IMPAIRMENT** For herpes zoster, 1 g every 12 hours if estimated glomerular filtration rate

Valaciclovir

● INDICATIONS AND DOSE

Herpes zoster infection, treatment in immunocompromised patients

- BY MOUTH
- Child 12–17 years: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

30–50 mL/minute/1.73 m² (1 g every 24 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²).

For treatment of *herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

For treatment of *herpes labialis*, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose).

For suppression of *herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Reduce dose according to estimated glomerular filtration rate for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).

Maintain adequate hydration.

- **PRESCRIBING AND DISPENSING INFORMATION** Valaciclovir is a pro-drug of aciclovir.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ Valaciclovir (Non-proprietary)

Valaciclovir (as Valaciclovir hydrochloride) 500 mg Valaciclovir 500mg tablets | 10 tablet [PoM] £20.59 DT price = £2.80 | 42 tablet [PoM] £86.30

▶ Valtrex (GlaxoSmithKline UK Ltd)

Valaciclovir (as Valaciclovir hydrochloride) 250 mg Valtrex 250mg tablets | 60 tablet [PoM] £123.28 DT price = £123.28

Valaciclovir (as Valaciclovir hydrochloride) 500 mg Valtrex 500mg tablets | 10 tablet [PoM] £20.59 DT price = £2.80 | 42 tablet [PoM] £86.30

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) • abnormally low neutrophil count (consult product literature) • abnormally low platelet count (consult product literature)

- **CAUTIONS** Children (possible risk of long-term carcinogenic or reproductive toxicity) • ensure adequate hydration • history of cytopenia • potential carcinogen • potential teratogen • radiotherapy • vesicant

- **INTERACTIONS** → Appendix 1: ganciclovir

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain • abnormal thinking • anaemia • anorexia • anxiety • arthralgia • chest pain • confusion • constipation • convulsions • cough • depression • dermatitis • diarrhoea • dizziness • dyspepsia • dysphagia • dyspnoea • ear pain • eye pain • fatigue • flatulence • headache • hepatic dysfunction • infection • injection-site reactions • insomnia • leucopenia • macular oedema • myalgia • nausea • night sweats • pancytopenia • peripheral neuropathy • pruritus • pyrexia • renal impairment • retinal detachment • taste disturbance • thrombocytopenia • vitreous floaters • vomiting • weight loss

- ▶ **Uncommon** Alopecia • anaphylactic reactions • arrhythmias • disturbances in hearing and vision • haematuria • hypotension • male infertility • mouth ulcers • pancreatitis • psychosis • tremor

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

- **PREGNANCY** Avoid—teratogenic risk.

- **BREAST FEEDING** Avoid—no information available.

- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 70 mL/minute/1.73 m²; consult product literature.

- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

- **DIRECTIONS FOR ADMINISTRATION** Infuse into vein with adequate flow preferably using plastic cannula. For *intravenous infusion*, reconstitute with Water for Injections (500 mg/10 mL) then dilute to a concentration of not more than 10 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give over 1 hour.

● HANDLING AND STORAGE

Caution in handling. Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

6.3a Cytomegalovirus infections

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ganciclovir

● INDICATIONS AND DOSE

Prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 5 mg/kg every 12 hours for 7–14 days

Treatment of life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Initially 5 mg/kg every 12 hours for 14–21 days, followed by maintenance 6 mg/kg daily on 5 days of the week, alternatively 5 mg/kg daily until adequate recovery of immunity, maintenance only for patients at risk of relapse of retinitis, if retinitis progresses initial induction treatment may be repeated

Congenital cytomegalovirus infection of the CNS

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate: 6 mg/kg every 12 hours for 6 weeks.

- **UNLICENSED USE** Not licensed for use in children.

ANTIVIRALS > OTHER

Foscarnet sodium

● INDICATIONS AND DOSE

Cytomegalovirus disease

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child (under expert supervision): Initially 60 mg/kg every 8 hours 2–3 weeks, then maintenance 60 mg/kg daily,

increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

► BY INTRAVENOUS INFUSION

- Child (under expert supervision): 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Ensure adequate hydration
- **INTERACTIONS** → Appendix 1: foscarnet
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · acute renal failure · aggression · agitation · anaemia · anorexia · anxiety · changes in blood pressure · changes in ECG · confusion · constipation · convulsions · depression · diarrhoea · dizziness · dyspepsia · dysuria · electrolyte disturbances · genital irritation and ulceration (due to high concentrations excreted in urine) · granulocytopenia · headache · hepatic dysfunction · hypocalcaemia · hypokalaemia · hypomagnesaemia · leucopenia · malaise · myalgia · nausea (reduce infusion rate) · neurological disorders · oedema · palpitation · pancreatitis · paraesthesia (reduce infusion rate) · polyuria · pruritus · rash · renal impairment · thrombocytopenia · thrombophlebitis if given undiluted by peripheral vein · tremor · vomiting
 - **Uncommon** Acidosis
 - **Frequency not known** Diabetes insipidus · myasthenia · myositis · oesophageal ulceration · rhabdomyolysis · ventricular arrhythmias
- **CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Reduce dose; consult product literature.
- **MONITORING REQUIREMENTS**
 - Monitor electrolytes, particularly calcium and magnesium.
 - Monitor serum creatinine every second day during induction and every week during maintenance.
- **DIRECTIONS FOR ADMINISTRATION** Avoid rapid infusion. For *intravenous infusion*, give undiluted solution via a central venous catheter; alternatively dilute to a concentration of 12 mg/mL with Glucose 5% or Sodium Chloride 0.9% for administration via a peripheral vein; give over at least 1 hour (give doses greater than 60 mg/kg over 2 hours).
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Foscavir** (Clinigen Healthcare Ltd)

Foscarnet Sodium 24 mg per 1 mL Foscavir 6g/250mL solution for infusion bottles | 1 bottle [PoM] £119.85 (Hospital only)

considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals.

The natural progression of HIV disease is different in children compared to adults; drug treatment should only be undertaken by specialists within a formal paediatric HIV clinical network. Guidelines and dose regimens are under constant review and for this reason some dose recommendations have not been included in *BNF for Children*.

Further information on the management of children with HIV can be obtained from the Children's HIV Association (CHIVA) www.chiva.org.uk; and further information on antiretroviral use and toxicity can be obtained from the Paediatric European Network for Treatment of AIDS (PENTA) website penta-id.org/.

Principles of treatment

Treatment is aimed at suppressing viral replication for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and the child's tolerance of treatment. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Initiation of treatment

Treatment is started in all HIV infected children under 1 year of age regardless of clinical and immunological parameters. In children over 1 year of age, treatment is based on the child's age, CD4 cell count, viral load, and symptoms. The choice of antiviral treatment for children should take into account the method and frequency of administration, risk of side-effects, compatibility of drugs with food, palatability, and the appropriateness of the formulation. Initiating treatment with a combination of drugs ('highly active antiretroviral therapy' which includes 2 nucleoside reverse transcriptase inhibitors with *either* a non-nucleoside reverse transcriptase inhibitor *or* a boosted protease inhibitor) is recommended. Abacavir p. 397 and lamivudine p. 401 are the nucleoside reverse transcriptase inhibitors of choice for initial therapy; however, zidovudine p. 403 and lamivudine are used in children who are positive for the HLA-B*5701 allele. Nevirapine p. 395 is the preferred non-nucleoside reverse transcriptase inhibitor in children under 3 years of age, but efavirenz p. 394 is preferred in older children. Lopinavir with ritonavir p. 405 is the preferred boosted protease inhibitor for initial therapy. The metabolism of many antiretrovirals varies in young children; it may therefore be necessary to adjust the dose according to the plasma-drug concentration. Children who require treatment for both HIV and chronic hepatitis B should receive antivirals that are active against both diseases.

Switching therapy

Deterioration of the condition (including clinical, virological changes, and CD4 cell changes) may require a complete change of therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance, and the possibility of cross-resistance.

Pregnancy

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited),

6.4 HIV infection

HIV infection

Overview

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy

to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. **All treatment options require careful assessment by a specialist.** Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Local protocols and national guidelines (www.bhiva.org) should be consulted for recommendations on treatment during pregnancy and the perinatal period. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

Breast-feeding

Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Post-exposure prophylaxis

Children exposed to HIV infection through needlestick injury or by another route should be sent immediately to an accident and emergency department for post-exposure prophylaxis (unlicensed indication). Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Recommendations have been developed by the Children's HIV Association, www.chiva.org.uk.

Drugs used for HIV infection

Zidovudine, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 398, emtricitabine p. 400, lamivudine, stavudine p. 402, and tenofovir disoproxil p. 402. There are concerns about renal toxicity and effects on bone mineralisation when tenofovir disoproxil is used in prepubertal children.

The protease inhibitors include atazanavir p. 404, darunavir p. 404, fosamprenavir p. 405 (a pro-drug of amprenavir), indinavir, lopinavir (available as lopinavir with ritonavir), ritonavir p. 406, and tipranavir p. 406. Indinavir is no longer recommended because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, lopinavir (available as lopinavir with ritonavir), and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 395, nevirapine and rilpivirine p. 396 are active against the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and rarely fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide below, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs. Enfuvirtide below should be combined with other potentially

active antiretroviral drugs; it is given by subcutaneous injection.

Maraviroc p. 407 is an antagonist of the CCR5 chemokine receptor. It is used in patients exclusively infected with CCR5-tropic HIV.

Dolutegravir p. 393 and raltegravir p. 393 are inhibitors of HIV integrase. They are used for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

Immune reconstitution syndrome

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves' disease) have also been reported many months after initiation of treatment.

Osteonecrosis

Osteonecrosis has been reported in children with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Neonates

In order to prevent transmission of infection, neonates born to HIV-positive mothers should be given post-exposure prophylaxis as soon as possible after birth, but starting no later than 72 hours after birth. Zidovudine p. 403 alone should be given to neonates whose mothers had a viral load less than 50 HIV RNA copies/mL between 36 weeks' gestation and delivery, or whose mothers underwent caesarean section while taking zidovudine monotherapy. Combination antiretroviral therapy should be given to neonates whose mothers had a viral load over 50 HIV RNA copies/mL at delivery or whose mothers are found to be HIV positive after delivery. Prophylaxis is continued for 4 weeks.

ANTIVIRALS > HIV-FUSION INHIBITORS

Enfuvirtide

- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

► BY SUBCUTANEOUS INJECTION

- Child 6–15 years: 2 mg/kg twice daily (max. per dose 90 mg)
- Child 16–17 years: 90 mg twice daily

● SIDE-EFFECTS

- **Common or very common** Acne · anorexia · anxiety · asthenia · conjunctivitis · diabetes mellitus · dry skin · erythema · gastro-oesophageal reflux disease · haematuria · hypertriglyceridaemia · impaired concentration · influenza-like illness · injection-site reactions · irritability · lymphadenopathy · myalgia · nightmares · pancreatitis · peripheral neuropathy · pneumonia · renal calculi · sinusitis · skin papilloma · tremor · vertigo · weight loss
- **Uncommon** Hypersensitivity reactions
- **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

- **Hypersensitivity reactions** Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

- **Osteonecrosis** For further information see HIV infection p. 391.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous injection*, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do **not** shake or invert vial.
- **PATIENT AND CARER ADVICE**
Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

► **Fuzeon** (Roche Products Ltd)

Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial [PoM] £1,081.57

ANTIVIRALS > HIV-INTEGRASE INHIBITORS

Dolutegravir

20-Nov-2015

- **DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

INDICATIONS AND DOSE

HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

► BY MOUTH

- Child 12–17 years (body-weight 40 kg and above): 50 mg once daily

HIV infection in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)

► BY MOUTH

- Child 12–17 years (body-weight 40 kg and above): 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

- **INTERACTIONS** → Appendix 1: dolutegravir

SIDE-EFFECTS

- **Common or very common** Abdominal pain · abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · headache · insomnia · nausea · pruritus · raised creatine kinase · rash · vomiting
- **Uncommon** Hepatitis · hypersensitivity reactions
- **Frequency not known** Osteonecrosis
- **SIDE-EFFECTS, FURTHER INFORMATION**
- Hypersensitivity reactions Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.
- Osteonecrosis For further information see HIV infection p. 391.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Avoid antacids 6 hours before or 2 hours after taking dolutegravir.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer dolutegravir tablets.

Missed doses

If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Tivicay** (ViiV Healthcare UK Ltd) ▼

Dolutegravir (as Dolutegravir sodium) 10 mg Tivicay 10mg tablets | 30 tablet [PoM] £99.75

Dolutegravir (as Dolutegravir sodium) 25 mg Tivicay 25mg tablets | 30 tablet [PoM] £249.38

Dolutegravir (as Dolutegravir sodium) 50 mg Tivicay 50mg tablets | 30 tablet [PoM] £498.75

Combinations available: *Abacavir with dolutegravir and lamivudine*, p. 398

Raltegravir

- **DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

INDICATIONS AND DOSE

HIV infection resistant to multiple antiretrovirals, in combination with other antiretroviral drugs

► BY MOUTH USING TABLETS

- Child 6–17 years (body-weight 25 kg and above): 400 mg twice daily

► BY MOUTH USING CHEWABLE TABLETS

- Child 2–11 years (body-weight 12–13 kg): 75 mg twice daily
- Child 2–11 years (body-weight 14–19 kg): 100 mg twice daily
- Child 2–11 years (body-weight 20–27 kg): 150 mg twice daily
- Child 2–11 years (body-weight 28–39 kg): 200 mg twice daily
- Child 2–11 years (body-weight 40 kg and above): 300 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- The bioavailability of *Isentress*® chewable tablets is higher than that of the 'standard' 400 mg tablets; the chewable tablets are **not** interchangeable with the 'standard' tablets on a milligram-for-milligram basis.

- **CAUTIONS** Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis

- **INTERACTIONS** → Appendix 1: raltegravir

SIDE-EFFECTS

- **Common or very common** Abdominal pain · abnormal dreams · asthenia · depression · diarrhoea · dizziness · dyspepsia · flatulence · headache · hyperactivity · hypertriglyceridaemia · insomnia · nausea · rash · vomiting
- **Uncommon** Acne · alopecia · anaemia · anxiety · appetite changes · arthralgia · bradycardia · carpal tunnel syndrome · chest pain · chills · confusion · constipation · drowsiness · dry mouth · dry skin · dysphonia · epistaxis · erectile dysfunction · flushing · gastritis · gingivitis · glossitis · gynaecomastia · hepatitis · hyperhidrosis · hypertension · impaired memory and attention · lipodystrophy · Lipodystrophy Syndrome · menopausal symptoms · myalgia · nasal congestion · neutropenia · nocturia · oedema · osteopenia · pain on swallowing · palpitation ·

pancreatitis · peptic ulcer · peripheral neuropathy · polydipsia · pruritus · pyrexia · rash with eosinophilia and systemic symptoms · rectal bleeding · renal failure · rhabdomyolysis · skin papilloma · Stevens-Johnson syndrome · suicidal ideation · taste disturbances · thrombocytopenia · tinnitus · tremor · ventricular extrasystoles · visual disturbances

► **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

- **Rash** Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.
- **Osteonecrosis** For further information see HIV infection p. 391.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).

● **PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).

● **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

► **BY MOUTH USING CAPSULES**

- Child 3 months–17 years (body-weight 3.5–4 kg): 100 mg once daily
- Child 3 months–17 years (body-weight 5–7.4 kg): 150 mg once daily
- Child 3 months–17 years (body-weight 7.5–14 kg): 200 mg once daily
- Child 3 months–17 years (body-weight 15–19 kg): 250 mg once daily
- Child 3 months–17 years (body-weight 20–24 kg): 300 mg once daily
- Child 3 months–17 years (body-weight 25–32.4 kg): 350 mg once daily
- Child 3 months–17 years (body-weight 32.5–39 kg): 400 mg once daily
- Child 3 months–17 years (body-weight 40 kg and above): 600 mg once daily

► **BY MOUTH USING TABLETS**

- Child (body-weight 40 kg and above): 600 mg once daily

► **BY MOUTH USING ORAL SOLUTION**

- Child 3–4 years (body-weight 13–14 kg): 360 mg once daily
- Child 3–4 years (body-weight 15–19 kg): 390 mg once daily

- Child 3–4 years (body-weight 20–24 kg): 450 mg once daily
- Child 3–4 years (body-weight 25–32.5 kg): 510 mg once daily
- Child 5–17 years (body-weight 13–14 kg): 270 mg once daily
- Child 5–17 years (body-weight 15–19 kg): 300 mg once daily
- Child 5–17 years (body-weight 20–24 kg): 360 mg once daily
- Child 5–17 years (body-weight 25–32.4 kg): 450 mg once daily
- Child 5–17 years (body-weight 32.5–39 kg): 510 mg once daily
- Child 5–17 years (body-weight 40 kg and above): 720 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- The bioavailability of *Sustiva*® oral solution is lower than that of the capsules and tablets; the oral solution is **not** interchangeable with either capsules or tablets on a milligram-for-milligram basis.

● **UNLICENSED USE** Opening capsules and adding contents to food is an unlicensed method of administration.

● **CAUTIONS** Acute porphyrias p. 577 · history of psychiatric disorders · history of seizures

● **INTERACTIONS** → Appendix 1: efavirenz

● **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · abnormal dreams · anxiety · depression · diarrhoea · dizziness · fatigue · headache · impaired concentration · nausea · pruritus · rash · sleep disturbances · Stevens-Johnson syndrome · vomiting
- **Uncommon** Amnesia · ataxia · blurred vision · convulsions · flushing · gynaecomastia · hepatitis · hypersensitivity · mania · pancreatitis · psychosis · suicidal ideation · tinnitus · tremor · vertigo
- **Rare** Hepatic failure · photosensitivity · suicide
- **Frequency not known** Lipodystrophy syndrome · osteonecrosis · raised serum cholesterol

SIDE-EFFECTS, FURTHER INFORMATION

- **Rash** Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.
- **CNS effects** Administration at bedtime especially in first 2–4 weeks reduces CNS effects.
- **Osteonecrosis** For further information see HIV infection p. 391.
- **Immune Reconstitution Syndrome** For further information see HIV infection p. 391.

● **PREGNANCY** Reports of neural tube defects when used in first trimester.

● **HEPATIC IMPAIRMENT** Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in severe impairment. In mild to moderate liver disease, monitor for dose-related side-effects (e.g. CNS effects) and liver function.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal failure—no information available.

● **MONITORING REQUIREMENTS** Monitor liver function if receiving other hepatotoxic drugs.

● **DIRECTIONS FOR ADMINISTRATION** Capsules may be opened and contents added to food (contents have a peppery taste).

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry and mint.

● **PATIENT AND CARER ADVICE**

Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms

such as severe depression, psychosis or suicidal ideation occur.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Etravirine

● INDICATIONS AND DOSE

HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)

► BY MOUTH

- Child 6–17 years (body-weight 16–19 kg): 100 mg twice daily
- Child 6–17 years (body-weight 20–24 kg): 125 mg twice daily
- Child 6–17 years (body-weight 25–29 kg): 150 mg twice daily
- Child 6–17 years (body-weight 30 kg and above): 200 mg twice daily

● CONTRA-INDICATIONS

Acute porphyrias p. 577

● INTERACTIONS

→ Appendix 1: etravirine

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anaemia · diabetes · flatulence · gastritis · gastro-oesophageal reflux · hyperlipidaemia · hypertension · Lipodystrophy Syndrome · nausea · peripheral neuropathy · rash · renal failure
- **Uncommon** Blurred vision · bronchospasm · chest pain · drowsiness · dry mouth · gynaecomastia · haematemesis · hepatitis · malaise · pancreatitis · sweating
- **Rare** Stevens-Johnson syndrome
- **Very rare** Toxic epidermal necrolysis
- **Frequency not known** Haemorrhagic stroke · hypersensitivity reactions · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

- **Hypersensitivity reactions** Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.
- **Osteonecrosis** For further information see HIV infection p. 391.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no

information available; greater risk of hepatic side-effects in chronic hepatitis B or C.

- **DIRECTIONS FOR ADMINISTRATION** Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

Missed doses

If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Etravirine 200 mg Intence 200mg tablets | 60 tablet [PoM] £301.27

Nevirapine

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (initial dose)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child: Initially 150–200 mg/m² once daily (max. per dose 200 mg) for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1 month–2 years: 150–200 mg/m² twice daily (max. per dose 200 mg), alternatively 300–400 mg/m² once daily (max. per dose 400 mg)
- Child 3–17 years: 150–200 mg/m² twice daily (max. per dose 200 mg)

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 3–17 years (body surface area 0.58–0.83 m²): 200 mg once daily
- Child 3–17 years (body surface area 0.84–1.17 m²): 300 mg once daily
- Child 3–17 years (body surface area 1.18 m² and above): 400 mg once daily
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Child 3–17 years (body surface area 0.58–0.83 m²): 200 mg once daily
- Child 3–17 years (body surface area 0.84–1.17 m²): 300 mg once daily
- Child 3–17 years (body surface area 1.18 m² and above): 400 mg once daily

● **UNLICENSED USE** 'Immediate-release' tablets not licensed for use in children weighing less than 50 kg or with body surface area less than 1.25 m²; 'immediate-release' tablets and suspension not licensed for once daily dose after the initial dose titration.

● **CONTRA-INDICATIONS** Acute porphyrias p. 577 · post-exposure prophylaxis

● **CAUTIONS** Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)

● **INTERACTIONS** → Appendix 1: nevirapine

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · diarrhoea · fatigue · fever · granulocytopenia · headache · hepatitis · hypersensitivity reactions (may involve hepatic reactions and rash) · nausea · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · vomiting

▶ **Uncommon** Anaemia · arthralgia · myalgia

▶ **Frequency not known** Osteonecrosis

● **SIDE-EFFECTS, FURTHER INFORMATION**

▶ **Hepatic effects** Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

▶ **Rash** Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

▶ **Osteonecrosis** For more information see HIV infection p. 391.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available; use 'immediate-release' preparation with caution in moderate impairment and avoid in severe impairment. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).

● **RENAL IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available.

● **MONITORING REQUIREMENTS**

▶ **Hepatic disease** Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.

▶ **Rash** Monitor closely for skin reactions during first 18 weeks.

● **PATIENT AND CARER ADVICE**

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Rilpivirine

28-Sep-2016

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than or equal to 100 000 copies/mL

▶ **BY MOUTH**

▶ **Child 12–17 years:** 25 mg once daily

● **INTERACTIONS** → Appendix 1: rilpivirine

● **SIDE-EFFECTS** Abdominal pain · abnormal dreams · anorexia · depression · dizziness · dry mouth · headache · hyperlipidaemia · Lipodystrophy Syndrome · malaise · nausea · osteonecrosis · raised serum amylase · raised serum lipase · rash · sleep disturbances · vomiting

● **SIDE-EFFECTS, FURTHER INFORMATION**

▶ **Osteonecrosis** For further information see HIV infection p. 391.

● **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.

● **DIRECTIONS FOR ADMINISTRATION** Avoid antacids 2 hours before or 4 hours after taking rilpivirine.

● **PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer rilpivirine tablets.

Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS**

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2016) that Rilpivirine (*Edurant*®) is recommended as an option for use within NHS Wales in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in antiretroviral treatment-naïve patients from 12 years old to < 18 years old with a viral load ≤ 100,000 HIV-1 RNA copies/mL.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

► **Edurant** (Janssen-Cilag Ltd)

Rilpivirine (as Rilpivirine hydrochloride) 25 mg Edurant 25mg tablets | 30 tablet **[PoM]** £200.27

Combinations available: **Emtricitabine with rilpivirine and tenofovir alafenamide**, p. 400

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Nucleoside reverse transcriptase inhibitors

- **SIDE-EFFECTS** Abdominal pain · anaemia · anorexia · arthralgia · blood disorders · cough · diarrhoea · dizziness · dyspnoea · fatigue · fever · flatulence · gastro-intestinal disturbances · headache · insomnia · liver damage · metabolic effects · myalgia · nausea · neutropenia · osteonecrosis · pancreatitis · rash · thrombocytopenia · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- Osteonecrosis For further information see HIV infection p. 391.
- **PREGNANCY** Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.
- **HEPATIC IMPAIRMENT** Use with caution in children with hepatic impairment (greater risk of hepatic side effects). However, some nucleoside reverse transcriptase inhibitors are used in children who also have chronic hepatitis B.

► above

Abacavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

► BY MOUTH

- Child 3 months–11 years: 8 mg/kg twice daily (max. per dose 300 mg), alternatively 16 mg/kg once daily (max. per dose 600 mg)
- Child 3 months–11 years (body-weight 14–20 kg): 150 mg twice daily, alternatively 300 mg once daily
- Child 3 months–11 years (body-weight 21–29 kg): 150 mg, taken in the morning and 300 mg, taken in the evening, alternatively 450 mg once daily
- Child 3 months–11 years (body-weight 30 kg and above): 300 mg twice daily, alternatively 600 mg once daily
- Child 12–17 years: 300 mg twice daily, alternatively 600 mg once daily

- **INTERACTIONS** → Appendix 1: abacavir

● SIDE-EFFECTS

- **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis
- **Frequency not known** Hypersensitivity reactions

SIDE-EFFECTS, FURTHER INFORMATION

- Hypersensitivity reactions Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and

myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis; laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time.

Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity.

- Gastro-intestinal disturbances More common in children.
- Rash More common in children.
- **ALLERGY AND CROSS-SENSITIVITY** Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.
- **HEPATIC IMPAIRMENT** Monitor closely in mild impairment (combination preparations not recommended as reduced abacavir dose may be required). Avoid in moderate impairment unless essential—close monitoring recommended. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.
- **PRE-TREATMENT SCREENING** Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.
- **MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.
- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.
Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment.

Didanosine

(ddi; DDI)

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- BY MOUTH
- Child 1–7 months: 50–100 mg/m² twice daily
- Child 8 months–17 years: 180–240 mg/m² once daily; usual dose 200 mg/m² once daily; maximum 400 mg per day

- **UNLICENSED USE** Tablets not licensed for use in children under 3 months. EC capsules not licensed for use in children under 6 years.
- **CAUTIONS** History of pancreatitis (preferably avoid, otherwise extreme caution) · hyperuricaemia · lactic acidosis · peripheral neuropathy
CAUTIONS, FURTHER INFORMATION
 - Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with didanosine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.
- **INTERACTIONS** → Appendix 1: didanosine
- **SIDE-EFFECTS** Acute renal failure · alopecia · anaphylactic reactions · diabetes mellitus · dry eyes · dry mouth · hyperuricaemia (suspend if raised significantly) · hypoglycaemia · lactic acidosis · lipodystrophy · liver failure · non-cirrhotic portal hypertension · optic nerve changes · pancreatitis (less common in children) · parotid gland enlargement · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · retinal changes · rhabdomyolysis · sialadenitis
SIDE-EFFECTS, FURTHER INFORMATION
 - Pancreatitis Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible

avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

- ▶ **Lipodystrophy syndrome** Metabolic effects may occur with antiretroviral regimens containing didanosine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** In hepatic impairment, monitor for toxicity.
- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²; consult product literature.
- **MONITORING REQUIREMENTS** Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.

- **DIRECTIONS FOR ADMINISTRATION** Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.

With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets (child under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Videx EC** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Didanosine 125 mg Videx EC 125mg capsules | 30 capsule [PoM]
£48.18 (Hospital only)

Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide

02-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 400, elvitegravir, cobicistat.

● INDICATIONS AND DOSE

HIV infection (specialist use only)

- ▶ BY MOUTH
- ▶ Child 12–17 years (body-weight 35 kg and above): 1 tablet once daily

- **INTERACTIONS** → Appendix 1: cobicistat, elvitegravir, tenofovir

● SIDE-EFFECTS

- ▶ **Uncommon** Angioedema

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol—no information available on progestogens other than norgestimate.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment (greater risk of hepatic side-effects); avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container—contains desiccant.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (*Genvoya*®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (July 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (*Genvoya*®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tenofovir alafenamide 10 mg, Cobicistat 150 mg, Elvitegravir 150 mg, Emtricitabine 200 mg Genvoya 150mg/150mg/200mg/10mg tablets | 30 tablet [PoM] £879.51

Emtricitabine (FTC)

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH USING CAPSULES
- ▶ Child (body-weight 33 kg and above): 200 mg once daily
- ▶ BY MOUTH USING ORAL SOLUTION
- ▶ Child 4 months–17 years (body-weight up to 33 kg): 6 mg/kg once daily
- ▶ Child 4 months–17 years (body-weight 33 kg and above): 240 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ 240 mg oral solution = 200 mg capsule; where appropriate the capsule may be used instead of the oral solution.

- **SIDE-EFFECTS** Abnormal dreams • hyperpigmentation • pruritus
- **HEPATIC IMPAIRMENT** On discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis).
- **RENAL IMPAIRMENT** Reduce dose or increase dosage interval if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include candy.
- **PATIENT AND CARER ADVICE**
Missed doses
If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

ELECTROLYTES: May contain Sodium

Emtricitabine with rilpivirine and tenofovir alafenamide

05-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine above, rilpivirine p. 396.

● INDICATIONS AND DOSE

HIV infection in patients with plasma HIV-1 RNA concentration of 100 000 copies/mL or less (specialist use only)

- ▶ BY MOUTH
- ▶ Child 12–17 years (body-weight 35 kg and above): 1 tablet once daily

- **INTERACTIONS** → Appendix 1: rilpivirine, tenofovir

● SIDE-EFFECTS

- ▶ **Common or very common** Raised bilirubin
- ▶ **Uncommon** Angioedema • dyspepsia • severe skin reactions (with systemic symptoms)

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Severe skin reactions Systemic symptoms reported with severe skin reactions include fever, blisters, conjunctivitis,

angioedema, elevated liver function tests, and eosinophilia.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in moderate impairment (greater risk of hepatic side-effects); avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—no information available.

● PATIENT AND CARER ADVICE

Vomiting Manufacturer advises if vomiting occurs within 4 hours of taking a dose, a replacement dose should be taken.

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (*Odefsey*®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (November 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (*Odefsey*®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1, without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine above.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (specialist use only)

- ▶ BY MOUTH
- ▶ Child 12–17 years (body-weight 35 kg and above): 200/10–200/25 mg once daily, dose is dependent on drug regimen—consult product literature

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg emtricitabine/tenofovir alafenamide.

- **INTERACTIONS** → Appendix 1: tenofovir

● SIDE-EFFECTS

- **Uncommon** Angioedema · dyspepsia

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution (greater risk of hepatic side-effects).

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available.

● PATIENT AND CARER ADVICE

Vomiting Manufacturer advises if vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

Missed doses

Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2016) that emtricitabine with tenofovir alafenamide (*Descovy*®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 in combination with other antiretroviral agents.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (September 2016) that emtricitabine with tenofovir alafenamide (*Descovy*®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 in combination with other antiretroviral agents.

● MEDICAL FORMS

Lamivudine (3TC)

● INDICATIONS AND DOSE

EPIVIR® ORAL SOLUTION

HIV infection in combination with other antiretroviral drugs

► BY MOUTH

- Child 1–2 months: 4 mg/kg twice daily
- Child 3 months–11 years (body-weight up to 14 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg)
- Child 3 months–11 years (body-weight 14–20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
- Child 3 months–11 years (body-weight 21–29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg daily, dose to be taken in the morning and 150 mg daily, dose to be taken in the evening, alternatively 225 mg once daily

- Child 3 months–11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily
- Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily

EPIVIR® TABLETS

HIV infection in combination with other antiretroviral drugs

► BY MOUTH

- Child 1–2 months: 4 mg/kg twice daily
- Child 3 months–11 years (body-weight up to 14 kg): 4 mg/kg twice daily, alternatively 8 mg/kg once daily
- Child 3 months–11 years (body-weight 14–20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
- Child 3 months–11 years (body-weight 21–29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg daily, dose to be taken in the morning and 150 mg daily, dose to be taken in the evening, alternatively 225 mg once daily
- Child 3 months–11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily
- Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily

ZEFFIX®

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

► BY MOUTH

- Child 2–11 years: 3 mg/kg once daily (max. per dose 100 mg), children receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection
- Child 12–17 years: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

● UNLICENSED USE

EPIVIR® ORAL SOLUTION Not licensed for use in children under 3 months.

ZEFFIX® Not licensed for use in children.

EPIVIR® TABLETS Not licensed for use in children under 3 months.

- **CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

- **INTERACTIONS** → Appendix 1: lamivudine

- **SIDE-EFFECTS** Alopecia · muscle disorders · nasal symptoms · peripheral neuropathy · rhabdomyolysis

- **BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature.

- **MONITORING REQUIREMENTS** When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every

3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and strawberry.

Stavudine

01-Sep-2016

(d4T)

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

► BY MOUTH

- Child (body-weight up to 30 kg): 1 mg/kg twice daily, to be taken preferably at least 1 hour before food
- Child (body-weight 30–59 kg): 30 mg twice daily, to be taken preferably at least 1 hour before food
- Child (body-weight 60 kg and above): 40 mg twice daily, to be taken preferably at least 1 hour before food

- **UNLICENSED USE** Capsules not licensed for use in children under 3 months.

- **CAUTIONS** Excessive alcohol intake · history of pancreatitis · history of peripheral neuropathy · lactic acidosis (especially when used in combination with didanosine)—use only if alternative regimens are not suitable

CAUTIONS, FURTHER INFORMATION

- **Lactic acidosis** Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with stavudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: stavudine

● SIDE-EFFECTS

- **Common or very common** Abnormal dreams · cognitive dysfunction · depression · drowsiness · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · pruritus
- **Uncommon** Anxiety · gynaecomastia
- **Frequency not known** Lactic acidosis · lipodystrophy

SIDE-EFFECTS, FURTHER INFORMATION

- **Lipodystrophy syndrome** Metabolic effects may occur with antiretroviral regimens containing stavudine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and

patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Reduce dose to 50% if estimated glomerular filtration rate 25–50 mL/minute/1.73 m²; reduce dose to 25% if estimated glomerular filtration rate less than 25 mL/minute/1.73 m². Risk of peripheral neuropathy.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.
- **LESS SUITABLE FOR PRESCRIBING** Stavudine (especially in combination with didanosine) is associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

Tenofovir disoproxil

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs when first-line nucleoside reverse transcriptase inhibitors cannot be used because of resistance or contra-indications

► BY MOUTH

- Child 2–17 years: 6.5 mg/kg once daily (max. per dose 245 mg)
- Child 6–17 years (body-weight 17–21 kg): 123 mg once daily
- Child 6–17 years (body-weight 22–27 kg): 163 mg once daily
- Child 6–17 years (body-weight 28–34 kg): 204 mg once daily
- Child 6–17 years (body-weight 35 kg and above): 245 mg once daily

Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histology of active liver inflammation or fibrosis)

► BY MOUTH

- Child 12–17 years (body-weight 35 kg and above): 245 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

- **INTERACTIONS** → Appendix 1: tenofovir
- **SIDE-EFFECTS**
- **Rare** Nephrogenic diabetes insipidus · proximal renal tubulopathy · renal failure
- **Frequency not known** Hypophosphataemia · reduced bone density
- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.

● MONITORING REQUIREMENTS

- ▶ Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
- ▶ When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

● **DIRECTIONS FOR ADMINISTRATION** *Granules*: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.

● PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer tenofovir granules.

Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Zidovudine

(Azidothymidine; AZT)

01-Sep-2016

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

▶ BY MOUTH

- ▶ Child: 180 mg/m² twice daily (max. per dose 300 mg)
- ▶ Child (body-weight 8–13 kg): 100 mg twice daily
- ▶ Child (body-weight 14–20 kg): 100 mg, to be taken in the morning and 200 mg, to be taken in the evening
- ▶ Child (body-weight 21–27 kg): 200 mg twice daily
- ▶ Child (body-weight 28–29 kg): 200–250 mg twice daily
- ▶ Child (body-weight 30 kg and above): 250–300 mg twice daily

HIV infection in combination with other antiretroviral drugs (dose expressed in mg/kg)

▶ BY MOUTH

- ▶ Child (body-weight 4–8 kg): 12 mg/kg twice daily
- ▶ Child (body-weight 9–29 kg): 9 mg/kg twice daily

Prevention of maternal-fetal HIV transmission

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: Seek specialist advice (combination therapy preferred) (consult local protocol)

HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

▶ BY INTRAVENOUS INFUSION

- ▶ Child 3 months–11 years: 60–80 mg/m² every 6 hours usually for not more than 2 weeks, dose approximating to 9–12 mg/kg twice daily by mouth
- ▶ Child 12–17 years: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

- **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) · abnormally low neutrophil counts (consult product literature) · acute porphyrias p. 577 · neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature)

- **CAUTIONS** Lactic acidosis · risk of haematological toxicity particularly with high dose and advanced disease · vitamin B₁₂ deficiency (increased risk of neutropenia)

CAUTIONS, FURTHER INFORMATION

- ▶ Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: zidovudine

- **SIDE-EFFECTS** Anaemia (may require transfusion) · anxiety · chest pain · convulsions · depression · dizziness · drowsiness · gynaecomastia · influenza-like symptoms · lactic acidosis · lipodystrophy · loss of mental acuity · myopathy · neuropathy · paraesthesia · pigmentation of nails · pigmentation of oral mucosa · pigmentation of skin · pruritus · sweating · taste disturbance · urinary frequency

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.
- ▶ Lipodystrophy syndrome Metabolic effects may occur with antiretroviral regimens containing zidovudine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.
- **HEPATIC IMPAIRMENT** Accumulation may occur.
- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²—consult product literature.
- **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment, then every 3 months.
- **DIRECTIONS FOR ADMINISTRATION** For *intermittent intravenous infusion*, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.
- **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Retrovir** (ViiV Healthcare UK Ltd)
Zidovudine 10 mg per 1 ml Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial [PoM] £44.61

Oral solution

- ▶ **Retrovir** (ViiV Healthcare UK Ltd)
Zidovudine 10 mg per 1 ml Retrovir 50mg/5ml oral solution sugar-free | 200 ml [PoM] £17.78

Capsule

- ▶ **Zidovudine (Non-proprietary)**
Zidovudine 100 mg Zidovudine 100mg capsules | 60 capsule [PoM]
no price available
Zidovudine 250 mg Zidovudine 250mg capsules | 60 capsule [PoM]
no price available
- ▶ **Retrovir** (ViiV Healthcare UK Ltd)
Zidovudine 100 mg Retrovir 100mg capsules | 100 capsule [PoM]
£88.86
Zidovudine 250 mg Retrovir 250mg capsules | 40 capsule [PoM]
£88.86

Zidovudine with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, zidovudine p. 403, lamivudine p. 401.

INDICATIONS AND DOSE**HIV infection in combination with other antiretroviral drugs**

- ▶ **BY MOUTH**
- ▶ Child (body-weight 14–20 kg): 0.5 tablet twice daily
- ▶ Child (body-weight 21–29 kg): 0.5 tablet daily, to be given in the morning and 1 tablet daily, to be given in the evening
- ▶ Child (body-weight 30 kg and above): 1 tablet twice daily

- **INTERACTIONS** → Appendix 1: lamivudine, zidovudine

- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION

COMBIVIR® TABLETS Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Zidovudine with lamivudine (Non-proprietary)**
Lamivudine 150 mg, Zidovudine 300 mg Zidovudine 300mg / Lamivudine 150mg tablets | 60 tablet [PoM] £240.10-£285.11
- ▶ **Combivir** (ViiV Healthcare UK Ltd)
Lamivudine 150 mg, Zidovudine 300 mg Combivir 150mg/300mg tablets | 60 tablet [PoM] £255.10

ANTIVIRALS > PROTEASE INHIBITORS**Protease inhibitors**

- **CONTRA-INDICATIONS** Acute porphyrias p. 577

- **CAUTIONS** Haemophilia (increased risk of bleeding)

- **SIDE-EFFECTS** Abdominal pain • anaemia • anaphylaxis • anorexia • blood disorders • diarrhoea • dizziness • fatigue • flatulence • gastro-intestinal disturbances • headache • hepatic dysfunction • hypersensitivity reactions • metabolic effects • myalgia • myositis • nausea • neutropenia • osteonecrosis • pancreatitis • paraesthesia • pruritus • rash • rhabdomyolysis • sleep disturbances • Stevens-Johnson syndrome • taste disturbances • thrombocytopenia • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Osteonecrosis** For further information see HIV infection p. 391.
- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

Atazanavir**INDICATIONS AND DOSE****HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**

- ▶ **BY MOUTH**
- ▶ Child 6–17 years (body-weight 15–19 kg): 150 mg once daily
- ▶ Child 6–17 years (body-weight 20–39 kg): 200 mg once daily
- ▶ Child 6–17 years (body-weight 40 kg and above): 300 mg once daily

- **CAUTIONS** Cardiac conduction disorders • electrolyte disturbances • predisposition to QT interval prolongation

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

SIDE-EFFECTS

- ▶ **Common or very common** AV block
- ▶ **Uncommon** Abnormal dreams • alopecia • amnesia • anxiety • arthralgia • chest pain • cholelithiasis • depression • disorientation • dry mouth • dyspnoea • gynaecomastia • haematuria • hypertension • increased appetite • mouth ulcers • nephrolithiasis • peripheral neuropathy • proteinuria • syncope • torsades de pointes • urinary frequency • weight changes
- ▶ **Rare** Abnormal gait • cholecystitis • hepatosplenomegaly • oedema • palpitation

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.
- **PREGNANCY** Theoretical risk of hyperbilirubinaemia in neonate if used at term. Monitor viral load and plasma-atazanavir concentration during third trimester.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- CAUTIONARY AND ADVISORY LABELS 5, 21
- ▶ **Reyataz** (Bristol-Myers Squibb Pharmaceuticals Ltd)
Atazanavir (as Atazanavir sulfate) 150 mg Reyataz 150mg capsules | 60 capsule [PoM] £303.38 (Hospital only)
- Atazanavir (as Atazanavir sulfate) 200 mg** Reyataz 200mg capsules | 60 capsule [PoM] £303.38 (Hospital only)
- Atazanavir (as Atazanavir sulfate) 300 mg** Reyataz 300mg capsules | 30 capsule [PoM] £303.38 (Hospital only)

Darunavir**INDICATIONS AND DOSE****HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir**

- ▶ **BY MOUTH**
- ▶ Child 3–17 years (body-weight 15–29 kg): 375 mg twice daily
- ▶ Child 3–17 years (body-weight 30–39 kg): 450 mg twice daily

- ▶ Child 3–17 years (body-weight 40 kg and above): 600 mg twice daily
- ▶ Child 12–17 years: 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells $\times 10^6$ /litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

▶ BY MOUTH

- ▶ Child 12–17 years (body-weight 40 kg and above): 800 mg once daily

● **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● **SIDE-EFFECTS**

- ▶ **Common or very common** Peripheral neuropathy · rash
- ▶ **Uncommon** Abnormal dreams · acne · alopecia · anxiety · arthralgia · chest pain · conjunctival hyperaemia · cough · depression · dry eyes · dry mouth · dyspnoea · dysuria · eczema · erectile dysfunction · flushing · gynaecomastia · hypertension · hypothyroidism · increased appetite · increased sweating · memory impairment · myocardial infarction · nail discoloration · nephrolithiasis · osteoporosis · peripheral oedema · polyuria · pyrexia · QT interval prolongation · reduced libido · renal failure · severe skin rash · Stevens-Johnson syndrome · stomatitis · tachycardia · throat irritation · toxic epidermal necrolysis · weight changes
- ▶ **Rare** Bradycardia · confusion · convulsions · haematemesis · palpitation · rhinorrhoea · seborrhoeic dermatitis · syncope · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.

● **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with sulfonamide sensitivity.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.

● **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

● **PATIENT AND CARER ADVICE**

Missed doses

If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Prezista** (Janssen-Cilag Ltd)

Darunavir (as Darunavir ethanolate) 100 mg per 1 ml Prezista 100mg/ml oral suspension sugar-free | 200 ml [PoM] £248.17

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Prezista** (Janssen-Cilag Ltd)

Darunavir (as Darunavir ethanolate) 75 mg Prezista 75mg tablets | 480 tablet [PoM] £446.70

Darunavir (as Darunavir ethanolate) 150 mg Prezista 150mg tablets | 240 tablet [PoM] £446.70

Darunavir (as Darunavir ethanolate) 400 mg Prezista 400mg tablets | 60 tablet [PoM] £297.80

Darunavir (as Darunavir ethanolate) 600 mg Prezista 600mg tablets | 60 tablet [PoM] £446.70

Darunavir (as Darunavir ethanolate) 800 mg Prezista 800mg tablets | 30 tablet [PoM] £297.80

Fosamprenavir

● **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

▶ BY MOUTH

- ▶ Child 6–17 years (body-weight 25–39 kg): 18 mg/kg twice daily (max. per dose 700 mg)
- ▶ Child 6–17 years (body-weight 40 kg and above): 700 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ 700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

● **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● **SIDE-EFFECTS**

- ▶ **Rare** Stevens-Johnson syndrome
- ▶ **Frequency not known** Rash

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines.

● **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.

● **HEPATIC IMPAIRMENT** Reduce dose in moderate to severe impairment. Manufacturer advises caution in mild impairment.

● **DIRECTIONS FOR ADMINISTRATION** In children, oral suspension should be taken with food.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Telzir** (ViiV Healthcare UK Ltd)

Fosamprenavir (as Fosamprenavir calcium) 700 mg Telzir 700mg tablets | 60 tablet [PoM] £220.13

Lopinavir with ritonavir

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

▶ BY MOUTH USING TABLETS

- ▶ Child 2–17 years (body-weight up to 40 kg and body surface area 0.5–0.7 m²): 200/50 mg twice daily continued →

- ▶ Child 2–17 years (body-weight up to 40 kg and body surface area 0.8–1.1 m²): 300/75 mg twice daily
- ▶ Child 2–17 years (body-weight 40 kg and above and body surface area 1.2 m² and above): 400/100 mg twice daily
- ▶ BY MOUTH USING ORAL SOLUTION
- ▶ Child 2–17 years: 2.9 mL/m² twice daily (max. per dose 5 mL), to be taken with food, oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease
- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors
- **SIDE-EFFECTS**
- ▶ **Common or very common** Amenorrhoea · anxiety · arthralgia · colitis · hypertension · menorrhagia · neuropathy · night sweats · sexual dysfunction · weight changes
- ▶ **Uncommon** Abnormal dreams · alopecia · atherosclerosis · AV block · cerebrovascular accident · convulsions · deep vein thrombosis · dry mouth · gastro-intestinal ulcer · haematuria · nephritis · rectal bleeding · stomatitis · tinnitus · tremor · visual disturbances
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed
- **PREGNANCY** Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies).
- **HEPATIC IMPAIRMENT** Avoid oral solution due to propylene glycol content; manufacturer advises avoid tablets in severe impairment.
- **RENAL IMPAIRMENT** Avoid oral solution due to high propylene glycol content.
- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.
- **PATIENT AND CARER ADVICE** Oral solution tastes bitter.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

EXCIPIENTS: May contain Alcohol, propylene glycol

▶ **Kaletra** (AbbVie Ltd)

Ritonavir 20 mg per 1 mL, Lopinavir 80 mg per 1 mL Kaletra 80mg/20mg/1mL oral solution | 300 mL [PoM] £307.39

Ritonavir 50 mg, Lopinavir 200 mg Kaletra 200mg/50mg tablets | 120 tablet [PoM] £285.41

F 404

Ritonavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

- ▶ BY MOUTH
- ▶ Child 2–17 years: Initially 250 mg/m² twice daily, increased in steps of 50 mg/m² every 2–3 days; increased to 350 mg/m² twice daily (max. per dose 600 mg twice daily), tolerability of this regimen is poor

Low-dose ritonavir to increase the effect of atazanavir

- ▶ BY MOUTH
- ▶ Child 6–17 years (body-weight 15–19 kg): 80–100 mg once daily

- ▶ Child 6–17 years (body-weight 20 kg and above): 100 mg once daily

Low-dose ritonavir to increase the effect of darunavir

- ▶ BY MOUTH
- ▶ Child 3–17 years (body-weight 15–29 kg): 50 mg twice daily
- ▶ Child 3–17 years (body-weight 30–39 kg): 60 mg twice daily
- ▶ Child 3–17 years (body-weight 40 kg and above): 100 mg twice daily
- ▶ Child 12–17 years (body-weight 40 kg and above): 100 mg once daily for use in patients taking darunavir once daily

Low-dose ritonavir to increase the effect of fosamprenavir

- ▶ BY MOUTH
- ▶ Child 6–17 years (body-weight 25–32 kg): 3 mg/kg twice daily
- ▶ Child 6–17 years (body-weight 33 kg and above): 100 mg twice daily

Low-dose ritonavir to increase the effect of tipranavir

- ▶ BY MOUTH
- ▶ Child 2–11 years: 150 mg/m² twice daily (max. per dose 200 mg)
- ▶ Child 12–17 years: 200 mg twice daily

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease
- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors
- **SIDE-EFFECTS**
- ▶ **Common or very common** Acne · anxiety · arthralgia · blood pressure changes · blurred vision · confusion · cough · decreased blood thyroxine concentration · fever · flushing · gastro-intestinal haemorrhage · menorrhagia · mouth ulcers · oedema · peripheral neuropathy · pharyngitis · renal impairment · seizures · syncope
- ▶ **Uncommon** Electrolyte disturbances · myocardial infarction
- ▶ **Rare** Toxic epidermal necrolysis
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.
- **PREGNANCY** Only use low-dose booster to increase the effect of other protease inhibitors.
- **HEPATIC IMPAIRMENT** Avoid in decompensated liver disease; in severe impairment without decompensation, use 'booster' doses with caution (avoid treatment doses).
- **DIRECTIONS FOR ADMINISTRATION** Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ritonavir oral solution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ **Norvir** (AbbVie Ltd)

Ritonavir 100 mg Norvir 100mg tablets | 30 tablet [PoM] £19.44

F 404

Tipranavir

● INDICATIONS AND DOSE

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir

- ▶ BY MOUTH USING CAPSULES
- ▶ Child 12–17 years: 500 mg twice daily

► BY MOUTH USING ORAL SOLUTION

- Child 2–11 years: 375 mg/m² twice daily (max. per dose 500 mg)

DOSE EQUIVALENCE AND CONVERSION

- The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

- **CAUTIONS** Patients at risk of increased bleeding from trauma, surgery or other pathological conditions
- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors
- **SIDE-EFFECTS**
 - **Rare** Dehydration
 - **Frequency not known** Anorexia · dyspnoea · influenza-like symptoms · peripheral neuropathy · photosensitivity · renal impairment
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include toffee and mint.
- **PATIENT AND CARER ADVICE** Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

● **MEDICINAL FORMS**

Maraviroc 300 mg Celsentri 300mg tablets | 60 tablet **[PoM]** £441.27

6.5 Influenza**Influenza****Management**

Oseltamivir p. 408 and zanamivir p. 409 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; oseltamivir is licensed for use within 48 hours of the first symptoms while zanamivir is licensed for use within 36 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in children with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised children.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Amantadine hydrochloride is licensed for prophylaxis and treatment of influenza A in children over 10 years of age, but it is no longer recommended.

ANTIVIRALS > NEURAMINIDASE INHIBITORS

Oseltamivir

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

● INDICATIONS AND DOSE

Prevention of influenza

► BY MOUTH

- Neonate: 3 mg/kg once daily for 10 days for post-exposure prophylaxis.
- Child 1–11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis
- Child 1–12 years (body-weight 10–15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 15–23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 23–40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 13–17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Treatment of influenza

► BY MOUTH

- Neonate: 3 mg/kg twice daily for 5 days.
- Child 1–11 months: 3 mg/kg twice daily for 5 days
- Child 1–12 years (body-weight 10–15 kg): 30 mg twice daily for 5 days
- Child 1–12 years (body-weight 15–23 kg): 45 mg twice daily for 5 days
- Child 1–12 years (body-weight 23–40 kg): 60 mg twice daily for 5 days
- Child 1–12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
- Child 13–17 years: 75 mg twice daily for 5 days

- **UNLICENSED USE** Not licensed for use in premature infants.

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · dyspepsia · headache · nausea · vomiting
- **Uncommon** Altered consciousness · arrhythmias · convulsions · eczema · rash
- **Rare** Gastro-intestinal bleeding · hepatitis · neuropsychiatric disorders · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances

- **PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

● RENAL IMPAIRMENT

For *treatment*, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).

For *prevention*, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).

Avoid for *treatment and prevention* if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-for-influenza

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- Oseltamivir **s not** recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community, oseltamivir is a treatment option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients are those who have one or more of the following conditions:

- chronic respiratory disease (including asthma);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/TA158

- ▶ **Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009)** NICE TA168
Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.

At risk patients are those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

NHS restrictions Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 9

▶ Oseltamivir (Non-proprietary)

Oseltamivir (as Oseltamivir phosphate) 15 mg per 1 ml
Oseltamivir 15mg/ml oral solution sugar free sugar-free | 20 ml [PoM] £10.00

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

EXCIPIENTS: May contain Sorbitol

▶ Tamiflu (Roche Products Ltd)

Oseltamivir (as Oseltamivir phosphate) 6 mg per 1 ml
Tamiflu 6mg/ml oral suspension sugar-free | 65 ml [PoM] £10.27

Capsule

CAUTIONARY AND ADVISORY LABELS 9

▶ Tamiflu (Roche Products Ltd)

Oseltamivir (as Oseltamivir phosphate) 30 mg
Tamiflu 30mg capsules | 10 capsule [PoM] £7.71

Oseltamivir (as Oseltamivir phosphate) 45 mg
Tamiflu 45mg capsules | 10 capsule [PoM] £15.41

Oseltamivir (as Oseltamivir phosphate) 75 mg
Tamiflu 75mg capsules | 10 capsule [PoM] £15.41

Zanamivir

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

● INDICATIONS AND DOSE

Post-exposure prophylaxis of influenza

▶ BY INHALATION OF POWDER

- ▶ Child 5–17 years: 10 mg once daily for 10 days

Prevention of influenza during an epidemic

▶ BY INHALATION OF POWDER

- ▶ Child 5–17 years: 10 mg once daily for up to 28 days

Treatment of influenza

▶ BY INHALATION OF POWDER

- ▶ Child 5–17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

- **UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

- **CAUTIONS** Asthma · chronic pulmonary disease · uncontrolled chronic illness

CAUTIONS, FURTHER INFORMATION

- ▶ Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

● SIDE-EFFECTS

- ▶ **Common or very common** Rash
- ▶ **Uncommon** Angioedema · bronchospasm · dyspnoea · urticaria
- ▶ **Rare** Neuropsychiatric disorders · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

- **DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

- **PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
Zanamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Zanamivir is not recommended for seasonal prophylaxis against influenza.

- When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the

same household or residential setting. Zanamivir should be given within 36 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients are those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

Inhalation powder

► **Relenza** (GlaxoSmithKline UK Ltd)

Zanamivir 5 mg Relenza 5mg inhalation powder blisters with Diskhaler | 20 blister (PaM) £16.36

6.6 Respiratory syncytial virus

Respiratory syncytial virus

Management

Ribavirin p. 384 inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is effective in Lassa fever and has also been used parenterally in the treatment of life-threatening RSV, parainfluenza virus, and adenovirus infections in immunocompromised children [unlicensed indications].

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at www.gov.uk/dh.

DRUGS FOR RESPIRATORY DISEASES > MONOCLONAL ANTIBODIES

Palivizumab

● **INDICATIONS AND DOSE**

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)

► BY INTRAMUSCULAR INJECTION

- Neonate: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk.
- Child 1–23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)

► **BY INTRAMUSCULAR INJECTION**

- **Child 1-23 months:** Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

- **UNLICENSED USE** Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

- **CAUTIONS** Moderate to severe acute infection · moderate to severe febrile illness · serum-palivizumab concentration may be reduced after cardiac surgery · thrombocytopenia

● **SIDE-EFFECTS**

- **Common or very common** Fever · injection-site reactions · nervousness
- **Uncommon** Asthenia · constipation · cough · diarrhoea · drowsiness · haemorrhage · hyperkinesia · leucopenia · pain · rash · rhinitis · vomiting · wheeze
- **Frequency not known** Anaphylaxis · apnoea · convulsions · hypersensitivity reactions · thrombocytopenia

- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to humanised monoclonal antibodies.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus

Diabetes insipidus is caused by either a deficiency of anti-diuretic hormone (ADH, vasopressin p. 65) secretion (cranial, neurogenic, or pituitary diabetes insipidus) or by failure of the renal tubules to react to secreted antidiuretic hormone (nephrogenic diabetes insipidus).

Vasopressin (antidiuretic hormone, ADH) is used in the treatment of *pituitary diabetes insipidus* as its analogue desmopressin below. Dosage is tailored to produce a regular diuresis every 24 hours to avoid water intoxication. Treatment may be required permanently or for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus; following an intramuscular or intranasal dose, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of pituitary diabetes insipidus. Failure to respond suggests nephrogenic diabetes insipidus. Fluid input must be managed carefully to avoid hyponatraemia; this test is not usually recommended in young children.

In *neurogenic and partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's

disease; it is also used to test fibrinolytic response.

Desmopressin also has a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, before introducing more definitive treatment. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, and octreotide are used similarly but experience in children is limited.

1.1 Diabetes insipidus

Other drugs used for Diabetes insipidus Chlorothiazide, p. 108

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES

Desmopressin

09-Jun-2017

- **DRUG ACTION** Desmopressin is an analogue of vasopressin.

● INDICATIONS AND DOSE

Diabetes insipidus, treatment

► BY MOUTH

- Neonate: Initially 1–4 micrograms 2–3 times a day, adjusted according to response.
- Child 1–23 months: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
- Child 2–11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
- Child 12–17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily

- ▶ BY SUBLINGUAL ADMINISTRATION
- ▶ Child 2–17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Neonate: Initially 100–500 nanograms, adjusted according to response; usual dose 1.25–10 micrograms daily in 1–2 divided doses.
- ▶ Child 1–23 months: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
- ▶ Child 2–11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
- ▶ Child 12–17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Neonate: Initially 100 nanograms once daily, adjusted according to response.
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years: Initially 400 nanograms once daily, adjusted according to response
- ▶ Child 12–17 years: Initially 1–4 micrograms once daily, adjusted according to response

Primary nocturnal enuresis

- ▶ BY MOUTH
- ▶ Child 5–17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- ▶ BY SUBLINGUAL ADMINISTRATION
- ▶ Child 5–17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

Diabetes insipidus, diagnosis (water deprivation test)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Neonate: Not recommended, use trial of treatment.
- ▶ Child 1–23 months: 5–10 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended
- ▶ Child 2–11 years: 10–20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia
- ▶ Child 12–17 years: 20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Neonate: Not recommended, use trial of treatment.
- ▶ Child 1–23 months: 400 nanograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended
- ▶ Child 2–11 years: 0.5–1 microgram for 1 dose, manage fluid input carefully to avoid hyponatraemia
- ▶ Child 12–17 years: 1–2 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia

Renal function testing

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–11 months: 10 micrograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload
- ▶ Child 1–14 years: 20 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

- ▶ Child 15–17 years: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1–11 months: 400 nanograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload
- ▶ Child 1–17 years: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

Mild to moderate haemophilia and von Willebrand's disease

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–17 years: 4 micrograms/kg for 1 dose, for pre-operative use give 2 hours before procedure
- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

Fibrinolytic response testing

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 2–17 years: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

Assessment of antidiuretic hormone secretion (congenital deficiency suspected) (specialist use only)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–23 months: Initially 100–500 nanograms for 1 dose

Assessment of antidiuretic hormone secretion (congenital deficiency not suspected) (specialist use only)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–23 months: 1–5 micrograms for 1 dose

- **UNLICENSED USE** Consult product literature for individual preparations. Not licensed for assessment of antidiuretic hormone secretion. Oral use of *DDAVP* intravenous injection is not licensed.

- **CONTRA-INDICATIONS** Cardiac insufficiency · conditions treated with diuretics · history of hyponatraemia · polydipsia in alcohol dependence · psychogenic polydipsia

CAUTIONS

GENERAL CAUTIONS

Asthma · avoid fluid overload · cardiovascular disease (not indicated for nocturnal enuresis or nocturia) · conditions which might be aggravated by water retention · cystic fibrosis · epilepsy · heart failure · hypertension (not indicated for nocturnal enuresis or nocturia) · migraine · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

SPECIFIC CAUTIONS

Should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

- **INTERACTIONS** → Appendix 1: desmopressin

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake · nausea
- ▶ **Frequency not known** Allergic reactions · emotional disturbance in children · epistaxis · fluid retention · headache · nasal congestion · stomach pain · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ With intranasal use Rhinitis

SIDE-EFFECTS, FURTHER INFORMATION

- **Hyponatraemic convulsions** The risk of hyponatraemic convulsions can be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants).
- **PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.
- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.
- **MONITORING REQUIREMENTS** In *nocturia*, periodic blood pressure and weight checks are needed to monitor for fluid overload.
- **DIRECTIONS FOR ADMINISTRATION** *DDAVP*® and *Desmotabs*® tablets may be crushed.
DDAVP® intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.
DDAVP® injection may be administered orally.
Desmopressin oral lyophilisates are for sublingual administration.
- **With intravenous use** Higher doses of *DDAVP*® by *intravenous infusion*, used in mild to moderate haemophilia and von Willebrand's disease, may be diluted with 30–50 mL Sodium Chloride 0.9% intravenous infusion.
For *intravenous infusion* (*Octim*®), dilute with 50 mL of Sodium Chloride 0.9% and give over 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.
Children requiring an intranasal dose of less than 10 micrograms should be given *DDAVP*® intranasal solution.
- **PATIENT AND CARER ADVICE**
Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

2 Corticosteroid responsive conditions

CORTICOSTEROIDS

Corticosteroids, general use

Overview

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy

are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 420 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, low-dose hydrocortisone p. 420 can be used in septic shock that is resistant to volume expansion and catecholamines, and is accompanied by suspected or proven adrenal insufficiency.

The suppressive action of glucocorticoids on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most adults a single dose of dexamethasone p. 419 at night is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone p. 418 and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 19); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should **not** be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 132. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

In the management of asthma, corticosteroids are preferably used by inhalation but systemic therapy along with bronchodilators is required for the emergency treatment of severe acute asthma.

Betamethasone is used in women at risk of preterm delivery to reduce the incidence of neonatal respiratory distress syndrome [unlicensed use].

Dexamethasone should not be used routinely for the prophylaxis and treatment of chronic lung disease in neonates because of an association with adverse neurological effects.

Corticosteroids may be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis, and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia and thrombocytopenic purpura.

High doses of a corticosteroid (usually prednisolone p. 421) are used in the treatment of *glomerular kidney disease*, including *nephrotic syndrome*. The condition frequently recurs; a corticosteroid given in high doses and for prolonged periods may delay relapse but the higher incidence of adverse effects limits the overall benefit. Those who suffer frequent relapses may be treated with prednisolone given in a low dose (daily or on alternate days) for 3–6 months; the dose should be adjusted to minimise effects on growth and development. Other drugs used in the treatment of glomerular kidney disease include levamisole

p. 367, cyclophosphamide p. 509, chlorambucil p. 508, and ciclosporin p. 496. *Congenital nephrotic syndrome* may be resistant to corticosteroids and immunosuppressants; indometacin p. 628 and an ACE inhibitor such as captopril p. 109 have been used.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa, allergic rhinitis, and aphthous ulcers.

Side-effects

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side effects

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone acetate, but are significant with hydrocortisone, corticotropin, and tetracosactide p. 452. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone p. 421, prednisolone, and triamcinolone.

Glucocorticoid side effects

- diabetes
- osteoporosis
- in addition high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.
- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

Managing side-effects

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no

effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 15 years; they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

Corticosteroids, replacement therapy

Overview

The adrenal cortex normally secretes hydrocortisone p. 420 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 420; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2–3 divided doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In *acute adrenocortical insufficiency*, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9% p. 561.

In *hypopituitarism*, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 464 and sex hormones should be given as indicated by the pattern of hormone deficiency.

In *congenital adrenal hyperplasia*, the pituitary gland increases production of corticotropin to compensate for reduced formation of cortisol; this results in excessive adrenal androgen production. Treatment is aimed at suppressing corticotropin using hydrocortisone. Careful and continual dose titration is required to avoid growth retardation and toxicity; for this reason potent, synthetic glucocorticoids such as dexamethasone are usually reserved for use in adolescents. The dose is adjusted according to clinical response and measurement of adrenal androgens and 17-hydroxyprogesterone. Salt-losing forms of congenital adrenal hyperplasia (where there is a lack of aldosterone production) also require mineralocorticoid replacement and salt supplementation (particularly in early life). The dose of mineralocorticoid is adjusted according to electrolyte concentration and plasma-renin activity.

Glucocorticoid therapy

Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 420 is so high that its anti-inflammatory activity is of no clinical relevance.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 1 mg	≡	Betamethasone 150 micrograms
	≡	Deflazacort 1.2 mg
	≡	Dexamethasone 150 micrograms
	≡	Hydrocortisone 4 mg
	≡	Methylprednisolone 800 micrograms
	≡	Triamcinolone 800 micrograms

The relatively high mineralocorticoid activity of hydrocortisone p. 420, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 421 has predominantly glucocorticoid activity and is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 418 and dexamethasone p. 419 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion.

Some esters of betamethasone and of beclomethasone dipropionate p. 154 (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 418 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) · systemic infection (unless specific therapy given)

CONTRA-INDICATIONS, FURTHER INFORMATION

For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **CAUTIONS** Congestive heart failure · diabetes mellitus (including a family history of) · diverticulitis · epilepsy · glaucoma (including a family history of or susceptibility to) · history of steroid myopathy · history of tuberculosis or X-ray changes (frequent monitoring required) · hypertension · hypothyroidism · infection (particularly untreated) · myasthenia gravis · ocular herpes simplex (risk of corneal perforation) · osteoporosis · peptic ulcer · psychiatric reactions · recent intestinal anastomoses · recent myocardial infarction (rupture reported) · severe affective disorders (particularly if history of steroid-induced psychosis) · should not be used long-term · thromboembolic disorders · ulcerative colitis

CAUTIONS, FURTHER INFORMATION

For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

• SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

Abdominal distension • acute pancreatitis • aggravation of epilepsy • aggravation of schizophrenia • amenorrhoea • anaphylaxis • bruising • candidiasis • congestive heart failure • corneal thinning • Cushing's syndrome (with moon face, striae and acne) • dyspepsia • ecchymoses • exacerbation of ophthalmic fungal disease • exacerbation of ophthalmic viral disease • exophthalmos • facial erythema • glaucoma • headache • hiccups • hirsutism • hypercholesterolaemia • hyperglycaemia • hyperhidrosis • hyperlipidaemia • hypersensitivity reactions • impaired healing • increased appetite • increased intra-ocular pressure • increased intracranial pressure with papilloedema (usually after withdrawal) • increased susceptibility to and severity of infection • insomnia • leucocytosis • long bone fractures • malaise • menstrual irregularities • muscle weakness • myocardial rupture following recent myocardial infarction • nausea • negative calcium balance • negative nitrogen balance • oesophageal ulceration • petechiae • posterior subcapsular cataracts • potassium loss • psychological dependence • reactivation of dormant tuberculosis • scleral thinning • skin atrophy • sodium retention • suppression of growth • telangiectasia • tendon rupture • thromboembolism • urticaria • vertebral fractures • vertigo • water retention • weight gain

SPECIFIC SIDE-EFFECTS

- With intra-articular use Flushing • may affect the hyaline cartilage

SIDE-EFFECTS, FURTHER INFORMATION

Side effects can be managed by choice of route and duration of course. For further detail see Corticosteroids, general use p. 414

- Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death.
 - To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists **must** know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:
 - Minor surgery under general anaesthesia—usual oral corticosteroid dose on the morning of surgery or hydrocortisone (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.
 - Moderate or major surgery—usual oral corticosteroid dose on the morning of surgery and hydrocortisone intravenously at induction, followed by hydrocortisone 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommended on stopping hydrocortisone injections.
- Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.
- Infections Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections;

clinical presentation of infections may also be atypical. Serious infections e.g. *septicaemia* and *tuberculosis* may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

- Chickenpox Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at *risk of severe chickenpox* (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature.

Passive immunisation with varicella–zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

- Measles Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.
- Psychiatric reactions Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

- **PREGNANCY** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.
 - Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.
- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
- **HEPATIC IMPAIRMENT** The plasma-drug concentration may be increased (particularly on systemic use). Oral and parenteral use should be undertaken with caution.

- **RENAL IMPAIRMENT** Use by oral and injectable routes should be undertaken with caution.
- **MONITORING REQUIREMENTS** The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
- **EFFECT ON LABORATORY TESTS** Suppression of skin test reactions.
- **TREATMENT CESSATION** The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
 - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week or 2 mg/kg daily for 1 week or 1 mg/kg daily for 1 month;
 - been given repeat doses in the evening;
 - received more than 3 weeks' treatment;
 - recently received repeated courses (particularly if taken for longer than 3 weeks);
 - taken a short course within 1 year of stopping long-term therapy;
 - other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

● PATIENT AND CARER ADVICE

Advice for patients. Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur.

Steroid treatment cards Steroid treatment cards should be issued where appropriate. Consider giving a 'steroid card' to support communication of the risks associated with treatment, and specific written advice to consider

corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal.

In **Scotland**, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dppas@apsgroup.co.uk or by fax on 0131 629 9967.

F 416

Betamethasone

● INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child 1–11 months: Initially 1 mg, repeated up to 4 times in 24 hours according to response
- Child 1–5 years: Initially 2 mg, repeated up to 4 times in 24 hours according to response
- Child 6–11 years: Initially 4 mg, repeated up to 4 times in 24 hours according to response
- Child 12–17 years: 4–20 mg, repeated up to 4 times in 24 hours according to response

● INTERACTIONS → Appendix 1: corticosteroids

● PREGNANCY

Readily crosses the placenta. Transient effect on fetal movements and heart rate.

● DIRECTIONS FOR ADMINISTRATION

For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

► Betamethasone (Non-proprietary)

Betamethasone (as Betamethasone sodium phosphate) 4 mg per 1 ml Betamethasone 4mg/1ml solution for injection ampoules | 5 ampoule (PoM) £13.06–£15.68

F 416

Deflazacort

● INDICATIONS AND DOSE

Inflammatory and allergic disorders

► BY MOUTH

- Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
- Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

Nephrotic syndrome

► BY MOUTH

- Child: Initially 1.5 mg/kg once daily (max. per dose 120 mg), reduced to the lowest effective dose for maintenance

● INTERACTIONS → Appendix 1: corticosteroids

● PATIENT AND CARER ADVICE

Patient counselling is advised for deflazacort tablets (steroid card).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Dexamethasone

● INDICATIONS AND DOSE

Physiological replacement

- BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION
- Child: 250–500 micrograms/m² every 12 hours, adjusted according to response

Suppression of inflammatory and allergic disorders

- BY MOUTH
- Child: 10–100 micrograms/kg daily in 1–2 divided doses, adjusted according to response; up to 300 micrograms/kg daily may be required in emergency situations
- BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child 1 month–11 years: 83–333 micrograms/kg daily in 1–2 divided doses; maximum 20 mg per day
- Child 12–17 years: Initially 0.4–20 mg daily

Mild croup

- BY MOUTH
- Child: 150 micrograms/kg for 1 dose

Severe croup (or mild croup that might cause complications)

- INITIALLY BY MOUTH
- Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

Adjunctive treatment of bacterial meningitis (starting before or with first dose of antibacterial)

- BY SLOW INTRAVENOUS INJECTION
- Child 3 months–17 years: 150 micrograms/kg every 6 hours (max. per dose 10 mg) for 4 days

Life-threatening cerebral oedema

- BY INTRAVENOUS INJECTION
- Child (body-weight up to 35 kg): Initially 16.7 mg, then 3.3 mg every 3 hours for 3 days, then 3.3 mg every 6 hours for 1 day, then 1.7 mg every 6 hours for 4 days, then reduced in steps of 0.8 mg daily
- Child (body-weight 35 kg and above): Initially 20.8 mg, then 3.3 mg every 2 hours for 3 days, then 3.3 mg every 4 hours for 1 day, then 3.3 mg every 6 hours for 4 days, then reduced in steps of 1.7 mg daily

● UNLICENSED USE

- With intravenous use Consult product literature; not licensed for use in bacterial meningitis.

● INTERACTIONS → Appendix 1: corticosteroids

● SIDE-EFFECTS Perineal irritation may follow intravenous administration of the phosphate ester

● PREGNANCY Dexamethasone readily crosses the placenta.

● DIRECTIONS FOR ADMINISTRATION

For administration *by mouth* tablets may be dispersed in water or injection solution given by mouth.

For *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.

● PRESCRIBING AND DISPENSING INFORMATION

Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular,

intrarticular use or local infiltration; are given in units of dexamethasone base.

● PATIENT AND CARER ADVICE Patient counselling is advised for dexamethasone tablet, oral solution and injection (steroid card).

400 microgram per 1 mL Martapan 2mg/5mL oral solution sugar-free | 150 mL [PoM] £42.30 DT price = £42.30

Fludrocortisone acetate

● INDICATIONS AND DOSE

Mineralocorticoid replacement in adrenocortical insufficiency

► BY MOUTH

► Neonate: Initially 50 micrograms once daily, adjusted according to response; usual dose 50–200 micrograms once daily, higher doses may be required, dose adjustment may be required if salt supplements are administered.

► Child: Initially 50–100 micrograms once daily; maintenance 50–300 micrograms once daily, adjusted according to response, dose adjustment may be required if salt supplements are administered

● **INTERACTIONS** → Appendix 1: corticosteroids

● **HEPATIC IMPAIRMENT** Monitor patient closely in hepatic impairment.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Fludrocortisone for hormone replacement www.medicinesforchildren.org.uk/fludrocortisone-for-hormone-replacement

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 10

► **Fludrocortisone acetate (Non-proprietary)**

Fludrocortisone acetate 100 microgram Fludrocortisone 100microgram tablets | 30 tablet [PoM] £30.00 DT price = £26.77 | 100 tablet [PoM] £55.00

18-May-2017

Hydrocortisone

● INDICATIONS AND DOSE

Acute adrenocortical insufficiency (Addisonian crisis)

► INITIALLY BY SLOW INTRAVENOUS INJECTION

► Neonate: Initially 10 mg, then (by continuous intravenous infusion) 100 mg/m² daily, alternatively (by intravenous infusion) 100 mg/m² daily in divided doses, to be given every 6–8 hours; adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose.

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child 1 month–11 years: Initially 2–4 mg/kg, then 2–4 mg/kg every 6 hours, adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose

► Child 12–17 years: 100 mg every 6–8 hours

Congenital adrenal hyperplasia

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Neonate: 9–15 mg/m² in 3 divided doses, adjusted according to response.

► Child: 9–15 mg/m² in 3 divided doses, adjusted according to response

Adrenal hypoplasia | Addison's disease, chronic maintenance or replacement therapy

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Neonate: 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed.

► Child: 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed

Inflammatory bowel disease—induction of remission

► BY INTRAVENOUS INJECTION

► Child 2–17 years: 2.5 mg/kg every 6 hours (max. per dose 100 mg)

► BY CONTINUOUS INTRAVENOUS INFUSION

► Child 2–17 years: 10 mg/kg daily; maximum 400 mg per day

Ulcerative colitis | Proctitis | Proctosigmoiditis

► BY RECTUM USING RECTAL FOAM

► Child 2–17 years: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

Acute hypersensitivity reactions | Angioedema

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response

► Child 6 months–5 years: Initially 50 mg 3 times a day, adjusted according to response

► Child 6–11 years: Initially 100 mg 3 times a day, adjusted according to response

► Child 12–17 years: Initially 200 mg 3 times a day, adjusted according to response

Hypotension resistant to inotropic treatment and volume replacement (limited evidence)

► BY INTRAVENOUS INJECTION

► Neonate: Initially 2.5 mg/kg, then 2.5 mg/kg after 4 hours if required, followed by 2.5 mg/kg every 6 hours for 48 hours or until blood pressure recovers, dose to then be reduced gradually over at least 48 hours.

► Child: 1 mg/kg every 6 hours (max. per dose 100 mg)

Severe acute asthma | Life-threatening acute asthma

► BY INTRAVENOUS INJECTION

► Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

► Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

► Child 5–11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

► Child 12–17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

● **UNLICENSED USE** Use of injection by mouth is unlicensed.

● CONTRA-INDICATIONS

With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● CAUTIONS

► With rectal use Systemic absorption may occur

● **INTERACTIONS** → Appendix 1: corticosteroids

● SIDE-EFFECTS

► With intravenous use Phosphate ester associated with pain and paraesthesia (particularly in the perineal region)

► With rectal use Local irritation

● DIRECTIONS FOR ADMINISTRATION

► With intravenous use For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.

- With oral use For administration *by mouth*, injection solution may be swallowed [unlicensed use] but consider phosphate content.
- PATIENT AND CARER ADVICE** Patient counselling is advised for hydrocortisone tablets and injections (steroid card).
- LESS SUITABLE FOR PRESCRIBING**
- With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.
- EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

Methylprednisolone

INDICATIONS AND DOSE

Inflammatory and allergic disorders

- BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: 0.5–1.7 mg/kg daily in 2–4 divided doses, divide doses depending on condition and response

Treatment of graft rejection reactions

- BY INTRAVENOUS INJECTION
- Child: 10–20 mg/kg once daily for 3 days, alternatively 400–600 mg/m² once daily (max. per dose 1 g) for 3 days

Severe erythema multiforme | Lupus nephritis | Systemic onset juvenile idiopathic arthritis

- BY INTRAVENOUS INJECTION
- Child: 10–30 mg/kg once daily or on alternate days (max. per dose 1 g) for up to 3 doses

DEPO-MEDRONE®

Suppression of inflammatory and allergic disorders

BY DEEP INTRAMUSCULAR INJECTION

- Child: Seek specialist advice, to be injected into the gluteal muscle

- CAUTIONS** Rapid intravenous administration of large doses associated with cardiovascular collapse
- INTERACTIONS** → Appendix 1: corticosteroids
- DIRECTIONS FOR ADMINISTRATION** Intravenous injection given over 30 minutes. For intravenous infusion, may be diluted with sodium chloride intravenous infusion 0.9% or 0.45%, or glucose intravenous infusion 5% or 10%.
- PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

Prednisolone

INDICATIONS AND DOSE

Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)

- BY MOUTH
- Child: 1–2 mg/kg

continued →

Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)

► BY MOUTH

- Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

Mild to moderate acute asthma | Severe or life-threatening acute asthma

► BY MOUTH

- Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary
- Child 12–17 years: 40–50 mg daily for at least 5 days

Autoimmune inflammatory disorders (including juvenile idiopathic arthritis, connective tissue disorders and systemic lupus erythematosus)

► BY MOUTH

- Child: Initially 1–2 mg/kg once daily, to be reduced after a few days if appropriate; maximum 60 mg per day

Autoimmune hepatitis

► BY MOUTH

- Child: Initially 2 mg/kg once daily, to then be reduced to minimum effective dose; maximum 40 mg per day

Corticosteroid replacement therapy

► BY MOUTH

- Child 12–17 years: 2–2.5 mg/m² daily in 1–2 divided doses, adjusted according to response

Infantile spasms

► BY MOUTH

- Child 1 month–1 year: Initially 10 mg 4 times a day for 14 days; increased to 20 mg 3 times a day for 7 days if seizures not controlled after initial 7 days, reduce dose gradually over 15 days until stopped

Infantile spasms (dose reduction in patient taking 40 mg daily)

► BY MOUTH

- Child 1 month–1 year: Reduced in steps of 10 mg every 5 days, then stop

Infantile spasms (dose reduction in patient taking 60 mg daily)

► BY MOUTH

- Child 1 month–1 year: Reduced to 40 mg daily for 5 days, then reduced to 20 mg daily for 5 days, then reduced to 10 mg daily for 5 days and then stop

Idiopathic thrombocytopenic purpura

► BY MOUTH

- Child 1–9 years: 1–2 mg/kg daily for maximum of 14 days, alternatively 4 mg/kg daily for a maximum of 4 days

Nephrotic syndrome

► BY MOUTH

- Child: Initially 60 mg/m² once daily for 4–6 weeks until proteinuria ceases, then reduced to 40 mg/m² once daily on alternate days for 4–6 weeks, then withdraw by reducing dose gradually; maximum 80 mg per day

Nephrotic syndrome (prevention of relapse)

► BY MOUTH

- Child: 0.5–1 mg/kg once daily or on alternate days for 3–6 months

Ulcerative colitis | Crohn's disease

► BY MOUTH

- Child 2–17 years: 2 mg/kg once daily (max. per dose 60 mg) until remission occurs, followed by reducing doses

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection

► BY MOUTH

- Child: 2 mg/kg daily for 5 days, the dose is then reduced over the next 16 days and then stopped, corticosteroid

treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards, the corticosteroid should be withdrawn before anti-pneumocystis treatment is complete; maximum 80 mg per day

Proctitis

► BY RECTUM USING RECTAL FOAM

- Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

► BY RECTUM USING SUPPOSITORIES

- Child 2–17 years: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Distal ulcerative colitis

► BY RECTUM USING RECTAL FOAM

- Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn's disease

► BY RECTUM USING SUPPOSITORIES

- Child 2–17 years: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

- **UNLICENSED USE** Prednisolone rectal foam not licensed for use in children (age range not specified by manufacturer).

● **CONTRA-INDICATIONS**

- With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● **CAUTIONS**

- With rectal use Systemic absorption may occur with rectal preparations
- With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

- **INTERACTIONS** → Appendix 1: corticosteroids

- **PREGNANCY** As it crosses the placenta 88% of prednisolone is inactivated.

- With systemic use Pregnant women with fluid retention should be monitored closely.

- **BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

- With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for prednisolone tablets (steroid card).

2.1 Cushing's syndrome and disease

Cushing's Syndrome

Management

Most types of *Cushing's syndrome* are treated surgically. Metyrapone p. 424 may be useful to control the symptoms of the disease or to prepare the child for surgery. The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease. It is used under specialist supervision in children over 12 years for treatment of endogenous Cushing's syndrome.

ENZYME INHIBITORS

Ketoconazole

16-Jun-2017

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17 α -hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease.

• INDICATIONS AND DOSE

Endogenous Cushing's syndrome (specialist use only)

- **BY MOUTH**
- Child 12–17 years: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

- **CONTRA-INDICATIONS** Acquired QTc prolongation • avoid concomitant use of hepatotoxic drugs • congenital QTc prolongation
- **CAUTIONS** Risk of adrenal insufficiency
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain • adrenal insufficiency • diarrhoea • hepatic enzymes increased • nausea • pruritus • rash • vomiting
- **Uncommon** Alopecia • dizziness • headache • malaise • somnolence • thrombocytopenia • urticaria
- **Rare** Hepatic failure • hepatitis • jaundice • liver damage
- **Very rare** Pyrexia
- **Frequency not known** Alcohol intolerance • anorexia • arthralgia • azoospermia • dermatitis • dry mouth • dysgeusia • dyspepsia • epistaxis • erectile dysfunction • erythema • flatulence • gynaecomastia • hot flush • increased appetite • insomnia • menstrual disorder • myalgia • nervousness • paraesthesia • peripheral oedema • photophobia • photosensitivity • raised intracranial pressure • reduced testosterone concentrations • tongue discoloration • xeroderma

SIDE-EFFECTS, FURTHER INFORMATION

- **Hepatotoxicity** Potentially life-threatening hepatotoxicity reported rarely.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT** Avoid in acute or chronic impairment. Do not initiate treatment if liver enzymes greater than 2 times the normal upper limit.
- **MONITORING REQUIREMENTS**
- Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
- Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose

established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.

- ▶ **Hepatotoxicity** Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.

● PATIENT AND CARER ADVICE

Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop.

Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

Driving and skilled tasks

Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

- ▶ **Ketoconazole (non-proprietary)** ▼

Ketoconazole 200 mg Ketoconazole 200mg tablets | 60 tablet (POM) £480.00

Metyrapone

- **DRUG ACTION** Metyrapone is a competitive inhibitor of 11 β -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

● INDICATIONS AND DOSE

Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)

▶ BY MOUTH

- ▶ Child: 15 mg/kg every 4 hours for 6 doses, alternatively 300 mg/m² every 4 hours for 6 doses; usual dose 250–750 mg every 4 hours

Management of Cushing's syndrome (specialist supervision in hospital)

▶ BY MOUTH

- ▶ Child: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

- **CONTRA-INDICATIONS** Adrenocortical insufficiency
- **CAUTIONS** Avoid in acute porphyrias p. 577 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)
- **INTERACTIONS** → Appendix 1: metyrapone

● SIDE-EFFECTS

- ▶ **Rare** Abdominal pain · allergic skin reactions · hirsutism · hypoadrenalism
- ▶ **Frequency not known** Dizziness · headache · hypotension · nausea · sedation · vomiting

- **PREGNANCY** Avoid (may impair biosynthesis of fetal-placental steroids).

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution in hepatic impairment (delayed response).

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

3 Diabetes mellitus and hypoglycaemia

3.1 Diabetes mellitus

Diabetes

05-Jun-2017

Description of condition

Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads to the abnormalities of carbohydrate, fat and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes mellitus p. 425 and Type 2 diabetes mellitus p. 428 are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrinological disease). Treatment with endocrine, antiviral or antipsychotic drugs may also cause secondary diabetes. In children, conditions such as cystic fibrosis can lead to diabetes; monogenic diabetes (previously known as maturity onset diabetes in the young) can also occur due to a single gene defect.

Driving

Information on the requirements for driving vehicles by young people receiving treatment for diabetes is available in the BNF or from the DVLA at www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive

Alcohol

Adolescents and their carers should be made aware that alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; (note: specialist sources recommend that **adult** patients with diabetes should drink alcohol only in moderation, and when accompanied by food).

Oral glucose tolerance tests

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is **not** recommended or necessary for routine diagnostic use of diabetes when severe symptoms of hyperglycaemia are present. In children who have less severe symptoms and blood glucose levels that do

not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It may be useful for diagnosis of monogenic diabetes or cystic fibrosis related diabetes, and is used to establish the presence of gestational diabetes.

An oral glucose tolerance test involves measuring the blood-glucose concentration after fasting, and then 2 hours after drinking a standard anhydrous glucose drink. Anhydrous glucose may alternatively be given as the appropriate amount of *Polycal*® or as *Rapilose*® OGTT oral solution.

HbA1c measurement

Glycated haemoglobin (HbA1c) forms when red blood cells are exposed to glucose in the plasma. The HbA1c test reflects average plasma glucose over the previous 2 to 3 months and provides a good indicator of glycaemic control. Unlike the oral glucose tolerance test, an HbA1c test can be performed at any time of the day and does not require any special preparation such as fasting.

HbA1c values are expressed in *mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol)*, a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values	
IFCC-HbA1c (mmol/mol)	DCCT-HbA1c (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
69	8.5
75	9.0

The HbA1c test is used for monitoring glycaemic control in both Type 1 diabetes below and Type 2 diabetes p. 428 in children, and for diagnosis of Type 2 diabetes in adults.

EvGr HbA1c should not be used to diagnose diabetes in children. ⚠

HbA1c is also a reliable predictor of microvascular and macrovascular complications and mortality. Lower HbA1c is associated with a lower risk of long term vascular complications, and children and their carers should be supported to aim for an individualised HbA1c target (see Type 1 diabetes below and Type 2 diabetes p. 428).

EvGr HbA1c should usually be measured in children with type 1 and type 2 diabetes every 3 months; and more frequently in children with type 1 diabetes if blood glucose is poorly controlled. ⚠

HbA1c monitoring is invalid in children with disturbed erythrocyte turnover or in children with a lack of, or abnormal haemoglobin (for example, any anaemia, a recent blood transfusion, or an altered red cell lifespan). In these cases, quality-controlled plasma glucose profiles, total glycated haemoglobin estimation (if there is abnormal haemoglobin), or fructosamine estimation can be used.

Laboratory measurement of fructosamine concentration measures the glycated fraction of all plasma proteins over the previous 14 to 21 days but is a less accurate measure of glycaemic control than HbA1c.

Type 1 diabetes

Description of condition

Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood.

Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, premature cardiovascular disease, and peripheral artery disease.

Typical features in children presenting with type 1 diabetes are hyperglycaemia, polyuria, polydipsia, weight loss, and excessive tiredness.

Aims of treatment

Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications. Disability from complications can often be prevented by early detection and active management of the disease (Diabetic complications p. 429).

EvGr The target for glycaemic control should be individualised for each child, considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, and history of hypoglycaemia. Tighter control of blood-glucose is now recommended for children with type 1 diabetes and treatment should attempt to reach near normal HbA1c and blood-glucose concentration. A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is recommended in children to minimise the risk of long-term complications. The optimal plasma glucose targets for children are: ⚠

- **EvGr** Fasting blood-glucose concentration of 4–7 mmol/litre on waking;
- A blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- A blood-glucose concentration of 5–9 mmol/litre after meals;
- A blood-glucose concentration of at least 5 mmol/litre in young people when driving. ⚠

Overview

EvGr Type 1 diabetes requires insulin replacement, supported when necessary by active management of other associated cardiovascular risk factors such as hypertension. Tight glycaemic control may be achieved by intensive insulin management (multiple daily injections or insulin pump therapy) from diagnosis, accompanied by carbohydrate counting.

The effectiveness of metformin in combination with insulin is not yet known in children, and so should not be used; other oral antidiabetic drugs should not be used in combination with insulin as their use may increase the risk of hypoglycaemia.

Dietary control is important in both type 1 and type 2 diabetes and children (with their families) should be encouraged to develop good knowledge of nutrition and how it affects their diabetes and insulin requirements. Healthy eating, regular exercise, and control of body-weight can reduce cardiovascular risk and help improve glycaemic control.

Children with type 1 diabetes over the age of 6 months should receive immunisation against influenza and

pneumococcal infection (in children treated with antidiabetic drugs)—see Vaccines p. 747. **⚠**

Management of type 1 diabetes with insulin

EvGr All children with type 1 diabetes require insulin therapy (see also Insulin p. 427). Treatment should be initiated and managed by clinicians with relevant expertise; there are three basic types of insulin regimen, although each regimen should be individualised.

Children should also be offered carbohydrate-counting training as part of a structured education programme. **⚠**

Multiple daily injection basal-bolus insulin regimens

One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside multiple bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

Mixed (biphasic) regimen

One, two, or three insulin injections per day of short-acting insulin mixed with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

Continuous subcutaneous insulin infusion (insulin pump)

A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

Recommended insulin regimens

EvGr Children should be offered multiple daily injection basal-bolus regimens initiated at diagnosis, considering personal and family circumstances, and personal preferences. Children and their carers should be encouraged to adjust the insulin dose as appropriate after each blood-glucose measurement, and to inject rapid-acting insulin analogues before eating (rather than after eating); this reduces blood-glucose concentrations after meals and helps to optimise blood-glucose control.

If a multiple daily injection basal-bolus insulin regimen is unsuitable, or the child does not have optimal blood-glucose control, it may be necessary to offer an alternative insulin regimen (either continuous subcutaneous insulin infusion or once-, twice- or three-times daily mixed injections) as well as additional support (such as increased contact with their specialist diabetes team).

Continuous subcutaneous insulin infusion (or insulin pump) therapy may be considered under the care of a specialist team. It should only be offered to children over 12 years who suffer disabling hypoglycaemia, or, who have high HbA1c concentrations (69 mmol/mol [8.5%] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Children under 12 years may be offered insulin pump therapy if a multiple daily injection regimen is impractical or inappropriate, but they should undergo a trial of a multiple dose injection regimen between the ages of 12 and 18 years.

If the chosen regimen is a twice daily injection regimen, the insulin dose should be adjusted according to the general trend in pre-meal, bedtime and occasional night-time blood-glucose concentration. **⚠**

Insulin requirements

EvGr The dosage of insulin must be determined individually for each child and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations.

Prescribers and patients should be aware that initiation of insulin may be followed by a **temporary** partial remission phase or 'honeymoon period' when lower doses of insulin are required than are subsequently necessary to maintain

glycaemic control with an HbA1c concentration of less than 48 mmol/mol (6.5%). **⚠**

EvGr Insulin doses should be reviewed after puberty (around 1 year after menarche or after the growth spurt in boys) as insulin resistance falls after puberty, and maintenance of pubertal doses may increase the risk for excessive weight gain. **⚠**

EvGr Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet and exercise), psychological issues, and organic causes such as renal disease, thyroid disorders, coeliac disease, Addison's disease or gastroparesis. A review of the child's injection sites should be offered at each clinic visit. **⚠**

Infection, stress, accidental or surgical trauma, and puberty may all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, and in certain endocrine disorders, such as anterior pituitary or adrenocortical insufficiency and hypothyroidism.

EvGr Rapid-acting insulin analogues should be supplied for use during intercurrent illness and episodes of hyperglycaemia. **⚠**

Risks of hypoglycaemia with insulin

EvGr Hypoglycaemia is an inevitable adverse effect of insulin treatment, and children and their carers should be advised of the warning signs and actions to take (for guidance on management, see Hypoglycaemia p. 443). **⚠**

Impaired awareness of hypoglycaemia can occur, when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present. **EvGr** Awareness of hypoglycaemia should be discussed and assessed with the child and their carer approximately every 3 months. **⚠**

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the child. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor.

Loss of warning of hypoglycaemia among insulin-treated children can be a serious hazard, especially for adolescents who are drivers, cyclists, or in dangerous occupations. Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see *Driving*, under Diabetes p. 424).

EvGr To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous glucose monitoring should be considered. **⚠**

EvGr Children and their carers should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. If recurrent severe episodes of hypoglycaemia continue despite appropriate interventions, the child should be referred to a specialist centre. **⚠**

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

Hypodermic equipment

EvGr Children and their carers should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers.

Arrangements should be made for the suitable disposal of these containers. **A**

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff

Insulin

05-Jun-2017

Overview

For recommended insulin regimens see Type 1 diabetes p. 425 and Type 2 diabetes p. 428.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins.

Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs).

Absorption from a limb site can vary considerably (by as much as 20–40%) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood

flow around the injection site due to exercise can also increase insulin absorption.

EvGr Lipohypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered. Lipohypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipohypertrophy before administration. **A**

Insulin preparations

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Short-acting insulins

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble Insulin (human and, bovine or porcine—both rarely used), and the rapid-acting insulin analogues (insulin aspart p. 437, insulin glulisine p. 438 and insulin lispro p. 438).

Soluble insulin

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimens, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours.

When injected intravenously, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. Diabetic ketoacidosis p. 430 and peri-operatively.

Rapid-acting insulin

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection.

EvGr For maintenance regimens, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA_{1c}, and reduction in the incidence of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of *post-meal* injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial-glucose concentration, and subsequent hypoglycaemia. **A**

Intermediate-acting insulin

Intermediate-acting insulins (isophane insulin p. 434) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of approximately 1–2 hours, a maximal effect at 3–12 hours, and a duration of action of 11–24 hours.

Isophane insulin is a suspension of insulin with protamine; it may be given as one or more daily injections alongside separate meal-time short-acting insulin injections, or mixed with a short-acting (soluble or rapid-

acting) insulin in the same syringe—for recommended insulin regimens see Type 1 diabetes p. 425 and Type 2 diabetes p. 428. Isophane insulin may be mixed with a short-acting insulin by the patient, or a pre-mixed biphasic insulin can be supplied (biphasic isophane insulin p. 433, biphasic insulin aspart p. 434 and biphasic insulin lispro p. 434).

Biphasic insulins (biphasic isophane insulin, biphasic insulin aspart, biphasic insulin lispro) are pre-mixed insulin preparations containing various combinations of short-acting insulin (soluble insulin or rapid-acting analogue insulin) and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 15% to 50%. These preparations should be administered by subcutaneous injection immediately before a meal.

Long-acting insulin

Like intermediate-acting insulins, the long-acting insulins (protamine zinc insulin p. 436, insulin zinc suspension p. 436, insulin detemir p. 435, insulin glargine p. 435, insulin degludec p. 435) mimic endogenous basal insulin secretion, but their duration of action may last up to 36 hours. They achieve a steady-state level after 2–4 days to produce a constant level of insulin.

Insulin glargine and insulin degludec are given once daily and insulin detemir is given once or twice daily according to individual requirements. The older long-acting insulins, (insulin zinc suspension and protamine zinc insulin) are now rarely prescribed.

Type 2 diabetes

05-Jun-2017

Description of condition

Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic insulin production also occurs progressively over time, resulting in hyperglycaemia.

Type 2 diabetes in children is associated with increased body-weight, increased risk of renal complications, hypertension, and dyslipidaemia; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

Aims of treatment

Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effective blood-glucose control and maintenance of HbA1c at or below the target value set for each individual child.

Overview

[EvGr] Lifestyle modifications (including weight loss, smoking cessation and regular exercise) can help to reduce hyperglycaemia and reduce cardiovascular risk and should be encouraged where appropriate. Children and their carers should also receive advice from a paediatric dietitian to help optimise body-weight and blood-glucose control.

Lifestyle modifications alone are often unsuccessful at achieving glycaemic control in children, therefore antidiabetic drugs should be offered and initiated alongside lifestyle interventions such as diet and exercise, from the time of diagnosis.

Children with type 2 diabetes should receive immunisation against influenza (over the age of 6 months) and pneumococcal infection—see Vaccines p. 747. **[A]**

Antidiabetic drugs

In children, type 2 diabetes does not usually occur until adolescence and information on the use of oral antidiabetic

drugs in children is limited. For recommended treatment regimens and the place in therapy of each drug, see *Treatment of type 2 diabetes*.

[EvGr] Treatment with antidiabetic drugs should be initiated under specialist supervision **only**. **[E]**

Metformin hydrochloride p. 430 is the only oral antidiabetic drug licensed for use in children. It has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. Metformin hydrochloride does not stimulate insulin secretion and therefore, when given alone, does not cause hypoglycaemia.

[EvGr] The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastro-intestinal side-effects. **[A]**

There is little experience of the use of other non-insulin antidiabetic drugs in children, with most evidence extrapolated from adult studies.

Several **sulfonylureas** (such as gliclazide p. 432, glibenclamide p. 431 and tolbutamide p. 432) are available but experience in children is limited; they are not the recommended choice of treatment in children; therefore treatment should be initiated by a specialist. The sulfonylureas may cause hypoglycaemia which may be more common in children than in adults. Hypoglycaemia is more likely with long-acting sulfonylureas such as glibenclamide, which has been associated with severe, prolonged and sometimes fatal cases—for this reason sulfonylureas are usually avoided in children.

Treatment of type 2 diabetes

[EvGr] A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is ideal to minimise the risk of long-term complications, however an individualised lowest achievable target should be agreed with each child and their carers taking into account factors such as daily activities, individual life goals, complications, and comorbidities. HbA1c concentrations should be monitored every 3 months.

Note: Consider relaxing the target HbA1c level on a case-by-case basis, with particular consideration for children where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

Standard-release metformin hydrochloride is the first-line choice for initial treatment in children and should be offered from diagnosis, alongside nutrition and lifestyle advice.

If the combination of lifestyle changes and metformin hydrochloride fails to reduce HbA1c to the agreed target within 3 to 4 months of therapy, addition of a long-acting insulin or once-daily human isophane insulin p. 434 should be considered (see also, Insulin p. 427). **[A]**

[EvGr] Initiation of insulin should be under specialist care. **[E]**

[EvGr] Metformin hydrochloride should be continued alongside insulin, to improve insulin sensitivity. The combination of metformin hydrochloride and once-daily insulin is usually an effective treatment for maintaining glycaemic control in the majority of children for extended periods of time. **[A]**

[EvGr] If the combination of basal insulin and metformin does not achieve the HbA1c target (and postprandial hyperglycaemia persists) addition of prandial rapid- or short-acting insulin should be initiated and titrated until the target HbA1c is met. **[A]** Weight gain may occur and can be particularly problematic in children with type 2 diabetes when insulin therapy is initiated, unless there is careful attention and adherence to dietary measures. **[EvGr]** The importance of diet and exercise should be emphasised. **[A]**

Useful Resources

Diabetes (type 1 and type 2) in children and young people: diagnosis and management. National Institute for Health and Care Excellence. Clinical guideline NG18. August 2015 www.nice.org.uk/guidance/ng18.

Diabetic complications

Cardiovascular disease

Diabetes is a strong risk factor for cardiovascular disease later in life. Other risk factors for cardiovascular disease (smoking, hypertension, obesity and hyperlipidaemia) should be addressed. The use of an ACE inhibitor and of a lipid-regulating drug can be beneficial in children with diabetes and a high cardiovascular disease risk. (ACE inhibitors may also have a role in the management of diabetic nephropathy).

Diabetic nephropathy

Regular review of diabetic children over 12 years of age should include an annual test for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Micral-Test II*® or *Microbumintest*®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Microalbuminuria can occur transiently during puberty; if it persists (at least 3 positive tests) treatment with an ACE inhibitor or an angiotensin-II receptor antagonist under specialist guidance should be considered; to minimise the risk of renal deterioration, blood pressure should be carefully controlled.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in children with renal impairment.

See also treatment of hypertension in diabetes.

Neuropathy

Clinical neuropathy is rare in children whose diabetes is well controlled.

Diabetes, pregnancy and breast-feeding

Pregnancy and breast-feeding

During pregnancy, women with *pre-existing diabetes* can be treated with metformin hydrochloride p. 430 [unlicensed use], either alone or in combination with insulin p. 436. Metformin hydrochloride can be continued, or glibenclamide p. 431 resumed, during breast-feeding for those with pre-existing diabetes. Women with *gestational diabetes* may be treated, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin hydrochloride [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

Diabetes, surgery and medical illness

[EvGr] Children with diabetes should undergo surgery in centres with facilities and expertise for the care of children with diabetes. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these children. All surgery requiring general anaesthesia in children with type 1 and type 2 diabetes requires hospital admission. **⚠**

Note: The following recommendations provide general guidance for the management of diabetes during surgery. **Local protocols and guidelines should be referred to where they exist.**

Use of insulin during surgery

Elective surgery—minor procedures

[EvGr] *Minor procedures* (procedures of less than 2 hours requiring either general anaesthesia or heavy sedation) in children who have type 1 or type 2 diabetes should not have a major impact on glycaemic control, and a slight modification of the usual regimen may be all that is necessary—adjustments should be made following local protocol; taking into consideration the type of insulin or antidiabetic drugs the child usually takes, whether fasting is required, the time of day of the operation, and requirement for intravenous fluids and glucose. All children who are usually prescribed insulin require intravenous insulin during surgery, to avoid ketoacidosis. **⚠**

Elective surgery—major procedures

[EvGr] *Major procedures* (procedures requiring general anaesthesia for more than 2 hours) in children who have type 1 or type 2 diabetes, should ideally be performed when diabetes is under optimal control. If glycaemic control is poor, the procedure should be delayed if possible; otherwise it is advisable to admit the child well in advance of surgery for stabilisation of glycaemic control.

Blood glucose concentration should be maintained within the usual target range of 5–10 mmol/litre throughout the peri-operative period for all surgical procedures.

Children usually prescribed insulin for type 1 or type 2 diabetes require an intravenous insulin infusion p. 436 during surgery (even if fasting) to avoid ketoacidosis. Detailed local protocols should be consulted. In general, the following steps should be followed:

- On the *evening before surgery*, the usual insulin regimen should be given as normal; the usual bedtime snack should be given and hourly capillary blood glucose monitoring should be initiated to detect hypoglycaemia or hyperglycaemia before the procedure. Ketones should also be checked if blood glucose is above 14 mmol/litre, and an appropriate dose of short-acting insulin should be administered to restore blood glucose to the target range;
- On the *morning of surgery* the **usual** insulin dose should be omitted;
- At least *2 hours before the procedure*, a maintenance fluid infusion of sodium chloride 0.45 % and glucose 5 % (sodium chloride with glucose p. 563) intravenous infusion should be started. A switch to sodium chloride 0.9 % infusion p. 561 may be required if sodium concentration falls and there is risk of hyponatraemia. After surgery, potassium chloride p. 575 should be added to the intravenous fluid, according to the child's body weight and fluid requirements. Electrolytes must be measured frequently throughout, and adjustments to the infusion made as necessary;
- Soluble human insulin 1 unit/mL in sodium chloride 0.9 % intravenous infusion should be started with the maintenance fluids at an infusion rate appropriate to the blood glucose concentration, to maintain a concentration between 5 and 10 mmol/litre, adjusted according to hourly blood glucose monitoring;
- If the blood glucose concentration falls below 6 mmol/litre the insulin infusion should **not** be stopped as this will cause rebound hyperglycaemia; instead the rate should be reduced; however, if blood-glucose concentration drops below 4 mmol/litre the insulin infusion can be stopped temporarily for 10–15 minutes. **⚠**

[EvGr] After surgery, continue the glucose infusion, and the intravenous insulin infusion or additional short-acting insulin as necessary, until the child can eat and drink normally and their usual treatment regimen can resume. A short-acting insulin can also be given if required to reduce hyperglycaemia. **⚠**

Emergency surgery

[EvGr] Children with diabetes (type 1 and 2) requiring emergency surgery, should always have their blood glucose, blood or urinary ketone concentration, and serum electrolytes checked before surgery. If ketones are high, blood gases should also be checked. If ketoacidosis is present, recommendations for Diabetic ketoacidosis, below, should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for *major elective surgery* (above). **[A]**

Use of antidiabetic drugs during surgery

[EvGr] If elective *minor surgical procedures* only require a short-fasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue.

Children who usually take **sulfonylureas** should have their medication stopped on the day of surgery. **[A]**

[EvGr] **Sulfonylureas** are associated with hypoglycaemia in the fasted state and therefore should not be recommenced until the child is eating and drinking normally. **[E]**

[EvGr] Children undergoing *minor procedures* require hourly blood glucose monitoring and, if blood glucose concentration rises above 10 mmol/litre, should be treated with subcutaneous rapid-acting insulin no more frequently than every 3 hours.

Children undergoing a *major surgical procedure* expected to last at least 2 hours should be managed on an intravenous insulin infusion following the recommendations for *Elective surgery* (above). **[A]**

[EvGr] Insulin is almost always required in medical and surgical emergencies. **[E]**

[EvGr] **Metformin hydrochloride** below is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. In children undergoing *major surgery* lasting more than 2 hours, metformin hydrochloride should be discontinued 24 hours before the procedure. Children having minor surgery lasting less than 2 hours may stop their metformin on the day of surgery. Metformin hydrochloride should not be restarted until at least 48 hours after surgery or after the child is eating again, and only once normal renal function has been established. **[A]**

The manufacturer advises that metformin should also be omitted if contrast medium is administered during surgery to reduce the risk of contrast-induced nephropathy. It should be stopped prior to, or at the time of the test, and not to be restarted until 48 hours afterwards, and only once normal renal function has been established.

Use of antidiabetic drugs during medical illness

Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during intercurrent illness when the drug is unlikely to control hyperglycaemia (such as coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Diabetic ketoacidosis

Management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis, published by the British Society of Paediatric Endocrinology and Diabetes, (available at www.bsped.org.uk) should be followed. Clinically well children with mild ketoacidosis who are dehydrated up to 5% usually respond to oral rehydration and subcutaneous insulin. For those who do

not respond, or are clinically unwell, or are dehydrated by more than 5%, insulin and replacement fluids are best given by intravenous infusion.

- To restore circulating volume for children in *shock*, give 10 mL/kg **sodium chloride 0.9%** as a rapid infusion, repeat as necessary up to a maximum of 30 mL/kg.
 - Further fluid should be given by intravenous infusion at a rate that replaces deficit and provides maintenance over 48 hours; initially use **sodium chloride 0.9%**, changing to **sodium chloride 0.45%** and **glucose 5%** after 12 hours if response is adequate and plasma-sodium concentration is stable.
 - Include **potassium chloride** in the fluids unless anuria is suspected, adjust according to plasma-potassium concentration.
 - Insulin infusion is necessary to switch off ketogenesis and reverse acidosis; it should not be started until at least 1 hour after the start of intravenous rehydration fluids.
 - **Soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL and infused at a rate of 0.1 units/kg/hour.
 - **Sodium bicarbonate** infusion (1.26% or 2.74%) is rarely necessary and is used only in cases of extreme acidosis (blood pH less than 6.9) and shock, since the acid-base disturbance is normally corrected by treatment with insulin.
 - Once blood glucose falls to 14 mmol/litre, **glucose intravenous infusion 5% or 10%** should be added to the fluids.
 - The insulin infusion rate can be reduced to no less than 0.05 units/kg/hour when blood-glucose concentration has fallen to 14 mmol/litre and blood pH is greater than 7.3 and a glucose infusion has been started; it is continued until the child is ready to take food by mouth. Subcutaneous insulin can then be started.
 - The insulin infusion should not be stopped until 1 hour after starting subcutaneous soluble or long acting insulin, or 10 minutes after starting subcutaneous insulin aspart p. 437, or insulin glulisine p. 438, or insulin lispro p. 438.
- Hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma occurs rarely in children. Treatment is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion and slower rehydration may be required.

BLOOD GLUCOSE LOWERING DRUGS > BIGUANIDES

Metformin hydrochloride

06-Jun-2017

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

• INDICATIONS AND DOSE

Diabetes mellitus

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 8–9 years (specialist use only): Initially 200 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
- Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day

- **UNLICENSED USE** Not licensed for use in children under 10 years.

- **CONTRA-INDICATIONS** Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)
- **CAUTIONS** Risk factors for lactic acidosis
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Risk factors for lactic acidosis Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.
- **INTERACTIONS** → Appendix 1: metformin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anorexia · diarrhoea (usually transient) · nausea · taste disturbance · vomiting
 - ▶ **Rare** Decreased vitamin-B₁₂ absorption · erythema · lactic acidosis (withdraw treatment) · pruritus · urticaria
 - ▶ **Frequency not known** Hepatitis
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ Gastro-intestinal effects Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.
- **PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.
- **BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.
- **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.
- **RENAL IMPAIRMENT** Manufacturer advises consider dose reduction in moderate impairment. Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be informed of the risk of lactic acidosis and told to seek immediate medical attention if symptoms such as dyspnoea, muscle cramps, abdominal pain, hypothermia, or asthenia occur.

BLOOD GLUCOSE LOWERING DRUGS > SULFONYLUREAS

Sulfonylureas

- **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.
- **CONTRA-INDICATIONS** Presence of ketoacidosis
- **CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) · G6PD deficiency
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Hypoglycaemia
 - ▶ **Rare** Agranulocytosis · aplastic anaemia · blood disorders · cholestatic jaundice · haemolytic anaemia · hepatic failure · hepatitis · leucopenia · pancytopenia · thrombocytopenia
 - ▶ **Frequency not known** Allergic skin reactions (usually in the first 6–8 weeks of therapy) · constipation · diarrhoea · disturbance in liver function · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · gastro-intestinal disturbances · hypersensitivity reactions (usually in the first 6–8 weeks of therapy) · jaundice (usually in the first 6–8 weeks of therapy) · nausea · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ Hypoglycaemia This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.
- **HEPATIC IMPAIRMENT** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.
- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

Glibenclamide

● INDICATIONS AND DOSE

Type 2 diabetes mellitus

▶ BY MOUTH

- ▶ Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

Maturity-onset diabetes of the young (specialist use only)

▶ BY MOUTH

- ▶ Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **UNLICENSED USE** Not licensed for use in breast feeding females with pre-existing diabetes. Not licensed for use in gestational diabetes.
Not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 577
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.
- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Glibenclamide (Non-proprietary)

Glibenclamide 2.5 mg Glibenclamide 2.5mg tablets | 28 tablet [PoM] £11.46 DT price = £8.91

Glibenclamide 5 mg Glibenclamide 5mg tablets | 28 tablet [PoM] £14.72 DT price = £1.39

Glucilazide

INDICATIONS AND DOSE

Type 2 diabetes mellitus

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

Maturity-onset diabetes of the young (specialist use only)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 577
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

► Gliclazide (Non-proprietary)

Gliclazide 40 mg Gliclazide 40mg tablets | 28 tablet [PoM] £3.36 DT price = £3.36

Gliclazide 80 mg Gliclazide 80mg tablets | 28 tablet [PoM] £7.22 DT price = £0.82 | 60 tablet [PoM] £9.32

Gliclazide 40 mg Zicron 40mg tablets | 28 tablet [PoM] £3.36 DT price = £3.36

Tolbutamide

INDICATIONS AND DOSE

Type 2 diabetes mellitus

► BY MOUTH

- Child 12–17 years (specialist use only): 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 577
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS** Headache · tinnitus
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

► Tolbutamide (Non-proprietary)

Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet [PoM] £34.88 DT price = £6.71 | 112 tablet [PoM] £27.00

INSULINS

Insulins

IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)

Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

SIDE-EFFECTS

- **Common or very common** Fat hypertrophy at injection site · local reactions at injection site · transient oedema
- **Rare** Hypersensitivity reactions · rash · urticaria

Overdose

Overdose causes hypoglycaemia.

- **PREGNANCY** During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.
- **BREAST FEEDING** During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.
- **HEPATIC IMPAIRMENT** Insulin requirements may be decreased in patients with hepatic impairment.

- **RENAL IMPAIRMENT** Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

● MONITORING REQUIREMENTS

- ▶ Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- ▶ Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- ▶ It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).
- ▶ While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

- **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

● PRESCRIBING AND DISPENSING INFORMATION

Units The word 'unit' should **not** be abbreviated.

Show container to patient or carer and confirm the expected version is dispensed.

● PATIENT AND CARER ADVICE

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Driving and skilled tasks

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

INSULINS > INTERMEDIATE-ACTING

432

Biphasic isophane insulin

(Biphasic Isophane Insulin Injection— intermediate acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements

- **INTERACTIONS** → Appendix 1: insulins

- **SIDE-EFFECTS** Protamine may cause allergic reactions

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humulin M3** (Eli Lilly and Company Ltd)

Insulin human (as insulin soluble human) 30 unit per 1 ml, Insulin human (as insulin isophane human) 70 unit per 1 ml Humulin M3 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT price = £19.08
Humulin M3 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68

- ▶ **Humulin M3 KwikPen** (Eli Lilly and Company Ltd)

Insulin human (as insulin soluble human) 30 unit per 1 ml, Insulin human (as insulin isophane human) 70 unit per 1 ml Humulin M3 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £21.70 DT price = £21.70

- ▶ **Hypurin Porcine 30/70 Mix** (Wockhardt UK Ltd)

Insulin porcine (as insulin soluble porcine) 30 unit per 1 ml, Insulin porcine (as insulin isophane porcine) 70 unit per 1 ml Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £37.80
Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £25.20

- ▶ **Insuman Comb 15** (Sanofi)

Insulin human (as insulin soluble human) 15 unit per 1 ml, Insulin human (as insulin isophane human) 85 unit per 1 ml Insuman Comb 15 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50

- ▶ **Insuman Comb 25** (Sanofi)

Insulin human (as insulin soluble human) 25 unit per 1 ml, Insulin human (as insulin isophane human) 75 unit per 1 ml Insuman Comb 25 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61
Insuman Comb 25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50

- ▶ **Insuman Comb 25 SoloStar** (Sanofi)

Insulin human (as insulin soluble human) 25 unit per 1 ml, Insulin human (as insulin isophane human) 75 unit per 1 ml Insuman Comb 25 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £19.80

- ▶ **Insuman Comb 50** (Sanofi)

Insulin human (as insulin isophane human) 50 unit per 1 ml, Insulin human (as insulin soluble human) 50 unit per 1 ml Insuman Comb 50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50

Isothane insulin

(Isothane Insulin Injection; Isothane Protamine Insulin Injection; Isothane Insulin (NPH)—intermediate acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child: According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **SIDE-EFFECTS** Protamine may cause allergic reactions
- **PREGNANCY** Recommended where longer-acting insulins are needed.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- **Humulin I** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68
Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT price = £19.08
- **Humulin I KwikPen** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £21.70 DT price = £21.70
- **Hypurin Bovine Isothane** (Wockhardt UK Ltd)
Insulin bovine (as Insulin isophane bovine) 100 unit per 1 ml Hypurin Bovine Isothane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72
Hypurin Bovine Isothane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £41.58
- **Hypurin Porcine Isothane** (Wockhardt UK Ltd)
Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml Hypurin Porcine Isothane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £37.80
Hypurin Porcine Isothane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £25.20
- **Insulatard** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £7.48
- **Insulatard InnoLet** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard InnoLet 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £20.40 DT price = £21.70
- **Insulatard Penfill** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £22.90 DT price = £19.08
- **Insuman Basal** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61
Insuman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT price = £19.08
- **Insuman Basal SoloStar** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £19.80 DT price = £21.70

INSULINS > INTERMEDIATE-ACTING COMBINED WITH RAPID-ACTING

Biphasic insulin aspart

(Intermediate-acting insulin)

● INDICATIONS AND DOSE

Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child: Administer up to 10 minutes before or soon after a meal, according to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **SIDE-EFFECTS** Protamine may cause allergic reactions
- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- **NovoMix 30 FlexPen** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £29.89 DT price = £29.89
- **NovoMix 30 Penfill** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £28.79 DT price = £28.79

Biphasic insulin lispro

(Intermediate-acting insulin)

● INDICATIONS AND DOSE

Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child: Administer up to 15 minutes before or soon after a meal, according to requirements

- **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)
- **INTERACTIONS** → Appendix 1: insulins
- **SIDE-EFFECTS** Protamine may cause allergic reactions
- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- **Humalog Mix25** (Eli Lilly and Company Ltd)
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £16.61
Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46 DT price = £29.46
- **Humalog Mix25 KwikPen** (Eli Lilly and Company Ltd)
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £30.98 DT price = £30.98

- ▶ **Humalog Mix50** (Eli Lilly and Company Ltd)
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46
- ▶ **Humalog Mix50 KwikPen** (Eli Lilly and Company Ltd)
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £30.98 DT price = £30.98

INSULINS > LONG-ACTING

F 432

Insulin degludec

14-Mar-2017

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1-17 years: Dose to be given according to requirements

● INTERACTIONS → Appendix 1: insulins

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin degludec (*Tresiba*®) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.

● NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2016) that insulin degludec (*Tresiba*®) is **not** recommended for use within NHS Wales for the treatment of diabetes mellitus in adolescents and children from the age of 1 year.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Tresiba FlexTouch** (Novo Nordisk Ltd) ▼
Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba FlexTouch 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £46.60
- Insulin human (as Insulin degludec) 200 unit per 1 ml Tresiba FlexTouch 200units/ml solution for injection 3ml pre-filled pen | 3 pre-filled disposable injection [PoM] £55.92
- ▶ **Tresiba Penfill** (Novo Nordisk Ltd) ▼
Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £46.60

F 432

Insulin detemir

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2-17 years: According to requirements

● INTERACTIONS → Appendix 1: insulins

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 434 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Levemir FlexPen** (Novo Nordisk Ltd)
Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £42.00 DT price = £42.00
- ▶ **Levemir InnoLet** (Novo Nordisk Ltd)
Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir InnoLet 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £44.85 DT price = £42.00
- ▶ **Levemir Penfill** (Novo Nordisk Ltd)
Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £42.00 DT price = £42.00

F 432

Insulin glargine

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2-17 years: According to requirements

● INTERACTIONS → Appendix 1: insulins

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that *Lantus*® preparations (April 2013) and *Toujeo*® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin

It is **not** recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Abasaglar** (Eli Lilly and Company Ltd) ▼
Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £35.28 DT price = £41.50
- ▶ **Abasaglar KwikPen** (Eli Lilly and Company Ltd) ▼
Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar KwikPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £35.28 DT price = £41.50
- ▶ **Lantus** (Sanofi)
Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £41.50 DT price = £41.50
- Lantus 100units/ml solution for injection 10ml vials | 1 vial [PoM] £30.68

- ▶ **Lantus SoloStar** (Sanofi)
Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £41.50 DT price = £41.50
- ▶ **Toujeo** (Sanofi)
Insulin human (as Insulin glargine) 300 unit per 1 ml Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pen | 3 pre-filled disposable injection [PoM] £33.13

F 432

Insulin zinc suspension

(Insulin zinc suspension (mixed)—long acting)

• INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements

• INTERACTIONS → Appendix 1: insulins

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 434 is recommended where longer-acting insulins are needed; insulin detemir p. 435 may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Hypurin Bovine Lente** (Wockhardt UK Ltd)
Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml Hypurin Bovine Lente 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

F 432

Protamine zinc insulin

(Protamine zinc insulin injection—long acting)

• INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements

• INTERACTIONS → Appendix 1: insulins

- **SIDE-EFFECTS** Protamine may cause allergic reactions
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 434 is recommended where longer-acting insulins are needed; insulin detemir p. 435 may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Hypurin Bovine Protamine Zinc** (Wockhardt UK Ltd)
Insulin bovine (as Insulin protamine zinc bovine) 100 unit per 1 ml Hypurin Bovine Protamine Zinc 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

INSULINS > RAPID-ACTING

F 432

Insulin

(Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)

• INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements

Hyperglycaemia during illness

- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

- ▶ Child: 0.025–0.1 unit/kg/hour, dose to be adjusted according to blood-glucose concentration

Neonatal hyperglycaemia | Neonatal diabetes

- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

Diabetic ketoacidosis | Diabetes during surgery

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

• INTERACTIONS → Appendix 1: insulins

- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

- ▶ With intravenous use For *intravenous infusion*, dilute to a concentration of 1 unit/mL with Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin. For *intravenous infusion in neonatal intensive care*, dilute 5 units to a final volume of 50 mL with Sodium Chloride 0.9% and mix thoroughly; an intravenous infusion rate of 0.1 mL/kg/hour provides a dose of 0.01 units/kg/hour.

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151**
Continuous subcutaneous insulin infusion is recommended as an option in children over 12 years with type 1 diabetes:
 - who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, **or**
 - whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
 Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens

are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

- ▶ **Actrapid** (Novo Nordisk Ltd)
Insulin human (as Insulin soluble human) 100 unit per 1 mL Actrapid 100units/mL solution for injection 10mL vials | 1 vial [PoM] £7.48
- ▶ **Humulin S** (Eli Lilly and Company Ltd)
Insulin human (as Insulin soluble human) 100 unit per 1 mL Humulin S 100units/mL solution for injection 10mL vials | 1 vial [PoM] £15.68
Humulin S 100units/mL solution for injection 3mL cartridges | 5 cartridge [PoM] £19.08
- ▶ **Hypurin Bovine Neutral** (Wockhardt UK Ltd)
Insulin bovine (as Insulin soluble bovine) 100 unit per 1 mL Hypurin Bovine Neutral 100units/mL solution for injection 10mL vials | 1 vial [PoM] £27.72
Hypurin Bovine Neutral 100units/mL solution for injection 3mL cartridges | 5 cartridge [PoM] £41.58
- ▶ **Hypurin Porcine Neutral** (Wockhardt UK Ltd)
Insulin porcine (as Insulin soluble porcine) 100 unit per 1 mL Hypurin Porcine Neutral 100units/mL solution for injection 10mL vials | 1 vial [PoM] £25.20
Hypurin Porcine Neutral 100units/mL solution for injection 3mL cartridges | 5 cartridge [PoM] £37.80
- ▶ **Insuman Infusaf** (Sanofi)
Insulin human 100 unit per 1 mL Insuman Infusaf 100units/mL solution for injection 3.15mL cartridges | 5 cartridge [PoM] £250.00
Insuman Infusaf 100units/mL solution for injection 10mL vials | 3 vial [PoM] £250.00
- ▶ **Insuman Rapid** (Sanofi)
Insulin human (as Insulin soluble human) 100 unit per 1 mL Insuman Rapid 100units/mL solution for injection 3mL cartridges | 5 cartridge [PoM] £17.50

3.1a Diabetes, diagnosis and monitoring

Diabetes mellitus, diagnostic and monitoring devices

Urinalysis

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with *Micral-Test II®* but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Carers and children should be properly trained in the use of blood glucose monitoring systems and the appropriate action to take on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Children using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the blood glucose level is high or if the child is unwell, blood ketones should be measured according to local guidelines in order to detect diabetic ketoacidosis. Children and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Hypodermic insulin injection pens

● HYPODERMIC INSULIN INJECTION PENS

AUTOPEN® 24

Autopen® 24 (for use with Sanofi- Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).

Autopen 24 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-21 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.58 • Drug Tariff (Part IXa)

Autopen 24 hypodermic insulin injection pen reusable for 3mL cartridge 2 unit dial up / range 2-42 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.58 • Drug Tariff (Part IXa)

AUTOPEN® CLASSIC

Autopen® Classic (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).

Autopen Classic hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-21 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.84 • Drug Tariff (Part IXa)

Autopen Classic hypodermic insulin injection pen reusable for 3mL cartridge 2 unit dial up / range 2-42 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.84 • Drug Tariff (Part IXa)

CLIKSTAR®

For use with **Lantus®**, **Apidra®**, and **Insuman®** 3-mL insulin cartridges; allowing 1-unit dose adjustment, max. 80 units.

ClikSTAR hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-80 units (Sanofi) 1 device • NHS indicative price = £25.00 • Drug Tariff (Part IXa)

ClikSTAR hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-80 units (Sanofi) 1 device • NHS indicative price = £25.00 • Drug Tariff (Part IXa)

HUMAPEN® LUXURA HD

For use with **Humulin®** and **Humalog®** 3-mL cartridges; allowing 0.5-unit dosage adjustment, max. 30 units.

HumaPen Luxura HD hypodermic insulin injection pen reusable for 3mL cartridge 0.5 unit dial up / range 1-30 units (Eli Lilly and Company Ltd) 1 device • NHS indicative price = £27.01 • Drug Tariff (Part IXa)

NOVOPEN® 4

For use with **Penfill®** 3-mL insulin cartridges; allowing 1-unit dosage adjustment, max. 60 units.

NovoPen 4 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-60 units (Novo Nordisk Ltd) 1 device • NHS indicative price = £26.86 • Drug Tariff (Part IXa)

NovoPen 4 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-60 units (Novo Nordisk Ltd) 1 device • NHS indicative price = £26.86 • Drug Tariff (Part IXa)

Needle free Insulin delivery systems

● NEEDLE FREE INSULIN DELIVERY SYSTEMS

INSUJET®

For use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max 40 units. Available as **starter set** (**Insulet®** device, nozzle cap, nozzle and piston, 1 × 10-mL adaptor, 1 × 3-mL adaptor, 1 cartridge cap removal key), **nozzle pack** (15 nozzles), **cartridge adaptor pack** (15 adaptors), or **vial adaptor pack** (15 adaptors).

Insulet starter set (Spirit Healthcare Ltd)

1 pack • NHS indicative price = £90.00 • Drug Tariff (Part IXa)

Urinanalysis reagent strips

● PRESCRIBING AND DISPENSING INFORMATION

Other reagent strips available for urinalysis

Include: **Combur-3 Test®** (glucose and protein—Roche Diagnostics); **Clinitek Microalbumin®** (albumin and creatinine—Siemens); **Ketodiastix®** (glucose and ketones—Bayer Diagnostics); **Medi-Test Combi 2®** (glucose and protein—BHR); **Micral-Test II®**, used to detect microalbuminuria but this should be followed by confirmation in the laboratory—false positive results are common (albumin—Roche Diagnostics); **Microalbumstix®** (albumin and creatinine—Siemens); **Uristix®** (glucose and protein—Siemens).

These reagent strips are not prescribable under National Health Service (NHS).

● URINE GLUCOSE TESTING STRIPS

Diastix testing strips (Bayer Diagnostics Manufacturing Ltd) 50 strip • NHS indicative price = £2.89 • Drug Tariff (Part IXr)

Medi-Test Glucose testing strips (BHR Pharmaceuticals Ltd) 50 strip • NHS indicative price = £2.33 • Drug Tariff (Part IXr)

Mission Glucose testing strips (Spirit Healthcare Ltd) 50 strip • NHS indicative price = £2.29 • Drug Tariff (Part IXr)

● URINE PROTEIN TESTING STRIPS

Albustix testing strips (Siemens Medical Solutions Diagnostics Ltd) 50 strip • NHS indicative price = £4.10 • Drug Tariff (Part IXr)

Medi-Test Protein 2 testing strips (BHR Pharmaceuticals Ltd) 50 strip • NHS indicative price = £3.27 • Drug Tariff (Part IXr)

● URINE KETONES TESTING STRIPS

GlucoRx KetoRx Sticks 2GK testing strips (GlucoRx Ltd) 50 strip • NHS indicative price = £2.25 • Drug Tariff (Part IXr)

Ketostix testing strips (Bayer Diagnostics Manufacturing Ltd) 50 strip • NHS indicative price = £3.06 • Drug Tariff (Part IXr)

Mission Ketone testing strips (Spirit Healthcare Ltd) 50 strip • NHS indicative price = £2.50 • Drug Tariff (Part IXr)

3.2 Hypoglycaemia

Hypoglycaemia

02-Jun-2017

Treatment of hypoglycaemia

Prompt treatment of hypoglycaemia in children from any cause is essential as severe hypoglycaemia may cause subsequent neurological damage. Hyperinsulinism, fatty acid oxidation disorders and glycogen storage disease are less common causes of acute hypoglycaemia in children.

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. If necessary this may be repeated after 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal (if it is due) can prevent blood-glucose concentration from falling again.

Proprietary products of quick-acting carbohydrate (e.g. *Glucogel*®, *DextroGel*®, *GSF-Syrup*®, *Rapilose*® gel) are available on prescription for patients to keep on hand in case of hypoglycaemia.

Alternatively, approximately 10 g of glucose is available from 2 teaspoons of sugar, or from 3 sugar lumps, and also from non-diet versions of the following soft drinks: 110 mL of *Lucozade*® *Energy Original* (also, see note below), 100 mL of *Coca-Cola*®, 19 mL of *Ribena*® *Blackcurrant* (to be diluted).

Note: the carbohydrate content of commercially available glucose-containing drinks is currently subject to change—individual product labels should be checked. Patients should be aware that for a time, both old and new bottles and cans may be available—individual product labels should be checked.

Hypoglycaemia which causes unconsciousness or seizures is an emergency. Glucagon below, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases blood-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon can be issued to parents or carers of insulin-treated children for emergency use in hypoglycaemic attacks. It is often advisable to prescribe it on an 'if necessary' basis for hospitalised insulin-treated children, so that it can be given rapidly by the nurses during a hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 10% can be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 50% is **not** recommended, as it is very viscous and hypertonic. Close monitoring is necessary, particularly in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Children whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs can persist for many hours.

Glucagon is not effective in the treatment of hypoglycaemia due to fatty acid oxidation or glycogen storage disorders.

Chronic hypoglycaemia

Diazoxide p. 445 is useful in the management of chronic hypoglycaemia due to excessive insulin secretion, either from a tumour involving the islets of Langerhans or from persisting hyperinsulinaemic hypoglycaemia of infancy (nesidioblastosis). Diazoxide has no place in the management of acute hypoglycaemia. Chlorothiazide p. 108 reduces diazoxide-induced sodium and water retention and has the added benefit of potentiating the glycaemic effect of diazoxide.

If diazoxide and chlorothiazide fail to suppress excessive glucose requirements in chronic hypoglycaemia then octreotide p. 445 or nifedipine p. 106 can be added. Octreotide suppresses secretion of growth hormone, but growth is unlikely to be affected in the long term.

Neonatal hypoglycaemia

Neonatal hypoglycaemia at birth is treated with glucose **intravenous infusion 10%**. Mild asymptomatic persistent hypoglycaemia may respond to a single dose of glucagon. Glucagon has also been used in the short-term management of endogenous hyperinsulinism.

GLYCOGENOLYTIC HORMONES

Glucagon

● INDICATIONS AND DOSE

Insulin-induced hypoglycaemia

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

► Neonate: 20 micrograms/kg.

- Child 1 month–1 year: 500 micrograms
- Child 2–17 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
- Child 2–17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given

Endogenous hyperinsulinism

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Neonate: 200 micrograms/kg (max. per dose 1 mg) for 1 dose.

► Child 1 month–1 year: 1 mg for 1 dose

► BY CONTINUOUS INTRAVENOUS INFUSION

► Neonate: 1–18 micrograms/kg/hour (max. per dose 50 micrograms/kg/hour), adjusted according to response.

► Child 1 month–1 year: 1–10 micrograms/kg/hour, dose to be adjusted as necessary

Diagnosis of growth hormone secretion (specialist use only)

► BY INTRAMUSCULAR INJECTION

► Child: 100 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may vary, consult local guidelines

Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

► INITIALLY BY INTRAVENOUS INJECTION

► Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

DOSE EQUIVALENCE AND CONVERSION

► 1 unit of glucagon = 1 mg of glucagon.

● **UNLICENSED USE** Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed. Unlicensed for growth hormone test and hyperinsulinism.

● **CONTRA-INDICATIONS** Phaeochromocytoma

● **CAUTIONS** Glucagonoma · ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency · insulinoma · when used in the diagnosis of growth hormone secretion, delayed hypoglycaemia may result—deaths reported (ensure a meal is eaten before discharge)

● **INTERACTIONS** → Appendix 1: glucagon

● SIDE-EFFECTS

► Rare Hypersensitivity reactions

► Frequency not known Diarrhoea · hypokalaemia · nausea · vomiting

● DIRECTIONS FOR ADMINISTRATION

► With intravenous use When administered by *continuous intravenous infusion*, do not add to infusion fluids containing calcium—precipitation may occur.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Glucagon for hypoglycaemia

www.medicinesforchildren.org.uk/glucagon-for-hypoglycaemia

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription-only medicine restriction does not apply where administration is for saving life in emergency.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► **Glucagen Hypokit** (Novo Nordisk Ltd)

Glucagon hydrochloride 1 mg GlucaGen Hypokit 1mg powder and solvent for solution for injection | 1 vial [PoM] £11.52 DT price = £11.52

3.2a Chronic hypoglycaemia

Other drugs used for Chronic hypoglycaemia

Chlorothiazide, p. 108

GLYCOGENOLYTIC HORMONES

Diazoxide

● INDICATIONS AND DOSE

Resistant hypertension

► BY MOUTH

- Neonate: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day.
- Child: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day

Chronic intractable hypoglycaemia

► BY MOUTH

- Neonate: Initially 5 mg/kg twice daily, adjusted according to response, initial dose used to establish response; maintenance 1.5–3 mg/kg 2–3 times a day; increased if necessary up to 7 mg/kg 3 times a day, higher doses are unlikely to be beneficial, but may be required in some cases.
- Child: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maintenance 1.5–3 mg/kg 2–3 times a day, increased if necessary up to 5 mg/kg 3 times a day, doses up to 5 mg/kg may be required in some cases, but higher doses are unlikely to be beneficial

- **UNLICENSED USE** Not licensed for resistant hypertension.

- **CAUTIONS** Aortic coarctation · aortic stenosis · arteriovenous shunt · heart failure · hyperuricaemia · impaired cardiac circulation · impaired cerebral circulation

- **INTERACTIONS** → Appendix 1: diazoxide

- **SIDE-EFFECTS** Taste disturbance · abdominal pain · anaemia · anorexia (prolonged use) · bleeding · constipation · decreased libido · dermatitis · diarrhoea · dizziness · dyspnoea · eosinophilia · extrapyramidal effects · galactorrhoea · headache · heart failure · hyperglycaemia · hyperosmolar non-ketotic coma · hypertrichosis · hyperuricaemia (prolonged use) · hypotension · ileus · lacrimation · leucopenia · lichenoid eruption · musculoskeletal pain · nausea · pancreatitis · pruritus · pulmonary hypertension · raised serum creatinine · raised serum urea · reversible nephritic syndrome · sodium and fluid retention · thrombocytopenia · tinnitus · transient cataracts · visual disturbances · voice changes (prolonged use) · vomiting

- **PREGNANCY** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Dose reduction may be required.

● MONITORING REQUIREMENTS

- Monitor blood pressure.
- Monitor white cell and platelet count during prolonged use.
- Regularly assess growth, bone, and psychological development during prolonged use.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Oral suspension

► **Diazoxide (Non-proprietary)**

Diazoxide 50 mg per 1 ml Proglycem 250mg/5ml oral suspension | 30 ml [PoM] no price available DT price = £136.65

Tablet

► **Eudemine** (Focus Pharmaceuticals Ltd)

Diazoxide 50 mg Eudemine 50mg tablets | 100 tablet [PoM] £46.45

Capsule

► **Diazoxide (Non-proprietary)**

Diazoxide 25 mg Proglycem 25 capsules | 100 capsule [PoM] no price available

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOSTATIN ANALOGUES

Somatostatin analogues

- **CAUTIONS** Diabetes mellitus (antidiabetic requirements may be reduced) · insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses)
- **SIDE-EFFECTS**
 - **Rare** Pancreatitis (shortly after administration)
 - **Frequency not known** Abdominal pain · anorexia · bloating · diarrhoea · flatulence · gallstones (after long-term treatment) · gastro-intestinal disturbances · hyperglycaemia (with chronic administration) · hypoglycaemia · impaired postprandial glucose tolerance (with chronic administration) · irritation at the injection site · nausea · pain at the injection site · steatorrhoea · vomiting
- **DIRECTIONS FOR ADMINISTRATION** Injection sites should be rotated.

▲ above

Octreotide

17-Oct-2016

● INDICATIONS AND DOSE

Persistent hyperinsulinaemic hypoglycaemia unresponsive to diazoxide and glucose

► BY SUBCUTANEOUS INJECTION

- Neonate: Initially 2–5 micrograms/kg every 6–8 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required.
- Child: Initially 1–2 micrograms/kg every 4–6 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required

Bleeding from oesophageal or gastric varices

► BY CONTINUOUS INTRAVENOUS INFUSION

- Child: 1 microgram/kg/hour, higher doses may be required initially, when no active bleeding reduce dose over 24 hours; Usual maximum 50 micrograms/hour

- **UNLICENSED USE** Not licensed in children.

- **INTERACTIONS** → Appendix 1: octreotide

- **SIDE-EFFECTS** Alopecia · arrhythmias · biliary colic (associated with abrupt withdrawal of subcutaneous octreotide) · bradycardia · constipation · dizziness · dyspnoea · headache · hepatitis · pancreatitis (associated with abrupt withdrawal of subcutaneous octreotide) · rash · reduced bile flow · reduced gall bladder motility

SIDE-EFFECTS, FURTHER INFORMATION

- **Gastro-intestinal side-effects** Administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects.
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **MONITORING REQUIREMENTS**
 - Monitor thyroid function on long-term therapy.
 - Monitor liver function.
- **TREATMENT CESSATION** Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).
- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection or intravenous infusion, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

➤ Octreotide (Non-proprietary)

Octreotide (as Octreotide acetate) 50 microgram per

1 ml Octreotide 50micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £18.85 DT price = £18.85

Octreotide 50micrograms/1ml solution for injection ampoules |

5 ampoule [PoM] £14.85–£18.60

Octreotide 50micrograms/1ml solution for injection vials |

5 vial [PoM] £14.87–£22.00 DT price = £22.00

Octreotide (as Octreotide acetate) 100 microgram per

1 ml Octreotide 100micrograms/1ml solution for injection ampoules

| 5 ampoule [PoM] £32.65 DT price = £27.97

Octreotide 100micrograms/1ml solution for injection pre-filled

syringes | 5 pre-filled disposable injection [PoM] £28.90–£32.90

Octreotide 100micrograms/1ml solution for injection vials |

5 vial [PoM] £27.97–£32.65

Octreotide (as Octreotide acetate) 200 microgram per

1 ml Octreotide 1mg/5ml solution for injection vials | 1 vial [PoM]

£65.00–£69.66

Octreotide (as Octreotide acetate) 500 microgram per

1 ml Octreotide 500micrograms/1ml solution for injection vials |

5 vial [PoM] £135.47–£158.25

Octreotide 500micrograms/1ml solution for injection ampoules |

5 ampoule [PoM] £169.35 DT price = £135.47

Octreotide 500micrograms/1ml solution for injection pre-filled

syringes | 5 pre-filled disposable injection [PoM] £139.43–£169.00

Octreotide (as Octreotide acetate) 20 mg Sandostatín LAR 20mg powder and solvent for suspension for injection vials | 1 vial [PoM] £799.33

Octreotide (as Octreotide acetate) 30 mg Sandostatín LAR 30mg powder and solvent for suspension for injection vials | 1 vial [PoM] £998.41

4 Disorders of bone metabolism

Bone metabolism

Disorders of bone metabolism

The two main disorders of bone metabolism that occur in children are rickets and osteoporosis. The two most common forms of rickets are Vitamin D deficiency rickets and hypophosphataemic rickets. See also calcium.

Osteoporosis

Osteoporosis in children may be primary (e.g. *osteogenesis imperfecta* and *idiopathic juvenile osteoporosis*), or secondary (e.g. due to inflammatory disorders, immobilisation, or corticosteroids); specialist management is required.

Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible.

Calcitonin

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon) p. 450 (synthetic or recombinant salmon calcitonin) is used by specialists to lower the plasma-calcium concentration in children with hypercalcaemia associated with malignancy.

Bisphosphonates

A bisphosphonate such as pamidronate disodium p. 448 is used in the management of severe forms of *osteogenesis imperfecta* and other causes of osteoporosis in children to reduce the number of fractures; the long-term effects of bisphosphonates in children have not been established. Single doses of bisphosphonates are also used to manage hypercalcaemia. Treatment should be initiated under specialist advice only.

BISPHOSPHONATES

Bisphosphonates

- **DRUG ACTION** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE JAW (NOVEMBER 2009) AND INTRAVENOUS BISPHOSPHONATES: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

Guidance for dentists in primary care is included in *Oral Health Management of Patients Prescribed Bisphosphonates: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at www.sdcep.org.uk).

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

● PATIENT AND CARER ADVICE

Atypical femoral fractures Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Osteonecrosis of the jaw During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms. **Osteonecrosis of the external auditory canal** Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

Alendronic acid (Alendronate)

● INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta and other causes) (initiated under specialist supervision)
Hypercalcaemia (initiated under specialist supervision)

- BY MOUTH
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Abnormalities of oesophagus · hypocalcaemia · other factors which delay emptying (e.g. stricture or achalasia)
- **CAUTIONS** Active gastro-intestinal bleeding · atypical femoral fractures · duodenitis · dysphagia · exclude other causes of osteoporosis · gastritis · history (within 1 year) of ulcers · surgery of the upper gastro-intestinal tract · symptomatic oesophageal disease · ulcers · upper gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal distension · abdominal pain · constipation · diarrhoea · dyspepsia · flatulence · headache · oesophageal reactions · regurgitation
 - **Uncommon** Episcleritis · erythema · gastritis · nausea · rash · scleritis · uveitis · vomiting
 - **Rare** Atypical femoral fractures with long-term use · hypocalcaemia · osteonecrosis of the jaw · photosensitivity · severe skin reactions · Stevens-Johnson syndrome · toxic epidermal necrolysis · upper gastro-intestinal ulcers
 - **Very rare** Osteonecrosis of the external auditory canal
 - **Frequency not known** Musculoskeletal pain
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - Oesophageal reactions Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 35 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.
- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution.
Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2016) that alendronic acid (*Binosto*®) is accepted for restricted use within NHS Scotland for the treatment of postmenopausal osteoporosis where alendronic acid is the appropriate treatment choice, but the patient is unable to swallow tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

Alendronic acid (Non-proprietary)

Alendronic acid 700 microgram per 1 ml Alendronic acid 70mg/100ml oral solution unit dose sugar free sugar-free | 4 unit dose [PoM] £27.36 DT price = £27.36

Effervescent tablet

Binosto (Internis Pharmaceuticals Ltd)

Alendronic acid (as Alendronate sodium) 70 mg Binosto 70mg effervescent tablets sugar-free | 4 tablet [PoM] £22.80 DT price = £22.80

Tablet

Alendronic acid (Non-proprietary)

Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet [PoM] £3.25 DT price = £1.83

Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet [PoM] £22.80 DT price = £0.74

Fosamax (Merck Sharp & Dohme Ltd)

Alendronic acid (as Alendronate sodium) 10 mg Fosamax 10mg tablets | 28 tablet [PoM] £23.12 DT price = £1.83

Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet [PoM] £22.80 DT price = £0.74

F 446

Pamidronate disodium

(Formerly called
aminohydroxypropylenediphosphonate
disodium (APD))

INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) | Hypercalcaemia (specialist use only)

► BY INTRAVENOUS INFUSION

► Child: (consult product literature)

● **UNLICENSED USE** Not licensed for use in children.

● **CAUTIONS** Atypical femoral fractures · cardiac disease · ensure adequate hydration · previous thyroid surgery (risk of hypocalcaemia)

● **INTERACTIONS** → Appendix 1: bisphosphonates

SIDE-EFFECTS

- **Common or very common** Arthralgia · bone pain · fever · headache · hypomagnesaemia · hypophosphataemia · influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes) · lymphocytopenia · myalgia · nausea · transient rise in body temperature · vomiting
- **Rare** Abdominal pain · acute renal failure · agitation · anaemia · anorexia · atypical femoral fractures · confusion · conjunctivitis · constipation · deterioration of renal disease · diarrhoea · dizziness · dyspepsia · haematuria · hallucinations · hyperkalaemia · hypernatraemia · hypertension · hypokalaemia · hypotension · insomnia · isolated cases of seizures · lethargy · leucopenia · muscle cramps · osteonecrosis of the jaw · other ocular symptoms · paraesthesia · pruritus · rash · somnolence · symptomatic hypocalcaemia · tetany · thrombocytopenia
- **Very rare** Osteonecrosis of the external auditory canal

► **Frequency not known** Atrial fibrillation · injection-site reactions · reactivation of herpes simplex · reactivation of herpes zoster

● **PREGNANCY** Avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—no information available.

● **RENAL IMPAIRMENT** Monitor renal function in renal disease or predisposition to renal impairment (e.g. in tumour-induced hypercalcaemia).

● **DIRECTIONS FOR ADMINISTRATION** For *slow intravenous infusion* (*Aredia*®; *Pamidronate disodium*, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For *Aredia*®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For *Pamidronate disodium* (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.

● **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw).

Driving and skilled tasks

Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Pamidronate disodium (Non-proprietary)

Pamidronate disodium 3 mg per 1 ml Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial [PoM] £27.50 (Hospital only) | 5 vial [PoM] £149.15

Pamidronate disodium 30mg/10ml solution for infusion vials | 1 vial [PoM] £55.00 (Hospital only) | 1 vial [PoM] £59.66

Pamidronate disodium 60mg/20ml solution for infusion vials | 1 vial [PoM] £110.00 (Hospital only)

Pamidronate disodium 90mg/30ml solution for infusion vials | 1 vial [PoM] £165.00 (Hospital only)

Pamidronate disodium 9 mg per 1 ml Pamidronate disodium 90mg/10ml solution for infusion vials | 1 vial [PoM] £170.45

Pamidronate disodium 15 mg per 1 ml Pamidronate disodium 60mg/4ml solution for infusion ampoules | 1 ampoule [PoM] £119.32

Pamidronate disodium 15mg/1ml solution for infusion ampoules | 4 ampoule [PoM] £119.32

Pamidronate disodium 90mg/6ml solution for infusion ampoules | 1 ampoule [PoM] £170.46

Pamidronate disodium 30mg/2ml solution for infusion ampoules | 2 ampoule [PoM] £119.32

F 446

Risedronate sodium

INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) | Hypercalcaemia (specialist use only)

► BY MOUTH

► Child: (consult local protocol)

● **UNLICENSED USE** Not licensed for use in children.

● **CONTRA-INDICATIONS** Hypocalcaemia

● **CAUTIONS** Atypical femoral fractures · oesophageal abnormalities · other factors which delay transit or emptying (e.g. stricture or achalasia)

● **INTERACTIONS** → Appendix 1: bisphosphonates

SIDE-EFFECTS

► **Common or very common** Abdominal pain · constipation · diarrhoea · dyspepsia · headache · musculoskeletal pain · nausea

- **Uncommon** Duodenitis · dysphagia · gastritis · oesophageal ulcer · oesophagitis · uveitis
- **Rare** Atypical femoral fractures · glossitis · oesophageal stricture
- **Very rare** Osteonecrosis of the external auditory canal
- **Frequency not known** Cutaneous vasculitis · gastroduodenal ulceration · hair loss · hepatic disorders · osteonecrosis of the jaw · Stevens-Johnson syndrome · toxic epidermal necrolysis

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Avoid.

● **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS**

- Correct hypocalcaemia before starting.
- Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.
- **DIRECTIONS FOR ADMINISTRATION** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risedronate sodium tablets.

Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

Medicines for Children leaflet: Risedronate for brittle bones

CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Calcitonin (salmon)

(Salcatonin)

• INDICATIONS AND DOSE

Hypercalcaemia (limited experience in children) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 2.5–5 units/kg every 12 hours (max. per dose 400 units every 6–8 hours), adjusted according to response, no additional benefit with doses over 8 units/kg every 6 hours
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 5–10 units/kg, to be administered by slow intravenous infusion over at least 6 hours

Osteoporosis (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: Refer for specialist advice, experience very limited

- **UNLICENSED USE** Not licensed in children.
- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Heart failure · history of allergy (skin test advised) · risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)
- **INTERACTIONS** → Appendix 1: calcitonin (salmon)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · fatigue · flushing · headache · malignancy (with long-term use) · musculoskeletal pain · nausea · taste disturbances · vomiting
 - ▶ **Uncommon** Cough · hypersensitivity reactions · hypertension · injection-site reactions · oedema · polyuria · pruritus · rash · visual disturbances
 - ▶ **Frequency not known** Tremor
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING** Avoid; inhibits lactation in animals.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Monitor bone growth.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute injection solution (e.g. 400 units in 500 mL) with Sodium Chloride 0.9% and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration—use diluted solution without delay.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Calcitonin (salmon) (Non-proprietary)

Calcitonin (salmon) 50 unit per 1 mL Calcitonin (salmon) 50units/1mL solution for injection ampoules | 5 ampoule [PoM] £167.50

Calcitonin (salmon) 100 unit per 1 mL Calcitonin (salmon) 100units/1mL solution for injection ampoules | 5 ampoule [PoM] £220.00

Calcitonin (salmon) 200 unit per 1 mL Calcitonin (salmon) 400units/2mL solution for injection vials | 1 vial [PoM] £352.00

5 Gonadotrophin responsive conditions

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPIN-RELEASING HORMONES

Goserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

• INDICATIONS AND DOSE

ZOLADEX LA®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

ZOLADEX®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 3.6 mg every 28 days, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **CAUTIONS** Depression · patients with metabolic bone disease (decrease in bone mineral density can occur)
- **SIDE-EFFECTS** Anaphylaxis · asthma · breast tenderness · changes in blood pressure · changes in breast size · changes in scalp and body hair · depression · headache · hypersensitivity reactions · local reactions at injection site · mood changes · ovarian cysts (may require withdrawal) · paraesthesia · pruritus · rash · urticaria · vaginal bleeding · visual disturbances · weight change · withdrawal bleeding
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Implant

▶ Zoladex (AstraZeneca UK Ltd)

Goserelin (as Goserelin acetate) 3.6 mg Zoladex 3.6mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [PoM] £65.00 DT price = £65.00

▶ Zoladex LA (AstraZeneca UK Ltd)

Goserelin (as Goserelin acetate) 10.8 mg Zoladex LA 10.8mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [PoM] £235.00 DT price = £235.00

Leuporelin acetate

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

PROSTAP 3 DCS®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 11.25 mg every 12 weeks, injections may be required more frequently in some cases

PROSTAP SR DCS®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 3.75 mg every 4 weeks, half this dose is sometimes used in children with body-weight under 20 kg, injections may be required more frequently in some cases

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)
- **INTERACTIONS** → Appendix 1: leuporelin
- **SIDE-EFFECTS** Abdominal pain · acne · anaphylaxis · asthma · breast tenderness (males and females) · changes in blood pressure · changes in breast size · changes in scalp and body hair · depression · headache · hypersensitivity reactions · local reactions at injection site · mood changes · paraesthesia · pruritus · rash · urticaria · visual disturbances · weight changes · withdrawal bleeding
- **PREGNANCY** Avoid—teratogenic in *animal* studies.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- ▶ **Prostap 3 DCS** (Takeda UK Ltd)
Leuporelin acetate 11.25 mg Prostap 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £225.72 DT price = £225.72
- ▶ **Prostap SR DCS** (Takeda UK Ltd)
Leuporelin acetate 3.75 mg Prostap SR DCS 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.24 DT price = £75.24

Triptorelin

27-Apr-2017

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

DECAPEPTYL® SR 11.25MG

Gonadotrophin-dependent precocious puberty

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 11.25 mg every 3 months, discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys

GONAPEPTYL DEPOT®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child (body-weight up to 20 kg): Initially 1.875 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 1.875 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
- ▶ Child (body-weight 20–30 kg): Initially 2.5 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 2.5 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
- ▶ Child (body-weight 31 kg and above): Initially 3.75 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 3.75 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **SIDE-EFFECTS** Anaphylaxis · arthralgia · asthenia · asthma · breast tenderness (males and females) · changes in blood pressure · changes in breast size · changes in scalp and body hair · depression · gastro-intestinal disturbances · headache · hypersensitivity reactions · local reactions at injection site · mood changes · ovarian cysts (may require withdrawal) · paraesthesia · pruritus · rash · urticaria · visual disturbances · weight changes · withdrawal bleeding (may occur in the first month of treatment)
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.
- **PRESCRIBING AND DISPENSING INFORMATION**
DECAPEPTYL® SR 11.25MG Each vial includes an overage to allow accurate administration of an 11.25 mg dose.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

► **Decapeptyl SR** (Ipsen Ltd)

Triptorelin (as Triptorelin acetate) 3 mg Decapeptyl SR 3mg powder and solvent for suspension for injection vials | 1 vial [PoM] £69.00 DT price = £69.00

Triptorelin (as Triptorelin acetate) 11.25 mg Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM] £207.00 DT price = £207.00

Triptorelin (as Triptorelin embonate) 22.5 mg Decapeptyl SR 22.5mg powder and solvent for suspension for injection vials | 1 vial [PoM] £414.00 DT price = £414.00

► **Gonapeptyl Depot** (Ferring Pharmaceuticals Ltd)

Triptorelin (as Triptorelin acetate) 3.75 mg Gonapeptyl Depot 3.75mg powder and solvent for suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £81.69

6 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Corticotrophins

Tetracosactide below (tetracosactrin), an analogue of corticotropin (adrenocorticotrophic hormone, ACTH), is used to test adrenocortical function; failure of plasma-cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency. A low-dose test is considered by some clinicians to be more sensitive when used to confirm established, partial adrenal suppression.

Tetracosactide should be given only if no other ACTH preparations have been given previously. Tetracosactide depot injection (*Synacthen Depot*®) is also used in the treatment of infantile spasms but it is contra-indicated in neonates because of the presence of benzyl alcohol in the injection. Corticotropin-releasing factor, corticorelin p. 453, (also known as corticotropin-releasing hormone, CRH) is used to test anterior pituitary function and secretion of corticotropin.

Gonadotrophins

Gonadotrophins are occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin p. 454 is used in the investigation of testicular function in suspected primary hypogonadism and incomplete masculinisation. It has also been used in delayed puberty in boys to stimulate endogenous testosterone production, but it has little advantage over testosterone.

Growth hormone

Growth hormone is used to treat proven deficiency of the hormone, Prader-Willi syndrome, Turner's syndrome, growth disturbance in children born small for corrected gestational age, chronic renal insufficiency, and short stature homeobox-containing gene (SHOX) deficiency. Growth hormone is also used in Noonan syndrome and idiopathic short stature [unlicensed indications] under specialist management. Treatment should be initiated and monitored by a paediatrician with expertise in managing growth-hormone disorders; treatment can be continued under a shared-care protocol by a general practitioner.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatotropin p. 454, produced using recombinant DNA technology.

Mecasermin p. 456, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 453 when injected intravenously in post-pubertal girls leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. It is used in the assessment of delayed or precocious puberty.

Other growth hormone stimulation tests involve the use of insulin, glucagon p. 444, arginine p. 586, and clonidine hydrochloride p. 99 [all unlicensed uses]. The tests should be carried out in specialist centres.

6.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

Tetracosactide

(Tetracosactrin)

● **INDICATIONS AND DOSE**

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), standard-dose test

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Child: 145 micrograms/m² (max. per dose 250 micrograms) for 1 dose

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), low-dose test

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Child: 0.3 microgram/m² for 1 dose

Infantile spasm

► BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION

► Child 1–23 months: Initially 500 micrograms once daily on alternate days, adjusted according to response

● **UNLICENSED USE** Not licensed for low-dose test for adrenocortical insufficiency. Not licensed for treatment of infantile spasms.

● **CONTRA-INDICATIONS** Acute psychosis · adrenogenital syndrome · allergic disorders · asthma · avoid injections containing benzyl alcohol in neonates · Cushing's syndrome · infectious diseases · peptic ulcer · primary adrenocortical insufficiency · refractory heart failure

● **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) · active systemic diseases (should not be used unless adequate disease-specific therapy is being given) · diabetes mellitus · diverticulitis · history of asthma · history of atopic allergy · history of eczema · history of hayfever · history of hypersensitivity · hypertension · latent amoebiasis (may become activated) · latent tuberculosis (may become activated) · myasthenia gravis · ocular herpes simplex · osteoporosis · predisposition to thromboembolic · psychological disturbances may be triggered · recent intestinal anastomosis · reduced immune response (should

not be used unless adequate disease-specific therapy is being given) · ulcerative colitis

CAUTIONS, FURTHER INFORMATION

- ▶ **Risk of anaphylaxis** Should only be administered under medical supervision. Consult product literature.
- ▶ **Hypertension** Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
- ▶ **Diabetes mellitus** Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.
- **SIDE-EFFECTS** Abdominal distention · abscess · acne · anaphylactic shock · anaphylactoid reactions in children aged under 3 years (benzyl alcohol-containing injections) · angioneurotic oedema · aseptic necrosis of femoral and humeral heads · benign intracranial pressure increased with papilloedema · calcium deficiency · cardiac disorders · convulsions · Cushing's syndrome · decreased carbohydrate tolerance · dizziness · dyspnoea · ecchymosis · erythema · euphoria · fluid retention · flushing · glaucoma · growth retardation · headache · hirsutism · hyperglycaemia · hyperhidrosis · hypersensitivity reactions (tend to be more severe in patients susceptible to allergies, especially asthma) · hypertension · hypokalaemia · hypokalaemic alkalosis · impaired healing · increased appetite · increased intraocular pressure · infection susceptibility increased · insomnia · irregular menstruation · leukocytosis · malaise · manifestations of latent diabetes mellitus · mood swings · muscle atrophy · muscular weakness · myopathy · nausea · necrotising vasculitis · negative nitrogen balance · osteoporosis · pancreatitis · pathological fracture of long bones · peptic ulcer · personality changes · petechiae · posterior subcapsular cataracts · pruritus · psychotic manifestations · Quincke's oedema · secondary adrenocortical unresponsiveness · secondary pituitary unresponsiveness · severe depression · skin atrophy · skin hyperpigmentation · skin reactions at injection site · sodium retention · spinal compression fractures · tendon rupture · thromboembolism · toxic reactions in children aged under 3 years (benzyl alcohol-containing injections) · ulcerative oesophagitis · urticaria · vertigo · vomiting · weight increase
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** An enhanced effect of tetracosactide therapy may occur in patients with cirrhosis of the liver. Use with caution in hepatic impairment. Monitor hepatic function closely during treatment.
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.
Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.
- **DIRECTIONS FOR ADMINISTRATION** For intramuscular or intravenous injection, may be diluted in sodium chloride 0.9% to 250 nanograms/mL.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Synacthen** (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd) Tetracosactide acetate 250 microgram per 1 ml Synacthen 250micrograms/1ml solution for injection ampoules | 1 ampoule [PoM] £38.00

Suspension for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Synacthen Depot** (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd) Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 1 ampoule [PoM] £346.28

6.2 Assessment of pituitary function

DIAGNOSTIC AGENTS

Corticotropin

(Corticotrophin-releasing hormone; CRH)

● INDICATIONS AND DOSE

Test of anterior pituitary function

▶ BY INTRAVENOUS INJECTION

- ▶ Child: 1 microgram/kg (max. per dose 100 micrograms) for 1 dose, to be administered over 30 seconds

- **UNLICENSED USE** Not licensed.

- **SIDE-EFFECTS** Flushing of face · flushing of neck · flushing of upper body · hypotension · mild sensation of smell · mild sensation of taste

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

Gonadorelin

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

● INDICATIONS AND DOSE

Assessment of anterior pituitary function | Assessment of delayed puberty

▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- ▶ Child 1-17 years: 2.5 micrograms/kg (max. per dose 100 micrograms) for 1 dose

- **CAUTIONS** Pituitary adenoma

- **SIDE-EFFECTS** Abdominal pain · headache · hypersensitivity reaction on repeated administration of large doses · increased menstrual bleeding · irritation at injection site · nausea

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Gonadorelin (Non-proprietary)**

Gonadorelin (as Gonadorelin hydrochloride)
100 microgram Gonadorelin 100microgram powder and solvent for solution for injection vials | 1 vial [PoM] £75.00 (Hospital only)

6.3 Gonadotrophin replacement therapy

GONADOTROPHINS

Chorionic gonadotrophin

(Human chorionic gonadotrophin; HCG)

- **DRUG ACTION** A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

• INDICATIONS AND DOSE

Delayed puberty in the male to stimulate endogenous testosterone production

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: (consult product literature)

Test of testicular function, short stimulation test

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 1500–2000 units once daily for 3 days

Test of testicular function, prolonged stimulation test

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 1500–2000 units twice weekly for 3 weeks

Hypogonadotrophic hypogonadism

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 1000–2000 units twice weekly, adjusted according to response

Undescended testes

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 7–16 years: Initially 500 units 3 times a week, adjusted according to response to up to 4000 units 3 times a week continue for 1–2 months after testicular descent
- ▶ Child 17 years: Initially 1000 units twice weekly, adjusted according to response to up to 4000 units 3 times a week continue for 1–2 months after testicular descent

- **UNLICENSED USE** Unlicensed in children for test of testicular function.
- **CONTRA-INDICATIONS** Androgen-dependent tumours
- **CAUTIONS** Asthma · cardiac impairment · epilepsy · migraine · prepubertal boys (risk of premature epiphyseal closure or precocious puberty)
- **SIDE-EFFECTS** Gynaecomastia · headache · local reactions · mood changes · oedema (particularly in males—reduce dose) · tiredness
- **RENAL IMPAIRMENT** Use with caution.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Power and solvent for solution for injection

- ▶ **Choragon** (Ferring Pharmaceuticals Ltd)
Chorionic gonadotrophin human 5000 unit Choragon 5,000unit powder and solvent for solution for injection ampoules | 3 ampoule [PoM] £9.77 [CD4-2]
- ▶ **Pregnyl** (Merck Sharp & Dohme Ltd)
Chorionic gonadotrophin human 1500 unit Pregnyl 1,500unit powder and solvent for solution for injection ampoules | 1 ampoule [PoM] £2.12 [CD4-2]
- Chorionic gonadotrophin human 5000 unit** Pregnyl 5,000unit powder and solvent for solution for injection ampoules | 1 ampoule [PoM] £3.15 [CD4-2]

6.4 Growth hormone disorders

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES

Somatropin

(Recombinant Human Growth Hormone)

• INDICATIONS AND DOSE

Gonadal dysgenesis (Turner syndrome)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily

Deficiency of growth hormone

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 23–39 micrograms/kg daily, alternatively 0.7–1 mg/m² daily

Growth disturbance in children born small for gestational age whose growth has not caught up by 4 years or later | Noonan syndrome

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 4–17 years: 35 micrograms/kg daily, alternatively 1 mg/m² daily

Prader-Willi syndrome, in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 1 mg/m² daily, alternatively 35 micrograms/kg daily; maximum 2.7 mg per day

Chronic renal insufficiency (renal function decreased to less than 50%)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 45–50 micrograms/kg daily, alternatively 1.4 mg/m² daily, higher doses may be needed, adjust if necessary after 6 months

SHOX deficiency

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 45–50 micrograms/kg daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose formerly expressed in units; somatropin 1 mg ≡ 3 units.

- **UNLICENSED USE** Not licensed for use in Noonan syndrome.
- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) · not to be used after renal transplantation · not to be used for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome) · severe obesity in Prader-Willi syndrome · severe respiratory impairment in Prader-Willi syndrome
- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · disorders of the epiphysis of the hip (monitor for limping) · history of malignant disease · hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value · initiation of treatment close to puberty not recommended in child born small for corrected gestational age · papilloedema · relative deficiencies of other pituitary hormones · resolved intracranial hypertension (monitor closely) · Silver-Russell syndrome
- **INTERACTIONS** → Appendix 1: somatropin
- **SIDE-EFFECTS** Antibody formation · arthralgia · benign intracranial hypertension · carpal tunnel syndrome · fluid retention (peripheral oedema) · headache · hyperglycaemia · hypoglycaemia · hypothyroidism · insulin resistance ·

leukaemia in children with growth hormone deficiency · myalgia · nausea · papilloedema · paraesthesia · reactions at injection site · visual problems · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Papilloedema** Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- **PREGNANCY** Discontinue if pregnancy occurs—no information available.

- **BREAST FEEDING** No information available. Absorption from milk unlikely.

- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipatrophy.

GENOTROPIN[®], NORDITROPIN[®], NUTROPINAQ[®], OMNITROPE[®], SAIZEN[®], ZOMACTON[®] For use by subcutaneous injection.

HUMATROPE[®] Cartridges for use by subcutaneous injection. Powder for reconstitution for use by subcutaneous or intramuscular injection.

- **PRESCRIBING AND DISPENSING INFORMATION** Somatropin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

SAIZEN[®] SOLUTION FOR INJECTION For use with *cool.click[®]* needle-free autoinjector device or *easypod[®]* autoinjector device (non-NHS but available free of charge from clinics).

NUTROPINAQ[®] For use with *NutropinAq[®]* Pen device (non-NHS but available free of charge from clinics).

OMNITROPE[®] For use with *Omnitrope Pen 5[®]* and *Omnitrope Pen 10[®]* devices (non-NHS but available free of charge from clinics).

NORDITROPIN[®] PREPARATIONS Cartridges are for use with appropriate *NordiPen[®]* device (non-NHS but available free of charge from clinics).

Multidose disposable prefilled pens for use with *NovaFine[®]* or *NovoTwist[®]* needles.

ZOMACTON[®] 4 mg vial for use with *ZomaJet 2[®] Vision* needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

10 mg vial for use with *ZomaJet Vision X[®]* needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

GENOTROPIN[®] PREPARATIONS Cartridges are for use with *Genotropin[®]* Pen device (non-NHS but available free of charge from clinics).

SAIZEN[®] POWDER AND SOLVENT FOR SOLUTION FOR INJECTION For use with *one.click[®]* autoinjector device or *cool.click[®]* needle-free autoinjector device or *easypod[®]* autoinjector device (non-NHS but available free of charge from clinics).

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Somatropin for the treatment of growth failure in children (May 2010) NICE TA188** Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency
- have Turner syndrome
- have Prader-Willi syndrome
- have chronic renal insufficiency
- are born small for gestational age with subsequent growth failure at 4 years of age or later
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA188

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Norditropin NordiFlex** (Novo Nordisk Ltd)

Somatropin (epr) 3.3 mg per 1 ml Norditropin NordiFlex 5mg/1.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £115.90 [CD4-2]

Somatropin (epr) 6.7 mg per 1 ml Norditropin NordiFlex 10mg/1.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £231.80 [CD4-2]

Somatropin (epr) 10 mg per 1 ml Norditropin NordiFlex 15mg/1.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £347.70 [CD4-2]

- ▶ **Norditropin SimpleXx** (Novo Nordisk Ltd)

Somatropin (epr) 3.3 mg per 1 ml Norditropin SimpleXx 5mg/1.5ml solution for injection cartridges | 1 cartridge [PoM] £106.35 [CD4-2]

Somatropin (epr) 6.7 mg per 1 ml Norditropin SimpleXx 10mg/1.5ml solution for injection cartridges | 1 cartridge [PoM] £212.70 [CD4-2]

Somatropin (epr) 10 mg per 1 ml Norditropin SimpleXx 15mg/1.5ml solution for injection cartridges | 1 cartridge [PoM] £319.05 [CD4-2]

6.4a Insulin-like growth factor-I deficiency

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOMEDINS

Mecasermin

(Recombinant human insulin-like growth factor-I; rhIGF-I)

- **DRUG ACTION** Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotrophic effects of human growth hormone.

● **INDICATIONS AND DOSE**

Treatment of growth failure in children with severe primary insulin-like growth factor-I deficiency

► **BY SUBCUTANEOUS INJECTION**

- Child 2-17 years: Initially 40 micrograms/kg twice daily for 1 week, increased, if tolerated, in steps of 40 micrograms/kg (max. per dose 120 micrograms/kg twice daily), discontinue if no response within 1 year, reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

- **CONTRA-INDICATIONS** Evidence of tumour activity (discontinue treatment)

- **CAUTIONS** Correct hypothyroidism before initiating treatment · diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · papilloedema

- **SIDE-EFFECTS** Antibody formation · arthralgia · cardiomegaly · convulsions · dizziness · gynaecomastia · headache · hyperglycaemia · hypoglycaemia (especially in first month, and in younger children) · impaired hearing · injection-site reactions (rotate site) · myalgia · nausea · nervousness · night terrors · severe or recurrent headache · sleep apnoea · tachycardia · tonsillar hypertrophy · ventricular hypertrophy · visual disturbance · visual problems · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Papilloedema** Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- **CONCEPTION AND CONTRACEPTION** Contraception advised in women of child-bearing potential.

- **PREGNANCY** Avoid unless essential.

- **BREAST FEEDING** Avoid.

● **MONITORING REQUIREMENTS**

- Monitor ECG before and on termination of treatment (and during treatment if ECG abnormal).
- Monitor for disorders of the epiphysis of the hip (monitor for limping).
- Monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions).

- **DIRECTIONS FOR ADMINISTRATION** Dose should be administered just before or after food.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer mecasermin injection.

Missed doses

Patients or carers should be advised not to increase dose if a dose is missed.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

Mecasermin 10 mg per 1 ml Increlex 40mg/4ml solution for injection vials | 1 vial [PoM] £605.00

7 Sex hormone responsive conditions

Sex hormones

Hormone replacement therapy

Sex hormone replacement therapy is indicated in children for the treatment of gonadotrophin deficiency, gonadal disorders, or delayed puberty that interferes with quality of life. Indications include constitutional delay in puberty, congenital or acquired hypogonadotrophic hypogonadism, hypergonadotrophic hypogonadism (Turner's syndrome, Klinefelter's syndrome), endocrine disorders (Cushing's syndrome or hyperprolactinaemia), and chronic illnesses, such as cystic fibrosis or sickle-cell disease, that may affect the onset of puberty.

Replacement therapy is generally started at the appropriate age for the development of puberty and should be managed by a paediatric endocrinologist. Patients with constitutional delay, chronic illness, or eating disorders may need only small doses of hormone supplements for 4 to 6 months to induce puberty and endogenous sex hormone production, which is then sustained. Patients with organic causes of hormone deficiency will require life-long replacement, adjusted to allow normal development.

Inadequate treatment may lead to poor bone mineralisation, resulting in fractures and osteoporosis.

Female sex hormones

Oestrogens

Oestrogens are necessary for the development of female secondary sexual characteristics. If onset of puberty is delayed because of organic pathology, puberty can be induced with ethinylestradiol below in increasing doses, guided by breast staging and uterine scans. Cyclical progestogen replacement is added after 12–18 months of oestrogen treatment. Once the adult dosage of oestrogen has been reached, it may be more convenient to provide replacement either as a low-dose oestrogen containing oral contraceptive formulation [unlicensed indication] or as a combined oestrogen and progestogen hormone replacement therapy preparation [unlicensed indication]. There is limited experience in the use of transdermal patches or gels in children; compliance and skin irritation are sometimes a problem.

Ethinylestradiol is occasionally used, under **specialist supervision**, for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited), for the prevention of tall stature, and in tests of growth hormone secretion.

Topical oestrogen creams are used in the treatment of labial adhesions.

Progestogens

There are two main groups of progestogen, *progesterone* and *its analogues* (dydrogesterone and medroxyprogesterone acetate p. 489) and *testosterone analogues* (norethisterone p. 458 and norgestrel). The newer progestogens (desogestrel p. 485, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 486 is the active isomer of norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

In delayed puberty cyclical progestogen is added after 12–18 months of oestrogen therapy to establish a menstrual cycle.

Norethisterone is also used to postpone menstruation during a cycle; treatment is started 3 days before the expected onset of menstruation.

7.1 Female sex hormone responsive conditions

OESTROGENS

Ethinylestradiol

(Ethinylestradiol)

● INDICATIONS AND DOSE

Induction of sexual maturation in girls

► BY MOUTH

- Child (female): Initially 2 micrograms daily for 6 months, then increased to 5 micrograms daily for 6 months, then increased to 10 micrograms daily for 6 months, then increased to 20 micrograms daily, after 12–18 months of treatment give progestogen for 7 days of each 28-day cycle.

Maintenance of sexual maturation in girls

► BY MOUTH

- Child (female): 20 micrograms daily, to be given with cyclical progestogen for 7 days of each 28-day cycle.

Prevention of tall stature in girls

► BY MOUTH

- Child 2–11 years (female): 20–50 micrograms daily.

Pituitary priming before growth hormone secretion test in girls with bone age over 10 years

► BY MOUTH

- Child (female): 100 micrograms daily for 3 days before test.

- **UNLICENSED USE** Unlicensed for use in children.
- **CONTRA-INDICATIONS** Acute porphyrias p. 577 · cardiovascular disease (sodium retention with oedema) · family history of thromboembolism · gallstones · heart disease associated with pulmonary hypertension · heart disease associated with risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer · history of haemolytic uraemic syndrome · migraine with aura · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding · venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment)
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · Crohn's disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression (especially if induced by hormonal contraceptive) · hyperprolactinaemia (seek specialist advice) · inflammatory bowel disease · migraine (migraine-like headaches) · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial disease · risk factors for migraine · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from treatment.
- Risk of venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:
 - *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
 - *obesity*—body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
 - *history of superficial thrombophlebitis*;
 - *smoking*.
- Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:
 - *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);

- **diabetes mellitus** (avoid if diabetes complications present);
 - **hypertension**—blood pressure above *systolic* 140 mmHg or *diastolic* 90 mmHg (avoid if blood pressure above *systolic* 160 mmHg or *diastolic* 95 mmHg); (In adolescents, avoid if blood pressure very high);
 - **smoking** (avoid if smoking 40 or more cigarettes daily);
 - **obesity** (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - **migraine without aura** (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- **Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).
- **INTERACTIONS** → Appendix 1: hormone replacement therapy
 - **SIDE-EFFECTS**
 - **Rare** Gallstones · systemic lupus erythematosus
 - **Frequency not known** Abdominal cramps · absence of withdrawal bleeding · amenorrhoea after discontinuation · breast enlargement · breast secretion · breast tenderness · cervical erosion · changes in libido · changes in lipid metabolism · changes in vaginal discharge · chloasma · chorea · contact lenses may irritate · depression · fluid retention · headache · hepatic tumours · hypertension · irritability · leg cramps (rule out venous thrombosis) · liver impairment · nausea · nervousness · photosensitivity · reduced menstrual loss · skin reactions · symptoms of endometriosis may be exacerbated · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) · uterine fibroids may increase in size · visual disturbances · vomiting · weight changes · 'spotting' in early cycles
 - **PREGNANCY** Avoid.
 - **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
 - **HEPATIC IMPAIRMENT** Avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and jaundice.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

► Ethinylestradiol (Non-proprietary)

Ethinylestradiol 10 microgram Ethinylestradiol 10microgram tablets | 21 tablet [PoM] £200.00 DT price = £200.00

Ethinylestradiol 50 microgram Ethinylestradiol 50microgram tablets | 21 tablet [PoM] £200.00 DT price = £200.00

Ethinylestradiol 1 mg Ethinylestradiol 1mg tablets | 28 tablet [PoM] £200.00 DT price = £200.00

PROGESTOGENS

Norethisterone

• INDICATIONS AND DOSE

Postponement of menstruation

► BY MOUTH

- Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

Induction and maintenance of sexual maturation in females (combined with an oestrogen after 12–18 months oestrogen therapy)

► BY MOUTH

- Child: 5 mg once daily for the last 7 days of 28-day cycle

Short-term contraception

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

Contraception

► BY MOUTH

- Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

• UNLICENSED USE

- When used for Induction and maintenance of sexual maturation in females or Postponement of menstruation Not licensed for use in children.
- When used for Contraception Consult product literature for the licensing status of individual preparations.

• CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications) · when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

SPECIFIC CONTRA-INDICATIONS

- With oral use Acute porphyrias p. 577 · severe arterial disease · undiagnosed vaginal bleeding

• CAUTIONS

GENERAL CAUTIONS

Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

SPECIFIC CAUTIONS

- When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies
- With intramuscular use for contraception Disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · possible risk of breast cancer

CAUTIONS, FURTHER INFORMATION

- As a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

- **Breast cancer risk with contraceptive use** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

• **INTERACTIONS** → Appendix 1: norethisterone

• **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Acne · alopecia · anaphylactoid reactions · breast tenderness · change in libido · depression · disturbance of appetite · dizziness · fluid retention · headache · hirsutism · insomnia (non-contraceptive indications) · jaundice · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · urticaria · vomiting · weight change

SPECIFIC SIDE-EFFECTS

- With intramuscular use Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION

- **Cervical cancer** Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives (use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years). The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

- **PREGNANCY** Not known to be harmful in contraceptive doses. Avoid in other indications.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

- With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

- **HEPATIC IMPAIRMENT** When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Caution when used for sexual maturation and to postpone menstruation; avoid if severe.

- **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.

• **PATIENT AND CARER ADVICE**

Missed oral contraceptive pill The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Contraceptives by injection Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

7.2 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

Androgens

Androgens cause masculinisation; they are used as replacement therapy in androgen deficiency, in delayed puberty, and in those who are hypogonadal due to either pituitary or testicular disease.

When given to patients with hypopituitarism androgens can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which stimulates spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate or propionate or alternatively *Sustanon®*, which consists of a mixture of testosterone esters and has a longer duration of action, can be used. For induction of puberty, depot testosterone injections are given monthly and the

doses increased every 6 to 12 months according to response. Single ester testosterone injections may need to be given more frequently.

Oral **testosterone undecanoate** is used for induction of puberty. An alternative approach that promotes growth rather than sexual maturation uses oral oxandrolone below.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

Testosterone topical gel is also available but experience of use in children under 15 years is limited. Topical testosterone is applied to the penis in the treatment of micropallus; an extemporaneously prepared cream should be used because the alcohol in proprietary gel formulations causes irritation.

Anti-androgens and precocious puberty

The gonadorelin stimulation test is used to distinguish between *gonadotrophin-dependent (central) precocious puberty* and *gonadotrophin-independent precocious puberty*. Treatment requires specialist management.

Gonadorelin analogues, used in the management of gonadotrophin-dependent precocious puberty, delay development of secondary sexual characteristics and growth velocity.

Testolactone p. 462 and cyproterone acetate p. 461 are used in the management of gonadotrophin-independent precocious puberty, resulting from McCune-Albright syndrome, familial male precocious puberty (testotoxicosis), hormone-secreting tumours, and ovarian and testicular disorders. Testolactone inhibits the aromatisation of testosterone, the rate limiting step in oestrogen synthesis. Cyproterone acetate is a progestogen with anti-androgen properties.

Spironolactone p. 123 is sometimes used in combination with testolactone because it has some androgen receptor blocking properties.

High blood concentration of sex hormones may activate release of gonadotrophin releasing hormone, leading to development of secondary, central gonadotrophin-dependent precocious puberty. This may require the addition of gonadorelin analogues to prevent progression of pubertal development and skeletal maturation.

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in girls. They are used in the treatment of some *aplastic anaemias*.

Oxandrolone is used to stimulate late pre-pubertal growth prior to induction of sexual maturation in boys with short stature and in girls with Turner's syndrome; specialist management is required.

ANABOLIC STEROIDS > ANDROSTAN DERIVATIVES

Oxandrolone

● INDICATIONS AND DOSE

Stimulation of late pre-pubertal growth in boys (of appropriate age) with short stature

- ▶ BY MOUTH
- ▶ Child 10–17 years (male): 1.25–2.5 mg daily for 3–6 months.

Stimulation of late pre-pubertal growth in girls with Turner's syndrome

- ▶ BY MOUTH
- ▶ Child (female): 0.625–2.5 mg daily, to be taken in combination with growth hormone.

- **CONTRA-INDICATIONS** History of primary liver tumours · hypercalcaemia · nephrosis

- **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · skeletal metastases (risk of hypercalcaemia)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Virilism in females · acne · androgenic effects · anxiety · asthenia · changes in libido · cholestatic jaundice · depression · electrolyte disturbances · excessive duration of penile erection · excessive frequency of penile erection · gastro-intestinal bleeding · gynaecomastia · headache · hirsutism · hypercalcaemia · hypertension · increased bone growth · male-pattern baldness · nausea · oedema · paraesthesia · polycythaemia · precocious sexual development in pre-pubertal males · premature closure of epiphyses in pre-pubertal males · pruritus · seborrhoea · sodium retention · suppression of spermatogenesis in males · weight gain
 - ▶ **Rare** Liver tumours
 - ▶ **Frequency not known** Sleep apnoea
- **PREGNANCY** Avoid—causes masculinisation of female fetus.
- **BREAST FEEDING** Avoid; may cause masculinisation in the female infant or precocious development in the male infant. High doses suppress lactation.
- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.
- **RENAL IMPAIRMENT** Use with caution—potential for fluid retention.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

ANDROGENS

Androgens

- **CONTRA-INDICATIONS** Breast cancer in males · history of liver tumours · hypercalcaemia · prostate cancer
- **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored · skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) · sleep apnoea · stop treatment or reduce dose if severe polycythaemia occurs · tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acne · androgenic effects (to be assessed regularly in women) · anxiety · asthenia · changes in libido · cholestatic jaundice · depression · electrolyte disturbances · excessive duration of penile erection · excessive frequency of penile erection · gastro-intestinal bleeding · gynaecomastia · headache · hirsutism · hypercalcaemia · hypertension · increased bone growth · male-pattern baldness · nausea · oedema · paraesthesia · polycythaemia · precocious sexual development in pre-pubertal males · premature closure of epiphyses in pre-pubertal males · pruritus · seborrhoea · sodium retention · suppression of virilism in women · weight gain
 - ▶ **Rare** Liver tumours
 - ▶ **Frequency not known** Sleep apnoea

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Polycythaemia** Stop treatment or reduce dose if severe polycythaemia occurs.
- **PREGNANCY** Avoid—causes masculinisation of female fetus.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.
- **RENAL IMPAIRMENT** Caution—potential for fluid retention.
- **MONITORING REQUIREMENTS** Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.

F 460

Testosterone enantate**● INDICATIONS AND DOSE****Induction and maintenance of sexual maturation in males (specialist use only)**

- ▶ **BY DEEP INTRAMUSCULAR INJECTION**
- ▶ Child 12–17 years: 25–50 mg/m² every month, increase dose every 6–12 months according to response

- **UNLICENSED USE** Not licensed for use in children.
- **SIDE-EFFECTS** Suppression of spermatogenesis

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Testosterone enantate (Non-proprietary)**

Testosterone enantate 250 mg per 1 ml Testosterone enantate 250mg/1ml solution for injection ampoules | 3 ampoule (PoM) £79.75 DT price = £79.75 (CD4-2)

F 460

Testosterone propionate**● INDICATIONS AND DOSE****Delayed puberty in males**

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ Child: 50 mg once weekly

Treatment of microphallus (specialist use only)

- ▶ **TO THE SKIN USING CREAM**
- ▶ Child: Apply 3 times a day for 3 weeks

- **SIDE-EFFECTS** Suppression of spermatogenesis

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cream

F 460

Testosterone undecanoate**● INDICATIONS AND DOSE****Induction and maintenance of sexual maturation in males (specialist use only)**

- ▶ **BY MOUTH**
- ▶ Child 12–17 years: 40 mg once daily on alternate days, adjusted according to response to 120 mg daily

- **SIDE-EFFECTS** Suppression of spermatogenesis

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Restandol** (Merck Sharp & Dohme Ltd)

Testosterone undecanoate 40 mg Restandol 40mg Testocaps | 30 capsule (PoM) £8.55 (CD4-2) | 60 capsule (PoM) £17.10 DT price = £17.10 (CD4-2)

7.2a Precocious puberty**Other drugs used for Precocious puberty** Goserelin, p. 450

• Leuporelin acetate, p. 451 • Triptorelin, p. 451

ANTI-ANDROGENS**Cyproterone acetate****● INDICATIONS AND DOSE****Gonadotrophin-independent precocious puberty (specialist use only)**

- ▶ **BY MOUTH**
- ▶ Child: Initially 25 mg twice daily, adjusted according to response

- **UNLICENSED USE** Unlicensed for use in children.
- **CONTRA-INDICATIONS** Dubin-Johnson syndrome • history of thromboembolic disorders • liver-disease • malignant diseases • meningioma or history of meningioma • previous or existing liver tumours • Rotor syndrome • severe depression • severe diabetes (with vascular changes) • sickle-cell anaemia • wasting diseases • youths under 18 years (may arrest bone maturation and testicular development)
- **CAUTIONS** Diabetes mellitus • in prostate cancer, severe depression • in prostate cancer, sickle-cell anaemia • ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)
- **INTERACTIONS** → Appendix 1: cyproterone
- **SIDE-EFFECTS**
- ▶ **Rare** Hypersensitivity reactions • osteoporosis • rash
- ▶ **Frequency not known** Breathlessness • changes in hair pattern • fatigue • gynaecomastia (rarely leading to galactorrhoea and benign breast nodules) • hepatic failure • hepatitis • hepatotoxicity • inhibition of spermatogenesis • jaundice • lassitude • reduced sebum production (may clear acne) • risk of recurrence of thromboembolic disease • weight changes

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hepatotoxicity** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).
- **HEPATIC IMPAIRMENT** Avoid—dose-related toxicity.
- **MONITORING REQUIREMENTS**
- ▶ Monitor blood counts initially and throughout treatment.
- ▶ Monitor adrenocortical function regularly.
- ▶ Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

● MEDICAL FORMS

Treatment in children should be undertaken by a specialist.

Carbimazole or propylthiouracil are initially given in large doses to block thyroid function. This dose is continued until the child becomes euthyroid, usually after 4 to 8 weeks, and is then gradually reduced to a maintenance dose of 30–60% of the initial dose. Alternatively high-dose treatment is continued in combination with levothyroxine sodium p. 464 replacement (*blocking-replacement regimen*); this is particularly useful when dose adjustment proves difficult. Treatment is usually continued for 12 to 24 months. The blocking-replacement regimen is **not** suitable during pregnancy. Hypothyroidism should be avoided particularly during pregnancy as it can cause fetal goitre.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (^{131}I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 101 is useful for rapid relief of thyrotoxic symptoms and can be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but atenolol p. 103 is also used.

Thyrotoxic crisis ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 420 as sodium succinate, as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Pregnancy

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

Neonates

Neonatal hyperthyroidism is treated with carbimazole or propylthiouracil, usually for 8 to 12 weeks. In severe symptomatic disease iodine may be needed to block the thyroid and propranolol required to treat peripheral symptoms.

8 Thyroid disorders

8.1 Hyperthyroidism

Antithyroid drugs

Overview

Antithyroid drugs are used for hyperthyroidism either to prepare children for thyroidectomy or for long-term management. In the UK carbimazole p. 463 is the most commonly used drug. Propylthiouracil p. 463 should be reserved for children who are intolerant of, or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

Carbimazole

● INDICATIONS AND DOSE

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

► BY MOUTH

- Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

Hyperthyroidism (including Graves' disease)

► BY MOUTH

- Neonate: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses (up to 1 mg/kg daily) are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses.
- Child 1 month–11 years: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses; maximum 30 mg per day
- Child 12–17 years: Initially 30 mg daily until euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses

DOSE EQUIVALENCE AND CONVERSION

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

IMPORTANT SAFETY INFORMATION

NEUTROPENIA AND AGRANULOCYTOSIS

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

- **INTERACTIONS** → Appendix 1: carbimazole

● SIDE-EFFECTS

- **Common or very common** Arthralgia · fever · headache · hepatic disorders · hepatitis · jaundice · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
- **Rare** Agranulocytosis · alopecia · bone marrow suppression · hypersensitivity reactions · jaundice · myopathy · pancytopenia

SIDE-EFFECTS, FURTHER INFORMATION

Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted.

- **PREGNANCY** Carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate. Carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the

hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.
- **PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

ANTITHYROID DRUGS > THIOURACILS

Propylthiouracil

● INDICATIONS AND DOSE

Hyperthyroidism (including Graves' disease)

► BY MOUTH

- Neonate: Initially 2.5–5 mg/kg twice daily until euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.
- Child 1–11 months: Initially 2.5 mg/kg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis
- Child 1–4 years: Initially 25 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis
- Child 5–11 years: Initially 50 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis
- Child 12–17 years: Initially 100 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis

DOSE EQUIVALENCE AND CONVERSION

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

- **UNLICENSED USE** Not licensed for use in children under 6 years of age.

- **INTERACTIONS** → Appendix 1: propylthiouracil

● SIDE-EFFECTS

- **Common or very common** Arthralgia · fever · headache · jaundice · leucopenia · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
- **Rare** Agranulocytosis · alopecia · aplastic anaemia · bone marrow suppression · cutaneous vasculitis ·

encephalopathy · hepatic disorders · hepatic failure · hepatic necrosis · hepatitis · hypersensitivity reactions · hypoprothrombinaemia · jaundice · lupus erythematosus-like syndromes · myopathy · nephritis · pancytopenia · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hepatotoxicity** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.
- **PREGNANCY** Propylthiouracil can be given but the blocking-replacement regimen is **not** suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).
- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function. Monitor infant's thyroid status.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Use 75% of normal dose if estimated glomerular filtration rate 10–50 mL/minute/1.73 m². Use 50% of normal dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor for hepatotoxicity.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

Iodine 50 mg per 1 mL, Potassium iodide 100 mg per 1 mL Iodine aqueous oral solution | 500 mL [P] £9.58

8.2 Hypothyroidism

Thyroid hormones

Overview

Thyroid hormones are used in hypothyroidism (juvenile myxoedema), and also in diffuse non-toxic goitre, congenital or neonatal hypothyroidism, and Hashimoto's thyroiditis (lymphadenoid goitre). Neonatal hypothyroidism requires prompt treatment to facilitate normal development.

Levothyroxine sodium below (thyroxine sodium) is the treatment of choice for *maintenance* therapy.

Doses for congenital hypothyroidism and juvenile myxoedema should be titrated according to clinical response, growth assessment, and measurement of plasma thyroxine and thyroid-stimulating hormone concentrations. In congenital hypothyroidism higher initial doses may normalise metabolism more quickly, with associated beneficial effects on mental development.

Liothyronine sodium p. 465 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 420, and treatment of infection; assisted ventilation is often required.

THYROID HORMONES

Levothyroxine sodium

(Thyroxine sodium)

● INDICATIONS AND DOSE

Hypothyroidism

▶ BY MOUTH

▶ Neonate: Initially 10–15 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 5 micrograms/kg every 2 weeks, alternatively adjusted in steps of 5 micrograms/kg as required; maintenance 20–50 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.

▶ Child 1 month–1 year: Initially 5 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 10–25 micrograms every 2–4 weeks until metabolism normalised; maintenance 25–75 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes

before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

- ▶ Child 2–11 years: Initially 50 micrograms once daily; adjusted in steps of 25 micrograms every 2–4 weeks until metabolism normalised; maintenance 75–100 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time
- ▶ Child 12–17 years: Initially 50 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks until metabolism normalised; maintenance 100–200 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole

▶ BY MOUTH

- ▶ Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

- **CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · long-standing hypothyroidism · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

- **INTERACTIONS** → Appendix 1: levothyroxine

- **SIDE-EFFECTS** Anginal pain (usually at excessive dosage) · arrhythmias (usually at excessive dosage) · benign intracranial hypertension (usually at excessive dosage) · craniosynostosis · diarrhoea (usually at excessive dosage) · eosinophilia · excitability (usually at excessive dosage) · fever · flushing · headache · heat intolerance · hypersensitivity reactions · insomnia (usually at excessive dosage) · liver dysfunction · menstrual irregularities · muscle cramp · muscular weakness · nervousness · oedema · palpitation (usually at excessive dosage) · premature closure of epiphyses · pruritus · rash · restlessness (usually at excessive dosage) · sweating · tachycardia (usually at excessive dosage) · transient hair loss · tremor (usually at excessive dosage) · vomiting (usually at excessive dosage) · weight-loss

- **PREGNANCY** Levothyroxine requirement may increase during pregnancy. Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

● **PRESCRIBING AND DISPENSING INFORMATION**

Levothyroxine equivalent to 100 micrograms/m²/day can be used as a guide to the requirements in children.

● **PATIENT AND CARER ADVICE**

● **INDICATIONS AND DOSE**

Hypothyroidism

▶ **BY MOUTH**

- ▶ Child 12–17 years: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses

Hypothyroid coma

▶ **BY SLOW INTRAVENOUS INJECTION**

- ▶ Child 12–17 years: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

Hypothyroidism (replacement for oral levothyroxine)

▶ **BY SLOW INTRAVENOUS INJECTION**

- ▶ Child: Convert daily levothyroxine dose to liothyronine and give in 2–3 divided doses, adjusted according to response

continued →

DOSE EQUIVALENCE AND CONVERSION

- ▶ 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- ▶ Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

- **CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · prolonged hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency) · severe hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency)

- **INTERACTIONS** → Appendix 1: liothyronine

- **SIDE-EFFECTS** Anginal pain (usually at excessive dosage) · arrhythmias (usually at excessive dosage) · diarrhoea (usually at excessive dosage) · excitability (usually at excessive dosage) · flushing · headache · muscle cramp · muscular weakness · palpitation (usually at excessive dosage) · restlessness (usually at excessive dosage) · sweating · tachycardia (usually at excessive dosage) · weight-loss

- **PREGNANCY** Liothyronine requirement may increase during pregnancy. Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

- **PRESCRIBING AND DISPENSING INFORMATION**

Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

Tablet

- ▶ **Liothyronine sodium (Non-proprietary)**

Liothyronine sodium 5 microgram Cytomel 5microgram tablets | 100 tablet [PoM] no price available

Liothyronine sodium 20 microgram Liothyronine 20microgram tablets | 28 tablet [PoM] £258.20 DT price = £258.20

Liothyronine sodium 25 microgram Cytomel 25microgram tablets | 100 tablet [PoM] no price available

Powder for solution for injection

- ▶ **Liothyronine sodium (Non-proprietary)**

Liothyronine sodium 20 microgram Liothyronine 20microgram powder for solution for injection vials | 5 vial [PoM] £1,425.00

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary incontinence

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity; oxybutynin hydrochloride p. 468 also has a direct relaxant effect on urinary smooth muscle. Oxybutynin hydrochloride can be considered first for children under 12 years. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose and then slowly titrating upwards; alternatively oxybutynin hydrochloride can be given by intravesicular instillation. Tolterodine tartrate p. 469 is also effective for urinary incontinence; it can be considered for children over 12 years, or for younger children who have failed to respond to oxybutynin hydrochloride. Modified-release preparations of oxybutynin hydrochloride and tolterodine tartrate are available; they may have fewer side-effects. Antimuscarinic treatment should be reviewed soon after it is commenced, and then at regular intervals; a response generally occurs within 6 months but occasionally may take longer. Children with nocturnal enuresis may require specific additional measures if night-time symptoms also need to be controlled.

Nocturnal enuresis in children

23-May-2017

Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

Treatment

Children under 5 years

[EvGr] For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families. **[A]**

Non Drug Treatment

[EvGr] Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in children under 7 years should be considered depending on the child's maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 412, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable. **[A]**

Drug Treatment

[EvGr] Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn **gradually** at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 468 or tolterodine tartrate p. 469 [unlicensed indication]). Treatment should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 231 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually.

ANTIMUSCARINICS

Antimuscarinics (systemic)

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention
- **CAUTIONS** Arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia) · cardiac surgery (due to association with tachycardia) · children (increased risk of side-effects) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · gastro-oesophageal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to angle-closure glaucoma · pyrexia · ulcerative colitis
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · dilation of pupils with loss of accommodation · dry mouth · photophobia · reduced bronchial secretions · skin dryness · skin flushing · transient bradycardia (followed by tachycardia, palpitation and arrhythmias) · urinary retention · urinary urgency
 - ▶ **Uncommon** Confusion · giddiness · nausea · vomiting
 - ▶ **Very rare** Angle-closure glaucoma
 - ▶ **Frequency not known** Angioedema · blurred vision · blurred vision · central nervous system stimulation · convulsion · diarrhoea · difficulty in micturition · disorientation · dizziness · drowsiness · dry eyes · euphoria · fatigue · flatulence · hallucinations · headache · impaired memory · palpitation · photosensitivity · rash · reduced sweating (may lead to heat sensations and fainting in hot environments or patients with fever) · restlessness · taste disturbances

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

 above

Oxybutynin hydrochloride

● INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
 - ▶ Child 2–4 years: 1.25–2.5 mg 2–3 times a day
 - ▶ Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
 - ▶ Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day

▶ BY INTRAVESICAL INSTILLATION

- ▶ Child 2–17 years: 5 mg 2–3 times a day
- ▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**
 - ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

Nocturnal enuresis associated with overactive bladder

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
 - ▶ Child 5–17 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime
- ▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**
 - ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*® XL

- **UNLICENSED USE** Not licensed for use in children under 5 years. Intravesical instillation not licensed for use in children.
- **CAUTIONS** Acute porphyrias p. 577
- **INTERACTIONS** → Appendix 1: oxybutynin
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Anorexia · facial flushing
 - ▶ **Rare** Night terrors
- **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturers advise avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **PRESCRIBING AND DISPENSING INFORMATION** The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

Intravesical instillation may be available from 'special-order' manufacturers or specialist importing companies.

- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Oxybutynin for daytime urinary symptoms www.medicinesforchildren.org.uk/oxybutynin-for-daytime-urinary-symptoms

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, bladder irrigation

Modified-release tablet

1.2 Urinary retention

Urinary retention

31-May-2017

Description of condition

Urinary retention is the inability to voluntarily urinate. Causes in children can include severe voiding dysfunction, urethral blockage, drug treatment (such as opioids and antimuscarinic drugs), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, and neurogenic causes.

Acute urinary retention is a medical emergency characterised by the abrupt (over a period of hours) development of the inability to pass urine, associated with increasing pain and the presence of a distended bladder, which can be palpated on examination.

Chronic urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by difficulties with initiating and maintaining urinary stream, urinary overflow, no sensation for needing to void and a post-void residual.

Treatment

[EvGr] Treatment of urinary retention depends on the underlying condition. Catheterisation is used as an effective initial management strategy, which should be followed by diagnostic evaluation and appropriate treatment of the underlying cause. Clean intermittent catheterisation on a long-term basis is effective for children with idiopathic or neurogenic bladder dysfunction.

The selective alpha-adrenoceptor blockers, doxazosin p. 470 and tamsulosin hydrochloride p. 470, have been shown to be of use in primary bladder neck dysfunction and dysfunctional voiding; they reduce urethral sphincteric pressure, thereby improving bladder emptying in children. Treatment should be under specialist advice only. ⚠

ALPHA-ADRENOCEPTOR BLOCKERS

Doxazosin

• INDICATIONS AND DOSE

Hypertension

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 6–11 years: Initially 500 micrograms once daily, then increased to 2–4 mg once daily, dose should be increased at intervals of 1 week
- Child 12–17 years: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily, rarely doses of up to 16 mg daily may be required

Dysfunctional voiding (initiated under specialist supervision)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 4–11 years: Initially 0.5 mg daily, adjusted according to response, dose should be increased at monthly intervals; maximum 2 mg per day
- Child 12–17 years: Initially 1 mg daily, adjusted according to response, dose may be doubled at intervals of 1 month; usual maintenance 2–4 mg daily; maximum 8 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** History of postural hypotension
- **CAUTIONS** Care with initial dose (postural hypotension) · cataract surgery (risk of intra-operative floppy iris syndrome) · heart failure · pulmonary oedema due to aortic or mitral stenosis
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety · back pain · coughing · dyspnoea · fatigue · influenza-like symptoms · myalgia · paraesthesia · sleep disturbance · vertigo
 - **Uncommon** Agitation · angina · arthralgia · epistaxis · gout · hypoaesthesia · impotence · micturition disturbance · myocardial infarction · purpura · tinnitus · tremor · weight changes
 - **Very rare** Abnormal ejaculation · alopecia · arrhythmias · bradycardia · bronchospasm · cholestasis · gynaecomastia · hepatitis · hot flushes · jaundice · leucopenia · thrombocytopenia
 - **Frequency not known** Asthenia · blurred vision · depression · dizziness · gastro-intestinal disturbances · headache · hypersensitivity · hypotension · oedema · palpitations · postural hypotension · priapism · pruritus · rash · rhinitis · syncope · tachycardia
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Accumulates in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution. Manufacturer advises avoid in severe impairment—no information available.
- **PATIENT AND CARER ADVICE**

Patient counselling is advised for doxazosin tablets (initial dose).

Driving and skilled tasks

May affect performance of skilled tasks e.g. driving.

1.3 Urological pain

Urological pain

Treatment

Lidocaine hydrochloride **gel** p. 796 is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

Alkalinisation of urine

Alkalinisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections.

ALKALISING DRUGS

Citric acid with potassium citrate

● **INDICATIONS AND DOSE**

Relief of discomfort in mild urinary-tract infections | Alkalinisation of urine

► **BY MOUTH USING ORAL SOLUTION**

- Child 1–5 years: 5 mL 3 times a day, diluted well with water
- Child 6–17 years: 10 mL 3 times a day, diluted well with water

● **CAUTIONS** Cardiac disease

- **INTERACTIONS** → Appendix 1: potassium citrate
- **SIDE-EFFECTS** Hyperkalaemia on prolonged high dosage • mild diuresis
- **RENAL IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL.
- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Citric acid monohydrate 50 mg per 1 mL, Potassium citrate 300 mg per 1 mL Potassium citrate mixture | 200 mL [P] £1.33 DT price = £1.33

2 Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine p. 673 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas* spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride **solution 0.9%** (physiological saline) p. 561 is usually adequate and is preferred as a mechanical irrigant.

Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

Catheter maintenance solutions

● **CATHETER MAINTENANCE SOLUTIONS**

OptiFlo R citric acid 6% catheter maintenance solution (Bard Ltd) 50 mL • NHS indicative price = £3.60 • Drug Tariff (Part IXa) 100 mL • NHS indicative price = £3.60 • Drug Tariff (Part IXa)

3 Contraception

Contraceptives, hormonal

Overview

The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg16) should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom*®) is also available; it is pre-lubricated but does not contain a spermicide.

Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen ('combined oral contraceptives') are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'phasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Combined Oral Contraceptives Monophasic 21-day preparations

Oestrogen content	Progestogen content	Brand
Ethinylestradiol 20 micrograms	Desogestrel 150 micrograms	Gedarel® 20/150

Choice

The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- *Low strength preparations* (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- *Standard strength preparations* (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased*

preparations) are appropriate for standard use. Phased preparations are generally reserved for women who *either* do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 478, ethinylestradiol with drospirenone p. 479, and ethinylestradiol with gestodene p. 480 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 478 is in the combined oral contraceptive *Qlaira*®. Nomegestrol is the progestogen contained in the combined oral contraceptive *Zoely*®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evra*®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*®).

Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) p. 489 is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (*Noristerat*®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interm contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems *Mirena*®, *Jaydess*® and *Levosert*® release levonorgestrel p. 486 directly into the uterine cavity. *Mirena*® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. *Jaydess*® and *Levosert*® are licensed for contraception, and *Levosert*® is additionally

licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Emergency contraception

Hormonal methods

Hormonal emergency contraceptives include levonorgestrel and ulipristal acetate p. 484; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device. Ulipristal acetate is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin p. 314). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

Contraceptives, interactions

06-Jun-2017

Overview

The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 189, eslicarbazepine acetate, nevirapine p. 395, oxcarbazepine p. 197, phenytoin p. 198, phenobarbital p. 208,

primidone p. 209, ritonavir p. 406, St John's Wort, topiramate p. 204 and, above all, rifabutin p. 348 and rifampicin p. 349) and possibly also griseofulvin p. 363.

EvGr A condom together with a long-acting method (such as an injectable contraceptive) may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists. **⚠**

Combined hormonal contraceptives interactions

EvGr Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progestogen-only contraceptives (medroxyprogesterone acetate p. 489 and norethisterone p. 458) or intra-uterine devices (levonorgestrel p. 486; see also Contraceptives, non-hormonal p. 476). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed **⚠**:

Short course (2 months or less) of an enzyme-inducing drug

EvGr Continuing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug. **⚠**

Long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin) or a course of griseofulvin

EvGr Use a monophasic combined oral contraceptive at a dose of ethinylestradiol 50 micrograms or more daily [unlicensed use] and use either an extended or a 'tricycling' regimen (i.e. taking three packets of monophasic tablets without a break followed by a shortened tablet-free interval of four days [unlicensed use]); continue for the duration of treatment with the interacting drug and for four weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use] on specialist advice, or to use additional precautions, or to change to a method unaffected by the interacting drugs.

Use of contraceptive patches and vaginal rings (including concurrent use of two patches or two vaginal rings) is not recommended for women taking enzyme-inducing drugs over a long period. **⚠**

Long-term course (over 2 months) of rifampicin or rifabutin

An alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for four weeks after stopping the enzyme-inducing drug.

Antibacterials that do not induce liver enzymes

EvGr It is recommended that no additional contraceptive precautions are required when *combined* oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman. **⚠**

There had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 326, doxycycline p. 338) reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes.

EvGr The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin

and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug. **⚠**

Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. **EvGr** The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

Effectiveness of the etonogestrel-releasing implant p. 489 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug. **⚠**

Hormonal emergency contraception interactions

The effectiveness of levonorgestrel and ulipristal acetate p. 484 is reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). **EvGr** A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See *Dose adjustments due to interactions* under levonorgestrel). There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers. **⚠**

The effectiveness of ulipristal acetate for emergency contraception may be reduced by drugs that increase gastric pH (such as regular use of antacids, H₂ receptor antagonists and proton pump inhibitors). **EvGr** Levonorgestrel or a copper intra-uterine device should be considered as alternatives.

Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception—the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended.

Ulipristal acetate can be used as emergency hormonal contraception more than once in the same cycle. **⚠** Conversely, manufacturer advises that use of levonorgestrel as emergency contraception more than once in the same cycle is not advisable due to increased risk of side-effects (such as menstrual irregularities).

EvGr Levonorgestrel should not be used (as emergency hormonal contraception) within 5 days of administration of ulipristal acetate (as emergency hormonal contraception), as the contraceptive effect of ulipristal acetate may be reduced by progestogens.

Ulipristal acetate is not recommended for use in women who have severe asthma treated by oral corticosteroids, due to the antiglucocorticoid effect of ulipristal acetate. **⚠**

Useful Resources

Drug interactions with hormonal contraception. The Faculty of Sexual and Reproductive Healthcare. Clinical guidance. January 2017.

www.fsrh.org/standards-and-guidance/current-clinical-guidance/drug-interactions

Contraceptives, non-hormonal

Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' p. 490 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for young women irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

A frameless, copper-bearing intra-uterine device (*Gyne Fix*®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

Caution with oil-based lubricants

Products such as petroleum jelly (*Vaseline*®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

3.1 Contraception, combined

OESTROGENS COMBINED WITH PROGESTOGENS

Combined hormonal contraceptives

- **CONTRA-INDICATIONS** Acute porphyrias p. 577 · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin

concentration)—seek specialist advice · Crohn's disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia (seek specialist advice) · inflammatory bowel disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial disease · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- ▶ **Risk of venous thromboembolism** There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of *arterial* thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

- ▶ **Risk factors for venous thromboembolism** Use with **caution** if any of following factors present but **avoid** if two or more factors present:
 - **family history of venous thromboembolism** in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
 - **obesity**; body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - **long-term immobilisation** e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
 - **history of superficial thrombophlebitis**;
 - **age over 35 years** (avoid if over 50 years);
 - **smoking**.

¹ Combined with ethinylestradiol ² Combined with estradiol	

- Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- *diabetes mellitus* (avoid if diabetes complications present);
- *hypertension*; blood pressure above *systolic 140 mmHg or diastolic 90 mmHg* (avoid if blood pressure above *systolic 160 mmHg or diastolic 95 mmHg*; (in adolescents, avoid if blood pressure very high);
- *smoking* (avoid if smoking 40 or more cigarettes daily);
- *age* over 35 years (avoid if over 50 years);
- *obesity* (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

- **Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

- **INTERACTIONS** → Appendix 1 combined hormonal contraceptives.

• SIDE-EFFECTS

- **Rare** Gallstones · systemic lupus erythematosus
- **Frequency not known** Abdominal cramps · absence of withdrawal bleeding · amenorrhoea after discontinuation · breast enlargement · breast secretion · breast tenderness · cervical erosion · changes in libido · changes in lipid metabolism · changes in vaginal discharge · chloasma · chorea · contact lenses may irritate · depression · fluid retention · headache · hepatic tumours · hypertension ·

irritability · leg cramps · liver impairment · nausea · nervousness · photosensitivity · reduced menstrual loss · skin reactions · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) · visual disturbances · vomiting · ‘spotting’ in early cycles

SIDE-EFFECTS, FURTHER INFORMATION

- **Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.
- **Cervical cancer** Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years.

The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.
- **DIRECTIONS FOR ADMINISTRATION**
 - With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. **21-day combined preparations**, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. **Every day (ED) combined preparations**, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

• PATIENT AND CARER ADVICE

Missed pill The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as

soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets).

Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Travel Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

F 476

Dienogest with estradiol valerate

● INDICATIONS AND DOSE

Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations

► BY MOUTH

- Females of childbearing potential: 1 active tablet once daily for 26 days, followed by 1 inactive tablet daily for 2 days, withdrawal bleeding may occur during the 2-day interval of *inactive* tablets, tablets should be taken at approximately the same time each day

- **UNLICENSED USE** Consult product literature for the licensing status.

● DIRECTIONS FOR ADMINISTRATION

- Changing to *Qlaira*[®]: start the first active *Qlaira*[®] tablet on the day after taking the last active tablet of the previous brand

● PATIENT AND CARER ADVICE

Missed doses

A missed pill for a patient taking *Qlaira*[®] is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*[®], refer to product literature.

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Qlaira*[®], refer to product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Dienogest with estradiol valerate (Non-proprietary)**

Dienogest 2 mg, Estradiol valerate 2 mg Estradiol valerate 2mg / Dienogest 2mg tablets | 15 tablet [PoM] no price available

Estradiol valerate 2 mg, Dienogest 3 mg Estradiol valerate 2mg / Dienogest 3mg tablets | 51 tablet [PoM] no price available

► **Qlaira (Bayer Plc)**

Qlaira tablets | 84 tablet [PoM] £25.18

F 476

Estradiol with nomegestrol

● INDICATIONS AND DOSE

Contraception

► BY MOUTH

- Females of childbearing potential: 1 active tablet daily for 24 days, followed by 1 inactive tablet daily for 4 days, to be started on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval

- **PREGNANCY** Toxicity in *animal* studies.

● DIRECTIONS FOR ADMINISTRATION

- Changing to *Zoely*[®]: start the first active *Zoely*[®] tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand

● PATIENT AND CARER ADVICE

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Zoely*[®], refer to product literature.

Missed doses

A missed pill for a patient taking *Zoely*[®] is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Zoely*[®], refer to product literature.

476

Ethinylestradiol with etonogestrel

● INDICATIONS AND DOSE

Contraception | Menstrual symptoms

► BY VAGINA

- Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

● DIRECTIONS FOR ADMINISTRATION

Changing method of contraception to vaginal ring
Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

● PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer vaginal ring.

Counselling The presence of the ring should be checked regularly.

Missed doses

Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for *less than 3 hours*,

rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle *or* allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

Ethinylestradiol with norelgestromin

F 476

● INDICATIONS AND DOSE

Contraception | Menstrual symptoms

► BY TRANSDERMAL APPLICATION

- Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

- **UNLICENSED USE** Consult product literature for the licensing status of individual preparations.
- **DIRECTIONS FOR ADMINISTRATION** Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch. Changing to a transdermal combined hormonal contraceptive **Changing from combined oral contraception** Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

Changing from progestogen-only method

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

After abortion or miscarriage Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

● PATIENT AND CARER ADVICE

Patients and carers should be given advice on how to administer patches.

Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Missed doses

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of

contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* (SMC) has advised (September 2003) that *Evra*® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Transdermal patch

- **Evra** (Janssen-Cilag Ltd)
Ethinylestradiol 33.9 microgram per 24 hour, Norelgestromin 203 microgram per 24 hour Evra transdermal patches | 9 patch [PoM] £19.51 DT price = £19.51

Levonorgestrel, p. 486

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper)

● INDICATIONS AND DOSE

Contraception

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

- **CONTRA-INDICATIONS** Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · distorted uterine cavity · established or marked immunosuppression · genital malignancy · medical diathermy · pelvic inflammatory disease · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding · Wilson's disease

- **CAUTIONS** Anaemia · anticoagulant therapy (avoid if possible) · diabetes · disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical

stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age

CAUTIONS, FURTHER INFORMATION

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- **Risk of infection** The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
 - they are under 25 years old *or*
 - they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

- **SIDE-EFFECTS** Allergy · bleeding (on insertion) · cervical perforation · displacement · dysmenorrhoea · expulsion · menorrhagia · occasionally epileptic seizure (on insertion) · pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection may be exacerbated · uterine perforation · vasovagal attack (on insertion)

SIDE-EFFECTS, FURTHER INFORMATION

- **Presence of significant symptoms (especially pain)** Advise the patient to seek medical attention promptly in case of significant symptoms.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a copper allergy.
- **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.
- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - UT380 STANDARD®** For uterine length 6.5–9 cm; replacement every 5 years.
 - NOVAPLUS T 380® AG 'Mini'** size for minimum uterine length 5 cm; 'Normal' size for uterine length 6.5–9 cm; replacement every 5 years.

Other drugs used for Contraception, emergency Intra-uterine contraceptive devices (copper), p. 483 • Levonorgestrel, p. 486

PROGESTERONE RECEPTOR MODULATORS

Ulipristal acetate

- **DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

• INDICATIONS AND DOSE

Emergency contraception

► BY MOUTH

- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

- **CONTRA-INDICATIONS** Repeated use as an emergency contraceptive within a menstrual cycle

- **CAUTIONS** Uncontrolled severe asthma

- **INTERACTIONS** → Appendix 1: ulipristal

• SIDE-EFFECTS

- **Common or very common** Abdominal pain • back pain • diarrhoea • dizziness • fatigue • gastro-intestinal disturbances • headache • menstrual irregularities • muscle spasms • nausea • vomiting

- **Uncommon** Blurred vision · breast tenderness · dry mouth · hot flushes · pruritus · rash · tremor · uterine spasm

● **CONCEPTION AND CONTRACEPTION** When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for *Qlaira*®) and 9 days for oral progestogen-only contraceptives.

- **PREGNANCY** Limited information available when used as an emergency contraceptive.
- **BREAST FEEDING** In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Ellaone** (HRA Pharma UK Ltd)
Ulipristal acetate 30 mg EllaOne 30mg tablets | 1 tablet [P] £14.05
- **Esmya** (Gedeon Richter (UK) Ltd)
Ulipristal acetate 5 mg Esmya 5mg tablets | 28 tablet [PoM] £114.13

3.4 Contraception, oral progestogen-only

Other drugs used for Contraception, oral progestogen-only Norethisterone, p. 458

PROGESTOGENS

Desogestrel

● INDICATIONS AND DOSE

Contraception

► BY MOUTH

- Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a 'missed pill'

- **UNLICENSED USE** Consult product literature for the licensing status of individual preparations.
- **CONTRA-INDICATIONS** Acute porphyrias p. 577 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- CAUTIONS, FURTHER INFORMATION**
 - Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- **INTERACTIONS** → Appendix 1: desogestrel

- **SIDE-EFFECTS** Breast discomfort · changes in libido · depression · disturbance of appetite · dizziness · headache · menstrual irregularities · nausea · skin disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

● PATIENT AND CARER ADVICE

Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Missed doses

The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2003) that *Cerazette*® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

Levonorgestrel

18-Feb-2016

● INDICATIONS AND DOSE

Emergency contraception

► BY MOUTH

- Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours

Contraception

► BY MOUTH

- Females of childbearing potential: 1 tablet daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

JAYDESS® 13.5MG INTRA-UTERINE DEVICE

Contraception

► BY VAGINA

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

LEVOSERT® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester abortion; postpartum insertions should be delayed until at least 6 weeks after delivery; effective for 3 years

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

DOSE ADJUSTMENTS DUE TO INTERACTIONS

When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

● UNLICENSED USE

- With oral use Consult product literature for licensing status of individual preparations.
- With vaginal use Not licensed for use in women under 18 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen;

consider this if there is severe pain following insertion and perform an ultrasound.

● CONTRA-INDICATIONS

- ▶ With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration · acute cervicitis · acute vaginitis · distorted uterine cavity · established immunosuppression · genital malignancy · history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception · infected abortion during the previous three months · marked immunosuppression · not suitable for emergency contraception · pelvic inflammatory disease · postpartum endometritis · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding
- ▶ With oral use Acute porphyrias p. 577
- ▶ With oral use for contraception History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

● CAUTIONS

- ▶ With intra-uterine use Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · anaemia · anticoagulant therapy (avoid if possible) · diabetes · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age
- ▶ With oral use for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- ▶ When used for emergency contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · past ectopic pregnancy · severe malabsorption syndromes

CAUTIONS, FURTHER INFORMATION

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- ▶ Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
 - they are under 25 years old *or*
 - they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.
 In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

- ▶ Use as a contraceptive in co-morbidities
- ▶ With oral use The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

MIRENA®20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE Advanced uterine atrophy

- **INTERACTIONS** → Appendix 1: levonorgestrel

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Depression (sometimes severe) · headache · nausea
- ▶ **Frequency not known** Vomiting

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intra-uterine use Changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) · abdominal pain · acne · alopecia · back pain · breast pain · expulsion · hirsutism · migraine · nervousness · pelvic pain · peripheral oedema · salpingitis
- ▶ **Uncommon**
- ▶ With intra-uterine use Abdominal distension · cervicitis · eczema · pelvic inflammatory disease · pruritus · skin hyperpigmentation
- ▶ **Rare**
- ▶ With intra-uterine use Rash · uterine perforation
- ▶ **Frequency not known**
- ▶ With intra-uterine use Functional ovarian cysts (usually asymptomatic and usually resolve spontaneously—ultrasound monitoring recommended) · allergy · bleeding (on insertion) · cervical perforation · displacement · dysmenorrhoea · epileptic seizures (on insertion) · menorrhagia · pain (on insertion, alleviated by NSAID such as ibuprofen 50 minutes before insertion) · pelvic infection may be exacerbated · vasovagal attack (on insertion)
- ▶ With oral use Breast discomfort · breast tenderness · changes in libido · disturbances of appetite · dizziness · fatigue · menstrual irregularities · skin disorders

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception.

- ▶ With intra-uterine use Endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent.
- ▶ With intra-uterine use Removal of the intra-uterine system should be considered if the patient experiences migraine or severe headache, jaundice, marked increase of blood pressure, or severe arterial disease.

● PREGNANCY

- ▶ With oral use Not known to be harmful.
- ▶ With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.
- **MONITORING REQUIREMENTS**
 - ▶ With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intra-uterine use *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*
- **PRESCRIBING AND DISPENSING INFORMATION**
 - ▶ With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHR recommends to prescribe and dispense by brand name to avoid inadvertent switching.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

JAYDESS® 13.5MG INTRA-UTERINE DEVICE When system is removed (and not immediately replaced) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

LEVONELLE® ONE STEP Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

- **PATIENT AND CARER ADVICE**

Diarrhoea and vomiting with use as an oral contraceptive

Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Missed doses

When used as an oral contraceptive, the following advice is recommended 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Starting routine

- ▶ With oral use for Contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive

course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

- ▶ With intra-uterine use Counsel women to seek medical attention promptly in case of significant symptoms, especially pain. Patient counselling advised. Patient information leaflet to be provided.
- ▶ With oral use for Emergency contraception If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given.
- ▶ With oral use for Emergency contraception When prescribing or supplying hormonal emergency contraception, women should be advised:
 - that their next period may be early or late;
 - that a barrier method of contraception needs to be used until the next period;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
 - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).
- **EXCEPTIONS TO LEGAL CATEGORY** *Levonelle® One Step* can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

3.5 Contraception, parenteral progesterone-only

Other drugs used for Contraception, parenteral progesterone-only Norethisterone, p. 458

PROGESTOGENS

Etonogestrel

27-Sep-2016

● INDICATIONS AND DOSE

Contraception (no hormonal contraceptive use in previous month)

► BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)

► BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery (delay until 28 days postpartum if breast-feeding), implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester

► BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the first trimester

► BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: 1 implant to be inserted within 5 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception (changing from other hormonal contraceptive)

► BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

- **UNLICENSED USE** *Nexplanon*® not licensed for use in females outside of the age range 18–40 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2016): *NEXPLANON*® (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: REPORTS OF DEVICE IN VASCULATURE AND LUNG

There have been rare reports of *Nexplanon*® implants reaching the lung via the pulmonary artery. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Correct subdermal insertion reduces the risk of these events.

- **CONTRA-INDICATIONS** Acute porphyria · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · history of jaundice in pregnancy ·

malabsorption syndromes · possible risk of breast cancer · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

- **INTERACTIONS** → Appendix 1: etonogestrel
- **SIDE-EFFECTS** Breast discomfort · changes in libido · depression · disturbance of appetite · dizziness · headache · injection-site reactions · menstrual irregularities · nausea · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - Cervical cancer Use of injectable progesterone-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progesterone-only contraceptives is not yet known.
 - Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progesterone-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.
- **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.
- **BREAST FEEDING** Progesterone-only contraceptives do not affect lactation.
- **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.

● MEDICINAL FORMS

Etonogestrel 68 mg Nexplanon 68mg implant | 1 device [PoM] £83.43 DT price = £83.43

Medroxyprogesterone acetate

24-May-2017

● INDICATIONS AND DOSE

Contraception

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Long-term contraception

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

continued →

► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: 104 mg every 13 weeks, first dose to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraceptive)

► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: (consult product literature)

- **UNLICENSED USE** [Evg] Not licensed for the treatment of hot flushes caused by long-term androgen suppression in men. A
- **CONTRA-INDICATIONS** Acute porphyrias p. 577 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** History during pregnancy in disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · possible risk of breast cancer

● **INTERACTIONS** → Appendix 1: medroxyprogesterone● **SIDE-EFFECTS**

- **Rare** Osteoporosis · osteoporotic fractures
- **Frequency not known** Breast discomfort · changes in libido · depression · Disturbance of appetite · dizziness · headache · indigestion · injection site-reactions · loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions) · menstrual irregularities · nausea · reduced bone mineral density · skin disorders · vomiting · weight gain

SIDE-EFFECTS, FURTHER INFORMATION

Reduction in bone mineral density occurs in the first 2–3 years of use then stabilises.

- **Cervical cancer** Use of injectable progesterone-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progesterone-only contraceptives is not yet known.

● **CONCEPTION AND CONTRACEPTION**

- **With intramuscular use** If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
- **With subcutaneous use** If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk—no adverse effects reported. Progesterone-only contraceptives do not affect lactation.

The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

- **HEPATIC IMPAIRMENT** Avoid in liver tumour. Caution in severe liver disease and recurrent cholestatic jaundice.
- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of

treatment but there is no evidence of permanent infertility.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection► **Depo-Provera** (Pfizer Ltd)

Medroxyprogesterone acetate 150 mg per 1 ml Depo-Provera 150mg/1ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection [Pm] £6.01 DT price = £6.01

► **Sayana Press** (Pfizer Ltd)

Medroxyprogesterone acetate 160 mg per 1 ml Sayana Press 104mg/0.65 ml suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [Pm] £6.90

3.6 Contraception, spermicidal

SPERMICIDALS**Nonoxinol**● **INDICATIONS AND DOSE****Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps**► **BY VAGINA**

- Females of childbearing potential: (consult product literature)

- **SIDE-EFFECTS** Genital lesions

SIDE-EFFECTS, FURTHER INFORMATION

High frequency use of the spermicide nonoxinol '9' has been associated with genital lesions, which may increase the risk of acquiring these infections.

- **CONCEPTION AND CONTRACEPTION** No evidence of harm to latex condoms and diaphragms.
- **PREGNANCY** Toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies.

Nonoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly | 30 gram [GS] £4.25 | 81 gram [GS] £11.00

4 Vaginal and vulval conditions

Vaginal and vulval conditions**Management**

Pre-pubertal girls may be particularly susceptible to vulvovaginitis. Barrier preparations applied after cleansing can be useful when the symptoms are due to non-specific irritation, but systemic drugs are required in the treatment of bacterial infection or threadworm infestation. Intravaginal preparations, particularly those that require the use of an applicator, are not generally suitable for young girls; topical preparations may be useful in some adolescent girls.

In older girls symptoms are often restricted to the vulva, but infections almost invariably involve the vagina, which should also be treated; treatment should be as for adults.

Preparations for vaginal and vulval changes

Topical oestrogen creams containing **estriol** 0.01% (*Gynest*®) are used in the treatment of labial adhesions; treatment is usually restricted to symptomatic cases. Estriol cream should be applied to the adhesions once or twice daily for 2–6 weeks; adhesions may recur following treatment.

Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Vaginal fungal infections are not normally a problem in younger girls but can occur in adolescents. *Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis*, rare in girls before puberty, can be treated with antifungal pessaries or cream inserted high into the vagina (including during menstruation), however, these are not recommended for pre-pubertal girls and treatment with an external cream may be more appropriate. Single-dose intravaginal preparations offer an advantage when compliance is a problem. Local irritation can occur on application of vaginal antifungal products.

Imidazole drugs (clotrimazole p. 492, econazole nitrate p. 492, fenticonazole nitrate p. 493, and miconazole p. 493) are effective against candida in short courses of 1 to 3 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 358 may be considered for girls post-puberty.

Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited absorption of imidazoles from the skin and vagina. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrent vulvovaginal candidiasis is very rare in children, but can occur if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection can also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus, as well as the gastro-intestinal tract and the bladder. The sexual partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 319 or tinidazole p. 320.

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream, below, and metronidazole gel, below, are indicated for bacterial vaginosis.

The antiviral drugs aciclovir p. 387 and valaciclovir p. 389 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus

shedding and healing, generally giving relief from pain and other symptoms.

- **SIDE-EFFECTS** Local irritation
- **CONCEPTION AND CONTRACEPTION** Cream and pessaries may damage latex condoms and diaphragms.
- **PREGNANCY** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.
- **EXCEPTIONS TO LEGAL CATEGORY** Brands for sale to the public include **Canesten®** Internal Cream.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pessary

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

▶ Clotrimazole (Non-proprietary)

Clotrimazole 500 mg Clotrimazole 500mg pessaries | 1 pessary [P] £3.75 DT price = £2.88

▶ Canesten (clotrimazole) (Bayer Plc)

Clotrimazole 100 mg Canesten 100mg pessaries | 6 pessary [P] £3.50 DT price = £3.50

Clotrimazole 200 mg Canesten 200mg pessaries | 3 pessary [P] £3.10 DT price = £3.10

Clotrimazole 500 mg Canesten 500mg Soft Gel pessaries |

1 pessary [P] £6.41 DT price = £2.88
Canesten 500mg pessaries | 1 pessary [P] no price available DT price = £2.88
Canesten Vaginal 500mg pessaries | 1 pessary [PoM] £2.00 DT price = £2.88

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

▶ Clotrimazole (Non-proprietary)

Clotrimazole 10 mg per 1 gram Clotrimazole 1% cream | 20 gram [P] £2.06 DT price = £1.12 | 50 gram [P] £5.45 DT price = £2.80

▶ Canesten (clotrimazole) (Bayer Plc)

Clotrimazole 10 mg per 1 gram Canesten 1% cream | 20 gram [P] £2.14 DT price = £1.12 | 50 gram [P] £3.50 DT price = £2.80

Canesten Antifungal 1% cream | 20 gram [P] £1.85 DT price = £1.12

Clotrimazole 20 mg per 1 gram Canesten 2% thrush cream |

10 gram [P] no price available | 20 gram [P] £4.46 DT price = £4.46

Clotrimazole 100 mg per 1 gram Canesten Internal 10% cream |

5 gram [P] £6.23 DT price = £6.23
Canesten 10% VC cream | 5 gram [PoM] £4.50 DT price = £6.23

Econazole nitrate

● INDICATIONS AND DOSE

GYNO-PEVARYL® ONCE

Vaginal and vulval candidiasis

- ▶ BY VAGINA
- ▶ Child: 1 pessary for 1 dose, pessary to be inserted at night, dose to be repeated once if necessary

GYNO-PEVARYL® PESSARY

Vaginal and vulval candidiasis

- ▶ BY VAGINA
- ▶ Child: 1 pessary daily for 3 days, pessary to be inserted at night, course can be repeated once if necessary

- **CAUTIONS** Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative
- **SIDE-EFFECTS** Occasional local irritation
- **CONCEPTION AND CONTRACEPTION** Cream and pessaries damage latex condoms and diaphragms.
- **PREGNANCY** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pessary

- ▶ **Gyno-Pevaryl** (Janssen-Cilag Ltd)
Econazole nitrate **150 mg** Gyno-Pevaryl Once 150mg vaginal pessary | 1 pessary [PoM] £3.69
Gyno-Pevaryl 150mg vaginal pessaries | 3 pessary [PoM] £4.17

- **CONCEPTION AND CONTRACEPTION** *Gyno-Daktarin*® damages latex condoms and diaphragms.
- **PREGNANCY** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

EXCIPIENTS: May contain hydroxybenzoates (parabens)

- ▶ **Gyno-Daktarin** (Janssen-Cilag Ltd)
Miconazole nitrate 1.2 gram Gyno-Daktarin 1200mg vaginal capsules | 1 capsule [PoM] £2.94 DT price = £2.94

Fenticonazole nitrate

● INDICATIONS AND DOSE

Vaginal and vulva candidiasis

- ▶ BY VAGINA USING CAPSULES
 - ▶ Child: 200 mg daily for 3 days, alternatively 600 mg daily for 1 dose, to be inserted at night
 - ▶ BY VAGINA USING CREAM
 - ▶ Child: 1 applicatorful twice daily for 3 days
- DOSE EQUIVALENCE AND CONVERSION**
- ▶ 1 applicatorful delivers a 5 g dose of fenticonazole 2 %.

- **CAUTIONS** Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative
- **SIDE-EFFECTS** Local irritation
- **CONCEPTION AND CONTRACEPTION** Intravaginal cream and vaginal capsules damage latex condoms and diaphragms.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol, wool fat and related substances including lanolin

- ▶ **Gynoxin** (Recordati Pharmaceuticals Ltd)
Fenticonazole nitrate 20 mg per 1 gram Gynoxin 2% vaginal cream | 30 gram [PoM] £3.74

Capsule

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- ▶ **Gynoxin** (Recordati Pharmaceuticals Ltd)
Fenticonazole nitrate 200 mg Gynoxin 200mg vaginal capsules | 3 capsule [PoM] £2.42
Fenticonazole nitrate 600 mg Gynoxin 600mg vaginal capsules | 1 capsule [PoM] £2.62

Miconazole

● INDICATIONS AND DOSE

Vaginal and vulval candidiasis

- ▶ BY VAGINA USING CAPSULES
 - ▶ Child: 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary

- **CAUTIONS** Avoid in acute porphyrias p. 577 • avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
 - ▶ Common or very common Nausea • rash • vomiting
 - ▶ Frequency not known Occasional local irritation

Immune system

1 Immune system disorders and transplantation

Immune response

Inflammatory bowel disease

Azathioprine p. 495, mercaptopurine p. 516, or once weekly methotrexate p. 517 are used to induce remission in unresponsive or chronically active Crohn's disease. Azathioprine or mercaptopurine may also be helpful for retaining remission in frequently relapsing inflammatory bowel disease; once weekly methotrexate is used in Crohn's disease when azathioprine or mercaptopurine are ineffective or not tolerated. Response to azathioprine or mercaptopurine may not become apparent for several months. Folic acid p. 546 should be given to reduce the possibility of methotrexate toxicity. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Ciclosporin (cyclosporin) p. 496 is a potent immunosuppressant and is markedly nephrotoxic. In children with severe ulcerative colitis unresponsive to other treatment, ciclosporin may reduce the need for urgent colorectal surgery.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 503), calcineurin inhibitors (ciclosporin or tacrolimus p. 499), corticosteroids, or sirolimus p. 498. Choice is dependent on the type of organ, time after transplant, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Infections in the immunocompromised child can be severe and show atypical features. Specific local protocols should be followed for the management of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised. Children should be up-to-

date with their childhood vaccinations before initiation of immunosuppressant therapy (e.g. before transplantation); vaccination with varicella-zoster vaccine is also necessary during this period—**important**: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella-zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced (to one quarter of the original dose in children) when allopurinol p. 529 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil may reduce the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Children may suffer a high incidence of side-effects, particularly gastrointestinal effects, calling for temporary reduction in dose or interruption of treatment.

Cyclophosphamide p. 509 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

The corticosteroids prednisolone p. 421 and dexamethasone p. 419 are widely used in paediatric oncology; they have a marked antitumour effect. Dexamethasone is preferred for acute lymphoblastic leukaemia whilst prednisolone may be used for Hodgkin's disease, non-Hodgkin's lymphoma, and B-cell lymphoma and leukaemia.

Dexamethasone is the corticosteroid of choice in paediatric supportive and palliative care. For children who are not receiving a corticosteroid as a component of their chemotherapy, dexamethasone may be used to reduce raised intracranial pressure, or to help control emesis when combined with an appropriate anti-emetic.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin (cyclosporin), a calcineurin inhibitor, is a potent immunosuppressant which is virtually

non-myelotoxic but markedly nephrotoxic. It may be used in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease. Ciclosporin also has a role in steroid-sensitive and steroid-resistant nephrotic syndrome; in corticosteroid-sensitive nephrotic syndrome it may be given with prednisolone.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects.

Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006) NICE TA99
When selecting immunosuppressive therapy for renal transplantation in children and adolescents, NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen **only if**:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Mycophenolic acid is not recommended as part of an immunosuppressive regimen for renal transplantation in children or adolescents.

Sirolimus [not licensed for use in children] is recommended as a component of immunosuppressive regimen **only if** intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

www.nice.org.uk/TA99

Other drugs used for Immune system disorders and transplantation Hydroxychloroquine sulfate, p. 612 • Rituximab, p. 505

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Antithymocyte immunoglobulin (rabbit)

• INDICATIONS AND DOSE

Prophylaxis of organ rejection in heart allograft recipients

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 1–2.5 mg/kg daily for 3–5 days, start treatment on day of transplantation, to be given over at least 6 hours

Prophylaxis of organ rejection in renal allograft recipients

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1–17 years: 1–1.5 mg/kg daily for 3–9 days, start treatment on day of transplantation, to be given over at least 6 hours

Treatment of corticosteroid-resistant allograft rejection in renal transplantation

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1–17 years: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

- **CONTRA-INDICATIONS** Infection

- **SIDE-EFFECTS** Anaphylaxis • cytokine release syndrome • diarrhoea • dysphagia • fever • hypotension • increased susceptibility to infection • increased susceptibility to malignancy • infusion-related reactions • lymphopenia • myalgia • nausea • neutropenia • pruritus • rash • serum sickness • shivering • thrombocytopenia • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor blood count.
- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with Glucose 5% or Sodium Chloride 0.9% to an approx. concentration of 0.5 mg/mL; begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); incompatible with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Antithymocyte immunoglobulin (rabbit) (Non-proprietary)**

Antithymocyte immunoglobulin (rabbit) 20 mg per 1 mL Grafalon 100mg/5mL concentrate for solution for infusion vials | 1 vial (PoM) no price available

Powder and solvent for solution for infusion

- ▶ **Thymoglobulin (Sanofi)**

Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobuline 25mg powder and solvent for solution for infusion vials | 1 vial (PoM) £158.77 (Hospital only)

IMMUNOSUPPRESSANTS > ANTIMETABOLITES

Azathioprine

11-May-2017

- **DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

• INDICATIONS AND DOSE

Severe ulcerative colitis | Severe Crohn's disease

- ▶ BY MOUTH
- ▶ Child 2–17 years: Initially 2 mg/kg once daily, then increased if necessary up to 2.5 mg/kg once daily

Systemic lupus erythematosus | Vasculitis | Autoimmune conditions usually when corticosteroid therapy alone has proved inadequate

- ▶ BY MOUTH
- ▶ Child: Initially 1 mg/kg daily, then adjusted according to response to 3 mg/kg daily, consider withdrawal if no improvement within 3 months; maximum 3 mg/kg per day

Suppression of transplant rejection

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child: Maintenance 1–3 mg/kg daily, adjusted according to response, consult local treatment protocol for details, oral route preferred, but if oral route is not possible then can be given by intravenous infusion, the total daily dose may alternatively be given in 2 divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

- **CAUTIONS** Reduced thiopurine methyltransferase activity
- **INTERACTIONS** → Appendix 1: azathioprine
- **SIDE-EFFECTS**
 - ▶ **Rare** Hepatic veno-occlusive disease · lymphoma · pancreatitis · pneumonitis · red cell aplasia
 - ▶ **Frequency not known** Arthralgia · cholestatic jaundice · colitis in patients also receiving corticosteroids · diarrhoea · dizziness · dose-related bone marrow suppression · fever · hair loss · herpes zoster infection · hypersensitivity reactions · hypotension · increased susceptibility to infections in patients also receiving corticosteroids · interstitial nephritis · liver impairment · malaise · myalgia · nausea · neutropenia · rash · rigors · thrombocytopenia · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ Red cell aplasia Cases of pure red cell aplasia have been reported with azathioprine; dose reduction or discontinuation should be considered under specialist supervision.
 - ▶ Neutropenia and thrombocytopenia Usually resolved by reducing the dose.
 - ▶ Hypersensitivity reactions Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis) call for immediate withdrawal.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.
- **PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.
- **BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Reduce dose. Monitor liver function.
- **RENAL IMPAIRMENT** Reduce dose.
- **PRE-TREATMENT SCREENING**

Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for toxicity throughout treatment.
 - ▶ Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
 - ▶ Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Consult local treatment protocol for details. For *intravenous injection*, reconstitute 50 mg with 5–15 mL Water for Injections; give over at least 1 minute.

For *intravenous infusion*, reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a concentration of 0.25–2.5 mg/mL in Glucose 5% or Sodium Chloride 0.9%. Intravenous injection is alkaline and very irritant. Intravenous route should therefore be used **only** if oral route not feasible and discontinued as soon as oral route can be tolerated. To reduce irritation flush line with infusion fluid.

● PATIENT AND CARER ADVICE

Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin (Cyclosporin)

01-Sep-2016

- **DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

● INDICATIONS AND DOSE

Refractory ulcerative colitis

▶ BY MOUTH

- ▶ Child 2–17 years: Initially 2 mg/kg twice daily (max. per dose 5 mg/kg twice daily), dose adjusted according to blood-ciclosporin concentration and response

▶ BY INTRAVENOUS INFUSION

- ▶ Child 3–17 years: Initially 0.5–1 mg/kg twice daily, dose adjusted according to blood-ciclosporin concentration and response

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

▶ BY MOUTH

- ▶ Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist

supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

► BY MOUTH

- Child: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

► BY MOUTH

- Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Prevention of graft rejection following bone-marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation | Prevention and treatment of graft-versus-host disease

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: (consult local protocol)

Nephrotic syndrome

► BY MOUTH

- Child: 3 mg/kg twice daily, dose can be increased if necessary in corticosteroid-resistant disease; for maintenance reduce to lowest effective dose according to whole blood-ciclosporin concentrations, proteinuria, and renal function

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- With oral use Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide.

- **UNLICENSED USE** Not licensed for use in children under 3 months. Not licensed for use in children under 16 years for atopic eczema (dermatitis) or psoriasis. Not licensed for use in ulcerative colitis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CICLOSPORIN MUST BE PRESCRIBED AND DISPENSED BY BRAND NAME (DECEMBER 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- **CONTRA-INDICATIONS** Abnormal baseline renal function (in non-transplant indications) · malignancy (in non-transplant indications) · uncontrolled hypertension (in non-transplant indications) · uncontrolled infections (in non-transplant indications)
- **CAUTIONS** Hyperuricaemia · in atopic dermatitis, active herpes simplex infections—allow infection to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis, *Staphylococcus aureus* skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in psoriasis treat, patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) · in uveitis, Behçet's syndrome (monitor neurological status) · lymphoproliferative disorders (discontinue treatment) · malignancy

CAUTIONS, FURTHER INFORMATION

- Malignancy In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any

lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.

- **INTERACTIONS** → Appendix 1: ciclosporin

● **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · acne · anorexia · convulsion · diarrhoea · fatigue · flushing · gingival hyperplasia · headache · hepatic dysfunction · hirsutism · hyperglycaemia · hyperkalaemia · hyperlipidaemia · hypertension · hypertrichosis · hyperuricaemia · hypomagnesaemia · leucopenia · muscle cramps · myalgia · nausea · paraesthesia · peptic ulcer · pyrexia · renal dysfunction (renal structural changes on long-term administration) · tremor · vomiting
- **Uncommon** Anaemia · oedema · signs of encephalopathy · thrombocytopenia · weight gain
- **Rare** Gynaecomastia · haemolytic uraemic syndrome · menstrual disturbances · micro-angiopathic haemolytic anaemia · motor polyneuropathy · muscle weakness · myopathy · pancreatitis
- **Very rare** Visual disturbances secondary to benign intracranial hypertension
- **Frequency not known** Migraine · pain in lower extremities
- With intravenous use Anaphylaxis

- **PREGNANCY** Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.

- **HEPATIC IMPAIRMENT** Extensively metabolised by the liver—manufacturer advises consider dose adjustment based on bilirubin and liver enzyme levels.

- **RENAL IMPAIRMENT** In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid. In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. *During treatment* for non-transplant indications, manufacturer recommends if the estimated glomerular filtration rate decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the estimated glomerular filtration rate decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.

- **MONITORING REQUIREMENTS** Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).

- In long-term management of nephrotic syndrome, perform renal biopsies every 1–2 years.

● **DIRECTIONS FOR ADMINISTRATION**

- With oral use Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.
- With intravenous use For intermittent intravenous infusion, dilute to a concentration of 0.5–2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

● **PRESCRIBING AND DISPENSING INFORMATION**

Brand name prescribing Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin

concentration, serum creatinine, blood pressure, and transplant function (for transplant indications). *Sandimmun*® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

● PATIENT AND CARER ADVICE

Patients and carers should be counselled on the administration of different formulations of ciclosporin.

Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

Sirolimus

- **DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

● INDICATIONS AND DOSE

As a component of immunosuppressive therapy for renal transplantation in children and adolescents only if intolerance necessitates the withdrawal of a calcineurin inhibitor

► BY MOUTH

► Child: (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

► The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should **not** be used as a substitute for other tablet strengths.

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Hyperlipidaemia · increased susceptibility to infection (especially urinary-tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

- **INTERACTIONS** → Appendix 1: sirolimus

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · acne · anaemia · arthralgia · ascites · constipation · diarrhoea · epistaxis · haemolytic uraemic syndrome · headache · hypercholesterolaemia · hyperglycaemia · hypertension · hypertriglyceridaemia · hypokalaemia · hypophosphataemia · impaired healing · leucopenia · lymphocele · nausea · neutropenia · oedema · osteonecrosis · pleural effusion · pneumonitis · proteinuria · pyrexia · rash · stomatitis · tachycardia · thrombocytopenia · thrombotic thrombocytopenic purpura · venous thromboembolism
- **Uncommon** Nephrotic syndrome · pancreatitis · pancytopenia · pericardial effusion · pulmonary embolism · pulmonary haemorrhage
- **Rare** Alveolar proteinosis · anaphylactic reactions · angioedema · exfoliative dermatitis · hepatic necrosis · hypersensitivity reactions · hypersensitivity vasculitis · interstitial lung disease · lymphoedema
- **Frequency not known** Focal segmental glomerulosclerosis · reversible impairment of male fertility

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary, consult local treatment protocols for details. Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

● MONITORING REQUIREMENTS

- Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
- Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.

- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus.
Patients should be advised to avoid excessive exposure to UV light.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Sirolimus 2 mg Rapamune 2mg tablets | 30 tablet [PoM] £172.98 DT
price = £172.98

Tacrolimus

● DRUG ACTION Tacrolimus is a calcineurin inhibitor.

● INDICATIONS AND DOSE

ADOPT®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily.

▶ Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily.

▶ Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

▶ BY MOUTH

▶ Neonate: Initially 50–150 micrograms/kg twice daily.

▶ Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

▶ Child: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion)

Allograft rejection resistant to conventional immunosuppressive therapy

▶ BY MOUTH

▶ Child: Seek specialist advice

CAPEXION®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily.

▶ Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily.

▶ Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

▶ BY MOUTH

▶ Neonate: Initially 50–150 micrograms/kg twice daily.

▶ Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

▶ Child: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion)

Allograft rejection resistant to conventional immunosuppressive therapy

▶ BY MOUTH

▶ Child: Seek specialist advice

MODIGRAF®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily.

▶ Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily.

▶ Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

● **UNLICENSED USE**

ADVAGRAF® *Advagraf®* not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- *Adoport®*, *Prograf®*, *Capexion®*, *Tacni®*, and *Vivadex®* are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- *Modigraf®* granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- *Advagraf®* is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: *Envarsus®* is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** Increased risk of infections · lymphoproliferative disorders · malignancies · neurotoxicity · QT-interval prolongation · UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS** → Appendix 1: tacrolimus

● **SIDE-EFFECTS**

- **Common or very common** Acne · alopecia · anaemia · anorexia · anxiety · arthralgia · ascites · bile-duct abnormalities · bloating · blood disorders · cholestasis · confusion · constipation · depression · diarrhoea · dizziness · dyspepsia · dyspnoea · electrolyte disturbances · flatulence · gastro-intestinal inflammation · gastro-intestinal perforation · gastro-intestinal ulceration · haemorrhage · headache · hepatic dysfunction · hyperglycaemia · hyperkalaemia · hypertension · hyperuricaemia · hypokalaemia · impaired hearing ·

ischaemic events · jaundice · leucopenia · mood changes · muscle cramp · nausea · oedema · pancytopenia · paraesthesia · parenchymal lung disorders · peripheral neuropathy · photophobia · pleural effusion · psychosis · renal failure · renal impairment · renal tubular necrosis · seizures · sleep disturbances · sweating · tachycardia · thrombocytopenia · thromboembolic events · tinnitus · tremor · urinary abnormalities · visual disturbances · vomiting · weight changes

- **Uncommon** Amnesia · arrhythmia · cardiac arrest · cardiomyopathy · cataract · cerebrovascular accident · coagulation disorders · coma · dermatitis · dysmenorrhoea · encephalopathy · gastro-intestinal reflux disease · heart failure · hypertonia · hypoglycaemia · influenza-like symptoms · palpitation · pancreatitis · paralysis · paralytic ileus · peritonitis · photosensitivity · respiratory failure · speech disorder
- **Rare** Blindness · dehydration · hirsutism · pericardial effusion · posterior reversible encephalopathy syndrome · respiratory distress syndrome · thrombotic thrombocytopenic purpura · toxic epidermal necrolysis
- **Very rare** Haemorrhagic cystitis · myasthenia · Stevens-Johnson syndrome
- **Frequency not known** Agranulocytosis · haemolytic anaemia · pure red cell aplasia

SIDE-EFFECTS, FURTHER INFORMATION

- **Cardiomyopathy** Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).
- **HEPATIC IMPAIRMENT** Dose reduction may be necessary in severe impairment.
- **MONITORING REQUIREMENTS**
 - After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
 - Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* over 24 hours, dilute to a concentration of 4–100 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%, to a total volume between 20–500mL. Tacrolimus is incompatible with PVC.

● **PRESCRIBING AND DISPENSING INFORMATION**

PROGRAF® INFUSION Intravenous route should only be used if oral route is inappropriate.

● **PATIENT AND CARER EDUCATION**

Avoid excessive exposure to UV light including sunlight.

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

Medicines for Children leaflet: Tacrolimus for prevention of transplant rejection www.medicinesforchildren.org.uk/tacrolimus-for-prevention-of-transplant-rejection

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2010) that tacrolimus granules for oral suspension (*Modigraf*®) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Granules

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Canakinumab

● **DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

● INDICATIONS AND DOSE

Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome)

► BY SUBCUTANEOUS INJECTION

► Child: (consult product literature)

Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone) in children who have had an inadequate response to NSAIDs and systemic corticosteroids

► BY SUBCUTANEOUS INJECTION

► Child 2–17 years (body-weight 7.5 kg and above): 4 mg/kg every 4 weeks (max. per dose 300 mg)

● **CONTRA-INDICATIONS** Active infection · leucopenia · neutropenia

● **CAUTIONS** History of recurrent infection · latent and active tuberculosis · predisposition to infection

CAUTIONS, FURTHER INFORMATION

► **Vaccinations** Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

► **Common or very common** Back pain · increased susceptibility to infection (including serious infection) · injection-site reactions · malaise · neutropenia · vertigo

► **Uncommon** Gastro-oesophageal reflux

► **Frequency not known** Malignancy · vomiting

SPECIFIC SIDE-EFFECTS

► When used for active systemic juvenile idiopathic arthritis Abdominal pain · arthralgia · musculoskeletal pain · rhinitis

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.

● **HEPATIC IMPAIRMENT** No information available.

● **RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.

● **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.

● MONITORING REQUIREMENTS

► Monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.

► Monitor for signs and symptoms of tuberculosis during and after treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Canakinumab 150 mg Ilaris 150mg powder for solution for injection vials | 1 vial [PoM] £9,927.80

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES, ANTI-LYMPHOCYTE**Basiliximab**

- **DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

INDICATIONS AND DOSE

Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child 1-17 years (body-weight up to 35 kg): Initially 10 mg, dose to be administered within 2 hours before transplant surgery, followed by 10 mg after 4 days, dose administered after transplant surgery, withhold second dose if severe hypersensitivity or graft loss occurs
- Child 1-17 years (body-weight 35 kg and above): Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs

- **CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS** Atrial flutter · cardiac arrest · cytokine release syndrome · palpitations · severe hypersensitivity reactions
- **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute reconstituted solution to a concentration not exceeding 400 micrograms/mL, with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- **Simulect** (Novartis Pharmaceuticals UK Ltd)
Basiliximab 10 mg Simulect 10mg powder and solvent for solution for injection vials | 1 vial [PoM] £758.69 (Hospital only)
Basiliximab 20 mg Simulect 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £842.38 (Hospital only)

IMMUNOSUPPRESSANTS > PURINE SYNTHESIS INHIBITORS**Mycophenolate mofetil****INDICATIONS AND DOSE**

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)

- BY MOUTH
- Child: 600 mg/m² twice daily, consult local protocol for details; maximum 2 g per day

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and tacrolimus) (under expert supervision)

- BY MOUTH
- Child: 300 mg/m² twice daily, consult local protocol for details; maximum 2 g per day

Prophylaxis of acute rejection in hepatic transplantation (in combination with a corticosteroid and ciclosporin or tacrolimus) (under expert supervision)

- BY MOUTH
- Child: 10 mg/kg twice daily, increased to 20 mg/kg twice daily, consult local protocol for details; maximum 2 g per day

- **UNLICENSED USE** Not licensed for use in children under 2 years for the prophylaxis of acute rejection in renal transplantation. Not licensed for use in children for the prophylaxis of acute rejection in hepatic transplantation.
- **CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · children (higher incidence of side-effects may call for temporary reduction of dose or interruption) · delayed graft function · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

CAUTIONS, FURTHER INFORMATION

- Hypogammaglobulinaemia or bronchiectasis Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.
- **INTERACTIONS** → Appendix 1: mycophenolate
- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain · acne · agitation · alopecia · anaemia · anorexia · anxiety · arthralgia · blood disorders · confusion · constipation · convulsions · cough · depression · diarrhoea · disturbances of blood lipids · disturbances of electrolytes and blood lipids · dizziness · dyspnoea · flatulence · gastro-intestinal bleeding · gastro-intestinal inflammation · gastro-intestinal ulceration · gingival hyperplasia · headache · hepatitis · hyperglycaemia · hypertension · hypotension · ileus · infections · influenza-like syndrome · insomnia · jaundice · leucopenia · malignancy (particularly of the skin) · myasthenic syndrome · nausea · oedema · pancreatitis · pancytopenia · paraesthesia · pleural effusion · rash · red cell aplasia · renal impairment · skin hypertrophy · stomatitis · tachycardia · taste disturbance · thrombocytopenia · tremor · vasodilatation · vomiting · weight loss
- **Frequency not known** Interstitial lung disease · intestinal villous atrophy · progressive multifocal leucoencephalopathy · pulmonary fibrosis

SIDE-EFFECTS, FURTHER INFORMATION

Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

● CONCEPTION AND CONTRACEPTION

Pregnancy prevention In females of child-bearing potential, exclude pregnancy immediately before and during treatment.

Women should use 2 methods of effective contraception during treatment, and for 6 weeks after discontinuation. Men should use condoms during treatment and for at least 90 days after discontinuation of treatment; female partners of male patients should also use effective contraception during treatment and for 90 days after discontinuation.

● PREGNANCY Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.

● BREAST FEEDING Manufacturer advises avoid—present in milk in *animal* studies.

● RENAL IMPAIRMENT Manufacturer advises consider dose reduction if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².

● MONITORING REQUIREMENTS Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).

● PRESCRIBING AND DISPENSING INFORMATION Tablets and capsules not appropriate for dose titration in children with body surface are less than 1.25 m².

● PATIENT AND CARER ADVICE

Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

Medicines for Children leaflet: Mycophenolate mofetil for nephrotic syndrome www.medicinesforchildren.org.uk/mycophenolate-mofetil-for-nephrotic-syndrome

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 25

► **Myfortic** (Novartis Pharmaceuticals UK Ltd)

Mycophenolic acid (as Mycophenolate sodium) 180 mg Myfortic 180mg gastro-resistant tablets | 120 tablet [PoM] £96.72

Mycophenolic acid (as Mycophenolate sodium) 360 mg Myfortic 360mg gastro-resistant tablets | 120 tablet [PoM] £193.43

Tablet

► **Mycophenolate mofetil (Non-proprietary)**

Mycophenolate mofetil 500 mg Mycophenolate mofetil 500mg tablets | 50 tablet [PoM] £42.50 DT price = £6.17

► **CellCept** (Roche Products Ltd)

Mycophenolate mofetil 500 mg CellCept 500mg tablets | 50 tablet [PoM] £82.26 DT price = £6.17

► **Myfenax** (Teva UK Ltd)

Mycophenolate mofetil 500 mg Myfenax 500mg tablets | 50 tablet [PoM] £78.15 DT price = £6.17

Oral suspension

EXCIPIENTS: May contain Aspartame

► **CellCept** (Roche Products Ltd)

Mycophenolate mofetil 200 mg per 1 mL CellCept 1g/5mL oral suspension sugar-free | 175 mL [PoM] £115.16 DT price = £115.16

Powder for solution for infusion

► **Mycophenolate mofetil (Non-proprietary)**

Mycophenolate mofetil (as Mycophenolate mofetil hydrochloride) 500 mg Mycophenolate mofetil 500mg powder for concentrate for solution for infusion vials | 4 vial [PoM] no price available (Hospital only)

► **CellCept** (Roche Products Ltd)

Mycophenolate mofetil (as Mycophenolate mofetil hydrochloride) 500 mg CellCept 500mg powder for solution for infusion vials | 4 vial [PoM] £36.49

Capsule

► **Mycophenolate mofetil (Non-proprietary)**

► **CellCept** (Roche Products Ltd)

Mycophenolate mofetil 250 mg CellCept 250mg capsules | 100 capsule [PoM] £82.26 DT price = £82.26

► **Myfenax** (Teva UK Ltd)

Mycophenolate mofetil 250 mg Myfenax 250mg capsules | 100 capsule [PoM] £78.15 DT price = £82.26

Malignant disease

1 Antibody responsive malignancy

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES, ANTI-LYMPHOCYTE

Anti-lymphocyte monoclonal antibodies

● DRUG ACTION The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

IMPORTANT SAFETY INFORMATION

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

● SIDE-EFFECTS

► **Common or very common** Allergic reactions · angioedema · bronchospasm · chills · cytokine release syndrome · dyspnoea · fever · flushing · nausea · pruritus · rash · tumour pain · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

► **Infusion-related side effects** Infusion-related side-effects occur predominantly during the first infusion. Patients should be given paracetamol and an antihistamine before each dose of anti-lymphocyte monoclonal antibodies to reduce infusion-related side-effects. Premedication with a corticosteroid should also be considered.

The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

► **Cytokine release syndrome** Fatalities following **severe** cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored **very closely** (and a slower rate of infusion considered).

● PRE-TREATMENT SCREENING All patients should be screened for hepatitis B before treatment.

Rituximab

● INDICATIONS AND DOSE

Post-transplantation lymphoproliferative disease (under expert supervision) | Non-Hodgkin's lymphoma (under expert supervision) | Hodgkin's lymphoma (under expert supervision) | Severe cases of resistant immune modulated disease including idiopathic thrombocytopenia purpura, haemolytic anaemia, and systemic lupus erythematosus (under expert supervision)

► BY INTRAVENOUS INFUSION

- Child: Patients should receive premedication before each dose (consult product literature for details) (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported · transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

CAUTIONS, FURTHER INFORMATION

- **Hepatitis B infection and reactivation** Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **rituximab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details on cautions, consult product literature or local treatment protocol.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS** Abdominal pain · anaemia · antibody formation · aplastic anaemia · arthralgia · asthenia · blood disorders · depression · dyspepsia · headache · hypertension · hypotension · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · migraine · muscle spasm · pancytopenia · paraesthesia · progressive multifocal leucoencephalopathy · pruritus · rhinitis · severe fatal skin reactions · severe skin reactions (permanently discontinue treatment if occurs) · sore throat · Stevens-Johnson syndrome (permanently discontinue treatment if occurs) · thrombocytopenia · toxic epidermal necrolysis (permanently discontinue treatment if occurs) · urticaria · worsening heart failure

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **Progressive multifocal leucoencephalopathy** Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

For full details, including management of side-effects, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective contraception (in both sexes) required during and for 12 months after treatment.

- **PREGNANCY** Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.

- **BREAST FEEDING** Avoid breast-feeding during and for 12 months after treatment.
- **MONITORING REQUIREMENTS** For full details on monitoring requirements consult product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Rituximab (Non-proprietary)

Rituximab 10 mg per 1 ml Truxima 500mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £785.84

► MabThera (Roche Products Ltd)

Rituximab 10 mg per 1 ml MabThera 100mg/10ml concentrate for solution for infusion vials | 2 vial [PoM] £349.25
MabThera 500mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £873.15

2 Cytotoxic responsive malignancy

Cytotoxic drugs

Overview

The management of childhood cancer is complex and is generally confined to specialist regional centres and some associated shared-care units.

Cytotoxic drugs have both anti-cancer activity and the potential for damage to normal tissue. In children, chemotherapy is almost always started with curative intent, but may be continued as palliation if the disease is refractory.

Chemotherapy with a combination of two or more cytotoxic drugs aims to reduce the development of resistance and to improve cytotoxic effect. Treatment protocols generally incorporate a series of treatment courses at defined intervals with clear criteria for starting each course, such as adequate bone-marrow recovery and renal or cardiac function. The principal component of treatment for leukaemias in children is cytotoxic therapy, whereas solid tumours may be managed with surgery or radiotherapy in addition to chemotherapy.

Only medical or nursing staff who have received appropriate training should administer parenteral cytotoxics. In most instances central venous access will be required for the intravenous administration of cytotoxics to children; care is required to avoid the risk of extravasation (see Side-effects of Cytotoxic Drugs and their Management).

Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local

guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from:

Department of Health

PO Box 777

London

SE1 6XH

Fax: 01623 724524

It is also available from the Department of Health website (www.dh.gov.uk).

Safe systems for cytotoxic medicines:

Safe system requirements for cytotoxic medicines:

- Cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care that is co-ordinated by a multi-disciplinary team
- Cytotoxic drugs should be prescribed, dispensed and administered only in the context of a written protocol or treatment plan
- Injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- Oral cytotoxic medicines should be dispensed with clear directions for use

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Doses

Doses of cytotoxic drugs are determined using a variety of different methods including age, body-surface area, or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from many of the drug entries in this chapter.

Pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended).

Alkylating drugs can have an adverse effect on gametogenesis, which may be reversible particularly in females. Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy. Amenorrhoea may occur, which also may be reversible.

Side-effects of cytotoxic drugs and their management

Gastro-intestinal effects

Management of gastrointestinal effects of cytotoxic drugs includes the use of antacids, H_2 -receptor antagonists, and proton pump inhibitors to protect the gastric mucosa, laxatives to treat constipation, and enteral and parenteral nutritional support.

Oral mucositis

Good oral hygiene keeps the mouth clean and moist and helps to prevent mucositis; prevention is more effective than treatment of the complication. Good oral hygiene measures for children over 6 months include brushing teeth with a soft small brush with fluoride toothpaste 2–3 times daily, and rinsing the mouth frequently. Daily fluoride supplements can be used on the advice of the child's dental team. For children under 6 months or when it is not possible to brush teeth, carers should be instructed how to clean the mouth using an oral sponge moistened with water or with an antimicrobial solution such as diluted chlorhexidine. Mucositis related to chemotherapy can be extremely painful and may, in some circumstances, require opioid analgesia. Secondary infection with candida is frequent; treatment with a systemically absorbed antifungal, such as fluconazole p. 358, is effective.

Nausea and vomiting

Nausea and vomiting cause considerable distress to many children who receive chemotherapy, and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Susceptibility to nausea and vomiting may increase with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered, and to the individual's susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide p. 522, low doses of methotrexate p. 517, the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—carboplatin p. 520, doxorubicin hydrochloride p. 513, intermediate and low doses of cyclophosphamide p. 509, mitoxantrone p. 514, and high doses of methotrexate.

Highly emetogenic treatment—cisplatin p. 521, dacarbazine p. 510, and high doses of alkylating drugs.

Anti-emetic drugs, when given regularly, help prevent or ameliorate emesis associated with chemotherapy in children.

Prevention of acute symptoms: For patients at low risk of emesis, pretreatment with a 5HT₃-receptor antagonist may be of benefit.

For patients at high risk of *emesis* or when other treatment is inadequate, a 5HT₃-receptor antagonist is often highly effective. The addition of dexamethasone p. 419 and other anti-emetics may also be required.

Prevention of delayed symptoms: dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide hydrochloride p. 252. Due to the risks of neurological side-effects, metoclopramide hydrochloride should only be used in children as a second-line option. The 5HT₃-receptor antagonists may have a role in preventing uncontrolled symptoms.

Prevention of anticipatory symptoms: Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam p. 214 can be helpful for its amnesiac, sedative, and anxiolytic effects.

Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 523 and bleomycin p. 520 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as melphalan p. 511. Peripheral blood counts must be checked before each treatment. The duration and severity of neutropenia can be reduced by the use of granulocyte-colony stimulating factors; their use should be reserved for children who have previously experienced severe neutropenia.

Cytotoxic drugs may be contra-indicated in children with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Infection in a child with neutropenia requires immediate broad-spectrum antibacterial treatment that covers all likely pathogens. Appropriate bacteriological investigations should be conducted as soon as possible. Children taking cytotoxic drugs who have signs or symptoms of infection (or their carers) should be advised to seek prompt medical attention. All children should be investigated and treated under the supervision of an appropriate oncology or haematology specialist. Antifungal treatment may be required in a child with prolonged neutropenia or fever lasting longer than 4–5 days. Chickenpox and measles can be particularly hazardous in immunocompromised children. Varicella-zoster immunoglobulin p. 746 is indicated if the child does not have immunity against varicella and has had close contact with infectious chickenpox or herpes zoster. Antiviral prophylaxis can be considered in addition to varicella-zoster immunoglobulin or as an alternative if varicella-zoster immunoglobulin is inappropriate. If an immunocompromised child has come into close contact with an infectious individual with measles, normal immunoglobulin p. 743 should be given.

For advice on the use of live vaccines in individuals with impaired immune response, see Vaccines.

Alopecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients.

Long-term and delayed toxicity

Cytotoxic drugs may produce specific organ-related toxicity in children (e.g. cardiotoxicity with doxorubicin hydrochloride p. 513 or nephrotoxicity with cisplatin p. 521 and ifosfamide p. 510). Manifestations of such toxicity may not appear for several months or even years after cancer treatment. Careful follow-up of survivors of childhood cancer is therefore vital; national and local guidelines have been developed to facilitate this.

Thromboembolism

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment related rapid destruction of malignant cells.

Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute myeloblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration and renal impairment are also predisposing factors. Features, include hyperkalaemia, hyperuricaemia, and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early recognition of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Treatment for cytotoxic-induced side effects

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure.

Allopurinol p. 529 is used routinely in children at low to moderate risk of hyperuricaemia. It should be started 24 hours before treatment; patients should be adequately hydrated (consideration should be given to omitting phosphate and potassium from hydration fluids). The dose of mercaptopurine p. 516 or azathioprine p. 495 should be reduced if allopurinol is given concomitantly.

Rasburicase p. 529 is a recombinant urate oxidase used in children who are at high-risk of developing hyperuricaemia. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Methotrexate-induced mucositis and myelosuppression

Folinic acid p. 528 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

The calcium salt of levofolinic acid p. 528, a single isomer of folinic acid, is also used following methotrexate administration. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate administration.

The efficacy of high dose methotrexate is enhanced by delaying initiation of folinic acid for at least 24 hours, local protocols define the correct time. Folinic acid is normally continued until the plasma-methotrexate concentration falls to 45–90 nanograms/mL (100–200 nanomol/litre).

In the treatment of methotrexate p. 517 overdose, folinate should be administered immediately; other measures to enhance the elimination of methotrexate are also necessary.

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 509 and ifosfamide p. 510; it is caused by the metabolite acrolein. Adequate hydration is essential to reduce the risk of urothelial toxicity. Mesna p. 527 reacts specifically with acrolein in the urinary tract, preventing toxicity. Mesna is given for the same duration as cyclophosphamide or ifosfamide. It is generally given intravenously; the dose of mesna is equal to or greater than that of the oxazaphosphorine. See the role of nebulised mesna as a mucolytic in cystic fibrosis.

Cytotoxic antibiotics

Cytotoxic antibiotics are widely used. Many act as radiomimetics and simultaneous use of radiotherapy should be avoided because it may markedly increase toxicity.

Daunorubicin p. 516, doxorubicin hydrochloride p. 513, and epirubicin hydrochloride p. 513 are anthracycline

antibiotics. Mitoxantrone p. 514 (mitoxantrone) is an anthracycline derivative.

Epirubicin hydrochloride and mitoxantrone are considered less toxic than the other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.

Vinca alkaloids

The vinca alkaloids, vinblastine sulfate p. 522 and vincristine sulfate p. 523 are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours.

Antimetabolites

Antimetabolites are incorporated into new nuclear material or they combine irreversibly with cellular enzymes and prevent normal cellular division. Cytarabine p. 515, fludarabine phosphate p. 515, mercaptopurine p. 516, methotrexate p. 517, and tioguanine p. 519 are commonly used in paediatric chemotherapy.

Other antineoplastic drugs

Asparaginase

Asparaginase is used almost exclusively in the treatment of acute lymphoblastic leukaemia. Hypersensitivity reactions may occur and facilities for the management of anaphylaxis should be available. A number of different preparations of asparaginase exist and only the product specified in the treatment protocol should be used.

ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS

Busulfan

(Busulphan)

● INDICATIONS AND DOSE

Conditioning treatment before haematopoietic progenitor cell transplantation

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

DOSES AT EXTREMES OF BODY-WEIGHT

Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **CAUTIONS** Avoid in acute porphyrias p. 577 · high dose (antiepileptic prophylaxis required) · history of seizures (antiepileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
GENERAL SIDE-EFFECTS
 - **Common or very common** Cardiac tamponade in thalassaemia · hepatic fibrosis · hepatic veno-occlusive disease · hepatotoxicity · hyperbilirubinaemia · jaundice · pneumonia · skin hyperpigmentation
 - **Rare** Aplastic anaemia · erythema · hypersensitivity reactions · progressive pulmonary fibrosis · seizures · urticaria · visual disturbances
 - **Very rare** Gynaecomastia · myasthenia gravis
 - **Frequency not known** Alopecia · amenorrhoea (may be reversible) · bone-marrow suppression · dilutional

hyponatraemia · fluid retention · gastro-intestinal effects · hyperuricaemia · irreversible bone-marrow aplasia · lung toxicity · male sterility · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- With intravenous use Extravasation
- SIDE-EFFECTS, FURTHER INFORMATION**
 - Lung toxicity Discontinue if lung toxicity develops.
 - Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
 - Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.
- **CONCEPTION AND CONTRACEPTION** Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid (teratogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. In patients with hepatic impairment, manufacturer advises regular liver function tests—consult product literature.
- **MONITORING REQUIREMENTS**
 - Monitor cardiac and liver function.
 - Monitor full blood count regularly throughout treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

Chlorambucil

● INDICATIONS AND DOSE

Hodgkin's disease | Non-Hodgkin's lymphoma

- BY MOUTH
- Child: (consult local protocol)

Relapsing steroid-sensitive nephrotic syndrome (initiated in specialist centres)

- BY MOUTH
- Child 3 months–17 years: 200 micrograms/kg daily for 8 weeks

- **UNLICENSED USE** Not licensed for use in nephrotic syndrome.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **CAUTIONS** Avoid in acute porphyrias p. 577 · children with nephrotic syndrome (increased seizure risk) · history of epilepsy (increased seizure risk)
- **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

- **Uncommon** Skin rash
- **Rare** Hepatotoxicity · jaundice · seizures
- **Very rare** Irreversible bone-marrow suppression · male sterility (in prepubertal and pubertal males) · peripheral neuropathy · pulmonary fibrosis · sterile cystitis · tremor
- **Frequency not known** Alopecia · amenorrhoea · bone-marrow suppression · dilutional hyponatraemia · fluid retention · gastro-intestinal effects · hyperuricaemia · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · Stevens-Johnson syndrome · thromboembolism · toxic epidermal necrolysis · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Secondary malignancy** Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- **Fluid retention** Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises consider dose reduction in severe impairment—limited information available.
- **MONITORING REQUIREMENTS** Monitor full blood count regularly throughout treatment.

- BY INTRAVENOUS INFUSION
- Child 3 months–17 years: 500 mg/m² once a month for 6 months

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **CONTRA-INDICATIONS** Haemorrhagic cystitis
- **CAUTIONS** Avoid in acute porphyrias p. 577 · diabetes mellitus · previous or concurrent mediastinal irradiation—risk of cardiotoxicity
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
GENERAL SIDE-EFFECTS
 - **Common or very common** Anorexia · cardiotoxicity at high doses · disturbances of carbohydrate metabolism · inappropriate secretion of anti-diuretic hormone · interstitial pulmonary fibrosis · pancreatitis · pigmentation of nails · pigmentation of palms · pigmentation of soles · urothelial toxicity
 - **Rare** Hepatotoxicity · renal dysfunction
 - **Frequency not known** Alopecia · amenorrhoea · bone-marrow suppression · dilutional hyponatraemia · fluid retention · gastro-intestinal effects · haemorrhagic cystitis · hyperuricaemia · male sterility · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- With intravenous use Extravasation
- SIDE-EFFECTS, FURTHER INFORMATION**
 - Haemorrhagic cystitis and urothelial toxicity Haemorrhagic cystitis is a common manifestation of urothelial toxicity; adequate hydration is essential to reduce the risk of urothelial toxicity with intravenous use of cyclophosphamide; mesna provides further protection against urotoxic effects.
 - Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
 - Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding during and for 36 hours after stopping treatment.
- **HEPATIC IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **RENAL IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **DIRECTIONS FOR ADMINISTRATION** Consult local treatment protocol for details.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Cyclophosphamide for nephrotic syndrome www.medicinesforchildren.org.uk/cyclophosphamide-nephrotic-syndrome-0

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion

Tablet

CAUTIONARY AND ADVISORY LABELS 25, 27

► Cyclophosphamide (Non-proprietary)

Cyclophosphamide (as Cyclophosphamide monohydrate)

50 mg Cyclophosphamide 50mg tablets | 100 tablet [PoM] £139.00
DT price = £139.00

► Cytoxan (Imported (United States))

Cyclophosphamide 25 mg Cytoxan 25mg tablets | 100 tablet [PoM]
no price available

Powder for solution for injection

► Cyclophosphamide (Non-proprietary)

Cyclophosphamide (as Cyclophosphamide monohydrate)

500 mg Cyclophosphamide 500mg powder for solution for injection vials | 1 vial [PoM] £9.66 (Hospital only) | 1 vial [PoM] £9.66

Cyclophosphamide (as Cyclophosphamide monohydrate)

1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial [PoM] £17.06 (Hospital only) | 1 vial [PoM] £17.91

Cyclophosphamide (as Cyclophosphamide monohydrate)

2 gram Cyclophosphamide 2g powder for solution for injection vials | 1 vial [PoM] £34.12 (Hospital only)

Dacarbazine

● INDICATIONS AND DOSE

Hodgkin's disease | Paediatric solid tumours

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

● CAUTIONS

Caution in handling—irritant to tissues

● INTERACTIONS

→ Appendix 1: alkylating agents

● SIDE-EFFECTS

- **Common or very common** Anorexia
- **Uncommon** Blurred vision · confusion · facial flushing · facial paraesthesia · headache · influenza-like symptoms · rash · renal impairment · seizures
- **Rare** Diarrhoea · hepatic vein thrombosis · hepatotoxicity · injection-site reactions · irritant to skin · irritant to tissues · liver necrosis · photosensitivity
- **Frequency not known** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

● CONCEPTION AND CONTRACEPTION

Ensure effective contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

● PREGNANCY

Avoid (carcinogenic and teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

● BREAST FEEDING

Discontinue breast-feeding.

● HEPATIC IMPAIRMENT

Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

● RENAL IMPAIRMENT

Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

● PRESCRIBING AND DISPENSING INFORMATION

Dacarbazine is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously *Adriamycin*®], bleomycin, vinblastine, and dacarbazine).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Dacarbazine (Non-proprietary)

Dacarbazine (as Dacarbazine citrate) 500 mg Dacarbazine 500mg powder for solution for infusion vials | 1 vial [PoM] £37.50

Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial [PoM] £70.00

Powder for solution for injection

► Dacarbazine (Non-proprietary)

Dacarbazine (as Dacarbazine citrate) 100 mg Dacarbazine 100mg powder for solution for injection vials | 10 vial [PoM] £90.00

Dacarbazine (as Dacarbazine citrate) 200 mg Dacarbazine 200mg powder for solution for injection vials | 10 vial [PoM] £160.00

Ifosfamide

● INDICATIONS AND DOSE

Rhabdomyosarcoma | Soft-tissue sarcomas | Ewing tumour | Germ cell tumour | Osteogenic sarcoma

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

● CONTRA-INDICATIONS

Acute infection · urinary-tract infection · urinary-tract obstruction · urothelial damage

● CAUTIONS

Avoid in acute porphyrias p. 577

● INTERACTIONS

→ Appendix 1: alkylating agents

● SIDE-EFFECTS

- **Common or very common** Confusion · disorientation · drowsiness · psychosis · renal toxicity (may lead to tubular dysfunction, Fanconi's syndrome, or diabetes insipidus) · restlessness · urothelial toxicity causing haemorrhagic cystitis and dysuria
- **Uncommon** Severe encephalopathy
- **Rare** Anorexia · constipation · convulsions · diarrhoea
- **Very rare** Jaundice · syndrome of inappropriate antidiuretic hormone secretion · thrombophlebitis
- **Frequency not known** Alopecia · amenorrhoea · bone-marrow suppression · dilutional hyponatraemia · extravasation · fluid retention · gastro-intestinal effects · hyperuricaemia · male sterility · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Urothelial toxicity** Adequate hydration may reduce the risk of urothelial toxicity with intravenous use of ifosfamide; mesna provides further protection against urotoxic effects.
- **Secondary malignancy** Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- **Fluid retention** Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

● CONCEPTION AND CONTRACEPTION

Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

● PREGNANCY

Avoid (teratogenic and carcinogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

● BREAST FEEDING

Discontinue breast-feeding.

● HEPATIC IMPAIRMENT

Avoid.

● RENAL IMPAIRMENT

Avoid.

● MONITORING REQUIREMENTS

Ensure satisfactory electrolyte balance and renal function before each course

(risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► Ifosfamide (Non-proprietary)

Ifosfamide 1 gram Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial [PoM] £91.32

Ifosfamide 2 gram Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial [PoM] £179.88

Melphalan

● INDICATIONS AND DOSE

High intravenous dose with haematopoietic stem cell transplantation in the treatment of childhood neuroblastoma and some other advanced embryonal tumours

► BY INTRAVENOUS INFUSION

► Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in embryonal tumours.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **CAUTIONS** Avoid in acute porphyrias p. 577 · consider use of prophylactic anti-infective agents · for high-dose intravenous administration establish adequate hydration · haematopoietic stem cell transplantation essential for high dose treatment (consult local treatment protocol for details)

- **INTERACTIONS** → Appendix 1: alkylating agents

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Rare** Interstitial pneumonitis · life threatening pulmonary fibrosis
- **Frequency not known** Alopecia · amenorrhoea · bone-marrow suppression (delayed) · dilutional hyponatraemia · fluid retention · gastro-intestinal effects · hyperuricaemia · male sterility · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- With intravenous use Extravasation

SIDE-EFFECTS, FURTHER INFORMATION

- Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAL IMPAIRMENT** Reduce dose initially (consult product literature).

- **MONITORING REQUIREMENTS** Monitor full blood count before and throughout treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► Melphalan (Non-proprietary)

Melphalan (as Melphalan hydrochloride) 50 mg Melphalan 50mg powder and solvent for solution for injection vials | 1 vial [PoM] £137.37

Temozolomide

- **DRUG ACTION** Temozolomide is structurally related to dacarbazine.

● INDICATIONS AND DOSE

Treatment of recurrent or progressive malignant glioma

► BY MOUTH

► Child 3–17 years: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **CAUTIONS** *Pneumocystis jirovecii* pneumonia—consult product literature for monitoring and prophylaxis requirements
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
For further information on side-effects consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

● **MONITORING REQUIREMENTS**

- Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
- Monitor for myelodysplastic syndrome.
- Monitor for secondary malignancies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule

CAUTIONARY AND ADVISORY LABELS 23, 25

► Temozolomide (Non-proprietary)

Temozolomide 5 mg Temozolomide 5mg capsules | 5 capsule [PoM] £16.00

Temozolomide 20 mg Temozolomide 20mg capsules | 5 capsule [PoM] £65.00

Temozolomide 100 mg Temozolomide 100mg capsules | 5 capsule [PoM] £325.00

Temozolomide 140 mg	Temozolomide 140mg capsules 5 capsule PoM £465.00

Temomedac 250 mg	Temomedac 250mg capsules 5 capsule PoM £806.08

Thiotepa

● INDICATIONS AND DOSE

Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **CAUTIONS** Avoid in acute porphyrias p. 577
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS** Alopecia · amenorrhoea · bone-marrow suppression · dilutional hyponatraemia · extravasation · fluid retention · gastro-intestinal effects · hyperuricaemia · male sterility · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ Secondary malignancy Alkylating drugs are associated with marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
 - ▶ Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (June 2012) that thiotepa (Tepadina[®]) is **not** recommended for use

within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Tepadina** (Adienne Pharma & Biotech)

Thiotepa 15 mg Tepadina 15mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) no price available

Thiotepa 100 mg Tepadina 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) no price available

ANTINEOPLASTIC DRUGS > ANTHRACYCLINES AND RELATED DRUGS

Daunorubicin

● INDICATIONS AND DOSE

Acute myelogenous leukaemia | Acute lymphocytic leukaemia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** *DaunoXome[®]* is not licensed for use in children.
- **CONTRA-INDICATIONS** Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracycline · recent myocardial infarction · severe arrhythmia
- CONTRA-INDICATIONS, FURTHER INFORMATION**
Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Leucopenia
 - ▶ **Uncommon** Mucositis
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · cardiac toxicity (usually 1–6 months after initiation of therapy) · extravasation · fever · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · red urine discolouration · thromboembolism · tumour lysis syndrome · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to serum bilirubin concentration—consult local protocol for details. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose—consult local treatment protocol for details. Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Cardiac monitoring essential.
 - ▶ Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Emulsion for infusion

► **DaunoXome** (Galen Ltd)

Daunorubicin (as **Daunorubicin hydrochloride citrate**)

50 mg DaunoXome 50mg emulsion for infusion vials | 1 vial [PoM]
£250.00

Powder for solution for infusion

► **Daunorubicin** (Non-proprietary)

Daunorubicin (as **Daunorubicin hydrochloride**)

20 mg Daunorubicin 20mg powder for solution for infusion vials |
10 vial [PoM] £650.00 (Hospital only)

Doxorubicin hydrochloride

10-Jun-2016

INDICATIONS AND DOSE

Some paediatric malignancies | **Ewing's sarcoma** |
Osteogenic sarcoma | **Wilm's tumour** | **Neuroblastoma** |
Retinoblastoma | **Some liver tumours** | **Acute**
lymphoblastic leukaemia | **Hodgkin's lymphoma** | **Non-**
Hodgkin's lymphoma

► BY INTRAVENOUS INFUSION

► Child: (consult local protocol)

- **CONTRA-INDICATIONS** Acute inflammatory heart disease · consult product literature · increased haemorrhagic tendency · marked persisting myelosuppression induced by previous treatment · marked persisting stomatitis induced by previous treatment · previous myocardial infarction · previous treatment with maximum cumulative doses of doxorubicin · previous treatment with maximum cumulative doses of other anthracycline · severe arrhythmia · severe myocardial insufficiency

CONTRA-INDICATIONS, FURTHER INFORMATION

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- **CAUTIONS** Caution in handling—irritant to tissues · consult product literature

- **INTERACTIONS** → Appendix 1: anthracyclines

SIDE-EFFECTS

- **Common or very common** Red colouration of the urine
- **Frequency not known** Alopecia · bone-marrow suppression · consult product literature · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Extravasation** Extravasation can cause severe tissue necrosis.
- **Cardiotoxic** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Consult product literature in severe impairment.
- **MONITORING REQUIREMENTS** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

► **Doxorubicin hydrochloride** (Non-proprietary)

Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 10mg/5ml

solution for injection vials | 1 vial [PoM] £18.54 (Hospital only)

Doxorubicin 50mg/25ml solution for injection Cytosafe vials |

1 vial [PoM] £103.00

Doxorubicin 50mg/25ml solution for infusion vials | 1 vial [PoM]

£103.00 (Hospital only)

Doxorubicin 10mg/5ml solution for injection Cytosafe vials |

1 vial [PoM] £20.60

Doxorubicin 10mg/5ml concentrate for solution for infusion vials |

1 vial [PoM] no price available

Doxorubicin 10mg/5ml solution for infusion vials | 1 vial [PoM] £20.60 (Hospital only)

Doxorubicin 50mg/25ml solution for injection vials | 1 vial [PoM]

£92.70 (Hospital only)

Doxorubicin 50mg/25ml concentrate for solution for infusion vials |

1 vial [PoM] no price available

Solution for infusion

► **Doxorubicin hydrochloride** (Non-proprietary)

Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin

200mg/100ml solution for injection Cytosafe vials | 1 vial [PoM]

£412.00

Doxorubicin 200mg/100ml solution for infusion vials | 1 vial [PoM]

£370.80–£412.00 (Hospital only)

Doxorubicin 200mg/100ml concentrate for solution for infusion vials

| 1 vial [PoM] no price available

► **Caelyx** (Janssen-Cilag Ltd)

Doxorubicin hydrochloride (as **Doxorubicin hydrochloride**

liposomal pegylated) **2 mg per 1 ml** Caelyx 50mg/25ml concentrate

for solution for infusion vials | 1 vial [PoM] £712.49

Caelyx 20mg/10ml concentrate for solution for infusion vials |

1 vial [PoM] £360.23

Powder for solution for injection

► **Doxorubin** (medac UK)

Doxorubicin hydrochloride 10 mg Doxorubin 10mg powder for

solution for injection vials | 10 vial [PoM] £182.80

Doxorubicin hydrochloride 50 mg Doxorubin 50mg powder for

solution for injection vials | 10 vial [PoM] £914.00

Powder and solvent for suspension for infusion

ELECTROLYTES: May contain Sodium

► **Myocet** (Teva UK Ltd)

Doxorubicin hydrochloride 50 mg Myocet 50mg powder and

solvent for suspension for infusion vials | 2 vial [PoM] £912.26 (Hospital only)

Epirubicin hydrochloride

INDICATIONS AND DOSE

Recurrent acute lymphoblastic leukaemia |
Rhabdomyosarcoma | **Other soft-tissue tumours of**
childhood

► BY INTRAVENOUS INFUSION

► Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Myocardiopathy · previous treatment with maximum cumulative doses of epirubicin or other anthracycline · recent myocardial infarction · severe arrhythmia · severe myocardial insufficiency · unstable angina

CONTRA-INDICATIONS, FURTHER INFORMATION

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: anthracyclines

- **SIDE-EFFECTS** Alopecia · anaphylaxis · bone-marrow suppression · cardiotoxicity · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · red

colouration of the urine • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Cardiotoxicity** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.
- ▶ **Cumulative doses of other anthracycline** Epirubicin is considered less toxic than other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid (carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to bilirubin concentration—consult local treatment protocol for details. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Dose reduction may be necessary in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ **Cardiac toxicity** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

- ▶ **Epirubicin hydrochloride (Non-proprietary)**
Epirubicin hydrochloride 2 mg per 1 ml Epirubicin 50mg/25ml solution for injection vials | 1 vial [PoM] £100.88
 Epirubicin 10mg/5ml solution for injection vials | 1 vial [PoM] £17.38
- ▶ **Pharmorubicin (Pfizer Ltd)**
Pharmorubicin hydrochloride 2 mg per 1 ml Pharmorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial [PoM] £106.19
 Pharmorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial [PoM] £21.24

Solution for infusion

- ▶ **Epirubicin hydrochloride (Non-proprietary)**
Epirubicin hydrochloride 2 mg per 1 ml Epirubicin 100mg/50ml solution for infusion vials | 1 vial [PoM] no price available
 Epirubicin 200mg/100ml solution for infusion vials | 1 vial [PoM] £347.55
- ▶ **Pharmorubicin (Pfizer Ltd)**
Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 200mg/100ml solution for infusion Cytosafe vials | 1 vial [PoM] £386.16

Mitoxantrone

(Mitoxantrone)

● INDICATIONS AND DOSE

Acute myeloid leukaemia | Recurrent acute lymphoblastic leukaemia

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Child:** (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- **INTERACTIONS** → Appendix 1: anthracyclines

● SIDE-EFFECTS

- ▶ **Common or very common** Transient blue-green discoloration of urine
- ▶ **Uncommon** Allergic reactions • amenorrhoea • anorexia • dyspnoea • fatigue • fever • gastro-intestinal bleeding • transient blue discoloration of nails • transient blue discoloration of skin
- ▶ **Frequency not known** Alopecia • bone-marrow suppression • dose-related cardiotoxicity • extravasation • gastro-intestinal effects • hyperuricaemia • myelosuppression • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Cardiotoxicity** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution—consult local treatment protocol.
- **MONITORING REQUIREMENTS**
 - ▶ **Cardiac toxicity** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Mitoxantrone (Non-proprietary)**
Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £121.85
- ▶ **Onkotrone (Baxter Healthcare Ltd)**
Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial [PoM] no price available
 Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial [PoM] no price available

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

Clofarabine

● INDICATIONS AND DOSE

Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Child 1–17 years:** (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children under 1 year.

- **CAUTIONS** Cardiac disease

- **INTERACTIONS** → Appendix 1: clofarabine

- **SIDE-EFFECTS** Abdominal pain • agitation • alopecia • anxiety • arthralgia • bone-marrow suppression • cough • diarrhoea • dizziness • drowsiness • dyspnoea • extravasation • flushing • gastro-intestinal effects • haematoma • haematuria • hand-foot (desquamative) syndrome • headache • hyperuricaemia • hypotension • increased sweating • jaundice • myalgia • nausea • oedema • oral mucositis • organ-related toxicity (long-term and delayed) • pancreatitis • paraesthesia • pericardial effusion • peripheral neuropathy • pruritus • rash • restlessness •

tachycardia • thromboembolism • tumour lysis syndrome • vomiting

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► Evoltra (Sanofi) ▼

Clofarabine 1 mg per 1 ml Evoltra 20mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,326.18 (Hospital only)

Cytarabine

- **DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

INDICATIONS AND DOSE

Acute lymphoblastic leukaemia | Acute myeloid leukaemia | Non-Hodgkin's lymphoma

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- Child: (consult local protocol)

Meningeal leukaemia | Meningeal neoplasms

- BY INTRATHECAL INJECTION
- Child: (consult local protocol)

- **UNLICENSED USE** Depocyte® intrathecal injection not licensed for use in children.

IMPORTANT SAFETY INFORMATION

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

- **INTERACTIONS** → Appendix 1: cytarabine
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS
- Common or very common Bone pain • maculopapular rash • myalgia
- Uncommon Conjunctivitis (consider prophylactic corticosteroid eye drops) • hepatic dysfunction • jaundice • neurotoxicity • renal dysfunction
- Frequency not known Alopecia • bone-marrow suppression • chest pain • extravasation • gastro-intestinal effects • hyperuricaemia • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • thromboembolism • tumour lysis syndrome • vomiting

SPECIFIC SIDE-EFFECTS

- Common or very common
- With intravenous use 'cytarabine syndrome' (6–12 hours after intravenous administration—characterised by fever and malaise)
- Rare
- With intrathecal use Severe spinal cord toxicity following intrathecal administration

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose—consult product literature.
- **RENAL IMPAIRMENT** Consult local treatment protocols.
- **MONITORING REQUIREMENTS**
- Haematological monitoring Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.
- **PRESCRIBING AND DISPENSING INFORMATION** Dose is based on weight or body-surface area, children may tolerate higher doses of cytarabine than adults.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- DEPOCYTE®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2007) that liposomal cytarabine suspension (DepoCyt®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

► Cytarabine (Non-proprietary)

Cytarabine 20 mg per 1 ml Cytarabine 500mg/25ml solution for injection vials | 1 vial [PoM] £19.50

Cytarabine 100mg/5ml solution for injection vials | 5 vial [PoM] £20.98–£30.00

Cytarabine 100 mg per 1 ml Cytarabine 1g/10ml solution for injection vials | 1 vial [PoM] £40.00

Cytarabine 500mg/5ml solution for injection vials | 5 vial [PoM] £100.00

Cytarabine 4g/40ml solution for injection vials | 1 vial [PoM] no price available

Cytarabine 100mg/1ml solution for injection vials | 5 vial [PoM] £30.00

Cytarabine 2g/20ml solution for injection vials | 1 vial [PoM] £79.00

Suspension for injection

► DepoCyt (Napp Pharmaceuticals Ltd)

Cytarabine 10 mg per 1 ml DepoCyt 50mg/5ml suspension for injection vials | 1 vial [PoM] £1,223.75 (Hospital only)

Fludarabine phosphate

INDICATIONS AND DOSE

Poor prognosis or relapsed acute myeloid leukaemia | Relapsed acute lymphoblastic leukaemia | Conditioning before bone marrow transplantation

- BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **CONTRA-INDICATIONS** Haemolytic anaemia
- **CAUTIONS** Increased susceptibility to skin cancer • worsening of existing skin cancer
- CAUTIONS, FURTHER INFORMATION
- Immunosuppression Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host

reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

- **INTERACTIONS** → Appendix 1: fludarabine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acute myeloid leukaemia · anorexia · chills · cough · diarrhoea · fever · immunosuppression · malaise · myelodysplastic syndrome · myelosuppression (may be cumulative) · oedema · peripheral neuropathy · pneumonia · rash · visual disturbances · weakness
 - ▶ **Uncommon** Autoimmune disorder · confusion · fibrosis · haemorrhage · pneumonitis · pulmonary toxicity
 - ▶ **Rare** Agitation · arrhythmia · blindness · coma · heart failure · optic neuropathy · seizures · skin cancer · Stevens-Johnson syndrome · toxic epidermal necrolysis
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · haemorrhagic cystitis · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (embryotoxic and teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute/1.73 m². Avoid if creatinine clearance less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for signs of haemolysis.
 - ▶ Monitor for neurological toxicity.
- **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Fludarabine phosphate (Non-proprietary)**

Fludarabine phosphate 25 mg per 1 mL Fludarabine phosphate 50mg/2mL concentrate for solution for injection vials | 1 vial [PoM] £156.00 (Hospital only) | 1 vial [PoM] £155.00

Tablet

▶ **Fludara** (Sanofi)

Fludarabine phosphate 10 mg Fludara 10mg tablets | 15 tablet [PoM] £302.48 (Hospital only) | 20 tablet [PoM] £403.31 (Hospital only)

Powder for solution for injection

▶ **Fludarabine phosphate (Non-proprietary)**

Fludarabine phosphate 50 mg Fludarabine phosphate 50mg powder for solution for injection vials | 1 vial [PoM] £155.00 (Hospital only)

▶ **Fludara** (Sanofi)

Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial [PoM] £735.34 (Hospital only)

Mercaptopurine

(6-Mercaptopurine)

● INDICATIONS AND DOSE

Severe ulcerative colitis | Severe Crohn's disease

- ▶ **BY MOUTH**
- ▶ **Child 2–17 years:** Initially 1–1.5 mg/kg once daily (max. per dose 50 mg), then increased if necessary up to 75 mg once daily

Acute lymphoblastic leukaemia | Lymphoblastic lymphomas

- ▶ **BY MOUTH**
- ▶ **Child:** (consult local protocol)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Mercaptopurine tablets and *Xaluprine*® oral suspension are **not** bioequivalent, haematological monitoring is advised when switching formulations.

- **UNLICENSED USE** Not licensed for use in severe ulcerative colitis and Crohn's disease. Not licensed for use in children for acute lymphoblastic lymphoma or T-cell non-Hodgkins lymphoma.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Reduced thiopurine methyltransferase activity
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ **Thiopurine methyltransferase** The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- **INTERACTIONS** → Appendix 1: mercaptopurine
- **SIDE-EFFECTS**
 - ▶ **Rare** Crystalluria with haematuria · fever · hyperpigmentation · intestinal ulceration · pancreatitis · rash
 - ▶ **Very rare** Lymphoma
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · gastro-intestinal effects · hepatotoxicity (more frequent at higher doses) · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ **Gastro-intestinal side-effects** Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** May need dose reduction.
- **RENAL IMPAIRMENT** Manufacturer advises consider reducing dose.

- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function—discontinue if jaundice develops.
 - ▶ When used for severe ulcerative colitis or severe Crohn's disease Monitor for toxicity throughout treatment. Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Oral suspension

EXCIPIENTS: May contain Aspartame

▶ **Xaluprine** (Nova Laboratories Ltd)

Mercaptopurine 20 mg per 1 ml Xaluprine 20mg/ml oral suspension
| 100 ml [PoM] £170.00

Tablet

▶ **Mercaptopurine (Non-proprietary)**

Mercaptopurine 50 mg Mercaptopurine 50mg tablets |
25 tablet [PoM] £49.15 DT price = £49.15

Methotrexate

17-May-2017

- **DRUG ACTION** Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

INDICATIONS AND DOSE

Severe Crohn's disease

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ Child 7-17 years: 15 mg/m² once weekly (max. per dose 25 mg)

Maintenance of remission of severe Crohn's disease

▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ Child 7-17 years: 15 mg/m² once weekly (max. per dose 25 mg), dose reduced according to response to lowest effective dose

Juvenile idiopathic arthritis | Juvenile dermatomyositis |

Vasculitis | Uveitis | Systemic lupus erythematosus |

Localised scleroderma | Sarcoidosis

▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ Child: Initially 10–15 mg/m² once weekly, then increased if necessary up to 25 mg/m² once weekly

Maintenance and remission of acute lymphoblastic leukaemia, lymphoblastic lymphoma

▶ BY MOUTH

▶ Child: (consult local protocol)

Treatment of early stage Burkitt's lymphoma, non-Hodgkin's lymphoma, osteogenic sarcoma, some CNS tumours including infant brain tumours, acute lymphoblastic leukaemia

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Child: (consult local protocol)

Meningeal leukaemia, treatment and prevention of CNS involvement of leukaemia

▶ BY INTRATHECAL INJECTION

▶ Child: (consult local protocol)

Severe psoriasis unresponsive to conventional therapy (specialist use only)

▶ BY MOUTH

▶ Child 2-17 years: Initially 200 micrograms/kg once weekly (max. per dose 10 mg), then increased if necessary to 400 micrograms/kg once weekly (max. per dose 25 mg), adjusted according to response, stop treatment if inadequate response after 3 months at the optimum dose

- **UNLICENSED USE** *Metotect*® is licensed for use in children over 3 years for polyarticular forms of juvenile idiopathic arthritis; other preparations not licensed for use in children for non-malignant conditions.

IMPORTANT SAFETY INFORMATION

Note that the dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the child or their carer is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medication (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

- **CONTRA-INDICATIONS** Active infection (in non-malignant conditions) · ascites · immunodeficiency syndromes (in non-malignant conditions) · significant pleural effusion

- **CAUTIONS** Acute porphyrias p. 577 · photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported) · diarrhoea · extreme caution in blood disorders (avoid if severe) · peptic ulceration · risk of accumulation in pleural effusion or ascites—drain before treatment · ulcerative colitis · ulcerative stomatitis

CAUTIONS, FURTHER INFORMATION

- ▶ Blood count Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another antifolate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
- ▶ Gastro-intestinal toxicity Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.
- ▶ Liver toxicity Persistent 2-fold rise in liver transaminases may necessitate dose reduction or rarely discontinuation; abrupt withdrawal should be avoided as this can lead to disease flare.
- ▶ Pulmonary toxicity Acute pulmonary toxicity is rare in children treated for juvenile idiopathic arthritis, but children and carers should seek medical attention if dyspnoea, cough or fever develops; discontinue if pneumonitis suspected.
- **INTERACTIONS** → Appendix 1: methotrexate
- **SIDE-EFFECTS**
- ▶ Rare Pneumonitis
- ▶ Frequency not known Abdominal discomfort · abnormal cranial sensations · acne · alopecia · anaphylactic reactions · anorexia · arthralgia · blepharitis · blood dyscrasias (including fatalities) · cerebral oedema · changes in nail pigmentation · changes in skin pigmentation · chills · chronic pulmonary fibrosis · confusion · conjunctivitis · cystitis · diarrhoea · dizziness · drowsiness · dyspepsia · dysuria · ecchymosis · fever · furunculosis · gastro-

intestinal bleeding · gastro-intestinal ulceration · haematuria · headache · hepatotoxicity · hypotension · impotence · injection-site reactions · insomnia · interstitial pneumonitis · liver cirrhosis · malaise · menstrual disturbances · mood changes · mucositis · myalgia · myelosuppression · nausea · neurotoxicity · osteoporosis · paraesthesia · pericardial tamponade · pericarditis · photosensitivity · pleuritic pain · precipitation of diabetes · pruritus · psychosis · pulmonary fibrosis · pulmonary oedema · rash · reduced libido · renal failure · Stevens-Johnson syndrome · telangiectasia · thrombosis · toxic epidermal necrolysis · toxic megacolon · urticaria · vaginitis · vasculitis · visual disturbance · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

In patients taking methotrexate for non-malignant conditions who experience side-effects, folic acid given on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 3 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).
- **BREAST FEEDING** Discontinue breast-feeding—present in milk.
- **HEPATIC IMPAIRMENT** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.
- **RENAL IMPAIRMENT** Reduce dose. Risk of nephrotoxicity at high doses. Avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.

Patients should have full blood count and renal and liver function tests before starting treatment.

Check immunity to varicella-zoster and consider vaccination before initiating therapy.

- **MONITORING REQUIREMENTS** Full blood count and liver function tests repeated fortnightly for at least the first 4 weeks of treatment and at this frequency after any change in dose until therapy stabilised, thereafter monthly; renal function tests should be performed regularly during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Folic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression. The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.
- **PATIENT AND CARER ADVICE** Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath). Children and carers should be advised to avoid self-medication with over-the-counter ibuprofen. Children and their carers should be counselled on the dose and use of NSAIDs. Medicines for Children leaflet: Methotrexate for skin conditions www.medicinesforchildren.org.uk/methotrexate-for-skin-conditions

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

► Methotrexate (Non-proprietary)

Methotrexate 2.5 mg Methotrexate 2.5mg tablets | 24 tablet [PoM] £3.75 | 28 tablet [PoM] £3.82 DT price = £1.77 | 100 tablet [PoM] £14.19

Nelarabine

● INDICATIONS AND DOSE

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in children who have relapsed or who are refractory after receiving at least two previous regimens

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

● **CAUTIONS** Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) · previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

● **INTERACTIONS** → Appendix 1: nelarabine

● SIDE-EFFECTS

- **Common or very common** Neurotoxicity (discontinue)
- **Frequency not known** Alopecia · arthralgia · asthenia · ataxia · benign and malignant tumours · bone-marrow suppression · confusion · constipation · demyelination · diarrhoea · drowsiness · electrolyte disturbances · extravasation · fatigue · gastro-intestinal effects · headache · hyperuricaemia · hypoaesthesia · hypoglycaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · paraesthesia · peripheral neurological disorders · pyrexia · seizures · thromboembolism · tremor · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

● **PREGNANCY** Avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

● **BREAST FEEDING** Discontinue breast-feeding.

● MONITORING REQUIREMENTS

- **Neurotoxicity** Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Atirance** (Novartis Pharmaceuticals UK Ltd) ▼

Nelarabine 5 mg per 1 ml Atirance 250mg/50ml solution for infusion vials | 6 vial [PoM] £1,332.00

Tioguanine

(Thioguanine)

● INDICATIONS AND DOSE

Infant acute lymphoblastic leukaemia

- BY MOUTH
- Child: Can be given at various stages of treatment in short-term cycles (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
 See Cytotoxic drugs p. 505.

● **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity

● **CAUTIONS** Thiopurine methyltransferase status

CAUTIONS, FURTHER INFORMATION

- Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- Long-term therapy Long-term therapy is no longer recommended because of the high risk of liver toxicity.

● **INTERACTIONS** → Appendix 1: tioguanine

● SIDE-EFFECTS

- **Rare** Intestinal necrosis · intestinal perforation
- **Frequency not known** Alopecia · bone-marrow suppression · gastro-intestinal effects · hepatotoxicity (discontinue) · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · stomatitis · thromboembolism · tumour lysis syndrome · vomiting · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- Gastro-intestinal side-effects Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men or women.

● **PREGNANCY** Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Reduce dose.

● **RENAL IMPAIRMENT** Reduce dose.

● **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.

● **MONITORING REQUIREMENTS** Monitor liver function weekly—discontinue if liver toxicity develops.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Tablet▶ **Tioguanine (Non-proprietary)**

Tioguanine 40 mg Tioguanine 40mg tablets | 25 tablet **[PoM]** £109.57

ANTINEOPLASTIC DRUGS > CYTOTOXIC ANTIBIOTICS AND RELATED SUBSTANCES**Bleomycin****INDICATIONS AND DOSE**

Some germ cell tumours | Hodgkin's lymphoma

▶ **BY INTRAVENOUS INFUSION**

▶ **Child:** (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Acute pulmonary infection · significantly reduced lung function
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: bleomycin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dermatological toxicity · mucositis
 - ▶ **Rare** Cardiorespiratory collapse · hyperpyrexia
 - ▶ **Frequency not known** Alopecia · anorexia · chills (after drug administration) · extravasation · fatigue · fever (after drug administration) · gastro-intestinal effects · hypersensitivity reactions · hyperuricaemia · increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques · less bone marrow suppression · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · progressive pulmonary fibrosis (dose-related) · pulmonary toxicity · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505
- **BREAST FEEDING** Discontinue breast feeding.
- **RENAL IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **MONITORING REQUIREMENTS** Ensure monitoring of pulmonary function—investigate any shortness of breath before initiation.
- **PRESCRIBING AND DISPENSING INFORMATION** To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection▶ **Bleo-Kyowa** (Kyowa Kirin Ltd)

Bleomycin (as Bleomycin sulfate) 15000 unit Bleo-Kyowa 15,000unit powder for solution for injection vials | 10 vial **[PoM]** £190.60

Dactinomycin**(Actinomycin D)****INDICATIONS AND DOSE**

Wilms' tumour | Childhood rhabdomyosarcoma and other soft-tissue sarcomas | Ewing's sarcoma

▶ **BY INTRAVENOUS INJECTION**

▶ **Child:** (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: dactinomycin
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Acne · anaemia · cheilitis · dysphagia · fever · hypoglycaemia · lethargy · malaise · myalgia
 - ▶ **Rare** Hepatotoxicity (possibly dose-related)
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.
- **PREGNANCY** Avoid (teratogenic in animal studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Consider dose reduction if raised serum bilirubin or biliary obstruction; consult local treatment protocols.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection▶ **Cosmegen** (Orphan Europe (UK) Ltd)

Dactinomycin 500 microgram Cosmegen Lyovac 500microgram powder for solution for injection vials | 1 vial **[PoM]** £52.58

ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS**Carboplatin**

10-Jun-2016

INDICATIONS AND DOSE

Stage 4 neuroblastoma | Germ cell tumours | Low-grade gliomas (including astrocytomas) | Neuroectodermal tumours (including medulloblastoma) | Rhabdomyosarcoma (metastatic and non-metastatic disease) | Soft-tissue sarcomas | Retinoblastoma | High risk Wilms' tumour | Some liver tumours

▶ **BY INTRAVENOUS INFUSION**

▶ **Child:** (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **INTERACTIONS** → Appendix 1: platinum compounds
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · myelosuppression · nausea · nausea · nephrotoxicity · neurotoxicity · oral mucositis · organ-related toxicity (long-term and delayed) · ototoxicity · thromboembolism · tumour lysis syndrome · vomiting · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
Carboplatin is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose. Avoid if creatinine clearance less than 20 mL/minute/1.73 m². Monitor haematological parameters in renal impairment.
Monitor renal function in renal impairment.
- **MONITORING REQUIREMENTS**
► Consider therapeutic drug monitoring.
- **PRESCRIBING AND DISPENSING INFORMATION** Carboplatin can be given in an outpatient setting.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
► Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284
Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).
www.nice.org.uk/TA284
► Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285
Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.
www.nice.org.uk/TA285

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Carboplatin (Non-proprietary)

- Carboplatin 10 mg per 1 mL Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £22.04 (Hospital only) | 1 vial [PoM] £20.00
Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial [PoM] £56.92 (Hospital only) | 1 vial [PoM] £50.00
Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial [PoM] £260.00
Carboplatin 600mg/60ml solution for infusion vials | 1 vial [PoM] £260.00
Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial [PoM] £168.85 (Hospital only) | 1 vial [PoM] £160.00
Carboplatin 450mg/45ml solution for infusion vials | 1 vial [PoM] £197.48
Carboplatin 150mg/15ml solution for infusion vials | 1 vial [PoM] £65.83
Carboplatin 50mg/5ml solution for infusion vials | 1 vial [PoM] £22.86

Cisplatin

● INDICATIONS AND DOSE

Osteogenic sarcoma | Stage 4 neuroblastoma | Some liver tumours | Infant brain tumours | Intra-cranial germ-cell tumours

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- Hydration Cisplatin requires intensive intravenous hydration; routine use of intravenous fluids containing potassium or magnesium may also be required to help control hypokalaemia and hypomagnesaemia. Treatment may be complicated by severe nausea and vomiting; delayed vomiting may occur and is difficult to control.
- **INTERACTIONS** → Appendix 1: platinum compounds
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · hyperuricaemia · hypocalcaemia · hypokalaemia · hypomagnesaemia · hypophosphataemia · nephrotoxicity (dose-related and potentially cumulative) · neurotoxicity (dose-related and potentially cumulative) · organ-related toxicity (long-term and delayed) · ototoxicity (dose-related and potentially cumulative) · peripheral neuropathy · severe nausea · severe vomiting (may be delayed and difficult to control) · thromboembolism · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if possible—nephrotoxic. Baseline testing of renal function is required; for children with pre-existing renal impairment, consideration should be given to withholding treatment or using another drug.
- **MONITORING REQUIREMENTS**
► Monitor full blood count.
► Monitor audiology.
► Monitor plasma electrolytes.
► Baseline testing of hearing is required; for children with pre-existing hearing impairment, consideration should be given to withholding treatment or using another drug.
► For children with pre-existing marked bone-marrow suppression, consideration should be given to withholding treatment or using another drug.
► Monitor renal function.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Cisplatin (Non-proprietary)

- Cisplatin 1 mg per 1 mL Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £25.11 DT price = £26.47 (Hospital only) | 1 vial [PoM] no price available DT price = £26.47
Cisplatin 100mg/100ml solution for infusion vials | 1 vial [PoM] £50.22 (Hospital only) | 1 vial [PoM] £50.22-£55.64
Cisplatin 10mg/10ml solution for infusion vials | 1 vial [PoM] £5.90 (Hospital only) | 1 vial [PoM] £5.90
Cisplatin 50mg/50ml solution for infusion vials | 1 vial [PoM] £25.37 DT price = £26.47 (Hospital only) | 1 vial [PoM] £25.37-£28.11 DT price = £26.47
Cisplatin 10mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £5.90 (Hospital only) | 1 vial [PoM] no price available
Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial [PoM] £50.22 (Hospital only) | 1 vial [PoM] no price available

ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES

Etoposide

• INDICATIONS AND DOSE

Stage 4 neuroblastoma | **Germ-cell tumours** | **Intracranial germ-cell tumours** | **Rhabdomyosarcoma** | **Soft-tissue sarcomas** | **Neuroectodermal tumours (including medulloblastoma)** | **Relapsed Hodgkin's disease** | **Non-Hodgkin's lymphoma** | **Ewing tumour** | **Acute lymphoblastic leukaemia** | **Acute myeloid leukaemia**

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **INTERACTIONS** → Appendix 1: etoposide

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Alopecia · bone-marrow suppression · dose limiting myelosuppression · gastro-intestinal effects · hyperuricaemia · irritant to tissues · nausea · oral mucositis (more common if given with doxorubicin) · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- With intravenous use Anaphylaxis (associated with concentrated infusions) · hypotension associated with rapid infusion · irritant to tissues (if extravasated)
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Consider dose reduction—consult local treatment protocol for details.
- **DIRECTIONS FOR ADMINISTRATION** Etoposide is usually given by slow intravenous infusion. It may also be given by mouth, but it is unpredictably absorbed.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Etoposide (Non-proprietary)

Etoposide 20 mg per 1 ml Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] no price available (Hospital only) | 1 vial [PoM] £11.50 | 10 vial [PoM] £115.00
Etoposide 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £60.75–£70.33 (Hospital only)

► Eposin (medac UK)

Etoposide 20 mg per 1 ml Eposin 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £67.50 (Hospital only)
Eposin 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £13.50 (Hospital only)

Powder for solution for injection

► Etopophos (Bristol-Myers Squibb Pharmaceuticals Ltd)

Etoposide (as Etoposide phosphate) 100 mg Etopophos 100mg powder for solution for injection vials | 10 vial [PoM] £261.68 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 23

► Vepesid (Bristol-Myers Squibb Pharmaceuticals Ltd)

Etoposide 50 mg Vepesid 50mg capsules | 20 capsule [PoM] £99.82 (Hospital only)

Etoposide 100 mg Vepesid 100mg capsules | 10 capsule [PoM] £87.23 (Hospital only)

ANTINEOPLASTIC DRUGS > VINCA ALKALOIDS

Vinblastine sulfate

• INDICATIONS AND DOSE

Hodgkin's disease and other lymphomas

- BY INTRAVENOUS INJECTION
- Child: (consult local protocol)

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

Vinblastine is for **intravenous administration only**.

Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

• CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION
Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: vinca alkaloids

• SIDE-EFFECTS

- **Common or very common** Abdominal pain · constipation · leucopenia · muscle pain
- **Uncommon** Peripheral neuropathy
- **Rare** Paralytic ileus
- **Frequency not known** Alopecia (reversible) · autonomic neuropathy · gastro-intestinal effects · hyperuricaemia · loss of deep tendon reflexes · motor weakness · myelosuppression (dose-limiting) · nausea · neurotoxicity · oral mucositis · organ-related toxicity (long-term and delayed) · ototoxicity · peripheral neuropathy · peripheral paraesthesia · severe local irritation (care must be taken to avoid extravasation) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Neurotoxicity** Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinblastine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

- **Constipation** Prophylactic use of laxatives may be considered.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

- **PREGNANCY** Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Dose reduction may be necessary—consult local treatment protocol for details.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Vinblastine sulfate (Non-proprietary)**

Vinblastine sulfate 1 mg per 1 mL Vinblastine 10mg/10mL solution for injection vials | 5 vial [PoM] £85.00

Vincristine sulfate

● INDICATIONS AND DOSE

Acute leukaemias | Lymphomas | Paediatric solid tumours

- ▶ BY INTRAVENOUS INJECTION

- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

Vincristine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues • ileus • neuromuscular disease

- **INTERACTIONS** → Appendix 1: vinca alkaloids

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation
- ▶ **Rare** Convulsions followed by coma • inappropriate secretion of antidiuretic hormone
- ▶ **Frequency not known** Abdominal pain • alopecia (reversible) • autonomic neuropathy • diarrhoea • extravasation • gastro-intestinal effects • hyperuricaemia • intestinal necrosis • loss of deep tendon reflexes • motor weakness • myelosuppression (negligible) • nausea • neuromuscular effects (dose-limiting) • neurotoxicity • oral mucositis • organ-related toxicity (long-term and delayed) • ototoxicity • paralytic ileus (in young children) • peripheral neuropathy • peripheral paraesthesia • severe local irritation (care must be taken to avoid extravasation) • thromboembolism • tumour lysis syndrome • urinary retention • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Neurotoxicity** Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Children with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced, but children generally tolerate vincristine better than adults.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

- ▶ **Constipation** Prophylactic use of laxatives may be considered.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

- **PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary—consult local treatment protocol for details.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Vincristine sulfate (Non-proprietary)**

Vincristine sulfate 1 mg per 1 mL Vincristine 1mg/1mL solution for injection vials | 1 vial [PoM] £13.47 (Hospital only) | 5 vial [PoM] £67.35

Vincristine 2mg/2mL solution for injection vials | 1 vial [PoM] £26.66 (Hospital only) | 5 vial [PoM] £133.30

Vincristine 5mg/5mL solution for injection vials | 5 vial [PoM] £329.50

ANTINEOPLASTIC DRUGS > OTHER

Asparaginase

16-Mar-2017

- **DRUG ACTION** Asparaginase is an enzyme which acts by breaking down L-asparagine to aspartic acid and ammonia, this disrupts protein synthesis of tumour cells.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: (consult product literature or local protocols).

- ▶ Child 1-11 months: (consult product literature or local protocols)

- ▶ Child 1-17 years: 5000 units/m² every 3 days

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy • history of serious haemorrhage related to asparaginase therapy • history of serious thrombosis related to asparaginase therapy • pancreatitis • pre-existing known coagulopathy

- **CAUTIONS** Diabetes (may raise blood glucose) • hypersensitivity reactions • hypertriglyceridaemia (severe)—increased risk of acute pancreatitis

CAUTIONS, FURTHER INFORMATION

- ▶ **Hypersensitivity reactions** Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—asparaginase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated. Manufacturer advises an intracutaneous or small intravenous test dose can be used but is of limited value for predicting which patients will experience an allergic reaction.

- **INTERACTIONS** → Appendix 1: asparaginase

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain • acute pancreatitis—discontinue if suspected and do not re-start if confirmed • agitation • anaemia • confusion • decreased appetite • decreased clotting factors • decreased fibrinogen • depression • diarrhoea • dizziness • elevated blood lipids • haemorrhage • hallucination • hyperglycaemia • hypersensitivity reactions • hypoaalbuminaemia • hypoglycaemia • myelosuppression • nausea • oedema • pain • somnolence • thrombosis • vomiting • weight loss
- ▶ **Uncommon** Headache • hyperammonaemia • hyperuricaemia

- ▶ **Rare** Convulsion · diabetic ketoacidosis · disturbances in consciousness (including coma) · hepatotoxicity · ischaemic stroke · parotitis · reversible posterior leucoencephalopathy syndrome
- ▶ **Very rare** Hypoparathyroidism · hypothyroidism (secondary) · tremor

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hepatotoxicity** There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 3 months after last dose; asparaginase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor trough serum asparaginase levels 3 days after administration; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
 - ▶ Manufacturer advises monitor bilirubin, hepatic transaminases, and coagulation parameters before and during treatment; in addition, monitor plasma and urinary glucose, amylase, lipase, triglycerides, cholesterol and serum protein levels during treatment.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage conditions after reconstitution and dilution.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks
Manufacturer advises asparaginase has moderate influence on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Spectrila** (medac UK) ▼

Asparaginase 10000 unit Spectrila 10,000unit powder for concentrate for solution for infusion vials | 1 vial [PoM] £450.00 (Hospital only)

Crisantaspase

16-Mar-2017

- **DRUG ACTION** Crisantaspase is the enzyme asparaginase produced by *Erwinia chrysanthemi*.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia | Acute myeloid leukaemia | Non-Hodgkin's lymphoma

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Preparations of asparaginase derived from *Escherichia coli* are available but they are not licensed, they include: *Medac*® asparaginase and *Elspar*® asparaginase.

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy
- **CAUTIONS** Diabetes (may raise blood glucose)
- **INTERACTIONS** → Appendix 1: crisantaspase
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Coagulation disorders · confusion · convulsions · diarrhoea · dizziness · drowsiness · headache · lethargy · liver dysfunction · neurotoxicity · pancreatitis
 - ▶ **Uncommon** Anaphylaxis · changes in blood lipids · hyperglycaemia
 - ▶ **Rare** CNS depression
 - ▶ **Very rare** Abdominal pain · hypertension · myalgia
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Children who are hypersensitive to asparaginase derived from one organism may tolerate asparaginase derived from another organism but cross-sensitivity occurs in about 20–30% of individuals.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid. See also, *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION** Facilities for the management of anaphylaxis should be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ **Erwinase** (EUSA Pharma Ltd)

Crisantaspase 10000 unit Erwinase 10,000unit powder for solution for injection vials | 5 vial [PoM] £3,065.00

Hydroxycarbamide

(Hydroxyurea)

● INDICATIONS AND DOSE

Sickle-cell disease in children who have recurrent episodes of acute pain (more than 3 admissions in the previous 12 months, or who are very symptomatic in the community) or who have had 2 or more episodes of acute sickle chest syndrome in the last 2 years (or 1 episode requiring ventilatory support)—consult with a specialist centre

- ▶ **BY MOUTH**
- ▶ Child 2–17 years: Initially 10–15 mg/kg once daily, increased in steps of 2.5–5 mg/kg daily, dose to be increased every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **CAUTIONS** Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)
- **INTERACTIONS** → Appendix 1: hydroxycarbamide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Headache · myelosuppression · skin reactions
 - ▶ **Rare** Amenorrhoea (in sickle-cell disease) · fever (in sickle-cell disease)

- **Frequency not known** Alopecia · bleeding (in sickle-cell disease) · bone-marrow suppression · dizziness · hyperuricaemia · hypomagnesaemia (in sickle-cell disease) · nausea · oral mucositis · rash · reduced sperm count and activity · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception before and during treatment.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment, unless used for malignant conditions.
- **RENAL IMPAIRMENT** In sickle-cell disease, reduce initial dose by 50% if estimated glomerular filtration rate less than 60 mL/minute/1.73 m². In sickle-cell disease, avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - Monitor renal and hepatic function before and during treatment.
 - Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).
 - Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.
- **PATIENT AND CARER ADVICE** Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure. Medicines for Children leaflet: Hydroxycarbamide for sickle cell disease www.medicinesforchildren.org.uk/hydroxycarbamide-for-sickle-cell-disease

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

- **Siklos** (Nordic Pharma Ltd)
Hydroxycarbamide 100 mg Siklos 100mg tablets | 60 tablet [PoM]
 £100.00 DT price = £100.00
Hydroxycarbamide 1 gram Siklos 1000mg tablets | 30 tablet [PoM]
 £500.00

Capsule

- **Hydroxycarbamide (Non-proprietary)**
Hydroxycarbamide 500 mg Hydroxycarbamide 500mg capsules | 100 capsule [PoM] £86.00 DT price = £12.12
- **Droxia** (Imported (United States))
Hydroxycarbamide 300 mg Droxia 300mg capsules | 60 capsule [PoM] no price available
- **Hydrea** (Bristol-Myers Squibb Pharmaceuticals Ltd)
Hydroxycarbamide 500 mg Hydrea 500mg capsules | 100 capsule [PoM] £10.47 DT price = £12.12

Mitotane

- **DRUG ACTION** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

● INDICATIONS AND DOSE

Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

- BY MOUTH
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
 See Cytotoxic drugs p. 505.

- **CAUTIONS** Avoid in acute porphyrias p. 577 · risk of accumulation in overweight patients
- **INTERACTIONS** → Appendix 1: mitotane
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · anorexia · asthenia · ataxia · cognitive impairment · confusion · diarrhoea · dizziness · drowsiness · epigastric discomfort · gastro-intestinal disturbances · gynaecomastia · headache · hypercholesterolaemia · hypertriglyceridaemia · leucopenia · liver disorders · movement disorder · myasthenia · nausea · neuropathy · paraesthesia · prolonged bleeding time · rash · thrombocytopenia · vomiting
 - **Rare** Flushing · haematuria · haemorrhagic cystitis · hypersalivation · hypertension · hypouricaemia · ocular disorders · postural hypotension · proteinuria · pyrexia · visual disturbances
 - **Frequency not known** Alopecia · bone-marrow suppression · gastro-intestinal effects · hyperuricaemia · nausea · neuropsychological impairment (possibly secondary to hypothyroidism, and growth retardation) · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Manufacturer advises avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. In mild to moderate hepatic impairment, monitoring of plasma-mitotane concentration is recommended.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. In mild to moderate renal impairment, monitoring of plasma-mitotane concentration is recommended.
- **MONITORING REQUIREMENTS**
 - Monitor plasma-mitotane concentration—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Corticosteroid replacement therapy. Corticosteroid replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.
- **PATIENT AND CARER ADVICE** Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency).
Driving and skilled tasks
 Central nervous system toxicity may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 10, 21

- **Lysodren** (HRA Pharma UK Ltd)
Mitotane 500 mg Lysodren 500mg tablets | 100 tablet [PoM]
 £590.97

Pegaspargase

16-Mar-2017

- **DRUG ACTION** Pegaspargase breaks down the amino acid L-asparagine, thereby interfering with the growth of malignant cells, which are unable to synthesise L-asparagine.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

► Neonate: 82.5 units/kg every 14 days.

► Child (body surface area up to 0.6 m²): 82.5 units/kg every 14 days

► Child (body surface area 0.6 m² and above): 2500 units/m² every 14 days

IMPORTANT SAFETY INFORMATION

Be aware that doses are calculated either using units/kg or units/m², depending on the size of the child.

- **CONTRA-INDICATIONS** History of pancreatitis · history of serious haemorrhagic event with previous L-asparaginase therapy · history of serious thrombosis with previous L-asparaginase therapy
- **CAUTIONS** Concomitant use of other hepatotoxic drugs (particularly in pre-existing hepatic impairment)—monitor hepatic function · diabetes (may raise blood glucose) · hypersensitivity reactions · marked decrease of leukocyte count at start of treatment is possible—may be associated with significant rise in serum uric acid and development of uric acid nephropathy
- **CAUTIONS, FURTHER INFORMATION**
 - Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—pegaspargase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises patients should be closely monitored for signs of hypersensitivity during treatment and for an hour after administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.
- **INTERACTIONS** → Appendix 1: pegaspargase
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · convulsion · diarrhoea · elevated blood lipids · hyperglycaemia · hypersensitivity reactions · hypoxia · myelosuppression · pain in extremities · pancreatitis—discontinue if suspected and do not re-start if confirmed · peripheral motor neuropathy · rash · stomatitis · syncope · thrombosis—discontinue treatment · vomiting
 - **Rare** Acute renal failure · reversible posterior leukoencephalopathy syndrome
 - **Very rare** Tremor
 - **Frequency not known** Confusion · decreased clotting factors · decreased fibrinogen · diabetic ketoacidosis · hepatobiliary disorders · hyperammonaemia—monitor if symptoms present · somnolence · toxic epidermal necrolysis
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - Hepatobiliary disorders There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 6 months after discontinuing treatment; pegaspargase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required,

see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

- **PREGNANCY** Manufacturer advises avoid unless essential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - Manufacturer advises trough serum asparaginase activity levels may be measured before the next administration of pegaspargase; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
 - Manufacturer advises monitor plasma and urine glucose levels during treatment; monitor coagulation profile at baseline and periodically during and after treatment (particularly with concomitant use of other drugs that inhibit coagulation); monitor serum amylase.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intramuscular injection, volumes over 2 mL must be divided between more than one site.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator between 2–8°C.
- **PATIENT AND CARER ADVICE**
 - Pancreatitis Manufacturer advises patients and carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of confusion and somnolence.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Pegaspargase for treating acute lymphoblastic leukaemia (September 2016) NICE TA408
- Pegaspargase, as part of antineoplastic combination therapy, is recommended as an option for treating acute lymphoblastic leukaemia only in patients with untreated newly diagnosed disease.

Patients whose treatment was started within the NHS before this guidance was published may continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta408

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2016) that pegaspargase (*Oncaspar*®) is accepted for use within NHS Scotland as a component of antineoplastic combination therapy in acute lymphoblastic leukaemia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Pegaspargase (non-proprietary) ▼

Pegaspargase 750 unit per 1 mL Oncaspar 3,750units/5ml solution for injection vials | 1 vial [PoM] no price available

Procarbazine

- **DRUG ACTION** Procarbazine is a mild monoamine-oxidase inhibitor.

● INDICATIONS AND DOSE

Hodgkin's lymphoma

- BY MOUTH
- Child: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **CONTRA-INDICATIONS** Pre-existing severe leucopenia · pre-existing severe thrombocytopenia
- **CAUTIONS** Cardiovascular disease · cerebrovascular disease · epilepsy · pheochromocytoma · procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)
- **INTERACTIONS** → Appendix 1: procarbazine
- **SIDE-EFFECTS**
 - **Common or very common** Loss of appetite
 - **Frequency not known** Alopecia · bone-marrow suppression · gastro-intestinal effects · hypersensitivity rash (discontinue treatment) · hyperuricaemia · jaundice · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid (teratogenic in *animal* studies and isolated reports in humans). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 4

- **Procarbazine (Non-proprietary)**
Procarbazine (as Procarbazine hydrochloride)
50 mg Procarbazine 50mg capsules | 50 capsule [PoM] £373.95

RETINOID AND RELATED DRUGS

Tretinoin

● INDICATIONS AND DOSE

Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

- BY MOUTH
- Child: (consult local protocol)

- **CAUTIONS** Increased risk of thromboembolism during first month of treatment
- **INTERACTIONS** → Appendix 1: retinoids
- **SIDE-EFFECTS** Alopecia · anxiety · arrhythmias · benign intracranial hypertension (children particularly susceptible—consider dose reduction if intractable headache in children) · bone pain · cheilitis · chest pain · confusion · depression · dizziness · dry mucous membranes

· dry skin · erythema · flushing · gastro-intestinal disturbances · genital ulceration · headache · hearing disturbances · hypercalcaemia · insomnia · oedema · pancreatitis · paraesthesia · pruritus · raised lipids · raised liver enzymes · raised serum creatinine · rash · retinoic acid syndrome · shivering · sweating · thromboembolism · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- **Retinoic acid syndrome** Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.
- **Nervous system effects** Children particularly susceptible to nervous system effects.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).
- **PREGNANCY** Teratogenic. See *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Avoid (discontinue breast-feeding).
- **HEPATIC IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **RENAL IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **MONITORING REQUIREMENTS** Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Tretinoin is the acid form of vitamin A.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

- **Tretinoin (Non-proprietary)**
Tretinoin 10 mg Tretinoin 10mg capsules | 100 capsule [PoM]
£240.00-£256.80 DT price = £240.00

2.1 Cytotoxic drug-induced side effects

DETOXIFYING DRUGS > UROPROTECTIVE DRUGS

Mesna

● INDICATIONS AND DOSE

Urothelial toxicity following oxazaphosphorine therapy

- BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- Child: (consult local protocol)

Mucolytic in cystic fibrosis

- BY INHALATION OF NEBULISED SOLUTION
- Child: 3–6 mL twice daily, use a 20% solution

- **UNLICENSED USE** Not licensed for use in children.
- **SIDE-EFFECTS**
 - **Common or very common** Colic · depression · diarrhoea · fatigue · headache · hypotension · irritability · joint pains · limb pains · nausea · rash · tachycardia · vomiting
 - **Rare** Hypersensitivity reactions (more common in patients with auto-immune disorders)
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to thiol-containing compounds.

- **PREGNANCY** Not known to be harmful. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **DIRECTIONS FOR ADMINISTRATION** For oral administration of the injection, contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Mesna (Non-proprietary)

Mesna 100 mg per 1 ml Mesna 1g/10ml solution for injection ampoules | 15 ampoule [PoM] £441.15
Mesna 400mg/4ml solution for injection ampoules | 5 ampoule [PoM] no price available | 15 ampoule [PoM] £201.15

VITAMINS AND TRACE ELEMENTS > FOLATES

Folinic acid

● INDICATIONS AND DOSE

Reduction of methotrexate-induced toxicity

- BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Child: (consult local protocol)

Methotrexate overdose

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Child: (consult local protocol)

Megaloblastic anaemia due to folate deficiency

- BY MOUTH
- Child 1 month–11 years: 250 micrograms/kg once daily
- Child 12–17 years: 15 mg once daily

Metabolic disorders leading to folate deficiency

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child: 15 mg once daily, larger doses may be required in older children

Prevention of megaloblastic anaemia associated with pyrimethamine and sulfadiazine treatment of congenital toxoplasmosis

- BY MOUTH

- Neonate: 5 mg 3 times a week; increased if necessary up to 20 mg 3 times a week, if the patient is neutropenic.

- Child 1–11 months: 10 mg 3 times a week

SODIOFOLIN®

As an antidote to methotrexate

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Child: (consult product literature)

- **UNLICENSED USE** Consult product literature for licensing status of individual preparations.

- **CONTRA-INDICATIONS** Intrathecal injection

- **CAUTIONS** Avoid simultaneous administration of methotrexate • **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency

- **INTERACTIONS** → Appendix 1: folates

● SIDE-EFFECTS

- **Rare** Agitation (after high doses) • depression (after high doses) • gastro-intestinal disturbances (after high doses) • insomnia (after high doses) • pyrexia (after parenteral use)

- **PREGNANCY** Not known to be harmful; benefit outweighs risk.

- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

► Folinic acid (Non-proprietary)

Folinic acid (as Calcium folinate) 7.5 mg per 1 ml Calcium folinate 15mg/2ml solution for injection ampoules | 5 ampoule [PoM] £39.00
DT price = £39.00

Folinic acid (as Calcium folinate) 10 mg per 1 ml Calcium folinate 50mg/5ml solution for injection vials | 1 vial [PoM] £20.00 (Hospital only) | 1 vial [PoM] £20.00

Calcium folinate 300mg/30ml solution for injection vials | 1 vial [PoM] £100.00 (Hospital only) | 1 vial [PoM] £100.00

Calcium folinate 100mg/10ml solution for injection vials | 1 vial [PoM] £37.50 (Hospital only) | 1 vial [PoM] £37.50

Folinic acid (as Disodium folinate) 50 mg per 1 ml Disodium folinate 50mg/1ml solution for injection vials | 1 vial [PoM] £24.70
Disodium folinate 200mg/4ml solution for injection vials | 1 vial [PoM] £80.40

► Refolinon (Pfizer Ltd)

Folinic acid (as Calcium folinate) 3 mg per 1 ml Refolinon 30mg/10ml solution for injection ampoules | 5 ampoule [PoM] £23.12

► Sodiofolin (medac UK)

Folinic acid (as Disodium folinate) 50 mg per 1 ml Sodiofolin 400mg/8ml solution for injection vials | 1 vial [PoM] £126.25 (Hospital only)
Sodiofolin 100mg/2ml solution for injection vials | 1 vial [PoM] £35.09 (Hospital only)

Tablet

► Folinic acid (Non-proprietary)

Folinic acid (as Calcium folinate) 15 mg Calcium folinate 15mg tablets | 10 tablet [PoM] £49.06 DT price = £49.05

► Refolinon (Pfizer Ltd)

Folinic acid (as Calcium folinate) 15 mg Refolinon 15mg tablets | 30 tablet [PoM] £85.74

Levofolinic acid

- **DRUG ACTION** Levofolinic acid is an isomer of folinic acid.

● INDICATIONS AND DOSE

Reduction of methotrexate-induced toxicity

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

Methotrexate overdose

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **CONTRA-INDICATIONS** Intrathecal injection

- **CAUTIONS** Avoid simultaneous administration of methotrexate • **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency

- **INTERACTIONS** → Appendix 1: folates

● SIDE-EFFECTS

- **Rare** Agitation (after high doses) • depression (after high doses) • gastro-intestinal disturbances (after high doses) • insomnia (after high doses) • pyrexia (after parenteral use)

- **PREGNANCY** Not known to be harmful; benefit outweighs risk.

- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Isovorin (Pfizer Ltd)

Levofolinic acid (as Calcium levofolinate) 10 mg per 1 ml Isovorin 175mg/17.5ml solution for injection vials | 1 vial [PoM] £81.33 (Hospital only)

Isovorin 25mg/2.5ml solution for injection vials | 1 vial [PoM] £11.62 (Hospital only)

2.1a Hyperuricaemia associated with cytotoxic drugs

DETOXIFYING DRUGS > URATE OXIDASES

Rasburicase

● INDICATIONS AND DOSE

Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** G6PD deficiency
- **CAUTIONS** Atopic allergies
- **SIDE-EFFECTS**
 - Common or very common Fever · nausea · vomiting
 - Uncommon Anaphylaxis · bronchospasm · diarrhoea · haemolytic anaemia · headache · hypersensitivity reactions · methaemoglobinaemia · rash
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor closely for hypersensitivity.
- **EFFECT ON LABORATORY TESTS** May interfere with test for uric acid—consult product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

- **Fasturtec** (Sanofi)
Rasburicase 1.5 mg Fasturtec 1.5mg powder and solvent for solution for infusion vials | 3 vial **[PoM]** £208.39 (Hospital only)
Rasburicase 7.5 mg Fasturtec 7.5mg powder and solvent for solution for infusion vials | 1 vial **[PoM]** £347.32 (Hospital only)

XANTHINE OXIDASE INHIBITORS

Allopurinol

● INDICATIONS AND DOSE

Prophylaxis of hyperuricaemia associated with cancer chemotherapy | Prophylaxis of hyperuricaemic nephropathy, enzyme disorders causing increased serum urate e.g Lesch-Nyhan syndrome

- BY MOUTH
 - Child 1 month–14 years: 10–20 mg/kg daily, dose to be taken preferably after food; maximum 400 mg per day
 - Child 15–17 years: Initially 100 mg daily, taken preferably after food; dose to be increased according to response, up to 900 mg daily in divided doses (max. per dose 300 mg)

- **CAUTIONS** Ensure adequate fluid intake · for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy
- **INTERACTIONS** → Appendix 1: allopurinol
- **SIDE-EFFECTS**
 - Common or very common Gastro-intestinal disorders · rashes (**withdraw** therapy; if rash mild re-introduce cautiously but **discontinue** immediately if recurrence)
 - Rare Alopecia · aplastic anaemia · arthralgia · blood disorders · drowsiness · eosinophilia resembling Stevens-Johnson syndrome · eosinophilia resembling toxic

epidermal necrolysis · exfoliation · fever · haemolytic anaemia · headache · hepatitis · hepatotoxicity · hypersensitivity reactions · hypertension · leucopenia · lymphadenopathy · malaise · neuropathy · paraesthesia · renal impairment · taste disturbances · thrombocytopenia · vasculitis · vertigo · visual disturbances

► Very rare Seizures

- **PREGNANCY** Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.
- **BREAST FEEDING** Present in milk—not known to be harmful.
- **HEPATIC IMPAIRMENT** Reduce dose. Monitor hepatic function.
- **RENAL IMPAIRMENT** Manufacturer advises reduce dose or increase dose interval in severe impairment; adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.
- **PATIENT AND CARER ADVICE**
 Medicines for Children leaflet: Allopurinol for hyperuricaemia www.medicinesforchildren.org.uk/allopurinol-for-hyperuricaemia

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, mouthwash

3 Immunotherapy responsive malignancy

IMMUNOSTIMULANTS > INTERFERONS

Interferon alfa

- **DRUG ACTION** Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

● INDICATIONS AND DOSE

Induction of early regression of life-threatening corticosteroid resistant haemangiomata of infancy

- BY SUBCUTANEOUS INJECTION
- Child: (consult local protocol)

INTRONA® PEN

Chronic active hepatitis B

- BY SUBCUTANEOUS INJECTION
- Child 2–17 years: 5 000 000–10 000 000 units/m² 3 times a week

Chronic active hepatitis C (in combination with oral ribavirin)

- BY SUBCUTANEOUS INJECTION
- Child 3–17 years: 3 000 000 units/m² 3 times a week

continued →

INTRONA® VIALS**Chronic active hepatitis B**

- BY SUBCUTANEOUS INJECTION
- Child 2-17 years: 5 000 000–10 000 000 units/m² 3 times a week

Chronic active hepatitis C (in combination with ribavirin)

- BY SUBCUTANEOUS INJECTION
- Child 3-17 years: 3 000 000 units/m² 3 times a week

ROFERON-A®**Chronic active hepatitis B**

- BY SUBCUTANEOUS INJECTION
- Child 2-17 years: 2 500 000–5 000 000 units/m² 3 times a week, up to 10 000 000 units/m² has been used 3 times a week

- **UNLICENSED USE** Not licensed for use in children for chronic active hepatitis B.
- **ROFERON-A®** *Roferon-A®* not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · history of severe psychiatric illness
- CONTRA-INDICATIONS, FURTHER INFORMATION** For contra-indications consult product literature and local treatment protocol.

CAUTIONS**CAUTIONS, FURTHER INFORMATION**

For cautions consult product literature and local treatment protocol.

Interferon alfa should always be used under the close supervision of a specialist; the decision to treat should be made only after careful assessment of the expected benefits versus the potential risks, in particular the risk of growth inhibition caused by combination therapy.

- **INTERACTIONS** → Appendix 1: interferons
- **SIDE-EFFECTS**
 - **Common or very common** Anorexia · influenza-like symptoms · lethargy · nausea
 - **Rare** Pneumonia · pneumonitis · pulmonary infiltrates
 - **Frequency not known** Alopecia · arrhythmias · cardiovascular problems · coma · confusion · depression · hepatotoxicity · hyperglycaemia · hypersensitivity reactions · hypertension · hypertriglyceridaemia (sometimes severe) · hypotension · myelosuppression (particularly affecting granulocyte counts) · nephrotoxicity · ocular side-effects · psoriasiform rash · reversible motor problems in young children · seizures · suicidal behaviour · thyroid abnormalities

SIDE-EFFECTS, FURTHER INFORMATION

Consult product literature and local treatment protocols for information on side-effects.

Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of interferon alfa should be considered.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Unlikely to be harmful.
- **HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment. Close monitoring required in mild to moderate hepatic impairment.
- **RENAL IMPAIRMENT** Avoid in severe renal impairment. Close monitoring required in mild to moderate renal impairment.
- **MONITORING REQUIREMENTS**
 - Monitoring of lipid concentration is recommended.
 - Monitoring of hepatic function is recommended.

● DIRECTIONS FOR ADMINISTRATION

ROFERON-A® *Roferon-A®* injection for subcutaneous injection.

INTRONA® VIALS *Introna®* injection vials for subcutaneous injection or intravenous infusion.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- **Introna** (Merck Sharp & Dohme Ltd)

Interferon alfa-2b 10 mega u per 1 ml Introna 10million units/1ml solution for injection vials | 1 vial [PoM] no price available
Introna 25million units/2.5ml solution for injection multidose vials | 1 vial [PoM] £103.94

Interferon alfa-2b 15 mega u per 1 ml Introna 18million units/1.2ml solution for injection multidose pens | 1 pre-filled disposable injection [PoM] £74.83

Interferon alfa-2b 25 mega u per 1 ml Introna 30million units/1.2ml solution for injection multidose pens | 1 pre-filled disposable injection [PoM] £124.72

Interferon alfa-2b 50 mega u per 1 ml Introna 60million units/1.2ml solution for injection multidose pens | 1 pre-filled disposable injection [PoM] £249.45

- **Roferon-A** (Roche Products Ltd)

Interferon alfa-2a 6 mega u per 1 ml Roferon-A 3million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.20

Interferon alfa-2a 9 mega u per 1 ml Roferon-A 4.5million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £21.29

Interferon alfa-2a 12 mega u per 1 ml Roferon-A 6million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £28.37

Interferon alfa-2a 18 mega u per 1 ml Roferon-A 9million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £42.57

Interferon gamma-1b

(Immune interferon)

● INDICATIONS AND DOSE**To reduce the frequency of serious infection in chronic granulomatous disease**

- BY SUBCUTANEOUS INJECTION

- Child 6 months-17 years (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
- Child 6 months-17 years (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week

To reduce the frequency of serious infection in severe malignant osteopetrosis

- BY SUBCUTANEOUS INJECTION

- Child (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
- Child (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week

- **CONTRA-INDICATIONS** Simultaneous administration of foreign proteins including immunological products (such as vaccines)—risk of exaggerated immune response
- **CAUTIONS** Arrhythmias · cardiac disease · congestive heart failure · ischaemia · seizure disorders (including seizures associated with fever)
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · arthralgia · chills · depression · diarrhoea · fatigue · fever · headache · injection-site reactions · myalgia · nausea · rash · vomiting
 - **Rare** Confusion · systemic lupus erythematosus
 - **Frequency not known** Neutropenia · proteinuria · raised liver enzymes · thrombocytopenia

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.
- **MONITORING REQUIREMENTS** Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Solution for injection
▶ **Immukin** (Boehringer Ingelheim Ltd)
Interferon gamma-1b (recombinant human) 200 microgram per 1 ml Immukin 100micrograms/0.5ml solution for injection vials | 6 vial [PoM] £450.00

IMMUNOSTIMULANTS > OTHER

Mifamurtide

● INDICATIONS AND DOSE

Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 2–17 years: Infusion to be given over 1 hour (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in patients under 2 years of age at initial diagnosis.
- **CAUTIONS** Asthma—consider prophylactic bronchodilator therapy · chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy · history of autoimmune disease · history of collagen disease · history of inflammatory disease
- **INTERACTIONS** → Appendix 1: mifamurtide
- **SIDE-EFFECTS** Abdominal pain · alopecia · anaemia · anorexia · anxiety · blurred vision · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry skin · dyspepsia · dyspnoea · dysuria · epistaxis · flushing · gastro-intestinal disturbances · granulocytopenia · haematuria · haemoptysis · headache · hearing loss · hypertension · hypoaesthesia · hypokalaemia · hypotension · insomnia · leucopenia · musculoskeletal pain · nausea · oedema · palpitations · paraesthesia · phlebitis · pleural effusion · pollakiuria · rash · respiratory disorders · sweating · tachycardia · tachypnoea · thrombocytopenia · tinnitus · tremor · vertigo · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution—no information available.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **MONITORING REQUIREMENTS**
▶ Monitor renal function, hepatic function and clotting parameters.

- ▶ Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235

Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.

www.nice.org.uk/TA235

- **DRUG ACTION** Everolimus is a protein kinase inhibitor.

● INDICATIONS AND DOSE

VOTUBIA® DISPERSIBLE TABLETS

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

- ▶ BY MOUTH USING DISPERSIBLE TABLETS
- ▶ Child 1–17 years: (consult product literature)

Adjunctive treatment of refractory partial-onset seizures, with or without secondary generalisation, associated with tuberous sclerosis complex

- ▶ BY MOUTH USING DISPERSIBLE TABLETS
- ▶ Child 2–17 years: (consult product literature)

VOTUBIA® TABLETS

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

- ▶ BY MOUTH USING TABLETS
- ▶ Child 1–17 years: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

- **CAUTIONS** History of bleeding disorders
- **INTERACTIONS** → Appendix 1: everolimus
- **SIDE-EFFECTS**
▶ **Common or very common** Abdominal pain · anorexia · arthralgia · asthenia · chest pain · convulsions · dehydration · diarrhoea · dry mouth · dysphagia · electrolyte disturbance · epistaxis · eyelid oedema · fatigue · hand-foot syndrome · headache · hypercholesterolaemia · hyperglycaemia · hyperlipidaemia · hypertension · hypoglycaemia · increased susceptibility to aspergillosis · increased susceptibility to candidiasis · increased

susceptibility to infections • increased susceptibility to pneumonia • insomnia • interstitial lung disease • irritability • nail disorders • peripheral oedema • pneumonitis • renal failure • skin disorders • taste disturbance

- ▶ **Uncommon** Aggression • agitation • congestive heart failure • flushing • impaired wound healing • rhabdomyolysis
 - ▶ **Frequency not known** Alopecia • bone-marrow suppression • gastro-intestinal effects • haemorrhage • hepatitis B reactivation • hyperuricaemia • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • thromboembolism • tumour lysis syndrome • vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
Reduce dose or discontinue if severe side-effects occur—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for up to 8 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Consult product literature.
- **MONITORING REQUIREMENTS**
 - ▶ For *Votubia*® preparations: manufacturer advises everolimus blood concentration monitoring is required—consult product literature.
 - ▶ Monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.
 - ▶ Monitor renal function before treatment and periodically thereafter.
- **DIRECTIONS FOR ADMINISTRATION**
VOTUBIA® DISPERSIBLE TABLETS Manufacturer advises tablets must be dispersed in water before administration—consult product literature for details.
VOTUBIA® TABLETS Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.
- **PRESCRIBING AND DISPENSING INFORMATION** *Votubia*® is available as both *tablets* and *dispersible tablets*. These formulations vary in their licensed indications and are not interchangeable—consult product literature for information on switching between formulations.
- **PATIENT AND CARER ADVICE**
Pneumonitis Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

● INDICATIONS AND DOSE

Treatment of newly diagnosed Philadelphia-chromosome-positive chronic myeloid leukaemia when bone marrow transplantation is not considered first line treatment |

Treatment of Philadelphia-chromosome-positive chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis |

Treatment of newly diagnosed Philadelphia-chromosome-positive acute lymphoblastic leukaemia in combination with chemotherapy

- ▶ BY MOUTH
- ▶ Child: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS
An EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Cardiac disease • hepatitis B infection • history of renal failure • risk factors for heart failure
- CAUTIONS, FURTHER INFORMATION**
 - ▶ Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.
- **INTERACTIONS** → Appendix 1: imatinib
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain • appetite changes • arthralgia • ascites • conjunctivitis • constipation • cough • cramps • diarrhoea • dizziness • dry eyes • dry mouth • dry skin • dyspnoea • epistaxis • fatigue • flatulence • flushing • gastro-oesophageal reflux • haemorrhage • headache • hypoaesthesia • increased lacrimation • influenza-like symptoms • insomnia • oedema • paraesthesia • photosensitivity • pleural effusion • pruritus • pulmonary oedema • rash • sweating • taste disturbance • visual disturbances • weight changes
 - ▶ **Uncommon** Acute respiratory failure • anxiety • cold extremities • cough • depression • drowsiness • dysphagia • electrolyte disturbances • gastric ulceration • gout • gynaecomastia • haematoma • hearing loss • heart failure • hepatic dysfunction • hepatitis • hypertension • hypotension • impaired memory • irregular menstruation • menorrhagia • migraine • palpitation • pancreatitis • peripheral neuropathy • renal failure • sexual dysfunction • skin hyperpigmentation • syncope • tachycardia • tinnitus • tremor • urinary frequency • vertigo

Blood and blood-forming organs

1 Anaemias

Anaemias

Initiation of treatment

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of

infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 524 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies;

thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;

- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

Drugs with definite risk of haemolysis in most G6PD-deficient individuals

- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Methylthioninium chloride
- Nitridazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

Drugs with possible risk of haemolysis in some G6PD-deficient individuals

- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfonyleureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

Drugs used in hypoplastic, haemolytic, and renal anaemias

Anabolic steroids, pyridoxine hydrochloride p. 600, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin p. 496 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special order' manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of *sideroblastic anaemia*

respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur with high doses. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but pyridoxine hydrochloride is indicated in pregnancy, haemolytic anaemias, or during isoniazid p. 352 treatment.

Corticosteroids have an important place in the management of haematological disorders including *autoimmune haemolytic anaemia*, *idiopathic thrombocytopenias* and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure.

Epoetin beta p. 538 is also used for the prevention of anaemia in preterm neonates of low birth-weight; a therapeutic response may take several weeks.

There is insufficient information to support the use of erythropoietins in children with leukaemia or in those receiving cancer chemotherapy.

Darbepoetin is a glycosylated derivative of epoetin; it persists longer in the body and can be administered less frequently than epoetin.

EPOETINS

Epoetins

IMPORTANT SAFETY INFORMATION

ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

In chronic kidney disease, the use of erythropoietins can be considered in a child with anaemia. The aim of treatment is to relieve symptoms of anaemia and to avoid the need for blood transfusion. The optimum haemoglobin concentration is dependent on the child's age and factors such as symptoms, comorbidities, and patient preferences. The haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia. In *adults*, overcorrection of haemoglobin concentration with

erythropoietins in those with chronic kidney disease may increase the risk of serious cardiovascular events and death; haemoglobin concentrations higher than 12 g/100 mL should be avoided in children.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates • pure red cell aplasia following erythropoietin therapy • uncontrolled hypertension
- **CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) • concurrent infection (can impair the response to erythropoietin) • correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment • during dialysis (increase in unfractionated or low molecular weight heparin dose may be needed) • epilepsy • inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled • ischaemic vascular disease • malignant disease • other inflammatory disease (can impair the response to erythropoietin) • sickle-cell disease (lower target haemoglobin concentration may be appropriate) • sudden stabbing migraine-like pain (warning of a hypertensive crisis) • thrombocytosis (monitor platelet count for first 8 weeks)

● SIDE-EFFECTS

- ▶ **Common or very common** Aggravation of hypertension (dose-dependent) • cardiovascular events • diarrhoea • dose-dependent increase in platelet count regressing during treatment (but thrombocytosis rare) • headache • hypertensive crisis (in isolated patients with normal or low blood pressure) • increase in blood pressure (dose-dependent) • influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes) • nausea • shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications • vomiting
- ▶ **Very rare** Sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure
- ▶ **Frequency not known** Anaphylaxis • angioedema • hyperkalaemia • hypersensitivity reactions • injection-site reactions • peripheral oedema • skin reactions

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hypertensive crisis** In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.
- ▶ **Pure red cell aplasia** There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should **not** be switched to another form of erythropoietin.

● MONITORING REQUIREMENTS

- ▶ Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- ▶ Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients and in preterm neonates.

Darbepoetin alfa

● INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure in patients on dialysis

- ▶ **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
- ▶ **Child 11–17 years:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ **Child 11–17 years:** Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- ▶ **BY INTRAVENOUS INJECTION**
- ▶ **Child 11–17 years:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

- **INTERACTIONS** → Appendix 1: darbepoetin alfa

- **SIDE-EFFECTS** Injection-site pain • oedema

- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Epoetin alfa

● INDICATIONS AND DOSE

BINOCRIT® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

▶ BY INTRAVENOUS INJECTION

- ▶ **Child (body-weight up to 10 kg):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin

- concentration decreases and then restart at a dose approximately 25% lower than the previous dose
- ▶ **Child (body-weight 10–30 kg):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 60–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
- ▶ **Child (body-weight 31 kg and above):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 30–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

EPREX® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

▶ BY INTRAVENOUS INJECTION

- ▶ **Child (body-weight up to 10 kg):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
- ▶ **Child (body-weight 10–30 kg):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 60–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
- ▶ **Child (body-weight 31–60 kg):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 30–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

continued →

- ▶ Child (body-weight 61 kg and above): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, maintenance dose can be given as a single dose or in divided doses, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

- **INTERACTIONS** → Appendix 1: epoetin alfa
- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.
- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.
- **HEPATIC IMPAIRMENT** Manufacturers advise caution in chronic hepatic failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Epoetin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

Epoetin beta

● INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure

▶ BY SUBCUTANEOUS INJECTION

- ▶ Neonate: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

- ▶ Child: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

▶ BY INTRAVENOUS INJECTION

- ▶ Neonate: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

- ▶ Child: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL

over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

Prevention of anaemias of prematurity in neonates

► BY SUBCUTANEOUS INJECTION

- Neonate up to 33 weeks corrected gestational age (body-weight 0.75–1.5 kg): 250 units/kg 3 times a week preferably started within 3 days of birth and continued for 6 weeks, using single-dose unpreserved injection.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MAY 2015) EPOETIN BETA (NEORECORMON): INCREASED RISK OF RETINOPATHY IN PRETERM INFANTS CANNOT BE EXCLUDED

There is a possible increased risk of retinopathy in premature infants, when epoetin beta is used for preventing anaemia of prematurity. When using epoetin beta in preterm infants:

- consider the benefits and risks of treatment, including the possible risk of retinopathy,
- monitor the infant for features of retinopathy, and
- advise parents or carers that their baby's eyes will be carefully monitored for any ill effects.

- **INTERACTIONS** → Appendix 1: epoetin beta

- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.

- **HEPATIC IMPAIRMENT** Manufacturers advise caution in chronic hepatic failure.

1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Eculizumab

- **DRUG ACTION** **Eculizumab**, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

• INDICATIONS AND DOSE

Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)

► BY INTRAVENOUS INFUSION

► Child: Refer for specialist advice, experience very limited

Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)

► BY INTRAVENOUS INFUSION

- Child 2 months–17 years (body-weight 5–9 kg): Initially 300 mg once weekly for 2 weeks, followed by 300 mg every 3 weeks
- Child 2 months–17 years (body-weight 10–19 kg): Initially 600 mg once weekly for 1 week, then reduced to 300 mg once weekly for 1 week, followed by 300 mg every 2 weeks
- Child 2 months–17 years (body-weight 20–29 kg): Initially 600 mg once weekly for 3 weeks, followed by 600 mg every 2 weeks
- Child 2 months–17 years (body-weight 30–39 kg): Initially 600 mg once weekly for 2 weeks, then increased to 900 mg once weekly for 1 week, followed by 900 mg every 2 weeks
- Child 2 months–17 years (body-weight 40 kg and above): Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week, followed by 1.2 g every 2 weeks

- **UNLICENSED USE** Not licensed for use in children for paroxysmal nocturnal haemoglobinuria.
- **CONTRA-INDICATIONS** Patients unvaccinated against *Neisseria meningitidis* · unresolved *Neisseria meningitidis* infection
- **CAUTIONS** Active systemic infection

CAUTIONS, FURTHER INFORMATION

- Meningococcal infection Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetraavalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- **Common or very common** Alopecia · arthralgia · blood disorders · cough · dizziness · dysgeusia · dysuria · fatigue · gastro-intestinal disturbances · headache · infection

(including meningococcal infection) · influenza-like symptoms · infusion-related reactions · leucopenia · myalgia · nasopharyngitis · oedema · paraesthesia · pruritus · rash · spontaneous erection · thrombocytopenia · vertigo

- **Uncommon** Anorexia · anxiety · chest pain · depression · epistaxis · gingival pain · Graves' disease · haematoma · hot flushing · hyperhidrosis · hypotension · jaundice · malignant melanoma · menstrual disorders · mood changes · muscle spasms · myelodysplastic syndrome · palpitation · petechiae · renal impairment · skin depigmentation · sleep disturbances · syncope · tinnitus · tremor · visual disturbances

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 5 months after treatment.
- **PREGNANCY** No information available—use only if potential benefit outweighs risk. Human IgG antibodies known to cross placenta.
- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.
- **MONITORING REQUIREMENTS**
- Monitor for 1 hour after infusion.
- For *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
- For *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.
- **DIRECTIONS FOR ADMINISTRATION** Dilute requisite dose to a concentration of 5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and mix gently; give over 25–45 minutes. If infusion-related reactions occur, infusion time may be increased to 4 hours in child under 12 years or 2 hours in child over 12 years.
- **PRESCRIBING AND DISPENSING INFORMATION** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.
- **PATIENT AND CARER ADVICE** A patient information card should be provided.
Patient or carers should be advised to report promptly any signs of meningococcal infection.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Soliris** (Alexion Pharma UK Ltd)

Eculizumab 10 mg per 1 ml Soliris 300mg/30ml concentrate for solution for infusion vials | 1 vial [PoM] £3,150.00 (Hospital only)

1.2 Iron deficiency anaemia

Anaemia, iron deficiency

Treatment and prophylaxis

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastro-intestinal bleeding). The possibility of thalassaemia should be considered in children of Mediterranean or Indian subcontinent descent.

Prophylaxis with an iron preparation may be appropriate in those with a poor diet, malabsorption, menorrhagia, pregnancy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by formulation, palatability, incidence of side-effects, and cost.

Treatment of iron-deficiency anaemia

The oral dose of elemental iron to treat deficiency is 3–6 mg/kg (max. 200 mg) daily given in 2–3 divided doses. Iron supplementation may also be required to produce an optimum response to erythropoietins in iron-deficient children with chronic renal failure or in preterm neonates.

When prescribing, express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered.

Iron content of different iron salts	
Iron salt/amount	Content of ferrous iron
ferrous fumarate 200 mg	65 mg
ferrous gluconate 300 mg	35 mg
ferrous sulfate 300 mg	60 mg
ferrous sulfate, dried 200 mg	65 mg
sodium feredetate 190 mg	27.5 mg

Prophylaxis of iron deficiency

In neonates, haemoglobin and haematocrit concentrations change rapidly. These changes are not due to iron deficiency and cannot be corrected by iron supplementation. Similarly, neonatal anaemia resulting from repeated blood sampling does not respond to iron therapy.

All babies, including preterm neonates, are born with substantial iron stores but these stores can become depleted unless dietary intake is adequate. All babies require an iron intake of 400–700 nanograms daily to maintain body stores. Iron in breast milk is well absorbed but that in artificial feeds or in cow's milk is less so. Most artificial formula feeds are sufficiently fortified with iron to prevent deficiency and their iron content should be taken into account when considering further iron supplementation.

Prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

Infants with a poor diet may become anaemic in the second year of life, particularly if cow's milk, rather than fortified formula feed, is a major part of the diet.

Compound preparations

Some oral preparations contain ascorbic acid p. 602 to aid absorption of the iron, but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins**, except folic acid p. 546 for pregnant women.

Parenteral iron

Iron can be administered parenterally as iron dextran p. 542, iron sucrose p. 542 or ferric carboxymaltose p. 542.

Parenteral iron is generally reserved for use when oral

therapy is unsuccessful because the child cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption.

Many children with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of children with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the child's body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

MINERALS AND TRACE ELEMENTS > IRON, INJECTABLE

Iron (injectable)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

• SIDE-EFFECTS Hypersensitivity reactions

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Anaphylactic reactions Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available. If children complain of acute symptoms particularly nausea, back pain, breathlessness, or develop hypotension, the infusion should be stopped.

Overdose

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 803.

F 541

Ferric carboxymaltose

● INDICATIONS AND DOSE

Iron-deficiency anaemia

- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: Dose calculated according to body-weight and iron deficit (consult product literature)

- **UNLICENSED USE** Not licensed for use in children under 14 years.
- **CAUTIONS** Allergic disorders · asthma · eczema · hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available · infection (discontinue if ongoing bacteraemia) · oral iron should not be given until 5 days after last injection
- **INTERACTIONS** → Appendix 1: iron (injectable)
- **SIDE-EFFECTS**
 - **Common or very common** Dizziness · gastro-intestinal disturbances · headache · injection-site reactions · rash
 - **Uncommon** Anaphylaxis · arthralgia · back pain · chest pain · fatigue · flushing · hypertension · hypotension · malaise · myalgia · paraesthesia · peripheral oedema · pruritus · pyrexia · rigors · urticaria
 - **Rare** Dyspnoea
- **PREGNANCY** Avoid in first trimester; crosses the placenta in *animal* studies. May influence skeletal development.
- **HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Sodium

- **Ferinject** (Vifor Pharma UK Ltd) ▼

Iron (as Ferric carboxymaltose) 50 mg per 1 mL Ferinject 1000mg/20mL solution for injection vials | 1 vial [PoM] £154.23
 Ferinject 100mg/2mL solution for injection vials | 5 vial [PoM] £81.18
 Ferinject 500mg/10mL solution for injection vials | 5 vial [PoM] £405.88

F 541

Iron dextran

● INDICATIONS AND DOSE

Iron-deficiency anaemia

- BY DEEP INTRAMUSCULAR INJECTION
- Child 14–17 years: Intramuscular injection to be administered into the gluteal muscle, doses calculated according to body-weight and iron deficit (consult product literature)
- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: Doses calculated according to body-weight and iron deficit (consult product literature)

- **UNLICENSED USE** Not licensed for use in children under 14 years.
- **CONTRA-INDICATIONS** Active rheumatoid arthritis · asthma · eczema · history of allergic disorders · infection
- **CAUTIONS** Hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available · oral iron should not be given until 5 days after last injection
- **INTERACTIONS** → Appendix 1: iron (injectable)

● SIDE-EFFECTS

- **Uncommon** Abdominal pain · anaphylaxis · blurred vision · cramps · dyspnoea · flushing · nausea · numbness · pruritus · rash · vomiting
- **Rare** Angioedema · arrhythmias · arthralgia · chest pain · diarrhoea · dizziness · fatigue · hypotension · impaired consciousness · injection-site reactions · myalgia · restlessness · seizures · sweating · tachycardia · tremor
- **Very rare** Haemolysis · headache · hypertension · palpitation · paraesthesia · transient deafness
- **PREGNANCY** Avoid in first trimester.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in acute renal failure.
- **PRESCRIBING AND DISPENSING INFORMATION** A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **CosmoFer** (Pharmacosmos UK Ltd) ▼

Iron (as Iron dextran) 50 mg per 1 mL CosmoFer 500mg/10mL solution for injection ampoules | 2 ampoule [PoM] £79.70

 Venofer 50mg/2.5mL solution for injection vials | 5 vial [PoM] no price available

MINERALS AND TRACE ELEMENTS > IRON > IRON, ORAL

Iron (oral)

- **SIDE-EFFECTS** Constipation · diarrhoea · epigastric pain (dose related) · faecal impaction · gastro-intestinal irritation · nausea (dose related)

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Managing side-effects If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulfate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.
- ▶ Altered bowel habit Iron preparations taken orally can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

The relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear than for nausea and epigastric pain.

Overdose

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 803.

Iron preparations are an important cause of accidental overdose in children and as little as 20 mg/kg of elemental iron can lead to symptoms of toxicity.

MONITORING REQUIREMENTS

- ▶ Therapeutic response The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

- **PRESCRIBING AND DISPENSING INFORMATION** Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription.

The iron content of artificial formula feeds should also be considered.

The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

- **PATIENT AND CARER ADVICE** Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

1.3 Megaloblastic anaemia

Anaemia, megaloblastic

Overview

Megaloblastic anaemias are rare in children; they may result from a lack of either vitamin B₁₂ or folate and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

Vitamin B₁₂ is used in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare disorders of congenital transcobalamin II deficiency and homocystinuria.

Vitamin B₁₂ should be given prophylactically after total ileal resection.

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂ in large oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 547 has completely replaced

cyanocobalamin p. 547 as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

Folic acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is administered concurrently otherwise neuropathy may be precipitated.

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores; higher doses may be necessary in malabsorption states. In pregnancy, folic acid daily is continued to term.

For prophylaxis in *chronic haemolytic states, malabsorption, or in renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in juvenile idiopathic arthritis, severe Crohn's disease and severe psoriasis.

Folic acid is actively excreted in breast milk and is well absorbed by the infant. It is also present in cow's milk and artificial formula feeds but is heat labile. Serum and red cell folate concentrations fall after delivery and urinary losses are high, particularly in low birth-weight neonates. Although symptomatic deficiency is rare in the absence of malabsorption or prolonged diarrhoea, it is common for neonatal units to give supplements of folic acid to all preterm neonates from 2 weeks of age until full-term corrected age is reached, particularly if heated breast milk is used without an artificial formula fortifier.

Folinic acid p. 528 is also effective in the treatment of folate deficient megaloblastic anaemia but it is normally only used in association with cytotoxic drugs; it is given as calcium folinate.

There is **no** justification for prescribing multiple ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 610.

VITAMINS AND TRACE ELEMENTS > FOLATES

Folic acid

09-Jun-2016

● INDICATIONS AND DOSE

Folate-deficient megaloblastic anaemia

► BY MOUTH

► Neonate: Initially 500 micrograms/kg once daily for up to 4 months.

- Child 1–11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
- Child 1–17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

Folate supplementation in neonates

► BY MOUTH

- Neonate: 50 micrograms once daily.

Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see p. 610)

► BY MOUTH

- Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant see p. 610)

► BY MOUTH

- Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those with sickle-cell disease)

► BY MOUTH

- Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy

Prevention of methotrexate side-effects in severe Crohn's disease | Prevention of methotrexate side-effects in severe psoriasis

► BY MOUTH

- Child: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prophylaxis of folate deficiency in dialysis

► BY MOUTH

- Child 1 month–11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- Child 12–17 years: 5–10 mg once daily

Haemolytic anaemia | Metabolic disorders

► BY MOUTH

- Child 1 month–11 years: 2.5–5 mg once daily
- Child 12–17 years: 5–10 mg once daily

Prevention of methotrexate side-effects in juvenile idiopathic arthritis

► BY MOUTH

- Child: 1 mg daily, alternatively 5 mg once weekly, dose to be adjusted according to local guidelines, weekly dose to be taken on a different day to methotrexate dose

- **UNLICENSED USE** Unlicensed for limiting methotrexate toxicity.

- **CAUTIONS** Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)

- **INTERACTIONS** → Appendix 1: folates

- **SIDE-EFFECTS**

- **Rare** Gastro-intestinal disturbances

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Folic acid for megaloblastic anaemia caused by folate deficiency and haemolytic anaemia www.medicinesforchildren.org.uk/folic-acid-megaloblastic-anaemia-caused-folate-deficiency-and-haemolytic-anaemia

- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided daily doses do not exceed 500 micrograms.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution
Tablet

- **Folic acid (Non-proprietary)**

Folic acid 400 microgram Folic acid 400microgram tablets | 90 tablet (PoM) no price available DT price = £2.71

Folic acid 5 mg Folic acid 5mg tablets | 28 tablet (PoM) £1.17 DT price = £0.90 | 1000 tablet (PoM) £32.14

Oral solution► **Folic acid (Non-proprietary)**

Folic acid 500 microgram per 1 ml Folic acid 2.5mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £9.16 DT price = £9.16 sugar-free | 150 ml £9.16 DT price = £9.16
Folic acid 1 mg per 1 ml Folic acid 5mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £13.74

► **Lexpec** (Rosemont Pharmaceuticals Ltd)

Folic acid 500 microgram per 1 ml Lexpec Folic Acid 2.5mg/5ml oral solution sugar-free | 150 ml [PoM] £9.16 DT price = £9.16

VITAMINS AND TRACE ELEMENTS > VITAMIN B GROUP**Cyanocobalamin**● **INDICATIONS AND DOSE****Vitamin B₁₂ deficiency of dietary origin**

- BY MOUTH
- Child: 50–105 micrograms daily in 1–3 divided doses

- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when vitamin B₁₂ injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied.

Currently available brands of the tablet may not be suitable for vegans.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Cyanocobalamin liquid, Cytac[®] tablets, and Cytamen[®] injection are not available on prescription under the NHS.

- **LESS SUITABLE FOR PRESCRIBING** Cyanocobalamin is less suitable for prescribing.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet► **Cyanocobalamin (Non-proprietary)**

Cyanocobalamin 50 microgram Cyanocobalamin 50microgram tablets | 50 tablet [P] £6.24 DT price = £8.99 | 50 tablet £8.99 DT price = £8.99 | 100 tablet no price available

Cyanocobalamin 100 microgram Vitamin B12 100microgram tablets | 100 tablet £3.88

► **Cytacon** (AMCo)

Cyanocobalamin 50 microgram Cytacon 50microgram tablets | 50 tablet [P] £8.99 DT price = £8.99

Oral solution► **Cyanocobalamin (Non-proprietary)**

Cyanocobalamin 7 microgram per 1 ml Cyanocobalamin 35micrograms/5ml oral solution | 200 ml [P] £8.75

Hydroxocobalamin● **INDICATIONS AND DOSE****Macrocytic anaemia without neurological involvement**

- BY INTRAMUSCULAR INJECTION
- Child: Initially 0.25–1 mg 3 times a week for 2 weeks, then 0.25 mg once weekly until blood count normal, then 1 mg every 3 months

Macrocytic anaemia with neurological involvement

- BY INTRAMUSCULAR INJECTION
- Child: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months

Prophylaxis of macrocytic anaemias associated with vitamin B₁₂ deficiency

- BY INTRAMUSCULAR INJECTION
- Child: 1 mg every 2–3 months

Leber's optic atrophy

► BY INTRAMUSCULAR INJECTION

- Child: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

Congenital transcobalamin II deficiency

► BY INTRAMUSCULAR INJECTION

- Neonate: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate.

- Child: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate

Methylmalonic acidemia and homocystinuria

► BY INTRAMUSCULAR INJECTION

- Child: Initially 1 mg daily for 5–7 days, then adjusted according to response to up to 1 mg 1–2 times a week, this is the maintenance dose

Methylmalonic acidemia, maintenance once intramuscular response established

► BY MOUTH

- Child: 5–10 mg 1–2 times a week, some children do not respond to oral route

CYANOKIT[®]**Poisoning with cyanides**

► BY INTRAVENOUS INFUSION

- Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

● **UNLICENSED USE**

- With intramuscular use or oral use Licensed for use in children (age not specified by manufacturers). Not licensed for use in inborn errors of metabolism.

● **CAUTIONS**

- With intramuscular use or oral use Should not be given before diagnosis fully established

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

Dizziness · headache · pruritus

SPECIFIC SIDE-EFFECTS

- With intramuscular use Hypokalaemia (during initial treatment) · injection-site reactions · rash · thrombocytosis (during initial treatment)
- With intramuscular use or oral use Chromaturia · fever · hypersensitivity reactions · nausea
- With intravenous use Dyspnoea · eye disorders · gastro-intestinal disturbances · hot flush · lymphocytopenia · memory impairment · peripheral oedema · pustular rashes · red coloration of urine · restlessness · reversible red coloration of skin and mucous membranes · throat disorders · transient hypertension

- **BREAST FEEDING** Present in milk but not known to be harmful.

● **EFFECT ON LABORATORY TESTS**

- With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.

● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (Cyanokit)[®], given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).
- With oral use For administration by mouth, injection solution may be given orally; it will not have prolonged effect via this route.

● PRESCRIBING AND DISPENSING INFORMATION

- With intramuscular use The BP directs that when vitamin B₁₂ injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied.
Poisoning by cyanides
- With intravenous use *Cyanokit*® is the only preparation of hydroxocobalamin that is suitable for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions *Cobalamin-H*® is not prescribable under National Health Service (NHS).

Neo-Cytamen® is not prescribable under National Health Service (NHS).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

► Hydroxocobalamin (Non-proprietary)

Hydroxocobalamin 1 mg per 1 ml Hydroxocobalamin 1mg/1ml solution for injection ampoules | 5 ampoule [PoM] £12.49 DT price = £7.12

Hydroxocobalamin 2.5 mg per 1 ml Hepavit 5mg/2ml solution for injection ampoules | 2 ampoule [PoM] no price available

Hydroxocobalamin 5 mg per 1 ml Megamilbedoce 10mg/2ml solution for injection ampoules | 10 ampoule [PoM] no price available

► Cobalamin (AMCo)

Hydroxocobalamin 1 mg per 1 ml Cobalamin-H 1mg/1ml solution for injection ampoules | 5 ampoule [PoM] £9.50 DT price = £7.12

► Neo-Cytamen (Focus Pharmaceuticals Ltd)

Hydroxocobalamin 1 mg per 1 ml Neo-Cytamen 1000micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £12.49 DT price = £7.12

Powder for solution for infusion

► Cyanokit (Swedish Orphan Biovitrum Ltd)

Hydroxocobalamin 5 gram Cyanokit 5g powder for solution for infusion vials | 1 vial [PoM] no price available

Desferrioxamine mesilate infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

ANTIDOTES AND CHELATORS > IRON CHELATORS

Deferasirox

14-Jun-2017

- **DRUG ACTION** Deferasirox, is an oral iron chelator.

● INDICATIONS AND DOSE

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

► BY MOUTH USING DISPERSIBLE TABLETS

- Child 2-5 years: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 mg/kg

Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

► BY MOUTH USING DISPERSIBLE TABLETS

- Child 6-17 years: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 mg/kg

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only)

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)

► BY MOUTH USING DISPERSIBLE TABLETS

- Child 2-17 years: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 mg/kg

Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

► BY MOUTH USING DISPERSIBLE TABLETS

- Child 10-17 years: Initially 10 mg/kg once daily, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 10 mg/kg per day

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

► BY MOUTH USING FILM-COATED TABLETS

- Child 2-5 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to

2 Iron overload

Iron overload

Overview

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, and in thalassaemia, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 550 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by ascorbic acid (vitamin C) p. 602 daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to children with cardiac dysfunction; in children with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

► BY MOUTH USING FILM-COATED TABLETS

- Child 6–17 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only)

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)

► BY MOUTH USING FILM-COATED TABLETS

- Child 2–17 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

► BY MOUTH USING FILM-COATED TABLETS

- Child 10–17 years: Initially 7 mg/kg once daily, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 7 mg/kg per day

DOSE EQUIVALENCE AND CONVERSION

- The bioavailability of dispersible tablets is lower than that of film-coated tablets; dispersible tablets are not interchangeable with film-coated tablets on a milligram-for-milligram basis—consult product literature for information on switching between formulations.

- **CAUTIONS** History of liver cirrhosis · not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) · platelet count less than 50×10^9 /litre · risk of gastro-intestinal ulceration and haemorrhage · unexplained cytopenia—consider treatment interruption

- **INTERACTIONS** → Appendix 1: deferasirox

● **SIDE-EFFECTS**

- **Common or very common** Abdominal distension · abdominal pain · constipation · diarrhoea · dyspepsia · gastro-intestinal haemorrhage (including fatal cases) · gastro-intestinal ulceration · headache · nausea · proteinuria · pruritus · raised serum creatinine · raised transaminases · rash · vomiting
- **Uncommon** Anxiety · cataract · cholelithiasis · disturbances of hearing and vision · dizziness · fatigue · gastritis · glucosuria · hepatitis · laryngeal pain · maculopathy · oedema · pyrexia · renal tubulopathy · skin pigmentation · sleep disorder
- **Rare** Oesophagitis · optic neuritis
- **Frequency not known** Acute pancreatitis · acute renal failure · alopecia · anaphylaxis · angioedema · blood disorders · erythema multiforme · hepatic failure · hypersensitivity reactions · hypersensitivity vasculitis · metabolic acidosis · nephrolithiasis · Stevens-Johnson

syndrome · toxic epidermal necrolysis · tubulointerstitial nephritis · urticaria

- **PREGNANCY** Manufacturer advises avoid unless essential— toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises reduce dose if serum-creatinine increased above age-appropriate limits or creatinine clearance less than 90 mL/minute on 2 consecutive occasions—consult product literature. Manufacturer advises avoid if estimated creatinine clearance less than 60 mL/minute.

● **MONITORING REQUIREMENTS**

- Manufacturer advises monitoring of the following patient parameters: baseline serum creatinine twice and creatinine clearance once before initiation of treatment, weekly in the first month after treatment initiation or modification, then monthly thereafter; proteinuria before treatment initiation then monthly thereafter, and other markers of renal tubular function as needed; liver function before treatment initiation, every 2 weeks during the first month of treatment, then monthly thereafter; eye and ear examinations before treatment and annually during treatment; serum-ferritin concentration monthly.
- Manufacturer advises monitor liver-iron concentration every three months in children with non-transfusion-dependent thalassaemia syndromes when serum ferritin is ≤ 800 micrograms/litre.
- Manufacturer advises monitor body-weight, height, and sexual development before treatment and then annually thereafter.

- **DIRECTIONS FOR ADMINISTRATION** For *dispersible tablets*, manufacturer advises tablets should be dispersed in 100–200 mL of water, orange juice, or apple juice; if necessary any residue should be resuspended in a small volume of water or juice then administered; do not chew or swallow whole. For *film-coated tablets*, manufacturer advises tablets may be crushed and sprinkled on to soft food (yoghurt or apple sauce), then administered immediately.

● **PATIENT AND CARER ADVICE**

Patient or carers should be given advice on how to administer deferasirox dispersible tablets.
Medicines for Children leaflet: Deferasirox for removing excess iron www.medicinesforchildren.org.uk/deferasirox-for-removing-excess-iron

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

The *Scottish Medicines Consortium* has advised (January 2017) that deferasirox (*Exjade*®) is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload due to blood transfusions when deferoxamine treatment is contra-indicated or inadequate, in adult and paediatric patients aged 2 years and older with rare acquired or inherited anaemias. This advice relates only for use in patients with myelodysplastic syndrome with an International Prognostic Scoring System score of low or intermediate -1 risk.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13, 22

► **Exjade** (Novartis Pharmaceuticals UK Ltd) ▼

Deferasirox 125 mg Exjade 125mg dispersible tablets sugar-free | 28 tablet [PoM](#) | £117.60

Deferiprone

- **DRUG ACTION** Deferiprone, is an oral iron chelator.

INDICATIONS AND DOSE

Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate

► BY MOUTH

► Child 6–17 years: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

- **UNLICENSED USE** Not licensed for use in children under 6 years.
- **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia
- **INTERACTIONS** → Appendix 1: deferiprone
- **SIDE-EFFECTS** Agranulocytosis · arthropathy · blood dyscrasias · gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance) · headache · increased appetite · neutropenia · red-brown urine discoloration · zinc deficiency
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in *animal* studies. Contraception advised in females of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
- **PATIENT AND CARER ADVICE**
Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Desferrioxamine mesilate

(Deferoxamine Mesilate)

INDICATIONS AND DOSE

Iron poisoning

► BY CONTINUOUS INTRAVENOUS INFUSION

► Neonate: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service.

► Child: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

Aluminium overload in dialysis patients

► BY INTRAVENOUS INFUSION

► Child: 5 mg/kg once weekly

Chronic iron overload (low iron overload)

► BY SUBCUTANEOUS INFUSION

► Child: Initially up to 30 mg/kg 3–7 times a week, to be given over 8–12 hours, the dose should reflect the degree of iron overload

Chronic iron overload (established overload)

► BY SUBCUTANEOUS INFUSION

► Child: 20–50 mg/kg daily

UNLICENSED USE

► When used for iron poisoning Licensed for use in children (age range not specified by manufacturer).

● **CAUTIONS** Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

● **INTERACTIONS** → Appendix 1: desferrioxamine

SIDE-EFFECTS

- **Common or very common** Abdominal pain · arthralgia · bone disorders · growth retardation · headache · hearing disturbances · injection-site reactions · myalgia · nausea · pyrexia · vomiting
- **Rare** Anaphylaxis · blood dyscrasias · bone pain · diarrhoea · hepatic impairment · hypotension (especially when given too rapidly by intravenous injection) · leg cramps · lens opacity · leucopenia · rash · retinopathy · thrombocytopenia · visual disturbances · Yersinia and mucormycosis infections
- **Very rare** Acute respiratory distress · convulsions · dizziness · neurological disturbances · neuropathy · paraesthesia · renal impairment
- **Frequency not known** Muscle spasms
- **PREGNANCY** Teratogenic in *animal* studies. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
 - Eye and ear examinations before treatment and at 3-month intervals during treatment.
 - Monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses.

- **DIRECTIONS FOR ADMINISTRATION** For full details and warnings relating to administration, consult product literature.
- ▶ When used for Chronic iron overload or Aluminium overload in dialysis patients For *intravenous* or *subcutaneous infusion*, reconstitute powder with Water for Injection to a concentration of 100 mg/mL; dilute with Glucose 5% or Sodium Chloride 0.9%. In *haemodialysis* or *haemo-filtration* administer over the last hour of dialysis (may be given via the dialysis fistula). *Intraperitoneal*: may be added to dialysis fluid. In CAPD give prior to the last exchange of the day.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Desferrioxamine mesilate (Non-proprietary)**
Desferrioxamine mesilate 500 mg Desferrioxamine 500mg powder for solution for injection vials | 10 vial [PoM] £39.90-£50.00
Desferrioxamine mesilate 2 gram Desferrioxamine 2g powder for solution for injection vials | 1 vial [PoM] £17.95-£20.00
- ▶ **Desferal** (Novartis Pharmaceuticals UK Ltd)
Desferrioxamine mesilate 500 mg Desferal 500mg powder for solution for injection vials | 10 vial [PoM] £46.63

3 Neutropenia and stem cell mobilisation

3.1 Neutropenia

Neutropenia

Management

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim below (unglycosylated rhG-CSF) and lenograstim (glycosylated rhG-CSF) p. 552 have similar effects; both have been used in a variety of clinical settings, including cytotoxic-induced neutropenia, and neutropenia following bone marrow transplantation, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy.

Treatment with granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

Neonatal neutropenia

Filgrastim has been used to treat sepsis-induced neutropenia in preterm neonates. There is no clear evidence that granulocyte-colony stimulating factors improve survival or long-term outcomes.

IMMUNOSTIMULANTS > GRANULOCYTE-COLONY STIMULATING FACTORS

Granulocyte-colony stimulating factors

- **DRUG ACTION** Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.

- **CAUTIONS** Malignant myeloid conditions · pre-malignant myeloid conditions · risk of splenomegaly and rupture—spleen size should be monitored · sickle-cell disease

● CAUTIONS, FURTHER INFORMATION

- ▶ Acute respiratory distress syndrome There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk.

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anorexia · asthenia · bone pain · chest pain · fever · gastro-intestinal disturbances · headache · injection-site reactions · leucocytosis · musculoskeletal pain · rash · thrombocytopenia
- ▶ **Rare** Acute febrile neutrophilic dermatosis · cutaneous vasculitis · pulmonary side-effects (particularly interstitial pneumonia)

● SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Pulmonary infiltration Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.
- **PREGNANCY** There have been reports of toxicity in *animal* studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.
- **BREAST FEEDING** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

● MONITORING REQUIREMENTS

- ▶ Full blood counts including differential white cell and platelet counts should be monitored.
- ▶ Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

Filgrastim

(Recombinant human granulocyte-colony stimulating factor; G-CSF)

● INDICATIONS AND DOSE

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion

continued →

Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Child: 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature

Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Child 16–17 years: 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Child: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Child: Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Persistent neutropenia in HIV infection (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Child: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

Neonatal neutropenia (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Neonate: 10 micrograms/kg daily, to be discontinued if white cell count exceeds 50×10^9 /litre.

Glycogen storage disease type 1b (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Child: Initially 5 micrograms/kg daily, dose to be adjusted as necessary

- **UNLICENSED USE** Not licensed for treatment of glycogen storage disease or neonatal neutropenia.

- **CONTRA-INDICATIONS** Severe congenital neutropenia (Kostmann's syndrome) with abnormal cytogenetics

- **CAUTIONS** Osteoporotic bone disease (monitor bone density if given for more than 6 months) · secondary acute myeloid leukaemia

● **SIDE-EFFECTS**

- **Common or very common** Anaemia · dysuria · epistaxis · exacerbation of rheumatoid arthritis · haematuria · hepatomegaly · mucositis · osteoporosis · proteinuria · pseudogout · raised uric acid · splenic enlargement · transient decrease in blood glucose · transient hypotension · urinary abnormalities

- **Uncommon** Capillary leak syndrome (including fatal cases)

- **Rare** Splenic rupture

- **MONITORING REQUIREMENTS** Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).

- **DIRECTIONS FOR ADMINISTRATION** For subcutaneous or intravenous infusion, dilute with Glucose 5% to a

concentration of not less than 15 micrograms/mL; to dilute to a concentration of 2–15 micrograms/mL, add albumin solution (human albumin solution) to produce a final albumin solution of 2 mg/mL; not compatible with Sodium Chloride solutions.

- **PRESCRIBING AND DISPENSING INFORMATION** Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological and Biosimilar medicines*, under Guidance on prescribing p. 1.

1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Accofil** (Accord Healthcare Ltd) ▼

Filgrastim 60 mega u per 1 ml Accofil 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £284.20

Lenograstim

(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)

● **INDICATIONS AND DOSE**

Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only)

Reduction in the duration of neutropenia and associated complications following peripheral stem cells transplantation for non-myeloid malignancy (specialist use only)

► BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION

- Child 2–17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes

Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Child 2–17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy

Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Child 2–17 years: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)

Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)

► BY SUBCUTANEOUS INJECTION

- Child 2–17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy, for timing of leucopheresis, consult product literature

- **UNLICENSED USE** Not licensed for use in children for cytotoxic-induced neutropenia, mobilisation of peripheral blood progenitor cells (monotherapy or adjunctive therapy), or following peripheral stem cells transplantation.

- **SIDE-EFFECTS** Mucositis · splenic rupture · toxic epidermal necrolysis

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute reconstituted solution to a concentration of not less than 2 micrograms/mL (*Granocyte-13*) or 2.5 micrograms/mL (*Granocyte-34*) with Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** *Granocyte*® solution for injection contains 105 micrograms of lenograstim per 13.4 mega unit vial and 263 micrograms lenograstim per 33.6 mega unit vial.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

4 Platelet disorders

Platelet disorders

Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. A corticosteroid, such as prednisolone p. 421, is sometimes used if idiopathic thrombocytopenic purpura does not resolve spontaneously or if it is associated with severe cutaneous symptoms or mucous membrane bleeding; corticosteroid treatment should not be continued longer than 14 days regardless of the response.

Immunoglobulin preparations may be used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively;

they are often used in preference to a corticosteroid. Anti-D (Rh₀) immunoglobulin p. 741 is licensed for the management of idiopathic thrombocytopenic purpura.

Other therapy that has been tried under specialist supervision in refractory idiopathic thrombocytopenic purpura includes azathioprine p. 495, cyclophosphamide p. 509, vincristine sulfate p. 523, and ciclosporin p. 496. Rituximab p. 505 is also used in specialist centres but experience of its use in children is limited. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 80 may be given to reduce the severity of haemorrhage.

Splenectomy is considered in chronic thrombocytopenic purpura if a satisfactory platelet count is not achieved with regular immunoglobulin infusions, if there is a relapse on withdrawing or reducing the dose of corticosteroid, and if other therapies are considered inappropriate.

Essential thrombocythaemia

Anagrelide below reduces platelets in essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs.

4.1 Essential thrombocythaemia

ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

Anagrelide

● **INDICATIONS AND DOSE**

Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)

► BY MOUTH

- Child 7–17 years: Initially 500 micrograms daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Cardiovascular disease—assess cardiac function before and regularly during treatment · concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment · risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment

- **INTERACTIONS** → Appendix 1: anagrelide

● **SIDE-EFFECTS**

- **Common or very common** Anaemia · dizziness · fatigue · fluid retention · gastro-intestinal disturbances · headache · palpitation · rash · tachycardia
- **Uncommon** Alopecia · amnesia · anorexia · arrhythmias · arthralgia · back pain · blood disorders · chest pain · confusion · congestive heart failure · depression · dry mouth · dyspnoea · ecchymosis · epistaxis · fever · gastro-intestinal haemorrhage · haemorrhage · hypertension · hypoaesthesia · impotence · malaise · myalgia · nervousness · oedema · pancreatitis · paraesthesia · pneumonia pleural effusion · pruritus · skin discoloration · sleep disturbances · syncope · weight changes
- **Rare** Angina · asthenia · cardiomegaly · cardiomyopathy · colitis · dry skin · dysarthria · gastritis · gingival bleeding · impaired coordination · migraine · myocardial infarction · nocturia · pericardial effusion · postural hypotension · pulmonary hypertension · pulmonary infiltrates · renal

failure • somnolence • tinnitus • vasodilatation • visual disturbances

- ▶ **Frequency not known** Hepatitis • interstitial lung disease • Torsade de pointes • tubulointerstitial nephritis

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment. Avoid in moderate to severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²

● **MONITORING REQUIREMENTS**

▶ Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).

▶ Monitor liver function.

▶ Monitor serum creatinine.

▶ Monitor urea.

▶ Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.

▶ Monitor closely for further signs of disease progression such as malignant transformation.

● **PRESCRIBING AND DISPENSING INFORMATION** Initiate only when signs of disease progression or patient suffers from thrombosis. Consider stopping treatment after 3 months if inadequate response.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

▶ **Xagrid** (Shire Pharmaceuticals Ltd) ▼

Anagrelide (as Anagrelide hydrochloride) 500 microgram Xagrid 500microgram capsules | 100 capsule [PoM] £404.57

4.2 Idiopathic thrombocytopenic purpura

ANTIHAEMORRHAGICS > THROMBOPOIETIN RECEPTOR AGONISTS

Eltrombopag

09-Jun-2017

● **INDICATIONS AND DOSE**

Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

▶ **BY MOUTH**

▶ **Child 1–5 years:** Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50x10⁹/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day

▶ **Child 6–17 years:** Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50x10⁹/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day

▶ **Child 6–17 years** (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50x10⁹/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

● **CAUTIONS** Patients of East Asian origin • risk factors for thromboembolism

● **INTERACTIONS** → Appendix 1: eltrombopag

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain • alopecia • anaemia • asthenia • blood disorders • bone pain • cataract • changes in appetite • changes in weight • chest pain • cough • depression • diarrhoea • dry eye • dry mouth • erythema • eye disorders • faeces discoloured • flatulence • headache • hepatobiliary disorders • hepatotoxicity including drug-induced liver injury • hyperhidrosis • influenza • irritability • malaise • menorrhagia • mood disturbances • mouth ulceration • muscle spasms • musculoskeletal pain • myalgia • nasopharyngitis • nausea • oral herpes • oropharyngeal pain • paraesthesia • pharyngitis • pruritus • pyrexia • rash • respiratory tract infection • rhinorrhoea • sleep disorders • toothache • urinary tract infections • vertigo • visual disturbances • vomiting

▶ **Uncommon** Acute myocardial infarction • anorexia • balance disorder • blood uric acid increased • cardiovascular disorders • cholestasis • cyanosis • dysaesthesia • ear pain • electrolyte disturbances • flushing • frequent bowel movements • gingivitis • glossodynia • gout • haematemesis • haematoma • hemiparesis • hepatic lesion • hepatitis • hypoaesthesia • lupus nephritis • migraine • muscular weakness • nasal discomfort • nocturia • oral discomfort • oropharyngeal blistering • peripheral neuropathy • QT-interval prolongation • rectosigmoid cancer • renal failure • sinus disorder • skin discolouration • skin infection • speech disorder • tachycardia • thromboembolic events • toxic neuropathy • tremor

▶ **Frequency not known** Increased bone marrow reticulin—discontinue

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment.

● **PREGNANCY** Avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** For *idiopathic thrombocytopenic purpura*, manufacturer advises avoid unless potential benefit outweighs risk—reduce initial dose to 25 mg once daily and wait at least 3 weeks before upwards titration of dose.

● **RENAL IMPAIRMENT** Use with caution.

● **MONITORING REQUIREMENTS**

▶ Manufacturer advises monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.

▶ Manufacturer advises regular ophthalmological examinations for cataract formation.

▶ Manufacturer advises peripheral blood smear prior to initiation to establish baseline level of cellular morphologic abnormalities; once stabilised, full blood count with white blood cell count differential should be performed monthly.

▶ For *idiopathic thrombocytopenic purpura*, manufacturer advises monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50x10⁹/litre or more for at least 4 weeks), then monthly thereafter; monitor platelet count weekly for 4 weeks following treatment discontinuation.

● **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or

medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.

- **PATIENT AND CARER ADVICE** Patient counselling is advised on how to administer eltrombopag tablets.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2017) that eltrombopag (*Revolade*®) is accepted for restricted use within NHS Scotland for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged 1 year to 17 years who have severe symptomatic ITP or a high risk of bleeding, and are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland, or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2016) that eltrombopag (*Revolade*®) is recommended as an option for use within NHS Wales for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged 1 year to 17 years who are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This recommendation applies only if the approved Wales Patient Access Scheme is used or where the list/contract price is equivalent or lower.

Nutrition and metabolic disorders

1 Acid-base imbalance

1.1 Metabolic acidosis

ALKALISING DRUGS

Trometamol

(Tris(hydroxymethyl)aminomethane, THAM)

● INDICATIONS AND DOSE

Metabolic acidosis

▶ BY INTRAVENOUS INFUSION

- ▶ Child: To be administered at an amount appropriate to the body base deficit

- **UNLICENSED USE** Unlicensed preparation.

- **CONTRA-INDICATIONS** Anuria · chronic respiratory acidosis

- **CAUTIONS** Extravasation can cause severe tissue damage

- **SIDE-EFFECTS** Hyperkalaemia in renal impairment · hypoglycaemia · liver necrosis (following administration via umbilical vein) (in neonates) · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Respiratory depression Respiratory support may be required because trometamol induces respiratory depression.

- **PREGNANCY** Limited information available, hypoglycaemia may harm fetus.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Use with caution, may cause hyperkalaemia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion

Trometamol 363.4 mg per 1 ml Tris 36.34% solution for infusion 20ml ampoules | 10 ampoule [PoM] no price available

2 Fluid and electrolyte imbalances

Fluids and electrolytes

Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

Oral potassium

Compensation for potassium loss is especially necessary:

- in children in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, renal tubule disorder, the nephrotic syndrome, and severe heart failure;
- in children with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse;
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias.

Measures to compensate for potassium loss may be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 136 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the *prevention of hypokalaemia*, then doses of potassium chloride p. 575 daily by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency to reduce the risk of **hyperkalaemia**.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness (small divided doses may minimise gastric irritation); when appropriate, potassium-sparing diuretics are preferable. When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of

any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia

Acute severe hyperkalaemia calls for urgent treatment with intravenous infusion of **soluble insulin** (0.3–0.6 units/kg/hour in neonates and 0.05–0.2 units/kg/hour in children over 1 month) with glucose 0.5–1 g/kg/hour (5–10 mL/kg of glucose 10%; 2.5–5 mL/kg of glucose 20% via a central venous catheter may also be considered). If insulin cannot be used, salbutamol p. 150 can be given by intravenous injection, but it has a slower onset of action and may be less effective for reducing plasma-potassium concentration.

Calcium gluconate p. 568 is given by slow intravenous injection to manage cardiac excitability caused by hyperkalaemia.

The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 558 should be considered (**important**: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Intravenous furosemide can also be given but is less effective in children with renal impairment. Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; dialysis may occasionally be required.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes. Calcium polystyrene sulfonate is preferred unless plasma-calcium concentrations are high.

Oral sodium and water

Sodium chloride p. 561 is indicated in states of sodium depletion. In preterm neonates in the first few weeks of life and in chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride may be sufficient. Sodium chloride solutions suitable for use by mouth in neonates are available from 'special-order' manufacturers or specialist importing companies, they should be used with care because they are hypertonic. Supplementation with sodium chloride may be required to replace losses in children with cystic fibrosis particularly in warm weather.

Oral rehydration therapy (ORT)

Diarrhoea in children is usually self-limiting, however, in children under 6 months of age, and more particularly in those under 3 months, symptoms of dehydration may be less obvious and there is a risk of rapid and severe deterioration. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium

citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na⁺ 75 mmol, K⁺ 20 mmol, Cl⁻ 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children's fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

Oral bicarbonate

Sodium bicarbonate is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Sodium bicarbonate p. 558 may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses when it is not possible or desirable to use the oral route. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 561 or glucose 5% p. 564) can also be given subcutaneously by hypodermoclysis.

In an individual patient the nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical examination. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, for example 15% glucose, are best given through an indwelling catheter positioned in a large vein.

Maintenance fluid requirements in children are usually derived from the relationship that exists between body-weight and metabolic rate; the figures in the table below may be used as a guide outside the neonatal period. The glucose requirement is that needed to minimise gluconeogenesis from amino acids obtained as substrate from muscle breakdown. Maintenance fluids are intended only to provide hydration for a short period until enteral or parenteral nutrition can be established.

It is usual to meet these requirements by using a standard solution of sodium chloride with glucose p. 563. Solutions containing 20 mmol/litre of potassium chloride p. 575 meet usual potassium requirements when given in the suggested

volumes; adjustments may be needed if there is an inability to excrete fluids or electrolytes, excessive renal loss or continuing extra-renal losses. The exact requirements depend upon the nature of the clinical situation and types of losses incurred.

Fluid requirements for children over 1 month:	
Body-weight	24-hour fluid requirement
Under 10 kg	100 mL/kg
10–20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight over 10 kg
Over 20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight between 10–20 kg + 20 mL/kg for each 1 kg body-weight over 20 kg (max. 2 litres in females, 2.5 litres in males)

Important The baseline fluid requirements shown in the table should be adjusted to take account of factors that reduce water loss (e.g. increased antidiuretic hormone, renal failure, hypothermia, and high ambient humidity) or increase water loss (e.g. pyrexia or burns).

Replacement therapy: initial intravenous replacement fluid is generally required if the child is over 10% dehydrated, or if 5–10% dehydrated and oral or enteral rehydration is not tolerated or possible. Oral rehydration is adequate, if tolerated, in the majority of those less than 10% dehydrated. Subsequent fluid and electrolyte requirements are determined by clinical assessment of fluid balance.

Intravenous sodium

Intravenous sodium chloride in isotonic (0.9%) solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*. It may be given for initial treatment of acute fluid loss and to replace ongoing gastro-intestinal losses from the upper gastro-intestinal tract. Intravenous sodium chloride is commonly given as a component of maintenance and replacement therapy, usually in combination with other electrolytes and glucose.

Chronic hyponatraemia should ideally be corrected by fluid restriction. However, if sodium chloride is required, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome; the rise in plasma sodium concentration should be no more than 10 mmol/litre in 24 hours.

Sodium chloride with glucose solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na^+ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

Compound sodium lactate (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded.

Intravenous glucose

Glucose solutions are used mainly to replace water deficit. Water depletion (dehydration) tends to occur when losses are not matched by a comparable intake, as may occur in coma or dysphagia.

Water loss rarely exceeds electrolyte losses but this can occur in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or

hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder; the rate of infusion should be adjusted to return the plasma-sodium concentration to normal over 48 hours.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given with insulin for the emergency management of *hyperkalaemia*. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuous insulin infusion.

Intravenous potassium

Potassium chloride with sodium chloride intravenous infusion p. 561 is the initial treatment for the correction of *severe hypokalaemia* and when sufficient potassium cannot be taken by mouth.

Repeated measurements of plasma-potassium concentration are necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

Bicarbonate and trometamol

Sodium bicarbonate is used to control severe *metabolic acidosis* ($\text{pH} < 7.1$) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anaemia or hypovolaemia, sodium bicarbonate (1.26%) p. 558 can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium depletion; in these circumstances sodium bicarbonate is best given intravenously as a small volume of hypertonic solution, such as 8.4%; plasma pH and electrolytes should be monitored. For *chronic acidotic states*, sodium bicarbonate can be given by mouth.

Trometamol (tris(hydroxymethyl)aminomethane, THAM) p. 555, an organic buffer, corrects metabolic acidosis by causing an increase in urinary pH and an osmotic diuresis. It is indicated when sodium bicarbonate is unsuitable as in carbon dioxide retention, hypernatraemia, or renal impairment. It is also used during cardiac bypass surgery and, very rarely, in cardiac arrest.

Plasma and plasma substitutes

Albumin solution p. 569, prepared from whole blood, contains soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in nephrotic syndrome).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma substitutes

Gelatin p. 569 is a macromolecular substance that is metabolised slowly. Gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicemia; it may also be used

Electrolyte concentrations—intravenous fluids					
	Millimoles per litre				
Intravenous infusion	Na ⁺	K ⁺	HCO ₃ ⁻	Cl ⁻	Ca ²⁺
Normal plasma values	142	4.5	26	103	2.5

Potassium Chloride 0.3% and Glucose 5%	-	40	-	40	-
Potassium Chloride 0.3% and Sodium Chloride 0.9%	150	40	-	190	-
To correct metabolic acidosis					
Sodium Bicarbonate 1.26%	150	-	150	-	-
Sodium Bicarbonate 8.4% for cardiac arrest	1000	-	1000	-	-
Sodium Lactate (m/6)	167	-	167	-	-

Electrolyte content—gastro-intestinal secretions					
	Millimoles per litre				
Type of fluid	H ⁺	Na ⁺	K ⁺	HCO ₃ ⁻	Cl ⁻
Gastric	40–60	20–80	5–20	-	100–150
Biliary	-	120–140	5–15	30–50	80–120
Pancreatic	-	120–140	5–15	70–110	40–80
Small bowel	-	120–140	5–15	20–40	90–130

as an immediate short-term measure to treat haemorrhage until blood is available. Gelatin is rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also the management of shock.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Neonates lose water through the skin and nose, particularly if preterm or if the skin is damaged. The basic fluid requirement for a term baby in average ambient humidity is 40–60 mL/kg/day plus urinary losses. Preterm babies have very high transepidermal losses particularly in the first few days of life; they may need more fluid replacement than full term babies and up to 180 mL/kg/day may be required. Local guidelines for fluid management in the neonatal period should be consulted.

Intravenous sodium

The sodium requirement for most healthy neonates is 3 mmol/kg daily. Preterm neonates, particularly below 30 weeks gestation, may require up to 6 mmol/kg daily. *Hyponatraemia* may be caused by excessive renal loss of sodium; it may also be dilutional and restriction of fluid

intake may be appropriate. Sodium supplementation is likely to be required if the serum sodium concentration is significantly reduced.

Hypermatraemia may also occur, most often due to dehydration (e.g. breast milk insufficiency). Severe hypernatraemia and hyponatraemia can cause fits and rarely brain damage. Sodium in drug preparations, delivered via continuous infusions, or in infusions to maintain the patency of intravascular or umbilical lines, can result in significant amounts of sodium being delivered, (e.g. 1 mL/hour of 0.9% sodium chloride infused over 24 hours is equivalent to 3.6 mmol/day of sodium).

BICARBONATE

Sodium bicarbonate

• INDICATIONS AND DOSE

Chronic acidotic states such as uraemic acidosis or renal tubular acidosis

► BY MOUTH

► Neonate: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response.

► Child: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response

Severe metabolic acidosis

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous

intravenous infusion of a weaker solution (usually 1.26%)

Renal hyperkalaemia

► BY SLOW INTRAVENOUS INJECTION

► Neonate: 1 mmol/kg daily.

► Child: 1 mmol/kg daily

Persistent cyanotic spell in a child with congenital heart disease despite optimal use of 100% oxygen and propranolol

► BY INTRAVENOUS INFUSION

► Child: 1 mmol/kg, dose given to correct acidosis (or dose calculated according to arterial blood gas results), sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year

● CONTRA-INDICATIONS

► With oral use Salt restricted diet

● CAUTIONS Respiratory acidosis

● INTERACTIONS → Appendix 1: sodium bicarbonate

● SIDE-EFFECTS

► When used for chronic acidotic states such as uraemic acidosis or renal tubular acidosis Fluid retention (in those at risk) · hypokalaemia may be exacerbated · increase blood pressure · pulmonary oedema (in those at risk)

● MONITORING REQUIREMENTS

► With intravenous use Plasma-pH and electrolytes should be monitored.

● DIRECTIONS FOR ADMINISTRATION

► With intravenous use For *peripheral infusion* dilute 8.4% solution at least 1 in 10. For *central line infusion* dilute 1 in 5 with Glucose 5% or 10% or Sodium Chloride 0.9%. Extravasation can cause severe tissue damage.
► With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

● PRESCRIBING AND DISPENSING INFORMATION

► With oral use *Sodium bicarbonate 500mg* capsules contain approximately 6 mmol each of Na^+ and HCO_3^- ; *Sodium bicarbonate 600mg* capsules contain approximately 7 mmol each of Na^+ and HCO_3^- . Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.
► With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na^+ and HCO_3^- /litre), various other strengths available.

● PATIENT AND CARER ADVICE

Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines. Medicines for Children leaflet: Sodium bicarbonate for acidosis www.medicinesforchildren.org.uk/sodium-bicarbonate-for-acidosis

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection

Tablet

► **Sodium bicarbonate (Non-proprietary)**

Sodium bicarbonate 600 mg Sodium bicarbonate 600mg tablets | 100 tablet [GSL] £29.75 DT price = £26.52 | 100 tablet £125.50 DT price = £26.52

Solution for injection

► **Sodium bicarbonate (Non-proprietary)**

Sodium bicarbonate 84 mg per 1 ml Sodium bicarbonate 8.4% (1mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £81.27
Sodium bicarbonate 8.4% (1mmol/ml) solution for injection 250ml bottles | 10 bottle [PoM] £65.34
Sodium bicarbonate 8.4% (1mmol/ml) solution for injection 100ml bottles | 10 bottle [PoM] £62.04

Oral solution

► **Sodium bicarbonate (Non-proprietary)**

Sodium bicarbonate 84 mg per 1 ml S-BicarB SF 420mg/5ml (1mmol/ml) oral solution sugar-free | 100 ml £26.25 DT price = £39.80
S-BicarB 420mg/5ml (1mmol/ml) oral solution | 100 ml no price available
SodiBic 420mg/5ml (1mmol/ml) oral solution sugar-free | 100 ml £17.71 DT price = £39.80

ELECTROLYTES AND MINERALS > POTASSIUM

Potassium chloride with calcium chloride and sodium chloride and sodium lactate

(Sodium Lactate Intravenous Infusion, Compound; Compound, Hartmann's Solution for Injection; Ringer-Lactate Solution for Injection)

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 575, sodium chloride p. 561, calcium chloride p. 567.

● INDICATIONS AND DOSE

For prophylaxis, and replacement therapy, requiring the use of sodium chloride and lactate, with minimal amounts of calcium and potassium

► BY INTRAVENOUS INFUSION

► Child: (consult product literature)

● **INTERACTIONS** → Appendix 1: calcium salts, potassium chloride

● **PRESCRIBING AND DISPENSING INFORMATION** Compound sodium lactate intravenous infusion contains Na^+ 131 mmol, K^+ 5 mmol, Ca^{2+} 2 mmol, HCO_3^- (as lactate) 29 mmol, Cl^- 111 mmol/litre.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

► **Potassium chloride with calcium chloride and sodium chloride and sodium lactate (Non-proprietary)**
Calcium chloride 270 microgram per 1 ml, Potassium chloride 400 microgram per 1 ml, Sodium lactate 3.17 mg per 1 ml,

Sodium chloride 6 mg per 1 ml Sodium lactate compound infusion
 1litre Macoflex N bags | 1 bag [PoM] no price available |
 10 bag [PoM] no price available
 Sodium lactate compound infusion 1litre Vialflex bags | 1 bag [PoM]
 no price available | 10 bag [PoM] no price available

 no price available | 12 bag [PoM] no price available
 Sodium lactate compound infusion 1litre Vialflo bags | 1 bag [PoM] no
 price available | 10 bag [PoM] no price available
 Ringer lactate infusion 1litre Vialflo bags | 1 bag [PoM] no price
 available | 10 bag [PoM] no price available

Potassium chloride with calcium chloride dihydrate and sodium chloride

(Ringer's solution)

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 575, sodium chloride p. 561.

● INDICATIONS AND DOSE

Electrolyte imbalance

- BY INTRAVENOUS INFUSION
- Child: Dosed according to the deficit or daily maintenance requirements (consult product literature)

● INTERACTIONS → Appendix 1: potassium chloride

● PRESCRIBING AND DISPENSING INFORMATION Ringer's solution for injection provides the following ions (in mmol/litre), Ca^{2+} 2.2, K^+ 4, Na^+ 147, Cl^- 156.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

- **Potassium chloride with calcium chloride dihydrate and sodium chloride (Non-proprietary)**
 Potassium chloride 300 microgram per 1 ml, Calcium chloride 320 microgram per 1 ml, Sodium chloride 8.6 mg per 1 ml Polyfusor C ringers infusion 500ml bottles | 1 bottle [PoM] £2.95
 Steriflex No.9 ringers infusion 1litre bags | 1 bag [PoM] £2.22
 Steriflex No.9 ringers infusion 500ml bags | 1 bag [PoM] £1.96

Potassium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 575, glucose p. 564.

● INDICATIONS AND DOSE

Electrolyte imbalance

- BY INTRAVENOUS INFUSION
- Child: Dosed according to the deficit or daily maintenance requirements

● INTERACTIONS → Appendix 1: glucose, potassium chloride

● PRESCRIBING AND DISPENSING INFORMATION Potassium chloride 0.3% contains 40 mmol each of K^+ and Cl^- /litre or 0.15% contains 20 mmol each of K^+ and Cl^- /litre with 5% of anhydrous glucose.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Infusion

- **Potassium chloride with glucose (Non-proprietary)**
 Potassium chloride 3 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml Potassium chloride 0.3% (potassium 40mmol/litre) / Glucose 5% infusion 1litre Macoflex bags | 1 bag [PoM] no price available

 Steriflex No.28 potassium chloride 0.2% (potassium 27mmol/1litre) / sodium chloride 0.9% infusion 1litre bags | 1 bag [PoM] £2.20

ELECTROLYTES AND MINERALS > SODIUM CHLORIDE

Sodium chloride

● INDICATIONS AND DOSE

Chronic renal salt wasting

► BY MOUTH

- Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements

Sodium supplementation in neonates

► INITIALLY BY MOUTH

- Neonate up to 36 weeks corrected gestational age: 2 mmol, dose to be administered in 100 ml of formula feed (consult dietician), alternatively (by mouth using modified-release tablets) 3–4 mmol, dose to be administered in 100 ml of breast milk (consult dietician).

continued →

Sodium replacement

- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- ▶ Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements, higher doses may be needed in severe depletion

Management of diabetic ketoacidosis (to restore circulating volume if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

Diluent for instillation of drugs to the bladder

- ▶ BY INTRAVESICAL INSTILLATION
- ▶ Child: (consult product literature)

• CAUTIONS

- ▶ With intravenous use Avoid excessive administration - cardiac failure - cardio-respiratory diseases - children receiving glucocorticoids - dilutional hyponatraemia - hepatic cirrhosis - hypertension - peripheral oedema - pulmonary oedema - reduced fluid loss - renal insufficiency - restrict intake in impaired renal function - toxemia of pregnancy

CAUTIONS, FURTHER INFORMATION

- ▶ Reduced fluid loss
- ▶ With intravenous use The volume of fluid infused should take into account the possibility of reduced fluid loss owing to increased antidiuretic hormone and factors such as renal failure, hypothermia, and high humidity.
- ▶ Dilutional hyponatraemia
- ▶ With intravenous use Dilutional hyponatraemia is a rare but potentially fatal risk of parenteral hydration. It may be caused by inappropriate use of hypotonic fluids such as sodium chloride 0.18% and glucose 4% intravenous infusion, especially in the postoperative period when antidiuretic hormone secretion is increased. Dilutional hyponatraemia is characterized by a rapid fall in plasma-sodium concentration leading to cerebral oedema and seizures; any child with severe hyponatraemia or rapidly changing plasma-sodium concentration should be referred urgently to a paediatric high dependency facility.

• SIDE-EFFECTS

- ▶ With intravenous use Administration of large doses may give rise to sodium accumulation - oedema

• MONITORING REQUIREMENTS

- ▶ During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

• PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intravenous use Sodium chloride 0.9% intravenous infusion contains Na⁺ and Cl⁻ each 150 mmol/litre. The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).
- ▶ With oral use Each *Slow Sodium*[®] tablet contains approximately 10 mmol each of Na⁺ and Cl⁻; tablets can be crushed before administration.

Combinations available: *Potassium chloride with calcium chloride and sodium chloride and sodium lactate*, p. 559 · *Potassium chloride with calcium chloride dihydrate and sodium chloride*, p. 560 · *Potassium chloride with glucose and sodium chloride*, p. 560 · *Potassium chloride with sodium chloride*, p. 561

Sodium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 561, glucose p. 564.

● INDICATIONS AND DOSE

Combined water and sodium depletion

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult product literature)

- **CAUTIONS** Sodium chloride 0.18% and glucose 4% intravenous infusion fluid should not be used for fluid replacement in children aged 16 years or less because of the risk of hyponatraemia; availability of this infusion should be restricted to high dependency and intensive care units, and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.

- **INTERACTIONS** → Appendix 1: glucose

● MONITORING REQUIREMENTS

- ▶ Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.
- ▶ During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

NUTRIENTS > SUGARS

Glucose

(Dextrose Monohydrate)

• INDICATIONS AND DOSE

Establish presence of gestational diabetes

► BY MOUTH

- Child: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Oral glucose tolerance test

► BY MOUTH

- Child: Test dose 1.75 g/kg (max. per dose 75 g), anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals. To be given with 200–300 mL fluid

Neonatal hypoglycaemia

► BY INTRAVENOUS INFUSION

- Neonate: 500 mg/kg/hour, to be administered as Glucose 10% intravenous infusion, an initial dose of 250 mg/kg over 5 minutes may be required if hypoglycaemia is severe enough to cause loss of consciousness or seizures.

Hypoglycaemia

► BY INTRAVENOUS INFUSION

- Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

Energy source

► BY INTRAVENOUS INFUSION

- Child: (consult product literature)

Water replacement

► BY INTRAVENOUS INFUSION

- Child: The volume of glucose solution needed to replace deficits may vary (consult product literature)

Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)

► BY INTRAVENOUS INFUSION

- Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

Management of diabetic ketoacidosis

► BY INTRAVENOUS INFUSION

- Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre

DOSE EQUIVALENCE AND CONVERSION

- 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

- **CAUTIONS** Do not give alone except when there is no significant loss of electrolytes · prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances
- **INTERACTIONS** → Appendix 1: glucose
- **SIDE-EFFECTS** Glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.
- **PRESCRIBING AND DISPENSING INFORMATION** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.
- **EXCEPTIONS TO LEGAL CATEGORY**
 - With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

ORAL REHYDRATION SALTS

Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride

(Formulated as oral rehydration salts)

• INDICATIONS AND DOSE

Fluid and electrolyte loss in diarrhoea

- BY MOUTH
- Child 1-11 months: 1–1½ times usual feed volume to be given
- Child 1-11 years: 200 mL, to be given after every loose motion
- Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include black currant, citrus, or natural.

• PATIENT AND CARER ADVICE

After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

Medicines for Children leaflet: Oral rehydration salts www.medicinesforchildren.org.uk/oral-rehydration-salts

(hypoparathyroidism), or resistance to parathyroid hormone (pseudohypoparathyroidism).

Mild asymptomatic hypocalcaemia may be managed with oral calcium supplements. *Severe symptomatic hypocalcaemia* requires an intravenous infusion of calcium gluconate 10% p. 568 over 5 to 10 minutes, repeating the dose if symptoms persist; in exceptional cases it may be necessary to maintain a continuous calcium infusion over a day or more. Calcium chloride injection p. 567 is also available, but is more irritant; care should be taken to prevent extravasation.

See the role of calcium gluconate in temporarily reducing the toxic effects of *hyperkalaemia*.

Persistent hypocalcaemia requires oral calcium supplements and either a vitamin D analogue (alfacalcidol p. 603 or calcitriol p. 603) for hypoparathyroidism and pseudohypoparathyroidism or natural vitamin D (calciferol) if due to vitamin D deficiency. It is important to monitor plasma and urinary calcium during long-term maintenance therapy.

Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 561. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If severe hypercalcaemia persists drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and pamidronate disodium p. 448 is probably the most effective.

Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 450 can be used by specialists for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful. Parathyroidectomy may be indicated for hyperparathyroidism.

Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

Neonates

Hypocalcaemia is common in the first few days of life, particularly following birth asphyxia or respiratory distress. Late onset at 4–10 days after birth may be secondary to vitamin D deficiency, hypoparathyroidism or hypomagnesaemia and may be associated with seizures.

2.1 Calcium imbalance

Calcium

Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand. Hypocalcaemia may be caused by vitamin D deficiency (see Vitamin D under Vitamins p. 596), impaired metabolism, a failure of secretion

2.1a Hypocalcaemia

ELECTROLYTES AND MINERALS > CALCIUM

Calcium salts

- **CONTRA-INDICATIONS** Conditions associated with hypercalcaemia (e.g. some forms of malignant disease) · conditions associated with hypercalciuria (e.g. some forms of malignant disease)
- **CAUTIONS** History of nephrolithiasis · sarcoidosis

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Rare** Gastro-intestinal disturbances
- **Frequency not known** Hypercalcaemia

SPECIFIC SIDE-EFFECTS

- With intravenous use Arrhythmias · bradycardia · fall in blood pressure · injection-site reactions · peripheral vasodilatation · severe tissue damage with extravasation · sweating

- **RENAL IMPAIRMENT** Use with caution. Risk of hypercalcaemia and renal calculi.

F 566

Calcium carbonate

● INDICATIONS AND DOSE

Phosphate binding in renal failure and hyperphosphataemia

► BY MOUTH

- Child 1–11 months: 120 mg 3–4 times a day, dose to be adjusted as necessary, to be taken with feeds
- Child 1–5 years: 300 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
- Child 6–11 years: 600 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
- Child 12–17 years: 1.25 g 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals

Calcium deficiency

► BY MOUTH

- Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
- Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
- Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
- Child 12–17 years: 10 mmol 4 times a day, adjusted according to response

- **INTERACTIONS** → Appendix 1: calcium salts

- **PRESCRIBING AND DISPENSING INFORMATION** *Adcal*[®] contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol); *Calcichew*[®] contains calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol); *Calcichew Forte*[®] contains calcium carbonate 2.5 g (calcium 1 g or Ca²⁺ 25 mmol); *Cacit*[®] contains calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca²⁺ 12.5 mmol); consult product literature for details of other available products.

Flavours of chewable tablet formulations may include orange or fruit flavour.

Calcium chloride 14.7% solution for injection 10mL ampoules | 10 ampoule [PoM] £67.29–£68.93 DT price = £67.29

F 566

Calcium gluconate

INDICATIONS AND DOSE

Calcium deficiency | Mild asymptomatic hypocalcaemia

BY MOUTH

Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.

- Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
- Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
- Child 12–17 years: 10 mmol 4 times a day, adjusted according to response

Acute hypocalcaemia, urgent correction | Hyperkalaemia (prevention of arrhythmias)

BY SLOW INTRAVENOUS INJECTION

Neonate: 0.11 mmol/kg for 1 dose, to be given over 5–10 minutes, some units use a dose of 0.46 mmol/kg (2 mL/kg calcium gluconate 10%) for hypocalcaemia in line with US practice.

Child: 0.11 mmol/kg, to be given over 5–10 minutes, maximum 4.5 mmol (20 mL calcium gluconate 10%)

Acute hypocalcaemia, maintenance

BY CONTINUOUS INTRAVENOUS INFUSION

Neonate: 0.5 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation.

- Child 1 month–1 year: 1 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation; Usual maximum 8.8 mmol
- Child 2–17 years: 8.8 mmol daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation

DOSE EQUIVALENCE AND CONVERSION

0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

IMPORTANT SAFETY INFORMATION

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

● **INTERACTIONS** → Appendix 1: calcium salts

MONITORING REQUIREMENTS

With intravenous use Plasma-calcium and ECG monitoring required for administration by slow intravenous injection (risk of arrhythmias if given too rapidly).

DIRECTIONS FOR ADMINISTRATION

With intravenous use For intravenous infusion dilute to at least 45 micromol/mL with Glucose 5% or Sodium Chloride 0.9%. Maximum administration rate 45 micromol/kg/hour (or in neonates max. 22 micromol/kg/hour). May be given more concentrated via a central venous catheter. May be used undiluted (10% calcium gluconate) in emergencies. Avoid extravasation; should not be given by intramuscular injection. Incompatible with sodium bicarbonate and phosphate solutions.

● **PRESCRIBING AND DISPENSING INFORMATION** Calcium gluconate 1 g contains calcium 89 mg or Ca^{2+} 2.23 mmol.

No licensed medicines listed.

2.2 Low blood volume

BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

Albumin solution

(Human Albumin Solution)

● INDICATIONS AND DOSE

Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)

► BY INTRAVENOUS INFUSION

► Child: (consult product literature)

Adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn (with concentrated solutions 20%)

► BY INTRAVENOUS INFUSION

► Child: (consult product literature)

● **CONTRA-INDICATIONS** Cardiac failure · severe anaemia

● **CAUTIONS** Correct dehydration when administering concentrated solution · history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · increased capillary permeability

● **SIDE-EFFECTS** Anaphylaxis · chills · fever · hypersensitivity reactions · hypotension · increased salivation · nausea · tachycardia · vomiting

● **MONITORING REQUIREMENTS** Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

● **PRESCRIBING AND DISPENSING INFORMATION** A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

PLASMA SUBSTITUTES

Gelatin

● INDICATIONS AND DOSE

Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

► BY INTRAVENOUS INFUSION

► Child: Initially 10–20 mL/kg, use 3.5–4% solution

● **CAUTIONS** Cardiac disease · severe liver disease

CAUTIONS, FURTHER INFORMATION

The use of plasma substitutes in children requires specialist supervision due to the risk of fluid overload; use is best restricted to an intensive care setting.

● SIDE-EFFECTS

► **Rare** Severe anaphylactic reactions

► **Frequency not known** Hypersensitivity reactions · transient increase in bleeding time

● **PREGNANCY** Manufacturer of *Geloplasma*® advises avoid at the end of pregnancy.

● **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

● **RENAL IMPAIRMENT** Use with caution in renal impairment.

● MONITORING REQUIREMENTS

► Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.

► Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

● **PRESCRIBING AND DISPENSING INFORMATION** The gelatin is partially degraded.

Gelaspan® contains succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na⁺ 151 mmol, K⁺ 4 mmol, Mg²⁺ 1 mmol, Cl⁻ 103 mmol, Ca²⁺ 1 mmol, acetate 24 mmol/litre; *Gelofusine*® contains

2.3 Magnesium imbalance

Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypomagnesaemia* (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia (with which it may be confused), particularly in neonates, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg. Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth in divided doses, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution below is available as a licensed preparation.

Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes*.

2.3a Hypomagnesaemia

ELECTROLYTES AND MINERALS > MAGNESIUM

Magnesium aspartate

• INDICATIONS AND DOSE

Treatment and prevention of magnesium deficiency

► BY MOUTH

- Child 2–3 years: 4.5 mmol daily, given as one level 5 mL spoonful of *Magnaspartate*[®] powder.
- Child 4–9 years: 4.5 mmol daily, given as a 5 mL level spoonful of *Magnaspartate*[®] powder, alternatively 10 mmol daily, given as 1 sachet of *Magnaspartate*[®] powder.
- Child 10–17 years: 10 mmol daily, given as 1 sachet of *Magnaspartate*[®] powder.

• CONTRA-INDICATIONS Disorders of cardiac conduction

• INTERACTIONS → Appendix 1: magnesium

• SIDE-EFFECTS

- **Uncommon** Diarrhoea
- **Rare** Hypermagnesaemia
- **Frequency not known** Dental caries (on long term use) • gastrointestinal irritation

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

Overdose

Symptoms of hypermagnesaemia may include nausea, vomiting, flushing of the skin, thirst, hypotension due to peripheral vasodilatation, drowsiness, confusion, loss of tendon reflexes and respiratory depression due to neuromuscular blockade, slurred speech, double vision, muscle weakness, bradycardia, cardiac arrhythmias, coma, and cardiac arrest.

• RENAL IMPAIRMENT Avoid in severe impairment (estimated glomerular filtration rate less than 30 mL/minute/1.73²).

• DIRECTIONS FOR ADMINISTRATION Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.

• PRESCRIBING AND DISPENSING INFORMATION

Magnaspartate[®] contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.

• PATIENT AND CARER ADVICE Patients and carers should be given advice on how to administer magnesium aspartate powder.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

EXCIPIENTS: May contain Sucrose

► *Magnaspartate* (KoRa Healthcare)

Magnesium (as Magnesium aspartate) 243 mg Magnaspartate 243mg (magnesium 10mmol) oral powder sachets | 10 sachet [PoM] £8.95

Magnesium glycerophosphate

02-Jun-2016

● INDICATIONS AND DOSE

Hypomagnesaemia

► BY MOUTH

- Child 1 month–11 years: Initially 0.2 mmol/kg 3 times a day, dose to be adjusted as necessary, dose expressed as Mg^{2+}
- Child 12–17 years: Initially 4–8 mmol 3 times a day, dose to be adjusted as necessary, dose expressed as Mg^{2+}

DOSE EQUIVALENCE AND CONVERSION

- Magnesium glycerophosphate 1 g is approximately equivalent to Mg^{2+} 4 mmol or magnesium 97 mg.

- **UNLICENSED USE** Not licensed for use.

- **INTERACTIONS** → Appendix 1: magnesium

- **SIDE-EFFECTS** Arrhythmias · colic · coma · confusion · diarrhoea · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting

- **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.

- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, capsule, oral suspension, oral solution, powder

Tablet

- **Magnesium glycerophosphate (Non-proprietary)**

Magnesium (as Magnesium glycerophosphate) 97.2 mg Mag-4 (magnesium 97.2mg (4mmol)) tablets | 30 tablet £84.50

Oral solution

Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 ml LiquaMag GP (magnesium 121.25mg/5ml (5mmol/5ml)) oral solution sugar-free | 200 ml £49.99 sugar-free | 250 ml £55.00

Chewable tablet

- **Magnesium glycerophosphate (Non-proprietary)**

Magnesium (as Magnesium glycerophosphate) 97.2 mg YourMAG (magnesium 97.2mg (4mmol)) chewable tablets | 50 tablet £20.00
Mag-4 (magnesium 97.2mg (4mmol)) chewable tablets sugar-free | 30 tablet £84.50

MagnaPhos 97.2mg (4mmol) chewable tablets sugar-free | 50 tablet £17.89

Neomag (magnesium 97mg (4mmol)) chewable tablets sugar-free | 50 tablet £48.50

- **MagnaPhate** (Arjun Products Ltd)

Magnesium (as Magnesium glycerophosphate)

97.2 mg MagnaPhate (magnesium 97.2mg (4mmol)) chewable tablets sugar-free | 50 tablet £22.64

Capsule

- **Magnesium glycerophosphate (Non-proprietary)**

Magnesium (as Magnesium glycerophosphate) 48.6 mg Mag-4 (magnesium 48.6mg (2mmol)) capsules | 30 capsule £85.70
MagnaPhos 48.6mg (2mmol) capsules | 50 capsule £35.87

Magnesium (as Magnesium glycerophosphate) 97.2 mg Mag-4 (magnesium 97.2mg (4mmol)) capsules | 30 capsule £89.30
MagnaPhos 97.2mg (4mmol) capsules | 50 capsule £37.87

Magnesium sulfate

● INDICATIONS AND DOSE

Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

► BY INTRAVENOUS INFUSION

- Child 2–17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes

Persistent pulmonary hypertension of the newborn

► INITIALLY BY INTRAVENOUS INFUSION

- Neonate: Initially 200 mg/kg, to be given over 20–30 minutes, then (by continuous intravenous infusion) 20–75 mg/kg/hour for up to 5 days if response occurs after initial dose (to maintain plasma magnesium concentration between 3.5–5.5 mmol/litre).

Hypomagnesaemia

► BY INTRAVENOUS INJECTION

- Neonate: 100 mg/kg every 6–12 hours as required, to be given over at least 10 minutes.

- Child 1 month–11 years: 50 mg/kg every 12 hours as required, to be given over at least 10 minutes
- Child 12–17 years: 1 g every 12 hours as required, to be given over at least 10 minutes

Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

► BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION

- Child: 50–100 mg/kg daily; maximum 5 g per day

Neonatal hypocalcaemia

► BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- Neonate: 100 mg/kg every 12 hours for 2–3 doses.

Torsade de pointes

► BY INTRAVENOUS INJECTION

- Child: 25–50 mg/kg (max. per dose 2 g), to be given over 10–15 minutes, dose may be repeated once if necessary (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

- Magnesium sulfate heptahydrate 1 g equivalent to Mg^{2+} approx. 4 mmol.

- **UNLICENSED USE** Unlicensed indication in severe acute asthma. Continuing respiratory deterioration in anaphylaxis.

- **INTERACTIONS** → Appendix 1: magnesium

- **SIDE-EFFECTS** Arrhythmias · coma · confusion · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting

- **PREGNANCY** Sufficient amount may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns.

- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.

- **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.

- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

- **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump).

- ▶ With intravenous use For *intravenous infusion*, in persistent pulmonary hypertension of the newborn, dilute to a max. concentration of 100 mg/mL (10%) (0.4 mmol/mL Mg^{2+}) magnesium sulfate heptahydrate (200 mg/mL (0.8 mmol/mL Mg^{2+}) if fluid restricted) with Glucose 5% or Sodium Chloride 0.9%.
- ▶ With intravenous use For neonatal hypocalcaemia, hypomagnesaemia, and torsade de pointes, dilute to 10% (100 mg magnesium sulfate heptahydrate (0.4 mmol Mg^{2+}) in 1 mL) with Glucose 5% or 10%, Sodium Chloride 0.45% or 0.9% or Glucose and Sodium Chloride combinations. Up to 20% solution may be given in fluid restriction. Rate of administration should not exceed 10 mg/kg/minute (0.04 mmol/kg/minute Mg^{2+}) of magnesium sulfate heptahydrate.
- **PRESCRIBING AND DISPENSING INFORMATION**
The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg^{2+}) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

▶ Magnesium sulfate (Non-proprietary)

Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £11.85–£35.25
Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 20ml vials | 10 vial [PoM] £46.40
Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 5ml ampoules | 10 ampoule [PoM] £21.80–£61.26
Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 2ml ampoules | 10 ampoule [PoM] £11.72–£17.90 DT price = £11.85

Solution for infusion

▶ Magnesium sulfate (Non-proprietary)

Magnesium sulfate heptahydrate 100 mg per 1 ml Magnesium sulfate 10% (magnesium 0.4mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £59.98–£60.50
Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial [PoM] £63.70

the child should be well hydrated and electrolytes monitored.

Neonates

Phosphate deficiency may occur in very low-birthweight infants and may compromise bone growth if not corrected. Parenterally fed infants may be at risk of phosphate deficiency due to the limited solubility of phosphate. Some units routinely supplement expressed breast milk with phosphate, although the effect on the osmolality of the milk should be considered.

Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium- containing preparations are rarely used as phosphate- binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride is licensed for the treatment of hyperphosphataemia in adults on haemodialysis or peritoneal dialysis. Although experience is limited in children sevelamer hydrochloride may be useful when hypercalcaemia prevents the use of calcium carbonate p. 567.

2.4a Hyperphosphataemia

ELECTROLYTES AND MINERALS > ALUMINIUM

Aluminium hydroxide

● INDICATIONS AND DOSE

Hyperphosphataemia in renal failure

▶ BY MOUTH USING CAPSULES

- ▶ Child 5–11 years: 1–2 capsules 3–4 times a day, dose adjusted as necessary
- ▶ Child 12–17 years: 1–5 capsules 3–4 times a day, dose adjusted as necessary

- **CONTRA-INDICATIONS** Hypophosphataemia · infants · neonates

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Neonates and infants Aluminium-containing antacids should not be used because accumulation may lead to increased plasma-aluminium concentrations.
- **INTERACTIONS** → Appendix 1: antacids
- **SIDE-EFFECTS** Constipation · hyperalumaemia
- **HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma.
- **RENAL IMPAIRMENT** There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

▶ Alu-Cap (Meda Pharmaceuticals Ltd)

Aluminium hydroxide 475 mg Alu-Cap 475mg capsules | 120 capsule [P] £13.71 DT price = £13.71

2.4 Phosphate imbalance

Phosphorus

Phosphate supplements

Oral phosphate supplements p. 573 may be required in addition to vitamin D in children with hypophosphataemic vitamin D-resistant rickets, see also Vitamin D, under Vitamins p. 596.

Phosphate infusion is occasionally needed in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. It is difficult to provide detailed guidelines for the treatment of severe hypophosphatemia because the extent of total body deficits and response to therapy are difficult to predict. High doses of phosphate may result in a transient serum elevation followed by redistribution into intracellular compartments or bone tissue. It is recommended that severe hypophosphataemia be treated intravenously as large doses of oral phosphate may cause diarrhoea; intestinal absorption may be unreliable and dose adjustment may be necessary.

Phosphate is not the first choice for the treatment of hypercalcaemia because of the risk of precipitation of calcium phosphate in the kidney and other tissues. If used,

Phosphate

● INDICATIONS AND DOSE

Hypophosphataemia | Hypophosphataemic rickets | Osteomalacia

► BY MOUTH USING EFFERVESCENT TABLETS

- Neonate: 1 mmol/kg daily in 1–2 divided doses, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details.
- Child 1 month–4 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details; maximum 48 mmol per day
- Child 5–17 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary; maximum 97 mmol per day
- BY INTRAVENOUS INFUSION
- Neonate: 1 mmol/kg daily, dose to be adjusted as necessary.
- Child 1 month–1 year: 0.7 mmol/kg daily, dose to be adjusted as necessary
- Child 2–17 years: 0.4 mmol/kg daily, dose to be adjusted as necessary

IMPORTANT SAFETY INFORMATION

Some phosphate injection preparations also contain potassium. For peripheral intravenous administration the *concentration* of potassium should not usually exceed 40 mmol/litre. The infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium concentrate should be followed. The potassium content of some phosphate preparations may also limit the *rate* at which they may be administered.

● CAUTIONS

GENERAL CAUTIONS

Cardiac disease · dehydration · diabetes mellitus · sodium and potassium concentrations of preparations

SPECIFIC CAUTIONS

- With intravenous use Avoid extravasation · severe tissue necrosis
- SIDE-EFFECTS
- Common or very common Diarrhoea
- Frequency not known Acute renal failure · hypocalcaemia · hypotension · metastatic calcification · nausea · oedema · phlebitis · tissue necrosis on extravasation

SIDE-EFFECTS, FURTHER INFORMATION

Diarrhoea is a common side-effect and should prompt a reduction in dosage.

- **RENAL IMPAIRMENT** Reduce dose. Monitor closely in renal impairment.
- **MONITORING REQUIREMENTS** It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Dilute injection with Sodium Chloride 0.9% or 0.45% or Glucose 5% or 10%. Administration rate of phosphate should not exceed 0.05 mmol/kg/hour. In emergencies in intensive care faster rates may be used—seek specialist advice.
- **PRESCRIBING AND DISPENSING INFORMATION** *Phosphate Sandoz*® contains sodium dihydrogen phosphate anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na^+ 20.4 mmol), potassium 123 mg (K^+ 3.1 mmol); *Polyfusor NA*® contains Na^+ 162 mmol/litre, K^+ 19 mmol/litre, PO_4^{3-} 100 mmol/litre; non-proprietary *potassium dihydrogen phosphate injection* (potassium acid phosphate) 13.6% may contain 1 mmol/mL phosphate, 1 mmol/mL potassium.

- ▶ BY RECTUM

▶ Neonate: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours.

▶ Child: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours; maximum 30 g per day

SORBISTERIT® POWDER

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

- ▶ BY MOUTH

▶ Child: 0.5–1 g/kg daily, to be given in at least 3 divided doses; maximum 60 g per day

- ▶ BY RECTUM

▶ Neonate: 0.5–1 g/kg daily, retained for 6 hours followed by irrigation to remove resin from colon.

▶ Child: 0.5–1 g/kg daily, retained for 6 hours followed by irrigation to remove resin from colon; maximum 40 g per day

- **CONTRA-INDICATIONS** Hyperparathyroidism • metastatic carcinoma • multiple myeloma • obstructive bowel disease • reduced gut motility (in neonates) • sarcoidosis

- **CAUTIONS** Impaction of resin with excessive dosage or inadequate dilution

- **INTERACTIONS** → Appendix 1: polystyrene sulfonate

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Anorexia • constipation (discontinue treatment—avoid magnesium-containing laxatives) • diarrhoea • gastric irritation • gastro-intestinal obstruction • hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment) • hypomagnesaemia • intestinal necrosis (reported with concomitant sorbitol) • ischaemic colitis • nausea • necrosis • ulceration • vomiting

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Gastro-intestinal concretions
- ▶ With rectal use Faecal impaction

- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.

- **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With rectal use Mix each 1 g of resin with 5 mL of water or 10% glucose.

SORBISTERIT® POWDER By mouth, administer in a small amount of water or soft drink—do not give with fruit juice or squash, which have a high potassium content.

By rectum, mix each 1 g of resin with 4 mL of 5% glucose.

2.5b Hypokalaemia

ELECTROLYTES AND MINERALS > POTASSIUM

Potassium bicarbonate with potassium acid tartrate

INDICATIONS AND DOSE

Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastro-intestinal disorders)

► BY MOUTH

► Child: (consult product literature)

● **CONTRA-INDICATIONS** Hypochloraemia · plasma-potassium concentration above 5 mmol/litre

● **CAUTIONS** Cardiac disease

● **SIDE-EFFECTS** Abdominal pain · diarrhoea · flatulence · nausea · vomiting

● **RENAL IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

● **DIRECTIONS FOR ADMINISTRATION** To be dissolved in water before administration.

● **PRESCRIBING AND DISPENSING INFORMATION** These tablets do not contain chloride.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

Potassium chloride

INDICATIONS AND DOSE

Prevention of hypokalaemia (patients with normal diet)

► BY MOUTH

► Child: 1–2 mmol/kg daily; Usual maximum 50 mmol

Electrolyte imbalance

► BY INTRAVENOUS INFUSION

► Neonate: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements.

► Child: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements

Potassium depletion

► BY MOUTH

► Neonate: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration.

► Child: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used.

Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be **thoroughly mixed**. Local policies on avoiding

inadvertent use of potassium chloride concentrate should be followed.

- **CONTRA-INDICATIONS** Plasma-potassium concentration above 5 mmol/litre
- **CAUTIONS**
 - ▶ With intravenous use Seek specialist advice in very severe potassium depletion or difficult cases
 - ▶ With oral use Cardiac disease · hiatus hernia (*with modified-release preparations*) · history of peptic ulcer (*with modified-release preparations*) · intestinal stricture (*with modified-release preparations*)
- **INTERACTIONS** → Appendix 1: potassium chloride
- **SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With oral use Abdominal pain · diarrhoea · flatulence · nausea · vomiting
 - ▶ **Frequency not known**
 - ▶ With intravenous use Heart toxicity (with rapid infusion)
 - ▶ With oral use Bleeding (*with modified-release preparations*) · gastro-intestinal obstruction (*with modified-release preparations*) · ulceration (*with modified-release preparations*)
- **RENAL IMPAIRMENT** Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia. Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **MONITORING REQUIREMENTS**
 - ▶ Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
 - ▶ With intravenous use ECG monitoring should be performed in difficult cases.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use in neonates Potassium chloride solutions suitable for use by mouth in neonates are available from 'special order' manufacturers or specialist importing companies; they should be used with care because they are hypertonic and can damage the gastric mucosa.
 - ▶ With oral use Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic states*).
 - ▶ With intravenous use Potassium chloride concentrate must be diluted with **not less** than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and **mixed well**.
 - ▶ With intravenous use Ready-mixed infusion solutions should be used when possible. For *peripheral intravenous infusion*, the concentration of potassium should not usually exceed 40 mmol/L. Potassium infusions should be given slowly over at least 2–3 hours and at a rate not exceeding 0.2 mmol/kg/hour with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride or faster infusion rates may be given in very severe depletion, but require specialist advice.
- **PRESCRIBING AND DISPENSING INFORMATION** Kay-Cee-L[®] contains 1 mmol/mL each of K⁺ and Cl⁻. Potassium Tablets Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer potassium chloride modified-release tablets. Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt[®]* and

Ruthmol[®]). These should not be used by patients with renal failure as potassium intoxication may result.

- **LESS SUITABLE FOR PRESCRIBING** Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, infusion, solution for infusion

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25, 27

▶ Potassium chloride (Non-proprietary)

Potassium chloride 600 mg Kaleorid LP 600mg tablets | 30 tablet [PoM] no price available
Duro-K 600mg tablets | 100 tablet [PoM] no price available

Solution for infusion

▶ Potassium chloride (Non-proprietary)

Potassium chloride 150 mg per 1 ml Potassium chloride 15% (potassium 20mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule [PoM] £6.50 | 20 ampoule [PoM] £6.50

Potassium chloride 15% (potassium 20mmol/10ml) solution for infusion 10ml Mini-Plasco ampoules | 20 ampoule [PoM] £10.70

Potassium chloride 200 mg per 1 ml Potassium chloride 20% (potassium 13.3mmol/5ml) solution for infusion 5ml ampoules | 10 ampoule [PoM] £3.84-£4.00

Potassium chloride 20% (potassium 27mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule [PoM] £121.25

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

▶ Kay-Cee-L (Geistlich Sons Ltd)

Potassium chloride 75 mg per 1 ml Kay-Cee-L syrup sugar-free | 500 ml [P] £7.95

3 Metabolic disorders

Metabolic disorders

Use of medicines in metabolic disorders

Metabolic disorders should be managed under the guidance of a specialist. As many preparations are unlicensed and may be difficult to obtain, arrangements for continued prescribing and supply should be made in primary care.

General advice on the use of medicines in metabolic disorders can be obtained from:

Alder Hey Children's Hospital, Medicines Information Centre

(0151) 252 5381

and

Great Ormond Street Hospital for Children, pharmacy

(020) 7405 9200

Urea cycle disorders

Sodium benzoate p. 587 and sodium phenylbutyrate p. 588 are used in the management of urea cycle disorders. Both, either singly or in combination, are indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy. Sodium benzoate is also used in non-ketotic hyperglycinaemia.

The long-term management of urea cycle disorders includes oral maintenance treatment with sodium benzoate and sodium phenylbutyrate combined with a low protein diet and other drugs such as arginine p. 586 or citrulline p. 587, depending on the specific disorder.

Emergency management

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at: www.bimdg.org.uk.

3.1 Acute porphyrias

Acute porphyrias

Overview

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs. Acute attacks of porphyria are exceptionally rare before puberty. When acute porphyria is suspected in a child, support from an expert porphyria service should be sought.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate p. 578 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke's Hospital, and King's College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or *in vitro*, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered **safe** in acute porphyrias is available at www.wmic.wales.nhs.uk/specialist-services/drugs-in-porphyria/. Further information may be obtained from: www.porphyria-europe.org and also from:

Welsh Medicines Information Centre
University Hospital of Wales
CF14 4XW
Cardiff
(029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Alkylating drugs (contact Welsh Medicines Information Centre for further advice)
- Anabolic steroids
- Antidepressants (includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe)

- Antihistamines (alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe)
- Barbiturates (includes primidone and thiopental)
- Calcium channel blockers (amlodipine, felodipine, and nifedipine thought to be safe)
- Contraceptives, hormonal (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in young women who have had a previous attack. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.)
- Ergot derivatives (includes ergometrine (oxytocin probably safe) and pergolide)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact Welsh Medicines Information Centre for further advice)
- Progestogens (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in young women who have had a previous attack. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.)
- Protease inhibitors (contact Welsh Medicines Information Centre for further advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonylureas (glipizide is thought to be safe)
- Taxanes (contact Welsh Medicines Information Centre for further advice)
- Thiazolidinediones (contact Welsh Medicines Information Centre for further advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant (contact Welsh Medicines Information Centre for further advice)
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Bromocriptine
- Buspirone
- Cabergoline
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clindamycin
- Cocaine
- Colistimethate sodium
- Danazol
- Dapsone
- Dextenfluramine
- Disopyramide
- Disulfiram
- Erythromycin

- Etamsylate
- Ethosuximide
- Etomidate
- Fenfluramine
- Flupentixol
- Flutamide
- Fosaprepitant (contact Welsh Medicines Information Centre for further advice)
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Indapamide
- Isometheptene mucate
- Isoniazid (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Ketamine
- Mefenamic acid (may be used with caution if safer alternative not available)
- Meprobamate
- Methyldopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (may be used with caution if safer alternative not available)
- Mitotane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine (buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, oxycodone, pethidine, and tramadol are thought to be safe)
- Pentoxifylline
- Phenoxybenzamine
- Phenytoin
- Pivmecillinam
- Porfimer
- Potassium canrenoate (evidence of hazard uncertain—contact Welsh Medicines Information Centre for further advice)
- Raloxifene
- Rifabutin (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Rifampicin
- Riluzole
- Risperidone
- Selegiline
- Spironolactone
- Sulfinpyrazone
- Tamoxifen
- Telithromycin
- Temoporfin
- Tiagabine
- Tibolone
- Tinidazole
- Topiramate
- Toremifene
- Trimethoprim
- Valproate
- Xipamide
- Zidovudine (contact Welsh Medicines Information Centre for further advice)
- Zuclopenthixol

BLOOD AND RELATED PRODUCTS > HAEM DERIVATIVES

Haem arginate

(Human hemin)

● INDICATIONS AND DOSE

Acute porphyrias | Acute intermittent porphyria | Porphyria variegata | Hereditary coproporphyria

► BY INTRAVENOUS INFUSION

► Child: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring; maximum 250 mg per day

● SIDE-EFFECTS

► **Common or very common** Pain at injection site . thrombophlebitis at injection site

► **Rare** Fever . hypersensitivity reactions

► **Frequency not known** Headache

● **PREGNANCY** Manufacturer advises avoid unless essential.

● **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

● **DIRECTIONS FOR ADMINISTRATION** Administer over at least 30 minutes through a filter via large antebachial or central vein; dilute requisite dose in 100 mL Sodium Chloride 0.9% in glass bottle; administer within 1 hour after dilution; max. concentration 2.5 mg/mL.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► **Normosang** (Orphan Europe (UK) Ltd)

Haem arginate 25 mg per 1 mL Normosang 250mg/10ml solution for infusion ampoules | 4 ampoule (PoM) £1,737.00

3.2 Carnitine deficiency

AMINO ACIDS AND DERIVATIVES

Levocarnitine

(Carnitine)

● INDICATIONS AND DOSE

Primary carnitine deficiency due to inborn errors of metabolism

► BY MOUTH

► **Neonate:** Up to 200 mg/kg daily in 2–4 divided doses.

► **Child:** Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

► **INITIALLY BY INTRAVENOUS INFUSION**

► **Neonate:** Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

► **Child:** Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour

► **BY SLOW INTRAVENOUS INJECTION**

► **Neonate:** Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

► **Child:** Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

Secondary carnitine deficiency in haemodialysis patients

► INITIALLY BY SLOW INTRAVENOUS INJECTION

- Child: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

Organic acidurias

► BY MOUTH

- Neonate: Up to 200 mg/kg daily in 2–4 divided doses.

- Child: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

► INITIALLY BY INTRAVENOUS INFUSION

- Neonate: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

- Child: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour

► BY SLOW INTRAVENOUS INJECTION

- Neonate: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

- Child: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

- **UNLICENSED USE** Not licensed for use in organic acidurias. Not licensed for use by intravenous infusion. Tablets, chewable tablets, and oral liquid (10%) not licensed in children under 12 years. Paediatric oral solution (30%) not licensed in children over 12 years.

- **CAUTIONS** Diabetes mellitus

- **SIDE-EFFECTS** Abdominal pain · body odour · diarrhoea · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

- **PREGNANCY** Appropriate to use; no evidence of teratogenicity in animal studies.

- **RENAL IMPAIRMENT** Accumulation of metabolites may occur with chronic oral administration in severe impairment.

- **MONITORING REQUIREMENTS**

- Monitoring of free and acyl carnitine in blood and urine recommended.

- **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For *intravenous infusion*, dilute injection with Sodium Chloride 0.9% or Glucose 5% or 10%.

- **PRESCRIBING AND DISPENSING INFORMATION**

- When used for Organic acidurias Levocarnitine is used in the treatment of some organic acidurias; however, use in fatty acid oxidation is controversial.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Carnitine for metabolic disorders www.medicinesforchildren.org.uk/carnitine-metabolic-disorders-0

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Solution for injection

- **Carnitor** (Logixx Pharma Solutions Ltd)
L-Carnitine 200 mg per 1 ml Carnitor 1g/5ml solution for injection ampoules | 5 ampoule [PoM] £59.50

Oral solution

- **Levocarnitine (Non-proprietary)**

L-Carnitine 300 mg per 1 ml Levocarnitine 1.5g/5ml (30%) oral solution paediatric | 20 ml [PoM] £71.40 DT price = £71.40

- **Carnitor** (Logixx Pharma Solutions Ltd)

L-Carnitine 100 mg per 1 ml Carnitor oral single dose 1g solution sugar-free | 10 unit dose [PoM] £35.00

Chewable tablet

- **Carnitor** (Logixx Pharma Solutions Ltd)

L-Carnitine 1 gram Carnitor 1g chewable tablets | 10 tablet [PoM] £35.00

Capsule

- **Levocarnitine (Non-proprietary)**

L-Carnitine 250 mg Carnitine 250mg capsules | 125 capsule £11.06

L-Carnitine 500 mg L-Carnitine 500mg capsules | 60 capsule £11.14

3.3 Fabry's disease

ENZYMES

Agalsidase alfa

- **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

● INDICATIONS AND DOSE**Fabry's disease (specialist use only)**

► BY INTRAVENOUS INFUSION

- Child 7–17 years: 200 micrograms/kg every 2 weeks

- **INTERACTIONS** → Appendix 1: agalsidase

- **SIDE-EFFECTS**

- **Common or very common** Acne · angioedema · arthralgia · asthenia · bradycardia · chest pain · cough · dizziness · dyspnoea · eye irritation · fatigue · flushing · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypertension · hypotension · influenza-like symptoms · muscle spasms · myalgia · nasopharyngitis · neuropathic pain · oedema · palpitation · paraesthesia · pruritus · rash · rhinorrhoea · sleep disturbances · syncope · tachycardia · taste disturbances · tinnitus · tremor · urticaria

- **Uncommon** Cold extremities · ear pain · ear swelling · injection-site reactions · parosmia · skin discoloration

SIDE-EFFECTS, FURTHER INFORMATION

- Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Administration for *intravenous infusion*, dilute requisite dose with 100 mL Sodium Chloride 0.9% and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- **Replagal** (Shire Pharmaceuticals Ltd)

Agalsidase alfa 1 mg per 1 ml Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial [PoM] £1,068.64

Agalsidase beta

- **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

● INDICATIONS AND DOSE

Fabry's disease (specialist use only)

- BY INTRAVENOUS INFUSION
- Child 8–17 years: 1 mg/kg every 2 weeks

- **INTERACTIONS** → Appendix 1: agalsidase

● SIDE-EFFECTS

- **Common or very common** Acne · angioedema · arthralgia · asthenia · bradycardia · chest pain · cough · dizziness · dyspnoea · eye irritation · fatigue · flushing · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypertension · hypotension · influenza-like symptoms · muscle spasms · myalgia · nasopharyngitis · neuropathic pain · oedema · palpitation · paraesthesia · pruritus · rash · rhinorrhoea · sleep disturbances · syncope · tachycardia · taste disturbances · tinnitus · tremor · urticaria
- **Uncommon** Cold extremities · ear pain · ear swelling · injection-site reactions · parosmia · skin discoloration

SIDE-EFFECTS, FURTHER INFORMATION

- **Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, given intermittently in Sodium chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Fabrazyme** (Genzyme Therapeutics Ltd)

Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial [\[PoM\]](#) £315.08

Agalsidase beta 35 mg Fabrazyme 35mg powder for solution for infusion vials | 1 vial [\[PoM\]](#) £2,196.99

3.4 Gaucher's disease

ENZYMES

Imiglucerase

- **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

● INDICATIONS AND DOSE

Gaucher's disease type I (specialist use only)

- BY INTRAVENOUS INFUSION

- **Neonate:** Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate.

- **Child:** Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate

Gaucher's disease type III (specialist use only)

- BY INTRAVENOUS INFUSION

- **Neonate:** Initially 60–120 units/kg every 2 weeks, adjusted according to response.

- **Child:** Initially 60–120 units/kg every 2 weeks, adjusted according to response

● SIDE-EFFECTS

- **Common or very common** Angioedema · backache · cyanosis · flushing · hypersensitivity reactions · hypotension · paraesthesia · tachycardia · urticaria
- **Uncommon** Abdominal cramps · arthralgia · diarrhoea · dizziness · fatigue · fever · headache · injection-site reactions · nausea · vomiting

- **PREGNANCY** Manufacturer advises use with caution—limited information available.

- **BREAST FEEDING** No information available.

● MONITORING REQUIREMENTS

- Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.
- When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Cerezyme*®), give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- **Cerezyme** (Genzyme Therapeutics Ltd)

Imiglucerase 400 unit Cerezyme 400unit powder for solution for infusion vials | 1 vial [\[PoM\]](#) £1,071.29

Velaglucerase alfa

- **DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

● INDICATIONS AND DOSE

Type I Gaucher's disease (specialist use only)

► BY INTRAVENOUS INFUSION

- Child 4–17 years: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

- **SIDE-EFFECTS** Abdominal pain · arthralgia · back pain · bone pain · dizziness · flushing · headache · hypersensitivity reactions · hypertension · hypotension · malaise · nausea · pyrexia · rash · tachycardia · urticaria

SIDE-EFFECTS, FURTHER INFORMATION

- Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.
- **PREGNANCY** Manufacturer advises use with caution—limited information available.
- **BREAST FEEDING** Manufacturer advises use with caution—no information available.
- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute each 400-unit vial with 4.3 mL water for injections; dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

► VPRIV (Shire Pharmaceuticals Ltd)

Velaglucerase alfa 400 unit VPRIV 400units powder for solution for infusion vials | 1 vial [PoM](#) £1,410.20

3.5 Homocystinuria

METHYL DONORS

Betaine

● INDICATIONS AND DOSE

Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)

► BY MOUTH

- Neonate: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response; maximum 150 mg/kg per day.
- Child 1 month–9 years: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response; maximum 150 mg/kg per day
- Child 10–17 years: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

● SIDE-EFFECTS

- **Uncommon** Agitation · alopecia · anorexia · depression · gastro-intestinal disorders · personality disorder · reversible cerebral oedema · sleep disturbances · urinary incontinence · urticaria
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.
- **DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane[®] powder.
- **PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (July 2010) that betaine anhydrous (Cystadane[®]) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution

Powder

► Cystadane (Orphan Europe (UK) Ltd)

Betaine 1 gram per 1 gram Cystadane oral powder | 180 gram [PoM](#) £347.00

3.6 Mitochondrial disorders

CO-ENZYMES

Ubidecarenone

(Ubiquinone; Co-enzyme Q10)

● INDICATIONS AND DOSE

Mitochondrial disorders

► BY MOUTH

- Neonate: Initially 5 mg 1–2 times a day, adjusted according to response, dose too to be taken with food, increased if necessary up to 200 mg daily.
- Child: Initially 5 mg 1–2 times a day, adjusted according to response, dose to be taken with food, increased if necessary up to 300 mg daily

- **UNLICENSED USE** Not licensed.

- **CAUTIONS** May reduce insulin requirement in diabetes mellitus

● SIDE-EFFECTS

- **Common or very common** Diarrhoea · heartburn · nausea
- **Rare** Agitation · dizziness · headache · irritability
- **HEPATIC IMPAIRMENT** Reduce dose in moderate and severe impairment.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Ubidecarenone for mitochondrial disease www.medicinesforchildren.org.uk/ubidecarenone-for-mitochondrial-disease

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral drops

Tablet

► Ubidecarenone (Non-proprietary)

Ubidecarenone 30 mg Co-enzyme Q10 30mg tablets | 30 tablet £6.90 | 90 tablet £19.21

Oral drops

► Ubidecarenone (Non-proprietary)

Ubidecarenone 5 mg per 1 mL Ubicor 5mg/mL oral drops | 10 mL [PoM] no price available

Chewable tablet

► Ubidecarenone (Non-proprietary)

Ubidecarenone 25 mg Coenzyme Q10 25mg chewable tablets sugar-free | 250 tablet [PoM] no price available

Capsule

► Ubidecarenone (Non-proprietary)

Ubidecarenone 30 mg Co-Enzyme Q10 30mg capsules | 60 capsule £8.51 | 180 capsule £17.64

Co-Enzyme Q10 30mg capsules | 30 capsule £6.96 | 60 capsule £12.17 | 120 capsule £21.78

Ubidecarenone 60 mg Solgar CoQ-10 60mg capsules | 30 capsule no price available

Ubidecarenone 100 mg BioActive Q10 Ubiquinol 100mg capsules | 60 capsule £26.57 | 150 capsule £53.14

G & G CoQ10 100mg capsules | 60 capsule £9.00
Natures Aid Co-Q-10 100mg capsules | 30 capsule £9.42 | 90 capsule £22.69

Co-Enzyme Q10 100mg capsules | 60 capsule £16.50

Bio-Quinone Q10 GOLD 100mg capsules | 20 capsule £8.12 |

60 capsule £21.03 | 150 capsule £42.09

Ubidecarenone 120 mg HealthAid Mega Co-Q-10 120mg capsules | 30 capsule £15.07

Ubidecarenone 200 mg Co-Enzyme Q10 200mg capsules | 60 capsule £20.07

Ubidecarenone 300 mg Natures Aid Co-Q-10 300mg capsules | 60 capsule £22.21

► Super Bio-Quinone (Pharma Nord (UK) Ltd)

Ubidecarenone 30 mg Super Bio-Quinone Q10 30mg capsules | 30 capsule £4.96 | 60 capsule £8.84 | 150 capsule £15.77

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · chills · diarrhoea · dizziness · dyspnoea · headache · hypersensitivity · infusion-related reactions · myalgia · nausea · oropharyngeal pain · pyrexia · vomiting

► **Uncommon** Anaphylaxis

● **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

● **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Vimizim®), give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 mL infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 mL/hour, then increase to a rate of 6 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 mL/hour to max. 36 mL/hour; body-weight 25 kg or over, dilute requisite dose to final volume of 250 mL and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 mL/hour, then increase to a rate of 12 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 mL/hour to max. 72 mL/hour.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates, sorbitol

ELECTROLYTES: May contain Sodium

► Vimizim (BioMarin Europe Ltd) ▼

Elosulfase alfa 1 mg per 1 mL Vimizim 5mg/5mL concentrate for solution for infusion vials | 1 vial [PoM] £750.00

3.7 Mucopolysaccharidosis

ENZYMES

Elosulfase alfa

01-Sep-2016

● **DRUG ACTION** Elosulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylgalactosamine-6-sulfatase (GALNS) deficiency.

● INDICATIONS AND DOSE

Mucopolysaccharidosis IVA (specialist use only)

► BY INTRAVENOUS INFUSION

► Neonate: 2 mg/kg once weekly.

► Child: 2 mg/kg once weekly

● **CAUTIONS** Infusion-related reactions

CAUTIONS, FURTHER INFORMATION

► Infusion-related reactions Infusion-related reactions can occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30–60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during re-administration following a severe reaction.

Galsulfase

● **DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

● INDICATIONS AND DOSE

Mucopolysaccharidosis VI (specialist use only)

► BY INTRAVENOUS INFUSION

► Child 5–17 years: 1 mg/kg once weekly

● **CAUTIONS** Acute febrile illness (consider delaying treatment) · acute respiratory illness (consider delaying treatment) · infusion-related reactions can occur · respiratory disease

● **SIDE-EFFECTS** Abdominal pain · apnoea · areflexia · chest pain · conjunctivitis · corneal opacity · dyspnoea · ear pain · facial oedema · gastroenteritis · hypertension · infusion-related reactions · malaise · nasal congestion · pharyngitis · rigors · umbilical hernia

SIDE-EFFECTS, FURTHER INFORMATION

► Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require

pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute requisite dose with Sodium Chloride 0.9% to a final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over at least 4 hours.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Naglazyme** (BioMarin Europe Ltd) ▼
Galsulfase 1 mg per 1 mL Naglazyme 5mg/5mL solution for infusion vials | 1 vial [PoM] £982.00

Idursulfase

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

● INDICATIONS AND DOSE

Mucopolysaccharidosis II (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 5–17 years: 500 micrograms/kg once weekly

- **CAUTIONS** Acute febrile respiratory illness (consider delaying treatment) · infusion-related reactions can occur · severe respiratory disease

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmia · arthralgia · bronchospasm · chest pain · cough · cyanosis · dizziness · dyspnoea · erythema · facial oedema · flushing · gastrointestinal disturbances · headache · hypertension · hypotension · hypoxia · infusion-site swelling · peripheral oedema · pruritus · pyrexia · rash · swollen tongue · tachycardia · tachypnoea · tremor · urticaria · wheezing
- ▶ **Frequency not known** Anaphylaxis · infusion-related reactions · pulmonary embolism

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Infusion-related reactions** Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute requisite dose in 100 mL Sodium Chloride 0.9% and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Elaprase** (Shire Pharmaceuticals Ltd) ▼
Idursulfase 2 mg per 1 mL Elaprase 6mg/3mL concentrate for solution for infusion vials | 1 vial [PoM] £1,985.00

Laronidase

- **DRUG ACTION** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

● INDICATIONS AND DOSE

Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 100 units/kg once weekly

- **CAUTIONS** Infusion-related reactions can occur

- **INTERACTIONS** → Appendix 1: laronidase

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · alopecia · anaphylaxis · angioedema · blood pressure changes · cold extremities · cough · diarrhoea · dizziness · dyspnoea · fatigue · flushing · headache · influenza-like symptoms · infusion-site reactions · musculoskeletal pain · nausea · pain in extremities · pallor · paraesthesia · pruritus · rash · restlessness · tachycardia · urticaria · vomiting
- ▶ **Frequency not known** Bronchospasm · infusion-related reactions · respiratory arrest

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Infusion-related reactions** Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute with Sodium Chloride 0.9%; body-weight under 20 kg, dilute to 100 mL, body-weight over 20 kg dilute to 250 mL; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Aldurazyme** (Genzyme Therapeutics Ltd)

Laronidase 100 unit per 1 mL Aldurazyme 500units/5mL solution for infusion vials | 1 vial [PoM] £444.70

3.8 Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine

(Cysteamine)

● INDICATIONS AND DOSE

Nephropathic cystinosis (specialist use only)

► BY MOUTH

- Neonate: Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
- Child 1 month–11 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses
- Child 12–17 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses
- Child 12–17 years (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

DOSE EQUIVALENCE AND CONVERSION

- 1.3 g/m² is approximately equivalent to 50 mg/kg.

- **UNLICENSED USE** Mercaptamine eye drops for the management of ocular symptoms arising from the deposition of cystine crystals in the eye are not licensed.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS** Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anorexia · breath and body odour · diarrhoea · dyspepsia · encephalopathy · fever · gastroenteritis · headache · malaise · nausea · rash · vomiting
 - **Uncommon** Drowsiness · gastro-intestinal ulcer · hallucinations · leucopenia · nephrotic syndrome · nervousness · seizures
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to penicillamine.
- **PREGNANCY** Avoid—teratogenic and toxic in *animal* studies.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Leucocyte-cystine concentration and haematological monitoring required—consult product literature.
- All patients receiving mercaptamine should be registered (contact local specialist centre for details).
- **DIRECTIONS FOR ADMINISTRATION** For children under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice).

● PRESCRIBING AND DISPENSING INFORMATION

Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Mercaptamine eye drops for ocular symptoms of cystinosis www.medicinesforchildren.org.uk/mercaptamine-eye-drops-for-cystinosis

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

► Procsybi (Horizon Pharma Europe B.V.)

Mercaptamine (as Mercaptamine bitartrate) 25 mg Procsybi 25mg gastro-resistant capsules | 60 capsule [PoM] £335.97

Mercaptamine (as Mercaptamine bitartrate) 75 mg Procsybi 75mg gastro-resistant capsules | 250 capsule [PoM] £4,199.65

Capsule

CAUTIONARY AND ADVISORY LABELS 21

► Cystagon (Orphan Europe (UK) Ltd)

Mercaptamine (as Mercaptamine bitartrate) 50 mg Cystagon 50mg capsules | 100 capsule [PoM] £70.00

Mercaptamine (as Mercaptamine bitartrate) 150 mg Cystagon 150mg capsules | 100 capsule [PoM] £190.00

3.9 Niemann-Pick type C disease

ENZYME INHIBITORS > GLUCOSYL CERAMIDE SYNTHASE INHIBITORS

Miglustat

- **DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

● INDICATIONS AND DOSE

Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)

► BY MOUTH

- Child 4–11 years (body surface area up to 0.48 m²): 100 mg once daily
- Child 4–11 years (body surface area 0.48–0.73 m²): 100 mg twice daily
- Child 4–11 years (body surface area 0.74–0.88 m²): 100 mg 3 times a day
- Child 4–11 years (body surface area 0.89–1.25 m²): 200 mg twice daily
- Child 4–11 years (body surface area 1.26 m² and above): 200 mg 3 times a day
- Child 12–17 years: 200 mg 3 times a day

- **SIDE-EFFECTS** Abdominal pain · amnesia · anorexia · ataxia · chills · constipation · decreased libido · depression · diarrhoea · dizziness · dyspepsia · flatulence · headache · hypoaesthesia · insomnia · malaise · muscle spasm · muscle weakness · nausea · paraesthesia · peripheral neuropathy · thrombocytopenia · tremor · vomiting · weight changes
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution.
- **RENAL IMPAIRMENT** Child 12–17 years, initially 200 mg twice daily if estimated glomerular filtration rate 50–70 mL/minute/1.73 m². Child 12–17 years, initially 100 mg twice daily if estimated glomerular filtration rate

30–50 mL/minute/1.73 m². Avoid if estimated glomerular filtration less than 30 mL/minute/1.73 m².

Child under 12 years—consult product literature.

● MONITORING REQUIREMENTS

- ▶ Monitor cognitive and neurological function.
- ▶ Monitor growth and platelet count in Niemann-Pick type C disease.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Zavesca** (Actelion Pharmaceuticals UK Ltd)
Miglustat 100 mg Zavesca 100mg capsules | 84 capsule [PoM](#)
£3,934.17 (Hospital only)

3.10 Pompe disease

ENZYMES

Alglucosidase alfa

- **DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

● INDICATIONS AND DOSE

Pompe disease (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 20 mg/kg every 2 weeks.
- ▶ Child: 20 mg/kg every 2 weeks

- **CAUTIONS** Cardiac dysfunction · infusion-related reactions—consult product literature · respiratory dysfunction

● SIDE-EFFECTS

- ▶ **Common or very common** Agitation · anaphylaxis · antibody formation · blood pressure changes · bronchospasm · chest discomfort · cold extremities · cough · cyanosis · diarrhoea · dizziness · facial oedema · fatigue · flushing · headache · hypersensitivity reactions · injection-site reactions · irritability · muscle spasm · myalgia · nausea · paraesthesia · pruritus · pyrexia · rash · restlessness · sweating · tachycardia · tachypnoea · tremor · urticaria · vomiting
- ▶ **Frequency not known** Infusion-related reactions · necrotising skin lesions · severe skin reactions · ulcerative skin lesions

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Infusion-related reactions Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

- **PREGNANCY** Toxicity in *animal* studies, but treatment should not be withheld.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● MONITORING REQUIREMENTS

- ▶ Monitor closely if cardiac dysfunction.
- ▶ Monitor closely if respiratory dysfunction.
- ▶ Monitor immunoglobulin G (IgG) antibody concentration.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with Sodium Chloride 0.9% to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7mg/kg/hour.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Myozyme** (Genzyme Therapeutics Ltd)
Alglucosidase alfa 50 mg Myozyme 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) £356.06 (Hospital only)

3.11 Tyrosinaemia type I

ENZYME INHIBITORS >

4-HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

Nitisinone

(NTBC)

● INDICATIONS AND DOSE

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

▶ BY MOUTH

- ▶ Neonate: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day.
- ▶ Child: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

- **INTERACTIONS** → Appendix 1: nitisinone

● SIDE-EFFECTS

- ▶ **Common or very common** Conjunctivitis · corneal opacity · eye pain · granulocytopenia · keratitis · leucopenia · photophobia · thrombocytopenia
- ▶ **Uncommon** Blepharitis · erythematous rash · exfoliative dermatitis · leucocytosis · pruritus

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—adverse effects in *animal* studies.

- **PRE-TREATMENT SCREENING** Slit-lamp examination of eyes recommended before treatment.

● MONITORING REQUIREMENTS

- ▶ Monitor liver function regularly.
- ▶ Monitor platelet and white blood cell count every 6 months.

- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Orfadin** (Swedish Orphan Biovitrum Ltd)
Nitisinone 4 mg per 1 ml Orfadin 4mg/1ml oral suspension sugar-free | 90 ml [PoM](#) £1,692.00

Capsule

- ▶ **Orfadin** (Swedish Orphan Biovitrum Ltd)
Nitisinone 2 mg Orfadin 2mg capsules | 60 capsule [PoM](#) £564.00
Nitisinone 5 mg Orfadin 5mg capsules | 60 capsule [PoM](#) £1,127.00
Nitisinone 10 mg Orfadin 10mg capsules | 60 capsule [PoM](#) £2,062.00
Nitisinone 20 mg Orfadin 20mg capsules | 60 capsule [PoM](#) £4,512.00

3.12 Urea cycle disorders

AMINO ACIDS AND DERIVATIVES

Arginine

● INDICATIONS AND DOSE

Acute hyperammonaemia in carbamylphosphate synthetase deficiency (specialist use only) | Acute hyperammonaemia in ornithine transcarbamylase deficiency (specialist use only)

► BY INTRAVENOUS INFUSION

► Neonate: 6 mg/kg/hour.

- Child (body-weight up to 40 kg): 6 mg/kg/hour
- Child (body-weight 40 kg and above): 4 mg/kg/hour

Maintenance treatment of hyperammonaemia in carbamylphosphate synthetase deficiency (specialist use only) | Maintenance treatment of hyperammonaemia in ornithine transcarbamylase deficiency (specialist use only)

► BY MOUTH

► Neonate: 100–200 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.

- Child (body-weight up to 20 kg): 100–200 mg/kg daily in 3–4 divided doses, dose to be given with feeds or meals
- Child (body-weight 20 kg and above): 2.5–6 g/m² daily in 3–4 divided doses, dose to be taken with meals; maximum 6 g per day

Acute hyperammonaemia in citrullinaemia (specialist use only) | Acute hyperammonaemia in arginosuccinic aciduria (specialist use only)

► BY INTRAVENOUS INFUSION

► Neonate: 300 mg/kg, to be administered over 90 minutes, followed by 12.5 mg/kg/hour, to be administered over 24 hours (maximum 25 mg/kg/hour thereafter).

- Child (body-weight up to 40 kg): Initially 300 mg/kg, to be administered over 90 minutes, followed by 12.5 mg/kg/hour, to be administered over 24 hours (maximum 25 mg/kg/hour thereafter)

► Child (body-weight 40 kg and above): 21 mg/kg/hour

Maintenance treatment of hyperammonaemia in citrullinaemia (specialist use only) | Maintenance treatment of hyperammonaemia in arginosuccinic aciduria (specialist use only)

► BY MOUTH

► Neonate: 100–300 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.

- Child (body-weight up to 20 kg): 100–300 mg/kg daily in 3–4 divided doses, dose to be taken with feed or meals
- Child (body-weight 20 kg and above): 2.5–6 g/m² daily in 3–4 divided doses, doses to be taken with meals; maximum 6 g per day

● **UNLICENSED USE** Injection not licensed in children.

Tablets not licensed in children. Powder licensed for urea cycle disorders in children.

● **CONTRA-INDICATIONS** Not to be used in the treatment of arginase deficiency

● SIDE-EFFECTS

► With intravenous use Flushing · headache · hyperchloraemic metabolic acidosis · hypotension · irritation at injection-site · nausea · numbness · vomiting

● **PREGNANCY** No information available.

● **BREAST FEEDING** No information available.

● **MONITORING REQUIREMENTS** Monitor plasma pH and chloride.

● DIRECTIONS FOR ADMINISTRATION

► With intravenous use For *intravenous infusion*, dilute to a max. concentration of 50 mg/mL with glucose 10%.

● PRESCRIBING AND DISPENSING INFORMATION

► With oral use Powder to be prescribed as a borderline substance (ACBS). For use as a supplement in urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullinaemia, arginosuccinic aciduria, and deficiency of N-acetylglutamate synthetase.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Arginine for urea cycle disorders www.medicinesforchildren.org.uk/arginine-urea-cycle-disorders-0

● MEDICINAL FORMS

Carglumic acid

● INDICATIONS AND DOSE

Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)

► BY MOUTH

► Neonate: Initially 50–125 mg/kg twice daily, to be taken immediately before feeds, dose adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses.

► Child: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses

Hyperammonaemia due to organic acidemia (under expert supervision)

► BY MOUTH

► Neonate: Initially 50–125 mg/kg twice daily, to be taken immediately before feeds, dose adjusted according to plasma-ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses.

► Child: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

IMPORTANT SAFETY INFORMATION**EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS**

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

• SIDE-EFFECTS

- ▶ **Common or very common** Sweating
- ▶ **Uncommon** Bradycardia · diarrhoea · pyrexia · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Carbamyl phosphate synthase deficiency | Ornithine carbamyl transferase deficiency

▶ BY MOUTH

- ▶ **Neonate:** 150 mg/kg daily in 3–4 divided doses, adjusted according to response.
- ▶ **Child:** 150 mg/kg daily in 3–4 divided doses, adjusted according to response

- **PREGNANCY** No information available.

- **BREAST FEEDING** No information available.

- **DIRECTIONS FOR ADMINISTRATION** Powder may be mixed with drinks or taken as a paste.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution, powder

Powder

- ▶ **Citrulline (Non-proprietary)**

L-citrulline 1 mg per 1 mg L-Citrulline powder | 100 gram £225.70

BENZOATES**Sodium benzoate****• INDICATIONS AND DOSE**

Acute hyperammonaemia due to urea cycle disorder (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ **Neonate:** Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response.
- ▶ **Child:** Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response

Maintenance treatment of hyperammonaemia due to urea cycle disorders (specialist use only) | Non-ketotic hyperglycaemia (specialist use only)**▶ BY MOUTH**

- ▶ **Neonate:** Up to 250 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.
- ▶ **Child:** Up to 250 mg/kg daily in 3–4 divided doses, dose to be taken with feeds or meals; maximum 12 g per day

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Conditions involving sodium retention with oedema (preparations contain significant amounts of sodium) · congestive heart failure (preparations contain significant amounts of sodium) · neonates (risk of kernicterus and increased side-effects)

- **SIDE-EFFECTS** Anorexia · coma · irritability · lethargy · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal side-effects may be reduced by giving smaller doses more frequently.

- **PREGNANCY** No information available.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Caution in renal insufficiency—preparations contain significant amounts of sodium.

• DIRECTIONS FOR ADMINISTRATION

- ▶ **With oral use** For administration *by mouth*, oral solution or powder may be administered in fruit drinks; less soluble in acidic drinks.
- ▶ **With intravenous use** For *intravenous infusion*, dilute to a max. concentration of 50 mg/mL with Glucose 10%.

DRUGS FOR METABOLIC DISORDERS >

AMMONIA LOWERING DRUGS

Sodium phenylbutyrate

● INDICATIONS AND DOSE

Acute hyperammonaemia due to urea cycle disorders (specialist use only)

► BY INTRAVENOUS INFUSION

- Neonate: Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response.

- Child: Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response

Maintenance treatment of hyperammonaemia due to urea cycle disorders (specialist use only)

► BY MOUTH

- Neonate: Up to 250 mg/kg daily in 3–4 divided doses, with feeds.
- Child (body-weight up to 20 kg): Up to 250 mg/kg daily in 3–4 divided doses, with feeds or meals
- Child (body-weight 20 kg and above): 5 g/m² daily in 3–4 divided doses, with meals; maximum 12 g per day

- **UNLICENSED USE** Injection not licensed for use in children.

IMPORTANT SAFETY INFORMATION**EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS**

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- **CAUTIONS** Conditions involving sodium retention with oedema (preparations contain significant amounts of sodium) · congestive heart failure (preparations contain significant amounts of sodium)
- **INTERACTIONS** → Appendix 1: sodium phenylbutyrate
- **SIDE-EFFECTS**
 - **Common or very common** Amenorrhoea · body odour · decreased appetite · depression · gastro-intestinal disturbances · headache · irregular menstrual cycles · oedema · rash · renal tubular acidosis · syncope · taste disturbance · weight gain
 - **Uncommon** Abdominal pain · aplastic anaemia · arrhythmias · ecchymoses · nausea · oedema · pancreatitis · peptic ulcer · rectal bleeding · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Gastro-intestinal side-effects may be reduced by giving smaller doses more frequently.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during administration in women of child-bearing potential.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution (preparations contain significant amounts of sodium).
- **DIRECTIONS FOR ADMINISTRATION**
 - With oral use Oral dose may be mixed with fruit drinks, milk, or feeds. Granules should be mixed with food before taking. *Pheburane*® granules must not be administered by nasogastric or gastrostomy tubes.

- With intravenous use For intravenous infusion, dilute to a maximum concentration of 50 mg/mL with Glucose 10%.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Sodium phenylbutyrate for urea cycle disorders www.medicinesforchildren.org.uk/sodium-phenylbutyrate-for-urea-cycle-disorders

3.13 Wilson's disease

ANTIDOTES AND CHELATORS > COPPER

ABSORPTION INHIBITORS

Zinc acetate

- **DRUG ACTION** Zinc prevents the absorption of copper in Wilson's disease.

● **INDICATIONS AND DOSE****Wilson's disease (initiated under specialist supervision)**

► BY MOUTH

- Child 1–5 years: 25 mg twice daily
- Child 6–15 years (body-weight up to 57 kg): 25 mg 3 times a day
- Child 6–15 years (body-weight 57 kg and above): 50 mg 3 times a day
- Child 16–17 years: 50 mg 3 times a day

DOSE EQUIVALENCE AND CONVERSION

- Doses expressed as elemental zinc.

PHARMACOKINETICS

Symptomatic Wilson's disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS** Portal hypertension (risk of hepatic decompensation when switching from chelating agent)
- **INTERACTIONS** → Appendix 1: zinc
- **SIDE-EFFECTS**
 - **Common or very common** Gastric irritation (usually transient)
 - **Uncommon** Leucopenia · sideroblastic anaemia
- SIDE-EFFECTS, FURTHER INFORMATION** Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.
- **PREGNANCY** Usual dose 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.
- **BREAST FEEDING** Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.
- **MONITORING REQUIREMENTS** Monitor full blood count and serum cholesterol.

- **DIRECTIONS FOR ADMINISTRATION** Capsules may be opened and the contents mixed with water.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

- ▶ **Wilzin** (Orphan Europe (UK) Ltd)

Zinc (as Zinc acetate) 25 mg Wilzin 25mg capsules | 250 capsule [PoM] £132.00

Zinc (as Zinc acetate) 50 mg Wilzin 50mg capsules | 250 capsule [PoM] £242.00

ANTIDOTES AND CHELATORS > COPPER CHELATORS

Penicillamine

- **DRUG ACTION** Penicillamine aids the elimination of copper ions in Wilson's disease (hepatolenticular degeneration).

● INDICATIONS AND DOSE

Wilson's disease

▶ BY MOUTH

- ▶ Child 1 month–11 years: 20 mg/kg daily in 2–3 divided doses, to be taken 1 hour before food; maximum 2 g per day
- ▶ Child 12–17 years: Initially 20 mg/kg daily in 2–3 divided doses. maintenance 0.75–1 g daily, to be taken 1 hour before food; maximum 2 g per day

Cystinuria

▶ BY MOUTH

- ▶ Child: 20–30 mg/kg daily in 2–3 divided doses, lower doses may be used initially and increased gradually, doses to be adjusted to maintain 24-hour urinary cystine below 1 mmol/litre, maintain adequate fluid intake, to be taken 1 hour before food; maximum 3 g per day

- **CONTRA-INDICATIONS** Lupus erythematosus

- **CAUTIONS** Neurological involvement in Wilson's disease

- **INTERACTIONS** → Appendix 1: penicillamine

● SIDE-EFFECTS

- ▶ **Common or very common** Anorexia · fever · nausea · proteinuria · rash · thrombocytopenia
- ▶ **Rare** Alopecia · breast enlargement (male and female) · elastosis perforans · haematuria (withdraw immediately if cause unknown) · mouth ulceration · pseudoxanthoma elasticum · skin laxity · stomatitis
- ▶ **Frequency not known** Agranulocytosis · aplastic anaemia · blood disorders · bronchiolitis · cholestatic jaundice · dermatomyositis · glomerulonephritis · Goodpasture's syndrome · haemolytic anaemia · haemolytic leucopenia · late rashes (consider dose reduction) · lupus erythematosus · myasthenia gravis · nephrotic syndrome · neuropathy (especially if neurological involvement in Wilson's disease—prophylactic pyridoxine recommended) · neutropenia · pancreatitis · pemphigus · pneumonitis · polymyositis · pulmonary haemorrhage · rheumatoid arthritis · Stevens-Johnson syndrome · taste loss (mineral supplements not recommended) · urticaria · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Patients who are hypersensitive to penicillin may react rarely to penicillamine.

- **PREGNANCY** Fetal abnormalities reported rarely; avoid if possible.

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **RENAL IMPAIRMENT** Reduce dose and monitor renal function or avoid (consult product literature).

● MONITORING REQUIREMENTS

- ▶ Consider withdrawal if platelet count falls below $120\,000/\text{mm}^3$ or white blood cells below $2500/\text{mm}^3$ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).
- ▶ Monitor urine for proteinuria.
- ▶ Monitor blood and platelet count regularly.
- **PATIENT AND CARER ADVICE** Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 6, 22

Trientine dihydrochloride 300 mg Trientine dihydrochloride 300mg capsules | 100 capsule [PoM] £3,090.00 DT price = £3,090.00

4 Mineral and trace elements deficiencies

4.1 Zinc deficiency

Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease, or in zinc-losing states.

Zinc is used in the treatment of Wilson's disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc, see also Intravenous nutrition below. If necessary, further zinc can be added to intravenous feeding regimens.

ELECTROLYTES AND MINERALS > ZINC

Zinc sulfate

● INDICATIONS AND DOSE

Zinc deficiency or supplementation in zinc-losing conditions

► BY MOUTH USING EFFERVESCENT TABLETS

► Neonate: 1 mg/kg daily, dose expressed as elemental zinc, to be dissolved in water and taken after food.

► Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

► Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

► Child (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

Acrodermatitis enteropathica

► BY MOUTH USING EFFERVESCENT TABLETS

► Neonate: 0.5–1 mg/kg twice daily, dose to be adjusted as necessary, total daily dose may alternatively be given in 3 divided doses, dose expressed as elemental zinc.

► Child: 0.5–1 mg/kg twice daily, dose to be adjusted as necessary, total daily dose may alternatively be given in 3 divided doses, dose expressed as elemental zinc

● **UNLICENSED USE** Solvazinc® is not licensed for use in acrodermatitis enteropathica.

● **INTERACTIONS** → Appendix 1: zinc

● **SIDE-EFFECTS** Abdominal pain · diarrhoea · dyspepsia · gastric irritation · gastritis · headache · irritability · lethargy · nausea · vomiting

● **PREGNANCY** Crosses placenta; risk theoretically minimal, but no information available.

● **BREAST FEEDING** Present in milk; risk theoretically minimal, but no information available.

● **RENAL IMPAIRMENT** Accumulation may occur in acute renal failure.

● **PRESCRIBING AND DISPENSING INFORMATION** Each Solvazinc® tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Zinc sulfate monohydrate 125 mg Solvazinc 125mg effervescent tablets sugar-free | 90 tablet  £16.45 DT price = £16.45

5 Nutrition (intravenous)

Intravenous nutrition

Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion.

This may be in addition to oral or enteral tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition (TPN)**. Complete enteral starvation is undesirable and total parenteral nutrition is a last resort.

Indications for parenteral nutrition include prematurity; severe or prolonged disorders of the gastro-intestinal tract; preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; major surgery, trauma, or burns; prolonged coma or inability to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations used in children is given under Proprietary Infusion Fluids for Parenteral Feeding p. 591.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, lipids, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of an amino-acid, glucose, electrolyte bag, and a separate lipid infusion or, in older children a single 'all-in-one' bag. If the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of nutritional solutions of low osmolality and neutral pH. Nutritional fluids should be given by a dedicated intravenous line; if not possible, compatibility with any drugs or fluids should be checked as precipitation of components may occur. Extravasation of parenteral nutrition solution can cause severe tissue damage and injury; the infusion site should be regularly monitored.

Before starting intravenous nutrition the patient should be clinically stable and renal function and acid-base status should be assessed. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment. The nutritional components of parenteral nutrition regimens are usually increased gradually over a number of days to prevent metabolic complications and to allow metabolic adaptation to the infused nutrients. The solutions are usually infused over 24 hours but this may be gradually reduced if long-term nutrition is required. Home parenteral nutrition is usually infused over 12 hours overnight.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and

2 Excludes protein- or amino acid-derived energy							

management of parenteral nutrition complications, specialist literature should be consulted.

Protein (nitrogen) is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes. Solutions for use in neonates and children under 1 year of age are based on the amino acid profile of umbilical cord blood (*Primene*[®]) or breast milk (*Vaminolact*[®]) and contain amino acids that are essential in this age group; these amino acids may not be present in sufficient quantities in preparations designed for older children and adults.

Energy requirements must be met if amino acids are to be utilised for tissue maintenance. An appropriate energy to protein ratio is essential and requirements will vary depending on the child's age and condition. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose p. 564 is the preferred source of carbohydrate, but frequent monitoring of blood glucose is required particularly during initiation and build-up of the regimen; insulin may be necessary. Glucose above a concentration of 12.5% must be infused through a central venous catheter to avoid thrombosis; the maximum concentration of glucose that should normally be infused in fluid restricted children is 20–25%.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphataemia. Neonates, particularly preterm neonates, and young children also require phosphorus and calcium to ensure adequate bone mineralisation. The compatibility and solubility of calcium and phosphorus salts is complex and unpredictable; precipitation is a risk and specialist pharmacy advice should be sought.

Fat (lipid) emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolality with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation.

Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Regular monitoring of plasma cholesterol and triglyceride is necessary to ensure clearance from the plasma, particularly in conditions where fat metabolism may be disturbed e.g. infection. Emulsions containing 20% or 30% fat should be used in neonates as they are cleared more efficiently. **Additives should not be mixed with fat emulsions unless compatibility is known.**

Electrolytes are usually provided as the chloride salts of potassium and sodium. Acetate salts can be used to reduce the amount of chloride infused; hyperchloraemic acidosis or hypochloraemic alkalosis can occur in preterm neonates or children with renal impairment.

Administration

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature and other specialist literature should be consulted.*

NUTRIENTS > PARENTERAL NUTRITION

Parenteral nutrition supplements

• INDICATIONS AND DOSE

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES

Amino acid supplement for hypercatabolic or hypermetabolic states

► BY INTRAVENOUS INFUSION

- Child: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

• CAUTIONS

PEDITRACE SOLUTION FOR INFUSION 10ML VIALS Reduced biliary excretion • reduced biliary excretion in cholestatic liver disease • reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required) • total parenteral nutrition exceeding one month

CAUTIONS, FURTHER INFORMATION

- Total parenteral nutrition exceeding one month Measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment—discontinue if manganese concentration raised or if cholestasis develops.

- **DIRECTIONS FOR ADMINISTRATION** Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature, and other specialist literature should be consulted.* Compatibility with the infusion solution must be ascertained before adding supplementary preparations. **Additives should not be mixed with fat emulsions unless compatibility is known.**

CERNEVIT SOLUTION FOR INJECTION VIALS AND DILUENT

Dissolve in 5 mL water for injections.

PEDITRACE SOLUTION FOR INFUSION 10ML VIALS For addition to *Vaminolact*[®], *Vamin*[®] 14 Electrolyte-Free solutions, and glucose intravenous infusions.

DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES For addition to infusion solutions.

ADDIPHOS[®] VIALS For addition to *Vamin*[®] solutions and glucose intravenous infusions.

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES For addition to infusion solutions containing amino acids.

ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES For addition to *Vamin*[®] solutions and glucose intravenous infusions.

GLYCOPHOS[®] VIALS For addition to *Vamin*[®] and *Vaminolact*[®] solutions, and glucose intravenous infusions.

SOLIVITO N POWDER FOR SOLUTION FOR INFUSION VIALS

Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or *Intralipid*[®], dissolve in *Vitlipid N*[®] or *Intralipid*[®] for adding to *Intralipid*[®] only.

VITLIPID N INFANT EMULSION FOR INJECTION 10ML AMPOULES For addition to *Intralipid*[®].

VITLIPID N ADULT EMULSION FOR INJECTION 10ML AMPOULES For addition to *Intralipid*[®].

• PRESCRIBING AND DISPENSING INFORMATION

CERNEVIT SOLUTION FOR INJECTION VIALS AND DILUENT

Cernevit[®] solution contains *dl*-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecalciferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dexpantenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg.

PEDITRACE SOLUTION FOR INFUSION 10ML VIALS For use in neonates (when kidney function established, usually second day of life), infants, and children.

Peditrace[®] solution contains traces of Zn²⁺, Cu²⁺, Mn²⁺, Se⁴⁺, F⁻, I⁻.

DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES For patients over 40 kg.

Decan[®] solution contains trace elements Fe²⁺, Zn²⁺, Cu²⁺, Mn²⁺, F⁻, Co²⁺, I⁻, Se⁴⁺, Mo⁶⁺, Cr³⁺.

ADDIPHOS[®] VIALS *Addiphos*[®] sterile solution contains phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL.

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES *Dipeptiven*[®] solution contains N(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg).

ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES For patients over 40 kg.

Additrace[®] solution contains traces of Fe³⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, F⁻, I⁻.

GLYCOPHOS[®] VIALS *Glycophos*[®] Sterile Concentrate solution contains phosphate 20 mmol, Na⁺ 40 mmol/20 mL.

SOLIVITO N POWDER FOR SOLUTION FOR INFUSION VIALS

Solvito N[®] powder for reconstitution contains biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg.

VITLIPID N INFANT EMULSION FOR INJECTION 10ML AMPOULES

Vitlipid N[®] infant emulsion contains vitamin A 230 units, ergocalciferol 40 units, *dl*-alpha tocopherol 0.7 unit, phytonadione 20 micrograms/mL.

VITLIPID N ADULT EMULSION FOR INJECTION 10ML AMPOULES

Vitlipid N[®] adult emulsion contains vitamin A 330 units, ergocalciferol 20 units, *dl*-alpha tocopherol 1 unit, phytonadione 15 micrograms/mL.

For adults and children over 11 years.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

- ▶ **Cernevit** (Baxter Healthcare Ltd)
Cyanocobalamin 6 microgram, Biotin 69 microgram, Folic acid 414 microgram, Thiamine 3.51 mg, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Pantothenic acid (as Dexpantenol) 17.25 mg, Nicotinamide 46 mg, Ascorbic acid 125 mg, Alpha tocopherol 11.2 unit, Colecalciferol 220 unit, Retinol 3500 unit Cernevit solution for injection vials and diluent | 10 vial [PoM] no price available

Solution for infusion

- ▶ **Parenteral nutrition supplements (Non-proprietary)**
Sodium glycerophosphate 216 mg per 1 ml Sodium glycerophosphate 4.32g/20ml concentrate for solution for infusion vials | 1 vial [PoM] £5.07 | 10 vial [PoM] no price available
- ▶ **Additrac** (Fresenius Kabi Ltd)
Sodium molybdate 4.85 microgram per 1 ml, Chromic chloride 5.33 microgram per 1 ml, Sodium selenite 10.5 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Manganese chloride 99 microgram per 1 ml, Sodium fluoride 210 microgram per 1 ml, Copper chloride 340 microgram per 1 ml, Ferric chloride 544 microgram per 1 ml, Zinc chloride 1.36 mg per 1 ml Additrac solution for infusion 10ml ampoules | 1 ampoule [PoM] £1.96 | 20 ampoule [PoM] no price available
- ▶ **Dipeptiven** (Fresenius Kabi Ltd)
N(2)-L-alanyl-L-glutamine 200 mg per 1 ml Dipeptiven 20g/100ml concentrate for solution for infusion bottles | 1 bottle [PoM] £25.93 | 10 bottle [PoM] no price available
Dipeptiven 10g/50ml concentrate for solution for infusion bottles | 1 bottle [PoM] £13.94 | 10 bottle [PoM] no price available
- ▶ **Peditrace** (Fresenius Kabi Ltd)
Manganese (as Manganese chloride) 1 microgram per 1 ml, Iodine (as Potassium iodide) 1 microgram per 1 ml, Selenium (as Sodium selenite) 2 microgram per 1 ml, Copper (as Copper chloride) 20 microgram per 1 ml, Fluoride (as Sodium fluoride) 57 microgram per 1 ml, Zinc (as Zinc chloride) 250 microgram per 1 ml Peditrace solution for infusion 10ml vials | 1 vial [PoM] £3.55 | 10 vial [PoM] no price available
- ▶ **Tracutit** (B.Braun Melsungen AG)
Sodium molybdate dihydrate 2.42 microgram per 1 ml, Chromic chloride 5.3 microgram per 1 ml, Sodium selenite pentahydrate 7.89 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Sodium fluoride 126 microgram per 1 ml, Manganese chloride 197.9 microgram per 1 ml, Copper chloride 204.6 microgram per 1 ml, Zinc chloride 681.5 microgram per 1 ml, Ferrous chloride 695.8 microgram per 1 ml Tracutit concentrate for solution for infusion 10ml ampoules | 5 ampoule [PoM] £7.96

Powder for solution for infusion

- ▶ **Solivit N** (Fresenius Kabi Ltd)
Cyanocobalamin 5 microgram, Biotin 60 microgram, Folic acid 400 microgram, Thiamine nitrate 3.1 mg, Pyridoxine hydrochloride 4.9 mg, Riboflavin sodium phosphate 4.9 mg, Sodium pantothenate 16.5 mg, Nicotinamide 40 mg, Sodium ascorbate 113 mg Solivit N powder for solution for infusion vials | 1 vial [PoM] £1.97 | 10 vial [PoM] no price available

Emulsion for injection

- ▶ **Vitlipid N Adult** (Fresenius Kabi Ltd)
Ergocalciferol 500 nanogram per 1 ml, Phytomenadione 15 microgram per 1 ml, Retinol palmitate 99 microgram per 1 ml, Alpha tocopherol 910 microgram per 1 ml Vitlipid N Adult emulsion for injection 10ml ampoules | 1 ampoule [PoM] £1.97 | 10 ampoule [PoM] no price available
- ▶ **Vitlipid N Infant** (Fresenius Kabi Ltd)
Ergocalciferol 1 microgram per 1 ml, Phytomenadione 20 microgram per 1 ml, Retinol palmitate 69 microgram per 1 ml, Alpha tocopherol 640 microgram per 1 ml Vitlipid N Infant emulsion for injection 10ml ampoules | 1 ampoule [PoM] £1.97 | 10 ampoule [PoM] no price available

6 Nutrition (oral)

Enteral nutrition

Overview

Children have higher nutrient requirements per kg bodyweight, different metabolic rates, and physiological responses compared to adults. They have low nutritional stores and are particularly vulnerable to growth and nutritional problems during critical periods of development. Major illness, operations, or trauma impose increased metabolic demands and can rapidly exhaust nutritional reserves.

Every effort should be made to optimise oral food intake before beginning enteral tube feeding; this may include change of posture, special seating, feeding equipment, oral densitisation, food texture changes, thickening of liquids, increasing energy density of food, treatment of reflux or oesophagitis, as well as using age-specific nutritional supplements.

Enteral tube feeding has a role in both short-term rehabilitation and long-term nutritional management in paediatrics. It can be used as supportive therapy, in which the enteral feed supplies a proportion of the required nutrients, or as primary therapy, in which the enteral feed delivers all the necessary nutrients. Most children receiving tube feeds should also be encouraged to take oral food and drink. Tube feeding should be considered in the following situations:

- unsafe swallowing and risk of aspiration
- inability to consume at least 60% of energy needs by mouth
- total feeding time of more than 4 hours per day
- weight loss or no weight gain for a period of 3 months (less for younger children and infants)
- weight for height (or length) less than 2nd percentile for age and sex

Most feeds for enteral use contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for children who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in the clinically unstable child. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

Choosing the best formula for children depends on several factors including: nutritional requirements, gastro-intestinal function, underlying disease, nutrient restrictions, age, and feed characteristics (nutritional composition, viscosity, osmolality, availability and cost). Children have specific dietary requirements and in many situations liquid feeds prepared for adults are totally unsuitable and should not be given. Expert advice from a dietician should be sought before prescribing enteral feeds for a child.

Infant formula feeds

Child 0–12 months. Term infants with normal gastro-intestinal function are given either breast milk or normal infant formula during the first year of life. The average intake is between 150 mL and 200 mL/kg/day. Infant milk formulas are based on whey- or casein-dominant protein, lactose with or without maltodextrin, amylose, vegetable oil and milk fat. The composition of all normal and soya infant formulas have to meet The Infant Formula and Follow-on Formula Regulations (England and Wales) 2007, which enact

the European Community Regulations 2006/141/EC; the composition of other enteral and specialist feeds has to meet the Commission Directive (1999/21/EC) on Dietary Foods for Special Medical Purposes.

A high-energy feed, which contains 9–11% of energy derived from protein can be used for infants who fail to grow adequately. Alternatively, energy supplements may be added to normal infant formula to achieve a higher energy content (but this will reduce the protein to energy ratio) or the normal infant formula concentration may be increased slightly. Care should be taken not to present an osmotic load of more than 500 milliosmols/kg water to the normal functioning gut, otherwise osmotic diarrhoea will result. Concentrating or supplementing feeds should not be attempted without the advice of a paediatric dietician.

Enteral feeds

Child 1–6 years (body-weight 8–20 kg). Ready-to-use feeds based on caseinates, maltodextrin and vegetable oils (with or without added medium chain triglyceride (MCT) oil or fibre) are well tolerated and effective in improving nutritional status in this age group. Although originally designed for children 1–6 years (body-weight 8–20 kg), some products have ACBS approval for use in children weighing up to 30 kg (approx. 10 years of age). Enteral feeds formulated for children 1–6 years are low in sodium and potassium; electrolyte intake and biochemical status should be monitored. Older children in this age range taking small feed volumes may need to be given additional micronutrients. Fibre-enriched feeds may be helpful for children with chronic constipation or diarrhoea.

Child 7–12 years (body-weight 21–45 kg). Depending on age, weight, clinical condition and nutritional requirements, ready-to-use feeds formulated for 7–12 year olds may be given at appropriate rates.

Child over 12 years (body-weight over 45 kg). As there are no standard enteral feeds formulated for this age group, adult formulations are used. The intake of protein, electrolytes, vitamins, and trace minerals should be carefully assessed and monitored. Note: Adult feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be used with caution and expert advice.

Specialised formula

It is essential that any infant who is intolerant of breast milk or normal infant formula, or whose condition requires nutrient-specific adaptation, is prescribed an adequate volume of a nutritionally complete replacement formula. In the first 4 months of life, a volume of 150–200 mL/kg/day is recommended. After 6 months, should the formula still be required, a volume of 600 mL/day should be maintained, in addition to solid food.

Products for cow's milk protein intolerance or lactose intolerance. There are a number of infant formulas formulated for cow's milk protein intolerance or lactose intolerance; these feeds may contain a residual amount of lactose (less than 1 g/100 mL formula)—sometimes described as clinically lactose-free or 'lactose-free' by manufacturers. If the total daily intake of these formulas is low, it may be necessary to supplement with calcium, and a vitamin and mineral supplement.

Soya-based infant formulas have a high phytoestrogen content and this may be a long-term reproductive health risk. The Chief Medical Officer has advised that soya-based infant formulas should not be used as the first choice for the management of infants with proven cow's milk sensitivity, lactose intolerance, galactokinase deficiency and galactosaemia. Most UK paediatricians with expertise in inherited metabolic disease still advocate soya-based formulations for infants with galactosaemia as there are concerns about the residual lactose content of low lactose formulas and protein hydrolysates based on cow's milk protein.

Low lactose infant formulations, based on whole cow's milk protein, are unsuitable for children with cow's milk protein intolerance. Liquid soya milks purchased from supermarkets and health food stores are not nutritionally complete and should never be used for infants under 1 year of age.

Protein hydrolysate formulas. Non-milk, peptide-based feeds containing hydrolysates of casein, whey, meat and soya protein, are suitable for infants with disaccharide or whole protein intolerance. The total daily intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet the child's nutritional requirements; these feeds have a high osmolality when given at recommended dilution and need gradual and careful introduction.

Elemental (amino acid based formula). Specially formulated elemental feeds containing essential and nonessential amino acids are available for use in infants and children under 6 years with proven whole protein intolerance. Adult elemental formula may be used for children over 6 years; the intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet nutritional requirements. These feeds have a high osmolality when given at the recommended concentration and therefore need gradual and careful introduction.

Modular feeds. Modular feeds (see Specialised Formulas for Specific Clinical Conditions) are based on individual protein, fat, carbohydrate, vitamin and mineral components or modules which can be combined to meet the specific needs of a child. Modular feeds are used when nutritionally complete specialised formula are not tolerated, or if the fluid and nutrient requirements change e.g. in gastro-intestinal, renal or liver disease. The main advantage of modular feeds is their flexibility; disadvantages include their complexity and preparation difficulties. Modular feeds should not be used without the supervision of a paediatric dietician.

Specialised formula. Highly specialised formulas are designed to meet the specific requirements in various clinical conditions such as renal and liver diseases. When using these formulas, both the biochemical status of the child and their growth parameters need to be monitored.

Feed thickeners

Carob based thickeners may be used to thicken feeds for infants under 1 year with significant gastro-oesophageal reflux. Breast-fed infants can be given the thickener mixed to a paste with water or breast-milk prior to feeds.

Pre-thickened formula Milk-protein- or casein-dominant infant formula, which contains small quantities of pre-gelatinized starch, is recommended primarily for infants with mild gastro-oesophageal reflux. Pre-thickened formula is prepared in the same way as normal infant formula and flows through a standard teat. The feeds do not thicken on standing but thicken in the stomach when exposed to acid pH.

Starched based thickeners can be used to thicken liquids and feeds for children over 1 year of age with dysphagia.

Dietary supplements for oral use

Three types of prescribable fortified dietary supplements are available: fortified milk and non-milk tasting (juice-style) drinks, and fortified milk-based semi-solid preparations. The recommended daily quantity is age-dependent. The following is a useful guide: 1–2 years, 200 kcal (840 kJ); 3–5 years, 400 kcal (1680 kJ); 6–11 years, 600 kcal (2520 kJ); and over 12 years, 800 kcal (3360 kJ). Supplements containing 1.5 kcal/mL are high in protein and should not be used for children under 3 years of age. Many supplements are high in sugar or maltodextrin; care should be taken to prevent prolonged contact with teeth. Ideally supplements should be administered after meals or at bedtime so as not to affect appetite.

Products for metabolic diseases

There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

Enteral feeding tubes

Care is required in choosing an appropriate formulation of a drug for administration through a nasogastric narrow-bore feeding tube or through a percutaneous endoscopic gastrostomy (PEG) or jejunostomy tube. Liquid preparations (or soluble tablets) are preferred; injection solutions may also be suitable for administration through an enteral tube.

If a solid formulation of a medicine needs to be given, it should be given as a suspension of particles fine enough to pass through the tube. It is possible to crush many immediate-release tablets but enteric-coated or modified-release preparations should **not** be crushed.

Enteral feeds may affect the absorption of drugs and it is therefore important to consider the timing of drug administration in relation to feeds. If more than one drug needs to be given, they should be given separately and the tube should be flushed with water after each drug has been given.

Clearing blockages

Carbonated (sugar-free) drinks may be marginally more effective than water in unblocking feeding tubes, but mildly acidic liquids (such as pineapple juice or cola-based drinks) can coagulate protein in feeds, causing further blockage. If these measures fail to clear the enteral feeding tube, an alkaline solution containing pancreatic enzymes may be introduced into the tube (followed after at least 5 minutes by water). Specific products designed to break up blockages caused by formula feeds are also available.

6.1 Special diets

Nutrition in special diets

Overview

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for children who either cannot tolerate or cannot metabolise certain common constituents of food.

Celiac disease

Celiac disease is caused by an abnormal immune response to gluten. For management and further information, see Celiac disease p. 33.

Phenylketonuria

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise **phenylalanine**, is managed by restricting dietary intake of **phenylalanine** to a small amount sufficient for tissue building and repair.

Aspartame (used as a sweetener in some foods and medicines) contributes to the **phenylalanine** intake and may affect control of *phenylketonuria*. If alternatives are unavailable, children with phenylketonuria should not be denied access to appropriate medication; the amount of **aspartame** consumed can be taken into account in the management of the condition. Where the presence of **aspartame** in a preparation is specified in the product literature, **aspartame** is listed as an excipient in the relevant

product entry in *BNF for Children*; the child or carer should be informed of this.

Some rare forms of *phenylketonuria* are caused by a deficiency of **tetrahydrobiopterin**. Treatment involves oral supplementation of tetrahydrobiopterin p. 596; in some severe cases, the addition of the neurotransmitter precursors, levodopa and 5-hydroxytryptophan, is also necessary.

Saproterin dihydrochloride below, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of **phenylalanine** in the management of patients with *phenylketonuria* and *tetrahydrobiopterin deficiency*.

Products for metabolic diseases

There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

6.1a Phenylketonuria

DRUGS FOR METABOLIC DISORDERS > TETRAHYDROBIOPTERIN AND DERIVATIVES

Saproterin dihydrochloride

● INDICATIONS AND DOSE

Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)

- ▶ BY MOUTH
- ▶ Child 4–17 years: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning

Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)

- ▶ BY MOUTH
- ▶ Neonate: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day.
- ▶ Child: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

● **CAUTIONS** History of convulsions

● **INTERACTIONS** → Appendix 1: saproterin

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · cough · diarrhoea · headache · nasal congestion · pharyngolaryngeal pain · vomiting
- ▶ **Frequency not known** Hypersensitivity reactions

● **PREGNANCY** Manufacturer advises caution—consider only if strict dietary management inadequate.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

● MONITORING REQUIREMENTS

- ▶ Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response

increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.

- ▶ Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be dissolved in water and taken within 20 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Sapropterin is a synthetic form of tetrahydrobiopterin.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

▶ **Kuvan** (BioMarin Europe Ltd)

Sapropterin dihydrochloride 100 mg Kuvan 100mg soluble tablets sugar-free | 30 tablet (PoM) £597.22

Tetrahydrobiopterin

- **INDICATIONS AND DOSE**

Monotherapy in tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)

▶ BY MOUTH

▶ Child: 10 mg/kg twice daily, adjusted according to response, total daily dose may alternatively be given in 3 divided doses

In combination with neurotransmitter precursors for tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)

▶ BY MOUTH

▶ Child 1 month–1 year: Initially 250–750 micrograms/kg 4 times a day, adjusted according to response, total daily dose may alternatively be given in 3 divided doses; maximum 7 mg/kg per day

▶ Child 2–17 years: Initially 250–750 micrograms/kg 4 times a day, adjusted according to response, total daily dose may alternatively be given in 3 divided doses; maximum 10 mg/kg per day

- **UNLICENSED USE** Not licensed.

- **SIDE-EFFECTS** Diarrhoea · disturbed sleep · urinary frequency

- **PREGNANCY** Crosses the placenta; use only if benefit outweighs risk.

- **BREAST FEEDING** Present in milk, effects unknown.

- **RENAL IMPAIRMENT** Use with caution—accumulation of metabolites.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

deficiency due to simple dietary inadequacy is rare in the developed world. Some children may be at risk of developing deficiencies because of an inadequate intake, impaired vitamin synthesis or malabsorption in disease states such as cystic fibrosis and Crohn's disease.

The use of vitamins as general 'pick-me-ups' is of unproven value and, the 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 602 and pyridoxine hydrochloride p. 600, is unscientific and can be harmful. Many vitamin supplements are described as 'multivitamin' but few contain the whole range of essential vitamins and many contain relatively high amounts of vitamins A and D. Care should be taken to ensure the correct dose is not exceeded.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. *Report on Health and Social Subjects* 41. London: HMSO, 1991.

Dental patients

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

Vitamin A

Deficiency of vitamin A (retinol) p. 599 is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin A supplementation may be required in children with liver disease, particularly cholestatic liver disease, due to the malabsorption of fat soluble vitamins. In those with complete biliary obstruction an intramuscular dose once a month may be appropriate.

Preterm neonates have low plasma concentrations of vitamin A and are usually given vitamin A supplements, often as part of an oral multivitamin preparation once enteral feeding has been established.

Vitamin B group

Deficiency of the B vitamins, other than vitamin B₁₂, is rare in the UK and is usually treated by preparations containing thiamine (B₁) p. 601, and riboflavin (B₂). Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate, and pantothenic acid or panthenol may be included in vitamin B preparations, but there is no evidence of their value as supplements; however, they can be used in the management of certain metabolic disorders. Anaphylaxis has been reported with parenteral B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride (B₆) deficiency is rare, but it may occur during isoniazid p. 352 therapy or penicillamine p. 589 treatment in Wilson's disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, cystathioninuria and homocystinuria; folic acid p. 546 supplementation may also be beneficial in these disorders. Pyridoxine hydrochloride is also used in sideroblastic anaemia. Rarely, seizures in the neonatal period or during infancy respond to pyridoxine hydrochloride treatment; pyridoxine hydrochloride should be tried in all cases of early-onset intractable seizures and status epilepticus. Pyridoxine hydrochloride has been tried for a wide variety of other

7 Vitamin deficiency

Vitamins

Overview

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements. Except for iron-deficiency anaemia, a primary vitamin or mineral

disorders, but there is little sound evidence to support the claims of efficacy.

A number of mitochondrial disorders may respond to treatment with certain B vitamins but these disorders require specialist management. Thiamine is used in the treatment of maple syrup urine disease, mitochondrial respiratory chain defects and, together with riboflavin, in the treatment of congenital lactic acidosis; riboflavin is also used in glutaric acidurias and cytochrome oxidase deficiencies; biotin is used in carboxylase defects.

Folic acid and vitamin B₁₂ are used in the treatment of megaloblastic anaemia. Folinic acid p. 528 (available as calcium folinate) is used in association with cytotoxic therapy.

Vitamin C

Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency have been reported. Vitamin C is used to enhance the excretion of iron one month after starting desferrioxamine mesilate p. 550 therapy; it is given separately from food as it also enhances iron absorption. Vitamin C is also used in the treatment of some inherited metabolic disorders, particularly mitochondrial disorders; specialist management of these conditions is required.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a child with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

Vitamin D

The term Vitamin D is used for a range of compounds including ergocalciferol (calciferol, vitamin D₂) p. 607, colecalciferol (vitamin D₃) p. 604, dihydrotachysterol, alfalcaldol (1 α -hydroxycholecalciferol) p. 603, and calcitriol (1,25-dihydroxycholecalciferol) p. 603.

Asymptomatic vitamin D deficiency is common in the United Kingdom; symptomatic deficiency may occur in certain ethnic groups, particularly as rickets or hypocalcaemia, and rarely in association with malabsorption. The amount of vitamin D required in infancy is related to the stores built up *in-utero* and subsequent exposure to sunlight. The amount of vitamin D in breast milk varies and some breast-fed babies, particularly if preterm or born to vitamin D deficient mothers, may become deficient. Most formula milk and supplement feeds contain adequate vitamin D to prevent deficiency.

Simple, nutritional vitamin D deficiency can be prevented by oral supplementation of ergocalciferol (calciferol, vitamin D₂) or colecalciferol (vitamin D₃) daily, using multi-vitamin drops, preparations of vitamins A and D, manufactured 'special' solutions, or as calcium and ergocalciferol tablets (although the calcium and other vitamins in supplements are unnecessary); excessive supplementation may cause hypercalcaemia.

Inadequate bone mineralisation can be caused by a deficiency, or a lack of action of vitamin D or its active metabolite. In childhood this causes bowing and distortion of bones (rickets). In nutritional vitamin D deficiency rickets, initial high doses of ergocalciferol or colecalciferol should be reduced to supplemental doses after 8–12 weeks, as there is a significant risk of hypercalcaemia. However, calcium supplements are recommended if there is hypocalcaemia or evidence of a poor dietary calcium intake. A single large dose of ergocalciferol or colecalciferol can also be effective for the treatment of nutritional vitamin D deficiency rickets.

Poor bone mineralisation in neonates and young children may also be due to inadequate intake of phosphate or calcium particularly during long-term parenteral nutrition—

supplementation with phosphate or calcium may be required.

Hypophosphataemic rickets occurs due to abnormal phosphate excretion; treatment with high doses of oral phosphate, and hydroxylated (activated) forms of vitamin D allow bone mineralisation and optimise growth.

Nutritional deficiency of vitamin D is best treated with colecalciferol or ergocalciferol. Preparations containing calcium and colecalciferol are also occasionally used in children where there is evidence of combined calcium and vitamin D deficiency. Vitamin D deficiency caused by *intestinal malabsorption* or *chronic liver disease* usually requires vitamin D in pharmacological doses; the hypocalcaemia of *hypoparathyroidism* often requires higher doses in order to achieve normocalcaemia and alfalcaldol is generally preferred.

Vitamin D supplementation is often given in combination with calcium supplements for persistent hypocalcaemia in neonates, and in chronic renal disease.

Vitamin D requires hydroxylation, by the kidney and liver, to its active form therefore the hydroxylated derivatives alfalcaldol or calcitriol should be prescribed if patients with *severe liver* or *renal impairment* require vitamin D therapy. Alfalcaldol is generally preferred in children as there is more experience of its use and appropriate formulations are available. Calcitriol is unlicensed for use in children and is generally reserved for those with severe liver disease.

Vitamin E

The daily requirement of vitamin E (tocopherol) has not been well defined. Vitamin E supplements are given to children with fat malabsorption such as in cystic fibrosis and cholestatic liver disease. In children with abetalipoproteinaemia abnormally low vitamin E concentrations may occur in association with neuromuscular problems; this usually responds to high doses of vitamin E. Some neonatal units still administer a single intramuscular dose of vitamin E at birth to preterm neonates to reduce the risk of complications; no trials of long-term outcome have been carried out. The intramuscular route should also be considered in children with severe liver disease when response to oral therapy is inadequate.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, children with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. For oral administration to prevent vitamin K deficiency in malabsorption syndromes, a water-soluble synthetic vitamin K derivative, menadiol sodium phosphate p. 609 can be used if supplementation with phytonadione p. 609 by mouth has been insufficient.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K; see advice on the use of vitamin K in haemorrhage.

Multivitamins

Multivitamin supplements are used in children with vitamin deficiencies and also in malabsorption conditions such as cystic fibrosis or liver disease. Supplementation is not required if nutrient enriched feeds are used; consult a dietician for further advice.

Neonates

Vitamin K deficiency bleeding

Neonates are relatively deficient in vitamin K and those who do not receive supplements of vitamin K are at risk of serious

bleeding including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). An appropriate regimen should be selected after discussion with parents in the antenatal period.

Vitamin K (as phytonadione) may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies.

Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytonadione should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytonadione is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytonadione by mouth at birth (using the contents of a phytonadione capsule) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytonadione are given by mouth (using the contents of a phytonadione capsule) at weekly intervals for 12 weeks.

VITAMINS AND TRACE ELEMENTS > MULTIVITAMINS

Vitamins A and D

● INDICATIONS AND DOSE

Prevention of vitamin A and D deficiency

► BY MOUTH

- Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D

- **UNLICENSED USE** Not licensed in children under 6 months of age.

● SIDE-EFFECTS

Overdose

Excessive ingestion Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

► Vitamins a and d (Non-proprietary)

Vitamin D 400 unit, Vitamin A 4000 unit Vitamins A and D capsules BPC 1973 | 28 capsule £2.81 | 28 capsule [\[GSL\]](#) £2.81 | 84 capsule £6.75–£8.42 DT price = £8.42

Vitamins A, B group, C and D

● INDICATIONS AND DOSE

Prevention of deficiency

► BY MOUTH USING CAPSULES

- Child 1–11 years: 1 capsule daily
- Child 12–17 years: 2 capsules daily

Cystic Fibrosis: prevention of deficiency

► BY MOUTH USING CAPSULES

- Child 1–17 years: 2–3 capsules daily

ABIDEC MULTIVITAMIN DROPS®

Prevention of deficiency

► BY MOUTH USING ORAL DROPS

- Preterm neonate: 0.6 mL daily.

- Neonate: 0.3 mL daily.

- Child 1–11 months: 0.3 mL daily

- Child 1–17 years: 0.6 mL daily

Cystic Fibrosis: prevention of deficiency

► BY MOUTH USING ORAL DROPS

- Child 1–11 months: 0.6 mL daily

- Child 1–17 years: 1.2 mL daily

DALIVIT ORAL DROPS®

Prevention of deficiency

► BY MOUTH USING ORAL DROPS

- Preterm neonate: 0.3 mL daily.

- Neonate: 0.3 mL daily.

- Child 1–11 months: 0.3 mL daily

- Child 1–17 years: 0.6 mL daily

Cystic Fibrosis: prevention of deficiency

► BY MOUTH USING ORAL DROPS

- Child 1–11 months: 0.6 mL daily

- Child 1–17 years: 1 mL daily

- **UNLICENSED USE** *Dalavit*® not licensed for use in children under 6 weeks.

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

Vitamin A concentration of preparations varies.

ABIDEC MULTIVITAMIN DROPS® *Abidec*® contains 1333 units of vitamin A (as palmitate) per 0.6 mL dose.

DALIVIT ORAL DROPS® *Dalavit*® contains 5000 units of vitamin A (as palmitate) per 0.6 mL dose.

Vitamins A, C and D

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A below, ascorbic acid p. 602.

● INDICATIONS AND DOSE

Prevention of vitamin deficiency

► BY MOUTH

- Child 1 month–4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

● INTERACTIONS → Appendix 1: ascorbic acid, vitamin A

● PRESCRIBING AND DISPENSING INFORMATION This drug contains vitamin D; consult individual vitamin D monographs.

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral drops

- **Healthy Start Children's Vitamin** (Secretary of State for Health) Vitamin A and D3 concentrate 55 mg per 1 ml, Sodium ascorbate 18.58 mg per 1 ml, Ascorbic acid 150 mg per 1 ml, Vitamin D 2000 iu per 1 ml, Vitamin A 5000 iu per 1 ml | **Healthy Start Children's Vitamin drops** | 10 ml no price available

VITAMINS AND TRACE ELEMENTS > VITAMIN A

Vitamin A

(Retinol)

● INDICATIONS AND DOSE

Vitamin A deficiency

► BY MOUTH

- Neonate: 5000 units daily, higher doses may be used initially for treatment of severe deficiency.
- Child 1–11 months: 5000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
- Child 1–17 years: 10 000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency

Prevention of deficiency in complete biliary obstruction

► BY INTRAMUSCULAR INJECTION

- Neonate: 50 000 units once a month.
- Child 1–11 months: 50 000 units once a month

● UNLICENSED USE Preparations containing only vitamin A are not licensed.

● INTERACTIONS → Appendix 1: vitamin A

● SIDE-EFFECTS

Overdose

Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

● PREGNANCY Excessive doses may be teratogenic. In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver pâté or liver sausage.

● BREAST FEEDING Theoretical risk of toxicity in infants of mothers taking large doses.

● MONITORING REQUIREMENTS Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: drops, solution for injection

Solution for injection

► Vitamin A (Non-proprietary)

Retinol (as Vitamin A palmitate) 50000 unit per 1 ml Vitamin A 100,000units/2ml solution for injection ampoules | 6 ampoule (POM) no price available

Pyridoxine hydrochloride (Vitamin B₆)

● INDICATIONS AND DOSE

Isoniazid-induced neuropathy (prophylaxis)

► BY MOUTH

► Neonate: 5 mg daily.

► Child 1 month–11 years: 5–10 mg daily

► Child 12–17 years: 10 mg daily

Isoniazid-induced neuropathy (treatment)

► BY MOUTH

► Neonate: 5–10 mg daily.

► Child 1 month–11 years: 10–20 mg 2–3 times a day

► Child 12–17 years: 30–50 mg 2–3 times a day

Prevention of penicillamine-induced neuropathy in Wilson's disease

► BY MOUTH

► Child 1–11 years: 5–10 mg daily

► Child 12–17 years: 10 mg daily

Metabolic diseases | Cystathioninuria | Homocystinuria

► BY MOUTH

► Neonate: 50–100 mg 1–2 times a day.

► Child: 50–250 mg 1–2 times a day

Pyridoxine-dependent seizures

► INITIALLY BY INTRAVENOUS INJECTION

► Neonate: Test dose 50–100 mg, repeated if necessary, if responsive, followed by an oral maintenance dose; (by mouth) maintenance 50–100 mg once daily, dose to be adjusted as necessary.

► Child 1 month–11 years: Test dose 50–100 mg daily, if responsive, followed by an oral maintenance dose, (by mouth) maintenance 20–50 mg 1–2 times a day, dose to be adjusted as necessary, (by mouth) increased if necessary up to 30 mg/kg daily, alternatively (by mouth) increased if necessary up to 1 g daily

- **UNLICENSED USE** Not licensed for prophylaxis of penicillamine-induced neuropathy in Wilson's disease. Not licensed for use in children.

● CAUTIONS

- With intravenous use Risk of cardiovascular collapse (with intravenous injection—resuscitation facilities must be available and monitor closely)

- **INTERACTIONS** → Appendix 1: pyridoxine

- **SIDE-EFFECTS** Sensory neuropathy (with high doses when given for extended periods)

Overdose

Overdosage induces toxic effects.

Thiamine

(Vitamin B₁)

● INDICATIONS AND DOSE

Maple syrup urine disease

▶ BY MOUTH

- ▶ Neonate: 5 mg/kg daily, dose to be adjusted as necessary.

- ▶ Child: 5 mg/kg daily, dose to be adjusted as necessary

Metabolic disorders | Congenital lactic acidosis

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate: 50–200 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes.

- ▶ Child: 100–300 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes, increased if necessary up to 2 g daily

● UNLICENSED USE Not licensed in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (SEPTEMBER 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

● CAUTIONS Anaphylaxis may occasionally follow injection

● SIDE-EFFECTS

- ▶ With intravenous use Hypersensitivity reactions

- **BREAST FEEDING** Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intravenous use Some preparations may contain phenol as a preservative.

VITAMINS AND TRACE ELEMENTS > VITAMIN C**Ascorbic acid**

(Vitamin C)

● **INDICATIONS AND DOSE****Treatment of scurvy**

► BY MOUTH

- Child 1 month–3 years: 125–250 mg daily in 1–2 divided doses
- Child 4–11 years: 250–500 mg daily in 1–2 divided doses
- Child 12–17 years: 0.5–1 g daily in 1–2 divided doses

Adjunct to desferrioxamine (to enhance the excretion of iron 1 month after treatment)

► BY MOUTH

- Child: 100–200 mg daily, to be taken 1 hour before food

Metabolic disorders | Tyrosinaemia type III | Transient tyrosinaemia of the newborn | Glutathione synthase deficiency | Hawkinsinuria

► BY MOUTH

- Neonate: 50–200 mg daily, dose to be adjusted as necessary.
- Child: 200–400 mg daily in 1–2 divided doses, dose to be adjusted as necessary, increased if necessary up to 1 g daily

- **UNLICENSED USE** Not licensed for metabolic disorders.

- **CONTRA-INDICATIONS** Hyperoxaluria

● **CAUTIONS****CAUTIONS, FURTHER INFORMATION**

- Iron overload Ascorbic acid should not be given to patients with cardiac dysfunction.

In patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

- **INTERACTIONS** → Appendix 1: ascorbic acid

- **SIDE-EFFECTS** Diarrhoea · fatigue · headache · hyperoxaluria · nausea

- **PRESCRIBING AND DISPENSING INFORMATION** It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

Ascorbic acid 500 mg Vitamin C 500mg capsules | 100 capsule no price available

Ascorbic acid 1 gram Vitamin C 1000mg capsules | 100 capsule no price available | 250 capsule no price available

Combinations available: Vitamins A, C and D, p. 599

VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

Vitamin D and analogues (systemic)

- **CONTRA-INDICATIONS** Hypercalcaemia · metastatic calcification
- **SIDE-EFFECTS**
Overdose
 Symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.
- **PREGNANCY** High doses teratogenic in *animals* but therapeutic doses unlikely to be harmful.
- **BREAST FEEDING** Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.
- **MONITORING REQUIREMENTS** **Important:** All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

above

Alfacalcidol

(1 α -Hydroxycholecalciferol)

● INDICATIONS AND DOSE

Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism

- BY MOUTH, OR BY INTRAVENOUS INJECTION
- Child 1 month–11 years: 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day
- Child 12–17 years: 1 microgram once daily, dose to be adjusted as necessary

Persistent neonatal hypocalcaemia

- BY MOUTH, OR BY INTRAVENOUS INJECTION
- Neonate: 50–100 nanograms/kg once daily, dose to be adjusted as necessary, in resistant cases higher doses may be needed; increased if necessary up to 2 micrograms/kg daily.

Prevention of vitamin D deficiency in renal or cholestatic liver disease

- BY MOUTH, OR BY INTRAVENOUS INJECTION
- Neonate: 20 nanograms/kg once daily, dose to be adjusted as necessary.
- Child 1 month–11 years (body-weight up to 20 kg): 15–30 nanograms/kg once daily (max. per dose 500 nanograms)
- Child 1 month–11 years (body-weight 20 kg and above): 250–500 nanograms once daily, dose to be adjusted as necessary
- Child 12–17 years: 250–500 nanograms once daily, dose to be adjusted as necessary

DOSE EQUIVALENCE AND CONVERSION

- One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

- **CAUTIONS** Nephrolithiasis · take care to ensure correct dose in infants
- **INTERACTIONS** → Appendix 1: vitamin D substances

● SIDE-EFFECTS

- **Rare** Nephrocalcinosis · pruritus · rash · urticaria
- **RENAL IMPAIRMENT** Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For injection, shake ampoule for at least 5 seconds before use, and give over 30 seconds.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

EXCIPIENTS: May contain Alcohol, propylene glycol

► One-Alpha (LEO Pharma)

Alfacalcidol 2 microgram per 1 ml One-Alpha 2micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £41.13
One-Alpha 1micrograms/0.5ml solution for injection ampoules | 10 ampoule [PoM] £21.57

Oral drops

EXCIPIENTS: May contain Alcohol

► One-Alpha (LEO Pharma)

Alfacalcidol 2 microgram per 1 ml One-Alpha 2micrograms/ml oral drops sugar-free | 10 ml [PoM] £21.30 DT price = £21.30

Capsule

EXCIPIENTS: May contain Sesame oil

► Alfacalcidol (Non-proprietary)

Alfacalcidol 250 nanogram Alfacalcidol 250nanogram capsules | 30 capsule [PoM] £5.20 DT price = £3.64

Alfacalcidol 500 nanogram Alfacalcidol 500nanogram capsules | 30 capsule [PoM] £10.00 DT price = £7.62

Alfacalcidol 1 microgram Alfacalcidol 1microgram capsules | 30 capsule [PoM] £14.03 DT price = £10.23 | 30 capsule no price available DT price = £10.23

► One-Alpha (LEO Pharma)

Alfacalcidol 250 nanogram One-Alpha 250nanogram capsules | 30 capsule [PoM] £3.37 DT price = £3.64

Alfacalcidol 500 nanogram One-Alpha 0.5microgram capsules | 30 capsule [PoM] £6.27 DT price = £7.62

Alfacalcidol 1 microgram One-Alpha 1microgram capsules | 30 capsule [PoM] £8.75 DT price = £10.23

Calcitriol

(1,25-Dihydroxycholecalciferol)

● INDICATIONS AND DOSE

Vitamin D dependent rickets | Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism | Pseudo-hypoparathyroidism (limited experience)

- BY MOUTH
- Child 1 month–11 years: Initially 15 nanograms/kg once daily (max. per dose 250 nanograms), increased in steps of 5 nanograms/kg daily (max. per dose 250 nanograms) if required, dose to be increased every 2–4 weeks
- Child 12–17 years: Initially 250 nanograms once daily, increased in steps of 5 nanograms/kg daily (max. per dose 250 nanograms) if required, dose to be increased every 2–4 weeks; usual dose 0.5–1 microgram daily

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Take care to ensure correct dose in infants
- **INTERACTIONS** → Appendix 1: vitamin D substances
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available. Monitor plasma-calcium concentration in renal impairment.

● MONITORING REQUIREMENTS

- ▶ Monitor plasma calcium, phosphate, and creatinine during dosage titration.
- ▶ Monitor plasma-calcium concentration in patients receiving high doses.

- **DIRECTIONS FOR ADMINISTRATION** Contents of capsule may be administered by oral syringe.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Colecalciferol with calcium carbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 604, calcium carbonate p. 567.

● INDICATIONS AND DOSE

Prevention and treatment of vitamin D and calcium deficiency

- ▶ **BY MOUTH**
- ▶ **Child:** Dosed according to the deficit or daily maintenance requirements (consult product literature)

- **UNLICENSED USE** *Adcal-D3*® and *Calceos*® are not licensed for use in children under 12 years. *Cacit*® D3, *Calcichew-D3*® Forte, *Calcichew-D3*® and *Kalcipos-D*® not licensed for use in children (age range not specified by manufacturers). *Accrete D3*® and *Natecal D3*® not licensed for use in children under 18 years.
- **INTERACTIONS** → Appendix 1: calcium salts, vitamin D substances
- **PRESCRIBING AND DISPENSING INFORMATION** *Accrete D3*® contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units); *Adcal-D3*® tablets contain calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units); *Cacit*® D3 contains calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet; *Calceos*® contains calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units); *Calcichew-D3*® tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 5 micrograms (200 units); *Calcichew-D3*® Forte tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units); *Calcichew-D3*® 500 mg/400 unit caplets contain calcium carbonate (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units); *Kalcipos-D*® contains calcium carbonate (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 20 micrograms (800 units); *Natecal D3*® contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units); consult product literature for details of other available products.

Flavours of chewable and soluble forms may include orange, lemon, aniseed, peppermint, molasses, or tutti-frutti.

Calcium carbonate 1.5 gram, Colecalciferol 400 unit Natecal D3 600mg/400unit chewable tablets | 60 tablet [P] £3.63
- **TheiCal-D3** (Stirling Anglian Pharmaceuticals Ltd)
Calcium carbonate 2.5 gram, Colecalciferol 880 unit TheiCal-D3 1000mg/880unit chewable tablets | 30 tablet [P] £2.95 DT price = £2.95

Colecalciferol with calcium phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 604, calcium phosphate p. 568.

● INDICATIONS AND DOSE

Calcium and vitamin D deficiency

- BY MOUTH
- Child: (consult product literature)

- **INTERACTIONS** → Appendix 1: calcium salts, vitamin D substances

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

CAUTIONARY AND ADVISORY LABELS 13, 21

- **Calfoviti D3** (A. Menarini Farmaceutica Internazionale SRL)
Calcium phosphate 3.1 gram, Colecalciferol 800 unit Calfoviti D3 oral powder sachets | 30 sachet [P] £4.32 DT price = £4.32

Ergocalciferol

(Calciferol; Vitamin D₂)

● INDICATIONS AND DOSE

Nutritional vitamin-D deficiency rickets

► BY MOUTH

- Child 1-5 months: 3000 units daily, dose to be adjusted as necessary
- Child 6 months-11 years: 6000 units daily, dose to be adjusted as necessary
- Child 12-17 years: 10 000 units daily, dose to be adjusted as necessary

Nutritional or physiological supplement | Prevention of rickets

► BY MOUTH

- Neonate: 400 units daily.

- Child: 400–600 units daily

Vitamin D deficiency in intestinal malabsorption or in chronic liver disease

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION

- Child 1-11 years: 10 000–25 000 units daily, dose to be adjusted as necessary
- Child 12-17 years: 10 000–40 000 units daily, dose to be adjusted as necessary

- **CAUTIONS** Take care to ensure correct dose in infants

- **INTERACTIONS** → Appendix 1: vitamin D substances

- **RENAL IMPAIRMENT** Monitor plasma-calcium concentration in renal impairment.

- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied.

When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection

Tablet

► Ergocalciferol (Non-proprietary)

Ergocalciferol 12.5 microgram Ergocalciferol 12.5microgram tablets | 30 tablet no price available | 60 tablet £3.74

► Ergoral (Cubic Pharmaceuticals Ltd)

Ergocalciferol 125 microgram Ergoral D2 5,000unit tablets | 30 tablet £19.95

Ergocalciferol 250 microgram Ergoral D2 10,000unit tablets | 30 tablet £23.95

Solution for injection

► Ergocalciferol (Non-proprietary)

Ergocalciferol 300000 unit per 1 ml Ergocalciferol 300,000units/1ml solution for injection ampoules | 10 ampoule [PoM] £93.50 DT price = £93.50

Ergocalciferol 400000 unit per 1 ml Sterogyl 15H 600,000units/1.5ml solution for injection ampoules | 1 ampoule [PoM] no price available

Oral solution

► Ergocalciferol (Non-proprietary)

Ergocalciferol 1500 unit per 1 ml Uvestrol D 1,500units/ml oral solution sugar-free | 20 ml [PoM] no price available

Ergocalciferol 20000 unit per 1 ml Sterogyl 100,000units/5ml oral solution | 20 ml [PoM] no price available DT price = £72.68

► Eciferol (Rhodes Pharma Ltd)

Ergocalciferol 3000 unit per 1 ml Eciferol D2 3,000units/ml liquid | 60 ml £55.00 DT price = £102.44

Capsule

► Ergocalciferol (Non-proprietary)

Ergocalciferol 1.25 mg Ergocalciferol 1.25mg capsules | 30 capsule [PoM] no price available | 50 capsule [PoM] £230.00

► Eciferol (Rhodes Pharma Ltd)

Ergocalciferol 1.25 mg Eciferol D2 50,000unit capsules | 10 capsule £29.99

► Ergoral (Cubic Pharmaceuticals Ltd)

Ergocalciferol 1.25 mg Ergoral D2 50,000unit capsules | 10 capsule £19.95

Ergocalciferol with calcium lactate and calcium phosphate

(Calcium and vitamin D)

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol above, calcium lactate p. 568.

● INDICATIONS AND DOSE

Prevention of calcium and vitamin D deficiency |

Treatment of calcium and vitamin D deficiency

► BY MOUTH

- Child: (consult product literature)

- **UNLICENSED USE** Calcium and Ergocalciferol tablets not licensed for use in children under 6 years.

- **INTERACTIONS** → Appendix 1: calcium salts, vitamin D substances

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed before administration, or may be chewed.

- **PRESCRIBING AND DISPENSING INFORMATION** Each tablet contains calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca²⁺ 2.4 mmol), ergocalciferol 10 micrograms (400 units).

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer calcium and ergocalciferol tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Ergocalciferol with calcium lactate and calcium phosphate (Non-proprietary)

Ergocalciferol 10 microgram, Calcium phosphate 150 mg, Calcium lactate 300 mg Calcium and Ergocalciferol tablets | 28 tablet [P] £18.50 DT price = £18.26 | 500 tablet [P] no price available

VITAMINS AND TRACE ELEMENTS > VITAMIN E

Alpha tocopherol

(Tocopherol)

● INDICATIONS AND DOSE

Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis

► BY MOUTH USING ORAL SOLUTION

- Neonate: 17 mg/kg daily, dose to be adjusted as necessary.

- Child: 17 mg/kg daily, dose to be adjusted as necessary

- **CONTRA-INDICATIONS** Preterm neonates

- **CAUTIONS** Predisposition to thrombosis

- **INTERACTIONS** → Appendix 1: vitamin E substances

- **SIDE-EFFECTS**

- Common or very common Diarrhoea

- **Uncommon** Alopecia · asthenia · disturbances in serum-potassium concentration · disturbances in serum-sodium concentration · headache · pruritus · rash
- **PREGNANCY** Manufacturer advises caution, no evidence of harm in *animal* studies.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available. Manufacturer advises monitor closely in hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. Risk of renal toxicity due to polyethylene glycol content. Manufacturer advises monitor closely in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION**
Tocofersolan is a water-soluble form of D-alpha tocopherol.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Oral solution
► **Vedrop** (Orphan Europe (UK) Ltd) ▼
D-alpha tocopherol (as Tocofersolan) 50 mg per 1 ml Vedrop 50mg/ml oral solution sugar-free | 20 ml [PoM] £54.55 sugar-free | 60 ml [PoM] £163.65
- **CAUTIONS** Increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg or in a preterm neonate · predisposition to thrombosis
- **INTERACTIONS** → Appendix 1: vitamin E substances
- **SIDE-EFFECTS** Abdominal pain (particularly with high doses) · diarrhoea (particularly with high doses)
- **PREGNANCY** No evidence of safety of high doses.
- **BREAST FEEDING** Excreted in milk; minimal risk, although caution with large doses.
- **MONITORING REQUIREMENTS** Increased bleeding tendency in vitamin-K deficient patients or those taking anticoagulants (prothrombin time and INR should be monitored).
- **DIRECTIONS FOR ADMINISTRATION**
► In neonates Consider dilution of oral suspension for use in neonates due to high osmolality.
- **MEDICINAL FORMS**

Alpha tocopheryl acetate (Tocopherol)

● **INDICATIONS AND DOSE****Vitamin E deficiency**► **BY MOUTH**

- Neonate: 10 mg/kg once daily.

- Child: 2–10 mg/kg daily, increased if necessary up to 20 mg/kg daily

Malabsorption in cystic fibrosis► **BY MOUTH**

- Child 1–11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Child 1–11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Child 12–17 years: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

Vitamin E deficiency in cholestasis and severe liver disease► **BY MOUTH**

- Neonate: 10 mg/kg daily.

- Child 1 month–11 years: Initially 100 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily
- Child 12–17 years: Initially 200 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily

► **BY INTRAMUSCULAR INJECTION**

- Neonate: 10 mg/kg once a month.

- Child: 10 mg/kg once a month (max. per dose 100 mg)

Malabsorption in abetalipoproteinaemia► **BY MOUTH**

- Neonate: 100 mg/kg once daily.

- Child: 50–100 mg/kg once daily

VITAMINS AND TRACE ELEMENTS > VITAMIN K

Menadiol sodium phosphate

● INDICATIONS AND DOSE

Supplementation in vitamin K malabsorption

- ▶ BY MOUTH
- ▶ Child 1–11 years: 5–10 mg daily, dose to be adjusted as necessary
- ▶ Child 12–17 years: 10–20 mg daily, dose to be adjusted as necessary

● CONTRA-INDICATIONS Infants • neonates

● CAUTIONS G6PD deficiency (risk of haemolysis) • vitamin E deficiency (risk of haemolysis)

● PREGNANCY Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- ▶ **Menadiol sodium phosphate (Non-proprietary)**
Menadiol phosphate (as Menadiol sodium phosphate)
10 mg Menadiol 10mg tablets | 100 tablet Ⓟ £185.90 DT price = £185.90

Phytomenadione

(Vitamin K₁)

● INDICATIONS AND DOSE

Neonatal prophylaxis of vitamin-K deficiency bleeding

▶ BY INTRAMUSCULAR INJECTION

- ▶ Preterm neonate: 400 micrograms/kg (max. per dose 1 mg) for 1 dose, to be given at birth, the intravenous route may be used in preterm neonates with very low birth-weight if intramuscular injection is not possible, however, it may not provide the prolonged protection of the intramuscular injection, any neonate receiving intravenous vitamin K should be given subsequent oral doses.

- ▶ Neonate: 1 mg for 1 dose, to be given at birth.

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at particular risk of bleeding disorders

▶ BY MOUTH USING CAPSULES

- ▶ Neonate: 1 mg for 1 dose at birth (to protect from the risk of vitamin K deficiency bleeding in the first week).

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at particular risk of bleeding disorders (exclusively breast-fed babies)

▶ BY MOUTH USING CAPSULES

- ▶ Neonate: Initially 1 mg for 1 dose at birth, then 1 mg every week for 12 weeks.

Neonatal hypoprothrombinaemia | Vitamin-K deficiency bleeding

▶ BY INTRAVENOUS INJECTION

- ▶ Neonate: 1 mg every 8 hours if required.

Neonatal biliary atresia and liver disease

▶ BY MOUTH

- ▶ Neonate: 1 mg daily.

Reversal of coumarin anticoagulation when continued anticoagulation required or if no significant bleeding—seek specialist advice

▶ BY INTRAVENOUS INJECTION

- ▶ Child: 15–30 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may be repeated as necessary

Reversal of coumarin anticoagulation when anticoagulation not required or if significant bleeding—seek specialist advice | Treatment of haemorrhage associated with vitamin-K deficiency—seek specialist advice

▶ BY INTRAVENOUS INJECTION

- ▶ Child: 250–300 micrograms/kg (max. per dose 10 mg) for 1 dose

KONAKION® MM PAEDIATRIC

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at risk of bleeding disorders

▶ BY MOUTH

- ▶ Neonate: Initially 2 mg for 1 dose at birth, then 2 mg after 4–7 days.

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at risk of bleeding disorders (exclusively breast fed babies)

▶ BY MOUTH

- ▶ Neonate: Initially 2 mg for 1 dose at birth, then 2 mg after 4–7 days for a further 1 dose, then 2 mg for a further 1 dose 1 month after birth.

● CAUTIONS Intravenous injections should be given very slowly—risk of vascular collapse

KONAKION® MM PAEDIATRIC

Parenteral administration in premature infant or neonate of less than 2.5 kg (increased risk of kernicterus)

● SIDE-EFFECTS

KONAKION® MM Anaphylactoid reactions

● PREGNANCY Use if potential benefit outweighs risk.

● BREAST FEEDING Present in milk.

● HEPATIC IMPAIRMENT

KONAKION® MM Caution—glycocholic acid may displace bilirubin.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use in neonates The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given.

KONAKION® MM PAEDIATRIC Konakion® MM Paediatric may be administered by mouth or by intramuscular injection or by intravenous injection.

For intravenous injection, may be diluted with Glucose 5% if necessary.

KONAKION® MM Konakion® MM may be administered by slow intravenous injection or by intravenous infusion in glucose 5%; **not** for intramuscular injection.

7.1 Neural tube defects (prevention in pregnancy)

Neural tube defects (prevention in pregnancy)

Prevention in pregnancy

Folic acid supplements p. 546 taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement daily (at low-risk group dose) before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.
- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has *coeliac disease* (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking **antiepileptic medicines**.
- Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid daily (at high-risk group dose) and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid (or to increase the dose to high-risk group daily dose) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

1 Arthritis

Juvenile idiopathic arthritis

Management

Rheumatic diseases require symptomatic treatment to relieve pain, swelling, and stiffness, together with treatment to control and suppress disease activity. Treatment of juvenile idiopathic arthritis may involve Non-steroidal anti-inflammatory drugs (NSAIDs) p. 621, a disease modifying anti-rheumatic drug (DMARD) such as methotrexate p. 517 or a cytokine modulator, and intra-articular, intravenous, or oral corticosteroids.

Rheumatic disease, suppressing drugs

Overview

Certain drugs, such as methotrexate p. 517, cytokine modulators, and sulfasalazine p. 30, are used to suppress the disease process in *juvenile idiopathic arthritis* (juvenile chronic arthritis); these drugs are known as disease-modifying antirheumatic drugs (DMARDs). In children, disease modifying antirheumatic drugs should be used under specialist supervision.

Some children with juvenile idiopathic arthritis do not require disease-modifying antirheumatic drugs.

Methotrexate is effective in juvenile idiopathic arthritis; sulfasalazine is an alternative but should be avoided in *systemic-onset juvenile idiopathic arthritis*. Gold and penicillamine p. 589 are no longer used. Cytokine modulators have a role in *polyarticular juvenile idiopathic arthritis*.

Unlike NSAIDs, disease-modifying antirheumatic drugs can affect the progression of disease but they may require 3–6 months of treatment for a full therapeutic response. Response to a disease-modifying antirheumatic drug may allow the dose of the NSAID to be reduced.

Disease-modifying antirheumatic drugs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations. They reduce the erythrocyte sedimentation rate and C-reactive protein.

Antimalarials

The antimalarial hydroxychloroquine sulfate p. 612 is rarely used to treat juvenile idiopathic arthritis. Hydroxychloroquine sulfate can also be useful for systemic

or discoid lupus erythematosus, particularly involving the skin and joints, and in sarcoidosis.

Retinopathy rarely occurs provided that the recommended doses are not exceeded.

Mepacrine hydrochloride is used on rare occasions to treat discoid lupus erythematosus [unlicensed].

Drugs affecting the immune response

Methotrexate, given as a once weekly dose, is the disease-modifying antirheumatic drug of choice in the treatment of juvenile idiopathic arthritis and also has a role in juvenile dermatomyositis, vasculitis, uveitis, systemic lupus erythematosus, localised scleroderma, and sarcoidosis; for these indications it is given by the subcutaneous, oral, or rarely, the intramuscular route. Absorption from intramuscular or subcutaneous routes may be more predictable than from the oral route; if the oral route is ineffective subcutaneous administration is generally preferred. Folic acid may reduce mucosal or gastro-intestinal side-effects of methotrexate. The dosage regimen for folic acid p. 546 has not been established—in children over 2 years a weekly dose [unlicensed indication], may be given on a different day from the methotrexate.

Azathioprine p. 495 may be used in children for vasculitis which has failed to respond to other treatments, for the management of severe cases of *systemic lupus erythematosus* and other connective tissue disorders, in conjunction with corticosteroids for patients with severe or progressive renal disease, and in cases of *polymyositis* which are resistant to corticosteroids. Azathioprine has a corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive.

Ciclosporin is rarely used in juvenile idiopathic arthritis, connective tissue diseases, vasculitis, and uveitis; it may be considered if the condition has failed to respond to other treatments.

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab p. 614, etanercept p. 616, and infliximab p. 31 inhibit the activity of tumour necrosis factor alpha (TNF- α). Adalimumab can be used for the management of active polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis. Etanercept is licensed for the treatment of the following subtypes of juvenile idiopathic arthritis: polyarticular juvenile idiopathic arthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, oligoarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, psoriatic arthritis in children over 12 years who have had an inadequate response to methotrexate or cannot tolerate it, and enthesitis-related arthritis in children over 12 years

who have had an inadequate response to conventional therapy or cannot tolerate it. Infliximab has been used in refractory polyarticular juvenile idiopathic arthritis [unlicensed indication] when other treatments, such as etanercept, have failed.

Abatacept p. 614 prevents the full activation of T-lymphocytes; it can be used for the management of active polyarticular juvenile idiopathic arthritis. Abatacept is not recommended for use in combination with TNF inhibitors.

Canakinumab p. 502 inhibits the activity of interleukin-1 beta (IL-1 β) and is licensed for the treatment of active systemic juvenile idiopathic arthritis in children over 2 years, when there has been an inadequate response to NSAIDs and systemic corticosteroids.

Tocilizumab p. 613 antagonises the actions of interleukin-6; it can be used for the management of active systemic juvenile idiopathic arthritis when there has been an inadequate response to NSAIDs and systemic corticosteroids and polyarticular juvenile idiopathic arthritis when there has been an inadequate response to methotrexate. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated. Tocilizumab is not recommended for use with other cytokine modulators.

Sulfasalazine

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity associated with some forms of juvenile idiopathic arthritis; it is generally not used in systemic-onset disease.

Other drugs used for Arthritis

Diclofenac sodium, p. 623 • Etoricoxib, p. 624 • Flurbiprofen, p. 625 • Ibuprofen, p. 625 • Indometacin, p. 628 • Ketoprofen, p. 629 • Meloxicam, p. 630 • Naproxen, p. 631 • Piroxicam, p. 632

DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS

Hydroxychloroquine sulfate

• INDICATIONS AND DOSE

Active rheumatoid arthritis (including juvenile idiopathic arthritis) (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice) | Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

► BY MOUTH

► Child: 5–6.5 mg/kg once daily (max. per dose 400 mg), dose given based on ideal body-weight

- **UNLICENSED USE** *Plaquenil*® not licensed for use in children for dermatological conditions caused or aggravated by sunlight.
- **CAUTIONS** Acute porphyrias p. 577 • diabetes (may lower blood glucose) • G6PD deficiency • may aggravate myasthenia gravis • may exacerbate psoriasis • neurological disorders (especially in those with a history of epilepsy) • severe gastro-intestinal disorders

CAUTIONS, FURTHER INFORMATION

- **Screening for ocular toxicity** Hydroxychloroquine is rarely associated with ocular toxicity. The British Society for Paediatric and Adolescent Rheumatology recommends that children should have their vision tested before long-term treatment with hydroxychloroquine and have an annual review of visual acuity. Children should be referred to an ophthalmologist if there is visual impairment, changes in visual acuity, or blurred vision. The Royal College of Ophthalmologists has recommended that a locally agreed protocol between the prescribing doctor and ophthalmologist be established to monitor the vision of

these children. A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening* 2009); this includes the recommendation that a child treated for juvenile idiopathic arthritis should receive slit-lamp examination routinely to check for uveitis.

- **INTERACTIONS** → Appendix 1: hydroxychloroquine

• SIDE-EFFECTS

- **Common or very common** Gastro-intestinal disturbances • headache • pruritus • rashes • skin reactions
- **Uncommon** Convulsions • discoloration of skin, nails, and mucous membranes • ECG changes • hair depigmentation • hair loss • keratopathy • ototoxicity • retinal damage • visual changes
- **Rare** Acute generalised exanthematous pustulosis • agranulocytosis • aplastic anaemia • blood disorders • cardiomyopathy • emotional disturbances • exfoliative dermatitis • hepatic damage • mental changes • myopathy • neuromyopathy • photosensitivity • psychosis • Stevens-Johnson syndrome • thrombocytopenia
- **Frequency not known** Angioedema • bronchospasm

Overdose

Hydroxychloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.
- **BREAST FEEDING** Avoid—risk of toxicity in infant.
- **HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. Monitor plasma-hydroxychloroquine concentration in severe renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.
- **PATIENT AND CARER ADVICE** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

► Hydroxychloroquine sulfate (Non-proprietary)

Hydroxychloroquine sulfate 200 mg Hydroxychloroquine 200mg tablets | 60 tablet [PoM] £5.15 DT price = £3.64

IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

Tocilizumab

31-May-2016

● INDICATIONS AND DOSE

Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have had an inadequate response to NSAIDs and systemic corticosteroids

► BY INTRAVENOUS INFUSION

- Child 2–17 years (body-weight up to 30 kg): 12 mg/kg every 2 weeks, review treatment if no improvement within 6 weeks
- Child 2–17 years (body-weight 30 kg and above): 8 mg/kg every 2 weeks, review treatment if no improvement within 6 weeks

Polyarticular juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have had an inadequate response to methotrexate

► BY INTRAVENOUS INFUSION

- Child 2–17 years (body-weight up to 30 kg): 10 mg/kg every 4 weeks, review treatment if no improvement within 12 weeks
- Child 2–17 years (body-weight 30 kg and above): 8 mg/kg every 4 weeks, review treatment if no improvement within 12 weeks

- **CONTRA-INDICATIONS** Do not initiate if absolute neutrophil count less than $2 \times 10^9/\text{litre}$ · severe active infection

- **CAUTIONS** History of diverticulitis · history of intestinal ulceration · history of recurrent or chronic infection (interrupt treatment if serious infection occurs) · low absolute neutrophil count · low platelet count · predisposition to infection (interrupt treatment if serious infection occurs)

CAUTIONS, FURTHER INFORMATION

- Tuberculosis Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- Common or very common Headache · hypercholesterolaemia · infection · neutropenia · raised hepatic transaminases · upper respiratory-tract infection
- Frequency not known Antibody formation · diarrhoea · infusion related reactions · nausea · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

- Neutrophil and platelet counts Discontinue if absolute neutrophil count less than $0.5 \times 10^9/\text{litre}$ or platelet count less than $50 \times 10^3/\text{microlitre}$.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—consult product literature.

- **RENAL IMPAIRMENT** Manufacturer advises monitor renal function closely in moderate or severe impairment.

● PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● MONITORING REQUIREMENTS

- Monitor lipid profile 4–8 weeks after starting treatment and then as indicated.
- Monitor for demyelinating disorders.
- Monitor hepatic transaminases.
- Monitor neutrophil and platelet counts.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*; body-weight less than 30 kg, dilute requisite dose to a volume of 50 mL with Sodium chloride 0.9% and give over 1 hour; body-weight over 30 kg, dilute requisite dose to a volume of 100 mL with Sodium chloride 0.9% and give over 1 hour.

- **PATIENT AND CARER ADVICE** An alert card should be provided.

Patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Tocilizumab for the treatment of systemic juvenile idiopathic arthritis (December 2011) NICE TA238

Tocilizumab is recommended for the treatment of systemic juvenile idiopathic arthritis in children aged over 2 years who have not responded adequately to NSAIDs, systemic corticosteroids and methotrexate, if the manufacturer makes tocilizumab available with the discount agreed as part of the patient access scheme.

Tocilizumab is not recommended for the treatment of systemic juvenile idiopathic arthritis in children whose disease continues to respond to methotrexate or who have not been treated with methotrexate.

Children currently receiving tocilizumab for systemic juvenile idiopathic arthritis who do not meet these criteria should have the option to continue treatment until it is considered appropriate to stop.

www.nice.org.uk/TA238

- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Tocilizumab is recommended as an option for treatment of polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in children 2 years and older whose disease has responded inadequately to previous therapy with methotrexate and if the manufacturer provides tocilizumab with the discounts agreed in the patient access schemes.

www.nice.org.uk/TA373

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- **RoActemra** (Roche Products Ltd)

Tocilizumab 20 mg per 1 mL RoActemra 400mg/20mL concentrate for solution for infusion vials | 1 vial [PoM] £512.00 (Hospital only)
RoActemra 200mg/10mL concentrate for solution for infusion vials | 1 vial [PoM] £256.00 (Hospital only)
RoActemra 80mg/4mL concentrate for solution for infusion vials | 1 vial [PoM] £102.40 (Hospital only)

IMMUNOSUPPRESSANTS > T-CELL ACTIVATION INHIBITORS

Abatacept

31-May-2016

● INDICATIONS AND DOSE

Moderate to severe active polyarticular juvenile idiopathic arthritis (in combination with methotrexate) in children who have not responded adequately to other disease-modifying antirheumatic drugs (including at least one tumour necrosis factor (TNF) inhibitor)

► BY INTRAVENOUS INFUSION

- Child 6–17 years (body-weight up to 75 kg): 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months
- Child 6–17 years (body-weight 75–100 kg): 750 mg every 2 weeks for 3 doses, then 750 mg every 4 weeks, review treatment if no response within 6 months
- Child 6–17 years (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses, then 1 g every 4 weeks, review treatment if no response within 6 months

● CONTRA-INDICATIONS Severe infection

- **CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy. do not initiate until active infections are controlled. predisposition to infection (screen for latent tuberculosis and viral hepatitis) · progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)

● INTERACTIONS → Appendix 1: abatacept

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · conjunctivitis · cough · diarrhoea · dizziness · dyspepsia · fatigue · flushing · headache · hypertension · infection · leucopenia · nausea · pain in extremities · paraesthesia · stomatitis · vomiting
- **Uncommon** Psoriasis · alopecia · anxiety · arthralgia · basal and squamous cell carcinoma · bradycardia · bronchospasm · bruising · depression · dry eye · dry skin · dyspnoea · gastritis · hyperhidrosis · hypotension · menstrual disturbances · palpitation · skin papilloma · sleep disorder · tachycardia · thrombocytopenia · visual disturbance · weight gain

► Frequency not known Lung cancer · lymphoma

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 14 weeks after last dose.

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Abatacept is recommended as options for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 6 years and older whose disease has responded inadequately to other disease-modifying anti-rheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor,

only if the manufacturer provides abatacept with the discounts agreed in the patient access schemes.

IMMUNOSUPPRESSANTS > TUMOR NECROSIS FACTOR ALPHA (TNF- α) INHIBITORS

Adalimumab

27-Apr-2017

● INDICATIONS AND DOSE

Severe chronic plaque psoriasis in children who have had an inadequate response to, or are inappropriate for topical therapy and phototherapies

► BY SUBCUTANEOUS INJECTION

- Child 4–17 years: Initially 0.8 mg/kg every week (max. per dose 40 mg) for 2 doses, then 0.8 mg/kg every 2 weeks (max. per dose 40 mg), review treatment if no response within 16 weeks; for further information on dose banding, consult product literature

Active polyarticular juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have not responded adequately to one or more disease-modifying antirheumatic drug

► BY SUBCUTANEOUS INJECTION

- Child 2–3 years: 24 mg/m² every 2 weeks (max. per dose 20 mg), review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
- Child 4–12 years: 24 mg/m² every 2 weeks (max. per dose 40 mg), review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
- Child 13–17 years: 40 mg every 2 weeks, review treatment if no response within 12 weeks; for further information on dose banding, consult product literature

Active enthesitis-related arthritis in children who have had an inadequate response to, or who are intolerant of, conventional therapy

► BY SUBCUTANEOUS INJECTION

- Child 6–17 years: 24 mg/m² every 2 weeks (max. per dose 40 mg), for further information on dose banding, consult product literature

Severe active Crohn's disease

► BY SUBCUTANEOUS INJECTION

- Child 6–17 years (body-weight up to 40 kg): Initially 40 mg, then 20 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once weekly, review treatment if no response within 12 weeks of initial dose
- Child 6–17 years (body-weight 40 kg and above): Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Severe active Crohn's disease (accelerated regimen)

► BY SUBCUTANEOUS INJECTION

- Child 6–17 years (body-weight up to 40 kg): Initially 80 mg, then 40 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once

weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

- ▶ Child 6–17 years (body-weight 40 kg and above): Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Active moderate to severe hidradenitis suppurativa (acne inversa) in patients with an inadequate response to conventional systemic therapy

▶ BY SUBCUTANEOUS INJECTION

- ▶ Child 12–17 years (body-weight 30 kg and above): Initially 80 mg, given as two 40 mg injections in one day, followed by 40 mg after 1 week, then maintenance 40 mg every 2 weeks; increased if necessary to 40 mg once weekly, review treatment if no response within 12 weeks; if treatment interrupted—consult product literature

- **CONTRA-INDICATIONS** Moderate or severe heart failure · severe infection
- **CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy · demyelinating disorders (risk of exacerbation) · development of malignancy · do not initiate until active infections are controlled (discontinue if new serious infection develops) · hepatitis B virus—monitor for active infection · history of malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection

CAUTIONS, FURTHER INFORMATION

- ▶ Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · benign tumours · chest pain · cough · dehydration · dermatitis · dizziness · dyspepsia · dyspnoea · electrolyte disturbances · eye disorders · flushing · gastrointestinal haemorrhage · haematuria · hyperlipidaemia · hypertension · hyperuricaemia · impaired healing · mood changes · musculoskeletal pain · oedema · onycholysis · paraesthesia · rash · renal impairment · skin cancer · sleep disturbances · tachycardia · vomiting
- ▶ **Uncommon** Aortic aneurysm · arrhythmias · cholecystitis · cholelithiasis · dysphagia · erectile dysfunction · hearing loss · hepatic steatosis · interstitial lung disease · leukaemia · lymphoma · malignancy · neuropathy · nocturia · pancreatitis · pneumonitis · rhabdomyolysis · solid tumours · tinnitus · tremor · vascular occlusion
- ▶ **Rare** Autoimmune hepatitis · demyelinating disorders · myocardial infarction
- ▶ **Frequency not known** Abdominal pain · anaemia · antibody formation · aplastic anaemia · blood disorders · cutaneous vasculitis · depression · fever · headache · hypersensitivity reactions · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · nausea · new onset psoriasis · pancytopenia · pleural effusion · pruritus ·

pulmonary embolism · sarcoidosis · Stevens-Johnson syndrome · thrombocytopenia · worsening heart failure · worsening of symptoms of dermatomyositis · worsening psoriasis

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid; manufacturer advises avoid for at least 5 months after last dose.
- **PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor for infection before, during, and for 4 months after treatment.
 - ▶ Manufacturer advises monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.
 - ▶ For uveitis, manufacturer advises patients should be assessed for pre-existing or developing central demyelinating disorders before and at regular intervals during treatment.
- **PATIENT AND CARER ADVICE** An alert card should be provided.

When used to treat *hidradenitis suppurativa*, patients and their carers should be advised to use a daily topical antiseptic wash on lesions during treatment with adalimumab.

Tuberculosis patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, or, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Adalimumab is recommended as an option for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 2 years and older whose disease has responded inadequately to 1 or more disease-modifying antirheumatic drugs (DMARDs) and for treating enthesitis-related JIA in patients 6 years and older whose disease has responded inadequately to, or who are intolerant of, conventional therapy.

www.nice.org.uk/TA373

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2015) that adalimumab (*Humira*®) is accepted for restricted use within NHS Scotland for the treatment of active enthesitis-related arthritis in children over 6 years of age who have had an inadequate response to, or who are intolerant of, conventional therapy, and is used within specialist rheumatology services (including those working within the network for paediatric rheumatology).

The *Scottish Medicines Consortium* has advised (June 2015) that adalimumab (*Humira*®) is accepted for restricted use within NHS Scotland for the treatment of severe chronic plaque psoriasis in children over 4 years who have had an inadequate response to, or are

inappropriate for, topical therapy and phototherapies, and have severe disease as defined by a total Psoriasis Area Severity Index (PASI) score of ≥ 10 and a Dermatology Life Quality Index (DLQI) of >10 .

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (January 2017) that adalimumab (Humira®) is recommended as an option for use within NHS Wales for the treatment of moderately to severely active Crohn's disease in children 6 years and over, who have had an inadequate response to conventional therapy including primary nutrition therapy and a corticosteroid and/or an immunomodulator, or who are intolerant to or have contra-indications for such therapies.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Uncommon** Interstitial lung disease · new onset or worsening psoriasis · rash · skin cancer · uveitis
- **Rare** Demyelinating disorders · lymphoma · seizures · Stevens–Johnson syndrome · vasculitis
- **Very rare** Toxic epidermal necrolysis
- **Frequency not known** Abdominal pain · anaemia · antibody formation · aplastic anaemia · appendicitis · blood disorders · cutaneous ulcer · depression · diabetes mellitus · fever · gastritis · headache · hypersensitivity reactions · inflammatory bowel disease · injection-site reactions · leucopenia · leukaemia · lupus erythematosus-like syndrome · macrophage activation syndrome · malignancy · nausea · oesophagitis · pancytopenia · pruritus · solid tumours · thrombocytopenia · vomiting · worsening heart failure

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicæmia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for 3 weeks after last dose.

- **PREGNANCY** Avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe alcoholic hepatitis.

● PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

- **MONITORING REQUIREMENTS** Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).

- **PRESCRIBING AND DISPENSING INFORMATION** Etanercept is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

BENEPALI® SOLUTION FOR INJECTION Manufacturer advises patients requiring less than the full 50 mg dose should **not** receive *Benepali*®—if an alternate dose is required, other etanercept formulations providing this option should be used.

- **PATIENT AND CARER ADVICE** An alert card should be provided. Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop. Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of

tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- **Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015)** NICE TA373

Etanercept is recommended as an option for treating:

- polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA, in patients 2 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate;
- enthesitis-related JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, conventional therapy;
- psoriatic JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate.

www.nice.org.uk/TA373

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* issued similar advice to NICE TA103 on the use of etanercept for severe plaque psoriasis in adults (August 2009) and children over 6 years old (April 2012).

The *Scottish Medicines Consortium* has advised (January 2013) that etanercept (*Enbrel*®) is accepted for restricted use within NHS Scotland for the treatment of polyarthritis (rheumatoid factor positive or negative) and extended oligoarthritis in children and adolescents from the age of 2 years who have had an inadequate response to or are intolerant of methotrexate, psoriatic arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of methotrexate, and enthesitis-related arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of conventional therapy. It is further restricted to use within specialist rheumatology services (including those working within the network for paediatric rheumatology).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2 Neuromuscular disorders

Neuromuscular disorders

Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 495 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in *myasthenia gravis*. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 779.

Neostigmine p. 619 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 61 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. In infants, neostigmine by either subcutaneous or intramuscular injection is preferred for the short-term management of myasthenia.

Pyridostigmine bromide p. 620 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required. It is inadvisable to use excessive doses because acetylcholine receptor down regulation may occur. Immunosuppressant therapy may be considered if high doses of pyridostigmine bromide are needed.

Neostigmine and pyridostigmine bromide should be given to neonates 30 minutes before feeds to improve suckling.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

Immunosuppressant therapy

A course of **corticosteroids** is an established treatment in severe cases of *myasthenia gravis* and may be particularly useful when antibodies to the acetylcholine receptor are present in high titre. Short courses of high-dose ('pulsed') methylprednisolone p. 421 followed by maintenance therapy with oral corticosteroids may also be useful.

Corticosteroid treatment is usually initiated under specialist supervision. Transient but very serious worsening of symptoms can occur in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Once remission has occurred (usually after 2–6 months), the dose of prednisolone p. 421 should be reduced slowly to the minimum effective dose.

Skeletal muscle relaxants

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with neurological damage; they are not indicated for spasm associated with minor injuries. They act principally on the central nervous system with the exception of dantrolene, which has a peripheral site of action. They differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Dantrolene sodium p. 791 acts directly on skeletal muscle and produces fewer central adverse effects. It is generally used in resistant cases. The dose should be increased slowly.

Baclofen p. 620 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

Diazepam p. 212 has undoubted efficacy in some children. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties.

2.1 Muscular dystrophy

DRUGS FOR NEUROMUSCULAR DISORDERS

Ataluren

24-May-2017

- **DRUG ACTION** Ataluren restores the synthesis of dystrophin by allowing ribosomes to read through premature stop codons that cause incomplete dystrophin synthesis in nonsense mutation Duchenne muscular dystrophy.

● INDICATIONS AND DOSE

Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients (initiated by a specialist)

- BY MOUTH
- Child 5–17 years: (consult product literature)

- **INTERACTIONS** → Appendix 1: ataluren
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal discomfort · constipation · cough · decreased appetite · diarrhoea · enuresis · epistaxis · flatulence · haematuria · headache · hypertension · hypertriglyceridaemia · musculoskeletal chest pain · nausea · pain in extremity · pyrexia · rash · upper abdominal pain · vomiting · weight loss
 - **Frequency not known** Changes in renal function tests · raised cholesterol
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.
- **RENAL IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function at least every 6–12 months, and

cholesterol and triglyceride concentrations at least annually.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises the contents of each sachet should be mixed with at least 30 mL of liquid (water, milk, fruit juice), or 3 tablespoons of semi-solid food (yoghurt or apple sauce).

- **PATIENT AND CARER ADVICE** Manufacturer advises patients should maintain adequate hydration during treatment.

Missed doses

Manufacturer advises if a morning or midday dose is more than 3 hours late, or an evening dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2016) that ataluren (*Translarna*®) is not recommended for use within NHS Scotland for the treatment of Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients aged 5 years and older as the economic case was not demonstrated.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Granules

- ▶ **Translarna** (PTC Therapeutics Ltd) ▼
Ataluren 125 mg Translarna 125mg granules for oral suspension sachets | 30 sachet [PoM] no price available
Ataluren 250 mg Translarna 250mg granules for oral suspension sachets | 30 sachet [PoM] no price available
Ataluren 1 gram Translarna 1,000mg granules for oral suspension sachets | 30 sachet [PoM] no price available

2.2 Myasthenia gravis

ANTICHOLINESTERASES

Anticholinesterases

- **DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.

- **CONTRA-INDICATIONS** Intestinal obstruction · urinary obstruction

- **CAUTIONS** Arrhythmias · asthma (extreme caution) · atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection) but not given routinely because it may mask signs of overdosage · bradycardia · epilepsy · hyperthyroidism · hypotension · parkinsonism · peptic ulceration · recent myocardial infarction · vagotonia

- **SIDE-EFFECTS** Abdominal cramps (more marked with higher doses) · diarrhoea · increased salivation · nausea · vomiting

Overdose

Signs of overdose include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Amount probably too small to be harmful.

Neostigmine

(Neostigmine methylsulfate)

• INDICATIONS AND DOSE

Treatment of myasthenia gravis

▶ BY MOUTH

- ▶ **Neonate:** Initially 1–2 mg, then 1–5 mg every 4 hours, given 30 minutes before feeds.
- ▶ **Child 1 month–5 years:** Initially 7.5 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg
- ▶ **Child 6–11 years:** Initially 15 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg
- ▶ **Child 12–17 years:** Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily
- ▶ **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
- ▶ **Neonate:** 150 micrograms/kg every 6–8 hours, to be given 30 minutes before feeds, then increased if necessary up to 300 micrograms/kg every 4 hours.

- ▶ **Child 1 month–11 years:** 200–500 micrograms, dose repeated at suitable intervals throughout the day
- ▶ **Child 12–17 years:** 1–2.5 mg, dose repeated at suitable intervals throughout the day

Reversal of non-depolarising (competitive) neuromuscular blockade

▶ BY INTRAVENOUS INJECTION

- ▶ **Neonate:** 50 micrograms/kg, to be given over 1 minute after or with glycopyrronium or atropine, followed by 25 micrograms/kg if required.
- ▶ **Child 1 month–11 years:** 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg if required
- ▶ **Child 12–17 years:** 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg (max. per dose 2.5 mg) if required

• UNLICENSED USE

- ▶ In neonates Dose for treatment of myasthenia gravis by subcutaneous or intramuscular injection is unlicensed.

• CAUTIONS

- ▶ With intravenous use Glycopyrronium or atropine should also be given when reversing neuromuscular blockade

- **INTERACTIONS** → Appendix 1: neostigmine

- **RENAL IMPAIRMENT** May need dose reduction.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection

▶ Neostigmine (Non-proprietary)

Neostigmine metilsulfate 2.5 mg per 1 ml Neostigmine 2.5mg/1ml solution for injection ampoules | 10 ampoule [PoM] £5.06–£5.45

Tablet

▶ Neostigmine (Non-proprietary)

Neostigmine bromide 15 mg Neostigmine 15mg tablets | 140 tablet [PoM] £99.60 DT price = £99.60

Pyridostigmine bromide

- **DRUG ACTION** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

● INDICATIONS AND DOSE

Myasthenia gravis

► INITIALLY BY MOUTH

- Neonate: Initially 1–1.5 mg/kg, dose repeated throughout the day, then (by mouth using immediate-release medicines) increased if necessary up to 10 mg, to be increased gradually and given 30–60 minutes before feeds.

- Child 1 month–11 years: Initially 1–1.5 mg/kg daily, then (by mouth using immediate-release medicines) increased to 7 mg/kg daily in 6 divided doses, to be increased gradually; (by mouth using immediate-release medicines) usual dose 30–360 mg daily in divided doses
- Child 12–17 years: 30–120 mg, dose repeated throughout the day; (by mouth using immediate-release medicines) usual dose 300–600 mg daily in divided doses, consider immunosuppressant therapy if total daily dose exceeds 360 mg, down-regulation of acetylcholine receptors possible if total daily dose exceeds 450 mg

- **INTERACTIONS** → Appendix 1: pyridostigmine

- **RENAL IMPAIRMENT** Reduce dose; excreted by kidney.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Pyridostigmine bromide (Non-proprietary)

Pyridostigmine bromide 60 mg Pyridostigmine bromide 60mg tablets | 200 tablet [PoM] £45.54 DT price = £45.54

► Mestinon (Meda Pharmaceuticals Ltd)

Pyridostigmine bromide 60 mg Mestinon 60mg tablets | 200 tablet [PoM] £45.57 DT price = £45.54

2.3 Spasticity

MUSCLE RELAXANTS > CENTRALLY ACTING

Baclofen

● INDICATIONS AND DOSE

Chronic severe spasticity of voluntary muscle

► BY MOUTH

- Child 1 month–7 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 40 mg per day
- Child 8–17 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 60 mg per day

Severe chronic spasticity of cerebral or spinal origin unresponsive to oral antispastic drugs (or oral therapy not tolerated) (specialist use only)

► BY INTRATHECAL INJECTION

- Child 4–17 years: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar

puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not more often than every 24 hours to determine initial maintenance dose; maintenance 25–200 micrograms daily, adjusted according to response, dose-titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose retaining some spasticity to avoid sensation of paralysis

IMPORTANT SAFETY INFORMATION

Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

● CONTRA-INDICATIONS

- With intrathecal use Local infection · systemic infection
- With oral use Avoid oral route in active peptic ulceration

● CAUTIONS

GENERAL CAUTIONS

Diabetes · epilepsy · history of peptic ulcer · hypertonic bladder sphincter · psychiatric illness · respiratory impairment

SPECIFIC CAUTIONS

- With intrathecal use Coagulation disorders · malnutrition (increased risk of post-surgical complications) · previous spinal fusion procedure

- **INTERACTIONS** → Appendix 1: baclofen

● SIDE-EFFECTS

- **Common or very common** Agitation · anxiety · ataxia · cardiovascular depression · confusion · depression · dizziness · drowsiness · dry mouth · euphoria · gastrointestinal disturbances · hallucinations · headache · hyperhidrosis · hypotension · insomnia · myalgia · nightmares · rash · respiratory depression · sedation · seizure · tremor · urinary disturbances · visual disorders
- **Rare** Abdominal pain · changes in hepatic function · dysarthria · erectile dysfunction · paraesthesia · taste disturbances
- **Very rare** Hypothermia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal* studies).

- **BREAST FEEDING** Present in milk—amount probably too small to be harmful.

● HEPATIC IMPAIRMENT

- With oral use Manufacturer advises use with caution.

● RENAL IMPAIRMENT

- With oral use Risk of toxicity—use smaller oral doses and if necessary increase dosage interval; if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² use by mouth only if potential benefit outweighs risk. Excreted by the kidney.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

● PATIENT AND CARER ADVICE**Driving and skilled tasks**

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

3 Pain and inflammation in musculoskeletal disorders

Non-steroidal anti-inflammatory drugs

Therapeutic effects

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 260 but paracetamol is preferred.

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation.

Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance of these drugs. A large proportion of

children will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. However, in juvenile idiopathic arthritis NSAIDs may take 4–12 weeks to be effective. If appropriate responses are not obtained within these times, another NSAID should be tried. The availability of appropriate formulations needs to be considered when prescribing NSAIDs for children.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. However, in children gastro-intestinal symptoms are rare in those taking NSAIDs for short periods. The role of selective inhibitors of cyclo-oxygenase-2 is undetermined in children.

Ibuprofen p. 625 and naproxen p. 631 are propionic acid derivatives used in children.

Ibuprofen combines anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other NSAIDs but its anti-inflammatory properties are weaker.

Naproxen combines good efficacy with a low incidence of side-effects.

Diclofenac sodium p. 623, diclofenac potassium p. 622, indometacin p. 628, mefenamic acid p. 629, and piroxicam p. 632 have properties similar to those of propionic acid derivatives:

Diclofenac sodium and diclofenac potassium are similar in efficacy to naproxen.

Indometacin has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances. It is rarely used in children and should be reserved for when other NSAIDs have been unsuccessful.

Mefenamic acid has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Meloxicam p. 630 is a selective inhibitor of cyclo-oxygenase-2. Its use may be considered in adolescents intolerant to other NSAIDs.

Ketorolac trometamol p. 787 can be used for the short-term management of postoperative pain.

Etoricoxib p. 624, a selective inhibitor of cyclo-oxygenase-2, is licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, and acute gout in children aged 16 years and over.

Dental and orofacial pain

Most mild to moderate dental pain and inflammation is effectively relieved by ibuprofen, diclofenac potassium or diclofenac sodium.

NSAIDs and cardiovascular events

The risk of cardiovascular events secondary to NSAID use is undetermined in children. In adults, all NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those patients receiving high doses long term. A small increased thrombotic risk cannot be excluded in children.

In adults, cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are

associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of etoricoxib. Naproxen (in adults, 1 g daily) is associated with a lower thrombotic risk, and lower doses of ibuprofen (in adults, 1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms, and the need for long-term treatment should be reviewed periodically.

NSAIDs and gastro-intestinal events

All NSAIDs are associated with gastro-intestinal toxicity. In adults, evidence on the relative safety of NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam and ketorolac trometamol are associated with the highest risk; indometacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Children appear to tolerate NSAIDs better than adults and gastro-intestinal side-effects are less common although they do still occur and can be significant; use of gastro-protective drugs may be necessary.

Asthma

All NSAIDs have the potential to worsen asthma, either acutely or as a gradual worsening of symptoms; consider both prescribed NSAIDs and those that are purchased over the counter.

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Diclofenac potassium

● INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders

► BY MOUTH

► Child 14–17 years: 75–100 mg daily in 2–3 divided doses

Postoperative pain

► BY MOUTH

► Child 9–13 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

► Child 14–17 years: 75–100 mg daily in 2–3 divided doses

Fever in ear, nose, or throat infection

► BY MOUTH

► Child 9–17 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

● **UNLICENSED USE** Voltarol® Rapid not licensed for use in children under 14 years or in fever.

● **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease

● **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be

exacerbated) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

● **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

► **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

► **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

● **BREAST FEEDING** Use with caution during breast-feeding. Amount in milk too small to be harmful.

● **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

● **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Diclofenac sodium

● INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 6 months–17 years: 1.5–2.5 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses; maximum 150 mg per day

Postoperative pain

► BY RECTUM

- Child 6 months–17 years (body-weight 8–11 kg): 12.5 mg twice daily for maximum 4 days
- Child 6 months–17 years (body-weight 12 kg and above): 1 mg/kg 3 times a day (max. per dose 50 mg) for maximum 4 days

Inflammation | Mild to moderate pain

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY RECTUM

- Child 6 months–17 years: 0.3–1 mg/kg 3 times a day (max. per dose 50 mg)

DICLOMAX RETARD®

Pain and inflammation

► BY MOUTH

- Child 12–17 years: 1 capsule once daily

DICLOMAX SR®

Pain and inflammation

► BY MOUTH

- Child 12–17 years: 1 capsule 1–2 times a day

MOTIFENE®

Pain and inflammation

► BY MOUTH

- Child 12–17 years: 1 capsule 1–2 times a day

VOLTAROL® 75MG SR TABLETS

Pain and inflammation

► BY MOUTH

- Child 12–17 years: 1 tablet 1–2 times a day

VOLTAROL® RETARD

Pain and inflammation

► BY MOUTH

- Child 12–17 years: 1 tablet once daily

VOLTAROL® SOLUTION FOR INJECTION

Postoperative pain

► BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION

- Child 2–17 years: 0.3–1 mg/kg 1–2 times a day for maximum 2 days, for intramuscular injection, to be injected into the gluteal muscle; maximum 150 mg per day

- **UNLICENSED USE** Not licensed for use in children under 1 year. *Suppositories* not licensed for use in children under 6 years except for use in children over 1 year for juvenile idiopathic arthritis. Solid dose forms containing more than 25 mg not licensed for use in children. *Injection* not licensed for use in children.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · avoid injections containing benzyl alcohol in neonates · avoid suppositories in proctitis · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease

- With intravenous use Dehydration · history of asthma · history of confirmed or suspected cerebrovascular bleeding · history of haemorrhagic diathesis · hypovolaemia · operations with high risk of haemorrhage

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- With intramuscular use or intravenous use Injection site reactions
- With rectal use Suppositories may cause rectal irritation

SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount in milk too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid in severe impairment. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- With intravenous use Contra-indicated in moderate or severe renal impairment.

● DIRECTIONS FOR ADMINISTRATION

For intravenous infusion, dilute 75 mg with 100–500 mL Glucose 5% or Sodium Chloride 0.9% (previously buffered with 0.5 mL Sodium Bicarbonate 8.4% solution or with 1 mL Sodium Bicarbonate 4.2% solution); give over 30–120 minutes.

Etoricoxib

23-Nov-2016

● INDICATIONS AND DOSE

Pain and inflammation in osteoarthritis

► BY MOUTH

- Child 16–17 years: 30 mg once daily, increased if necessary to 60 mg once daily

Pain and inflammation in rheumatoid arthritis |

Ankylosing spondylitis

► BY MOUTH

- Child 16–17 years: 60 mg once daily, increased if necessary to 90 mg once daily

Acute gout

► BY MOUTH

- Child 16–17 years: 120 mg once daily for maximum 8 days

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease · uncontrolled hypertension (persistently above 140/90 mmHg)

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · dehydration · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- **Common or very common** Ecchymosis · fatigue · influenza-like symptoms · palpitation
- **Uncommon** Anxiety · appetite change · arthralgia · atrial fibrillation · chest pain · cough · dry mouth · dyspnoea · electrolyte disturbance · epistaxis · flushing · mental acuity impaired · mouth ulcer · myalgia · paraesthesia · taste disturbance · transient ischaemic attack · weight change
- **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- **Very rare** Confusion · hallucinations
- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects. For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Max. 60 mg daily in mild impairment. Max. 60 mg on alternate days or 30 mg once daily in moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution.
Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². In renal impairment monitor renal function; sodium and water retention may occur and renal failure may deteriorate, possibly leading to renal failure.
- **MONITORING REQUIREMENTS** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

Flurbiprofen

● INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

► BY MOUTH

- Child 12–17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

Dysmenorrhoea

► BY MOUTH

- Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- **Common or very common** Stomatitis
- **Uncommon** Confusion · fatigue · hallucinations · paraesthesia
- **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic

damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

► **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Small amount present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution.
Deterioration in renal function has also been reported after topical use.
Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Ibuprofen

● INDICATIONS AND DOSE

Closure of ductus arteriosus

► BY SLOW INTRAVENOUS INJECTION

- **Neonate:** Initially 10 mg/kg for 1 dose, followed by 5 mg/kg every 24 hours for 2 doses, the course may be repeated after 48 hours if necessary.

continued →

Mild to moderate pain | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1–2 months: 5 mg/kg 3–4 times a day
- Child 3–5 months: 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 6–11 months: 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 1–3 years: 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 4–6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 7–9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 10–11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 12–17 years: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

Pain and inflammation

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Child 12–17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 3 months–17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

Pain and inflammation in systemic juvenile idiopathic arthritis

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 3 months–17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

Post-immunisation pyrexia in infants (on doctor's advice only)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 2–3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

● UNLICENSED USE

- With intravenous use Orphan licence for the injection for closure of ductus arteriosus in premature neonates less than 34 weeks corrected gestational age.
- With oral use Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- With intravenous use Active bleeding (especially intracranial or gastro-intestinal) · coagulation defects · known or suspected necrotising enterocolitis · life-threatening infection · marked unconjugated hyperbilirubinaemia · pulmonary hypertension · thrombocytopenia

- **CAUTIONS** Cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be

exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- With intravenous use May mask symptoms of infection

CAUTIONS, FURTHER INFORMATION

- **High-dose ibuprofen** A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose ibuprofen (≥ 2.4 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II–III), and uncontrolled hypertension.

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS► **Common or very common**

- With intravenous use Bronchopulmonary dysplasia · fluid retention · haematuria · hyponatraemia · intestinal perforation · intraventricular haemorrhage · ischaemic brain injury · neutropenia · oliguria · pulmonary haemorrhage · thrombocytopenia

► **Uncommon**

- With intravenous use Gastrointestinal haemorrhage
- **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- With intravenous use Hypoxaemia

SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

Overdose

Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated p. 810 followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour.

For details on the management of poisoning, see Emergency treatment of poisoning p. 803.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.

● HEPATIC IMPAIRMENT

- With intravenous use Increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

● RENAL IMPAIRMENT Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- With intravenous use Use lowest effective dose. Avoid if possible in severe impairment.
- With oral use The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment.

● MONITORING REQUIREMENTS

- With intravenous use Monitor for bleeding. Monitor gastro-intestinal function.

● DIRECTIONS FOR ADMINISTRATION For *slow intravenous injection*, give over 15 minutes, preferably undiluted. May be diluted with Glucose 5% or Sodium Chloride 0.9%.**● PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include orange.**● PATIENT AND CARER ADVICE**

Indometacin

(Indomethacin)

• INDICATIONS AND DOSE

Symptomatic ductus arteriosus

► BY INTRAVENOUS INFUSION

- Neonate: Initially 100–200 micrograms/kg for 1 dose, followed by 100 micrograms/kg after 24 hours for 2 doses, at 24-hour intervals, doses to be given over 20–30 minutes, if residual patency present, 100 micrograms/kg to be given for a further 3 doses at 24-hour intervals.

Relief of pain and inflammation in rheumatic diseases including juvenile idiopathic arthritis

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child: 0.5–1 mg/kg twice daily, higher doses may be used under specialist supervision

• UNLICENSED USE

- With oral use Not licensed for use in children.

• CONTRA-INDICATIONS

- With intravenous use Bleeding (especially with active intracranial haemorrhage or gastro-intestinal bleeding) · coagulation defects · necrotising enterocolitis · thrombocytopenia · untreated infection
- With oral use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

• CAUTIONS

GENERAL CAUTIONS

Heart failure

SPECIFIC CAUTIONS

- With intravenous use Inhibition of platelet aggregation (monitor for bleeding) · may induce hyponatraemia · may mask symptoms of infection · may reduce urine output by 50% or more and precipitate renal impairment especially if extracellular volume depleted · sepsis
- With oral use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · epilepsy · ischaemic heart disease · peripheral arterial disease · psychiatric disturbances · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

• SIDE-EFFECTS

► Rare

- With oral use Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · blood disorders · confusion · convulsions · hepatic damage · hyperglycaemia · interstitial fibrosis associated with NSAIDs can lead to renal failure · intestinal strictures · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · peripheral neuropathy · psychiatric disturbances · pulmonary eosinophilia · Stevens-Johnson syndrome · syncope · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
- **Frequency not known**
- With intravenous use Coagulation disorders · exacerbation of infection · fluid retention · gastro-intestinal disorders · haemorrhagic disorders · intracranial bleeding · metabolic disorders · pulmonary hypertension · renal disorders

- With oral use Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hyperkalaemia · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

• PREGNANCY

- With oral use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

• BREAST FEEDING

- With oral use Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.

• HEPATIC IMPAIRMENT

- With intravenous use Increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe impairment.
- With oral use or rectal use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

• RENAL IMPAIRMENT

- With intravenous use Use lowest effective dose. Avoid if possible in severe impairment If anuria or marked oliguria (urinary output less than 0.6 mL/kg/hour), delay further doses until renal function returns to normal.
- With oral use The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

• MONITORING REQUIREMENTS

- With oral use During prolonged therapy ophthalmic and blood examinations particularly advisable.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute each vial with 1–2 mL Sodium Chloride 0.9% or Water for Injections.

• PATIENT AND CARER ADVICE

Driving and skilled tasks

Dizziness may affect performance of skilled tasks (e.g. driving).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 21

Ketoprofen

● INDICATIONS AND DOSE

For use as a component of Ketoprofen with omeprazole, below

► BY MOUTH

► Child 15–17 years: (consult product literature)

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **SIDE-EFFECTS**
 - **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
 - **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount probably too small to be harmful but manufacturers advise avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Should be avoided in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration.
Avoid if possible or use with caution. Avoid in severe impairment. Monitor renal function; sodium and water

retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ketoprofen with omeprazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, ketoprofen above, omeprazole p. 57.

● INDICATIONS AND DOSE

Patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID associated duodenal or gastric ulcer or gastroduodenal erosions

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

► Child 15–17 years: Initially 100/20 mg daily, increased if necessary to 200/20 mg daily, depending on severity of symptoms, dose expressed as x/y mg ketoprofen/omeprazole

- **INTERACTIONS** → Appendix 1: NSAIDs, proton pump inhibitors
- **PRESCRIBING AND DISPENSING INFORMATION** Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

Mefenamic acid

● INDICATIONS AND DOSE

Acute pain including dysmenorrhoea | Menorrhagia

► BY MOUTH

► Child 12–17 years: 500 mg 3 times a day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · inflammatory bowel disease · severe heart failure
- **CAUTIONS** Acute porphyrias p. 577 · allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · epilepsy · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea (withdraw treatment) · rashes (withdraw treatment) · stomatitis
 - **Uncommon** Fatigue · paraesthesia
 - **Rare** Alveolitis · aplastic anaemia · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · glucose intolerance · haemolytic anaemia (positive Coombs' test) · hepatic damage · hypotension ·

interstitial fibrosis associated with NSAIDs can lead to renal failure • palpitation • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • thrombocytopenia • toxic epidermal necrolysis • visual disturbances

- **Frequency not known** Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • Crohn's disease (induction of or exacerbation of) • depression • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

Overdose

Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent, require treatment.

For details on the management of poisoning, see Emergency treatment of poisoning p. 803, in particular, Convulsions.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Meloxicam

● INDICATIONS AND DOSE

Exacerbation of osteoarthritis (short-term)

► BY MOUTH

- Child 16–17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

Pain and inflammation in rheumatic disease | Ankylosing spondylitis

► BY MOUTH

- Child 16–17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required

Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs

► BY MOUTH

- Child 12–17 years (body-weight up to 50 kg): 7.5 mg once daily
- Child 12–17 years (body-weight 50 kg and above): 15 mg once daily

- **UNLICENSED USE** Not licensed for use in children under 16 years.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure

- **CAUTIONS** Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn's disease (may be exacerbated) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- **Rare** Alveolitis • aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances
- **Frequency not known** Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • Crohn's disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution.
Avoid if estimated glomerular filtration rate less than 25 mL/minute/1.73 m². In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● SIDE-EFFECTS

- **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **DIRECTIONS FOR ADMINISTRATION** Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing.
Piroxicam orodispersible tablets may be halved to give 10 mg dose.
- **LESS SUITABLE FOR PRESCRIBING**
Piroxicam is less suitable for prescribing.

Piroxicam

● INDICATIONS AND DOSE

Relief of pain and inflammation in juvenile idiopathic arthritis

► BY MOUTH

- Child 6–17 years (body-weight up to 15 kg): 5 mg daily
- Child 6–17 years (body-weight 15–25 kg): 10 mg daily
- Child 6–17 years (body-weight 26–45 kg): 15 mg daily
- Child 6–17 years (body-weight 46 kg and above): 20 mg daily

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent should be considered.

Topical preparations containing piroxicam are not affected by these restrictions.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal

4 Soft tissue and joint disorders

4.1 Local inflammation of joints and soft tissue

CORTICOSTEROIDS

Corticosteroids, inflammatory disorders

Systemic corticosteroids

In children with rheumatic diseases corticosteroids should be reserved for specific indications (e.g. when other therapies are unsuccessful or while waiting for DMARDs to take effect) and should be used only under the supervision of a specialist.

Systemic corticosteroids may be considered for the management of juvenile idiopathic arthritis in systemic disease or when several joints are affected. Systemic corticosteroids may also be considered in severe, possibly life-threatening conditions such as systemic lupus erythematosus, systemic vasculitis, juvenile dermatomyositis, Behçet's disease, and polyarticular joint disease.

In severe conditions, short courses ('pulses') of high dose intravenous methylprednisolone p. 421 or a pulsed oral corticosteroid may be particularly effective for providing rapid relief, and has fewer long-term adverse effects than continuous treatment.

Corticosteroid doses should be reduced with care because of the possibility of relapse if the reduction is too rapid. If complete discontinuation of corticosteroids is not possible, consideration should be given to alternate-day (or alternate high-dose, low-dose) administration; on days when no corticosteroid is given, or a lower dose is given, an additional dose of a NSAID may be helpful. In some conditions, alternative treatment using an antimalarial or concomitant use of an immunosuppressant drug, such as azathioprine p. 495, methotrexate p. 517 or cyclophosphamide p. 509 may prove useful; in less severe conditions treatment with a NSAID alone may be adequate.

Administration of corticosteroids may result in suppression of growth and may affect the development of puberty. The risk of corticosteroid-induced osteoporosis should be considered for those on long-term corticosteroid treatment; corticosteroids may also increase the risk of osteopenia in those unable to exercise. See the disadvantages of corticosteroid treatment.

Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, including juvenile idiopathic arthritis, they are given by *intra-articular injection* as monotherapy, or as an adjunct to long-term therapy to reduce swelling and deformity in one or a few joints. Aseptic precautions (e.g. a no-touch technique) are essential, as is a clinician skilled in the technique; infected areas should be avoided and general anaesthesia, or local anaesthesia, or conscious sedation should be used. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Triamcinolone hexacetonide p. 634 [unlicensed] is preferred for intra-articular injection because it is almost insoluble and has a long-acting (depot) effect. Triamcinolone acetonide p. 634 and methylprednisolone may also be considered for intra-articular injection into larger joints, whilst hydrocortisone below acetate should be reserved for smaller joints or for soft-tissue injections. Intra-articular corticosteroid injections can cause flushing and, in adults, may affect the hyaline cartilage. Each joint should usually be treated no more than 3–4 times in one year.

A smaller amount of corticosteroid may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis or golfer's elbow* or *compression neuropathies*, which occur rarely in children. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

INDICATIONS AND DOSE

Symptomatic treatment of subacute and chronic inflammatory joint diseases (for details, consult product literature)

► BY INTRA-ARTICULAR INJECTION

- Child 12–17 years: 2–20 mg, according to size of the joint; if appropriate repeat treatment at intervals of 3–4 weeks, no more than 2 joints should be treated on any one day

4.2 Soft tissue disorders

Soft-tissue disorders

Soft-tissue and musculoskeletal disorders

The management of children with soft-tissue injuries and strains, and musculoskeletal disorders, may include temporary rest together with the local application of heat or cold, local massage and physiotherapy. For pain relief, paracetamol p. 260 is often adequate and should be used first. Alternatively, the lowest effective dose of a **NSAID** (e.g. ibuprofen p. 625) can be used. If pain relief with either drug is inadequate, both paracetamol (in a full dose appropriate for the child) and a low dose of a NSAID may be required.

Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolality greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. Very young children are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

Prevention of extravasation

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and children receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trinitrate patch or using glyceryl trinitrate ointment distal to the cannula may improve the patency of the vessel in children with small veins or in those whose

veins are prone to collapse. Children or their carers should be asked to report any pain or burning at the site of injection immediately.

Management of extravasation

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 633 or dexamethasone p. 419 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. Antihistamines and analgesics may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase below. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should **not** be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique).

Enzymes

Hyaluronidase is used for the management of extravasation.

ENZYMES

Hyaluronidase

● INDICATIONS AND DOSE

Extravasation

- ▶ BY LOCAL INFILTRATION
- ▶ Child: (consult product literature)

- **UNLICENSED USE** Licensed for use in children, but age range not specified by the manufacturer.
- **CONTRA-INDICATIONS** Avoid sites where infection is present • avoid sites where malignancy is present • do not apply direct to cornea • not for anaesthesia in unexplained premature labour • not for intravenous administration • not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists • not to be used to reduce swelling of bites • not to be used to reduce swelling of stings
- **CAUTIONS** Infants (control speed and total volume and avoid overhydration especially in renal impairment)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Oedema
 - ▶ **Rare** Bleeding • bruising • infection • local irritation
 - ▶ **Frequency not known** Anaphylaxis • severe allergy

● MEDICINAL FORMS

Eye

Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—contact individual manufacturers for further information. They are particularly useful for children in whom normal application is difficult, for the visually impaired, or otherwise physically limited patients.

Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; in neonates and infants it may be more appropriate to administer the drop in the inner angle of the open eye. One drop is all that is needed; instillation of more than one drop at a time should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow can occur when one immediately follows the other. The carer or child should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops. Both drops and ointment can cause transient blurred vision; children should be warned, where appropriate, not to perform skilled tasks (e.g. cycling or driving) until vision is clear.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

Also see warnings relating to eye drops and contact lenses.

Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% p. 645 solution is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Ophthalmic Specials

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product will not be suitable for a child's needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *domiciliary* use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in *hospital wards* are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be

discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In *out-patient departments* single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In *eye surgery* single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann's solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 120 and hydralazine hydrochloride p. 113). Other drugs that may affect contact lens wear are isotretinoin p. 727 (can cause conjunctival inflammation),

aspirin p. 89 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 349 and sulfasalazine p. 30 (can discolour lenses).

1 Allergic and inflammatory eye conditions

Eye, allergy and inflammation

Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

Topical corticosteroids should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' can follow prolonged use.

Products combining a corticosteroid with an antimicrobial are used after ocular surgery to reduce inflammation and prevent infection: use of combination products is otherwise rarely justified.

Systemic corticosteroids may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

Other anti-inflammatory preparations

Eye drops containing **antihistamines**, such as **antazoline** (with xylometazoline hydrochloride p. 637 as *Otrivine-Antistin*®), azelastine hydrochloride p. 638, epinastine hydrochloride p. 638, ketotifen p. 638, and olopatadine p. 638, can be used for allergic conjunctivitis.

Sodium cromoglicate p. 639 and nedocromil sodium p. 639 eye drops may be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops p. 639 are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Emedastine eye drops p. 638 are licensed for seasonal allergic conjunctivitis.

1.1 Allergic conjunctivitis

ANTIHISTAMINES

Antazoline with xylometazoline

• INDICATIONS AND DOSE

Allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12–17 years: Apply 2–3 times a day for maximum 7 days

- **CAUTIONS** Angle-closure glaucoma • cardiovascular disease • diabetes mellitus • hypertension • hyperthyroidism • phaeochromocytoma • urinary retention
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

● SIDE-EFFECTS

- **Common or very common** Transient stinging
- **Frequency not known** Blurred vision · eye irritation · mydriasis

SIDE-EFFECTS, FURTHER INFORMATION

Absorption of antazoline and xylometazoline may result in systemic side-effects.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Otrivine Antistin** (Thea Pharmaceuticals Ltd)

Xylometazoline hydrochloride 500 microgram per 1 ml,
Antazoline sulfate 5 mg per 1 ml Otrivine Antistin 0.5%/0.05% eye
drops | 10 ml [P] £3.35 DT price = £3.35

Azelastine hydrochloride

● INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

- TO THE EYE
- Child 4–17 years: Apply twice daily, increased if necessary to 4 times a day

Perennial conjunctivitis

- TO THE EYE
- Child 12–17 years: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks

- **INTERACTIONS** → Appendix 1: antihistamines (non-sedating)

● SIDE-EFFECTS

- Frequency not known Bitter taste · mild transient irritation

● MEDICINAL FORMS

- Child 3–17 years: Apply twice daily

- **INTERACTIONS** → Appendix 1: antihistamines (sedating)

● SIDE-EFFECTS

- **Common or very common** Punctate corneal epithelial erosion · transient burning · transient stinging
- **Uncommon** Dry eye · photophobia · subconjunctival haemorrhage
- **Frequency not known** Drowsiness · dry mouth · headache · skin reactions

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- **Zaditen** (Thea Pharmaceuticals Ltd)

Ketotifen (as Ketotifen fumarate) 250 microgram per
1 ml Zaditen 250micrograms/ml eye drops | 5 ml [PoM] £7.80 DT
price = £7.80

Olopatadine

● INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

- TO THE EYE
- Child 3–17 years: Apply twice daily for maximum 4 months

● SIDE-EFFECTS

- **Common or very common** Local irritation
- **Uncommon** Asthenia · dizziness · dry eye · headache · keratitis · local oedema · photophobia
- **Frequency not known** Dry nose

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- **Opatanol** (Alcon Laboratories (UK) Ltd)

Olopatadine (as Olopatadine hydrochloride) 1 mg per
1 ml Opatanol 1mg/ml eye drops | 5 ml [PoM] £4.68 DT price = £4.68

MAST-CELL STABILISERS

Lodoxamide

● INDICATIONS AND DOSE

Allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 4–17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

● SIDE-EFFECTS

- ▶ **Common or very common** Blurred vision • burning • itching • ocular discomfort • stinging • tear production disturbance
- ▶ **Uncommon** Blepharitis • dizziness • drowsiness • flushing • headache • keratitis • nasal dryness

- **EXCEPTIONS TO LEGAL CATEGORY** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in children over 4 years.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Alomide** (Alcon Laboratories (UK) Ltd)

Lodoxamide (as Lodoxamide trometamol) 1 mg per 1 ml Alomide 0.1% eye drops | 10 ml [PoM] £5.21 DT price = £5.21
Alomide Allergy 0.1% eye drops | 5 ml [P] £3.12

Nedocromil sodium

● INDICATIONS AND DOSE

Seasonal and perennial conjunctivitis

- ▶ TO THE EYE
- ▶ Child 6–17 years: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis

Seasonal keratoconjunctivitis

- ▶ TO THE EYE
- ▶ Child 6–17 years: Apply 4 times a day

- **SIDE-EFFECTS** Distinctive taste • transient burning • transient stinging

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Rapitol** (Sanofi)

Nedocromil sodium 20 mg per 1 ml Rapitol 2% eye drops | 5 ml [PoM] £2.86 DT price = £2.86

Sodium cromoglicate

(Sodium cromoglycate)

● INDICATIONS AND DOSE

Allergic conjunctivitis | Seasonal keratoconjunctivitis

- ▶ TO THE EYE
- ▶ Child: Apply 4 times a day

- **SIDE-EFFECTS** Transient burning • transient stinging

- **PREGNANCY** Not known to be harmful. Inhaled drugs can be taken as normal during pregnancy.

- **EXCEPTIONS TO LEGAL CATEGORY** Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

- ▶ **Sodium cromoglicate (Non-proprietary)**

Sodium cromoglicate 20 mg per 1 ml Sodium cromoglicate 2% eye drops | 13.5 ml [PoM] £8.03 DT price = £2.35

- ▶ **Cromolux** (Tubilux Pharma Ltd)

Sodium cromoglicate 20 mg per 1 ml Cromolux 2% eye drops | 13.5 ml [PoM] £3.20 DT price = £2.35

- ▶ **Opticrom** (Sanofi)

Sodium cromoglicate 20 mg per 1 ml Opticrom Aqueous 2% eye drops | 13.5 ml [PoM] £8.03 DT price = £2.35

- ▶ **Vividrin** (Bausch & Lomb UK Ltd)

Sodium cromoglicate 20 mg per 1 ml Vividrin 2% eye drops | 13.5 ml [PoM] £10.95 DT price = £2.35

1.2 Inflammatory eye conditions

CORTICOSTEROIDS

Betamethasone

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply every 1–2 hours until controlled then reduce frequency
- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Child: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Adrenal suppression following prolonged use in neonates • corneal thinning • scleral thinning

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betamethasone (Non-proprietary)**

Betamethasone sodium phosphate 1 mg per 1 ml Betamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] no price available

- ▶ **Betnesol** (Focus Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [PoM] £2.32 DT price = £2.32

- ▶ **Vistamethasone** (Martindale Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] £0.87 | 10 ml [PoM] £0.99 DT price = £2.32

Eye ointment

- ▶ **Betnesol** (Focus Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 gram Betnesol 0.1% eye ointment | 3 gram [PoM] £1.41 DT price = £1.41

Combinations available: *Betamethasone with neomycin*, p. 640

Dexamethasone

06-Jun-2016

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply 4–6 times a day

Short term local treatment of inflammation (severe conditions)

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply every 30–60 minutes until controlled, reduce frequency when control achieved

- **UNLICENSED USE** *Maxidex*® not licensed for use in children under 2 years. *Dropodex*® not licensed for use in children.
- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Adrenal suppression following prolonged use in neonates · corneal thinning · scleral thinning
- **PREGNANCY** Dexamethasone readily crosses the placenta.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose Dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 639, neomycin sulfate p. 662.

● INDICATIONS AND DOSE

Local treatment of eye inflammation and bacterial infection (short-term)

- TO THE EYE USING EYE DROP
- Child: (consult product literature)

- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin eye-drops are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Betnesol-N (Focus Pharmaceuticals Ltd)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT price = £2.39

Fluorometholone

● INDICATIONS AND DOSE

Local treatment of inflammation (short term)

- TO THE EYE
- Child 2-17 years: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

- **UNLICENSED USE** Not licensed for use in children under 2 years.

- **SIDE-EFFECTS** Adrenal suppression following prolonged use in neonates · corneal thinning · scleral thinning

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

► FML Liquifilm (Allergan Ltd)

Fluorometholone 1 mg per 1 ml FML Liquifilm 0.1% ophthalmic suspension | 5 ml [PoM] £1.71 DT price = £1.71 | 10 ml [PoM] £2.95 DT price = £2.95

Prednisolone

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- TO THE EYE
- Child: Apply every 1–2 hours until controlled then reduce frequency

- **UNLICENSED USE** *Pred Forte*® not licensed for use in children (age range not specified by manufacturer).

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- TO THE EYE
- Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

Dexamethasone with framycetin sulfate and gramicidin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 639, framycetin sulfate p. 661.

- **LESS SUITABLE FOR PRESCRIBING** *Sofradex*® is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

► *Sofradex* (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulphobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml *Sofradex* ear/eye drops | 10 ml [PoM] £7.50

Dexamethasone with hypromellose, neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 639, neomycin sulfate p. 662.

INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

► TO THE EYE USING EYE DROP

- Child: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

Local treatment of inflammation (short-term)

► TO THE EYE USING EYE OINTMENT

- Child: Apply 3–4 times a day, alternatively, apply at night when used with eye drops

- **LESS SUITABLE FOR PRESCRIBING** Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

EXCIPIENTS: May contain Hydroxybenzoates (parabens), wool fat and related substances including lanolin

► *Maxitrol* (Alcon Laboratories (UK) Ltd)

Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram *Maxitrol* eye ointment | 3.5 gram [PoM] £1.44

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

► *Maxitrol* (Alcon Laboratories (UK) Ltd)

Dexamethasone 1 mg per 1 ml, Hypromellose 5 mg per 1 ml, Neomycin (as Neomycin sulfate) 3500 unit per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml *Maxitrol* eye drops | 5 ml [PoM] £1.68

1.2a Anterior uveitis

ANTIMUSCARINICS

Antimuscarinics (eye)

- **CAUTIONS** Children under 3 months owing to the possible association between cycloplegia and the development of amblyopia · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · mydriasis can precipitate acute angle-closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber) · neonates at increased risk of systemic toxicity
- **SIDE-EFFECTS** Conjunctivitis (on prolonged administration) · contact dermatitis · eye oedema (on prolonged administration) · hyperaemia (on prolonged administration) · local irritation (on prolonged

administration) · raised intraocular pressure · transient stinging

- **PATIENT AND CARER ADVICE** Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

► above

Atropine sulfate

INDICATIONS AND DOSE

Cycloplegia

► TO THE EYE USING EYE DROP

- Child 3 months–17 years: Apply twice daily for 3 days, before procedure

Anterior uveitis

► TO THE EYE USING EYE DROP

- Child 2–17 years: Apply 1 drop up to 4 times a day

- **UNLICENSED USE** Not licensed for use in children for uveitis.

- **INTERACTIONS** → Appendix 1: atropine

SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION Toxic systemic reactions can occur. Systemic side-effects can occur.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose atropine sulphate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

P 641

Homatropine hydrobromide

● INDICATIONS AND DOSE

Anterior uveitis

- TO THE EYE
- Child 3 months–1 year: Apply 1 drop daily, alternatively apply 1 drop once daily on alternate days, adjusted according to response, only 0.5% eye drops to be used
- Child 2–17 years: Apply 1 drop twice daily, adjusted according to response

● **INTERACTIONS** → Appendix 1: homatropine

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

2 Dry eye conditions

Dry eye

Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion often responds to tear replacement therapy. The severity of the condition and child's preference will often guide the choice of preparation.

Hypermellose p. 643 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypermellose with a mucolytic such as acetylcysteine below can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol p. 644 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 645 are also used in the management of tear deficiency.

Sodium chloride 0.9% drops p. 645 are sometimes useful in tear deficiency, and can be used as 'comfort drops' by contact lens wearers, and to facilitate lens removal. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery and in first aid for removal of harmful substances.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

OCULAR LUBRICANTS

Acetylcysteine

07-Feb-2017

● INDICATIONS AND DOSE

Tear deficiency | Impaired or abnormal mucus production

- TO THE EYE
- Child: Apply 3–4 times a day

● MEDICINAL FORMS

Eye drops

- ▶ **Emustil** (Moorfields Pharmaceuticals)
Emustil eye drops 0.3ml unit dose preservative free | 20 unit dose £6.22

3 Eye infections

Eye infections

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial *blepharitis* is treated by lid hygiene and application of antibacterial eye drops to the conjunctival sac or to the lid margins. Systemic treatment may be required and may be necessary for 3 months or longer.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis or antibiotic resistance.

Corneal *ulcer* and *keratitis* require specialist treatment, usually under inpatient care, and may call for intensive topical, subconjunctival, or systemic administration of antimicrobials.

Endophthalmitis is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

See reference to the treatment of *crab lice* of the eyelashes.

Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 648 has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 647, levofloxacin p. 648, moxifloxacin p. 648, and ofloxacin p. 648; the aminoglycosides, gentamicin p. 647 and tobramycin p. 647 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 647 are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamidine isetionate p. 649 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication].

Other antibacterial eye drops may be prepared aseptically in a specialist manufacturing unit from material supplied for injection.

With corticosteroids

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye' which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- *Eye drops*, apply 1 drop at least every 2 hours in severe infection then reduce frequency as infection is controlled and continue for 48 hours after healing. For less severe infection 3–4 times daily is generally sufficient.
- *Eye ointment*, apply *either* at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

Antifungals

Fungal infections of the cornea are rare. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Debility or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent in Scotland or Northern Ireland), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk.

Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 649. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Also see systemic treatment of CMV retinitis.

Antibacterials in neonates

Antibacterial eye drops are used to treat acute bacterial conjunctivitis in neonates (ophthalmia neonatorum); where possible the causative microorganism should be identified. Chloramphenicol eye drops are used to treat mild conjunctivitis; more serious infections also require a systemic antibacterial. Failure to respond to initial treatment requires further investigation; chlamydial infection is one of the most frequent causes of neonatal conjunctivitis and should be considered. Azithromycin eye drops are licensed to treat trachomatous conjunctivitis caused by *Chlamydia trachomatis* and purulent bacterial conjunctivitis in neonates. However, as there is a risk of simultaneous infection at other sites in neonates and children under 3 months presenting with conjunctivitis caused by *Chlamydia trachomatis*, systemic treatment with oral erythromycin p. 316 is required. *Gonococcal eye infections* are treated with a single-dose of parenteral cefotaxime p. 307 or ceftriaxone p. 308. Gentamicin eye drops together with appropriate systemic antibacterials are used in the treatment of *pseudomonal eye infections*; high-strength gentamicin eye drops (1.5%) [unlicensed] are available for severe infections.

3.1 Bacterial eye infection

ANTIBACTERIALS > AMINOGLYCOSIDES

Gentamicin

● INDICATIONS AND DOSE

Bacterial eye infections

► TO THE EYE

- Child: Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

● INTERACTIONS → Appendix 1: aminoglycosides

● PRESCRIBING AND DISPENSING INFORMATION Eye drops may be sourced as a manufactured special or from specialist importing companies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride

► Gentamicin (Non-proprietary)

Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% ear/eye drops | 10 ml [PoM] £2.14 DT price = £2.15

Tobramycin

30-Nov-2016

● INDICATIONS AND DOSE

Local treatment of infections

► TO THE EYE

- Child 1–17 years: Apply twice daily for 6–8 days

Local treatment of infections (severe infection)

► TO THE EYE

- Child 1–17 years: Apply 4 times a day for first day, then apply twice daily for 5–7 days

● INTERACTIONS → Appendix 1: aminoglycosides

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzododecinium bromide

► Tobravisc (Alcon Laboratories (UK) Ltd)

Tobramycin 3 mg per 1 ml Tobravisc 3mg/ml eye drops | 15 ml [PoM] £4.74

ANTIBACTERIALS > MACROLIDES

Azithromycin

● INDICATIONS AND DOSE

Trachomatous conjunctivitis caused by *Chlamydia trachomatis* | Purulent bacterial conjunctivitis

► TO THE EYE

- Child: Apply twice daily for 3 days, review if no improvement after 3 days of treatment

● INTERACTIONS → Appendix 1: macrolides

● SIDE-EFFECTS

- **Common or very common** Blurred vision · ocular burning · ocular discomfort · ocular pruritus
- **Uncommon** Conjunctival hyperaemia · eyelid eczema · eyelid erythema · eyelid oedema · keratitis

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

► Azyter (Thea Pharmaceuticals Ltd)

Azithromycin dihydrate 15 mg per 1 gram Azyter 15mg/g eye drops 0.25g unit dose | 6 unit dose [PoM] £6.99 DT price = £6.99

ANTIBACTERIALS > QUINOLONES

Ciprofloxacin

● INDICATIONS AND DOSE

Superficial bacterial eye infection

► TO THE EYE USING EYE DROP

- Child: Apply 4 times a day for maximum duration of treatment 21 days

► TO THE EYE USING EYE OINTMENT

- Child 1–17 years: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days

Superficial bacterial eye infection (severe infection)

► TO THE EYE USING EYE DROP

- Child: Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days

Corneal ulcer

► TO THE EYE USING EYE DROP

- Child: Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night
- TO THE EYE USING EYE OINTMENT
- Child 1–17 years: Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night

● UNLICENSED USE Eye ointment not licensed for use in children under 1 year.

● INTERACTIONS → Appendix 1: quinolones

● SIDE-EFFECTS

- **Common or very common** Corneal deposits (reversible after completion of treatment) · ocular discomfort · ocular hyperaemia · taste disturbance
- **Uncommon** Increased lacrimation · blurred vision · conjunctival hyperaemia · corneal infiltrates · corneal staining · eye dryness · eye irritation · eye pain · eye pruritus · eye swelling · eyelid disorders · eyelid erythema · eyelid exfoliation · eyelid oedema · headache · keratopathy · nausea · photophobia
- **Rare** Abdominal pain · asthenopia · corneal disorders · corneal epithelium defect · dermatitis · diarrhoea · diplopia · dizziness · ear pain · eye hypoaesthesia · keratitis · paranasal sinus hypersecretion · rhinitis

● PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

● BREAST FEEDING Manufacturer advises caution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► Ciloxan (Alcon Laboratories (UK) Ltd)

Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml Ciloxan 0.3% eye drops | 5 ml [PoM] £4.70 DT price = £4.70

Eye ointment

- **Ciloxan** (Alcon Laboratories (UK) Ltd)
Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 gram Ciloxan 3mg/g eye ointment | 3.5 gram [PoM] £5.22

Levofloxacin**● INDICATIONS AND DOSE****Local treatment of eye infections**

- TO THE EYE
- Child 1–17 years: Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days

- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
- **Common or very common** Ocular burning · visual disturbances
- **Uncommon** Conjunctival follicles · headache · lid erythema · lid oedema · ocular discomfort · ocular dryness · ocular itching · ocular pain · photophobia · rhinitis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose levofloxacin eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► **Levofloxacin (Non-proprietary)**

Levofloxacin (as Levofloxacin hemihydrate) 5 mg per 1 ml Levofloxacin 5mg/ml eye drops | 5 ml [PoM] £6.25

► **Oftraquix** (Santen UK Ltd)

Levofloxacin (as Levofloxacin hemihydrate) 5 mg per 1 ml Oftraquix 5mg/ml eye drops 0.3ml unit dose | 30 unit dose [PoM] £17.95
Oftraquix 5mg/ml eye drops | 5 ml [PoM] £6.95

Moxifloxacin**● INDICATIONS AND DOSE****Local treatment of infections**

- TO THE EYE
- Child: Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days

- **CAUTIONS** Not recommended for neonates
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
- **Common or very common** Hyperaemia · ocular discomfort · ocular dryness · ocular irritation · ocular pain · taste disturbances
- **Uncommon** Conjunctival haemorrhage · corneal disorders · corneal erosion · corneal keratitis · corneal staining · eyelid erythema · headache · nasal discomfort · paraesthesia · pharyngolaryngeal pain · visual disturbances · vomiting
- **Frequency not known** Dizziness · dyspnoea · nausea · palpitation · photophobia · pruritus · raised intra-ocular pressure · rash

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops► **Moxivig** (Alcon Laboratories (UK) Ltd)

Moxifloxacin (as Moxifloxacin hydrochloride) 5 mg per 1 ml Moxivig 0.5% eye drops | 5 ml [PoM] £9.80

Ofloxacin**● INDICATIONS AND DOSE****Local treatment of infections**

- TO THE EYE
- Child 1–17 years: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment

- **CAUTIONS** Corneal ulcer (risk of corneal perforation) · epithelial defect (risk of corneal perforation)
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
- **Common or very common** Ocular discomfort
- **Frequency not known** Dry eyes · facial oedema · increased lacrimation · keratitis · ocular hyperaemia · ocular oedema · photophobia · visual disturbances
- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk (systemic quinolones have caused arthropathy in *animal* studies).
- **BREAST FEEDING** Manufacturer advises avoid.

● MEDICINAL FORMS

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► **Exocin** (Allergan Ltd)

Ofloxacin 3 mg per 1 ml Exocin 0.3% eye drops | 5 ml [PoM] £2.17
DT price = £2.17

ANTIBACTERIALS > OTHER**Chloramphenicol**

- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

● INDICATIONS AND DOSE**Superficial eye infections**

- TO THE EYE USING EYE DROP
- Child: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient
- TO THE EYE USING EYE OINTMENT
- Child: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

- **INTERACTIONS** → Appendix 1: chloramphenicol
- **SIDE-EFFECTS** Transient stinging
- **PREGNANCY** Avoid unless essential—no information on *topical* use but risk of 'neonatal grey-baby syndrome' with *oral* use in third trimester.
- **BREAST FEEDING** Avoid unless essential—*theoretical* risk of bone-marrow toxicity.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose chloramphenicol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Chloramphenicol for eye infections www.medicinesforchildren.org.uk/chloramphenicol-eye-infections-0

- **EXCEPTIONS TO LEGAL CATEGORY** Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Phenylmercuric acetate

► Chloramphenicol (Non-proprietary)

Chloramphenicol 5 mg per 1 mL Minimis chloramphenicol 0.5% eye drops 0.5 mL unit dose | 20 unit dose [PoM] £10.99 DT price = £10.99
Chloramphenicol Antibiotic 0.5% eye drops | 10 mL [P] £1.70 DT price = £1.52
Chloramphenicol 0.5% eye drops | 10 mL [PoM] £2.20 DT price = £1.52

► Chloromycetin (AMCo)

Chloramphenicol 5 mg per 1 mL Chloromycetin Redidrops 0.5% | 10 mL [PoM] £0.90 DT price = £1.52

Eye ointment

► Chloramphenicol (Non-proprietary)

Chloramphenicol 10 mg per 1 gram Chloramphenicol 1% eye ointment | 4 gram [PoM] £2.27 DT price = £2.27

► Chloromycetin (AMCo)

Chloramphenicol 10 mg per 1 gram Chloromycetin 1% eye ointment | 4 gram [PoM] £1.08 DT price = £2.27

► Klorafect (Blumont Pharma Ltd)

Chloramphenicol 10 mg per 1 gram Klorafect 1% eye ointment | 4 gram [PoM] £1.81 DT price = £2.27

Fusidic acid

16-Jun-2017

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

● INDICATIONS AND DOSE

Staphylococcal eye infections

- TO THE EYE
- Child: Apply twice daily

- **INTERACTIONS** → Appendix 1: fusidic acid

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Fusidic acid (Non-proprietary)

Fusidic acid 10 mg per 1 gram Fusidic acid 1% modified-release eye drops | 5 gram [PoM] £29.06 DT price = £29.06

ANTIPROTOZOALS

Propamidine isetionate

● INDICATIONS AND DOSE

Acanthamoeba keratitis infections (specialist use only) | Local treatment of eye infections

- TO THE EYE USING EYE OINTMENT
- Child: Apply 1–2 times a day
- TO THE EYE USING EYE DROP
- Child: Apply up to 4 times a day

- **UNLICENSED USE** Not licensed for *acanthamoeba keratitis* infections.
- **SIDE-EFFECTS** Eye irritation · eye pain
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

► Brolene (Dibrompropamidine) (Sanofi)

Dibrompropamidine isetionate 1.5 mg per 1 gram Brolene 0.15% eye ointment | 5 gram [P] £2.92 DT price = £3.49

► Golden Eye (dibrompropamidine) (Cambridge Healthcare Supplies Ltd)

Dibrompropamidine isetionate 1.5 mg per 1 gram Golden Eye 0.15% ointment | 5 gram [P] £3.49 DT price = £3.49

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► Brolene (Propamidine) (Sanofi)

Propamidine isetionate 1 mg per 1 mL Brolene 0.1% eye drops | 10 mL [P] £2.80

► Golden Eye (propamidine) (Cambridge Healthcare Supplies Ltd)

Propamidine isetionate 1 mg per 1 mL Golden Eye 0.1% drops | 10 mL [P] £3.26

3.2 Viral eye infection

3.2a Ophthalmic herpes simplex

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Aciclovir

(Acyclovir)

● INDICATIONS AND DOSE

Herpes simplex infection (local treatment)

► TO THE EYE USING EYE OINTMENT

- Child: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing

- **INTERACTIONS** → Appendix 1: aciclovir

● SIDE-EFFECTS

- **Common or very common** Local inflammation · local irritation · superficial punctate keratopathy
- **Rare** Blepharitis
- **Very rare** Angioedema · hypersensitivity reactions

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Aciclovir eye ointment for herpes simplex infections www.medicinesforchildren.org.uk/aciclovir-eye-ointment-for-herpes-simplex-infection

● MEDICINAL FORMS

Eye ointment

► Zovirax (GlaxoSmithKline UK Ltd)

Aciclovir 30 mg per 1 gram Zovirax 3% ophthalmic ointment | 4.5 gram [PoM] £9.34 DT price = £9.34

4 Eye procedures

Mydriatics and cycloplegics

Overview

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide 0.5% p. 650 (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Cyclopentolate hydrochloride 1% p. 641 (action up to 24 hours) or atropine sulfate p. 641 (action up to 7 days) are

preferable for producing cycloplegia for refraction in young children; tropicamide may be preferred in neonates.

Phenylephrine hydrochloride p. 651 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 642 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

ANTIMUSCARINICS

p. 641

Tropicamide

● INDICATIONS AND DOSE

Funduscopy

► TO THE EYE

- Neonate: 0.5% eye drops to be applied 20 minutes before examination.
- Child: 0.5% eye drops to be applied 20 minutes before examination

● INTERACTIONS → Appendix 1: tropicamide

● PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, edetic acid (edta)

► Mydracyl (Alcon Laboratories (UK) Ltd)

Tropicamide 5 mg per 1 ml Mydracyl 0.5% eye drops | 5 ml [PoM] £1.29

Tropicamide 10 mg per 1 ml Mydracyl 1% eye drops | 5 ml [PoM] £1.60

► Tropicamide (Bausch & Lomb UK Ltd)

Tropicamide 5 mg per 1 ml Minims tropicamide 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.75

Tropicamide 10 mg per 1 ml Minims tropicamide 1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.77

ANTISEPTICS AND DISINFECTANTS > IODINE PRODUCTS

Povidone-iodine

● INDICATIONS AND DOSE

Cutaneous peri-ocular and conjunctival antisepsis before ocular surgery

► TO THE EYE

- Neonate: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%.
- Child: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

● CONTRA-INDICATIONS

Concomitant use of ocular antimicrobial drugs · concomitant use of ocular formulations containing mercury-based preservatives · preterm neonates

● SIDE-EFFECTS

- Rare Conjunctival hyperaemia · superficial punctate keratitis
- Frequency not known Cytotoxicity on deep tissue · cytotoxicity on mucous membranes · hypothyroidism in neonates · residual yellow coloration of the conjunctiva

● PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose povidone iodine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

► Povidone iodine (Bausch & Lomb UK Ltd)

Povidone-iodine 50 mg per 1 ml Minims povidone iodine 5% eye drops 0.4ml unit dose | 20 unit dose [PoM] £16.00

DIAGNOSTIC AGENTS > DYES

Fluorescein sodium

● INDICATIONS AND DOSE

Detection of lesions and foreign bodies

► TO THE EYE USING EYE DROP

- Child: Use sufficient amount to stain damaged areas

● PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

► Fluorescein sodium (Bausch & Lomb UK Ltd)

Fluorescein sodium 10 mg per 1 ml Minims fluorescein sodium 1% eye drops 0.5ml unit dose | 20 unit dose [P] £8.89

Fluorescein sodium 20 mg per 1 ml Minims fluorescein sodium 2% eye drops 0.5ml unit dose | 20 unit dose [P] £8.89

MIOTICS > PARASYMPATHOMIMETICS

Acetylcholine chloride

● INDICATIONS AND DOSE

Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis

► TO THE EYE

- Child: (consult product literature)

● UNLICENSED USE

Not licensed for use in children.

● CAUTIONS

Asthma · gastro-intestinal spasm · heart failure · hyperthyroidism · peptic ulcer · urinary-tract obstruction

● INTERACTIONS → Appendix 1: acetylcholine

● PREGNANCY

Avoid unless potential benefit outweighs risk—no information available.

● BREAST FEEDING

Avoid unless potential benefit outweighs risk—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Irrigation

► Miochol-E (Bausch & Lomb UK Ltd)

Acetylcholine chloride 20 mg Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 1 vial [PoM] £7.28

► Miphtel (Alan Pharmaceuticals)

Acetylcholine chloride 20 mg Miphtel 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoule [PoM] £43.68 (Hospital only)

SYMPATHOMIMETICS > VASOCONSTRICTOR**Phenylephrine hydrochloride****● INDICATIONS AND DOSE****Mydriasis****► TO THE EYE**

- Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

- **CONTRA-INDICATIONS** 10% strength eye drops in children · 10% strength eye drops in neonates · aneurysms · cardiovascular disease · hypertension · thyrotoxicosis

- **CAUTIONS** Asthma · corneal epithelial damage · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · diabetes (avoid eye drops in long standing diabetes) · mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber · neonates are at an increased risk of systemic toxicity · ocular hyperaemia · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS** Arrhythmias · blurred vision · conjunctivitis on prolonged administration · coronary artery spasm · extrasystoles · hyperaemia on prolonged administration · hypertension · local irritation on prolonged administration · myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease) · oedema on prolonged administration · palpitation · photophobia · raised intraocular pressure · tachycardia · transient stinging

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose phenylephrine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● PATIENT AND CARER ADVICE**Driving and skilled tasks**

Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Disodium edetate, sodium metabisulfite

- **Phenylephrine hydrochloride** (Bausch & Lomb UK Ltd)

Phenylephrine hydrochloride 25 mg per 1 ml Minims phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose **P** £11.41

Sodium hyaluronate p. 645 is used during surgical procedures on the eye.

Apraclonidine p. 658, an α_2 -adrenoceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used for short-term treatment only.

Balanced Salt Solution is used routinely in intra-ocular surgery.

Povidone-iodine p. 650 is used for peri-ocular and conjunctival antiseptics before ocular surgery to support postoperative infection control.

Local anaesthetics

Oxybuprocaine hydrochloride below and tetracaine p. 652 are widely used topical local anaesthetics. Proxymetacaine hydrochloride p. 652 causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride p. 796 and fluorescein sodium p. 650 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 132, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

ANAESTHETICS, LOCAL**Fluorescein with lidocaine****● INDICATIONS AND DOSE****Local anaesthesia****► TO THE EYE**

- Child: Apply as required

- **CONTRA-INDICATIONS** Avoid in pre-term neonate (immature metabolising enzyme system)

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose lidocaine and fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- **Lidocaine and Fluorescein** (Bausch & Lomb UK Ltd)

Fluorescein sodium 2.5 mg per 1 ml, Lidocaine hydrochloride 40 mg per 1 ml Minims lidocaine and fluorescein eye drops 0.5ml unit dose | 20 unit dose **PoM** £11.24

Oxybuprocaine hydrochloride

(Benoxinate hydrochloride)

● INDICATIONS AND DOSE**Local anaesthetic****► TO THE EYE**

- Child: Apply as required

- **CONTRA-INDICATIONS** Avoid in preterm neonates

- **INTERACTIONS** → Appendix 1: anaesthetics, local

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose oxybuprocaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

4.1 Post-operative pain and inflammation**Eye, surgical and peri-operative drug use****Ocular peri-operative drugs**

Drugs used to prepare the eye for surgery and drugs that are injected into the anterior chamber at the time of surgery are included here.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- **Oxybuprocaine hydrochloride** (Bausch & Lomb UK Ltd)
Oxybuprocaine hydrochloride 4 mg per 1 ml Minimises oxybuprocaine hydrochloride 0.4% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.15

Proxymetacaine hydrochloride

● INDICATIONS AND DOSE

Local anaesthetic

- TO THE EYE
- Child: Apply as required

- **CONTRA-INDICATIONS** Avoid in preterm neonates
- **INTERACTIONS** → Appendix 1: anaesthetics, local
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose proxymetacaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- **Proxymetacaine** (Bausch & Lomb UK Ltd)
Proxymetacaine hydrochloride 5 mg per 1 ml Minimises proxymetacaine 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.54

Tetracaine

(Amethocaine)

● INDICATIONS AND DOSE

Local anaesthetic

- TO THE EYE
- Child: Apply as required

- **UNLICENSED USE** Not licensed for use in neonates.
- **CONTRA-INDICATIONS** Avoid in preterm neonates
- **INTERACTIONS** → Appendix 1: anaesthetics, local
- **SIDE-EFFECTS** Local skin reactions
- **SIDE-EFFECTS, FURTHER INFORMATION**
The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems; systemic side effects unlikely as minimal absorption following topical application.
- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tetracaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

5 Glaucoma and ocular hypertension

Glaucoma

Overview

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage and is generally associated with raised intra-ocular pressure.

Glaucoma is rare in children and should always be managed by a specialist. *Primary congenital glaucoma* is the most common form of glaucoma in children, followed by *secondary glaucomas*, such as following hereditary anterior segment malformations; *juvenile open-angle glaucoma* is less common and usually occurs in older children.

Treatment of glaucoma is determined by the pathophysiology and usually involves controlling raised intra-ocular pressure with surgery. Drug therapy is generally supportive, and can be used temporarily, pre- or post-operatively, or both, to reduce intra-ocular pressure. In secondary glaucomas, drug therapy is often used first-line, and long-term treatment may be required. Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue can be used. It may be necessary to combine these drugs or add others, such as carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Children with an acute form of glaucoma (usually presenting with pain in older children, a cloudy cornea, and may be associated with a previous history of controlled glaucoma or recent intra-ocular surgery) need immediate referral for specialist ophthalmology assessment and treatment.

Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary and secondary glaucomas, probably by reducing the rate of production of aqueous humour.

Prostaglandin analogues

The prostaglandin analogues latanoprost p. 657, and travoprost, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure. Only latanoprost (*Xalatan*®) and certain non-proprietary preparations of latanoprost is licensed for use in children. Children receiving prostaglandin analogues should be managed by a specialist.

Sympathomimetics

Apraclonidine p. 658 is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used for a short period to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

Brimonidine tartrate, an alpha₂-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

Carbonic anhydrase inhibitors and systemic drugs

The **carbonic anhydrase inhibitors**, acetazolamide p. 655, brinzolamide p. 656, and dorzolamide p. 656, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

Acetazolamide is given by mouth or, rarely in children, by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are unlicensed in children but are used in those resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

Metabolic acidosis can occur in children using topical carbonic anhydrase inhibitors; symptoms may include poor feeding and lack of weight gain.

Miotics

Miotics act by opening up the inefficient drainage channels in the trabecular meshwork. Pilocarpine p. 657 is a miotic used pre- and post-operatively in goniotomy and trabeculotomy; it is used occasionally for aphakic glaucoma.

BETA-ADRENOCEPTOR BLOCKERS

Betaxolol

● INDICATIONS AND DOSE

Primary and secondary glaucomas

► TO THE EYE

► Child: Apply twice daily

● **UNLICENSED USE** Not licensed for use in children.

● **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block

● **CAUTIONS** Patients with corneal disease

CAUTIONS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

● **INTERACTIONS** → Appendix 1: beta blockers (selective)

- **SIDE-EFFECTS** Anaphylaxis · blepharoconjunctivitis · burning · corneal disorders · cough, rather than wheeze, may occur · dry eyes · erythema · itching · ocular stinging · pain

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose bexatolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

▶ Betagan (Allergan Ltd)

Levobunolol hydrochloride 5 mg per 1 ml Betagan 0.5% eye drops | 5 ml [PoM] £1.85 DT price = £1.85

Betagan Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit dose [PoM] £9.98

Timolol maleate

INDICATIONS AND DOSE

Primary congenital and primary juvenile glaucoma, for a transitional period, before surgery or following failed surgery

▶ TO THE EYE

▶ Child: (consult product literature)

TIMOPTOL-LA®

Reduction of intra-ocular pressure in primary and secondary glaucoma

▶ TO THE EYE

▶ Child: Apply once daily

TIOPEX®

Reduction of intra-ocular pressure primary and secondary glaucomas

▶ TO THE EYE

▶ Child: Apply once daily, to be applied in the morning

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block
- **CAUTIONS** Consider also cautions listed for systemically administered beta blockers · patients with corneal disease

- **INTERACTIONS** → Appendix 1: beta blockers (non-selective)
- **SIDE-EFFECTS** Anaphylaxis · blepharoconjunctivitis · burning · corneal disorders · cough, rather than wheeze, may occur · dry eyes · erythema · itching · ocular stinging · pain

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

- **BREAST FEEDING** Manufacturer advises avoidance.
- **NATIONAL FUNDING/ACCESS DECISIONS**

TIOPLEX®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2014) that timolol gel eye drops (*Tiopex*®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye gel

EXCIPIENTS: May contain Benzododecinium bromide

▶ Timoptol-LA (Santen UK Ltd)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timoptol-LA 0.25% ophthalmic gel-forming solution | 2.5 ml [PoM] £3.12 DT price = £3.12
Timolol (as Timolol maleate) 5 mg per 1 ml Timoptol-LA 0.5% ophthalmic gel-forming solution | 2.5 ml [PoM] £3.12 DT price = £3.12

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ Timolol maleate (Non-proprietary)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timolol 0.25% eye drops | 5 ml [PoM] £1.76 DT price = £1.43

Timolol (as Timolol maleate) 5 mg per 1 ml Timolol 0.5% eye drops | 5 ml [PoM] £1.95 DT price = £1.25

▶ Timoptol (Santen UK Ltd)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timoptol 0.25% eye drops | 5 ml [PoM] £3.12 DT price = £1.43

Timoptol Unit Dose 0.25% ophthalmic solution 0.2ml unit dose | 30 unit dose [PoM] £8.45 DT price = £8.45

Timolol (as Timolol maleate) 5 mg per 1 ml Timoptol 0.5% eye drops | 5 ml [PoM] £3.12 DT price = £1.25

Timoptol Unit Dose 0.5% ophthalmic solution 0.2ml unit dose | 30 unit dose [PoM] £9.65 DT price = £9.65

▶ Tiopex (Thea Pharmaceuticals Ltd)

Timolol (as Timolol maleate) 1 mg per 1 gram Tiopex 1mg/g eye gel 0.4g unit dose | 30 unit dose [PoM] £7.49 DT price = £7.49

Combinations available: **Dorzolamide with timolol**, p. 657

CARBONIC ANHYDRASE INHIBITORS

Acetazolamide

● INDICATIONS AND DOSE

Glaucoma

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12-17 years: 250–500 mg daily

Epilepsy

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION

- ▶ Neonate: Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day.

- ▶ Child 1 month–11 years: Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day; maximum 750 mg per day
- ▶ Child 12–17 years: 250 mg 2–4 times a day

Reduction of intra-ocular pressure in primary and secondary glaucoma (specialist use only)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years: 5 mg/kg 2–4 times a day, adjusted according to response; maximum 750 mg per day
- ▶ Child 12–17 years: 250 mg 2–4 times a day

Raised intracranial pressure

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years: Initially 8 mg/kg 3 times a day, then increased if necessary up to 100 mg/kg daily

- **UNLICENSED USE** Not licensed for the treatment of glaucoma.
- **CONTRA-INDICATIONS** Adrenocortical insufficiency · hyperchloraemic acidosis · hypokalaemia · hyponatraemia · long-term administration in chronic angle-closure glaucoma
- **CAUTIONS** Avoid extravasation at injection site (risk of necrosis) · diabetes mellitus · impaired alveolar ventilation (risk of acidosis) · not generally recommended for long-term use · pulmonary obstruction (risk of acidosis) · renal calculi

- **INTERACTIONS** → Appendix 1: acetazolamide

● SIDE-EFFECTS

- ▶ **Common or very common** Ataxia · depression · diarrhoea · dizziness · excitement · fatigue · flushing · headache · irritability · loss of appetite · nausea · paraesthesia · polyuria · taste disturbance · thirst · vomiting
- ▶ **Uncommon** Blood disorders · bone marrow suppression · confusion · crystalluria · drowsiness · electrolyte disturbances on long-term therapy · fever · glycosuria · haematuria · hearing disturbances · melaena · metabolic acidosis · rash · renal calculi · renal colic · renal failure · renal lesions · Stevens-Johnson syndrome · toxic epidermal necrosis · ureteric colic
- ▶ **Rare** Cholestatic jaundice · convulsions · flaccid paralysis · fulminant hepatic necrosis · hepatitis · photosensitivity
- ▶ **Frequency not known** Transient myopia

SIDE-EFFECTS, FURTHER INFORMATION

Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—patients should be told to report any unusual skin rash.

If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering potassium bicarbonate (as effervescent potassium tablets).

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid, especially in first trimester (toxicity in *animal studies*).
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid—risk of metabolic acidosis.
- **MONITORING REQUIREMENTS** Monitor blood count and plasma electrolyte concentrations with prolonged use.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 3

▶ Acetazolamide (Non-proprietary)

Acetazolamide 250 mg Acetazolamide 250mg tablets | 112 tablet [PoM] £75.36 DT price = £28.20

Powder for solution for injection

▶ Diamox (AMCO)

Acetazolamide 500 mg Diamox Sodium Parenteral 500mg powder for solution for injection vials | 1 vial [PoM] £14.76

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 3, 25

► **Diamox SR** (AMCO)**Acetazolamide 250 mg** Diamox SR 250mg capsules | 30 capsule [PoM] £16.66 DT price = £16.66► **Eytazox** (Teva UK Ltd)**Acetazolamide 250 mg** Eytazox 250mg modified-release capsules | 30 capsule [PoM] £16.60 DT price = £16.66**Brinzolamide**● **INDICATIONS AND DOSE****Reduction of intra-ocular pressure in primary and secondary glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone if unresponsive to beta-blockers or if beta-blockers contra-indicated**► **TO THE EYE**

- Child: Apply twice daily, then increased if necessary up to 3 times a day

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Hyperchloraemic acidosis

- **CAUTIONS** Renal tubular immaturity or abnormality—risk of metabolic acidosis · systemic absorption follows topical application

- **INTERACTIONS** → Appendix 1: brinzolamide

● **SIDE-EFFECTS**

- **Common or very common** Corneal erosion · corneal oedema · dry mouth · headache · ocular disturbances · photophobia · reduced visual acuity · taste disturbances
- **Uncommon** Alopecia · amnesia · bradycardia · chest pain · cough · decreased libido · depression · diarrhoea · dizziness · drowsiness · dyspepsia · dyspnoea · epistaxis · erectile dysfunction · flatulence · malaise · nasal dryness · nausea · nervousness · oesophagitis · oral hypoesthesia and paraesthesia · palpitation · paraesthesia · pharyngitis · renal pain · sinusitis · sleep disturbances · throat irritation · tinnitus · upper respiratory tract congestion · vomiting
- **Frequency not known** Arrhythmia · asthma · dermatitis · erythema · hypertension · peripheral oedema · pollakiuria · rhinitis · tachycardia · tremor · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Use only if benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

Cosopt eye drops | 5 ml [PoM] £10.05 DT price = £1.81

MIOTICS > PARASYMPATHOMIMETICS

Pilocarpine

- **DRUG ACTION** Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

● INDICATIONS AND DOSE

Raised intra-ocular pressure

- ▶ TO THE EYE
- ▶ Child 1 month–1 year: Apply 1 drop 3 times a day, doses are for 0.5% or 1% solution
- ▶ Child 2–17 years: Apply 1 drop 4 times a day

Pre- and postoperatively in goniotomy and trabeculotomy

- ▶ TO THE EYE
- ▶ Child: Apply once daily, 1% or 2% solution to be applied

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Acute inflammatory disease of the anterior segment · acute iritis · anterior uveitis · conditions where pupillary constriction is undesirable · some forms of secondary glaucoma (where pupillary constriction is undesirable)

- **CAUTIONS** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdose · asthma · cardiac disease · care in conjunctival damage · care in corneal damage · epilepsy · gastro-intestinal spasm · hypertension · hyperthyroidism · hypotension · peptic ulceration · retinal detachment has occurred in susceptible individuals and those with retinal disease · urinary-tract obstruction

- **INTERACTIONS** → Appendix 1: pilocarpine

● SIDE-EFFECTS

- ▶ **Rare** Parasympathomimetics systemic side effects

- ▶ **Frequency not known** Blurred vision · ciliary spasm (leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment—a particular disadvantage in patients under 40 years of age) · conjunctival vascular congestion · lens changes (with chronic use) · myopia · ocular burning · ocular itching · pupillary block · smarting · vitreous haemorrhage
- **PREGNANCY** Avoid unless the potential benefit outweighs risk—limited information available.
- **BREAST FEEDING** Avoid unless the potential benefit outweighs risk—no information available.
- **PRE-TREATMENT SCREENING** Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).
- **MONITORING REQUIREMENTS** Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks
Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ Pilocarpine (Non-proprietary)

Pilocarpine hydrochloride 10 mg per 1 ml Pilocarpine hydrochloride 1% eye drops | 10 ml [PoM] £16.10 DT price = £13.44

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

Latanoprost

● INDICATIONS AND DOSE

Reduction of intra-ocular pressure in raised intra-ocular pressure and glaucoma

- ▶ TO THE EYE
- ▶ Child: Apply once daily, to be administered preferably in the evening

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015)

Following reformulation of Xalatan®, to allow for long-term storage at room temperature, there has been an increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.

- **CONTRA-INDICATIONS** Active herpes simplex keratitis · history of recurrent herpetic keratitis associated with prostaglandin analogues
- **CAUTIONS** Aphakia · asthma · children less than 1 year—limited information available · history of herpetic keratitis · history of significant ocular viral infections · peri-operative period of cataract surgery · preterm neonates less than 36 weeks gestational age—no information available · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis
- **SIDE-EFFECTS**
 - **Common or very common** Blepharitis · conjunctival hyperaemia · eye irritation · eye pain · eyelash and vellus hair changes · increased iris pigmentation · transient punctate epithelial erosion
 - **Uncommon** Blurred vision · conjunctivitis · dry eye · eyelid oedema · keratitis · skin rash
 - **Rare** Corneal erosion · corneal oedema · distichiasis · iritis · macular oedema · misdirected eyelashes · periorbital oedema · photophobia · uveitis
 - **Very rare** Chest pain · darkening of palpebral skin of the eyelids · localised skin reaction on the eyelids · periorbital changes resulting in deepening of the eyelid sulcus
 - **Frequency not known** Arthralgia · asthma · dizziness · dyspnoea · exacerbation of asthma · headache · herpetic keratitis · iris cyst · myalgia · nasopharyngitis · palpitation · pyrexia
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** May be present in milk—manufacturer advises avoid.
- **MONITORING REQUIREMENTS** Monitor for changes to eye coloration.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE**

Changes in eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.
- **NATIONAL FUNDING/ACCESS DECISIONS**

MONOPOST®**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2013) that *Monopost®* is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS**Apraclonidine**

- **DRUG ACTION** Apraclonidine is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

● **INDICATIONS AND DOSE****Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery**► **TO THE EYE**

- **Child:** Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug► **TO THE EYE**

- **Child 12-17 years:** Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

- **UNLICENSED USE** 0.5% drops are not licensed for use in children under 12 years. 1% drops are not licensed for use in children.
- **CONTRA-INDICATIONS** History of severe or unstable and uncontrolled cardiovascular disease
- **CAUTIONS** Cerebrovascular disease · depression · heart failure · history of angina · hypertension · loss of effect may occur over time · Raynaud's syndrome · recent myocardial infarction · reduction in vision in end-stage glaucoma (suspend treatment) · severe coronary insufficiency · thromboangiitis obliterans · vasovagal attack
- **INTERACTIONS** → Appendix 1: apraclonidine
- **SIDE-EFFECTS**
 - **Common or very common** Conjunctivitis · dry eye · ocular intolerance · rhinitis · taste disturbance
 - **Uncommon** Asthma · blepharitis · blepharospasm · chest pain · conjunctival vascular disorders · corneal erosion and infiltrates · dyspnoea · eyelid ptosis or retraction · impaired co-ordination · irritability · keratitis · keratopathy · myalgia · mydriasis · nervousness · parosmia · photophobia · rhinorrhoea · throat irritation · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION

- **Ocular intolerance** Withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.
- **Systemic effects** Since absorption may follow topical application, see clonidine hydrochloride p. 99.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.
- **MONITORING REQUIREMENTS**
 - Monitor intra-ocular pressure and visual fields.
 - Monitor for excessive reduction in intra-ocular pressure following peri-operative use.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

DRUGS FOR METABOLIC DISORDERS >

ANTIOXIDANTS

Idebenone

31-May-2017

- **DRUG ACTION** Idebenone is a nootropic and antioxidant that is thought to act by restoring cellular ATP generation, thereby reactivating retinal ganglion cells.

INDICATIONS AND DOSE

Leber's Hereditary Optic Neuropathy (initiated by a specialist)

► BY MOUTH

► Child 12-17 years: 300 mg 3 times a day

SIDE-EFFECTS

- **Common or very common** Back pain · cough · diarrhoea · nasopharyngitis
- **Frequency not known** Anorexia · azotaemia · blood disorders · bronchitis · chromaturia · dyspepsia · hepatitis · malaise · nausea · nervous system disorders · pain in extremity · pruritus · raised lipids · raised liver enzymes · rash · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Chromaturia** The metabolites of idebenone may cause red-brown discolouration of the urine. This effect is harmless, but the manufacturer advises caution as this may mask colour changes due to other causes (e.g. renal or blood disorders).
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution—no information available.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2017) that idebenone (*Raxone*®) is accepted for restricted use within NHS Scotland for the treatment of visual impairment in patients with Leber's Hereditary Optic Neuropathy (LHON) who are not yet blind i.e. they do not meet the UK criteria to be registered as severely sight impaired. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

Ear

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the lining of the ear canal usually associated with an underlying seborrhoeic dermatitis or eczema; it is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping.

A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as aluminium acetate solution p. 664. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

Secondary infection in otitis externa may be of bacterial, fungal, or viral origin. If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 662 or **clioquinol**) may be used, but for only about a week because excessive use may result in fungal infections that are difficult to treat. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 662 may be used, but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating children when infection is present with inflammation and eczema. Clotrimazole 1% solution p. 662 is used topically to treat fungal infection in otitis externa.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical **aminoglycosides** or **polymyxins** in children with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in children with chronic suppurative otitis media and when other measures have

failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of **acetic acid** 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (*EarCalm*® spray) is on sale to the public for children over 12 years.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 260 or ibuprofen p. 625, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin p. 330 is the drug of choice; oral ciprofloxacin p. 333 or a systemic aminoglycoside may be needed for pseudomonal infections, particularly in children with diabetes or compromised immunity.

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments are then required, but prolonged use should be avoided.

Otitis media

Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in young children and may occur with even minor upper respiratory tract infections. Children diagnosed with acute otitis media should not be prescribed antibacterials routinely as many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a **simple analgesic**, such as paracetamol, may be sufficient. In children without systemic features, a **systemic antibacterial** may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the child is systemically unwell, if the

child is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in children with *acute otitis media* usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial can be given. Topical antibacterial treatment of acute otitis media is ineffective and there is no place for ear drops containing a local anaesthetic.

Otitis media with effusion

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Antimicrobials, corticosteroids, decongestants, and antihistamines have little place in the routine management of otitis media with effusion. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

Chronic otitis media

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in children with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction, which may completely resolve long-standing infection. Cleansing may be followed by topical treatment as for otitis externa; this is particularly beneficial for discharging ears or infections of the mastoid cavity. Acute exacerbations of chronic infection may require treatment with an oral antibacterial; a swab should be taken to identify infecting organisms and antibacterial sensitivity.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin p. 647 or ofloxacin eye drops p. 648 used in the ear [unlicensed use] or ear drops [both unlicensed; available from 'special-order' manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing **aminoglycosides** or **polymyxins** [unlicensed indications] cautiously in children with chronic suppurative otitis media and perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

Removal of ear wax

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax causing discomfort or impaired hearing may be softened using simple remedies such as **olive oil** ear drops or **almond oil** ear drops; sodium bicarbonate ear drops p. 664 are also effective, but may cause dryness of the ear canal. If

the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The child should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 664 or urea hydrogen peroxide p. 665 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in children unable to co-operate with the procedure, in children who have had otitis media in the last six weeks, in otitis externa, in children with cleft palate, a history of ear drum perforation, or previous ear surgery. A child who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

Administration

To administer ear drops, lay the child down with the head turned to one side; for an infant pull the earlobe back and down, for an older child pull the earlobe back and up.

1 Otitis externa

ANTIBACTERIALS > AMINOGLYCOSIDES

Framycetin sulfate

• INDICATIONS AND DOSE

Bacterial infection in otitis externa

- ▶ TO THE EAR
- ▶ Child: (consult product literature)

- **CONTRA-INDICATIONS** Perforated tympanic membrane

- **CAUTIONS** Avoid prolonged use

- **SIDE-EFFECTS** Local sensitivity

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

Combinations available: **Dexamethasone with framycetin sulfate and gramicidin**, p. 663

Gentamicin

• INDICATIONS AND DOSE

Bacterial infection in otitis externa

- ▶ TO THE EAR
- ▶ Child: Apply 2–3 drops 4–5 times a day, (including a dose at bedtime)

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 660) • perforated tympanic membrane (although may be used by specialists, see Ear p. 660)

- **CAUTIONS** Avoid prolonged use

- **SIDE-EFFECTS** Local sensitivity

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride

► Gentamicin (Non-proprietary)

Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% ear/eye drops | 10 ml [PoM] £2.14 DT price = £2.15

Gentamicin with hydrocortisone

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

► TO THE EAR

► Child: Apply 2–4 drops 4–5 times a day, (including a dose at bedtime)

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 660) • perforated tympanic membrane (although may be used by specialists, see Ear p. 660)

- **CAUTIONS** Avoid prolonged use

- **SIDE-EFFECTS** Local sensitivity reactions

Urea hydrogen peroxide 50 mg per 1 gram Otex 5% ear drops | 8 ml Ⓟ £2.89 DT price = £2.89

Nose

Nose

Rhinitis and bacterial sinusitis

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials. Many nasal preparations contain sympathomimetic drugs which can give rise to rebound congestion (*rhinitis medicamentosa*) and may damage the nasal cilia. Sodium chloride 0.9% solution p. 561 may be used as a douche or 'sniff' following endonasal surgery.

Administration

To administer nasal drops, lay the child face-upward with the neck extended, instil the drops, then sit the child up and tilt the head forward.

Drugs used in nasal allergy

Mild allergic rhinitis is controlled by **antihistamines** (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 165) or topical **nasal corticosteroids**; systemic nasal decongestants are not recommended for use in children. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms can be relieved by topical nasal **corticosteroids**; sodium cromoglicate p. 671 is an alternative, but may be less effective. The topical antihistamine, azelastine hydrochloride p. 638, is useful for controlling breakthrough symptoms in allergic rhinitis. Azelastine hydrochloride is less effective than nasal corticosteroids, but probably more effective than sodium cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous long-term treatment may be required in perennial rhinitis.

Montelukast p. 159 is less effective than topical nasal corticosteroids; it can be used in children with seasonal allergic rhinitis (unresponsive to other treatments) and concomitant asthma.

Children with disabling symptoms of seasonal rhinitis (e.g. students taking important examinations), may be treated with oral **corticosteroids** for short periods. Oral corticosteroids may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal mucosa.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide p. 668 can reduce watery rhinorrhoea.

Corticosteroids

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Nasal polyps

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the child in the 'head down' position. A short course of a systemic corticosteroid may be required initially to shrink

large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

Pregnancy

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 669, budesonide p. 669, fluticasone p. 670, or sodium cromoglicate may be considered.

Topical nasal decongestants

Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions in children with rhinitis. In infants, 1–2 drops of sodium chloride 0.9% solution in each nostril before feeds will help relieve congestion and allow more effective suckling.

Inhalation of **warm moist air** is useful in the treatment of symptoms of acute nasal congestion in infants and children, but the use of boiling water for steam inhalation is dangerous for children and should **not** be recommended. Volatile substances such as menthol and eucalyptus may encourage inhalation of warm moist air (see also Aromatic inhalations, cough preparations and systemic nasal decongestants p. 180).

Topical nasal decongestants containing sympathomimetics can cause rebound congestion (*rhinitis medicamentosa*) following prolonged use (more than 7 days), and are therefore of limited value in the treatment of nasal congestion.

Ephedrine hydrochloride nasal drops below is the least likely of the sympathomimetic nasal decongestants to cause rebound congestion and can provide relief for several hours. The more potent sympathomimetic drugs **oxymetazoline** and **xylometazoline** hydrochloride p. 667 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide.

Recurrent, persistent bleeding may respond to the use of a sympathomimetic nasal spray; if infection is present, chlorhexidine and neomycin (*Naseptin*®) cream may be effective.

Sinusitis and oral pain

Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air or with ephedrine hydrochloride nasal drops.

Systemic antibacterials may sometimes be required for sinusitis (see under Nose infections, bacterial p. 295).

Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; see elimination of nasal staphylococci. In children, acute complications such as periorbital cellulitis require hospital treatment.

Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin*®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 668 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of methicillin-resistant *Staphylococcus aureus* (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the

throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

For eradication of MRSA also consult local infection control policy. See also MRSA p. 345.

● INDICATIONS AND DOSE

Nasal congestion | Sinusitis affecting the maxillary antrum

► BY INTRANASAL ADMINISTRATION

► Child 12–17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops

IMPORTANT SAFETY INFORMATION

CHM/MHRA ADVICE

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Avoid excessive or prolonged use · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
 - **Common or very common** Headache · nausea
 - **Frequency not known** After excessive use tolerance with diminished effect · cardiovascular effect · local irritation · rebound congestion
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- **PRESCRIBING AND DISPENSING INFORMATION** For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.
- **PROFESSION SPECIFIC INFORMATION**
 - Dental practitioners' formulary** Ephedrine nasal drops may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).
- **MEDICINAL FORMS**
 - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: nasal drops

Nasal drops

► Ephedrine hydrochloride (Non-proprietary)

Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops | 10 ml [P] £1.87–£1.90 DT price = £1.87

Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml [P] £1.91–£1.94 DT price = £1.91

Pseudoephedrine hydrochloride

● INDICATIONS AND DOSE

Congestion of mucous membranes of upper respiratory tract

► BY MOUTH

- Child 6–11 years: 30 mg 3–4 times a day
- Child 12–17 years: 60 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009): OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN
Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

- **CAUTIONS** Diabetes · heart disease · hypertension · hyperthyroidism · raised intra-ocular pressure
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety · headache · hypertension · insomnia · nausea · restlessness · tachycardia · vomiting
 - **Rare** Hallucinations · rash
 - **Very rare** Angle-closure glaucoma
 - **Frequency not known** Urinary retention
- **PREGNANCY** Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.
- **BREAST FEEDING** May suppress lactation; avoid if lactation not well established or if milk production insufficient.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.
- **LESS SUITABLE FOR PRESCRIBING** Pseudoephedrine hydrochloride is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** *Galpseud*® and *Sudafed*® can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Alcohol

► *Galpseud* (Thornton & Ross Ltd)

Pseudoephedrine hydrochloride 6 mg per 1 ml *Galpseud* 30mg/5ml linctus sugar-free | 2000 ml [PoM] £14.00

► *Sudafed Non-Drowsy Decongestant (pseudoephedrine)* (McNeil Products Ltd)

Pseudoephedrine hydrochloride 6 mg per 1 ml *Sudafed* Decongestant 30mg/5ml liquid | 100 ml [P] £1.92

Tablet

► *Galpseud* (Thornton & Ross Ltd)

Pseudoephedrine hydrochloride 60 mg *Galpseud* 60mg tablets | 24 tablet [PoM] £2.25 | 100 tablet [PoM] £5.42 DT price = £5.42

► *Sudafed Non-Drowsy Decongestant (pseudoephedrine)* (McNeil Products Ltd)

Pseudoephedrine hydrochloride 60 mg *Sudafed* Decongestant 60mg tablets | 12 tablet [P] £2.04

Xylometazoline hydrochloride

- **DRUG ACTION** Xylometazoline is a sympathomimetic.

● INDICATIONS AND DOSE

Nasal congestion

► BY INTRANASAL ADMINISTRATION USING NASAL DROPS

- Child 6–11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril
- Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril

► BY INTRANASAL ADMINISTRATION USING NASAL SPRAY

- Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

IMPORTANT SAFETY INFORMATION

The CHM/MHRA has stated that non-prescription cough and cold medicines containing oxymetazoline or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Angle-closure glaucoma · avoid excessive or prolonged use · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism · rebound congestion

CAUTIONS, FURTHER INFORMATION

- **Rebound congestion** Sympathomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS** Cardiovascular effects · hallucinations in small children · headache · local irritation · nausea · rebound congestion · restlessness in small children · sleep disturbances in small children · tolerance with diminished effect (after excessive use) · transient visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- Hallucinations (in small children) Discontinue treatment if the hallucinations occur.

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

► *Otrivine* (GlaxoSmithKline Consumer Healthcare)

Xylometazoline hydrochloride 1 mg per 1 ml *Otrivine* Congestion Relief 0.1% nasal spray | 10 ml [GSL] £3.05 DT price = £2.18

Otrivine Adult Measured Dose Sinusitis spray | 10 ml [GSL] £2.62 DT price = £2.18

Otrivine Allergy Relief 0.1% nasal spray | 10 ml [GSL] £2.62 DT price = £2.18

Otrivine Adult nasal spray | 10 ml [GSL] £2.18 DT price = £2.18

Otrivine Adult Metered Dose 0.1% nasal spray | 10 ml [GSL] £2.62 DT price = £2.18

► *Sudafed Congestion Relief* (McNeil Products Ltd)

Xylometazoline hydrochloride 1 mg per 1 ml *Sudafed* Congestion Relief 0.1% nasal spray | 10 ml [GSL] £3.25 DT price = £2.18

► *Sudafed Mucus Relief* (McNeil Products Ltd)

Xylometazoline hydrochloride 1 mg per 1 ml *Sudafed* Mucus Relief 0.1% nasal spray | 15 ml [GSL] £2.37

- ▶ **Sudafed Non-Drowsy Decongestant (xylometazoline)** (McNeil Products Ltd)
Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Blocked Nose 0.1% spray | 15 ml [GSL] £2.38

Nasal drops

- ▶ **Otrivine** (GlaxoSmithKline Consumer Healthcare)
Xylometazoline hydrochloride 500 microgram per 1 ml Otrivine Child nasal drops | 10 ml [P] £1.91 DT price = £1.91
Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Adult 0.1% nasal drops | 10 ml [GSL] £2.18 DT price = £2.18

2 Nasal infection

ANTIBACTERIALS > AMINOGLYCOSIDES

Chlorhexidine with neomycin

● INDICATIONS AND DOSE

Eradication of nasal carriage of staphylococci

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply 4 times a day for 10 days

Preventing nasal carriage of staphylococci

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply twice daily

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Naseptin** (Alliance Pharmaceuticals Ltd)
Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Naseptin nasal cream | 15 gram [PoM] £2.24 DT price = £2.24

ANTIBACTERIALS > OTHER

Mupirocin

● INDICATIONS AND DOSE

BACTROBAN NASAL®

For eradication of nasal carriage of staphylococci, including meticillin-resistant *Staphylococcus aureus* (MRSA)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nasal ointment

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)
Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% nasal ointment | 3 gram [PoM] £4.24 DT price = £4.24

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 662, neomycin sulfate p. 662.

● INDICATIONS AND DOSE

Nasal infection

- ▶ BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- ▶ Child: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betnesol-N** (Focus Pharmaceuticals Ltd)
Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT price = £2.39

3 Nasal inflammation, nasal polyps and rhinitis

Other drugs used for Nasal inflammation, nasal polyps and rhinitis Desloratadine, p. 168 • Fexofenadine hydrochloride, p. 169 • Ketotifen, p. 174

ANTIMUSCARINICS

¶ 147

Ipratropium bromide

24-Feb-2016

● INDICATIONS AND DOSE

Rhinorrhoea associated with allergic and non-allergic rhinitis

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 12–17 years: 2 sprays 2–3 times a day, dose to be sprayed into each nostril

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 metered spray of nasal spray = 21 micrograms.

- **CAUTIONS** Avoid spraying near eyes • bladder outflow obstruction • cystic fibrosis • susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: ipratropium
- **SIDE-EFFECTS**
 - ▶ Common or very common Epistaxis • nasal dryness • nasal irritation
 - ▶ Uncommon Headache • nausea
 - ▶ Very rare Gastro-intestinal motility disturbances • palpitations • urinary retention
- **PREGNANCY** Manufacturer advises only use if potential benefit outweighs the risk.
- **BREAST FEEDING** No information available—manufacturer advises only use if potential benefit outweighs risk.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► **Rinatec** (Boehringer Ingelheim Ltd)

Ipratropium bromide 21 microgram per 1 dose Rinatec
21micrograms/dose nasal spray | 180 dose [PoM] £6.54 DT price = £6.54

CORTICOSTEROIDS

Corticosteroids (intranasal)

● **CAUTIONS** Avoid after nasal surgery (until healing has occurred) • avoid in pulmonary tuberculosis • avoid in the presence of untreated nasal infections • patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

CAUTIONS, FURTHER INFORMATION

► **Systemic absorption** Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

● SIDE-EFFECTS

► **Rare** Glaucoma • raised intra-ocular pressure
► **Very rare** Nasal septal perforation (usually following nasal surgery)
► **Frequency not known** Aggression (particularly in children) • anxiety (particularly in children) • bronchospasm • depression (particularly in children) • dryness • epistaxis • headache • hyperactivity (particularly in children) • hypersensitivity reactions • nasal irritation • nasal ulceration • sleep disturbances (particularly in children) • smell disturbances • taste disturbances • throat irritation

SIDE-EFFECTS, FURTHER INFORMATION

► **Systemic absorption** Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

● **MONITORING REQUIREMENTS** The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

above

Beclometasone dipropionate (Beclomethasone dipropionate)

● INDICATIONS AND DOSE

Prophylaxis and treatment of allergic and vasomotor rhinitis

► **BY INTRNASAL ADMINISTRATION**

► Child 6–17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

● **INTERACTIONS** → Appendix 1: corticosteroids

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug

Spray

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

► **Beclometasone dipropionate (Non-proprietary)**

Beclometasone dipropionate 50 microgram per 1 dose
Beclometasone 50micrograms/dose nasal spray | 200 dose [P] £2.52

Fluticasone

● INDICATIONS AND DOSE

Prophylaxis and treatment of allergic rhinitis and perennial rhinitis

- BY INTRANASAL ADMINISTRATION USING NASAL SPRAY
- Child 4–11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
- Child 12–17 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved

Nasal polyps

- BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- Child 16–17 years: 200 micrograms 1–2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops)

AVAMYS® SPRAY

Prophylaxis and treatment of allergic rhinitis

- BY INTRANASAL ADMINISTRATION
- Child 6–11 years: 27.5 micrograms once daily, dose to be sprayed into each nostril, then increased if necessary to 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose
- Child 12–17 years: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

DOSE EQUIVALENCE AND CONVERSION

- For Avamys® spray: 1 spray equivalent to 27.5 micrograms.

● **INTERACTIONS** → Appendix 1: corticosteroids

● **SIDE-EFFECTS** Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

MAST-CELL STABILISERS

Sodium cromoglicate

(Sodium cromoglycate)

● INDICATIONS AND DOSE

Prophylaxis of allergic rhinitis

► BY INTRANASAL ADMINISTRATION

- Child: 1 spray 2–4 times a day, to be administered into each nostril

● **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturers).

● SIDE-EFFECTS

- **Rare** Transient bronchospasm
- **Frequency not known** Local irritation

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

Oropharynx

1 Dry mouth

Treatment of dry mouth

Overview

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics and sedating antihistamines), by irradiation of the head and neck region or by damage to or disease of the salivary glands. Children with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop dental caries, periodontal disease, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate.

Artificial saliva products

● ARTIFICIAL SALIVA PRODUCTS

AS SALIVA ORTHANA® LOZENGES

Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral

● INDICATIONS AND DOSE

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

► BY MOUTH

- Child: 1 lozenge as required, allow to dissolve slowly in the mouth

● **PRESCRIBING AND DISPENSING INFORMATION** AS Saliva Orthana® lozenges do not contain fluoride.

- **AS Saliva Orthana lozenges** (A S Pharma Ltd)
30 lozenge(ACBS) • NHS indicative price = £3.50

AS SALIVA ORTHANA® SPRAY

Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

● INDICATIONS AND DOSE

Symptomatic treatment of dry mouth

► BY MOUTH

- Child: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

AS Saliva Orthana® Oral Spray may be prescribed.

BIOXTRA® GEL

Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

- **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- BY MOUTH
- Child: Apply as required, apply to oral mucosa

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

BioXtra® Gel may be prescribed.

- **BioXtra Dry Mouth oral gel** (R.I.S. Products Ltd)
40 ml • NHS indicative price = £3.94 • Drug Tariff (Part IXa)

BIOTENE ORALBALANCE®

Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH
- Child: Apply as required, apply to gums and tongue

- **PATIENT AND CARER ADVICE** Avoid use with toothpastes containing detergents (including foaming agents).

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Biotene Oralbalance® Saliva Replacement Gel may be prescribed as Artificial Saliva Gel.

- **Biotene Oralbalance dry mouth saliva replacement gel** (GlaxoSmithKline Consumer Healthcare) **Glucose oxidase 12000 unit, Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg** 50 gram • NHS indicative price = £4.46 • Drug Tariff (Part IXa)

GLANDOSANE®

Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

- **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- BY MOUTH
- Child: Apply as required, spray onto oral and pharyngeal mucosa

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Glandosane® Aerosol Spray may be prescribed.

- **Glandosane synthetic saliva spray lemon** (Fresenius Kabi Ltd)
50 ml • NHS indicative price = £5.68
- **Glandosane synthetic saliva spray natural** (Fresenius Kabi Ltd)
50 ml • NHS indicative price = £5.68
- **Glandosane synthetic saliva spray peppermint** (Fresenius Kabi Ltd)
50 ml • NHS indicative price = £5.68

ORALIEVE GEL

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH
- Child: Apply as required, particularly at night, to oral mucosa

- **PRESCRIBING AND DISPENSING INFORMATION** Contains traces of milk protein and egg white protein.

SST®

Sugar-free, citric acid, malic acid and other ingredients in a sorbitol base.

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts

- BY MOUTH
- Child: 1 tablet as required, allow tablet to dissolve slowly in the mouth

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

May be prescribed as Saliva Stimulating Tablets.

- **SST saliva stimulating tablets** (Sinclair IS Pharma Plc)
100 tablet • NHS indicative price = £4.86 • Drug Tariff (Part IXa)

SALIVEZE®

Carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral

- **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- BY MOUTH
- Child: Apply 1 spray as required, spray onto oral mucosa

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Saliveze® Oral Spray may be prescribed.

- **Saliveze mouth spray** (Wyvern Medical Ltd)
50 ml(ACBS) • NHS indicative price = £3.50

SALIVIX®

Sugar-free, reddish-amber, acacia, malic acid and other ingredients.

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH USING PASTILLES
- Child: 1 unit as required, suck pastille

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Salivix® Pastilles may be prescribed as Artificial Saliva Pastilles.

- **Salivix pastilles** (Galen Ltd)
50 pastille • NHS indicative price = £3.55 • Drug Tariff (Part IXa)

XEROTIN®

Sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral.

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH
- Child: 1 spray as required

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Xerotin® Oral Spray may be prescribed as Artificial Saliva Oral Spray.

- **Xerotin spray** (SpePharm UK Ltd)
100 ml • NHS indicative price = £6.86 • Drug Tariff (Part IXa)

2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes and gargles

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. Mouthwashes may not be suitable for children under 7 years (risk of the solution being swallowed); the mouthwash or dental gel may be applied using a cotton bud.

A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 674 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 674, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris. Concentrations greater than 1.5% in children may cause ulceration and tissue damage.

Chlorhexidine below is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine mouthwash is used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in children undergoing dental procedures.

ANTISEPTICS AND DISINFECTANTS

Chlorhexidine

• INDICATIONS AND DOSE

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

► BY MOUTH USING MOUTHWASH

► Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

Oral hygiene and plaque inhibition and gingivitis

► BY MOUTH USING DENTAL GEL

► Child: Apply 1–2 times a day, to be brushed on the teeth

Oral candidiasis | Management of aphthous ulcers

► BY MOUTH USING DENTAL GEL

► Child: Apply 1–2 times a day, to affected areas

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

► BY MOUTH USING OROMUCOSAL SPRAY

► Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces

Bladder irrigation and catheter patency solutions

► BY INTRAVESICAL INSTILLATION

► Child: (consult product literature)

• **UNLICENSED USE** *Corsodyl*® not licensed for use in children under 12 years (unless on the advice of a healthcare professional).

• **SIDE-EFFECTS** Anaphylaxis • hypersensitivity • mucosal irritation • parotid gland swelling • reversible brown staining of composite restorations • reversible brown staining of silicate compositions • reversible brown staining of teeth • taste disturbance • tongue discolouration

SIDE-EFFECTS, FURTHER INFORMATION If desquamation occurs with mucosal irritation, discontinue treatment or dilute mouthwash with an equal volume of water.

• **PATIENT AND CARER ADVICE** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

• PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Corsodyl® dental gel may be prescribed as Chlorhexidine Gluconate Gel; *Corsodyl*® mouthwash may be prescribed as Chlorhexidine Mouthwash; *Corsodyl*® oral spray may be prescribed as Chlorhexidine Oral Spray.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Chlorhexidine with chlorobutanol

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 673.

● INDICATIONS AND DOSE

Oral hygiene and plaque inhibition

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child 6–17 years: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include mint.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

Hexetidine

● INDICATIONS AND DOSE

Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child 6–17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

● SIDE-EFFECTS

- ▶ **Very rare** Taste disturbance · transient anaesthesia
- ▶ **Frequency not known** Local irritation

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

Hydrogen peroxide

- **DRUG ACTION** Hydrogen peroxide is an oxidising agent.

● INDICATIONS AND DOSE

Oral hygiene (with hydrogen peroxide 6%)

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water

PEROXYL®

Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH

- ▶ Child 6–17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime

- **SIDE-EFFECTS** Hypertrophy of papillae of tongue on prolonged used
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.
- **HANDLING AND STORAGE** Hydrogen peroxide bleaches fabric.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Hydrogen Peroxide Mouthwash may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Mouthwash

- ▶ **Peroxy** (Colgate-Palmolive (UK) Ltd)
Hydrogen peroxide 15 mg per 1 ml Peroxyl 1.5% mouthwash sugar-free | 300 ml [GSL](#) £2.94

Sodium bicarbonate with sodium chloride

● INDICATIONS AND DOSE

Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child: (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** For mouthwash, extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water prior to administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include peppermint.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Compound sodium chloride mouthwash may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: mouthwash

Sodium chloride

● INDICATIONS AND DOSE

Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child: Rinse or gargle as required
