MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **SIDE-EFFECTS** Cataract · eye discomfort · eye disorders · eye infection · eye inflammation · rash · taste altered · vision disorders
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

► FML Liquifilm (Allergan Ltd)

Fluorometholone 1 mg per 1 ml FML Liquifilm 0.1% ophthalmic suspension | 5 ml [PoM] £1.71 DT = £1.71 | 10 ml [PoM] £2.95 DT = £2.95

Prednisolone

21-Dec-2017

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- TO THE EYE
- Child: Apply every 1–2 hours until controlled then reduce frequency

- **UNLICENSED USE** *Pred Forte*® not licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Eye discomfort · increased risk of infection · taste altered · visual impairment
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose prednisolone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

► Prednisolone (Non-proprietary)

Prednisolone sodium phosphate 5 mg per 1 ml Minim's prednisolone sodium phosphate 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £12.25 DT = £12.25

► Pred Forte (Allergan Ltd)

Prednisolone acetate 10 mg per 1 ml Pred Forte 1% eye drops | 5 ml [PoM] £1.82 DT = £1.82 | 10 ml [PoM] £3.66 DT = £3.66

Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Predsol (RPH Pharmaceuticals AB)

Prednisolone sodium phosphate 5 mg per 1 ml Predsol 0.5% ear/eye drops | 10 ml [PoM] £2.00 DT = £2.00

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 668.

● INDICATIONS AND DOSE

Local treatment of eye inflammation and bacterial infection (short-term)

- TO THE EYE USING EYE DROP
- Child: (consult product literature)

- **INTERACTIONS** → Appendix 1: corticosteroids · neomycin
- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin eye-drops are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ Betnesol-N (RPH Pharmaceuticals AB)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT = £2.39

Dexamethasone with framycetin sulfate and gramicidin

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 668.

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

▶ TO THE EYE

- ▶ Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **INTERACTIONS** → Appendix 1: corticosteroids
- **LESS SUITABLE FOR PRESCRIBING** Sofradex® is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

▶ Sofradex (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml Sofradex ear/eye drops | 8 ml [PoM] £7.50

Dexamethasone with hypromellose, neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 668.

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

▶ TO THE EYE USING EYE DROP

- ▶ Child: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

Local treatment of inflammation (short-term)

▶ TO THE EYE USING EYE OINTMENT

- ▶ Child: Apply 3–4 times a day, alternatively, apply at night when used with eye drops

- **INTERACTIONS** → Appendix 1: corticosteroids · neomycin
- **LESS SUITABLE FOR PRESCRIBING** Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

EXCIPIENTS: May contain Hydroxybenzoates (parabens), woolfat and related substances (including lanolin)

▶ Maxitrol (Novartis Pharmaceuticals UK Ltd)

Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram Maxitrol eye ointment | 3.5 gram [PoM] £1.44

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

▶ Maxitrol (Novartis Pharmaceuticals UK Ltd)

Dexamethasone 1 mg per 1 ml, Hypromellose 5 mg per 1 ml, Neomycin (as Neomycin sulfate) 3500 unit per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml Maxitrol eye drops | 5 ml [PoM] £1.68

1.2a Anterior uveitis

ANTIMUSCARINICS

Antimuscarinics (eye)

- **CAUTIONS** Children under 3 months owing to the possible association between cycloplegia and the development of amblyopia · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · mydriasis can precipitate acute angle-closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber) · neonates at increased risk of systemic toxicity
- **SIDE-EFFECTS** Arrhythmias · conjunctivitis (on prolonged administration) · dry mouth · dry skin · eye oedema (on prolonged administration · flushing · hyperaemia (on prolonged administration) · gastrointestinal disorders · urinary disorders
- **PATIENT AND CARER ADVICE** Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

▮ above

Atropine sulfate

● INDICATIONS AND DOSE

Cycloplegia

▶ TO THE EYE USING EYE DROP

- ▶ Child 3 months–17 years: Apply twice daily for 3 days, before procedure

Anterior uveitis

▶ TO THE EYE USING EYE DROP

- ▶ Child 2–17 years: Apply 1 drop up to 4 times a day

- **UNLICENSED USE** Not licensed for use in children for uveitis.
- **INTERACTIONS** → Appendix 1: atropine
- **SIDE-EFFECTS**
SIDE-EFFECTS, FURTHER INFORMATION Systemic side-effects can occur.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose atropine sulphate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

▶ Atropine sulfate (Non-proprietary)

Atropine sulfate 10 mg per 1 ml Atropine 1% eye drops | 10 ml [PoM] £132.25 DT = £132.25

- **Atropine sulfate** (Bausch & Lomb UK Ltd)
Atropine sulfate 10 mg per 1 ml Minimim atropine sulfate 1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £15.10 DT = £15.10

F 670

Cyclopentolate hydrochloride

● INDICATIONS AND DOSE

Cyclopentolate

- ▶ TO THE EYE
- ▶ Child 3 months–11 years: Apply 1 drop, 30–60 minutes before examination, using 1% eye drops
- ▶ Child 12–17 years: Apply 1 drop, 30–60 minutes before examination, using 0.5% eye drops

Uveitis

- ▶ TO THE EYE
- ▶ Child 3 months–17 years: Apply 1 drop 2–4 times a day, using 0.5% eye drops (1% for deeply pigmented eyes)

- **INTERACTIONS** → Appendix 1: cyclopentolate

- **SIDE-EFFECTS** Mydriasis • photophobia

SIDE-EFFECTS, FURTHER INFORMATION Systemic side-effects can occur.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose cyclopentolate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Cyclopentolate hydrochloride** (Bausch & Lomb UK Ltd)
Cyclopentolate hydrochloride 5 mg per 1 ml Minimim cyclopentolate hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.41 DT = £11.41

- ▶ **Cyclopentolate hydrochloride 10 mg per 1 ml** Minimim cyclopentolate hydrochloride 1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.68 DT = £11.68

- ▶ **Mydrilate** (Intrapharm Laboratories Ltd)

- ▶ **Cyclopentolate hydrochloride 5 mg per 1 ml** Mydrilate 0.5% solution | 5 ml [PoM] £8.08 DT = £8.08

- ▶ **Cyclopentolate hydrochloride 10 mg per 1 ml** Mydrilate 1% solution | 5 ml [PoM] £8.08 DT = £8.08

F 670

Homatropine hydrobromide

● INDICATIONS AND DOSE

Anterior uveitis

- ▶ TO THE EYE
- ▶ Child 3 months–1 year: Apply 1 drop daily, alternatively apply 1 drop once daily on alternate days, adjusted according to response, only 0.5% eye drops to be used
- ▶ Child 2–17 years: Apply 1 drop twice daily, adjusted according to response

- **UNLICENSED USE** Not licensed for use in children under 3 months.

- **INTERACTIONS** → Appendix 1: homatropine

● MEDICINAL FORMS

Forms available from special-order manufacturers include: eye drops

2 Dry eye conditions

Dry eye

Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion often responds to tear replacement therapy. The severity of the condition and child's preference will often guide the choice of preparation.

Hyromellose p. 672 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hyromellose with a mucolytic such as acetylcysteine below can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol p. 673 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 674, with or without trehalose, are also used in the management of tear deficiency.

Sodium chloride 0.9% drops p. 673 are sometimes useful in tear deficiency, and can be used as 'comfort drops' by contact lens wearers, and to facilitate lens removal. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery and in first aid for removal of harmful substances.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

OCULAR LUBRICANTS

Acetylcysteine

07-Feb-2017

● INDICATIONS AND DOSE

Tear deficiency | Impaired or abnormal mucus production

- ▶ TO THE EYE
- ▶ Child: Apply 3–4 times a day

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Ilube** (Rayner Pharmaceuticals Ltd)

- ▶ **Acetylcysteine 50 mg per 1 ml** Ilube 5% eye drops | 10 ml [PoM] £16.90 DT = £16.90

Carbomers

(Polyacrylic acid)

● INDICATIONS AND DOSE

Dry eyes including keratoconjunctivitis sicca, unstable tear film

- ▶ TO THE EYE
- ▶ Child: Apply 3–4 times a day or when required

- **UNLICENSED USE** Some preparations not licensed for use in children.

- **PRESCRIBING AND DISPENSING INFORMATION** Synthetic high molecular weight polymers of acrylic acid cross-

linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye gel

EXCIPIENTS: May contain Benzalkonium chloride, cetrimide, disodium edetate

► Blephagel (Thea Pharmaceuticals Ltd)

Carbomer 3.5 mg per 1 gram Blephagel 0.35% eye gel | 40 gram £6.66

Carbomer 3.6 mg per 1 gram Blephagel 0.36% eye gel preservative free | 30 gram £7.53

► Liquivisc (Thea Pharmaceuticals Ltd)

Carbomer 974P 2.5 mg per 1 gram Liquivisc 0.25% eye gel | 10 gram [P] £4.50 DT = £4.50

Eye drops

► Carbomers (Non-proprietary)

Carbomer 980 2 mg per 1 gram EyeGel 0.2% eye gel | 10 gram £2.80 DT = £2.80

Carbomer '980' 0.2% eye drops | 10 gram [P] £2.80 DT = £2.80

Carbomer 0.2% eye gel | 10 gram £2.80 DT = £2.80

Carbomer 980 2 mg per 1 gram Artelac Nighttime 0.2% eye gel | 10 gram £2.96 DT = £2.80

► Clinitas Carbomer (Altacor Ltd)

Carbomer 980 2 mg per 1 gram Clinitas Carbomer 0.2% eye gel | 10 gram £1.49 DT = £2.80

► GelTears (Bausch & Lomb UK Ltd)

Carbomer 980 2 mg per 1 gram GelTears 0.2% gel | 10 gram [P] £2.80 DT = £2.80

► Lumecare Long Lasting (Medicom Healthcare Ltd)

Carbomer 980 2 mg per 1 gram Lumecare Carbomer 0.2% eye gel | 10 gram £1.51 DT = £2.80

► Viscotears (Bausch & Lomb UK Ltd)

Carbomer 980 2 mg per 1 gram Viscotears 2mg/g liquid gel | 10 gram [P] £1.59 DT = £2.80

Viscotears 2mg/g eye gel 0.6ml unit dose | 30 unit dose [P] £5.42 DT = £5.42

► Xailin (Visufarma UK Ltd)

Carbomer 980 2 mg per 1 gram Xailin 0.2% eye gel | 10 gram £3.28 DT = £2.80

Carmellose sodium

INDICATIONS AND DOSE

Dry eye conditions

- TO THE EYE
- Child: Apply as required

- **PRESCRIBING AND DISPENSING INFORMATION** Some preparations are contained units which are resealable and may be used for up to 12 hours.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

► Carmellose sodium (Non-proprietary)

Carmellose 1% eye drops 0.4ml unit dose preservative free | 30 unit dose [PoD] [N] DT = £3.00

Carmellose sodium 5 mg per 1 ml Carmellose 0.5% eye drops 0.4ml unit dose preservative free | 30 unit dose [P] [N] DT = £4.80

► Celluvisc (Allergan Ltd)

Celluvisc 1% eye drops 0.4ml unit dose | 30 unit dose [P] £3.00 DT = £3.00 | 60 unit dose [P] £10.99

Carmellose sodium 5 mg per 1 ml Celluvisc 0.5% eye drops 0.4ml unit dose | 30 unit dose [P] £4.80 DT = £4.80 | 90 unit dose [P] £15.53

Hydroxyethylcellulose

INDICATIONS AND DOSE

Tear deficiency

- TO THE EYE
- Child: Apply as required

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose hydroxyethylcellulose eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

► Artificial tears (Bausch & Lomb UK Ltd)

Hydroxyethylcellulose 4.4 mg per 1 ml Minims artificial tears 0.44% eye drops 0.5ml unit dose | 20 unit dose [P] £9.33

Hydroxypropyl guar with polyethylene glycol and propylene glycol

(Formulated as an ocular lubricant)

INDICATIONS AND DOSE

Dry eye conditions

- TO THE EYE
- Child: Apply as required

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

► Systane (Alcon Laboratories (UK) Ltd)

Systane Gel eye drops | 10 ml [P] £7.49

Hypromellose

INDICATIONS AND DOSE

Tear deficiency

- TO THE EYE
- Child: Apply as required

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose hypromellose eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, cetrimide, disodium edetate

► Hypromellose (Non-proprietary)

Hypromellose 3 mg per 1 ml Hypromellose 0.3% eye drops | 10 ml [P] £1.06 DT = £1.06

Hypromellose 5 mg per 1 ml Hypromellose 0.5% eye drops | 10 ml £0.81 DT = £0.81

► Artelac (Bausch & Lomb UK Ltd)

Hypromellose 3.2 mg per 1 ml Artelac Single Dose Unit 0.32% eye drops 0.5ml unit dose | 30 unit dose [P] £16.95 | 60 unit dose [P] £32.85

Artelac 0.32% eye drops | 10 ml [P] £4.99 DT = £4.99

Hypromellose with dextran 70

The properties listed below are those particular to the combination only. For the properties of the components please consider, hypromellose p. 672.

● INDICATIONS AND DOSE

Tear deficiency

- ▶ TO THE EYE
- ▶ Child: Apply as required

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Tears Naturale** (Novartis Pharmaceuticals UK Ltd)

Dextran 70 1 mg per 1 ml, Hypromellose 3 mg per 1 ml Tears Naturale eye drops | 15 ml [P] £1.89 DT = £1.89
Tears Naturale eye drops 0.4ml unit dose | 28 unit dose [P] £13.26 DT = £13.26

Liquid paraffin with white soft paraffin and wool alcohols

● INDICATIONS AND DOSE

Dry eye conditions

- ▶ TO THE EYE
- ▶ Child: Apply as required, best suited for application before sleep

- **PATIENT AND CARER ADVICE** May cause temporary visual disturbance. Should not be used during contact lens wear.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

- ▶ **Lacri-Lube** (Allergan Ltd)

Wool alcohols 2 mg per 1 gram, Liquid paraffin 425 mg per 1 gram, White soft paraffin 573 mg per 1 gram Lacri-lube eye ointment | 3.5 gram [P] £3.01 | 5 gram [P] £3.98

Paraffin, yellow, soft

● INDICATIONS AND DOSE

Eye surface lubrication

- ▶ TO THE EYE
- ▶ Child: Apply every 2 hours as required

- **PATIENT AND CARER ADVICE** Ophthalmic preparations may cause temporary visual disturbance. Should not be used during contact lens wear.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

- ▶ **Paraffin, yellow, soft (Non-proprietary)**

Liquid paraffin 100 mg per 1 gram, Wool fat 100 mg per 1 gram, Yellow soft paraffin 800 mg per 1 gram Simple eye ointment | 4 gram [P] £18.62 DT = £18.46

Polyvinyl alcohol

● INDICATIONS AND DOSE

Tear deficiency

Emustil eye drops 0.3ml unit dose preservative free | 20 unit dose £6.22

3 Eye infections

Eye, infections

Eye infections

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial blepharitis is treated by lid hygiene and application of antibacterial eye drops to the conjunctival sac or to the lid margins. Systemic treatment may be required and may be necessary for 3 months or longer.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye

drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis or antibiotic resistance.

Corneal ulcer and keratitis require specialist treatment, usually under inpatient care, and may call for intensive topical, subconjunctival, or systemic administration of antimicrobials.

Endophthalmitis is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

See reference to the treatment of *crab lice* of the eyelashes.

Antibacterials for eye infections

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 677 has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 676, levofloxacin p. 676, moxifloxacin p. 677, and ofloxacin p. 677; the aminoglycosides, gentamicin below and tobramycin p. 676 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 676 are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamidine isetionate p. 678 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication].

Other antibacterial eye drops may be prepared aseptically in a specialist manufacturing unit from material supplied for injection.

With corticosteroids

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye' which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- *Eye drops*, apply 1 drop at least every 2 hours in severe infection then reduce frequency as infection is controlled and continue for 48 hours after healing. For less severe infection 3–4 times daily is generally sufficient.
- *Eye ointment*, apply either at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

Antifungals for eye infections

Fungal infections of the cornea are rare. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread

of infection from the paranasal sinuses. Debility or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent in Scotland or Northern Ireland), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk.

Antivirals for eye infections

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 678. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Also see systemic treatment of CMV retinitis.

Antibacterials for eye infections in neonates

Antibacterial eye drops are used to treat acute bacterial conjunctivitis in neonates (ophthalmia neonatorum); where possible the causative microorganism should be identified. Chloramphenicol eye drops are used to treat mild conjunctivitis; more serious infections also require a systemic antibacterial. Failure to respond to initial treatment requires further investigation; chlamydial infection is one of the most frequent causes of neonatal conjunctivitis and should be considered. Azithromycin eye drops are licensed to treat trachomatous conjunctivitis caused by *Chlamydia trachomatis* and purulent bacterial conjunctivitis in neonates. However, as there is a risk of simultaneous infection at other sites in neonates and children under 3 months presenting with conjunctivitis caused by *Chlamydia trachomatis*, systemic treatment with oral erythromycin p. 331 is required. *Gonococcal eye infections* are treated with a single-dose of parenteral cefotaxime p. 320 or ceftriaxone p. 322. Gentamicin eye drops together with appropriate systemic antibacterials are used in the treatment of *pseudomonal eye infections*; high-strength gentamicin eye drops (1.5%) [unlicensed] are available for severe infections.

3.1 Bacterial eye infection

ANTIBACTERIALS > AMINOGLYCOSIDES

Gentamicin

11-Dec-2017

• INDICATIONS AND DOSE

Bacterial eye infections

► TO THE EYE

- Child: Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

- **INTERACTIONS** → Appendix 1: aminoglycosides

- **PRESCRIBING AND DISPENSING INFORMATION** Eye drops may be sourced as a manufactured special or from specialist importing companies.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride

► **Gentamicin (Non-proprietary)**

Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% ear/eye drops | 10 ml [PoM] £2.63 DT = £2.47

Tobramycin

22-Nov-2016

INDICATIONS AND DOSE**Local treatment of infections**

► TO THE EYE

► Child 1–17 years: Apply twice daily for 6–8 days

Local treatment of infections (severe infection)

► TO THE EYE

► Child 1–17 years: Apply 4 times a day for first day, then apply twice daily for 5–7 days

INTERACTIONS → Appendix 1: aminoglycosides**MEDICINAL FORMS**

No licensed medicines listed

ANTIBACTERIALS ► **MACROLIDES****Azithromycin****INDICATIONS AND DOSE**

Trachomatous conjunctivitis caused by *Chlamydia trachomatis* | Purulent bacterial conjunctivitis

► TO THE EYE

► Child: Apply twice daily for 3 days, review if no improvement after 3 days of treatment

INTERACTIONS → Appendix 1: macrolides**SIDE-EFFECTS**

- **Common or very common** Eye discomfort · vision blurred
- **Uncommon** Angioedema · eye allergy

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops► **Azyter** (Thea Pharmaceuticals Ltd)

Aciclovir 30 mg per 1 gram Zovirax 3% ophthalmic ointment | 4.5 gram [PoM] £9.34 DT = £9.34

4 Eye procedures

Mydriatics and cycloplegics

Overview

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide 0.5% below (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Cyclopentolate hydrochloride 1% p. 671 (action up to 24 hours) or atropine sulfate p. 670 (action up to 7 days) are preferable for producing cycloplegia for refraction in young children; tropicamide may be preferred in neonates.

Phenylephrine hydrochloride p. 679 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 671 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

ANTIMUSCARINICS

F 670

Tropicamide

INDICATIONS AND DOSE

Funduscopy

▶ TO THE EYE

▶ **Neonate:** 0.5% eye drops to be applied 20 minutes before examination.

▶ **Child:** 0.5% eye drops to be applied 20 minutes before examination

● **INTERACTIONS** → Appendix 1: tropicamide

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

4.1 Post-operative pain and inflammation

Eye, surgical and peri-operative drug use

Ocular peri-operative drugs

Drugs used to prepare the eye for surgery and drugs that are injected into the anterior chamber at the time of surgery are included here.

Sodium hyaluronate p. 674 is used during surgical procedures on the eye.

Apraclonidine p. 686, an α_2 -adrenoceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used for short-term treatment only.

Balanced Salt Solution is used routinely in intra-ocular surgery.

Povidone-iodine p. 679 is used for peri-ocular and conjunctival antiseptics before ocular surgery to support postoperative infection control.

Ocular local anaesthetics

Oxybuprocaine hydrochloride below and tetracaine below are widely used topical local anaesthetics. Proxymetacaine hydrochloride below causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride p. 826 and fluorescein sodium p. 679 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 136, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

ANAESTHETICS, LOCAL

Fluorescein with lidocaine

● INDICATIONS AND DOSE

Local anaesthesia

► TO THE EYE

► Child: Apply as required

● **CONTRA-INDICATIONS** Avoid in pre-term neonate (immature metabolising enzyme system)

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose lidocaine and fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

► Tetracaine (Non-proprietary)

Tetracaine hydrochloride 5 mg per 1 ml Minimis tetracaine hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.57 DT = £10.57

Tetracaine hydrochloride 10 mg per 1 ml Minimis tetracaine hydrochloride 1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.57 DT = £10.57

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Diclofenac sodium

● INDICATIONS AND DOSE

Inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties) | Postoperative inflammation in cataract surgery, strabismus surgery, argon laser trabeculoplasty

► TO THE EYE

► Child: (consult product literature)

● **UNLICENSED USE** Not licensed for use in children.

● **INTERACTIONS** → Appendix 1: NSAIDs

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose diclofenac sodium eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispersible tablet, oral suspension, oral solution

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, propylene glycol

► Voltarol Ophtha (Thea Pharmaceuticals Ltd)

Diclofenac sodium 1 mg per 1 ml Voltarol Ophtha 0.1% eye drops 0.3ml unit dose | 5 unit dose [PoM] £4.00 DT = £4.00 | 40 unit dose [PoM] £32.00 DT = £32.00

► Voltarol Ophtha Multidose (Thea Pharmaceuticals Ltd)

Diclofenac sodium 1 mg per 1 ml Voltarol Ophtha Multidose 0.1% eye drops | 5 ml [PoM] £6.68 DT = £6.68

Flurbiprofen

● INDICATIONS AND DOSE

Inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties) | Control of anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated

► TO THE EYE

► Child: (consult product literature)

● **UNLICENSED USE** Not licensed for use in children.

● **INTERACTIONS** → Appendix 1: NSAIDs

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of

asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

► Ocufen (Allergan Ltd)

Flurbiprofen sodium 300 microgram per 1 ml Ocufen 0.03% eye drops 0.4ml unit dose | 40 unit dose [PoM] £37.15

Ketorolac trometamol

● INDICATIONS AND DOSE

Prophylaxis and reduction of inflammation and associated symptoms following ocular surgery

► TO THE EYE

► Child: (consult product literature)

● **UNLICENSED USE** Not licensed for use in children.

● **INTERACTIONS** → Appendix 1: NSAIDs

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Ketorolac trometamol (Non-proprietary)

Ketorolac trometamol 5 mg per 1 ml Ketorolac 0.5% eye drops | 5 ml [PoM] £2.85–£3.00 DT = £3.00

► Acular (Allergan Ltd)

Ketorolac trometamol 5 mg per 1 ml Acular 0.5% eye drops | 5 ml [PoM] £3.00 DT = £3.00

5 Glaucoma and ocular hypertension

Glaucoma

Overview

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage and is generally associated with raised intra-ocular pressure.

Glaucoma is rare in children and should always be managed by a specialist. *Primary congenital glaucoma* is the most common form of glaucoma in children, followed by *secondary glaucomas*, such as following hereditary anterior segment malformations; *juvenile open-angle glaucoma* is less common and usually occurs in older children.

Treatment of glaucoma is determined by the pathophysiology and usually involves controlling raised intra-ocular pressure with surgery. Drug therapy is generally supportive, and can be used temporarily, pre- or post-operatively, or both, to reduce intra-ocular pressure. In secondary glaucomas, drug therapy is often used first-line, and long-term treatment may be required. Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue can be used. It may be necessary to combine these drugs or add others, such as carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Children with an acute form of glaucoma (usually presenting with pain in older children, a cloudy cornea, and may be associated with a previous history of controlled glaucoma or recent intra-ocular surgery) need immediate referral for specialist ophthalmology assessment and treatment.

Beta-blockers for glaucoma

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary and secondary glaucomas, probably by reducing the rate of production of aqueous humour.

Prostaglandin analogues for glaucoma

The prostaglandin analogues latanoprost p. 686, and travoprost, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure. Only latanoprost (*Xalatan*® and certain non-proprietary preparations of latanoprost) is licensed for use in children. Children receiving prostaglandin analogues should be managed by a specialist.

Sympathomimetics for glaucoma

Apraclonidine p. 686 is an α_2 -adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used for a short period to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

Brimonidine tartrate, an α_2 -adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

Carbonic anhydrase inhibitors and systemic drugs for glaucoma

The **carbonic anhydrase inhibitors**, acetazolamide p. 683, brinzolamide p. 684, and dorzolamide p. 684, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

Acetazolamide is given by mouth or, rarely in children, by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are unlicensed in children but are used in those resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

Metabolic acidosis can occur in children using topical carbonic anhydrase inhibitors; symptoms may include poor feeding and lack of weight gain.

Miotics for glaucoma

Miotics act by opening up the inefficient drainage channels in the trabecular meshwork. Pilocarpine p. 685 is a miotic used pre- and post-operatively in goniotomy and trabeculotomy; it is used occasionally for aphakic glaucoma.

BETA-ADRENOCEPTOR BLOCKERS

Betaxolol

● INDICATIONS AND DOSE

Primary and secondary glaucomas

- TO THE EYE
- Child: Apply twice daily

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block
- **CAUTIONS** Patients with corneal disease
- CAUTIONS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.
- **INTERACTIONS** → Appendix 1: beta blockers, selective
- **SIDE-EFFECTS**
 - **Common or very common** Eye discomfort · eye disorders · vision disorders
 - **Uncommon** Dry eye · eye inflammation · rhinitis
 - **Rare or very rare** Cataract · rhinorrhoea · skin reactions
 - **Frequency not known** Angioedema · hypersensitivity
- SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose bexotaxol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Betaxolol (non-proprietary)

Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betaxolol 0.5% eye drops | 5 ml [PoM] [X] DT = £1.90

► Betoptic (Novartis Pharmaceuticals UK Ltd)

Betaxolol (as Betaxolol hydrochloride) 2.5 mg per 1 ml Betoptic 0.25% suspension eye drops | 5 ml [PoM] £2.66 DT = £2.66
Betoptic 0.25% eye drops suspension 0.25ml unit dose | 50 unit dose [PoM] £13.77 DT = £13.77

Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betoptic 0.5% eye drops | 5 ml [PoM] £1.90 DT = £1.90

Levobunolol hydrochloride

● INDICATIONS AND DOSE

Primary and secondary glaucomas

- TO THE EYE
- Child: Apply 1–2 times a day

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block
- **CAUTIONS** Patients with corneal disease
- CAUTIONS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.
- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
 - **Common or very common** Eye discomfort · eye inflammation
 - **Frequency not known** Dry eye · eye disorders · vision blurred
- SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose levobunolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

▶ **Betagan** (Allergan Ltd)

Levobunolol hydrochloride 5 mg per 1 ml Betagan 0.5% eye drops | 5 ml [PoM] £1.85 DT = £1.85
Betagan Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit dose [PoM] £9.98

Timoptol Unit Dose 0.5% ophthalmic solution 0.2ml unit dose | 30 unit dose [PoM] £9.65 DT = £9.65

▶ **TiopeX** (Thea Pharmaceuticals Ltd)

Timolol (as Timolol maleate) 1 mg per 1 gram TiopeX 1mg/g eye gel 0.4g unit dose | 30 unit dose [PoM] £7.49 DT = £7.49

Combinations available: **Dorzolamide with timolol**, p. 685

CARBONIC ANHYDRASE INHIBITORS**Acetazolamide****INDICATIONS AND DOSE****Glaucoma**

▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

▶ Child 12–17 years: 250–500 mg daily

Epilepsy

▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION**

▶ **Neonate:** Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day.

▶ **Child 1 month–11 years:** Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day; maximum 750 mg per day

▶ **Child 12–17 years:** 250 mg 2–4 times a day

Reduction of intra-ocular pressure in primary and secondary glaucoma (specialist use only)

▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION**

▶ **Child 1 month–11 years:** 5 mg/kg 2–4 times a day, adjusted according to response; maximum 750 mg per day

▶ **Child 12–17 years:** 250 mg 2–4 times a day

Raised intracranial pressure

▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION**

▶ **Child 1 month–11 years:** Initially 8 mg/kg 3 times a day, then increased if necessary up to 100 mg/kg daily

● **UNLICENSED USE** Not licensed for the treatment of glaucoma.

● **CONTRA-INDICATIONS** Adrenocortical insufficiency · hyperchloraemic acidosis · hypokalaemia · hyponatraemia · long-term administration in chronic angle-closure glaucoma

● **CAUTIONS** Avoid extravasation at injection site (risk of necrosis) · diabetes mellitus · impaired alveolar ventilation (risk of acidosis) · not generally recommended for long-term use · pulmonary obstruction (risk of acidosis) · renal calculi

● **INTERACTIONS** → Appendix 1: acetazolamide

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

▶ **Common or very common** Haemorrhage · metabolic acidosis · nephrolithiasis · sensation abnormal

- ▶ **Uncommon** Bone marrow disorders · depression · dizziness · electrolyte imbalance · hearing impairment · hepatic disorders · leucopenia · nausea · renal colic · renal impairment · renal lesions · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · urinary tract discomfort · urine abnormalities · vomiting
- ▶ **Rare or very rare** Anaphylactic reaction · appetite changes · confusion · diarrhoea · fatigue · fever · flushing · headache · irritability · libido decreased · paralysis · photosensitivity reaction · seizure
- ▶ **Frequency not known** Agranulocytosis · drowsiness · myopia · polyuria · taste altered · thirst

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
- ▶ With oral use Osteomalacia
- ▶ **Rare or very rare**
- ▶ With oral use Ataxia · hyperglycaemia · hypoglycaemia · renal tubular necrosis
- ▶ **Frequency not known**
- ▶ With oral use Agitation

SIDE-EFFECTS, FURTHER INFORMATION Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—patients should be told to report any unusual skin rash.

If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering bicarbonate.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid, especially in first trimester (toxicity in *animal* studies).
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid—risk of metabolic acidosis.
- **MONITORING REQUIREMENTS** Monitor blood count and plasma electrolyte concentrations with prolonged use.

Timolol (as Timolol maleate) 5 mg per 1 mL, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 mL Eylamdo 20mg/mL / 5mg/mL eye drops | 5 mL [PoM] £14.29 DT = £14.29

MIOTICS > PARASYMPATHOMIMETICS

Pilocarpine

- **DRUG ACTION** Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

● INDICATIONS AND DOSE

Raised intra-ocular pressure

- TO THE EYE
- Child 1 month–1 year: Apply 1 drop 3 times a day, doses are for 0.5% or 1% solution
- Child 2–17 years: Apply 1 drop 4 times a day

Pre- and postoperatively in goniotomy and trabeculotomy

- TO THE EYE
- Child: Apply once daily, 1% or 2% solution to be applied

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Acute inflammatory disease of the anterior segment · acute iritis · anterior uveitis · conditions where pupillary constriction is undesirable · some forms of secondary glaucoma (where pupillary constriction is undesirable)
- **CAUTIONS** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage · asthma · cardiac disease · care in conjunctival damage · care in corneal damage · epilepsy · gastro-intestinal spasm · hypertension · hyperthyroidism · hypotension · peptic ulceration · retinal detachment has occurred in susceptible individuals and those with retinal disease · urinary-tract obstruction
- **INTERACTIONS** → Appendix 1: pilocarpine
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · headache · hyperhidrosis · hypersalivation · nausea · skin reactions · vision disorders · vomiting
 - **Frequency not known** Bradycardia · bronchospasm · conjunctival vascular congestion · eye disorder (long term use) · hypotension · pain · paraesthesia · pulmonary oedema · sensitisation · vitreous haemorrhage
- **PREGNANCY** Avoid unless the potential benefit outweighs risk—limited information available.
- **BREAST FEEDING** Avoid unless the potential benefit outweighs risk—no information available.
- **PRE-TREATMENT SCREENING** Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).
- **MONITORING REQUIREMENTS** Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **PATIENT AND CARER ADVICE** **Driving and skilled tasks** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► **Pilocarpine (Non-proprietary)**

Pilocarpine hydrochloride 10 mg per 1 ml Pilocarpine hydrochloride 1% eye drops | 10 ml [PoM] £20.78 DT = £19.95

Pilocarpine hydrochloride 20 mg per 1 ml Pilocarpine hydrochloride 2% eye drops | 10 ml [PoM] £21.52 DT = £19.88

Pilocarpine hydrochloride 40 mg per 1 ml Pilocarpine hydrochloride 4% eye drops | 10 ml [PoM] £27.20 DT = £23.14

► **Pilocarpine nitrate** (Bausch & Lomb UK Ltd)

Pilocarpine nitrate 20 mg per 1 ml Minims pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose [PoM] £12.47

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

Latanoprost

● INDICATIONS AND DOSE

Reduction of intra-ocular pressure in raised intra-ocular pressure and glaucoma

► TO THE EYE

- Child: Apply once daily, to be administered preferably in the evening

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015)

Following reformulation of Xalatan®, to allow for long-term storage at room temperature, there has been an increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.

- **CONTRA-INDICATIONS** Active herpes simplex keratitis · history of recurrent herpetic keratitis associated with prostaglandin analogues
- **CAUTIONS** Aphakia · asthma · children less than 1 year—limited information available · history of herpetic keratitis · history of significant ocular viral infections · peri-operative period of cataract surgery · preterm neonates less than 36 weeks gestational age—no information available · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis
- **SIDE-EFFECTS**
 - **Common or very common** Eye discolouration · eye discomfort · eye disorders · eye inflammation · vision disorders
 - **Uncommon** Dry eye · rash
 - **Rare or very rare** Asthma · chest pain · dyspnoea · unstable angina
 - **Frequency not known** Arthralgia · dizziness · headache · myalgia · ophthalmic herpes simplex · palpitations
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** May be present in milk—manufacturer advises avoid.

- **MONITORING REQUIREMENTS** Monitor for changes to eye coloration.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● PATIENT AND CARER ADVICE

Changes in eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

● NATIONAL FUNDING/ACCESS DECISIONS

MONOPOST®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2013) that Monopost® is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► **Latanoprost (Non-proprietary)**

Latanoprost 50 microgram per 1 ml Latanoprost 50micrograms/ml eye drops | 2.5 ml [PoM] £12.48 DT = £1.53

► **Medizol** (Medicom Healthcare Ltd)

Latanoprost 50 microgram per 1 ml Medizol 0.005% eye drops | 2.5 ml [PoM] £1.40 DT = £1.53

► **Monopost** (Thea Pharmaceuticals Ltd)

Latanoprost 50 microgram per 1 ml Monopost 50micrograms/ml eye drops 0.2ml unit dose | 30 unit dose [PoM] £8.49 DT = £8.49 | 90 unit dose [PoM] £25.47 DT = £25.47

► **Xalatan** (Pfizer Ltd)

Latanoprost 50 microgram per 1 ml Xalatan 50micrograms/ml eye drops | 2.5 ml [PoM] £12.48 DT = £1.53

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Apraclonidine

- **DRUG ACTION** Apraclonidine is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

● INDICATIONS AND DOSE

Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

► TO THE EYE

- Child: Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug

► TO THE EYE

- Child 12–17 years: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

- **UNLICENSED USE** 0.5% drops are not licensed for use in children under 12 years. 1% drops are not licensed for use in children.

- **CONTRA-INDICATIONS** History of severe or unstable and uncontrolled cardiovascular disease
 - **CAUTIONS** Cerebrovascular disease · depression · heart failure · history of angina · hypertension · loss of effect may occur over time · Raynaud's syndrome · recent myocardial infarction · reduction in vision in end-stage glaucoma (suspend treatment) · severe coronary insufficiency · thromboangiitis obliterans · vasovagal attack
 - **INTERACTIONS** → Appendix 1: apraclonidine
 - **SIDE-EFFECTS**
 - **Common or very common** Eye disorders
 - **Uncommon** Bradycardia · conjunctival haemorrhage · diarrhoea · dry eye · eye discomfort · eye inflammation · gastrointestinal discomfort · irritability · libido decreased · nasal dryness · palpitations · postural hypotension · sensation abnormal · sleep disorders · syncope · vision disorders · vomiting
 - **Rare or very rare** Chest pain · dry mouth · fatigue · headache · hyperhidrosis · pain in extremity · pruritus · taste altered · temperature sensation altered
- SIDE-EFFECTS, FURTHER INFORMATION** Since systemic absorption may follow topical application, see clonidine hydrochloride p. 102.
- Ocular intolerance** Manufacturer advises withdrawal if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.
- **PREGNANCY** Manufacturer advises avoid—no information available.
 - **BREAST FEEDING** Manufacturer advises avoid—no information available.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution.
 - **RENAL IMPAIRMENT** Use with caution in chronic renal failure.
 - **MONITORING REQUIREMENTS**
 - Monitor intra-ocular pressure and visual fields.
 - Monitor for excessive reduction in intra-ocular pressure following peri-operative use.
 - **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- **Iopidine** (Novartis Pharmaceuticals UK Ltd)

Apraclonidine (as Apraclonidine hydrochloride) 5 mg per 1 ml Iopidine 5mg/ml eye drops | 5 ml [PoM] £10.88 DT = £10.88
Apraclonidine (as Apraclonidine hydrochloride) 10 mg per 1 ml Iopidine 1% eye drops 0.25ml unit dose | 24 unit dose [PoM] £77.85 DT = £77.85

6 Retinal disorders

6.1 Optic neuropathy

DRUGS FOR METABOLIC DISORDERS > ANTIOXIDANTS

Idebenone

31-May-2017

- **DRUG ACTION** Idebenone is a nootropic and antioxidant that is thought to act by restoring cellular ATP generation, thereby reactivating retinal ganglion cells.

● INDICATIONS AND DOSE

Leber's Hereditary Optic Neuropathy (initiated by a specialist)

- **BY MOUTH**
- Child 12–17 years: 300 mg 3 times a day

● SIDE-EFFECTS

- **Common or very common** Cough · diarrhoea · increased risk of infection · pain
- **Frequency not known** Agranulocytosis · anaemia · anxiety · appetite decreased · azotaemia · delirium · dizziness · dyspepsia · hallucination · headache · hepatitis · leucopenia · malaise · movement disorders · nausea · neutropenia · poriomania · seizure · skin reactions · stupor · thrombocytopenia · urine discolouration · vomiting

SIDE-EFFECTS, FURTHER INFORMATION The metabolites of idebenone may cause red-brown discolouration of the urine. This effect is harmless, but the manufacturer advises caution as this may mask colour changes due to other causes (e.g. renal or blood disorders).

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2017) that idebenone (*Raxone*®) is accepted for restricted use within NHS Scotland for the treatment of visual impairment in patients with Leber's Hereditary Optic Neuropathy (LHON) who are not yet blind i.e. they do not meet the UK criteria to be registered as severely sight impaired. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

Ear

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the lining of the ear canal usually associated with an underlying seborrhoeic dermatitis or eczema; it is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping.

A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as aluminium acetate solution p. 693. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

Secondary infection in otitis externa may be of bacterial, fungal, or viral origin. If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 690 or **clioquinol**) may be used, but for only about a week because excessive use may result in fungal infections that are difficult to treat. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 690 may be used, but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating children when infection is present with inflammation and eczema. Clotrimazole 1% solution p. 691 is used topically to treat fungal infection in otitis externa.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical **aminoglycosides** or **polymyxins** in children with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in children with chronic suppurative otitis media and when other measures have

failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of **acetic acid** 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (*EarCalm*® spray) is on sale to the public for children over 12 years.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 271 or ibuprofen p. 655, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin p. 345 is the drug of choice; oral ciprofloxacin p. 690 or a systemic aminoglycoside may be needed for pseudomonal infections, particularly in children with diabetes or compromised immunity.

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments are then required, but prolonged use should be avoided.

Otitis media

Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in young children and may occur with even minor upper respiratory tract infections. Children diagnosed with acute otitis media should not be prescribed antibacterials routinely as many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a **simple analgesic**, such as paracetamol, may be sufficient. In children without systemic features, a **systemic antibacterial** may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the child is systemically unwell, if the

child is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in children with *acute otitis media* usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial can be given. Topical antibacterial treatment of acute otitis media is ineffective and there is no place for ear drops containing a local anaesthetic.

Otitis media with effusion

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Antimicrobials, corticosteroids, decongestants, and antihistamines have little place in the routine management of otitis media with effusion. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

Chronic otitis media

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in children with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction, which may completely resolve long-standing infection. Cleansing may be followed by topical treatment as for otitis externa; this is particularly beneficial for discharging ears or infections of the mastoid cavity. Acute exacerbations of chronic infection may require treatment with an oral antibacterial; a swab should be taken to identify infecting organisms and antibacterial sensitivity.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin or ofloxacin p. 677 eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from 'special-order' manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing **aminoglycosides** or **polymyxins** [unlicensed indications] cautiously in children with chronic suppurative otitis media and perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by **specialists** in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

Removal of ear wax

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax causing discomfort or impaired hearing may be softened using simple remedies such as **olive oil** ear drops or **almond oil** ear drops; sodium bicarbonate ear drops p. 693 are also effective, but may cause dryness of the ear canal. If

the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The child should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 694 or urea hydrogen peroxide p. 694 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in children unable to co-operate with the procedure, in children who have had otitis media in the last six weeks, in otitis externa, in children with cleft palate, a history of ear drum perforation, or previous ear surgery. A child who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

Administration

To administer ear drops, lay the child down with the head turned to one side; for an infant pull the earlobe back and down, for an older child pull the earlobe back and up.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ear drops

Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Predsol** (RPH Pharmaceuticals AB)
Prednisolone sodium phosphate 5 mg per 1 ml | Predsol 0.5% ear/eye drops | 10 ml [PoM] £2.00 DT = £2.00

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 691, neomycin sulfate p. 690.

● INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

- ▶ TO THE EAR USING EAR DROPS
- ▶ Child: Apply 2–3 drops 3–4 times a day

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 688) · perforated tympanic membrane (although may be used by specialists, see Ear p. 688)

- **CAUTIONS** Avoid prolonged use

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betnesol-N** (RPH Pharmaceuticals AB)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT = £2.39

Dexamethasone with ciprofloxacin

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, ciprofloxacin p. 690.

● INDICATIONS AND DOSE

Acute otitis media in patients with tympanostomy tubes

- ▶ TO THE EAR
- ▶ Child 6 months–17 years: Apply 4 drops twice daily for 7 days

Acute otitis externa

- ▶ TO THE EAR
- ▶ Child 1–17 years: Apply 4 drops twice daily for 7 days

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **CONTRA-INDICATIONS** Fungal ear infections · viral ear infections

- **CAUTIONS** Avoid prolonged use

● SIDE-EFFECTS

- ▶ **Common or very common** Ear discomfort
- ▶ **Uncommon** Ear infection fungal · flushing · irritability · malaise · otorrhoea · paraesthesia · skin reactions · taste altered · vomiting
- ▶ **Rare or very rare** Dizziness · headache · hearing impairment

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises further evaluation of underlying conditions if otorrhoea persists after a full course, or if at least two episodes of otorrhoea occur within 6 months.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **PATIENT AND CARER ADVICE** Manufacturer advises counselling on administration.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2017) that dexamethasone with ciprofloxacin (*Cilodex*®) is accepted for restricted use within NHS Scotland for the treatment of acute otitis media in patients with tympanostomy tubes (AOMT).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Cilodex** (Novartis Pharmaceuticals UK Ltd)

Dexamethasone 1 mg per 1 ml, Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml Cilodex ear drops | 5 ml [PoM] £6.12 DT = £6.12

Dexamethasone with framycetin sulfate and gramicidin

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, framycetin sulfate p. 689.

● INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

- ▶ TO THE EAR
- ▶ Child: 2–3 drops 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **LESS SUITABLE FOR PRESCRIBING** *Sofradex*® is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain polysorbates

- ▶ **Sofradex** (Sanofi)

Gramicidin 50 microgram per 1ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5mg per 1 ml Sofradex ear/eye drops | 10 ml [PoM] £7.50

Dexamethasone with glacial acetic acid and neomycin sulfate

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, neomycin sulfate p. 690.

● INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

- ▶ TO THE EAR
- ▶ Child 2–17 years: Apply 1 spray 3 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 688) • perforated tympanic membrane (although may be used by specialists, see Ear p. 688)
- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Paraesthesia • skin reactions

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

▶ Otimize (Teva UK Ltd)

Dexamethasone 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram, Acetic acid glacial 20 mg per 1 gram Otimize ear spray | 5 ml [PoM] £3.27

Hydrocortisone with neomycin and polymyxin B sulfate

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, neomycin sulfate p. 690.

INDICATIONS AND DOSE

Bacterial infection in otitis externa

- ▶ TO THE EAR
- ▶ Child 3–17 years: Apply 3 drops 3–4 times a day for 7 days (review treatment if there is no clinical improvement)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **RENAL IMPAIRMENT** Manufacturer advises avoid prolonged, unsupervised use.
Dose adjustments Manufacturer advises reduce dose.

MEDICINAL FORMS

Ear drops

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates

▶ Otosporin (Phoenix Labs Ltd)

Hydrocortisone 10 mg per 1 ml, Neomycin sulfate 3400 unit per 1 ml, Polymyxin B sulfate 10000 unit per 1 ml Otosporin ear drops | 10 ml [PoM] £7.45

DERMATOLOGICAL DRUGS > ASTRINGENTS

Aluminium acetate

INDICATIONS AND DOSE

Inflammation in otitis externa

- ▶ TO THE EAR
- ▶ Child: To be inserted into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

- **UNLICENSED USE** Not licensed for use in children.
- **DIRECTIONS FOR ADMINISTRATION** For ear drops 8%—dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared.

MEDICINAL FORMS

Forms available from special-order manufacturers include: ear drops

2 Removal of earwax

BICARBONATE

Sodium bicarbonate

INDICATIONS AND DOSE

Removal of earwax (with 5% ear drop solution)

- ▶ TO THE EAR
- ▶ Child: (consult product literature)

- **SIDE-EFFECTS** Dry ear

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection, liquid, mouthwash

Ear drops

▶ Sodium bicarbonate (Non-proprietary)

Sodium bicarbonate 50 mg per 1 ml Sodium bicarbonate 5% ear drops | 10 ml £1.23–£1.25

SOFTENING DRUGS

Almond oil

INDICATIONS AND DOSE

Removal of earwax

- ▶ TO THE EAR
- ▶ Child: Allow drops to warm to room temperature before use (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

▶ Almond oil (Non-proprietary)

Almond oil 1 ml per 1 ml Almond oil liquid | 50 ml £0.95 DT = £0.95 | 70 ml £0.85 | 200 ml £2.68 | 500 ml £11.90

Arachis oil with chlorobutanol

INDICATIONS AND DOSE

Removal of earwax

- ▶ TO THE EAR
- ▶ Child 1–17 years: (consult product literature)

- **LESS SUITABLE FOR PRESCRIBING** Arachis (peanut) oil with chlorobutanol ear drops are less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

Urea hydrogen peroxide 50 mg per 1 gram Otex 5% ear drops | 8 ml £2.89 DT = £2.89

Nose

Nose

31-Oct-2017

Rhinitis

Rhinitis is often self-limiting. Many nasal preparations contain sympathomimetic drugs which can give rise to rebound congestion (*rhinitis medicamentosa*) and may damage the nasal cilia. Sodium chloride 0.9% solution p. 589 may be used as a douche or 'sniff' following endonasal surgery.

Administration

To administer nasal drops, lay the child face-upward with the neck extended, instil the drops, then sit the child up and tilt the head forward.

Drugs used in nasal allergy

Mild allergic rhinitis is controlled by **antihistamines** (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 171) or topical **nasal corticosteroids**; systemic nasal decongestants are not recommended for use in children. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms can be relieved by topical nasal **corticosteroids**; sodium cromoglicate p. 701 is an alternative, but may be less effective. The topical antihistamine, azelastine hydrochloride p. 698, is useful for controlling breakthrough symptoms in allergic rhinitis. Azelastine hydrochloride is less effective than nasal corticosteroids, but probably more effective than sodium cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous long-term treatment may be required in perennial rhinitis.

Montelukast p. 165 is less effective than topical nasal corticosteroids; it can be used in children with seasonal allergic rhinitis (unresponsive to other treatments) and concomitant asthma.

Children with disabling symptoms of seasonal rhinitis (e.g. students taking important examinations), may be treated with oral **corticosteroids** for short periods. Oral corticosteroids may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal mucosa.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide p. 698 can reduce watery rhinorrhoea.

Corticosteroids

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are

administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Nasal polyps

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the child in the 'head down' position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

Pregnancy

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclomethasone dipropionate p. 699, budesonide p. 699, fluticasone p. 700, or sodium cromoglicate may be considered.

Topical nasal decongestants

Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions in children with rhinitis. In infants, 1–2 drops of sodium chloride 0.9% solution in each nostril before feeds will help relieve congestion and allow more effective suckling.

Inhalation of **warm moist air** may be useful in the treatment of symptoms of acute nasal congestion in infants and children, but the use of boiling water for steam inhalation is dangerous for children and should **not** be recommended. Volatile substances such as menthol and eucalyptus may encourage inhalation of warm moist air (see also Aromatic inhalations, cough preparations and systemic nasal decongestants p. 187).

Topical nasal decongestants containing sympathomimetics can cause rebound congestion (*rhinitis medicamentosa*) following prolonged use (more than 7 days), and are therefore of limited value in the treatment of nasal congestion.

Ephedrine hydrochloride below nasal drops is the least likely of the sympathomimetic nasal decongestants to cause rebound congestion and can provide relief for several hours. The more potent sympathomimetic drugs **oxymetazoline** and **xylometazoline hydrochloride** p. 696 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide.

Recurrent, persistent bleeding may respond to the use of a sympathomimetic nasal spray; if infection is present, chlorhexidine and neomycin (*Naseptin*®) cream may be effective.

Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis; see elimination of nasal staphylococci. In children, acute complications such as periorbital cellulitis require hospital treatment.

Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin*®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 697 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant *Staphylococcus aureus* (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The

course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

For eradication of MRSA also consult local infection control policy. See also MRSA p. 360.

1 Nasal congestion

SYMPATHOMIMETICS > VASOCONSTRICTOR

Ephedrine hydrochloride

• INDICATIONS AND DOSE

Nasal congestion | Sinusitis affecting the maxillary antrum

► BY INTRANASAL ADMINISTRATION

- Child 12–17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops

IMPORTANT SAFETY INFORMATION

CHM/MHRA ADVICE

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Avoid excessive or prolonged use • cardiovascular disease • diabetes mellitus • hypertension • hyperthyroidism
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety • headache • insomnia • nausea
 - **Frequency not known** Appetite decreased • arrhythmia • circulation impaired • dermatitis • dizziness • drug dependence • drug tolerance • dry mouth • dyspnoea • hallucination • hyperglycaemia • hyperhidrosis • hypersalivation • hypertension • hypokalaemia • hypotension • irritability • muscle weakness • mydriasis • pain • palpitations • paranoia • piloerection • rebound congestion • syncope • thirst • tremor • urinary disorders • vasoconstriction • vasodilation • vomiting
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- **PRESCRIBING AND DISPENSING INFORMATION** For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.
- **PROFESSION SPECIFIC INFORMATION**
 - Dental practitioners' formulary** Ephedrine nasal drops may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nasal drops► **Ephedrine hydrochloride (Non-proprietary)**

Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops | 10 ml [P] £1.90–£1.94 DT = £1.90

Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml [P] £1.94–£2.01 DT = £1.94

Pseudoephedrine hydrochloride**INDICATIONS AND DOSE**

Congestion of mucous membranes of upper respiratory tract

► **BY MOUTH**

- Child 6–11 years: 30 mg 3–4 times a day
- Child 12–17 years: 60 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009): OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN
Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

- **CAUTIONS** Diabetes · heart disease · hypertension · hyperthyroidism · raised intra-ocular pressure
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Angle closure glaucoma · anxiety · arrhythmias · circulation impaired · dry mouth · hallucination · headache · hypertension · irritability · nausea · palpitations · psychotic disorder · skin reactions · sleep disorders · tremor · urinary retention · vomiting
- **PREGNANCY** Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.
- **BREAST FEEDING** May suppress lactation; avoid if lactation not well established or if milk production insufficient.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.
- **LESS SUITABLE FOR PRESCRIBING** Pseudoephedrine hydrochloride is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** *Galpseud*® and *Sudafed*® can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Alcohol

► **Galpseud** (Thornton & Ross Ltd)

Pseudoephedrine hydrochloride 6 mg per 1 ml Galpseud 30mg/5ml linctus sugar-free | 2000 ml [PoM] £14.00

► **Sudafed Non-Drowsy Decongestant (pseudoephedrine)** (McNeil Products Ltd)

Pseudoephedrine hydrochloride 6 mg per 1 ml Sudafed Decongestant 30mg/5ml liquid | 100 ml [P] £2.22

Tablet► **Galpseud** (Thornton & Ross Ltd)

Pseudoephedrine hydrochloride 60 mg Galpseud 60mg tablets | 24 tablet [PoM] £2.25 | 100 tablet [PoM] £5.42 DT = £5.42

► **Sudafed Non-Drowsy Decongestant (pseudoephedrine)** (McNeil Products Ltd)

Pseudoephedrine hydrochloride 60 mg Sudafed Decongestant 60mg tablets | 12 tablet [P] £2.43

Xylometazoline hydrochloride

- **DRUG ACTION** Xylometazoline is a sympathomimetic.

INDICATIONS AND DOSE**Nasal congestion**► **BY INTRANASAL ADMINISTRATION USING NASAL DROPS**

► Child 6–11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril

► Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril

► **BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**

► Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

IMPORTANT SAFETY INFORMATION

The CHM/MHRA has stated that non-prescription cough and cold medicines containing oxymetazoline or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Angle-closure glaucoma · avoid excessive or prolonged use · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism · rebound congestion

CAUTIONS, FURTHER INFORMATION

- **Rebound congestion** Sympathomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Cardiovascular effects · headache · hypersensitivity · nasal dryness · nausea · paraesthesia · visual impairment
- SIDE-EFFECTS, FURTHER INFORMATION** Use of decongestants in infants and children under 6 years has been associated with agitated psychosis, ataxia, hallucinations, and even death—avoid.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

2 Nasal infection

Sinusitis (acute)

31-Oct-2017

Description of condition

Sinusitis is an inflammation of the mucosal lining of the paranasal sinuses. Acute sinusitis (rhinosinusitis) is a self-limiting condition usually triggered by a viral upper respiratory tract infection such as the 'common cold'. Occasionally, acute sinusitis may become complicated by a bacterial infection (see *Antibacterial therapy for acute sinusitis* in Nose infections, antibacterial therapy p. 308).

Children with acute sinusitis, particularly young children, often present with non-specific symptoms in the upper respiratory tract, including nasal blockage or congestion, discoloured nasal discharge, or cough during the day or night.

Symptoms usually improve within 2 to 3 weeks without requiring treatment.

Rarely, acute sinusitis may lead to orbital, intracranial or skeletal complications (e.g. periorbital cellulitis, symptoms or signs of meningitis).

Aims of treatment

Treatment is aimed at managing symptoms including pain, fever, and nasal congestion as well as treatment of bacterial infection if present.

Treatment

[EvGr] Children presenting with symptoms for around 10 days or less, should be given advice about the usual duration of acute sinusitis, self-care of pain or fever with paracetamol p. 271 or ibuprofen p. 655, and when to seek medical help. Children and their carers should be reassured that antibiotics are usually not required.

Children (over the age of 12) presenting with symptoms for around 10 days or more with no improvement could be considered for treatment with a high-dose nasal corticosteroid, such as mometasone furoate p. 700 [unlicensed use] or fluticasone p. 700 [unlicensed use] for 14 days.

If the child is systemically very unwell, has signs and symptoms of a more serious illness or condition, or is at high-risk of complications, an immediate antibiotic could be offered if deemed appropriate. **[A]** (see *Antibacterial therapy for acute sinusitis* in Nose infections, antibacterial therapy p. 308).

[EvGr] Children presenting with symptoms of acute sinusitis associated with a severe systemic infection or with orbital or intracranial complications should be referred to hospital. **[A]**

Eradication of nasal carriage of staphylococci

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply 4 times a day for 10 days

Preventing nasal carriage of staphylococci

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply twice daily

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Naseptin** (Alliance Pharmaceuticals Ltd)

Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Naseptin nasal cream | 15 gram [PoM] £2.03 DT = £2.24

ANTIBACTERIALS > OTHER

Mupirocin

• INDICATIONS AND DOSE

BACTROBAN NASAL[®]

For eradication of nasal carriage of staphylococci, including meticillin-resistant *Staphylococcus aureus* (MRSA)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nasal ointment

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% nasal ointment | 3 gram [PoM] £4.24 DT = £4.24

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 691, neomycin sulfate p. 690.

● INDICATIONS AND DOSE

Nasal infection

- BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- Child: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

● INTERACTIONS → Appendix 1: corticosteroids · neomycin

● LESS SUITABLE FOR PRESCRIBING Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Betnesol-N (RPH Pharmaceuticals AB)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT = £2.39

3 Nasal inflammation, nasal polyps and rhinitis

Other drugs used for Nasal inflammation, nasal polyps and rhinitis Desloratadine, p. 174 · Fexofenadine hydrochloride, p. 175 · Ketotifen, p. 180 · Rupatadine, p. 177

ANTIHISTAMINES > NON-SEDATING

Azelastine hydrochloride

● INDICATIONS AND DOSE

Allergic rhinitis

- BY INTRANASAL ADMINISTRATION
- Child 6–17 years: 1 spray twice daily, to be administered into each nostril

DOSE EQUIVALENCE AND CONVERSION

- 1 spray equivalent to 140 micrograms.

● INTERACTIONS → Appendix 1: antihistamines, non-sedating

● SIDE-EFFECTS

- Common or very common Taste bitter (if administered incorrectly)
- Uncommon Epistaxis · nasal complaints

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

► Rhinolast (Meda Pharmaceuticals Ltd)

Azelastine hydrochloride 140 microgram per

1 actuation Rhinolast 140micrograms/dose nasal spray | 22 ml [PoM] £10.50 DT = £10.50

Combinations available: **Fluticasone with azelastine**, p. 700

ANTIMUSCARINICS

Ipratropium bromide

22-Jan-2018

● INDICATIONS AND DOSE

Rhinorrhoea associated with allergic and non-allergic rhinitis

► BY INTRANASAL ADMINISTRATION

- Child 12–17 years: 2 sprays 2–3 times a day, dose to be sprayed into each nostril

DOSE EQUIVALENCE AND CONVERSION

- 1 metered spray of nasal spray = 21 micrograms.

● CAUTIONS Avoid spraying near eyes · bladder outflow obstruction · cystic fibrosis · susceptibility to angle-closure glaucoma

● INTERACTIONS → Appendix 1: ipratropium

● SIDE-EFFECTS

- Common or very common Gastrointestinal motility disorder · nasal complaints · throat complaints
- Uncommon Corneal oedema · eye disorders · eye pain · respiratory disorders · vision disorders

● ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with hypersensitivity to atropine or its derivatives.

● PREGNANCY Manufacturer advises only use if potential benefit outweighs the risk.

● BREAST FEEDING No information available—manufacturer advises only use if potential benefit outweighs risk.

● PATIENT AND CARER ADVICE Patients or carers should be counselled on appropriate administration technique and warned against accidental contact with the eye (due to risk of ocular complications).

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and vision disorders.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Rinattec (Boehringer Ingelheim Ltd)

Ipratropium bromide 21 microgram per 1 dose Rinattec

21micrograms/dose nasal spray | 180 dose [PoM] £6.54 DT = £6.54

CORTICOSTEROIDS

Corticosteroids (intranasal)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

● CAUTIONS Avoid after nasal surgery (until healing has occurred) · avoid in pulmonary tuberculosis · avoid in the presence of untreated nasal infections · patients

transferred from systemic corticosteroids may experience exacerbation of some symptoms

CAUTIONS, FURTHER INFORMATION

- **Systemic absorption** Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

• SIDE-EFFECTS

- **Common or very common** Altered smell sensation · amenorrhoea · anxiety · behaviour abnormal · cognitive impairment · Cushing's syndrome · dyspepsia · electrolyte imbalance · epistaxis · hair changes · headache · healing impaired · hypertension · increased risk of infection · mood altered · nasal complaints · nausea · osteoporosis · skin reactions · sleep disorder · taste altered · throat irritation · voice alteration
- **Uncommon** Adrenal suppression · cataract · diabetic control impaired · glaucoma · osteonecrosis · pancreatitis · peptic ulcer · psychotic disorder · thromboembolism · vision blurred
- **Rare or very rare** Bronchospasm paradoxical · nasal septum perforation (more common following nasal surgery) · telangiectasia
- **Frequency not known** Growth retardation · local reaction · pneumonia (in patients with COPD)

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids.

- **MONITORING REQUIREMENTS** The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

F 698

Beclometasone dipropionate (Beclomethasone dipropionate)

04-Jan-2016

• INDICATIONS AND DOSE

Prophylaxis and treatment of allergic and vasomotor rhinitis

- **BY INTRANASAL ADMINISTRATION**
- **Child 6–17 years:** 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

- **INTERACTIONS** → Appendix 1: corticosteroids

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

• Beclometasone dipropionate (Non-proprietary)

Beclometasone dipropionate 50 microgram per 1 dose Beclometasone 50micrograms/dose nasal spray | 200 dose [PoM] DT = £2.55

• Beconase (GlaxoSmithKline UK Ltd, Omega Pharma Ltd)

Beclometasone dipropionate 50 microgram per 1 dose Beconase Aqueous 50micrograms/dose nasal spray | 200 dose [PoM] £2.63 DT = £2.55

• Nasobec (Teva UK Ltd)

Beclometasone dipropionate 50 microgram per 1 dose Nasobec Aqueous 50micrograms/dose nasal spray | 200 dose [PoM] £3.06 DT = £2.55

Betamethasone

F 698

21-Dec-2017

• INDICATIONS AND DOSE

BETNESOL®

Non-infected inflammatory conditions of nose

► BY INTRANASAL ADMINISTRATION

- **Child:** Apply 2–3 drops 2–3 times a day, dose to be applied into each nostril

VISTAMETHASONE®

Non-infected inflammatory conditions of nose

► BY INTRANASAL ADMINISTRATION

- **Child:** Apply 2–3 drops twice daily, dose to be applied into each nostril

- **INTERACTIONS** → Appendix 1: corticosteroids

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

• Betnesol (RPH Pharmaceuticals AB)

Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [PoM] £2.32 DT = £2.32

● **MEDICINAL FORMS**

No licensed medicines listed.

Oropharynx

1 Dry mouth

Treatment of dry mouth

Overview

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics and sedating antihistamines), by irradiation of the head and neck region or by damage to or disease of the salivary glands. Children with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop dental caries, periodontal disease, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate.

Artificial saliva products

● **ARTIFICIAL SALIVA PRODUCTS**

AS SALIVA ORTHANA® LOZENGES

Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral

● **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

▶ BY MOUTH

- ▶ Child: 1 lozenge as required, allow to dissolve slowly in the mouth

● **PRESCRIBING AND DISPENSING INFORMATION** *AS Saliva Orthana®* lozenges do not contain fluoride.

AS Saliva Orthana lozenges (A S Pharma Ltd)

30 lozenge(ACBS) • NHS indicative price = £3.50 • Drug Tariff (Part VIIIA Category C) price = £3.50

AS SALIVA ORTHANA® SPRAY

Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

● **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

▶ BY MOUTH

- ▶ Child: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

AS Saliva Orthana® Oral Spray may be prescribed.

BIOXTRA® GEL

Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

- **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy | Dry mouth as a result of sicca syndrome

- BY MOUTH
- Child: Apply as required, apply to oral mucosa

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

BioXtra® Gel may be prescribed.

BioXtra Dry Mouth oral gel (R.I.S. Products Ltd)

40 ml • NHS indicative price = £3.94 • Drug Tariff (Part IXa)

BIOTENE ORBALANCE®

Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH
- Child: Apply as required, apply to gums and tongue

- **PATIENT AND CARER ADVICE** Avoid use with toothpastes containing detergents (including foaming agents).

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Biotene Oralbalance® Saliva Replacement Gel may be prescribed as Artificial Saliva Gel.

Biotene Oralbalance dry mouth saliva replacement gel

(GlaxoSmithKline Consumer Healthcare) **Glucose oxidase 12000 unit, Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg**
50 gram • NHS indicative price = £4.46 • Drug Tariff (Part IXa)

GLANDOSANE®

Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

- **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- BY MOUTH
- Child: Apply as required, spray onto oral and pharyngeal mucosa

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Glandosane® Aerosol Spray may be prescribed.

Glandosane synthetic saliva spray lemon (Fresenius Kabi Ltd)
50 ml • NHS indicative price = £5.68

Glandosane synthetic saliva spray natural (Fresenius Kabi Ltd)
50 ml • NHS indicative price = £5.68

Glandosane synthetic saliva spray peppermint (Fresenius Kabi Ltd)
50 ml • NHS indicative price = £5.68

ORALIEVE GEL

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH
- Child: Apply as required, particularly at night, to oral mucosa

- **PRESCRIBING AND DISPENSING INFORMATION** Contains traces of milk protein and egg white protein.

SST®

Sugar-free, citric acid, malic acid and other ingredients in a sorbitol base.

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts

- BY MOUTH
- Child: 1 tablet as required, allow tablet to dissolve slowly in the mouth

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

May be prescribed as Saliva Stimulating Tablets.

SST saliva stimulating tablets (Sinclair IS Pharma Plc)
100 tablet • NHS indicative price = £4.86 • Drug Tariff (Part IXa)

SALIVEZE®

Carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral

- **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

- BY MOUTH
- Child: Apply 1 spray as required, spray onto oral mucosa

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Saliveze® Oral Spray may be prescribed.

Saliveze mouth spray (Wyvern Medical Ltd)
50 ml (ACBS) • NHS indicative price = £3.50

SALIVIX®

Sugar-free, reddish-amber, acacia, malic acid and other ingredients.

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH USING PASTILLES
- Child: 1 unit as required, suck pastille

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Salivix® Pastilles may be prescribed as Artificial Saliva Pastilles.

Salivix pastilles (Galen Ltd)
50 pastille • NHS indicative price = £3.55 • Drug Tariff (Part IXa)

XEROTIN®

Sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral.

- **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

- BY MOUTH
- Child: 1 spray as required

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Xerotin® Oral Spray may be prescribed as Artificial Saliva Oral Spray.

Xerotin spray (SpePharm UK Ltd)
100 ml • NHS indicative price = £6.86 • Drug Tariff (Part IXa)

2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes and gargles

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. Mouthwashes may not be suitable for children under 7 years (risk of the solution being swallowed); the mouthwash or dental gel may be applied using a cotton bud.

A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 704 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 704, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris. Concentrations greater than 1.5% in children may cause ulceration and tissue damage.

Chlorhexidine below is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine mouthwash is used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in children undergoing dental procedures.

ANTISEPTICS AND DISINFECTANTS

Chlorhexidine

● INDICATIONS AND DOSE

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

Oral hygiene and plaque inhibition and gingivitis

- ▶ BY MOUTH USING DENTAL GEL
- ▶ Child: Apply 1–2 times a day, to be brushed on the teeth

Oral candidiasis | Management of aphthous ulcers

- ▶ BY MOUTH USING DENTAL GEL
- ▶ Child: Apply 1–2 times a day, to affected areas

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

- ▶ BY MOUTH USING OROMUCOSAL SPRAY
- ▶ Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces

Bladder irrigation and catheter patency solutions

- ▶ BY INTRAVESICAL INSTILLATION
- ▶ Child: (consult product literature)

- **UNLICENSED USE** *Corsodyl*® not licensed for use in children under 12 years (unless on the advice of a healthcare professional).

● SIDE-EFFECTS

- ▶ Common or very common
- ▶ With buccal use Dry mouth · hypersensitivity · oral disorders · taste altered

SIDE-EFFECTS, FURTHER INFORMATION If desquamation occurs with mucosal irritation, discontinue treatment.

- **PATIENT AND CARER ADVICE** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Corsodyl® dental gel may be prescribed as Chlorhexidine Gluconate Gel; *Corsodyl*® mouthwash may be prescribed as Chlorhexidine Mouthwash; *Corsodyl*® oral spray may be prescribed as Chlorhexidine Oral Spray.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dental gel

- ▶ *Corsodyl* (GlaxoSmithKline Consumer Healthcare)
Chlorhexidine gluconate 10 mg per 1 g *Corsodyl* 1% dental gel sugar-free | 50 g *P* | £1.56 DT = £1.56

Irrigation

- ▶ **Chlorhexidine (Non-proprietary)**
Chlorhexidine acetate 200 microgram per 1 mL Chlorhexidine acetate 0.02% catheter maintenance solution | 100 mL *P* *NS*
- ▶ **Uro-Tainer (chlorhexidine)** (B.Braun Medical Ltd)
Chlorhexidine acetate 200 microgram per 1 mL Uro-Tainer chlorhexidine 1:5000 catheter maintenance solution | 100 mL *P* | £2.70

Mouthwash

- ▶ **Chlorhexidine (Non-proprietary)**
Chlorhexidine gluconate 2 mg per 1 mL Chlorhexidine gluconate 0.2% mouthwash aniseed | 300 mL *GSL* | £2.09 DT = £4.09
Chlorhexidine gluconate 0.2% mouthwash natural | 300 mL *GSL* | £4.02 DT = £4.09
Chlorhexidine gluconate 0.2% mouthwash plain | 300 mL *GSL* | £4.09 DT = £4.09
Chlorhexidine gluconate 0.2% mouthwash peppermint | 300 mL *GSL* | £4.09 DT = £4.09
Chlorhexidine gluconate 0.2% mouthwash original | 300 mL *GSL* | £4.18 DT = £4.09

Chlorhexidine gluconate 0.2% mouthwash alcohol free | 300 ml [GSL] DT = £4.09

► **Corosdyl** (GlaxoSmithKline Consumer Healthcare)

Chlorhexidine gluconate 2 mg per 1 ml Corosdyl 0.2% mouthwash aniseed | 300 ml [GSL] £2.44 DT = £4.09

Corosdyl Mint 0.2% mouthwash | 300 ml [GSL] £2.44 DT = £4.09 | 600 ml [GSL] £4.50

Corosdyl 0.2% mouthwash alcohol free | 300 ml [GSL] £3.06 DT = £4.09

► **Curasept** (Curaprox (UK) Ltd)

Chlorhexidine gluconate 2 mg per 1 ml Curasept 0.2% oral rinse | 200 ml DT

Irrigation solution

► **Chlorhexidine (Non-proprietary)**

Chlorhexidine acetate 200 microgram per 1 ml Chlorhexidine acetate 0.02% irrigation solution 1litre bottles | 1 bottle [P] DT

Chlorhexidine acetate 500 microgram per 1 ml Chlorhexidine acetate 0.05% irrigation solution 1litre bottles | 1 bottle [P] DT

Hexetidine

● **INDICATIONS AND DOSE**

Oral hygiene

► **BY MOUTH USING MOUTHWASH**

- Child 6–17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

● **SIDE-EFFECTS**

- Rare or very rare Anaesthesia • taste altered
- Frequency not known Cough • dry mouth • dysphagia • dyspnoea • nausea • salivary gland enlargement • vomiting

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Mouthwash

► **Oraldene** (McNeil Products Ltd)

Hexetidine 1 mg per 1 ml Oraldene 0.1% mouthwash peppermint sugar-free | 200 ml [GSL] £2.92

Hydrogen peroxide

- **DRUG ACTION** Hydrogen peroxide is an oxidising agent.

● **INDICATIONS AND DOSE**

Oral hygiene (with hydrogen peroxide 6%)

► **BY MOUTH USING MOUTHWASH**

- Child: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water

PEROXYL®

Oral hygiene

► **BY MOUTH USING MOUTHWASH**

- Child 6–17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime

- **SIDE-EFFECTS** Tongue papilla hypertrophy (long term use)

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.

- **HANDLING AND STORAGE** Hydrogen peroxide bleaches fabric.

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Hydrogen Peroxide Mouthwash may be prescribed.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Mouthwash

► **PeroxyL** (Colgate-Palmolive (UK) Ltd)

Hydrogen peroxide 15 mg per 1 ml PeroxyL 1.5% mouthwash sugar-free | 300 ml [GSL] £2.94 DT = £2.94

Sodium bicarbonate with sodium chloride

● **INDICATIONS AND DOSE**

Oral hygiene

► **BY MOUTH USING MOUTHWASH**

- Child: (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** For mouthwash, extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water prior to administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include peppermint.

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Compound sodium chloride mouthwash may be prescribed.

● **MEDICINAL FORMS**

Forms available from special-order manufacturers include: mouthwash

Sodium chloride

● **INDICATIONS AND DOSE**

Oral hygiene

► **BY MOUTH USING MOUTHWASH**

- Child: Rinse or gargle as required

- **DIRECTIONS FOR ADMINISTRATION** Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water.

- **PRESCRIBING AND DISPENSING INFORMATION** No mouthwash preparations available—when prepared extemporaneously, the BP states Sodium Chloride Mouthwash, Compound, BP consists of sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Compound Sodium Chloride Mouthwash may be prescribed.

● **MEDICINAL FORMS**

No licensed medicines listed.

2.1 Dental caries

Fluoride

Fluoride

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

VITAMINS AND TRACE ELEMENTS

Sodium fluoride

● INDICATIONS AND DOSE

Prophylaxis of dental caries for water content less than 300micrograms/litre (0.3 parts per million) of fluoride ion

- ▶ BY MOUTH USING TABLETS
- ▶ Child 6 months-2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Child 3-5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Child 6-17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)

Prophylaxis of dental caries for water content between 300 and 700micrograms/litre (0.3-0.7 parts per million) of fluoride ion

- ▶ BY MOUTH USING TABLETS
- ▶ Child 3-5 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Child 6-17 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)

Prophylaxis of dental caries for water content above 700micrograms/litre (0.7 parts per million) of fluoride ion

- ▶ Child 6 months-17 years: Supplements not advised

Prophylaxis of dental caries for individuals who are caries prone or medically compromised

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child 6-17 years: Rinse or gargle 10 mL daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.
- ▶ These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric

Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; **182**: 6–7).

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE

Prophylaxis of dental caries

- ▶ BY MOUTH USING PASTE
- ▶ Child 10-17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE

Prophylaxis of dental caries

- ▶ BY MOUTH USING PASTE
- ▶ Child 16-17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

EN-DE-KAY® FLUORINSE

Prophylaxis of dental caries for individuals who are caries prone or medically compromised

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child 8-17 years: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL

- **CONTRA-INDICATIONS** Not for areas where drinking water is fluoridated

- **SIDE-EFFECTS** Dental fluorosis

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be sucked or dissolved in the mouth and taken preferably in the evening. For mouthwash, rinse mouth for 1 minute and then spit out.

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE Brush teeth for 1 minute before spitting out.

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE Brush teeth for 3 minutes before spitting out.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral tablet formulations may include orange.

- **PATIENT AND CARER ADVICE**

Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.

COLGATE DURAPHAT® 2800PPM FLUORIDE

TOOTHPASTE Patients or carers should be given advice on how to administer sodium fluoride toothpaste. Avoid drinking or rinsing mouth for 30 minutes after use.

COLGATE DURAPHAT® 5000PPM FLUORIDE

TOOTHPASTE Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Tablets may be prescribed as Sodium Fluoride Tablets.

Oral drops may be prescribed as Sodium Fluoride Oral Drops.

Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE May be prescribed as Sodium Fluoride Toothpaste 0.619%.

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE May be prescribed as Sodium Fluoride Toothpaste 1.1%.

Dental information

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Endekay** (Manx Healthcare Ltd)
Sodium fluoride 1.1 mg Endekay Flutabts 3-6 Years 1.1mg tablets | 200 tablet [P] £2.38 DT = £2.38
- Sodium fluoride 2.2 mg** Endekay Flutabts 6+ Years 2.2mg tablets | 200 tablet [P] £2.38 DT = £2.38

Paste

- **Colgate Duraphat** (Colgate-Palmolive (UK) Ltd)

- sugar-free** | 500 ml [GSL] £2.45
- Sodium fluoride 20 mg per 1 ml** Endekay Fluorinse 2% mouthwash sugar-free | 100 ml [PoM] £4.97

Hydrocortisone oromucosal tablets p. 440 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclomethasone dipropionate inhaler p. 160 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets p. 438 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 661) is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics

Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. When local anaesthetics are used in the mouth, care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Benzylamine hydrochloride p. 707 and flurbiprofen p. 654 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzylamine hydrochloride mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillectomy and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat in adolescents.

Choline salicylate p. 708 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration in adults and children over 16 years of age.

Other preparations

Doxycycline p. 352 rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis

Low-dose doxycycline (*Periostat*®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharyngeal infections, antibacterial therapy p. 709. See also Mouthwashes and other preparations for oropharyngeal use p. 703 for mouthwashes used for oral hygiene and plaque inhibition.

ANAESTHETICS, LOCAL

Lidocaine hydrochloride

(Lignocaine hydrochloride)

● INDICATIONS AND DOSE

Dental practice

- BY BUCCAL ADMINISTRATION USING OINTMENT
- Child: Rub gently into dry gum

LARYNGOJET®

Anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract

- TO MUCOUS MEMBRANES
- Child: Up to 3 mg/kg (max. per dose 200 mg), to be given as a single dose sprayed, instilled (if a cavity) or applied with a swab; reduce dose according to size, age, and condition of child

3 Oral ulceration and inflammation

Oral ulceration and inflammation

Ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy. It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Children with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude oral cancer in adults or secondary causes such as leukaemia.

Simple mouthwashes

A saline mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes

Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of chlorhexidine mouthwash p. 703 is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids

Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the 'prodromal' phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

XYLOCAINE®**Bronchoscopy | Laryngoscopy | Oesophagoscopy | Endotracheal intubation**

- TO MUCOUS MEMBRANES
- Child: Up to 3 mg/kg

- **CAUTIONS** Can damage plastic cuffs of endotracheal tubes
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.
- **BREAST FEEDING** Present in milk but amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.
- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Lidocaine ointment 5% may be prescribed.
Spray may be prescribed as Lidocaine Spray 10%
XYLOCAINE®
May be prescribed as lidocaine spray 10%.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

Spray

- **Xylocaine** (Aspen Pharma Trading Ltd)
Lidocaine 10 mg per 1 actuation Xylocaine 10mg/dose spray sugar-free | 50 ml [P] £6.29 DT = £6.29

Ointment

- **Lidocaine hydrochloride (Non-proprietary)**
Lidocaine hydrochloride 50 mg per 1 gram Lidocaine 5% ointment | 15 gram [P] £6.50 DT = £6.18

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS**Benzydamine hydrochloride**● **INDICATIONS AND DOSE****Painful inflammatory conditions of oropharynx**

- TO THE LESION USING MOUTHWASH
 - Child 13–17 years: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
- TO THE LESION USING OROMUCOSAL SPRAY
 - Child 1 month–5 years (body-weight 4–7 kg): 1 spray every 1.5–3 hours, to be administered onto the affected area
 - Child 1 month–5 years (body-weight 8–11 kg): 2 sprays every 1.5–3 hours, to be administered onto the affected area
 - Child 1 month–5 years (body-weight 12–15 kg): 3 sprays every 1.5–3 hours, to be administered onto the affected area

- Child 1 month–5 years (body-weight 16 kg and above): 4 sprays every 1.5–3 hours, to be administered onto the affected area
- Child 6–11 years: 4 sprays every 1.5–3 hours, to be administered onto affected area
- Child 12–17 years: 4–8 sprays every 1.5–3 hours, to be administered onto affected area

- **INTERACTIONS** → Appendix 1: NSAIDs

● **SIDE-EFFECTS**

- **Uncommon** Oral disorders
- **Rare or very rare** Photosensitivity reaction · respiratory disorders · skin reactions
- **Frequency not known** Angioedema

● **PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

Benzydamine Oromucosal Spray 0.15% may be prescribed.

Benzydamine mouthwash may be prescribed as Benzydamine Mouthwash 0.15%.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Spray

- **Benzydamine hydrochloride (Non-proprietary)**
Benzydamine hydrochloride 1.5 mg per 1 ml Benzydamine 0.15% oromucosal spray sugar free sugar-free | 30 ml [P] £4.24 DT = £4.21
- **Diffiam** (Meda Pharmaceuticals Ltd)

Benzydamine hydrochloride 1.5 mg per 1 ml Diffiam Oral Rinse 0.15% solution sugar-free | 300 ml [P] £6.50 DT = £6.53
Diffiam 0.15% Sore Throat Rinse sugar-free | 200 ml [P] £4.64

Flurbiprofen● **INDICATIONS AND DOSE****Relief of sore throat**► **BY MOUTH USING LOZENGES**

- Child 12–17 years: 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS** Oral ulceration (move lozenge around mouth) · taste altered

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Lozenge

- **Strefen** (Reckitt Benckiser Healthcare (UK) Ltd)
Flurbiprofen 8.75 mg Strefen 8.75mg lozenges | 16 lozenge [P] £2.58 DT = £2.58

CORTICOSTEROIDS

Betamethasone

21-Dec-2017

● INDICATIONS AND DOSE

Oral ulceration

- ▶ TO THE LESION USING SOLUBLE TABLETS
- ▶ Child 12–17 years: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

- **UNLICENSED USE** Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **CONTRA-INDICATIONS** Untreated local infection
- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Increased risk of infection
- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone soluble tablets (administration).

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Betamethasone Soluble Tablets 500 micrograms may be prescribed for oral ulceration.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)

▶ Betamethasone (Non-proprietary)

Betamethasone (as Betamethasone sodium phosphate)

500 microgram Betamethasone 500microgram soluble tablets sugar free sugar-free | 100 tablet [PoM] £51.12 DT = £51.12

Hydrocortisone

21-Dec-2017

● INDICATIONS AND DOSE

Oral and perioral lesions

- ▶ TO THE LESION USING BUCCAL TABLET
- ▶ Child 1 month–11 years: Only on medical advice
- ▶ Child 12–17 years: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer

- **UNLICENSED USE** Hydrocortisone mucoadhesive buccal tablets licensed for use in children (under 12 years—on medical advice only).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **CONTRA-INDICATIONS** Untreated local infection
- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Diabetic control impaired · infection exacerbated

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Mucoadhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Muco-adhesive buccal tablet

▶ Hydrocortisone (Non-proprietary)

Hydrocortisone (as Hydrocortisone sodium succinate)

2.5 mg Hydrocortisone 2.5mg muco-adhesive buccal tablets sugar free sugar-free | 20 tablet [P] £8.30 DT = £7.70

SALICYLIC ACID AND DERIVATIVES

Choline salicylate

● INDICATIONS AND DOSE

Mild oral and perioral lesions

▶ TO THE LESION

- ▶ Child 16–17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

- **CONTRA-INDICATIONS** Children under 16 years

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ **Reye's syndrome** The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.

- **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning

- **INTERACTIONS** → Appendix 1: choline salicylate

- **SIDE-EFFECTS** Bronchospasm

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Choline Salicylate Dental Gel may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oromucosal gel

▶ Bonjela (Reckitt Benckiser Healthcare (UK) Ltd)

Choline salicylate 87 mg per 1 gram Bonjela Cool Mint gel sugar-free | 15 gram [GSL] £3.55 DT = £2.58

Bonjela Original gel sugar-free | 15 gram [GSL] £2.58 DT = £2.58

Salicylic acid with rhubarb extract

● INDICATIONS AND DOSE

Mild oral and perioral lesions

▶ TO THE LESION

- ▶ Child 16–17 years: Apply 3–4 times a day maximum duration 7 days

- **CONTRA-INDICATIONS** Children under 16 years

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ **Reye's syndrome** The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.

- **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning

- **SIDE-EFFECTS**

▶ **Common or very common** Oral disorders

- **PATIENT AND CARER ADVICE** May cause temporary discolouration of teeth and oral mucosa.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Paint

EXCIPIENTS: May contain Ethanol

► **Pyralvex** (Meda Pharmaceuticals Ltd)

Salicylic acid 10 mg per 1 mL, Rhubarb extract 50 mg per 1 mL Pyralvex solution | 10 mL £3.25

4 Oropharyngeal bacterial infections

Oropharyngeal infections, antibacterial therapy

Pericoronitis

Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

- Metronidazole p. 333, or *alternatively*, amoxicillin p. 339
- *Suggested duration of treatment* 3 days or until symptoms resolve.

Gingivitis (acute necrotising ulcerative)

Antibacterial required only if systemic features of infection.

- Metronidazole, or *alternatively*, amoxicillin
- *Suggested duration of treatment* 3 days or until symptoms resolve.

Abscess (periapical or periodontal)

Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

- Amoxicillin, or *alternatively*, metronidazole
- *Suggested duration of treatment* 5 days.

Periodontitis

Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole, or *alternatively in adults and children over 12 years*, doxycycline p. 352

Throat infections

Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

- Phenoxymethylpenicillin p. 339
- In severe infection, initial parenteral therapy with benzylpenicillin sodium p. 338, then oral therapy with phenoxymethylpenicillin or amoxicillin (or ampicillin p. 341). **Avoid** amoxicillin if possibility of glandular fever.
- *Suggested duration of treatment* 10 days.
- If penicillin-allergic, clarithromycin p. 330 (or azithromycin p. 329 or erythromycin p. 331)
- *Suggested duration of treatment* 10 days

ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

Doxycycline

● INDICATIONS AND DOSE

Treatment of recurrent aphthous ulceration

- **BY MOUTH USING SOLUBLE TABLETS**
- Child 12–17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed

- **UNLICENSED USE** Not licensed for severe recurrent aphthous ulceration.

- **CAUTIONS** Alcohol dependence

- **INTERACTIONS** → Appendix 1: tetracyclines

● SIDE-EFFECTS

- **Common or very common** Dyspnoea · hypotension · peripheral oedema · serum sickness · skin reactions · tachycardia
- **Uncommon** Gastritis · gastrointestinal discomfort
- **Rare or very rare** Antibiotic associated colitis · arthralgia · flushing · hepatic function abnormal · myalgia · photoonycholysis · severe cutaneous adverse reactions (SCARs) · tinnitus · vision disorders

- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).

- **PATIENT AND CARER ADVICE** Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 6, 9, 11, 13

► **Vibramycin-D** (Pfizer Ltd)

Doxycycline (as Doxycycline monohydrate) 100 mg Vibramycin-D 100mg dispersible tablets sugar-free | 8 tablet £4.91 DT = £4.91

5 Oropharyngeal fungal infections

Oropharyngeal fungal infections

Overview

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

Thrush

Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics, or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 710 or miconazole p. 710 may be needed. Fluconazole p. 374 is effective for

unresponsive infections or if a topical antifungal drug cannot be used. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

Acute erythematous candidiasis

Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

Angular cheilitis

Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream p. 725 or fusidic acid ointment p. 357; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 744 can be used.

Immunocompromised patients

See advice on prevention of fungal infections under *Immunocompromised children* in Antifungals, systemic use p. 370.

Antiseptic mouthwashes can have a role in the prevention of oral candidiasis in immunocompromised children.

Drugs used in oropharyngeal candidiasis

Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is used by local application (as an oral gel) in the mouth but it is also absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. In neonates, nystatin oral suspension or miconazole oral gel is used for the treatment of oropharyngeal candidiasis; to prevent re-infection it is important to ensure that the mother's breast nipples and the teats of feeding bottles are cleaned adequately.

Fluconazole given by mouth is reliably absorbed; it is used for infections that do not respond to topical therapy or when topical therapy cannot be used. Itraconazole p. 375 can be used for fluconazole-resistant infections.

If candidal infection fails to respond after 1 to 2 weeks of treatment with antifungal drugs the child should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by re-infection from the genito-urinary or gastro-intestinal tract.

after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

Intestinal candidiasis

► BY MOUTH USING ORAL GEL

- Child 4 months–17 years: 5 mg/kg 4 times a day (max. per dose 250 mg) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

- **UNLICENSED USE** Not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term.
- **CONTRA-INDICATIONS** Infants with impaired swallowing reflex
- **CAUTIONS** Avoid in Acute porphyrias p. 603
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
 - Common or very common Dry mouth · nausea · oral disorders · regurgitation · skin reaction
 - Uncommon Taste altered
 - Frequency not known Angioedema · choking · diarrhoea · hepatitis · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Manufacturer advises avoid if possible—toxicity at high doses in *animal* studies.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **HEPATIC IMPAIRMENT** Avoid.
- **DIRECTIONS FOR ADMINISTRATION** Oral gel should be held in mouth, after food.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral gel may include orange.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer miconazole oromucosal gel.
- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary
Miconazole Oromucosal Gel may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** 15-g tube of oral gel can be sold to the public.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

6 Oropharyngeal viral infections

Oropharyngeal viral infections

Management

Viral infections are the most common cause of a sore throat. It is usually a self-limiting condition which does not benefit from anti-infective treatment. Adequate analgesia may be all that is required.

Children with varicella–zoster infection often develop painful lesions in the mouth and throat. Benzydamine hydrochloride p. 707 may be used to provide local analgesia. Chlorhexidine mouthwash or gel p. 703 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In severe herpetic stomatitis systemic aciclovir p. 404 or valaciclovir p. 406 may be used for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used to prevent frequently recurring herpes simplex lesions of the mouth particularly when associated with the initiation of erythema multiforme. See the treatment of labial herpes simplex infections.

Skin conditions, management

Topical preparations

When prescribing topical preparations for the treatment of skin conditions in children, the site of application, the condition being treated, and the child's (and carer's) preference for a particular vehicle all need to be taken into consideration.

Vehicles

The British Association of Dermatologists list of preferred frictioned dermatological preparations (specials) is available at www.bad.org.uk.

The vehicle in topical preparations for the skin affects the degree of hydration, has a mild anti-inflammatory effect, and aids the penetration of the active drug. Therefore, the vehicle, as well as the active drug, should be chosen on the basis of their suitability for the child's skin condition.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both *hydrophilic and lipophilic* properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water:

they often have a mild anti-inflammatory effect. *Water-soluble ointments* contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution

The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

Suitable quantities for prescribing

Suitable quantities of dermatological preparations to be prescribed for specific areas of the body

Area of body	Creams and Ointments	Lotions
Face	15–30 g	100 ml
Both hands	25–50 g	200 ml
Scalp	50–100 g	200 ml
Both arms or both legs	100–200 g	200 ml
Trunk	400 g	500 ml
Groins and genitalia	15–25 g	100 ml

These amounts are usually suitable for children 12–18 years for twice daily application for 1 week; smaller quantities will be required for children under 12 years. These recommendations **do not apply** to corticosteroid preparations.

Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis). The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulfite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

Neonates

Caution is required when prescribing topical preparations for neonates—their large body surface area in relation to body mass increases susceptibility to toxicity from systemic absorption of substances applied to the skin. Topical preparations containing potentially sensitising substances such as corticosteroids, aminoglycosides, iodine, and parasitocidal drugs should be avoided. Preparations containing alcohol should be avoided because they can dehydrate the skin, cause pain if applied to raw areas, and the alcohol can cause necrosis. In *preterm neonates*, the skin is more fragile and offers a poor barrier, especially in the first fortnight after birth. Preterm infants, especially if below 32 weeks corrected gestational age, may also require special measures to maintain skin hydration.

1 Dry and scaling skin disorders

Emollient and barrier preparations

Borderline substances

The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated.

Emollients

Emollients hydrate the skin, soften the skin, act as barrier to water and external irritants, and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis; they should be applied immediately after washing or bathing to maximise the effect of skin hydration. The choice of an appropriate emollient will depend on the severity of the condition, the child's (or

carer's) preference, and the site of application. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as **aqueous cream** and **emulsifying ointment** can be used as soap substitutes for handwashing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Emollient bath and shower preparations

In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for older children are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for younger children reflect this.

MHRA/CHM update (April 2016): Fire risk with paraffin-based skin emollients on dressings and clothing

When patients are being treated with a paraffin-based emollient product that is covered by a dressing or clothing, there is a danger that smoking or using a naked flame could cause dressings or clothing to catch fire.

Patients should be advised not to smoke, use naked flames (or be near people who are smoking or using naked flames), or go near anything that may cause a fire while emollients are in contact with their medical dressings or clothing. Patients' clothing and bedding should be changed regularly—preferably daily—because emollients soak into fabric and can become a fire hazard.

Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone p. 728, natural oils, and paraffins, to help protect the skin from abrasion and irritation; they are used to protect intact skin around stomas and pressure sores, and as a barrier against nappy rash. In neonates, barrier preparations which do not contain potentially sensitising excipients are preferred. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations with zinc oxide or titanium salts are used to aid healing of uninfected, excoriated skin.

Nappy rash (Dermatitis)

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 739 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids (see cautions). If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream p. 724 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

Emollients

In the *neonate*, a preservative-free paraffin-based emollient hydrates the skin without affecting the normal skin flora; substances such as olive oil are also used. The development of blisters (epidermolysis bullosa) or ichthyosis may be alleviated by applying liquid and white soft paraffin ointment while awaiting dermatological investigation.

DERMATOLOGICAL DRUGS > BARRIER PREPARATIONS

Barrier creams and ointments

● INDICATIONS AND DOSE

For use as a barrier preparation

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

EXCIPIENTS: May contain Woolfat and related substances (including lanolin)

▶ Barrier creams and ointments (Non-proprietary)

Cetostearyl alcohol 20 mg per 1 gram, Zinc oxide 75 mg per 1 gram, Beeswax white 100 mg per 1 gram, Arachis oil 305 mg per 1 gram, Castor oil 500 mg per 1 gram | Zinc and Castor oil ointment | 100 gram [GSL] £1.46 | 500 gram [GSL] £4.99–£5.38 DT = £5.38

Zinc and Castor oil cream | 100 gram [GSL] £1.46

- ▶ Brands may include Metanium

Spray

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), woolfat and related substances (including lanolin)

▶ Sprilon (J M Loveridge Ltd)

Dimeticone 10.4 mg per 1 gram, Zinc oxide 125 mg per 1 gram | Sprilon aerosol spray | 115 gram [GSL] £8.90 DT = £8.90

Cream

EXCIPIENTS: May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, woolfat and related substances (including lanolin)

▶ Conotrane (LEO Pharma)

Benzalkonium chloride 1 mg per 1 gram, Dimeticone 220 mg per 1 gram | Conotrane cream | 100 gram [GSL] £0.88 DT = £0.88 | 500 gram [GSL] £3.51

▶ Drapolene (Supra Enterprises Ltd)

Benzalkonium chloride 100 microgram per 1 gram, Cetrimide 2 mg per 1 gram | Drapolene cream | 100 gram [GSL] £1.76 | 200 gram [GSL] £2.86 | 350 gram [GSL] £4.28

▶ Siopel (Derma UK Ltd)

Dimeticone 3 mg per 1 gram, Dimeticone 1000 100 mg per 1 gram | Siopel cream | 50 gram [GSL] £4.65

▶ Sudocrem (Teva UK Ltd)

Benzyl cinnamate 1.5 mg per 1 gram, Benzyl alcohol 3.9 mg per 1 gram, Benzyl benzoate 10.1 mg per 1 gram, Wool fat hydrous 40 mg per 1 gram, Zinc oxide 152.5 mg per 1 gram | Sudocrem antiseptic healing cream | 30 gram [GSL] £1.45 | 60 gram [GSL] £1.45 | 125 gram [GSL] £2.15 | 250 gram [GSL] £3.67 | 400 gram [GSL] £5.25

DERMATOLOGICAL DRUGS > EMOLLIENTS

Emollient bath and shower products, antimicrobial-containing

31-Aug-2016

● INDICATIONS AND DOSE

DERMOL[®] 200 SHOWER EMOLLIENT

Dry and pruritic skin conditions including eczema and dermatitis

- ▶ TO THE SKIN
- ▶ Child: To be applied to the skin or used as a soap substitute

DERMOL[®] 600[®] BATH EMOLLIENT

Dry and pruritic skin conditions including eczema and dermatitis

- ▶ TO THE SKIN
- ▶ Child 1-23 months: 5–15 mL/bath, not to be used undiluted
- ▶ Child 2-17 years: 15–30 mL/bath, not to be used undiluted

DERMOL[®] WASH EMULSION

Dry and pruritic skin conditions including eczema and dermatitis

- ▶ TO THE SKIN
- ▶ Child: To be applied to the skin or used as a soap substitute

EMULSIDERM[®]

Dry skin conditions including eczema and ichthyosis

- ▶ TO THE SKIN
- ▶ Child 1-23 months: 5–10 mL/bath, alternatively, to be rubbed into dry skin until absorbed
- ▶ Child 2-17 years: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed

OLATUM[®] PLUS

Topical treatment of eczema, including eczema at risk from infection

- ▶ TO THE SKIN
- ▶ Child 6-11 months: 1 mL/bath, not to be used undiluted
- ▶ Child 1-17 years: 1–2 capfuls/bath, not to be used undiluted

IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING
See Emollient and barrier preparations p. 713.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

- **PRESCRIBING AND DISPENSING INFORMATION** Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Dermol 200** (Dermal Laboratories Ltd)
Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 25 mg per 1 gram, Liquid paraffin 25 mg per 1 gram Dermol 200 shower emollient | 200 ml [P] £3.55
- ▶ **Dermol Wash** (Dermal Laboratories Ltd)
Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 25 mg per 1 gram, Liquid paraffin 25 mg per 1 gram Dermol Wash cutaneous emulsion | 200 ml [P] £3.55

Emollient bath and shower products, colloidal oatmeal-containing**● INDICATIONS AND DOSE****Endogenous and exogenous eczema | Xeroderma | Ichthyosis**

- ▶ TO THE SKIN
- ▶ Child 2–17 years: 20–30 mL/bath, alternatively apply to wet skin and rinse

IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

● MEDICINAL FORMS

No licensed medicines listed.

Emollient bath and shower products, paraffin-containing

15-Aug-2016

● INDICATIONS AND DOSE**AQUAMAX[®] WASH****Dry skin conditions**

- ▶ TO THE SKIN
- ▶ Child: To be applied to wet or dry skin and rinse

CETRABEN[®] BATH**Dry skin conditions, including eczema**

- ▶ TO THE SKIN
- ▶ Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.

- ▶ Child 1 month–11 years: 0.5–1 capful/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 12–17 years: 1–2 capfuls/bath, alternatively, to be applied to wet skin and rinse

DERMALO[®]**Dermatitis | Dry skin conditions, including ichthyosis**

▶ TO THE SKIN

- ▶ Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.

- ▶ Child 1 month–11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 12–17 years: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse

DOUBLEBASE[®] EMOLLIENT BATH ADDITIVE**Dry skin conditions including dermatitis and ichthyosis**

▶ TO THE SKIN

- ▶ Neonate: 5–10 mL/bath.

- ▶ Child 1 month–11 years: 5–10 mL/bath
- ▶ Child 12–17 years: 15–20 mL/bath

DOUBLEBASE[®] EMOLLIENT SHOWER GEL**Dry, chapped, or itchy skin conditions**

▶ TO THE SKIN

- ▶ Child: To be applied to wet or dry skin and rinse, or apply to dry skin after showering

E45[®] BATH OIL**Endogenous and exogenous eczema, xeroderma, and ichthyosis**

▶ TO THE SKIN

- ▶ Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.

- ▶ Child 1 month–11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 12–17 years: 15 mL/bath, alternatively, to be applied to wet skin and rinse

E45[®] WASH CREAM**Endogenous and exogenous eczema, xeroderma, and ichthyosis**

▶ TO THE SKIN

- ▶ Child: To be used as a soap substitute

HYDOMOL[®] BATH AND SHOWER EMOLLIENT**Dry skin conditions | Eczema | Ichthyosis**

▶ TO THE SKIN

- ▶ Neonate: 0.5 capful/bath, alternatively apply to wet skin and rinse.

- ▶ Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively apply to wet skin and rinse
- ▶ Child 12–17 years: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

LPL 63.4[®]**Dry skin conditions**

▶ TO THE SKIN

- ▶ Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.

- ▶ Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 12–17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

OILATUM[®] EMOLLIENT BATH ADDITIVE**Dry skin conditions including dermatitis and ichthyosis**

▶ TO THE SKIN

- ▶ Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.

continued →

- ▶ Child 1 month–11 years: Apply 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 12–17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

OILATUM® JUNIOR BATH ADDITIVE**Dry skin conditions including dermatitis and ichthyosis**

▶ TO THE SKIN

- ▶ Neonate: 0.5 capful/bath, alternatively, apply to wet skin and rinse.

- ▶ Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively, apply to wet skin and rinse
- ▶ Child 12–17 years: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse

QV® BATH OIL**Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus**

▶ TO THE SKIN

- ▶ Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.

- ▶ Child 1–11 months: 5 mL/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 1–17 years: 10 mL/bath, alternatively, to be applied to wet skin and rinse

QV® GENTLE WASH**Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus**

▶ TO THE SKIN

- ▶ Child: To be used as a soap substitute

ZEROLATUM®**Dry skin conditions | Dermatitis | Ichthyosis**

▶ TO THE SKIN

- ▶ Child 1 month–11 years: 5–10 mL/bath
- ▶ Child 12–17 years: 15–20 mL/bath

IMPORTANT SAFETY INFORMATION

These preparations make the skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING

Emollients, urea-containing

- **DRUG ACTION** Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis).

• **INDICATIONS AND DOSE****AQUADRATE**®**Dry, scaling, and itching skin**

► TO THE SKIN

- Child: Apply twice daily, to be applied thinly

BALNEUM® CREAM**Dry skin conditions**

► TO THE SKIN

- Child: Apply twice daily

BALNEUM® PLUS CREAM**Dry, scaling, and itching skin**

► TO THE SKIN

- Child: Apply twice daily

CALMURID®**Dry, scaling, and itching skin**

► TO THE SKIN

- Child: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

DERMATONICS ONCE HEEL BALM®**Dry skin on soles of feet**

► TO THE SKIN

- Child 12–17 years: Apply once daily

E45® ITCH RELIEF CREAM**Dry, scaling, and itching skin**

► TO THE SKIN

- Child: Apply twice daily

EUCERIN® INTENSIVE CREAM**Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**

► TO THE SKIN

- Child: Apply twice daily, to be applied thinly and rubbed into area

EUCERIN® INTENSIVE LOTION**Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**

► TO THE SKIN

- Child: Apply twice daily, to be applied sparingly and rubbed into area

FLEXITOL®**Dry skin on soles of feet and heels**

► TO THE SKIN

- Child 12–17 years: Apply 1–2 times a day

HYDROMOL® INTENSIVE**Dry, scaling, and itching skin**

► TO THE SKIN

- Child: Apply twice daily, to be applied thinly

IMUDERM® EMOLLIENT**Dry skin conditions including eczema, psoriasis or dermatitis**

► TO THE SKIN

- Child: Apply to skin or use as a soap substitute

NUTRAPLUS®**Dry, scaling, and itching skin**

► TO THE SKIN

- Child: Apply 2–3 times a day

- **DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Neomycin sulfate p. 722 applied topically may cause sensitisation and cross-sensitivity with other aminoglycoside antibacterials such as gentamicin p. 312 may occur. Topical antibacterials applied over large areas can cause systemic toxicity; ototoxicity with neomycin sulfate and with polymyxins p. 723 is a particular risk for neonates and children with renal impairment.

Superficial bacterial infection of the skin may be treated with a topical antiseptic such as povidone-iodine p. 679 which also softens crusts, or hydrogen peroxide 1% cream p. 704.

Bacterial infections such as *impetigo* and *folliculitis* can be treated with a short course of topical fusidic acid; mupirocin p. 724 should be used only to treat meticillin-resistant *Staphylococcus aureus*.

For extensive or long-standing impetigo, an oral antibacterial such as flucloxacillin p. 345 (or clarithromycin p. 330 in children with penicillin-allergy), should be used. A mild antiseptic may help to soften crusts. Mild antiseptics may be useful in reducing the spread of infection, but there is little evidence to support the use of topical antiseptics alone in the treatment of impetigo.

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis.

Erysipelas, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

Staphylococcal scalded-skin syndrome requires urgent treatment with a systemic antibacterial, such as flucloxacillin.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic, such as povidone-iodine, chlorhexidine p. 703, or alcohol, can be used; their use should be discussed with the local microbiologist.

Mupirocin ointment contains macrogols; extensive absorption of macrogols through the mucous membranes or through application to thin or damaged skin may result in renal toxicity, especially in neonates. Mupirocin nasal ointment is formulated in a paraffin base and may be more suitable for the treatment of MRSA-infected open wound in neonates.

Metronidazole gel p. 723 is used topically in children to reduce the odour associated with anaerobic infections and for the treatment of periorificial rosacea; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

Retapamulin p. 724 can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA.

Silver sulfadiazine p. 723 is licensed for the prevention and treatment of infection in burns but the use of appropriate dressings may be more effective. Systemic effects may occur following extensive application of silver sulfadiazine; its use is not recommended in neonates.

2 Infections of the skin

Skin infections

Antibacterial preparations for the skin

Topical antibacterial preparations are used to treat localised bacterial skin infections caused by Gram-positive organisms (particularly by staphylococci or streptococci). Systemic antibacterial treatment is more appropriate for deep-seated skin infections.

Problems associated with the use of topical antibacterials include bacterial resistance, contact sensitisation, and superinfection. In order to minimise the development of resistance, antibacterials used systemically (e.g. fusidic acid p. 357) should not generally be chosen for topical use. *Resistant organisms* are more common in hospitals, and

Antibacterial preparations also used systemically

Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 709 for further information on angular cheilitis.

Metronidazole is used topically to treat rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

Antifungal preparations for the skin

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Specimens of scale, nail or hair should be sent for mycological examination before starting treatment, unless the diagnosis is certain.

Dermatophytoses

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete's foot), or nail (tinea unguium, onychomycosis). Tinea capitis is a common childhood infection that requires systemic treatment with an oral antifungal; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm.

Tinea corporis and tinea pedis infections in children respond to treatment with a topical **imidazole** (clotrimazole p. 724, econazole nitrate p. 725, or miconazole p. 725) or terbinafine cream p. 726. Nystatin p. 710 is less effective against tinea.

Compound benzoic acid ointment (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic children with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of tioconazole p. 726 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy. Chronic paronychia on the fingers (usually due to a candidal infection) should be treated with topical clotrimazole or nystatin, but these preparations should be used with caution in children who suck their fingers. Chronic paronychia of the toes (usually due to dermatophyte infection) can be treated with topical terbinafine.

Pityriasis versicolor

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo p. 725 or **selenium sulfide** shampoo. Topical imidazole antifungals such as clotrimazole, econazole nitrate and miconazole or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with an azole antifungal. Relapse is common, especially in the immunocompromised.

Candidiasis

Candidal skin infections can be treated with topical imidazole antifungals clotrimazole p. 724, econazole nitrate p. 725, or miconazole p. 725; topical terbinafine p. 726 is an alternative. Topical application of nystatin p. 710 is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 374; systemic treatment with griseofulvin p. 379 or terbinafine is **not appropriate** for refractory candidiasis. See the treatment of oral candidiasis and for the management of nappy rash.

Angular cheilitis

Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*.

Compound topical preparations

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 739) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of *intertriginous eczema* associated with candida.

Antiviral preparations for the skin

Aciclovir cream p. 729 is used for the treatment of initial and recurrent labial, cutaneous, and genital *herpes simplex infections* in children; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections or if cold sores recur frequently.

Herpes labialis

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Parasitocidal preparations for the skin

Suitable quantities of parasitocidal preparations			
Area of body	Skin creams	Lotions	Cream rinses
Scalp (head lice)		50–100 mL	50–100 mL
Body (scabies)	30–60 g	100 mL	
Body (crab lice)	30–60 g	100 mL	
These amounts are usually suitable for a child 12–17 years for single application.			

Scabies

Permethrin p. 729 is used for the treatment of *scabies* (*Sarcoptes scabiei*); malathion p. 729 can be used if permethrin is inappropriate.

Benzyl benzoate is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 383 (available from 'special-order' manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone.

Application

Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole

body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching

The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and *eczema* may be required. Application of crotamiton p. 752 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a **sedating antihistamine** at night may also be useful.

Head lice

Dimeticone p. 728 is effective against head lice (*Pediculus humanus capitis*) and acts on the surface of the organism. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is not recommended for use in children.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated at the same time.

MHRA/CHM advice: *Head lice eradication products: risk of serious burns if treated hair is exposed to open flames or other sources of ignition (March 2018)*

Some products for the eradication of head lice infestations are combustible/flamable when on the hair and can ignite and cause serious harm in the presence of an open flame or other source of ignition such as when lighting cigarettes.

Patients and carers should be advised on the safe and correct use of head lice eradication treatments and if appropriate, should be advised that they should not smoke around treated hair and that it should be kept away from open flames or other sources of ignition, including in the morning after overnight application until hair is washed.

Wet combing methods

Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Crab lice

Permethrin p. 729 and malathion p. 729 are used to eliminate *crab lice* (*Phthirus pubis*); permethrin is not licensed for treatment of crab lice in children under 18 years. An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

Parasitidal preparations

Dimeticone p. 728 coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days.

Malathion is recommended for *scabies*, *head lice* and *crab lice*. The risk of systemic effects associated with 1–2 applications of malathion is considered to be very low; however, except in the treatment of hyperkeratotic scabies in children, applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be **avoided** since the likelihood of eradication of lice is not increased.

Permethrin is effective for *scabies*. It is also active against *head lice* but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice. Permethrin is also effective against *crab lice* but it is not licensed for this purpose in children under 18 years.

2.1 Bacterial skin infections

ANTIBACTERIALS > AMINOGLYCOSIDES

Neomycin sulfate

• INDICATIONS AND DOSE

Bacterial skin infections

► TO THE SKIN

- Child: Apply up to 3 times a day, for short-term use only

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Ointment

- **Mupirocin (Non-proprietary)**

Mupirocin 20 mg per 1 gram Mupirocin 2% ointment | 15 gram [PoM] £12.50 DT = £5.26

- **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin 20 mg per 1 gram Bactroban 2% ointment | 15 gram [PoM] £5.26 DT = £5.26

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

- **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% cream | 15 gram [PoM] £5.26 DT = £5.26

Retapamulin

- **INDICATIONS AND DOSE**

Superficial bacterial skin infection caused by *Staphylococcus aureus* and *Streptococcus pyogenes* (if resistant to first line topical antibacterials)

- TO THE SKIN
- Child 9 months–17 years: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 2% of body surface area, review treatment if no response within 2–3 days

- **CONTRA-INDICATIONS** Contact with eyes · contact with mucous membranes

- **SIDE-EFFECTS**

- **Uncommon** Contact dermatitis

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2008) that retapamulin (*Altargo*®) is **not** recommended for use within NHS Scotland for the treatment of superficial skin infections.

- **MEDICINAL FORMS**

No licensed medicines listed.

2.2 Fungal skin infections

Other drugs used for Fungal skin infections Griseofulvin, p. 379 · Hydrocortisone with clotrimazole, p. 743

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS**Clotrimazole**

- **INDICATIONS AND DOSE**

Fungal skin infections

- TO THE SKIN
- Child: Apply 2–3 times a day

- **CAUTIONS** Contact with eyes and mucous membranes should be avoided

- **INTERACTIONS** → Appendix 1: antifungals, azoles

- **SIDE-EFFECTS** Oedema · pain · paraesthesia · skin reactions · syncope
- **PREGNANCY** Minimal absorption from skin; not known to be harmful.
- **PRESCRIBING AND DISPENSING INFORMATION** Spray may be useful for application of clotrimazole to large or hairy areas of the skin.

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

► Clotrimazole (Non-proprietary)

Clotrimazole 10 mg per 1 gram Clotrimazole 1% cream | 20 gram [P] £2.06 DT = £0.72 | 50 gram [P] £5.45 DT = £1.80

► Canesten (Bayer Plc)

Clotrimazole 10 mg per 1 gram Canesten 1% cream | 20 gram [P] £2.20 DT = £0.72 | 50 gram [P] £3.50 DT = £1.80

Canesten Antifungal 1% cream | 20 gram [P] £1.85 DT = £0.72

Canesten Dual Action 1% cream | 15 gram [GSL] £2.14 | 30 gram [GSL] £2.76

Clotrimazole 20 mg per 1 gram Canesten 2% thrush cream | 20 gram [P] £4.76 DT = £4.76

Clotrimazole 100 mg per 1 gram Canesten Internal 10% cream | 5 gram [P] £6.23 DT = £6.23

Canesten 10% VC cream | 5 gram [PoM] £4.50 DT = £6.23

Liquid

► Canesten (Bayer Plc)

Clotrimazole 10 mg per 1 ml Canesten 1% solution | 20 ml [P] £2.30 DT = £2.30

Spray

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain propylene glycol

► Canesten (Bayer Plc)

Clotrimazole 10 mg per 1 ml Canesten Dermatological 1% spray | 40 ml [P] £4.72 DT = £4.72

Combinations available: *Hydrocortisone with clotrimazole*, p. 743

Econazole nitrate

● INDICATIONS AND DOSE

Fungal skin infections

► TO THE SKIN

- Child: Apply twice daily

Fungal nail infections

► BY TRANSUNGUAL APPLICATION

- Child: Apply once daily, applied under occlusive dressing

- **CAUTIONS** Avoid contact with eyes and mucous membranes

● SIDE-EFFECTS

- Common or very common Pain · skin reactions
- Uncommon Swelling
- Frequency not known Angioedema

SIDE-EFFECTS, FURTHER INFORMATION Treatment should be discontinued if side-effects are severe.

- **PREGNANCY** Minimal absorption from skin; not known to be harmful.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, fragrances

► Pevaryl (Janssen-Cilag Ltd)

Econazole nitrate 10 mg per 1 gram Pevaryl 1% cream | 30 gram [P] £3.71

Ketoconazole

20-Jul-2017

● INDICATIONS AND DOSE

Treatment of seborrhoeic dermatitis and dandruff

► TO THE SKIN USING SHAMPOO

- Child 12–17 years: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing

Prophylaxis of seborrhoeic dermatitis and dandruff

► TO THE SKIN USING SHAMPOO

- Child 12–17 years: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing

Treatment of pityriasis versicolor

► TO THE SKIN USING SHAMPOO

- Child 12–17 years: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing

Prophylaxis of pityriasis versicolor

► TO THE SKIN USING SHAMPOO

- Child 12–17 years: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing

- **CONTRA-INDICATIONS** Acute porphyrias p. 603

- **CAUTIONS** Avoid contact with eyes · avoid contact with mucous membranes

- **INTERACTIONS** → Appendix 1: antifungals, azoles

● SIDE-EFFECTS

- Uncommon Excessive tearing · folliculitis · hair changes · skin reactions
- Rare or very rare Eye irritation

- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole maximum 2%, in a pack containing maximum 120 mL and labelled to show a maximum frequency of application of once every 3 days.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Shampoo

EXCIPIENTS: May contain Imidurea

► Ketoconazole (Non-proprietary)

Ketoconazole 20 mg per 1 gram Ketoconazole 2% shampoo | 120 ml [PoM] £3.60 DT = £3.14

► Dandrazol (Transdermal Ltd)

Ketoconazole 20 mg per 1 gram Dandrazol Anti-dandruff 2% shampoo | 60 ml [GSL] £3.42 | 100 ml [GSL] £5.28

Dandrazol 2% shampoo | 120 ml [PoM] £3.39 DT = £3.14

► Nizoral (Janssen-Cilag Ltd, McNeil Products Ltd)

Ketoconazole 20 mg per 1 gram Nizoral 2% shampoo | 120 ml [PoM] £3.59 DT = £3.14

Nizoral anti-dandruff 2% shampoo | 60 ml [GSL] £4.08

Nizoral Dandruff 2% shampoo | 100 ml [P] £6.28

Miconazole

11-Oct-2017

● INDICATIONS AND DOSE

Fungal skin infections

► TO THE SKIN

- Neonate: Apply twice daily continuing for 10 days after lesions have healed.

- Child: Apply twice daily continuing for 10 days after lesions have healed

Fungal nail infections

► TO THE SKIN

- Child: Apply 1–2 times a day

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Avoid in Acute porphyrias p. 603 • contact with eyes and mucous membranes should be avoided
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dry mouth • nausea • oral disorders • vomiting
 - ▶ **Uncommon** Skin reactions • taste altered
 - ▶ **Frequency not known** Angioedema • choking • diarrhoea • hepatitis • severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Absorbed from the skin in small amounts; manufacturer advises caution.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Miconazole cream may be prescribed.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole

- ▶ **Daktarin** (McNeil Products Ltd, Janssen-Cilag Ltd)
Miconazole nitrate 20 mg per 1 gram Daktarin 2% cream | 15 gram **P** £2.51 | 30 gram **P** £1.82 DT = £1.82

Powder

- ▶ **Daktarin** (McNeil Products Ltd)
Miconazole nitrate 20 mg per 1 gram Daktarin 2% powder | 20 gram **P** £2.95 DT = £2.78

Tioconazole• **INDICATIONS AND DOSE****Fungal nail infection**

- ▶ **BY TRANSUNGUAL APPLICATION**
- ▶ **Child:** Apply twice daily usually for up to 6 months (may be extended to 12 months), apply to nails and surrounding skin

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Contact with eyes and mucous membranes should be avoided • use with caution if child likely to suck affected digits
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Peripheral oedema
 - ▶ **Uncommon** Skin reactions
 - ▶ **Frequency not known** Nail disorder • pain • paraesthesia • periorbital oedema
- **PREGNANCY** Manufacturer advises avoid.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Paint

- ▶ **Tioconazole (Non-proprietary)**
Tioconazole 283 mg per 1 ml Tioconazole 283mg/ml medicated nail lacquer | 12 ml **PoM** £27.38-£28.74 DT = £28.74
- ▶ **Trosyl** (Pfizer Ltd)
Tioconazole 283 mg per 1 ml Trosyl 283mg/ml nail solution | 12 ml **PoM** £27.38 DT = £28.74

ANTIFUNGALS > OTHER**Amorolfine**• **INDICATIONS AND DOSE****Fungal nail infections**

- ▶ **BY TRANSUNGUAL APPLICATION**
- ▶ **Child 1 month–11 years:** Apply 1–2 times a week for 6 months to treat finger nails and for toe nails

9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes

- ▶ **Child 12–17 years:** Apply 1–2 times a week for 6 months to treat finger nails and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CAUTIONS** Avoid contact with ears • avoid contact with eyes and mucous membranes • use with caution in child likely to suck affected digits
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Nail discolouration • skin reactions
- **PATIENT AND CARER ADVICE** Avoid nail varnish or artificial nails during treatment.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Medicated nail lacquer

Terbinafine

23-Apr-2018

• **INDICATIONS AND DOSE****Tinea pedis**

- ▶ **TO THE SKIN USING CREAM**
- ▶ **Child:** Apply 1–2 times a day for up to 1 week, to be applied thinly
- ▶ **BY MOUTH USING TABLETS**
- ▶ **Child 1–17 years (body-weight 10–19 kg):** 62.5 mg once daily for 2–6 weeks
- ▶ **Child 1–17 years (body-weight 20–39 kg):** 125 mg once daily for 2–6 weeks
- ▶ **Child 1–17 years (body-weight 40 kg and above):** 250 mg once daily for 2–6 weeks

Tinea corporis

- ▶ **TO THE SKIN USING CREAM**
- ▶ **Child:** Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
- ▶ **BY MOUTH USING TABLETS**
- ▶ **Child 1–17 years (body-weight 10–19 kg):** 62.5 mg once daily for 4 weeks
- ▶ **Child 1–17 years (body-weight 20–39 kg):** 125 mg once daily for 4 weeks
- ▶ **Child 1–17 years (body-weight 40 kg and above):** 250 mg once daily for 4 weeks

Tinea cruris

- ▶ **TO THE SKIN USING CREAM**
- ▶ **Child:** Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
- ▶ **BY MOUTH USING TABLETS**
- ▶ **Child 1–17 years (body-weight 10–19 kg):** 62.5 mg once daily for 2–4 weeks
- ▶ **Child 1–17 years (body-weight 20–39 kg):** 125 mg once daily for 2–4 weeks

- ▶ Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 2–4 weeks

Tinea capitis

▶ BY MOUTH USING TABLETS

- ▶ Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 4 weeks
- ▶ Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 4 weeks
- ▶ Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 4 weeks

Dermatophyte infections of the nails

▶ BY MOUTH USING TABLETS

- ▶ Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)
- ▶ Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)
- ▶ Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)

Cutaneous candidiasis | Pityriasis versicolor

▶ TO THE SKIN USING CREAM

- ▶ Child: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

- **UNLICENSED USE** Not licensed for use in children.

● CAUTIONS

- ▶ With oral use autoimmune disease (risk of lupus-erythematosus-like effect) · psoriasis (risk of exacerbation)
- ▶ With topical use contact with eyes and mucous membranes should be avoided

- **INTERACTIONS** → Appendix 1: terbinafine

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ Common or very common Skin reactions

SPECIFIC SIDE-EFFECTS

- ▶ Common or very common

- ▶ With oral use Appetite decreased · arthralgia · diarrhoea · gastrointestinal discomfort · gastrointestinal disorder · headache · myalgia · nausea

▶ Uncommon

- ▶ With oral use Taste altered · weight decreased

▶ Rare or very rare

- ▶ With oral use Agranulocytosis · alopecia · cutaneous lupus erythematosus · dizziness · hepatic disorders · malaise · neutropenia · photosensitivity reaction · sensation abnormal · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thrombocytopenia · vertigo

▶ Frequency not known

- ▶ With oral use Anaemia · anxiety · depressive symptom · fatigue · fever · hearing impairment · influenza like illness · pancreatitis · pancytopenia · rhabdomyolysis · serum sickness-like reaction · smell altered · vasculitis · vision disorders

- ▶ With topical use Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION

Liver toxicity With oral use; discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).

Serious skin reactions With oral use; discontinue treatment in progressive skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis).

● PREGNANCY

- ▶ With topical use Manufacturer advises use only if potential benefit outweighs risk—animal studies suggest no adverse effects.
- ▶ With oral use Manufacturer advises use only if potential benefit outweighs risk—no information available.

● BREAST FEEDING

- ▶ With topical use Manufacturer advises avoid—present in milk. Less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's chest.
- ▶ With oral use Avoid—present in milk.

● HEPATIC IMPAIRMENT

- ▶ With oral use Manufacturer advises avoid—elimination reduced.

● RENAL IMPAIRMENT

Dose adjustments ▶ With oral use Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m² and no suitable alternative available.

● MONITORING REQUIREMENTS

- ▶ With oral use Monitor hepatic function before treatment and then periodically after 4–6 weeks of treatment—discontinue if abnormalities in liver function tests.

● PATIENT AND CARER ADVICE

- ▶ With oral use Manufacturer advises that patients should immediately report any signs or symptoms suggestive of liver dysfunction such as pruritus, unexplained persistent nausea, decreased appetite, anorexia, jaundice, vomiting, fatigue, right upper abdominal pain, dark urine, or pale stools. Patients with these symptoms should discontinue taking terbinafine and the patient's liver function should be immediately evaluated.

- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of terbinafine hydrochloride (maximum 1%) can be sold to the public for use in those over 16 years for external use for the treatment of tinea pedis as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing maximum 30 mL spray or as a gel in a pack containing maximum 30 g gel.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

'wet-wrap' bandaging over topical corticosteroids or emollients to cool the skin and relieve itching, but there is an increased risk of infection and excessive absorption of the corticosteroid; 'wet-wrap' bandaging should be used under specialist supervision.

See *Wound management products and elasticated garments* for details of elasticated viscose stockinette tubular bandages and garments, and silk clothing.

See Eczema and psoriasis, drugs affecting the immune response p. 732 for the role of topical pimecrolimus p. 747 and tacrolimus p. 522 in atopic eczema.

Infection

Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema. A topical antibacterial may be used for small areas of mild infection; treatment should be limited to a short course (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving moderate to severe, widespread, or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Preparations that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid combined with a suitable antimicrobial drug.

Widespread *herpes simplex infection* may complicate atopic eczema (eczema herpeticum) and treatment under specialist supervision with a systemic antiviral drug is indicated. Secondary bacterial infection often exacerbates eczema herpeticum.

Management of other features of eczema

Lichenification, which results from repeated scratching, is treated initially with a potent corticosteroid. Bandages containing ichthammol p. 744 (to reduce pruritus) and other substances such as **zinc oxide** can be applied over the corticosteroid or emollient. **Coal tar** and ichthammol can be useful in some cases of *chronic eczema*. *Discoid eczema*, with thickened plaques in chronic atopic eczema, is usually treated with a topical antiseptic preparation, a potent topical corticosteroid, and paste bandages containing ichthammol with zinc oxide.

A *non-sedating* antihistamine may be of some value in relieving severe itching or urticaria associated with eczema.

A *sedating* antihistamine can be used at night if itching causes sleep disturbance, but a large dose may be needed and drowsiness may persist on the following day.

Exudative ('weeping') eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate solution (1 in 10,000) p. 761 can be used as a soak in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system.

Seborrhoeic dermatitis

Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast *Malassezia*. *Infantile seborrhoeic dermatitis* affects particularly the body folds, nappy area and scalp; it is treated with emollients and mild topical corticosteroids with suitable antimicrobials. *Infantile seborrhoeic dermatitis* affecting the scalp (*cradle cap*) is treated by hydrating the scalp using natural oils and the use of mild shampoo.

In older children, seborrhoeic dermatitis affects the scalp, paranasal areas, and eyebrows. Shampoos active against the

3 Inflammatory skin conditions

3.1 Eczema and psoriasis

Eczema

Types and management

The main types of eczema (dermatitis) in children are atopic, irritant and allergic contact; different types may co-exist.

Atopic eczema is the most common type and it usually involves dry skin as well as infection and lichenification caused by scratching and rubbing. *Seborrhoeic dermatitis* is also common in infants.

Management of eczema involves the removal or treatment of contributory factors; known or suspected irritants and contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; *BNF for Children* lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires **emollients** applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

Topical corticosteroids are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition, and the age of the child. Mild corticosteroids are generally used on the face and on flexures; the more potent corticosteroids are generally required for use on lichenified areas of eczema or for severe eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In children with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 744) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. Wet elasticated viscose stockinette is used for

yeast (including those containing ketoconazole p. 725 and coal tar) and combinations of mild topical corticosteroids with suitable antimicrobials are used to treat older children.

Medicated bandages

Zinc paste bandages (see *Wound management products and elasticated garments*) are used with **coal tar** or ichthammol in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions.

Psoriasis

Management

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp. For mild psoriasis, reassurance and treatment with an emollient may be all that is necessary. *Guttate psoriasis* is a distinctive form of psoriasis that characteristically occurs in children and young adults, often following a streptococcal throat infection or tonsillitis.

Occasionally psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not occur until the drug has been taken for weeks or months.

Emollients, in addition to their effects on dryness, scaling and cracking, may have an antiproliferative effect in psoriasis. They are particularly useful in *inflammatory psoriasis* and in *chronic stable plaque psoriasis*.

For *chronic stable plaque psoriasis* on extensor surfaces of trunk and limbs preparations containing **coal tar** are moderately effective, but the smell is unacceptable to some children. **Vitamin D** and its analogues are effective and cosmetically acceptable alternatives to preparations containing coal tar or dithranol p. 745. Dithranol is an effective topical antipsoriatic agent but it irritates and stains the skin and it should be used only under specialist supervision. Adverse effects of dithranol are minimised by using a 'short-contact technique' and by starting with low concentration preparations. Tazarotene, a topical retinoid for the treatment of mild to moderate plaque psoriasis, is not recommended for use in children under 18 years. These medications can irritate the skin particularly in the flexures and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Widespread *unstable psoriasis* of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously. More localised acute or subacute *inflammatory psoriasis* with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent. This requires softening with an emollient ointment, cream, or oil and usually combined with salicylic acid p. 768 as a keratolytic.

Some preparations for psoriasis affecting the scalp combine salicylic acid with coal tar or **sulfur**. The preparation should be applied generously and left on for at least an hour, often more conveniently overnight, before washing it off. If a corticosteroid lotion or gel is required (e.g. for itch), it can be used in the morning.

Flexural psoriasis can be managed with short-term use of a mild potency topical corticosteroid. Calcitriol p. 631 or tacalcitol p. 751 can be used in the longer term; calcipotriol p. 750 is more likely to cause irritation in flexures and should be avoided. Low-strength tar preparations can also be used.

Facial psoriasis can be treated with short-term use of a mild topical corticosteroid; if this is ineffective, calcitriol, tacalcitol, or a low-strength tar preparation can be used.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcitriol is an active form of vitamin D. Vitamin D and its analogues are used as first-line treatment for plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcitriol are less likely to irritate.

Coal tar p. 745 has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Contact of coal tar products with normal skin is not normally harmful and preparations containing coal tar can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. Leave-on preparations that remain in contact with the skin, such as creams or ointments, containing up to 6% coal tar may be used on children 1 month to 2 years; leave-on preparations containing coal tar 10% may be used on children over 2 years with more severe psoriasis. Tar baths and tar shampoos may also be helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 20–30 minutes ('short contact' technique). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

A topical **corticosteroid** is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis e.g. erythrodermic psoriasis or generalised pustular psoriasis on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures with a mild corticosteroid, and psoriasis of the scalp, palms, and soles with a potent corticosteroid. Very potent topical corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. *Eczema* co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

Phototherapy

Phototherapy is available in specialist centres under the supervision of a dermatologist. Narrow band ultraviolet B (UVB) radiation is usually effective for *chronic stable psoriasis* and for *guttate psoriasis*. It can be considered for children with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis. The use of phototherapy and photochemotherapy in children is limited by concerns over carcinogenicity and premature ageing.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including the *localised palmoplantar pustular psoriasis*. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

Systemic treatment

Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (see Eczema and psoriasis, drugs affecting the immune response below).

Acitretin p. 749, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication of acitretin is severe psoriasis resistant to other forms of therapy. It is also used in disorders of keratinisation such as severe *Darier's disease* (keratosis follicularis), and some forms of *ichthyosis*. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases; adverse effects are a limiting factor. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. Continuous treatment for longer than 6 months is not usually necessary in psoriasis. However, some patients, particularly those with severe ichthyosis, may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly. Topical preparations containing keratolytics should normally be stopped before administration of acitretin. Liberal use of emollients should be encouraged and topical corticosteroids can be continued if necessary.

Acitretin is teratogenic; in females of child-bearing age, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

Topical treatment

The vitamin D and analogues, calcipotriol p. 750, calcitriol p. 631, and tacalcitol p. 751 are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia).

topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in treating atopic eczema.

Topical corticosteroids have a role in eczema and a limited role in psoriasis. A systemic corticosteroid such as prednisolone p. 442 may be used in severe refractory eczema.

Systemic drugs acting on the immune system are generally used by **specialists** in a hospital setting.

Ciclosporin p. 519 by mouth can be used for *severe psoriasis* and for *severe eczema*. Azathioprine p. 518 or mycophenolate mofetil p. 527 are also used for severe refractory eczema in children.

Methotrexate p. 543 can be used for *severe resistant psoriasis*; the dose is given **once weekly** and adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 574 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid can be given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Etanercept p. 643 (a cytokine modulator) is licensed in children over 6 years of age for the treatment of *severe plaque psoriasis* that is inadequately controlled by other systemic treatments and photochemotherapy, or when these other treatments cannot be used because of intolerance or contraindications.

Adalimumab p. 642 (a cytokine modulator) is licensed in children over 4 years for the treatment of *severe chronic plaque psoriasis* that is inadequately controlled by other topical treatments and phototherapies, or when these treatments are inappropriate.

CORTICOSTEROIDS

Topical corticosteroids

Overview

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), particularly eczema, contact dermatitis, insect stings, and eczema of scabies. Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. Carers of young children should be advised that treatment should **not** necessarily be reserved to 'treat only the worst areas' and they may need to be advised that patient information leaflets may contain inappropriate advice for the child's condition.

In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. Topical corticosteroids may worsen ulcerated or secondarily infected lesions. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are **not** recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on

Eczema and psoriasis, drugs affecting the immune response

Overview

Drugs affecting the immune response are used for eczema or psoriasis. Pimecrolimus p. 747 by topical application is licensed for *mild to moderate atopic eczema*. Tacrolimus p. 522 is licensed for topical use in *moderate to severe atopic eczema*. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatment unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment with

withdrawal (sometimes precipitating severe pustular psoriasis). Topical use of potent corticosteroids on widespread psoriasis can lead to systemic as well as to local side-effects. It is reasonable, however, to prescribe a mild topical corticosteroid for a short period (2–4 weeks) for *flexural and facial psoriasis*, and to use a more potent corticosteroid such as betamethasone p. 735 or fluocinonide p. 738 for *psoriasis of the scalp, palms, or soles*.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as *chronic discoid lupus erythematosus*, *lichen simplex chronicus*, *hypertrophic lichen planus*, and *palmoplantar pustulosis*. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as *keloid scars*, *hypertrophic lichen planus*, or *localised alopecia areata*.

Perioral lesions

Hydrocortisone cream 1% p. 739 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole cream or ointment p. 744 is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including streptococci and staphylococci.

Choice

Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. *Occlusive polythene or hydrocolloid dressings* increase absorption, but also increase the risk of side-effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). Disposable nappies and tight fitting pants also increase the risk of side-effects by increasing absorption of the corticosteroid. The inclusion of urea or salicylic acid p. 768 also increases the penetration of the corticosteroid.

In the *BNF for Children*, topical corticosteroids for the skin are categorised as 'mild', 'moderately potent', 'potent' or 'very potent'; the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

Topical hydrocortisone is usually used in children under 1 year of age. Moderately potent and potent topical corticosteroids should be used with great care in children and for short periods (1–2 weeks) only. A very potent corticosteroid should be initiated under the supervision of a specialist.

Appropriate topical corticosteroids for specific conditions are:

- *insect bites and stings*—mild corticosteroid such as hydrocortisone 1% cream;
- *inflamed nappy rash causing discomfort* in infant over 1 month—mild corticosteroid such as hydrocortisone 0.5% or 1% for up to 7 days (combined with antimicrobial if infected);
- *mild to moderate eczema, flexural and facial eczema or psoriasis*—mild corticosteroid such as hydrocortisone 1%;
- *severe eczema of the face and neck*—moderately potent corticosteroid for 3–5 days only, if not controlled by a mild corticosteroid;

- *severe eczema on the trunk and limbs*—moderately potent or potent corticosteroid for 1–2 weeks only, switching to a less potent preparation as the condition improves;
- *eczema affecting area with thickened skin (e.g. soles of feet)*—potent topical corticosteroid in combination with urea or salicylic acid (to increase penetration of corticosteroid).

Absorption through the skin

Mild and moderately potent topical corticosteroids are associated with few side-effects but particular care is required when treating neonates and infants, and in the use of *potent and very potent* corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing's syndrome, depending on the area of the body being treated and the duration of treatment. Absorption of corticosteroid is greatest from severely inflamed skin, thin skin (especially on the face or genital area), from flexural sites (e.g. axillae, groin), and in infants where skin surface area is higher in relation to body-weight; absorption is increased by occlusion.

Compound preparations

The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid p. 768 facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

Topical corticosteroid preparation potencies

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

Mild

- Hydrocortisone 0.1–2.5%
- Dioderm
- Mildison
- Synalar 1 in 10 dilution

Mild with antimicrobials

- Canesten HC
- Daktacort
- Econacort
- Fucidin H
- Nystaform-HC
- Terra-Cortril
- Timodine

Moderate

- Elocon
- Hydrocortisone butyrate
- Locoid
- Locoid Crelo
- Metosyn
- Mometasone furoate 0.1%
- Nerisone
- Synalar

Potent with antimicrobials

- Aureocort
- Betamethasone and clioquinol
- Betamethasone and neomycin
- Fucibet
- Lotriderm
- Synalar C
- Synalar N

Potent with salicylic acid

- Diprosalic
- Very potent**
- Dermovate
- Nerisone Forte

Very potent with antimicrobials

- Clobetasol propionate 0.05% with neomycin and nystatin

Corticosteroids (topical)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periorcular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

- **CONTRA-INDICATIONS** Acne · perioral dermatitis · potent corticosteroids in widespread plaque psoriasis · untreated bacterial, fungal or viral skin lesions
- **CAUTIONS** Avoid prolonged use (particularly on the face) · cautions applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use · dermatoses of infancy, including nappy rash (extreme caution required—treatment should be limited to 5–7 days) · infection · keep away from eyes · use potent or very potent topical corticosteroids under specialist supervision
- **SIDE-EFFECTS**
 - **Uncommon** Adrenal suppression · skin reactions · telangiectasia
 - **Rare or very rare** Hypertrichosis · skin depigmentation (may be reversible)
 - **Frequency not known** Local reaction · telangiectasia · vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Side-effects applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use. In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more

frequently than twice daily, and to use the least potent formulation which is fully effective.

- **DIRECTIONS FOR ADMINISTRATION** Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a *fingertip unit* (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

'Wet-wrap bandaging' increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.

- **PRESCRIBING AND DISPENSING INFORMATION** The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer corticosteroid creams and ointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

Alclometasone dipropionate

21-Dec-2017

• INDICATIONS AND DOSE

Inflammatory skin disorders such as eczemas

➤ **TO THE SKIN**

➤ **Child:** Apply 1–2 times a day, to be applied thinly

POTENCY

➤ Alclometasone dipropionate cream 0.05%: moderate

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the application of alclometasone dipropionate cream.

Skin

Calcipotriol with betamethasone

30-May-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcipotriol p. 750, betamethasone p. 735.

● INDICATIONS AND DOSE

DOVOBET® GEL

Scalp psoriasis

► TO THE SKIN

- Child 12–17 years (specialist use only): Apply 1–4 g once daily usual duration of therapy 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, shampoo off after leaving on scalp overnight or during day, when different preparations containing calcipotriol used together, maximum total calcipotriol 3.75 mg in any one week

Mild to moderate plaque psoriasis

► TO THE SKIN

- Child 12–17 years (specialist use only): Apply once daily usual duration for up to 4 weeks; if necessary treatment should be continued beyond 4 weeks, or repeated, only on the advice of a specialist, apply to maximum 30% of body surface, when different preparations containing calcipotriol used together, max. total calcipotriol 3.75 mg in any one week; maximum 75 g per week

DOVOBET® OINTMENT

Stable plaque psoriasis

► TO THE SKIN

- Child 12–17 years (specialist use only): Apply once daily for up to 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, apply to a maximum 30% of body surface, when different preparations containing calcipotriol used together, max. total calcipotriol 3.75 mg in any one week; maximum 75 g per week

- **UNLICENSED USE** *Dovobet*® not licensed for use in children.

● CONTRA-INDICATIONS

- **ENSTILAR**® Erythrodermic psoriasis · pustular psoriasis

- **INTERACTIONS** → Appendix 1: corticosteroids · vitamin D substances

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxytoluene

- **Dovobet** (LEO Pharma)

Calcipotriol (as Calcipotriol hydrate) 50 microgram per 1 gram, Betamethasone (as Betamethasone dipropionate) 500 microgram per 1 gram Dovobet ointment | 30 gram [PoM] £19.84 DT = £19.84 | 60 gram [PoM] £39.68 | 120 gram [PoM] £73.86

Clobetasol propionate

21-Dec-2017

● INDICATIONS AND DOSE

Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids | Psoriasis

► TO THE SKIN

- Child 1–17 years: Apply 1–2 times a day for up to 4 weeks, to be applied thinly

POTENCY

► Clobetasol propionate 0.05% cream, foam, ointment, scalp application, and shampoo: very potent.

- **UNLICENSED USE** *Dermovate*® not licensed for use in children under 1 year.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clobetasol propionate foam, liquid (scalp application), cream, ointment and shampoo.

Scalp application Patients or carers should be advised to apply foam directly to scalp lesions (foam begins to subside immediately on contact with skin).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, paste

Foam

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Clioquinol 30 mg per 1 gram | Betamethasone valerate 0.1% / Clioquinol 3% ointment | 30 gram [PoM] £38.88 DT = £38.88

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

- ▶ **Betamethasone with clioquinol (Non-proprietary)**

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Clioquinol 30 mg per 1 gram | Betamethasone valerate 0.1% / Clioquinol 3% cream | 30 gram [PoM] £38.88 DT = £38.88

Betamethasone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 735, clotrimazole p. 724.

● INDICATIONS AND DOSE

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)

POTENCY

- ▶ Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

- **UNLICENSED USE** *Lotriderm*® not licensed for use in children under 12 years.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer betamethasone with clotrimazole cream.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol

► **Lotiderm** (Merck Sharp & Dohme Ltd)

Betamethasone dipropionate 640 microgram per 1 gram, Clotrimazole 10 mg per 1 gram Lotiderm cream | 30 gram [PoM]
£6.34 DT = £6.34

Betamethasone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 735, fusidic acid p. 357.

INDICATIONS AND DOSE

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

► TO THE SKIN

► Child: (consult product literature)

POTENCY

► Betamethasone (as valerate) 0.1% with fusidic acid cream: potent.

● **UNLICENSED USE** *Fucibet® Lipid Cream* is not licensed for use in children under 6 years.

● **PATIENT AND CARER ADVICE** Patients or carers should be counselled on application of betamethasone with fusidic acid preparations.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

► **Betamethasone with neomycin (Non-proprietary)**

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Betamethasone valerate 0.1% / Neomycin 0.5% cream | 30 gram [PoM] £38.88 DT = £31.36 | 100 gram [PoM] £97.00 DT = £104.52

Betamethasone with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 735, salicylic acid p. 768.

INDICATIONS AND DOSE

DIPROSALIC® OINTMENT

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

► TO THE SKIN

► Child: Apply 1–2 times a day, max. 60 g per week

POTENCY

► For *Diprosalic*® ointment: betamethasone (as dipropionate) 0.05% with salicylic acid 3%: potent.

DIPROSALIC® SCALP APPLICATION

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

► TO THE SKIN

► Child: Apply 1–2 times a day, apply a few drops

POTENCY

► For *Diprosalic*® scalp application: betamethasone (as dipropionate) 0.05% with salicylic acid 2%: potent.

PATIENT AND CARER ADVICE

DIPROSALIC® OINTMENT Patients or carers should be counselled on application of betamethasone and salicylic acid preparations.

DIPROSALIC® SCALP APPLICATION Patients or carers should be counselled on application of betamethasone and salicylic acid scalp application.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Hydrocortisone with oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 739.

● INDICATIONS AND DOSE

Mild inflammatory skin disorders such as eczemas

► TO THE SKIN

► Child 12–17 years: (consult product literature)

POTENCY

► Hydrocortisone 1% with oxytetracycline ointment: mild.

● **CONTRA-INDICATIONS** Children under 12 years

● **PREGNANCY** Tetracyclines should not be given to pregnant women. Effects on skeletal development have been

documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child's teeth.

● **BREAST FEEDING** Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

● **PATIENT AND CARER ADVICE** Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dithranol

(Anthralin)

● INDICATIONS AND DOSE

Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)

DITHROCREAM®

Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Child: For application to skin or scalp, 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)

MICANOL®

Subacute and chronic psoriasis

- ▶ TO THE SKIN
- ▶ Child: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

● UNLICENSED USE

MICANOL® Micanol® licensed for use in children, but not recommended for infants or young children (age range not specified by manufacturer).

DITHROCREAM® Dithrocream® is licensed for use in children (age range not specified by manufacturer).

● CONTRA-INDICATIONS

Acute and pustular psoriasis · hypersensitivity

● CAUTIONS

Avoid sensitive areas of skin · avoid use near eyes

● SIDE-EFFECTS

Skin reactions

● PREGNANCY

No adverse effects reported.

● BREAST FEEDING

No adverse effects reported.

● DIRECTIONS FOR ADMINISTRATION

When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.

MICANOL® At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.

● PRESCRIBING AND DISPENSING INFORMATION

Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance.

● PATIENT AND CARER ADVICE

Dithranol can stain the skin, hair and fabrics.

● EXCEPTIONS TO LEGAL CATEGORY

Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

Cream

Forms available from special-order manufacturers include: ointment, paste

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Pimecrolimus

● INDICATIONS AND DOSE

Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)

- TO THE SKIN
- Child 2–17 years: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

- **CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions · application under occlusion · congenital epidermal barrier defects · contact with eyes · contact with mucous membranes · generalised erythroderma · immunodeficiency · infection at treatment site

- **CAUTIONS** Alcohol consumption (risk of facial flushing and skin irritation) · avoid other topical treatments except emollients at treatment site · UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS** → Appendix 1: pimecrolimus

● SIDE-EFFECTS

- **Common or very common** Increased risk of infection
- **Rare or very rare** Skin discolouration
- **Frequency not known** Skin papilloma

- **PREGNANCY** Manufacturer advises avoid; toxicity in animal studies following systemic administration.

- **BREAST FEEDING** Manufacturer advises caution; ensure infant does not come in contact with treated areas.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82**
Topical pimecrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged

2–16 years. Pimecrolimus should be used within its licensed indications.

100 gram [PoM] £59.07 DT = £59.07

Tacrolimus

19-Mar-2018

- **DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

● INDICATIONS AND DOSE

Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (initiated by a specialist)

- TO THE SKIN
- Child 2–15 years: Apply twice daily for up to 3 weeks (consider other treatment if eczema worsens or if no improvement after 2 weeks), 0.03% ointment to be applied thinly, then reduced to once daily until lesion clears
- Child 16–17 years: Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or strength of ointment to 0.03% if condition allows

Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (initiated by a specialist)

- TO THE SKIN
- Child 2–15 years: Apply twice weekly, 0.03% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year
- Child 16–17 years: Apply twice weekly, 0.1% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

- **CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions · application under occlusion · avoid contact with eyes · avoid contact with mucous membranes · congenital epidermal barrier defects · generalised erythroderma · immunodeficiency · infection at treatment site

- **CAUTIONS** UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS** → Appendix 1: tacrolimus

● SIDE-EFFECTS

- **Common or very common** Increased risk of infection · sensation abnormal · skin reactions
- **Uncommon** Lymphadenopathy
- **Frequency not known** Neoplasms

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.

- **PREGNANCY** Manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration.

13

Skin

- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).
- **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82**
Topical tacrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical tacrolimus is recommended as an option for the second-line treatment for moderate to severe atopic eczema in adults and children over 2 years. Tacrolimus should be used within its licensed indications.

www.nice.org.uk/guidance/TA82

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2010) that tacrolimus 0.03% ointment (*Protopic*®) is accepted for restricted use within NHS Scotland for the prevention of flares in children aged 2 to 15 years with moderate-to-severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with a specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

The *Scottish Medicines Consortium* has advised (April 2010) that tacrolimus 0.1% ointment (*Protopic*®) is accepted for restricted use within NHS Scotland for the prevention of flares in patients aged 16 years and over with moderate-to-severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with a specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS**Ustekinumab**

03-Oct-2017

● **INDICATIONS AND DOSE**

Moderate-to-severe plaque psoriasis that has not responded to other systemic treatments or photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications (specialist use only)

▶ **BY SUBCUTANEOUS INJECTION**

- ▶ Child 12–17 years (body-weight up to 60 kg): Initially 750 micrograms/kg, then 750 micrograms/kg after 4 weeks, then 750 micrograms/kg every 12 weeks, consider discontinuation if no response within 28 weeks, consult product literature for advice on calculating volume of injection to be given

- ▶ Child 12–17 years (body-weight 60–100 kg): Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, consider discontinuation if no response within 28 weeks
- ▶ Child 12–17 years (body-weight 100 kg and above): Initially 90 mg, then 90 mg after 4 weeks, then 90 mg every 12 weeks, consider discontinuation if no response within 28 weeks

● **CONTRA-INDICATIONS** Active infection

- **CAUTIONS** Development of malignancy · history of malignancy · predisposition to infection · start appropriate treatment if widespread erythema and skin exfoliation develop, and stop ustekinumab treatment if exfoliative dermatitis suspected

CAUTIONS, FURTHER INFORMATION

- ▶ **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies● **SIDE-EFFECTS**

- ▶ **Common or very common** Arthralgia · asthenia · back pain · diarrhoea · dizziness · headache · increased risk of infection · myalgia · nausea · oropharyngeal pain · skin reactions · vomiting
- ▶ **Uncommon** Depression · facial paralysis · hypersensitivity (may be delayed) · nasal congestion
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment.

● **PREGNANCY** Avoid.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **PRE-TREATMENT SCREENING**

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● **MONITORING REQUIREMENTS**

- ▶ Monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immunosuppressant therapy, or those over 60 years of age.
- ▶ Monitor for signs and symptoms of exfoliative dermatitis or erythrodermic psoriasis.

● **PATIENT AND CARER ADVICE**

Exfoliative dermatitis Patients should be advised to seek prompt medical attention if symptoms suggestive of exfoliative dermatitis or erythrodermic psoriasis (such as increased redness and shedding of skin over a larger area of the body) develop.
Tuberculosis Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ Adalimumab, etanercept and ustekinumab for treating plaque psoriasis in children and young people (July 2017) NICE TA455
Ustekinumab is recommended as an option for treating plaque psoriasis in children and young people aged 12 years or older, only if the disease:
 - is severe, as defined by a total PASI of 10 or more, and

- has not responded to standard systemic therapy, such as ciclosporin, methotrexate or phototherapy, or these options are contra-indicated or not tolerated.

If the psoriasis has not responded adequately, stop treatment at 16 weeks. An adequate response is defined as a 75% reduction in PASI score from the start of treatment.

Patients currently receiving ustekinumab who do not meet the above criteria and whose treatment was started within the NHS before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

RETINOID AND RELATED DRUGS

Acitretin

- **DRUG ACTION** Acitretin is a metabolite of etretinate.

• INDICATIONS AND DOSE

Severe extensive psoriasis resistant to other forms of therapy (under expert supervision) | Palmoplantar pustular psoriasis (under expert supervision) | Severe congenital ichthyosis (under expert supervision)

▶ BY MOUTH

- ▶ Child 1 month–11 years: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required; maximum 35 mg per day
- ▶ Child 12–17 years: Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

Severe Darier's disease (keratosis follicularis) (under expert supervision)

▶ BY MOUTH

- ▶ Child 1 month–11 years: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required; maximum 35 mg per day
- ▶ Child 12–17 years: Initially 10 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily

Harlequin ichthyosis (under expert supervision)

▶ BY MOUTH

- ▶ Neonate: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required.

- **CONTRA-INDICATIONS** Hyperlipidaemia

- **CAUTIONS** Avoid excessive exposure to sunlight and unsupervised use of sunlamps • diabetes (can alter glucose tolerance—initial frequent blood glucose checks) • do not donate blood during and for 2 years after stopping therapy (teratogenic risk) • in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported) • investigate atypical musculoskeletal symptoms

- **INTERACTIONS** → Appendix 1: retinoids

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain • arthralgia • brittle nails • conjunctivitis • diarrhoea • dry mouth • gastrointestinal disorder • haemorrhage • hair texture abnormal • headache • increased risk of infection • mucosal abnormalities • myalgia • nausea • oral disorders • peripheral oedema • skin reactions • thirst • vomiting • xerophthalmia
- ▶ **Uncommon** Dizziness • hepatic disorders • photosensitivity reaction • vision disorders
- ▶ **Rare or very rare** Bone pain • exostosis • idiopathic intracranial hypertension • peripheral neuropathy
- ▶ **Frequency not known** Angioedema • capillary leak syndrome • drowsiness • dysphonia • flushing • glucose tolerance impaired • granuloma • hearing impairment • hyperhidrosis • malaise • pyogenic granuloma • retinoic acid syndrome • taste altered

SIDE-EFFECTS, FURTHER INFORMATION

Exostosis Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which acitretin is a metabolite) and premature epiphyseal closure in children.

Benign intracranial hypertension Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used. Pregnancy prevention In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

- **PREGNANCY** Avoid—teratogenic.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment—risk of further impairment.

- **RENAL IMPAIRMENT** Avoid in severe impairment; increased risk of toxicity.

• MONITORING REQUIREMENTS

- ▶ Monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.
- ▶ Check liver function at start, at least every 4 weeks for first 2 months and then every 3 months.

• PRESCRIBING AND DISPENSING INFORMATION

Prescribing for women of child-bearing potential Each prescription for acitretin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription.

- **PATIENT AND CARER ADVICE** Females of child-bearing potential must be advised on pregnancy prevention. A patient information leaflet should be provided.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 10, 11, 21

SALICYLIC ACID AND DERIVATIVES**Salicylic acid with zinc oxide****INDICATIONS AND DOSE****Hyperkeratotic skin disorders**

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily

CAUTIONS Avoid broken skin · avoid inflamed skin**CAUTIONS, FURTHER INFORMATION**

- ▶ **Salicylate toxicity** Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin.

SIDE-EFFECTS Skin reactions**PRESCRIBING AND DISPENSING INFORMATION** Zinc and Salicylic Acid Paste BP is also referred to as Lassar's Paste. When prepared extemporaneously, the BP states Zinc and Salicylic Acid Paste, BP (Lassar's Paste) consists of zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.**MEDICINAL FORMS**

Forms available from special-order manufacturers include: paste

VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES**Calcipotriol****INDICATIONS AND DOSE****Plaque psoriasis**

- ▶ TO THE SKIN USING OINTMENT
- ▶ Child 6–11 years: Apply twice daily, when preparations used together maximum total calcipotriol 2.5 mg in any one week (e.g. scalp solution 20 mL with ointment 30 g); maximum 50 g per week
- ▶ Child 12–17 years: Apply twice daily, when preparations used together maximum total calcipotriol 3.75 mg in any one week (e.g. scalp solution 30 mL with ointment 45 g); maximum 75 g per week

Scalp psoriasis

- ▶ TO THE SKIN USING SCALP LOTION
- ▶ Child 6–11 years (specialist use only): Apply twice daily, when preparations used together max. total calcipotriol 2.5 mg in any one week (e.g. scalp solution 20 mL with ointment 30 g); maximum 30 mL per week
- ▶ Child 12–17 years (specialist use only): Apply twice daily, when preparations used together maximum total calcipotriol 3.75 mg in any one week (e.g. scalp solution 30 mL with ointment 45 g); maximum 45 mL per week

UNLICENSED USE Calcipotriol ointment and scalp solution not licensed for use in children.**CONTRA-INDICATIONS** Calcium metabolism disorders

- ▶ **CAUTIONS** Avoid excessive exposure to sunlight and sunlamps · avoid use on face · erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) · generalised pustular psoriasis (enhanced risk of hypercalcaemia)

INTERACTIONS → Appendix 1: vitamin D substances**SIDE-EFFECTS**

- ▶ **Common or very common** Skin reactions
- ▶ **Uncommon** Increased risk of infection
- ▶ **Rare or very rare** Hypercalcaemia · hypercalciuria · photosensitivity reaction
- ▶ **PREGNANCY** Manufacturers advise avoid unless essential.
- ▶ **BREAST FEEDING** No information available.
- ▶ **HEPATIC IMPAIRMENT** Manufacturers advise avoid in severe impairment.
- ▶ **RENAL IMPAIRMENT** Manufacturers advise avoid in severe impairment.

PATIENT AND CARER ADVICE

Advice on application Patient information leaflet for *Dovonex*® ointment advises liberal application. However, patients should be advised of maximum recommended weekly dose.

Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

4 Perspiration

4.1 Hyperhidrosis

Hyperhidrosis

Overview

Aluminium chloride hexahydrate p. 752 is a potent antiperspirant used in the treatment of axillary, palmar, and plantar hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use tap water or glycopyrronium bromide below (as a 0.05% solution) in the iontophoretic treatment of hyperhidrosis of palms and soles.

Botox® contains botulinum toxin type A complex p. 258 and is available for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment; intradermal treatment is unlikely to be tolerated by most children and should be administered under hospital specialist supervision.

ANTIMUSCARINICS

Glycopyrronium bromide

(Glycopyrrolate)

13-Sep-2017

● INDICATIONS AND DOSE

Iontophoretic treatment of hyperhidrosis

▶ TO THE SKIN

- ▶ Child: Only 1 site to be treated at a time, maximum 2 sites treated in any 24 hours, treatment not to be repeated within 7 days (consult product literature)

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS** Infections affecting the treatment site

CONTRA-INDICATIONS, FURTHER INFORMATION Contra-indications applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION Cautions applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

5 Pruritus

Topical local antipruritics

Overview

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (such as eczema, psoriasis, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying cause should be treated. Local antipruritics have a role in the treatment of pruritus in palliative care. Pruritus caused by cholestasis generally requires a bile acid sequestrant.

An **emollient** may be of value where the pruritus is associated with dry skin. Preparations containing calamine or crotamiton below are sometimes used but are of uncertain value.

A topical preparation containing doxepin 5% p. 753 is licensed for the relief of pruritus in eczema in children over 12 years; it can cause drowsiness and there may be a risk of sensitisation.

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause sensitisation. For *insect stings* and *insect bites*, a short course of a topical

corticosteroid is appropriate. Short-term treatment with a **sedating antihistamine** may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

In *pruritus ani*, the underlying cause such as faecal soiling, eczema, psoriasis, or helminth infection should be treated.

Other drugs used for Pruritus Alimemazine tartrate, p. 177 · Cetirizine hydrochloride, p. 174 · Chlorphenamine maleate, p. 178 · Hydroxyzine hydrochloride, p. 179 · Levocetirizine hydrochloride, p. 175

ANTIPRURITICS

Calamine with zinc oxide

► **Xepin** (Cambridge Healthcare Supplies Ltd)

Doxepin hydrochloride 50 mg per 1 gram Xepin 5% cream | 30 gram **PoM** £11.70

before improving. The choice of treatment depends on age, severity, and whether the acne is predominantly inflammatory or comedonal.

Mild to moderate acne is generally treated with topical preparations, such as benzoyl peroxide p. 756, azelaic acid p. 756, and retinoids.

For moderate to severe inflammatory acne or where topical preparations are not tolerated or are ineffective or where application to the site is difficult, systemic treatment with oral antibacterials may be effective. Co-cyprindiol p. 754 (cyproterone acetate with ethinylestradiol) has anti-androgenic properties and may be useful in young women with acne refractory to other treatments.

Severe acne, acne unresponsive to prolonged courses of oral antibacterials, acne with scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe oral isotretinoin p. 757.

Acne in neonates and infants

Inflammatory papules, pustules, and occasionally comedones may develop at birth or within the first month; most neonates with acne do not require treatment. Acne developing at 3–6 months of age may be more severe and persistent; lesions are usually confined to the face. Topical preparations containing benzoyl peroxide (at the lowest strength possible to avoid irritation), adapalene p. 756, or tretinoin p. 554 may be used if treatment for infantile acne is necessary. In infants with inflammatory acne, oral erythromycin p. 331 is used because topical preparations for acne are not well tolerated. In cases of erythromycin-resistant acne, oral isotretinoin can be given on the advice of a consultant dermatologist.

Acne: topical preparations

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide or topical retinoids. Alternatively, topical application of an antibacterial such as erythromycin or clindamycin p. 755 may be effective for inflammatory acne. However, topical antibacterials are probably no more effective than benzoyl peroxide and may promote the emergence of resistant organisms. If topical preparations prove inadequate, oral preparations may be needed. The choice of product and formulation (gel, solution, lotion, or cream) is largely determined by skin type, patient preference, and previous usage of acne products.

Benzoyl peroxide and azelaic acid

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. The usefulness of benzoyl peroxide washes is limited by the short time the products are in contact with the skin. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with a reduction in benzoyl peroxide concentration, frequency, and area of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid has antimicrobial and anticomedonal properties. It may be used as an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face; azelaic acid is less likely to cause local irritation than benzoyl peroxide.

Topical antibacterials for acne

In the treatment of mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for children who wish to avoid oral antibacterials or who cannot tolerate them.

6 Rosacea and acne

Rosacea and Acne

Acne vulgaris in children

Acne vulgaris commonly affects children around puberty and occasionally affects infants. Treatment of acne should be commenced early to prevent scarring; lesions may worsen

Topical preparations of erythromycin and clindamycin may be used to treat *inflamed lesions* in mild to moderate acne when topical benzoyl peroxide or tretinoin is ineffective or poorly tolerated. Topical benzoyl peroxide, azelaic acid, or retinoids used in combination with an antibacterial (topical or systemic) may be more effective than an antibacterial used alone. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (but treatment with a topical preparation should be continued for at least 6 months).

Topical retinoids and related preparations for acne

Topical tretinoin, its isomer isotretinoin, and adapalene (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

Tretinoin can be used under specialist supervision to treat infantile acne; adapalene can also be used.

Other topical preparations for acne

A topical preparation of nicotinamide p. 759 is available for inflammatory acne.

Acne: oral preparations

Oral antibacterials for acne

Oral antibacterials may be used in *moderate to severe inflammatory acne* when topical treatment is not adequately effective or is inappropriate. Concomitant antimicrobial treatment with topical benzoyl peroxide or azelaic acid may also be required.

Tetracyclines should not be given to children under 12 years. In children over 12 years, either oxytetracycline p. 354 or tetracycline p. 354 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer. Doxycycline p. 352 and lymecycline p. 353 are alternatives to tetracycline in children over 12 years.

Although minocycline p. 353 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Erythromycin is an alternative for the management of moderate to severe acne with inflamed lesions, but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response. In cases of erythromycin-resistant *P. acnes* in infants, oral isotretinoin may be used on the advice of a consultant dermatologist.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

Hormone treatment for acne

Co-cyprindiol below (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is no more effective than an oral broad-spectrum antibacterial but is useful in females of childbearing age who also wish to receive oral contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some females with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

Oral retinoid for acne

The retinoid isotretinoin p. 757 reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, acne with scarring, or for acne which has not responded to an adequate course of a systemic antibacterial. Isotretinoin is used for the treatment of severe infantile acne resistant to erythromycin p. 331.

Isotretinoin is a toxic drug that should be prescribed **only** by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required. The drug is **teratogenic** and **must not** be given to females of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. They must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

Rosacea

The adult form of rosacea rarely occurs in children.

Persistent or repeated use of potent topical corticosteroids may cause periorificial rosacea (steroid acne). The pustules and papules of rosacea may be treated for at least 6 weeks with a topical metronidazole preparation p. 333, or a systemic antibacterial such as erythromycin, or for a child over 12 years, oxytetracycline p. 354. Tetracyclines are **contra-indicated** in children under 12 years of age.

6.1 Acne

ANTI-ANDROGENS

Co-cyprindiol

02-Mar-2017

• INDICATIONS AND DOSE

Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials | Moderately severe hirsutism

► BY MOUTH

► Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

- **CONTRA-INDICATIONS** Acute porphyrias p. 603 · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer but can be used after 5 years if no evidence of disease and non-

hormonal methods unacceptable · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · presence or history of liver tumours · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease or for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia—seek specialist advice · inflammatory bowel disease including Crohn's disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- ▶ **Venous thromboembolism** There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third generation progestogens (desogestrel and gestodene) or drospirenone. Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

● SIDE-EFFECTS

- ▶ **Rare or very rare** Cholelithiasis · photosensitivity reactions · systemic lupus erythematosus (SLE)
- ▶ **Frequency not known** Abdominal cramps · amenorrhoea (on discontinuation) · breast abnormalities · cervical erosion · chorea · contact lens intolerance · depression · fluid retention · headache · hepatic impairment · hepatic neoplasm · hypertension · irritability · leg cramps · libido disorder · lipid metabolism change · melasma · menstrual disorder · nausea · thrombosis (more common when factor V Leiden present or in blood groups A, B and AB) · vulvovaginal disorders · visual impairment · vomiting

- **PREGNANCY** Avoid—risk of feminisation of male fetus with cyproterone.

- **BREAST FEEDING** Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (until liver function returns to normal.)

- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.

● MEDICINAL FORMS

Acne vulgaris

- ▶ TO THE SKIN
- ▶ Child 9–17 years: Apply once daily, to be applied thinly in the evening

● INTERACTIONS → Appendix 1: retinoids

- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

- **PATIENT AND CARER ADVICE** Gel may bleach clothing and hair.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2014) that *Epiduo*® should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Disodium edetate, polysorbates, propylene glycol

▶ Epiduo (Galderma (UK) Ltd)

Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per 1 gram Epiduo 0.1%/2.5% gel | 45 gram [PoM] £19.53 DT = £19.53

Isotretinoin

03-Nov-2017

● INDICATIONS AND DOSE

Topical treatment of mild to moderate acne

▶ TO THE SKIN

- ▶ Child: Apply 1–2 times a day, to be applied thinly

Severe acne (under expert supervision) | Acne which is associated with psychological problems (under expert supervision) | Acne which has not responded to an adequate course of a systemic antibacterial (under expert supervision) | Acne with scarring (under expert supervision) | Systemic treatment of nodulo-cystic and conglobate acne (under expert supervision)

▶ BY MOUTH

- ▶ Child 12–17 years: Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course

Severe infantile acne (under expert supervision)

▶ BY MOUTH

- ▶ Child 1 month–1 year: Initially 200 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks; maximum 150 mg/kg per course

- **UNLICENSED USE** Not licensed for use in infantile acne.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ISOTRETINOIN (ROACCUTANE®): RARE REPORTS OF ERECTILE DYSFUNCTION AND DECREASED LIBIDO (OCTOBER 2017)

An EU-wide review has concluded that on rare occasions, oral isotretinoin, indicated for severe acne, may cause sexual side-effects, including erectile dysfunction and decreased libido.

● CONTRA-INDICATIONS

- ▶ With oral use Hyperlipidaemia · hypervitaminosis A
- ▶ With topical use Perioral dermatitis · rosacea

● CAUTIONS

- ▶ With oral use Avoid blood donation during treatment and for at least 1 month after treatment · diabetes · dry eye syndrome (associated with risk of keratitis) · history of depression · monitor for depression
- ▶ With topical use Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid · alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) · avoid accumulation in angles of the nose · avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · avoid exposure to UV light (including sunlight, solariums) · avoid in severe acne involving large areas · avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics · caution in sensitive areas such as the neck · personal or familial history of skin cancer

- **INTERACTIONS** → Appendix 1: retinoids

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ Common or very common Skin reactions
- ▶ Rare or very rare Photosensitivity reaction

SPECIFIC SIDE-EFFECTS

- ▶ Common or very common
- ▶ With oral use Alopecia · anaemia · arthralgia · back pain · cheilitis · dry eye · eye discomfort · eye inflammation · haemorrhage · headache · increased risk of infection · myalgia · nasal dryness · neutropenia · proteinuria · skin fragility (trauma may cause blistering) · thrombocytopenia · thrombocytosis

- ▶ **Rare or very rare**
- ▶ With oral use Anxiety · arthritis · behaviour abnormal · bone disorders · bronchospasm · cataract · corneal opacity · depression · diabetes mellitus · dizziness · drowsiness · dry throat · gastrointestinal disorders · glomerulonephritis · hair changes · hearing impairment · hepatitis · hoarseness · hyperhidrosis · hyperuricaemia · idiopathic intracranial hypertension · inflammatory bowel disease · lymphadenopathy · malaise · mood altered · nail dystrophy · nausea · pancreatitis · psychotic disorder · pyogenic granuloma · seizure · suicidal tendencies · tendinitis · vasculitis · vision disorders

- ▶ **Frequency not known**

- ▶ With oral use Rhabdomyolysis · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.

Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.

Visual disturbances require expert referral and possible withdrawal.

Psychiatric side-effects could require expert referral.

- **CONCEPTION AND CONTRACEPTION**

Pregnancy prevention

- ▶ With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.
- ▶ With topical use Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

- **PREGNANCY** Contra-indicated in pregnancy (teratogenic).

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT**

- ▶ With oral use Avoid—further impairment may occur.

- **RENAL IMPAIRMENT**

Dose adjustments ▶ With oral use In severe impairment, reduce initial dose and increase gradually, if necessary, up to 1 mg/kg daily as tolerated.

- **MONITORING REQUIREMENTS**

- ▶ With oral use Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).

- **PRESCRIBING AND DISPENSING INFORMATION** Isotretinoin is an isomer of tretinoin.

- **PATIENT AND CARER ADVICE**

- ▶ With oral use Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping: patient should avoid

exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.

Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.

- ▶ With topical use Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

7 Scalp and hair conditions

Scalp and hair conditions

Overview

The detergent action of shampoo removes grease (sebum) from hair. Prepubertal children produce very little grease and require shampoo less frequently than adults. Shampoos can be used as vehicles for medicinal products, but their usefulness is limited by the short time the product is in contact with the scalp and by their irritant nature.

Oils and ointments are very useful for scaly, dry scalp conditions; if a greasy appearance is cosmetically unacceptable, the preparation may be applied at night and washed out in the morning. Alcohol-based lotions are rarely used in children; alcohol causes painful stinging on broken skin and the fumes may exacerbate asthma.

Itchy, inflammatory, eczematous scalp conditions may be relieved by a simple emollient oil such as **olive oil** or **coconut oil** (arachis oil (ground nut oil, peanut oil) is best avoided in children under 5 years). In more severe cases a topical **corticosteroid** may be required. Preparations containing **coal tar** are used for the common scaly scalp conditions of childhood including seborrhoeic dermatitis, dandruff (a mild form of seborrhoeic dermatitis), and psoriasis; salicylic acid p. 768 is used as a keratolytic in some scalp preparations.

Shampoos containing antimicrobials such as selenium below or ketoconazole p. 725 are used for seborrhoeic dermatitis and dandruff in which yeast infection has been implicated, and for tinea capitis (ringworm of the scalp). Bacterial infection affecting the scalp (usually secondary to eczema, head lice, or ringworm) may be treated with shampoos containing antimicrobials such as **pyrithione zinc**, cetrimide, or povidone-iodine p. 679.

In neonates and infants, *cradle cap* (which is also a form of seborrhoeic eczema) can be treated by massaging **coconut oil** or **olive oil** into the scalp; a bland emollient such as **emulsifying ointment** can be rubbed onto the affected area once or twice daily before bathing and a mild shampoo used.

Other drugs used for Scalp and hair conditions Coal tar, p. 745 • Coal tar with lecithin, p. 746 • Coal tar with salicylic acid and precipitated sulfur, p. 746

ANTISEPTICS AND DISINFECTANTS > UNDECENOATES

Cetrimide with undecenoic acid

• INDICATIONS AND DOSE

Scalp psoriasis | Seborrhoeic dermatitis | Dandruff

► TO THE SKIN

► Child: Apply 3 times a week for 1 week, then apply twice weekly

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

8 Skin cleansers, antiseptics and desloughing agents

Skin cleansers, antiseptics and desloughing agents

Skin cleansers and antiseptics

Soap or detergent is used with water to cleanse intact skin but they can irritate infantile skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry or irritated skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 762 or povidone-iodine p. 761,

which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Preparations containing alcohol, and regular use of povidone-iodine, should be avoided on neonatal skin.

Hydrogen peroxide p. 763, an oxidising agent, is available as a cream and can be used for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride p. 589 0.9% solution is used but tap water is often appropriate.

Potassium permanganate below solution 1 in 10 000, a mild antiseptic with astringent properties, can be used as a soak for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

Desloughing agents

Alginate, hydrogel, and hydrocolloid dressings are effective in wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised.

ANTISEPTICS AND DISINFECTANTS

Potassium permanganate

● INDICATIONS AND DOSE

Cleansing and deodorising suppurating eczematous reactions and wounds

► TO THE SKIN

► Child: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

● **CAUTIONS** Irritant to mucous membranes

● **DIRECTIONS FOR ADMINISTRATION** Potassium permanganate 0.1% solution to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution. With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.

● **PATIENT AND CARER ADVICE** Can stain clothing, skin and nails (especially with prolonged use).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

Tablet for cutaneous solution

► **Potassium permanganate (Non-proprietary)**

Potassium permanganate 400 mg Potassium permanganate 400mg tablets for cutaneous solution | 30 tablet DT = £19.25

ANTISEPTICS AND DISINFECTANTS > IODINE PRODUCTS

Povidone-iodine

● INDICATIONS AND DOSE

Skin disinfection

► TO THE SKIN

► Child: (consult product literature)

BETADINE® DRY POWDER SPRAY

Skin disinfection, particularly minor wounds and infections

► TO THE SKIN

► Child 2-17 years: Not for use in serous cavities (consult product literature)

SAVLON® DRY

Skin disinfection of minor wounds

► TO THE SKIN

► Child: (consult product literature)

VIDENE® SOLUTION

Skin disinfection

► TO THE SKIN

► Child: Apply undiluted in pre-operative skin disinfection and general antiseptics

VIDENE® SURGICAL SCRUB®

Skin disinfection

► TO THE SKIN

► Child: Use as a pre-operative scrub for hand and skin disinfection

VIDENE® TINCTURE

Skin disinfection

► TO THE SKIN

► Child: Apply undiluted in pre-operative skin disinfection

● **CONTRA-INDICATIONS** Concomitant use of lithium · corrected gestational age under 32 weeks · infants body-weight under 1.5 kg · regular use in neonates

VIDENE® TINCTURE Neonates

- **CAUTIONS** Broken skin · large open wounds

CAUTIONS, FURTHER INFORMATION The application of povidone–iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

VIDENE® TINCTURE Procedures involving hot wire cautery and diathermy

- **SIDE-EFFECTS**

- ▶ Rare or very rare Eye erythema · punctate keratitis
- ▶ **Frequency not known** Cytotoxicity · eye discolouration · hypothyroidism (in neonates)
- **PREGNANCY** Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.
- **BREAST FEEDING** Avoid regular or excessive use.
- **RENAL IMPAIRMENT** Avoid regular application to inflamed or broken skin or mucosa.
- **EFFECT ON LABORATORY TESTS** May interfere with thyroid function tests.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

8.1 Minor cuts and abrasions

Minor cuts and abrasions

Management

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and proflavine p. 763 may be used to treat infected wounds or burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 704 is used to clean minor cuts and abrasions.

Flexible collodion (see castor oil with collodion and colophony below) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

DERMATOLOGICAL DRUGS > COLLODIONS

Castor oil with collodion and colophony

• INDICATIONS AND DOSE

Used to seal minor cuts and wounds that have partially healed

- TO THE SKIN
- Child: (consult product literature)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has an allergy to colophony in elastic adhesive plasters and tape.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

9 Skin disfigurement

Camouflagers

Overview

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances

The preparations marked 'ACBS' can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

10 Sun protection and photodamage

Sunscreen

Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as *polymorphic light eruption*, *solar urticaria*, and it provokes the various *cutaneous porphyrias*. It also provokes (or at least aggravates) skin lesions of *lupus erythematosus* and may aggravate some other *dermatoses*. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as *sunburn*) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include *ageing changes* and more importantly the initiation of *skin cancer*.

Solar ultraviolet radiation is approximately 200–400 m in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause sunburn. The long wavelengths (320–400 nm, known as UVA) are responsible for many *photosensitivity reactions* and *photodermatoses*. Both UVA and UVB contribute to long-term *photodamage* and to the changes responsible for *skin cancer* and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. Protective clothing and sun avoidance (rather than the use of sunscreen preparations) are recommended for children under 6 months of age.

The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a child to remain 8 times longer in the sun without burning. However, in practice users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies. Some manufacturers use a star rating system to indicate the protection against UVA relative to

protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied **thickly** and **frequently** (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

Ingredient nomenclature in sunscreen preparations	
rINN	INCI
amiloxate	isoamyl <i>p</i> -methoxycinnamate
avobenzene	butyl methoxydibenzoylmethane
bemotrizinol	bis-ethylhexyloxyphenol methoxyphenyl triazine
bisotrizole	methylene bis-benzotriazolyl tetramethylbutylphenol
ecamsule	terephthalylidene dicamphor sulfonic acid
ensulizole	phenylbenzimidazole sulfonic acid
enzacamene	4-methylbenzylidene camphor
octinoxate	octyl (or ethylhexyl) methoxycinnamate
octocrilene	octocrylene
oxybenzone	benzophenone-3
The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNFC	

Borderline substances

Anthelios® XL SPF 50+ Melt-in cream; *Sunsense*® Ultra; *Uvistat*® Lipscreen SPF 50; and *Uvistat*® Suncream SPF 30 and 50 (see *Borderline substances*) cannot be prescribed on the NHS except for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those resulting from radiotherapy; chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed.

Photodamage

Overview

Actinic keratoses occur very rarely in healthy children; actinic cheilitis may occur on the lips of adolescents following excessive sun exposure.

Diclofenac gel (Solaraze®) and topical preparations of fluorouracil are licensed for the treatment of actinic keratoses but they are not licensed for use in children.

In children with photosensitivity disorders, such as erythropoietic protoporphyria, specialists may use

betacarotene below, mepacrine, chloroquine or hydroxychloroquine to reduce skin reactions.

VITAMINS AND TRACE ELEMENTS > VITAMIN A

Betacarotene

• **DRUG ACTION** Betacarotene is a precursor to vitamin A.

• INDICATIONS AND DOSE

Management of photosensitivity reactions in erythropoietic protoporphyria (specialist use only)

► BY MOUTH

- Child 1–4 years: 60–90 mg daily, to be given as a single dose or in divided doses
- Child 5–8 years: 90–120 mg daily, to be given as a single dose or in divided doses
- Child 9–11 years: 120–150 mg daily, to be given as a single dose or in divided doses
- Child 12–15 years: 150–180 mg daily, to be given as a single dose or in divided doses
- Child 16–17 years: 180–300 mg daily, to be given as a single dose or in divided doses

• **UNLICENSED USE** Not licensed.

• **CAUTIONS** Monitor vitamin A intake

CAUTIONS, FURTHER INFORMATION Protection not total—avoid strong sunlight and use sunscreen preparations; generally 2–6 weeks of treatment (resulting in yellow coloration of palms and soles) necessary before increasing exposure to sunlight; dose should be adjusted according to level of exposure to sunlight.

• SIDE-EFFECTS

- **Rare or very rare** Arthralgia · skin reactions
- **Frequency not known** Diarrhoea
- **PREGNANCY** Partially converted to vitamin A, but does not give rise to abnormally high serum concentration; manufacturer advises use only if potential benefit outweighs risk.

• **BREAST FEEDING** Use with caution—present in milk.

• **HEPATIC IMPAIRMENT** Avoid.

• **RENAL IMPAIRMENT** Use with caution.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule

11 Superficial soft-tissue injuries and superficial thrombophlebitis

Topical circulatory preparations

Overview

These preparations are used to improve circulation in conditions such as bruising and superficial thrombophlebitis but are of little value. First aid measures such as rest, ice,

compression, and elevation should be used. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

HEPARINOIDS

Heparinoid

• INDICATIONS AND DOSE

Superficial thrombophlebitis | Bruising | Haematoma

► TO THE SKIN

- Child 5–17 years: Apply up to 4 times a day

• **CONTRA-INDICATIONS** Should not be used on large areas of skin, broken or sensitive skin, or mucous membranes

• **LESS SUITABLE FOR PRESCRIBING** Hirudoid® is less suitable for prescribing.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

► **Hirudoid** (Thornton & Ross Ltd)

Heparinoid 3 mg per 1 gram Hirudoid 0.3% cream | 50 gram [P] £3.99 DT = £3.99

Gel

EXCIPIENTS: May contain Fragrances, propylene glycol

► **Hirudoid** (Thornton & Ross Ltd)

Heparinoid 3 mg per 1 gram Hirudoid 0.3% gel | 50 gram [P] £3.99 DT = £3.99

12 Warts and calluses

Warts and calluses

Overview

Warts (verruca vulgaris) are common, benign, self-limiting, and usually asymptomatic. They are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction and is required only if the warts are painful, unsightly, persistent, or cause distress. In immunocompromised children, warts may be more difficult to eradicate.

Preparations of salicylic acid p. 768, formaldehyde p. 767, glutaraldehyde p. 767 or silver nitrate p. 767 are used for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line in the treatment of warts; it is also suitable for the removal of *corns and calluses*. Preparations of salicylic acid in a colloidion basis are available but some patients may develop an allergy to colophony in the formulation; colloidion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

Anogenital warts

Anogenital warts (condylomata acuminata) in children are often asymptomatic and require only a simple barrier preparation. If treatment is required it should be supervised by a hospital specialist. Persistent warts on genital skin may require treatment with cryotherapy or other forms of physical ablation under general anaesthesia.

Podophyllotoxin p. 767 (the major active ingredient of podophyllum), or imiquimod p. 768 are used to treat external anogenital warts; these preparations can cause considerable irritation of the treated area and are therefore suitable only for children who are able to co-operate with the treatment.

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Podophyllotoxin

● INDICATIONS AND DOSE

CONDYLINE®

Condylomata acuminata affecting the penis or the female external genitalia

▶ TO THE LESION

- ▶ Child 2–17 years (initiated under specialist supervision): Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm² in the male, maximum 50 single applications ('loops') per session (consult product literature)

WARTICON® CREAM

Condylomata acuminata affecting the penis or the female external genitalia

▶ TO THE LESION

- ▶ Child 2–17 years (initiated under specialist supervision): Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm²

WARTICON® LIQUID

Condylomata acuminata affecting the penis or the female external genitalia

▶ TO THE LESION

- ▶ Child 2–17 years (initiated under specialist supervision): Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm², maximum 50 single applications ('loops') per session (consult product literature)

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Avoid normal skin · avoid open wounds · keep away from face · very irritant to eyes
- **SIDE-EFFECTS** Balanoposthitis · skin irritation
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

● INDICATIONS AND DOSE

ALDARA®

Warts (external genital and perianal)

► TO THE LESION

- Child (initiated under specialist supervision): Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night

● UNLICENSED USE

ALDARA® Not licensed for use in children.

- **CAUTIONS** Autoimmune disease · avoid broken skin · avoid normal skin · avoid open wounds · immunosuppressed patients · not suitable for internal genital warts · uncircumcised males (risk of phimosis or stricture of foreskin)
- **SIDE-EFFECTS**
 - Common or very common Appetite decreased · arthralgia · asthenia · headaches · increased risk of infection · lymphadenopathy · myalgia · nausea · pain
 - Uncommon Anorectal disorder · chills · conjunctival irritation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysuria · erectile dysfunction · eyelid oedema · face oedema · fever · flushing · gastrointestinal discomfort · genital pain · hyperhidrosis · inflammation · influenza like illness · insomnia · irritability · laryngeal pain · malaise · nasal congestion · painful sexual intercourse · paraesthesia

- penis disorder · skin reactions · skin ulcer · tinnitus · uterovaginal prolapse · vomiting · vulvovaginal disorders
- Rare or very rare Autoimmune disorder exacerbated
- Frequency not known Alopecia · cutaneous lupus erythematosus · severe cutaneous adverse reactions (SCARs)

● **CONCEPTION AND CONTRACEPTION** May damage latex condoms and diaphragms.

● **PREGNANCY** No evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution.

● **BREAST FEEDING** No information available.

● DIRECTIONS FOR ADMINISTRATION

ALDARA® ► **Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

● **PATIENT AND CARER ADVICE** A patient information leaflet should be provided.

● MEDICINAL FORMS

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Immunoglobulins

04-Oct-2017

Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 773 and **disease-specific immunoglobulins**.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult www.ivig.nhs.uk and *Clinical Guidelines for Immunoglobulin Use*, www.gov.uk/dh.

Further information on the use of immunoglobulins is included in Public Health England's *Immunoglobulin Handbook*, www.gov.uk/phe, and in the Department of Health's publication, *Immunisation against Infectious Disease*, www.gov.uk/dh.

Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 775 which is available from BPL,

hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 775 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 773 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the *Scottish National Blood Transfusion Service* (SNBTS).

In Wales all immunoglobulins are available from the *Welsh Blood Service* (WBS).

In Northern Ireland all immunoglobulins are available from the *Northern Ireland Blood Transfusion Service* (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin ('HNIG') is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin (containing 10–18% protein) is administered by *intramuscular injection* for the protection of susceptible contacts against **hepatitis A virus** (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting for several weeks.

Normal immunoglobulin (containing 3–12% protein) for *intravenous administration* is used as *replacement therapy* for children with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

The dose of normal immunoglobulin used as replacement therapy in patients with immunodeficiencies is **not the same** as the dose required for treatment of acute conditions. For Kawasaki disease a single dose by intravenous infusion should be given with concomitant aspirin p. 91 within 10 days of onset of symptoms (but children with a delayed diagnosis may also benefit).

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for other conditions, consult *Clinical Guidelines for Immunoglobulin Use* (www.gov.uk/dh).

Hepatitis A

Hepatitis A vaccine p. 795 is recommended for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and

New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for prophylaxis in travellers.

Public Health England recommends the use of normal immunoglobulin in addition to hepatitis A vaccine for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease (including chronic hepatitis B or C infection), or HIV infection (with a CD4 count < 200 cells per microlitre), or who are immunosuppressed; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts with chronic liver disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

Measles

Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Children with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 799 for prophylaxis following exposure to measles.

Rubella

Intramuscular immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin p. 773 should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 799.

Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see *Immunoglobulin Handbook* (www.gov.uk/phe).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as postexposure prophylaxis.

Hepatitis B immunoglobulin

Disease-specific hepatitis B immunoglobulin ('HBIG') p. 773 is available for use in association with hepatitis B vaccine

p. 796 for the prevention of infection in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see hepatitis B vaccine). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

Rabies immunoglobulin

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin p. 775 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine p. 800 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

Tetanus immunoglobulin

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 775 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 333 and wound cleansing, should also be used for the treatment of established cases of tetanus.

Varicella-zoster immunoglobulin

Varicella-zoster immunoglobulin (VZIG) p. 775 is recommended for individuals who are at increased risk of severe varicella (neonates, pregnant women, and immunosuppressed individuals with varicella-zoster virus immunoglobulin G antibody less than 150 mIU/mL) and who have no antibodies to varicella-zoster virus and who have significant exposure to chickenpox (varicella) or shingles (herpes zoster) during the infectious period.

Immunosuppressed children receiving regular intravenous immunoglobulin replacement therapy only require varicella-zoster immunoglobulin if the most recent dose was administered more than 3 weeks before exposure.

Immunosuppressed children on long term aciclovir p. 404 or valaciclovir p. 406 prophylaxis will require a temporary increase in their dose following exposure; for children within 12 months of a stem cell transplant, varicella-zoster immunoglobulin should also be considered.

Important: for full details consult *Guidance for issuing varicella-zoster immunoglobulin (VZIG) and immunisation against infectious disease* from Public Health England (www.gov.uk).

Anti-D (Rh₀) immunoglobulin

● INDICATIONS AND DOSE

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following birth of rhesus-positive infant

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders

continued →

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks' gestation

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis (alternative NICE recommendation)

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 30 weeks gestation

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following Rh₀(D) incompatible blood transfusion

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders

RHOPHYLAC®

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following birth of rhesus-positive infant

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Females of childbearing potential: 1000–1500 units, dose to be administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed

immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following Rh₀(D) incompatible blood transfusion

► BY INTRAVENOUS INJECTION

- Females of childbearing potential: 50 units per mL of transfused rhesus-positive blood, alternatively 100 units per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders

- **CONTRA-INDICATIONS** Treatment of idiopathic thrombocytopenia purpura in rhesus negative patients · treatment of idiopathic thrombocytopenia purpura in splenectomised patients

- **CAUTIONS** Immunoglobulin A deficiency · possible interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION

- **MMR vaccine** MMR vaccine may be given in the postpartum period with anti-D (Rh₀) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

● **SIDE-EFFECTS**

- **Uncommon** Chills · fever · headache · malaise · skin reactions
- **Rare or very rare** Arthralgia · dyspnoea · hypersensitivity · hypotension · nausea · tachycardia · vomiting
- **Frequency not known** Intravascular haemolysis

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008)** NICE TA156
Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.
www.nice.org.uk/TA156

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **D-Gam** (Bio Products Laboratory Ltd)

Anti-D (RHO) immunoglobulin 500 unit D-Gam Anti-D immunoglobulin 500unit solution for injection vials | 1 vial [PoM] £33.75

Anti-D (RHO) immunoglobulin 1500 unit D-Gam Anti-D immunoglobulin 1,500unit solution for injection vials | 1 vial [PoM] £58.00

► **Rhophylac** (CSL Behring UK Ltd)

Anti-D (RHO) immunoglobulin 750 unit per 1 ml Rhophylac 1,500units/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £46.50

Hepatitis B immunoglobulin

● INDICATIONS AND DOSE

Prophylaxis against hepatitis B infection

► BY INTRAMUSCULAR INJECTION

- Neonate: 200 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.
- Child 1 month–4 years: 200 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure
- Child 5–9 years: 300 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure
- Child 10–17 years: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure

Prevention of transmitted infection at birth

► BY INTRAMUSCULAR INJECTION

- Neonate: 200 units, dose to be administered as soon as possible after birth; for full details consult Immunisation against Infectious Disease (www.dh.gov.uk).

► BY INTRAVENOUS INFUSION

- Neonate: (consult product literature).

Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material

► BY INTRAVENOUS INFUSION

- Child: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)

Prophylaxis against re-infection of transplanted liver

► BY INTRAVENOUS INFUSION

- Child: (consult product literature)

- **CAUTIONS** IgA deficiency · interference with live virus vaccines

● SIDE-EFFECTS

- **Uncommon** Abdominal pain upper · headache
- **Rare or very rare** Cardiac discomfort · fatigue · hypersensitivity · hypertension · hypotension · muscle spasms · nasopharyngitis · oropharyngeal pain · palpitations · skin reactions

- **PRESCRIBING AND DISPENSING INFORMATION** Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Hepatitis B immunoglobulin (Non-proprietary)**

Hepatitis B immunoglobulin human 200 unit Hepatitis B immunoglobulin human 200unit solution for injection vials | 1 vial [PoM] £150.00

Hepatitis B immunoglobulin human 500 unit Hepatitis B immunoglobulin human 500unit solution for injection vials | 1 vial [PoM] £300.00

- **Zutectra** (Biotest (UK) Ltd)

Zutectra 500units/1ml solution for injection pre-filled syringes |

5 syringe [PoM] £1,500.00

Solution for infusion

- **Hepatect CP** (Biotest (UK) Ltd)

Hepatitis B immunoglobulin human 50 unit per 1 ml Hepatect CP 100units/2ml solution for infusion vials | 1 vial [PoM] £55.00

Hepatect CP 2000units/40ml solution for infusion vials | 1 vial [PoM] £1,100.00

Hepatect CP 500units/10ml solution for infusion vials | 1 vial [PoM] £275.00

Hepatect CP 5000units/100ml solution for infusion vials | 1 vial [PoM] £2,750.00

- **Omri-Hep-B** (Imported (Israel))

Hepatitis B immunoglobulin human 50 unit per 1 ml Omri-Hep-B 5000units/100ml solution for infusion vials | 1 vial [PoM] Ⓢ

Normal immunoglobulin

● INDICATIONS AND DOSE

To control outbreaks of hepatitis A

► BY DEEP INTRAMUSCULAR INJECTION

- Child 1 month–9 years: 250 mg
- Child 10–17 years: 500 mg

Rubella in pregnancy, prevention of clinical attack

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 750 mg

Antibody deficiency syndromes

► BY SUBCUTANEOUS INFUSION

- Child: (consult product literature)

Kawasaki disease (with concomitant aspirin)

► BY INTRAVENOUS INFUSION

- Child: 2 g/kg daily for 1 dose, treatment should be given within 10 days of onset of symptom (but children with a delayed diagnosis may also benefit)

SUBGAM[®]

Hepatitis A prophylaxis in outbreaks

► BY INTRAMUSCULAR INJECTION

- Child 1 month–9 years: 500 mg
- Child 10–17 years: 750 mg

● UNLICENSED USE

SUBGAM[®] *Subgam[®]* is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

- **CONTRA-INDICATIONS** Patients with selective IgA deficiency who have known antibody against IgA

PRIVIGEN[®] Hyperprolinaemia (contains -proline)

FLEBOGAMMA[®] DIF Hereditary fructose intolerance (contains sorbitol)

HIZENTRA[®] Hyperprolinaemia (contains -proline)

GAMMAPLEX[®] Hereditary fructose intolerance (contains sorbitol)

● CAUTIONS

GENERAL CAUTIONS Agammaglobulinaemia with or without IgA deficiency · hypogammaglobulinaemia with or without IgA deficiency · interference with live virus vaccines

SPECIFIC CAUTIONS

- With intravenous use Ensure adequate hydration · obesity · renal insufficiency · risk factors for arterial or venous thromboembolic events · thrombophilic disorders

CAUTIONS, FURTHER INFORMATION

- Interference with live virus vaccines Normal immunoglobulin may **interfere with the immune response to live virus**

vaccines which should therefore only be given at **least 3 weeks before or 3 months after** an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

OCTAGAM® Falsely elevated results with blood glucose testing systems (contains maltose)

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Chills · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · headache · hypotension · muscle complaints · nausea · pain · skin reactions
- ▶ **Uncommon** Paraesthesia
- ▶ **Rare or very rare** Arthralgia
- ▶ **Frequency not known** Fever

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With subcutaneous use Drowsiness
- ▶ **Uncommon**
 - ▶ With intramuscular use Feeling hot
- ▶ **Rare or very rare**
 - ▶ With intramuscular use Musculoskeletal stiffness · peripheral coldness · tremor
- ▶ With intravenous use Acute kidney injury · meningitis aseptic
- ▶ **Frequency not known**
 - ▶ With intramuscular use Chest discomfort · dyspnoea · facial swelling · flushing · hyperhidrosis · hypertension · malaise · oral paraesthesia · pallor · tachycardia · vomiting
- ▶ With intravenous use Embolism and thrombosis · haemolytic anaemia · myocardial infarction · stroke

SIDE-EFFECTS, FURTHER INFORMATION Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

- **MONITORING REQUIREMENTS** Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

• DIRECTIONS FOR ADMINISTRATION

Preparations for subcutaneous use May be administered by intramuscular injection if subcutaneous route not possible; intramuscular route **not** for patients with thrombocytopenia or other bleeding disorders.

GAMUNEX® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

KIOVIG® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

- **PRESCRIBING AND DISPENSING INFORMATION** Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are **not interchangeable**; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.

- ▶ With intramuscular use Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

• MEDICINAL FORMS

Rabies immunoglobulin

● INDICATIONS AND DOSE

Post-exposure prophylaxis against rabies infection

- BY LOCAL INFILTRATION, OR BY INTRAMUSCULAR INJECTION
- **Child:** 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

- **CAUTIONS** IgA deficiency · interference with live virus vaccines

● SIDE-EFFECTS

- **Rare or very rare** Arthralgia · chills · fatigue · fever · headache · hypersensitivity · hypotension · influenza like illness · malaise · nausea · skin reactions · tachycardia · vomiting

- **PRESCRIBING AND DISPENSING INFORMATION** The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose.

Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Rabies immunoglobulin (Non-proprietary)**

Rabies immunoglobulin human 500 unit Rabies immunoglobulin human 500unit solution for injection vials | 1 vial [PoM] £600.00

- **CAUTIONS** IgA deficiency · interference with live virus vaccines

● SIDE-EFFECTS

- **Rare or very rare** Anaphylactic reaction · hypotension
- **Frequency not known** Arthralgia · chest pain · dizziness · dyspnoea · face oedema · oral disorders · tremor

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● MEDICINAL FORMS

Solution for injection

► **Tetanus immunoglobulin (Non-proprietary)**

Tetanus immunoglobulin human 250 unit Tetanus immunoglobulin human 250unit solution for injection vials | 1 vial [PoM] £125.00

Varicella-zoster immunoglobulin

(Antivaricella-zoster Immunoglobulin)

● INDICATIONS AND DOSE

Prophylaxis against varicella infection

- BY DEEP INTRAMUSCULAR INJECTION

- **Neonate:** 250 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.

- **Child 1 month–5 years:** 250 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease
- **Child 6–10 years:** 500 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease
- **Child 11–14 years:** 750 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease
- **Child 15–17 years:** 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease

- **CAUTIONS** IgA deficiency · interference with live virus vaccines

- **SIDE-EFFECTS** Arthralgia · chills · fever · headache · hypersensitivity · hypotension · malaise · nausea · skin reactions · tachycardia · vomiting

- **DIRECTIONS FOR ADMINISTRATION** Normal immunoglobulin for intravenous use may be used in those unable to receive intramuscular injections.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from selected Public Health England and NHS laboratories (also from BPL).

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions

Tetanus immunoglobulin

● INDICATIONS AND DOSE

Post-exposure prophylaxis

- BY INTRAMUSCULAR INJECTION

- **Child:** Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns

Treatment of tetanus infection

- BY INTRAMUSCULAR INJECTION

- **Child:** 150 units/kg, dose may be given over multiple sites

recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Varicella-Zoster** (Bio Products Laboratory Ltd)

Varicella-Zoster immunoglobulin human 250 mg Varicella-Zoster immunoglobulin human 250mg solution for injection vials | 1 vial [PoM] £450.00

2 Post-exposure prophylaxis

IMMUNE SERA AND IMMUNOGLOBULINS > ANTITOXINS

Botulism antitoxin

- **DRUG ACTION** A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

● INDICATIONS AND DOSE

Post exposure prophylaxis of botulism

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: (consult product literature)

- **SIDE-EFFECTS** Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

- **PRE-TREATMENT SCREENING** All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).
- **PRESCRIBING AND DISPENSING INFORMATION** Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank.

The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

● MEDICINAL FORMS

No licensed medicines listed.

Diphtheria antitoxin

(Dip/Ser)

● INDICATIONS AND DOSE

Passive immunisation in suspected cases of diphtheria

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Dose should be given without waiting for bacteriological confirmation (consult product literature)

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- ▶ **Hypersensitivity** Hypersensitivity is common after administration; resuscitation facilities should be available.

Diphtheria antitoxin is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis and vaccine.

● SIDE-EFFECTS

- ▶ **Common or very common** Hypersensitivity

- **PRE-TREATMENT SCREENING** Diphtheria antitoxin is derived from horse serum and reactions are common; tests for hypersensitivity should be carried out before use.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Diphtheria antitoxin (Non-proprietary)**

Diphtheria antitoxin 1000 unit per 1 ml Antidiphtheria serum 10,000units/10ml solution for injection ampoules | 1 ampoule [PoM] £

3 Tuberculosis diagnostic test

DIAGNOSTIC AGENTS

Tuberculin purified protein derivative (Tuberculin PPD)

● INDICATIONS AND DOSE

Mantoux test

- ▶ BY INTRADERMAL INJECTION
- ▶ Child: 2 units for one dose

Mantoux test (if first test is negative and a further test is considered appropriate)

- ▶ BY INTRADERMAL INJECTION
- ▶ Child: 10 units for 1 dose

DOSE EQUIVALENCE AND CONVERSION

- ▶ 2 units is equivalent to 0.1 mL of 20 units/mL strength.
- ▶ 10 units is equivalent to 0.1 mL of 100 units/mL strength.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- ▶ **Mantoux test** Response to tuberculin may be suppressed by viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment and the MMR vaccine. If a tuberculin skin test has already been initiated, then the MMR should be delayed until the skin test has been read unless protection against measles is required urgently. If a child has had a recent MMR, and requires a tuberculin test, then a 4 week interval should be observed. Apart from tuberculin and MMR, all other live vaccines can be administered at any time before or after tuberculin.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from ImmForm (SSI brand).

The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Tuberculin purified protein derivative (Non-proprietary)

Tuberculin purified protein derivative 20 tuberculin unit per 1 ml Tuberculin PPD RT 23 SSi 20 tuberculin units/ml solution for injection 1.5ml vials | 1 vial 

Tuberculin purified protein derivative 100 tuberculin unit per 1 ml Tuberculin PPD RT 23 SSi 100 tuberculin units/ml solution for injection 1.5ml vials | 1 vial 

4 Vaccination

Vaccines

16-Aug-2017

Active immunity

Active immunity can be acquired by natural disease or by vaccination. **Vaccines** stimulate production of antibodies and other components of the immune mechanism; they consist of either:

- a *live attenuated* form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- *inactivated* preparations of the virus (e.g. influenza vaccine) or bacteria, or
- *detoxified exotoxins* produced by a micro-organism (e.g. tetanus vaccine), or
- *extracts* of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Chapters from the handbook (including updates since 2013) are available at www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book.

The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Children with unknown or incomplete immunisation history

For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administered where the routine childhood immunisation schedule has not been completed.

For advice on the immunisation of children coming to the UK, consult the handbook *Immunisation against Infectious Disease* (2006) (available at www.dh.gov.uk).

Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from **local health organisations** or from **ImmForm** (www.immform.dh.gov.uk)—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

For the most up to date immunisation schedule consult 'The complete routine immunisation schedule', available at www.gov.uk.

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks postmenstrual age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48–72 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks' gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* type b, meningococcal C, and hepatitis B after primary immunisation.

Vaccines and HIV infection

HIV-positive children with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; use of normal immunoglobulin should be considered after exposure to measles and varicella-zoster immunoglobulin considered after exposure to chickenpox or herpes zoster), rotavirus;

and the following inactivated vaccines:

- anthrax, cholera (oral), diphtheria, *haemophilus influenzae* type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis (inactivated poliomyelitis vaccine is now used instead of oral poliomyelitis vaccine for routine immunisation of children), rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive children should **not** receive:

- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought).

The above advice differs from that for other immunocompromised patients; *Immunisation of HIV infected Children* issued by *Children's HIV Association* (CHIVA) are available at www.chiva.org.uk.

Vaccines and asplenia

The following vaccines are recommended for asplenic patients, those with splenic dysfunction or complement disorders, depending on the age at which their condition is diagnosed:

- *Haemophilus influenzae* type b with meningococcal group C vaccine p. 791;
- Influenza vaccine p. 798;
- Meningococcal groups A with C and W135 and Y vaccine p. 792 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 792;
- pneumococcal polysaccharide vaccine.

Children first diagnosed under 1 year of age should be vaccinated according to the Immunisation Schedule. Additionally, one dose of meningococcal groups A with C and W135 and Y vaccine should be given during infancy followed by a second dose at least one month apart. Two months following the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of *haemophilus influenzae* type b with meningococcal group C vaccine and

Routine immunisation schedule

2–8 years (including children in school years 1, 2, 3 and 4)	<ul style="list-style-type: none"> ▶ Influenza vaccine p. 798 Each year from September. Note: Flu nasal spray is recommended (<i>Fluenz Tetra</i>[®]). If contra-indicated and child is in clinical risk group, use inactivated flu vaccine
Between 3 years and 4 months, and 5 years	<ul style="list-style-type: none"> ▶ Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 789 Single booster dose. Note: Preferably allow interval of at least 3 years after completing primary course ▶ Measles, mumps and rubella vaccine, live p. 799 Second dose
11–14 years (females only). First dose of HPV vaccine will be offered to females aged 12–13 years of age in England, Wales, and Northern Ireland, and 11–13 years of age in Scotland.	<ul style="list-style-type: none"> ▶ Human papillomavirus vaccines p. 797 Two doses; second dose 6–24 months after first dose. If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed (2 doses less than 6 months apart does not provide long-term protection). The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, since 2012, only <i>Gardasil</i>[®] is offered as part of the national immunisation programme; for those females who started the schedule with <i>Cervarix</i>[®] under the national immunisation programme, but did not complete the vaccination course, the course can be completed with <i>Gardasil</i>[®].
13–15 years	<ul style="list-style-type: none"> ▶ Meningococcal groups A with C and W135 and Y vaccine p. 792 Single booster dose
13–18 years	<ul style="list-style-type: none"> ▶ Diphtheria with poliomyelitis and tetanus vaccine p. 790 Single booster dose. Note: Can be given at the same time as the booster dose of meningococcal group A with C and W135 and Y vaccine at 13–15 years of age
During adult life, women of child-bearing age susceptible to rubella	<ul style="list-style-type: none"> ▶ Measles, mumps and rubella vaccine, live p. 799 Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation.
Pregnant females	<ul style="list-style-type: none"> ▶ Acellular pertussis-containing vaccine administered as diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 789 (<i>Boostrix-IPV</i>[®]) 1 dose from the 16th week of pregnancy, preferably after the fetal anomaly scan (weeks 18–20) ▶ Influenza vaccine (inactivated) p. 798, Single dose administered from September, regardless of the stage of pregnancy

23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually in children aged 6 months or older.

Children first diagnosed between 1 and 2 years of age should be vaccinated according to the Immunisation Schedule, including the 12 month boosters. Two months after the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type b with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually.

Children first diagnosed over 2 years of age should be vaccinated according to the Immunisation schedule, including the 12 month boosters. The child should receive one additional booster dose of haemophilus influenzae type b with meningococcal group C vaccine along with the 23-valent pneumococcal polysaccharide vaccine, followed by one dose of meningococcal groups A with C and W135 and Y vaccine after 2 months. The influenza vaccine should be administered annually.

Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which

protection is sought (see under Immunoglobulins). The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed *immunoglobulins*. The term *antisera* is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced whenever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins, but reports of such reactions are very rare.

Vaccines and antisera availability

Anthrax vaccine and yellow fever vaccine, live p. 802, botulism antitoxin p. 776, diphtheria antitoxin p. 776, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning. Enquiries for vaccines not available commercially can also be made to:

Vaccines and Countermeasures Response Department
Public Health England
Wellington House
133–155 Waterloo Road
London
SE1 8UG
vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

Welsh Medicines Information Centre
University Hospital of Wales
Cardiff
CF14 4XW
(029) 2074 2979

In Northern Ireland:

Pharmacy and Medicines Management Centre
Northern Health and Social Care Trust
Beech House
Antrim Hospital Site
Bush Road
Antrim
BT41 2RL
rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

Anthrax vaccine

Anthrax vaccine is rarely required for children.

BCG vaccine

BCG (Bacillus Calmette–Guérin vaccine p. 790) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of hypersensitivity to *M. tuberculosis*. Bacillus Calmette–Guérin vaccine should be given intradermally by operators skilled in the technique.

The expected reaction to successful Bacillus Calmette–Guérin vaccine is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

All children of 6 years and over being considered for Bacillus Calmette–Guérin vaccine must first be given a skin test for hypersensitivity to tuberculin (see under Diagnostic agents). A skin test is not necessary for a child under 6 years, provided that the child has not stayed for

longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000 (a list of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.gov.uk/phe), the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

Bacillus Calmette–Guérin vaccine is recommended for the following groups of children if BCG immunisation has not previously been carried out and they are negative for tuberculin hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–18 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts of those with active respiratory tuberculosis;
- children under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000.

Bacillus Calmette–Guérin vaccine can be given simultaneously with another live vaccine, but if they are not given at the same time, an interval of 4 weeks should normally be allowed between them. When Bacillus Calmette–Guérin vaccine is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

For advice on chemoprophylaxis against tuberculosis; for treatment of infection following vaccination, seek expert advice.

Tuberculosis Diagnostic Agents

The *Mantoux* test is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at www.dh.gov.uk/immunisation.

In the Mantoux test, the diagnostic dose is administered by intradermal injection of Tuberculin Purified Protein Derivative (PPD).

The *Heaf* test (involving the use of multiple-puncture apparatus) is no longer available.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: *QuantiFERON® TB Gold* and *T-SPOT® TB*. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see www.gov.uk/phe.

Botulism antitoxin

A polyvalent botulism antitoxin p. 776 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g.

asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

Cholera vaccine

Cholera vaccine (oral) p. 791 contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is **essential**.

Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.

Diphtheria vaccine

Diphtheria vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 790 (*Infanrix hexa*[®]) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of **adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine**.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive **either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria** [low dose], **tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine**. Individuals aged over 10 years should receive **adsorbed diphtheria** [low dose], **tetanus, and poliomyelitis (inactivated) vaccine**.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed). For children who have been vaccinated following a tetanus-prone wound, see tetanus vaccines.

Travel

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of **adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine** should be administered.

Contacts

Advice on the management of cases of diphtheria, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected children and their contacts should be determined: those who

have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. Also see advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune child.

Haemophilus influenzae type b conjugate vaccine

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. *Haemophilus influenzae type b vaccine* immunisation is given in combination with diphtheria, tetanus, pertussis, hepatitis B and poliomyelitis vaccine (*Infanrix hexa*[®]), as a component of the primary course of childhood immunisation (see Immunisation schedule). For infants under 1 year, the course consists of 3 doses of a vaccine containing *Haemophilus influenzae type b* component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae type b* need to receive only 1 dose of *Haemophilus influenzae type b* vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, children born before August 2017 should be given 3 doses of the combined vaccine they were started on. The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae type b* disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

Invasive Haemophilus influenzae type b disease

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

Also see use of rifampicin p. 364 in the prevention of secondary cases of *Haemophilus influenzae type b* disease.

Hepatitis A vaccine

Hepatitis A vaccine p. 795 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:

- residents of homes for those with severe learning difficulties;
- children with haemophilia or other conditions treated with plasma-derived clotting factors;
- children with severe liver disease;
- children travelling to high-risk areas;
- adolescents who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- children with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure

to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose of hepatitis A vaccine is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

In children under 16 years, a single dose of the combined vaccine *Ambirix*® can be used to provide rapid protection against hepatitis A. Public Health England recommends the use of intramuscular normal immunoglobulin p. 773 in addition to hepatitis A vaccine for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed. For further guidance, see Immunoglobulins p. 770.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

Hepatitis B vaccine

Hepatitis B vaccine p. 796 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto an adjuvant. It is made biosynthetically using recombinant DNA technology.

From August 2017, vaccination against hepatitis B is recommended as part of the **routine immunisation schedule**. Primary immunisation (see *Routine immunisation schedule*) requires 3 doses, given at intervals of 1 month from the age of 2 months, to be given as part of the combined diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 790 (*Infanrix hexa*®).

As part of the **selective neonatal immunisation programme**, hepatitis B is recommended for neonates whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers). Hepatitis B vaccination is started immediately after birth with a dose of the monovalent hepatitis B vaccine (no later than 24 hours after delivery), followed by a second dose at 4 weeks; the routine immunisation combination vaccine (*Infanrix hexa*®) at weeks 8, 12 and 16; and a further dose of the monovalent hepatitis B vaccine at one year of age.

Neonates born to highly infectious mothers should also receive hepatitis B immunoglobulin p. 773 at the same time as the first dose of monovalent hepatitis B vaccine, but administered at a different site—more detailed guidance is given in the handbook *Immunisation against Infectious Disease* www.gov.uk/government/publications/hepatitis-b-the-green-book-chapter-18.

Following **significant exposure to hepatitis B** (e.g. through needle-stick injury or unprotected sex) and for **pre-exposure prophylaxis in high-risk groups**, 'an accelerated schedule' using the single, monovalent hepatitis B vaccine is recommended immediately, with the second dose given 1 month after the initial dose, and the third dose given 2 months after the initial dose. For those at continued high risk following exposure, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook *Immunisation against Infectious Disease*.

Specific hepatitis B immunoglobulin can also be indicated for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection. If hepatitis B

immunoglobulin is indicated, it should be given as soon as possible, ideally at the same time or within 24 hours of the first dose of vaccine, but not after seven days have elapsed since exposure. See also *hepatitis B immunoglobulin* in Immunoglobulins p. 770.

In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to 'progress' to injecting;
- adolescents who are at risk from their sexual behaviour;
- close family contacts of an individual with chronic hepatitis B infection;
- children with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- children with chronic renal failure including those on haemodialysis. Children receiving haemodialysis should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- children with chronic liver disease
- patients of day-care or residential accommodation for those with severe learning difficulties;
- children in custodial institutions;
- children travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Following a primary course of immunisation, most children do not require a reinforcing dose of a hepatitis B-containing vaccine. A single booster dose should be offered to healthcare workers around five years after primary immunisation, to patients on renal dialysis with anti-HBs levels below 10mIU/mL, and at the time of a subsequent significant exposure.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses* (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

A combined hepatitis A and B vaccine p. 794 is also available.

Human papillomavirus vaccine

Human papillomavirus vaccine is available as a bivalent vaccine (*Cervarix*®) or a quadrivalent vaccine (*Gardasil*®). Since 2012, only *Gardasil*® is offered as part of the national immunisation programme. *Cervarix*® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. *Gardasil*® is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the

first—see Immunisation schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

Females aged 15 years or older require a 3-dose schedule (see *Cervarix*[®] and *Gardasil*[®]), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

If a 3-dose course of vaccination had been started before September 2014 in a female aged under 15 years, then where possible this should be completed; the interrupted course should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Under the national programme in England, females remain eligible to receive the vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

Influenza vaccine

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 798 in use contain the H and N components of the prevalent strain or strains recommended each year by the World Health Organization.

The inactivated influenza vaccine is recommended for children aged 6 months–2 years in an at risk group (see below), those aged 18 years and over, in pregnancy and in children with a contra-indication to the live influenza vaccine.

Unless contra-indicated, the live influenza vaccine, administered as a nasal spray (*Fluenz Tetra*[®]), is preferred in children aged 2–17 years because it provides a higher level of protection than the inactivated influenza vaccine.

Immunisation is recommended for persons at high risk, and to reduce transmission of infection. Annual immunisation is strongly recommended for children (including infants that were preterm or low birth-weight) aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease at stage 3, 4 or 5;
- chronic neurological disease;
- complement disorders;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: *child under 20 kg*, 1 mg/kg or more daily; *child over 20 kg*, 20 mg or more daily] and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine is also recommended for all pregnant women, for children living in long-stay facilities, and for carers of children whose welfare may be at risk if the

carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

In the 2017/2018 national influenza immunisation programme, seasonal influenza vaccine will also be offered to all children who were aged 2–8 years on 31 August 2017 (including those in school years 1, 2, 3 and 4), and all primary school-aged children in former primary school pilot areas.

Further information on pandemic influenza, avian influenza, and swine influenza may be found at www.dh.gov.uk/pandemicflu and at www.gov.uk/phe.

Japanese encephalitis vaccine

Japanese encephalitis vaccine p. 799 is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathnac.org).

Management of Measles, Mumps and Rubella

Measles vaccine has been replaced by a combined measles, mumps and rubella vaccine, live (MMR vaccine) p. 799.

A combined measles, mumps and rubella vaccine, live (MMR vaccine) aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live p. 799 by entry to primary school, unless there is a valid contra-indication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose.

Measles, mumps and rubella vaccine, live should be used to protect against rubella in *seronegative women of child-bearing age* (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously *unimmunised and seronegative post-partum women* (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts

Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children

immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin p. 773 after exposure to measles; routine MMR immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children with impaired immune response should not receive live vaccines (for advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

Travel

Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

Meningococcal vaccine

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C.

Meningococcal group C conjugate vaccine protects only against infection by serogroup C and **meningococcal group B vaccine** protects only against infection by serogroup B. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetavalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the **meningococcal groups A, C, W135, and Y conjugate vaccine** is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

A meningococcal group B vaccine (rDNA, component, adsorbed) p. 792, *Bexsero*®, is licensed in the UK against infection caused by *Neisseria meningitidis* serogroup B and is recommended in the Immunisation Schedule. *Bexsero*® contains 3 recombinant *Neisseria meningitidis* serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against *Neisseria meningitidis* serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

Childhood immunisation

Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 12 months of age (as the haemophilus influenzae type b with meningococcal group C vaccine p. 791) and a second dose

given at 13–15 years of age (as the meningococcal groups A with C and W135 and Y vaccine p. 792) (see Immunisation Schedule).

Meningococcal group B vaccine provides protection against infection by serogroup B of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see *Immunisation Schedule* above).

Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B vaccine (rDNA, component, adsorbed) followed by a second dose two months later. They should then be vaccinated according to the Immunisation Schedule (ensuring at least a two month interval between doses of meningococcal group B vaccines). Unimmunised children aged 12–23 months should be given 2 doses of meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months if they have received less than 2 doses in the first year of life. Unimmunised children aged 2–9 years should be given a single dose of meningococcal group C vaccine (as the haemophilus influenzae type b with meningococcal group C vaccine), followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age.

From 2015, unimmunised individuals aged 10–25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine; a booster dose is not required.

Children with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel

Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetavalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathna.org).

Proof of vaccination with the tetavalent (meningococcal groups A, C, W135, and Y) vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts

For advice on the immunisation of *laboratory workers and close contacts* of cases of meningococcal disease in the UK and on the role of the vaccine in the control of *local outbreaks*, consult Guidelines for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

Pertussis vaccine

Pertussis vaccine is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough)

requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with a combination vaccine of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 790 (*Infanrix hexa*®).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed.

Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

Vaccination of pregnant women against pertussis

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred, through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis [acellular, component] and poliomyelitis [inactivated] vaccine; *Boostrix-IPV*®) between 16 and 32 weeks of pregnancy. Public Health England has advised (2016) that the vaccine is probably best offered on or after the fetal anomaly scan at around 18–20 weeks. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 16–32 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

Contacts

Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

Side-effects

Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

Pneumococcal vaccine

The pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 793 and the pneumococcal polysaccharide vaccine p. 793 protect against infection with *Streptococcus pneumoniae* (pneumococcus). Both vaccines contain

polysaccharide from capsular pneumococci. The pneumococcal polysaccharide vaccine contains purified polysaccharide from **23 capsular types** of pneumococci, whereas the pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide from either **10 capsular types** (*Synflorix*®) or **13 capsular types** (*Prevenar 13*®), with the polysaccharide being conjugated to protein.

Prevenar 13®, is the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) used for childhood immunisation. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see *Immunisation Schedule*).

The 23-valent pneumococcal polysaccharide vaccine is recommended for children aged 2 years or over at increased risk of pneumococcal infection as follows:

- child under 5 years with a history of invasive pneumococcal disease;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological conditions;
- complement disorders;
- diabetes mellitus;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: *child under 20 kg*, 1 mg/kg or more daily; *child over 20 kg*, 20 mg or more daily);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid could occur.

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, chemotherapy, or radiotherapy; children and carers should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Prophylactic antibacterial therapy against pneumococcal infection should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Government, Health Protection Division (Tel (0131) 244 2879).

Choice of vaccine

Children under 2 years of age, at increased risk of pneumococcal infection (see list above), should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 793 at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine p. 793 after their second birthday. Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide

vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

Revaccination

In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

Poliomyelitis vaccine

Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccines (for injection) and live (oral) poliomyelitis vaccines. **Inactivated** poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation; it is given by injection and contains inactivated strains of human poliovirus types 1, 2 and 3.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised children; no child should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses should be given every 10 years only to individuals at special risk.

Live (oral) poliomyelitis vaccines is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must **not** be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Travel

Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine**. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre, (www.nathnac.org).

Rabies vaccine

Rabies vaccine p. 800 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and postexposure prophylaxis.

Pre-exposure prophylaxis

Immunisation should be offered to children at high risk of exposure to rabies—where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than

1 month, and for those on shorter visits who may be exposed to unusual risk. Transmission of rabies by humans has not been recorded but it is advised that those caring for children with the disease should be vaccinated.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk.

Post-exposure management

Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual's immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England's Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997/(028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a child has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of *fully immunised* individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin p. 775 is not necessary in such cases.

Post-exposure treatment for *unimmunised individuals* (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine p. 800 given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine. The immunisation course can be discontinued if it is proved that the child was not at risk.

Rotavirus vaccine

Rotavirus vaccine p. 801 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be

completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with *immunosuppressed* close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

Smallpox vaccine

Limited supplies of **smallpox vaccine** are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, *Guidelines for smallpox response and management in the post-eradication era* should be consulted at www.gov.uk/phe.

Tetanus vaccine

Tetanus vaccine contains a cell-free purified toxin of *Clostridium tetani* adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** are given with an interval of 1 month between doses.

When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

Wounds

Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For *clean wounds*: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up

to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need)

- For *tetanus-prone wounds*: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

Tick-borne encephalitis vaccine

Tick-borne encephalitis vaccine, inactivated p. 801 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

Typhoid vaccine

Typhoid vaccine p. 794 is available as Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and as live attenuated *Salmonella typhi* vaccine for oral use. Typhoid immunisation is advised for children travelling to:

- areas where typhoid is endemic, especially if staying with or visiting local people;
- endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely;

Typhoid vaccination is not a substitute for scrupulous personal hygiene.

Capsular **polysaccharide typhoid vaccine** is usually given by *intramuscular* injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

Oral typhoid vaccine p. 794 is a **live attenuated** vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to *Salmonella typhi*, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

Varicella-zoster vaccine

Varicella-zoster vaccine (live) p. 801 is licensed for immunisation against varicella (chickenpox) in seronegative individuals. It is not recommended for routine use in children but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections.

Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant females;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Varicella-zoster immunoglobulin p. 775 is used to protect susceptible children at increased risk of severe varicella infection (see Immunoglobulins p. 770).

Yellow fever vaccine

Live yellow fever vaccine, live p. 802 is indicated for those travelling to or living in areas where infection is endemic. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Very rarely vaccine-associated adverse effects have been reported, such as viscerotropic disease (yellow fever vaccine, live-associated viscerotropic disease, YEL–AVD), a syndrome which may include metabolic acidosis, muscle and liver cytotoxicity, and multi-organ failure. Neurological disorders (yellow fever vaccine, live-associated neurotropic disease, YEL–AND) such as encephalitis have also been reported. These *very rare* adverse effects have usually occurred after the first dose of yellow fever vaccine, live in those with no previous immunity.

Vaccines for travel

Immunisation for travel

See advice on Malaria, treatment p. 386.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of **poliomyelitis** or **tuberculosis** should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available from www.gov.uk/phe); it should preferably be given 3 months or more before departure.

Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, *Health Information for Overseas Travel*, www.dh.gov.uk).

Immunisation against **meningococcal meningitis** is recommended for a number of areas of the world.

Protection against **hepatitis A** is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is recommended and it is likely to be

effective even if given shortly before departure; Public Health England recommends travellers can be vaccinated with hepatitis A vaccine up to the day of travel, and no longer recommends the use of normal immunoglobulin for travel prophylaxis. Special care must also be taken with food hygiene.

Hepatitis B vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against **rabies** is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a **tetanus** booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.

There is no requirement for cholera vaccination as a condition for entry into any country, but **oral cholera vaccine** should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on **diphtheria**, on **Japanese encephalitis**, and on **tick-borne encephalitis** is included in *Health Information for Overseas Travel*.

Food hygiene

In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers' diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Information on health advice for travellers

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathnac.org.

The handbook, *Health Information for Overseas Travel* (2010), which draws together essential information for *healthcare professionals* regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

National Travel Health Network and Centre

UCLH NHS Foundation Trust

3rd Floor Central,

250 Euston Road,

VACCINES

Vaccines

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED NOVEMBER 2017)

Following reports of death in neonates who received a live attenuated vaccine after exposure to a tumor necrosis factor alpha (TNF- α) inhibitor in utero, the MHRA has issued the following advice:

- any infant who has been exposed to immunosuppressive treatment from the mother either in utero during pregnancy or via breastfeeding should have any live attenuated vaccination deferred for as long as a postnatal influence on the immune status of the infant remains possible;
- in the case of infants who have been exposed to TNF- α inhibitors and other immunosuppressive biological medicines in utero, PHE advise that any live attenuated vaccination (e.g. BCG vaccine) should be deferred until the infant is age 6 months;
- PHE advise if there is any doubt as to whether an infant due to receive a live attenuated vaccine may be immunosuppressed due to the mother's therapy, including exposure through breast-feeding, specialist advice should be sought.

• CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Impaired immune response Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

• CAUTIONS Acute illness - minor illnesses

CAUTIONS, FURTHER INFORMATION Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.

- ▶ Impaired immune response and drugs affecting immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines.

Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: **adults**, at least 40 mg daily for more than 1 week; **children**, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose

systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

The Royal College of Paediatrics and Child Health has produced a statement, *Immunisation of the Immunocompromised Child* (2002) (available at www.rcpch.ac.uk).

- ▶ Predisposition to neurological problems When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is *recommended*; advice on the *management of fever* (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is *recommended*.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

When there is a *still evolving neurological problem*, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

• SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · arthralgia · diarrhoea · dizziness · fatigue · fever · headache · irritability · lymphadenopathy · malaise · myalgia · nausea · skin reactions · vomiting
- ▶ **Uncommon** Hypersensitivity

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines).

- **PREGNANCY** Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids.

- **BREAST FEEDING** Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids.

- **DIRECTIONS FOR ADMINISTRATION** If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart. See also Bacillus Calmette-Guérin vaccine p. 790, and Cautions, further

information in measles, mumps and rubella vaccine, live p. 799.

Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with **bleeding disorders** such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

The Department of Health has advised *against the use of jet guns* for vaccination owing to the risk of transmitting blood borne infections, such as HIV.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

- **HANDLING AND STORAGE** Care must be taken to store all vaccines under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many vaccines need to be stored at 2–8°C and not allowed to freeze. Vaccines should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

VACCINES > BACTERIAL AND VIRAL VACCINES, COMBINED

F 788

Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus

● INDICATIONS AND DOSE

Primary immunisation

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 2 months–9 years: 0.5 mL every month for 3 doses

- **UNLICENSED USE** *Infanrix-IPV* + *Hib*® not licensed for use in children over 36 months; *Pediacel*® not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

● SIDE-EFFECTS

- ▶ **Common or very common** Crying abnormal · drowsiness · restlessness
 - ▶ **Uncommon** Cough · extensive swelling of vaccinated limb · increased risk of infection · rhinorrhoea
 - ▶ **Frequency not known** Anaphylactoid reaction · angioedema · apnoea · hypotonic-hyporesponsiveness episode · seizure
- SIDE-EFFECTS, FURTHER INFORMATION** The incidence of local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis.

Public Health England has advised (2016) that the vaccine should not be withheld from children with a history to a preceding dose of: fever, irrespective of severity; hypotonic-hyporesponsive episodes; persistent crying or screaming for more than 3 hours; severe local reaction, irrespective of extent.

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and suspension for suspension for injection

- ▶ **Infanrix-IPV + Hib** (GlaxoSmithKline UK Ltd)
Infanrix-IPV + Hib vaccine powder and suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection **[PoM]** £27.86

F 788

Diphtheria with pertussis, poliomyelitis vaccine and tetanus

● INDICATIONS AND DOSE

First booster dose

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 3–9 years: 0.5 mL, to be given 3 years after primary immunisation

Vaccination of pregnant women against pertussis (using low dose vaccines)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 0.5 mL for 1 dose

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain
- ▶ **Uncommon** Apathy · asthma · chills · drowsiness · dry throat · extensive swelling of vaccinated limb · oral herpes · pain · paraesthesia · sleep disorder
- ▶ **Frequency not known** Anaphylactoid reaction · angioedema · asthenia · hypotonic-hyporesponsiveness episode · seizure

SIDE-EFFECTS, FURTHER INFORMATION The incidence of local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis.

Public Health England has advised (2016) that the vaccine should not be withheld from children with a history to a preceding dose of: fever, irrespective of severity; hypotonic-hyporesponsive episodes; persistent crying or screaming for more than 3 hours; severe local reaction, irrespective of extent.

- **PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.

- **PRESCRIBING AND DISPENSING INFORMATION** Pregnant women should be vaccinated using low dose vaccines (brands may include *Boostrix-IPV*® or *Repevax*®).

Available as part of childhood immunisation schedule from health organisations or ImmForm.

Available for vaccination of pregnant women from ImmForm.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

- ▶ **Boostrix-IPV** (GlaxoSmithKline UK Ltd)
Boostrix-IPV suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection **[PoM]** £22.74
- ▶ **Repevax** (Sanofi Pasteur)
Repevax vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection **[PoM]** £20.00

F 788

Diphtheria with poliomyelitis and tetanus vaccine

● INDICATIONS AND DOSE

Primary immunisation

- BY INTRAMUSCULAR INJECTION
- Child 10–17 years: 0.5 mL every month for 3 doses

Booster doses

- BY INTRAMUSCULAR INJECTION
- Child 10–17 years: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine

● SIDE-EFFECTS

- **Common or very common** Vertigo
- **Frequency not known** Abdominal pain · asthenia · chills · face oedema · influenza like illness · nerve disorders · pallor · seizure · shock · syncope · vaccination reactions

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

- **Revaxis** (Sanofi Pasteur)
Revaxis vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £7.80 DT = £7.80

F 788

Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine

12-Oct-2017

● INDICATIONS AND DOSE

Primary immunisation (first dose)

- BY DEEP INTRAMUSCULAR INJECTION
- Child 2 months: 0.5 mL for 1 dose

Primary immunisation (second dose)

- BY DEEP INTRAMUSCULAR INJECTION
- Child 3 months: 0.5 mL for 1 dose, preferably administer at a different injection site to that of first dose

Primary immunisation (third dose)

- BY DEEP INTRAMUSCULAR INJECTION
- Child 4 months: 0.5 mL for 1 dose, preferably administer at a different injection site to that of second dose

● SIDE-EFFECTS

- **Common or very common** Anxiety · crying abnormal
- **Uncommon** Cough · drowsiness · extensive swelling of vaccinated limb · increased risk of infection
- **Rare or very rare** Anaphylactoid reaction · angioedema · apnoea · dermatitis · hypotonic-hyporesponsiveness episode · seizure · swelling · thrombocytopenia

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and suspension for suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b

- **Infanrix Hexa** (GlaxoSmithKline UK Ltd)

Infanrix Hexa vaccine powder and suspension for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] [S]

VACCINES > BACTERIAL VACCINES

F 788

Bacillus Calmette-Guérin vaccine (BCG Vaccine)

- **DRUG ACTION** BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of immunity to *M. tuberculosis*.

● INDICATIONS AND DOSE

Immunisation against tuberculosis

- BY INTRADERMAL INJECTION

- **Neonate:** 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**.

- **Child 1–11 months:** 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**

- **Child 1–17 years:** 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**

- **CONTRA-INDICATIONS** Generalised septic skin conditions · neonate in household contact with known or suspected case of active tuberculosis

CONTRA-INDICATIONS, FURTHER INFORMATION

A lesion-free site should be used to administer BCG vaccine to patients with eczema.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION BCG vaccine can be given simultaneously with another live vaccine, but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

- **INTERACTIONS** → Appendix 1: live vaccines

● SIDE-EFFECTS

- **Rare or very rare** Increased risk of infection · osteitis
- **PRE-TREATMENT SCREENING** Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculin (see tuberculin purified protein derivative p. 776). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

● DIRECTIONS FOR ADMINISTRATION

Intradermal injection technique Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen

through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb \equiv 0.1 mL injection, 3 mm bleb \equiv 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from health organisations or direct from ImmForm www.immform.dh.gov.uk (SSI brand, multidose vial with diluent).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- ▶ **Bacillus calmette-guérin vaccine (Non-proprietary)**
Bacillus Calmette-Guérin vaccine powder and solvent for suspension for injection vials | 10 vial [PoM] 

F 788

Cholera vaccine

● INDICATIONS AND DOSE

Immunisation against cholera (for travellers to endemic or epidemic areas on the basis of current recommendations)

- ▶ **BY MOUTH**
- ▶ Child 2–5 years: 1 dose every 1–6 weeks for 3 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
- ▶ Child 6–17 years: 1 dose every 1–6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

Booster

- ▶ **BY MOUTH**
- ▶ Child 2–5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated
- ▶ Child 6–17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated

- **CONTRA-INDICATIONS** Acute gastro-intestinal illness

- **INTERACTIONS** → Appendix 1: cholera vaccine

● SIDE-EFFECTS

- ▶ **Uncommon** Gastrointestinal discomfort · gastrointestinal disorders
- ▶ **Rare or very rare** Chills · cough · dehydration · drowsiness · hyperhidrosis · increased risk of infection · insomnia · pulmonary reaction · syncope · taste altered · throat pain
- ▶ **Frequency not known** Angioedema · asthenia · dyspnoea · hypertension · influenza like illness · lymphadenitis · pain · paraesthesia · sputum increased

- **DIRECTIONS FOR ADMINISTRATION** Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2–5 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

- **PATIENT AND CARER ADVICE** Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be

warned that scrupulous attention to food, water, and personal hygiene is **essential**.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Dukoral** (Valneva UK Ltd)
Dukoral cholera vaccine oral suspension | 2 dose [PoM] £26.35 DT = £26.35

F 788

Haemophilus influenzae type b with meningococcal group C vaccine

● INDICATIONS AND DOSE

Booster dose (for infants who have received primary immunisation with a vaccine containing *Haemophilus influenzae* type b component) and primary immunisation against *Neisseria meningitidis*

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ Child 12–13 months: 0.5 mL for 1 dose

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ Child 1–9 years: 0.5 mL for 1 dose

Booster dose (for children who have not been immunised against *Haemophilus influenzae* type b) | Booster dose after recovery from *Haemophilus influenzae* type b disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ Child 1–9 years: 0.5 mL for 1 dose

Booster dose after recovery from *Haemophilus influenzae* type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ Child 1–17 years: 0.5 mL for 1 dose

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ Child 2–17 years: 0.5 mL for 1 dose, this booster dose should be given after the second birthday, this is the second dose of haemophilus influenzae type b vaccine combined with meningococcal group C conjugate vaccine (the first dose is given during the routine immunisation schedule)

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ Child 2–17 years: 0.5 mL for 1 dose, this booster dose should be followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine (in patients from 11 years of age, this interval can be reduced to one month)

- **UNLICENSED USE** Not licensed for use in patients over 2 years.

● SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness
- ▶ **Uncommon** Crying
- ▶ **Rare or very rare** Abdominal pain · insomnia
- ▶ **Frequency not known** Anaphylactoid reaction · apnoea (in neonates) · febrile seizure · meningism (but no evidence that vaccine causes meningococcal C meningitis) · muscle tone decreased

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of the childhood immunisation schedule from ImmForm.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Menitorix** (GlaxoSmithKline UK Ltd)
Menitorix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial [PoM] £37.76

F 788

Meningococcal group B vaccine (rDNA, component, adsorbed)

19-Oct-2017

INDICATIONS AND DOSE

BEXSERO®

Immunisation against *Neisseria meningitidis*, primary immunisation

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 271.
- ▶ Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 271.

Immunisation against *Neisseria meningitidis*, primary immunisation booster dose

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 12–23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

Immunisation against *Neisseria meningitidis*, primary immunisation (in unimmunised patients)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 6–11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- ▶ Child 12–23 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12–24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- ▶ Child 2–10 years: 0.5 mL for 2 doses, separated by an interval of at least 2 months. Injected preferably into deltoid region (or anterolateral thigh in infants)
- ▶ Child 11–17 years: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

TRUMENBA®

Immunisation against *Neisseria meningitidis*, primary immunisation

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10–17 years: 0.5 mL for 2 doses, separated by an interval of 6 months, alternatively 0.5 mL for 2 doses, separated by an interval of at least 1 month, followed by 0.5 mL as a third dose, given at least 4 months after the second dose, injected preferably into deltoid region, a booster dose should be considered for individuals at continued risk—consult product literature

SIDE-EFFECTS

- ▶ **Common or very common** Crying abnormal · drowsiness · eating disorder
- ▶ **Uncommon** Eczema · seizures · vascular disorders
- ▶ **Frequency not known** Extensive swelling of vaccinated limb · hypotonic-hyposponsiveness episode

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

F 788

Meningococcal group C vaccine

INDICATIONS AND DOSE

Patients with confirmed serogroup C disease (who have previously been immunised)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1–17 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital

SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · cough · crying · drowsiness · gastrointestinal discomfort · hyperhidrosis · increased risk of infection
- ▶ **Uncommon** Chills · eyelid oedema · flushing · joint stiffness
- ▶ **Rare or very rare** Circulatory collapse · influenza like illness
- ▶ **Frequency not known** Angioedema · apnoea · asthenia · dyspnoea · hypotonic-hyposponsiveness episode · immune thrombocytopenic purpura · meningism (but no evidence that vaccine causes meningococcal C meningitis) · musculoskeletal stiffness · nasal congestion · oedema · pain · respiratory disorders · seizures · sensation abnormal · sleep disorders · Stevens-Johnson syndrome · syncope

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from www.immform.dh.gov.uk.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **NeisVac-C** (Pfizer Ltd)
NeisVac-C vaccine suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection [PoM] £187.50

F 788

Meningococcal groups A with C and W135 and Y vaccine

INDICATIONS AND DOSE

MENVEO®

Primary immunisation against *Neisseria meningitidis*

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 13–15 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10–17 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against *Neisseria meningitidis* in those at risk of exposure to prevent invasive disease

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 3–11 months: 0.5 mL every month for 2 doses, dose preferably injected into deltoid region
- ▶ Child 1–17 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Patients attending university for the first time (who have not received the routine meningococcal A, C, W135, and Y conjugate vaccine over the age of 10 years)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 16–17 years: 0.5 mL for 1 dose

NIMENRIX®**Primary immunisation against *Neisseria meningitidis***

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 13–15 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10–17 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against *Neisseria meningitidis* in those at risk of exposure

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1–17 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region (or anterolateral thigh in child 12–23 months), then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection

Patients attending university for the first time (who have not received the routine meningococcal A, C, W135, and Y conjugate vaccine over the age of 10 years)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 16–17 years: 0.5 mL for 1 dose

● UNLICENSED USE

MENVEO® Menveo® is not licensed for use in children under 2 years.

● SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness
- ▶ **Uncommon** Crying · insomnia · numbness · pain in extremity
- ▶ **Frequency not known** Extensive swelling of vaccinated limb

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 2 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Primary immunisation against pneumococcal infection (second dose)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 4 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Primary immunisation against pneumococcal infection (booster dose)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 12–13 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Immunisation against pneumococcal infection (in patients who have not been vaccinated or not completed the primary course)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 12 months–4 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

Immunisation against pneumococcal infection, in immunocompromised or asplenic patients or patients with splenic dysfunction (who have not been vaccinated or not completed the primary course)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 12 months–4 years: 0.5 mL every 2 months for 2 doses, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

SYNFLORIX®**Immunisation against pneumococcal infection**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 6 weeks–4 years: Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants (consult product literature)

● UNLICENSED USE

PREVENAR 13® The dose in BNF publications may differ from that in product literature.

● SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness
- ▶ **Uncommon** Apnoea · crying abnormal · extensive swelling of vaccinated limb
- ▶ **Rare or very rare** Angioedema · hypotonic-hyporesponsiveness episode · Kawasaki disease · seizure

● PRESCRIBING AND DISPENSING INFORMATION

PREVENAR 13® Available as part of childhood immunisation schedule from ImmForm www.immform.dh.gov.uk.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Prevenar** (Pfizer Ltd)
Prevenar 13 vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £49.10 | 10 pre-filled disposable injection [PoM] £491.00
- ▶ **Synflorix** (GlaxoSmithKline UK Ltd)
Synflorix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £27.60

788**Pneumococcal polysaccharide vaccine****● INDICATIONS AND DOSE****Immunisation against pneumococcal infection**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years: 0.5 mL for 1 dose

continued →

Immunisation in patients at increased risk of pneumococcal disease

- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Child 2–4 years: 0.5 mL for 1 dose, dose should be administered after the second birthday or at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed)
- Child 5–17 years: 0.5 mL for 1 dose

- **SIDE-EFFECTS** Angioedema · arthritis · asthenia · chills · febrile seizure · haemolytic anaemia · hypersensitivity · leucocytosis · lymphadenitis · nerve disorders · paraesthesia · peripheral oedema · thrombocytopenia

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Pneumococcal polysaccharide vaccine (Non-proprietary)**
Pneumococcal polysaccharide vaccine solution for injection 0.5mL vials
| 1 vial [PoM] £8.32

F 788

Typhoid vaccine● **INDICATIONS AND DOSE****Immunisation against typhoid fever in children at high risk of typhoid fever**

- BY INTRAMUSCULAR INJECTION
- Child 12–23 months: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection, response may be suboptimal

Immunisation against typhoid fever

- BY INTRAMUSCULAR INJECTION
- Child 2–17 years: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
- BY MOUTH
- Child 6–17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)

● **UNLICENSED USE**

- With intramuscular use Not licensed for use in children under 2 years.

● **CONTRA-INDICATIONS**

- With oral use Acute gastro-intestinal illness

● **INTERACTIONS** → Appendix 1: live vaccines● **SIDE-EFFECTS**

- **Common or very common**
- With oral use Gastrointestinal discomfort · influenza like illness
- **Rare or very rare**
- With oral use Asthenia · back pain · chills · flatulence · paraesthesia
- **Frequency not known**
- With parenteral use Abdominal pain · asthma · serum sickness · shock · syncope

- **DIRECTIONS FOR ADMINISTRATION** Capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

- **HANDLING AND STORAGE** It is important to store capsules in a refrigerator.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Typhim Vi** (Sanofi Pasteur)
Salmonella typhi Vi capsular polysaccharide 50 microgram per 1 mL Typhim Vi 25micrograms/0.5mL vaccine solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £11.16 DT = £11.16 | 10 pre-filled disposable injection [PoM] £93.00 DT = £93.00

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 25

► **Vivotif** (PaxVax Ltd)

Vivotif vaccine gastro-resistant capsules | 3 capsule [PoM] £14.77

Combinations available: **Hepatitis A with typhoid vaccine**, p. 795

VACCINES > VIRAL VACCINES**Hepatitis A and B vaccine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 795, hepatitis B vaccine p. 796.

● **INDICATIONS AND DOSE****AMBIRIX®****Immunisation against hepatitis A and hepatitis B infection (primary course)**

- BY INTRAMUSCULAR INJECTION
- Child 1–15 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

TWINRIX® ADULT**Immunisation against hepatitis A and hepatitis B infection (primary course)**

- BY INTRAMUSCULAR INJECTION
- Child 16–17 years: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Immunisation against hepatitis A and hepatitis B infection—accelerated schedule for travellers departing within 1 month

- BY INTRAMUSCULAR INJECTION
- Child 1–15 years: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

TWINRIX® PAEDIATRIC**Immunisation against hepatitis A and hepatitis B infection (primary course)**

- BY INTRAMUSCULAR INJECTION
- Child 1–15 years: Initially 0.5 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients

with bleeding disorders (but immune response may be reduced)

IMPORTANT SAFETY INFORMATION

Ambirix® and *Twinrix*® are not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus.

● PRESCRIBING AND DISPENSING INFORMATION

AMBIRIX® Primary course should be completed with *Ambirix*® (single component vaccines given at appropriate intervals may be used for booster dose).

TWINRIX® **ADULT** Primary course should be completed with *Twinrix*® (single component vaccines given at appropriate intervals may be used for booster dose).

TWINRIX® **PAEDIATRIC** Primary course should be completed with *Twinrix*® (single component vaccines given at appropriate intervals may be used for booster dose).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

- ▶ **Ambirix** (GlaxoSmithKline UK Ltd)
Ambirix vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £31.18 DT = £31.18
- ▶ **Twinrix** (GlaxoSmithKline UK Ltd)
Twinrix Paediatric vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £20.79
Twinrix Adult vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £33.31 DT = £31.18 | 10 pre-filled disposable injection [PoM] £333.13

F 788

Hepatitis A vaccine

● INDICATIONS AND DOSE

AVAXIM®

Immunisation against hepatitis A infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 16–17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

HAVRIX MONODOSE®

Immunisation against hepatitis A infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1–15 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- ▶ Child 16–17 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

VAQTA® PAEDIATRIC

Immunisation against hepatitis A infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1–17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

● SIDE-EFFECTS

- ▶ **Uncommon** Anxiety · asthenia · cough · crying · drowsiness · gastrointestinal discomfort · nasal complaints · pain · skin reactions · sleep disorders
- ▶ **Rare or very rare** Allergic rhinitis · asthma · ataxia · burping · chest pain · constipation · dehydration · ear pain · eyelid crusting · feeling hot · flushing · gait abnormal · gastrointestinal disorders · infantile spitting up · influenza like illness · musculoskeletal stiffness · oropharyngeal pain · paraesthesia · respiratory tract congestion · screaming · sensation of tightness · sweat changes · synovitis
- ▶ **Frequency not known** Guillain-Barre syndrome · thrombocytopenia

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

- ▶ **Avaxim** (Sanofi Pasteur)
Avaxim vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £21.72 | 10 pre-filled disposable injection [PoM] £181.00
- ▶ **Havrix** (GlaxoSmithKline UK Ltd)
Havrix Monodose vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £22.14 | 10 pre-filled disposable injection [PoM] £221.43
Havrix Junior Monodose vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.77 | 10 pre-filled disposable injection [PoM] £167.68
- ▶ **VAQTA** (Merck Sharp & Dohme Ltd)
VAQTA Paediatric vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.74

Hepatitis A with typhoid vaccine

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine above, typhoid vaccine p. 794.

● INDICATIONS AND DOSE

HEPATYRIX®

Immunisation against hepatitis A and typhoid infection (primary course)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 15–17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

VIATIM®

Immunisation against hepatitis A and typhoid infection (primary course)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 16–17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

▶ **VIATIM** (Sanofi Pasteur)

VIATIM vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £35.76

£ 788

Hepatitis B vaccine

● INDICATIONS AND DOSE

ENGERIX B®

Immunisation against hepatitis B infection

▶ BY INTRAMUSCULAR INJECTION

▶ Neonate: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.

▶ Child 1 month–15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

▶ Child 16–17 years: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)

▶ BY INTRAMUSCULAR INJECTION

▶ Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.

▶ Child 1 month–15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

▶ Child 16–17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection, alternative accelerated schedule

▶ BY INTRAMUSCULAR INJECTION

▶ Child 11–15 years: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (for neonates born to hepatitis B surface antigen positive mother)

▶ BY INTRAMUSCULAR INJECTION

▶ Neonate: 10 micrograms once a month for 3 doses, first dose to be given at birth with hepatitis B

immunoglobulin injection (separate site), followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)

▶ BY INTRAMUSCULAR INJECTION

▶ Neonate: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.

▶ Child 1 month–15 years: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

▶ Child 16–17 years: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients (accelerated schedule))

▶ BY INTRAMUSCULAR INJECTION

▶ Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.

▶ Child 1 month–15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

FENDRIX®

Immunisation against hepatitis B infection in renal insufficiency (including pre-haemodialysis and haemodialysis patients)

▶ BY INTRAMUSCULAR INJECTION

▶ Child 15–17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

HBVAXPRO®

Immunisation against hepatitis B infection

▶ BY INTRAMUSCULAR INJECTION

▶ Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then

5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.

- ▶ Child 1 month–15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Child 16–17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.

- ▶ Child 1 month–15 years: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Child 16–17 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)

Neonate born to hepatitis B surface antigen-positive mother

▶ BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 5 micrograms every month for 3 doses, first dose given at birth with hepatitis B immunoglobulin injection (separate site), followed by 5 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

Chronic haemodialysis patients

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 16–17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)

● SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness · gastrointestinal disorder
- ▶ **Uncommon** Influenza like illness
- ▶ **Rare or very rare** Sensation abnormal
- ▶ **Frequency not known** Anaphylactoid reaction · angioedema · apnoea · arthritis · encephalitis · encephalopathy · hypotension · meningitis · multiple sclerosis · muscle weakness · nerve disorders · paralysis · seizure · skin reactions · thrombocytopenia · vasculitis

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Thiomersal

▶ Enderix B (GlaxoSmithKline UK Ltd)

Hepatitis B virus surface antigen 20 microgram per 1 ml Enderix B 10micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £9.67

Enderix B 20micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £12.99 | 10 pre-filled disposable injection [PoM] £129.92

▶ Fendrix (GlaxoSmithKline UK Ltd)

Hepatitis B virus surface antigen 40 microgram per 1 ml Fendrix 20micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £38.10

▶ HBVAXPRO (Merck Sharp & Dohme Ltd)

Hepatitis B virus surface antigen 10 microgram per 1 ml HBVAXPRO 10micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £12.20
HBVAXPRO 5micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £8.95

Hepatitis B virus surface antigen 40 microgram per 1 ml HBVAXPRO 40micrograms/1ml vaccine suspension for injection vials | 1 vial [PoM] £27.60

£ 788

Human papillomavirus vaccines

02-Mar-2017

● INDICATIONS AND DOSE

CERVARIX®

Prevention of premalignant genital lesions and cervical cancer

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.
- ▶ Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

GARDASIL®

Prevention of premalignant genital (cervical, vulvar and vaginal) and anal lesions, cervical and anal cancers, and genital warts

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 6 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is continued →

interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- ▶ Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Prevention of premalignant genital (cervical, vulvar, and vaginal) and anal lesions, cervical and anal cancers, and genital warts (alternative schedule)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

● **UNLICENSED USE**

GARDASIL® Two dose schedule not licensed for use in girls aged 14 years.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Pain in extremity
- ▶ **Rare or very rare** Bronchospasm
- ▶ **Frequency not known** Acute disseminated encephalomyelitis · anaphylactoid reaction · asthenia · chills · Guillain-Barre syndrome · immune thrombocytopenic purpura · syncope

- **PREGNANCY** Not known to be harmful, but vaccination should be postponed until completion of pregnancy.

- **PRESCRIBING AND DISPENSING INFORMATION** To avoid confusion, prescribers should specify the brand to be dispensed.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Cervarix** (GlaxoSmithKline UK Ltd)
Cervarix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection **PoM** £80.50
- ▶ **Gardasil** (Merck Sharp & Dohme Ltd)
Gardasil vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection **PoM** £86.50

▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 2–9 years: 0.1 mL for 1 dose, followed by 0.1 mL for 1 dose, after at least 4 weeks. 0.1 mL dose to be administered to each nostril

- **UNLICENSED USE** Some products containing inactivated influenza vaccine (surface antigen) are not licensed for use in children under 4 years—check product literature.

OPTAFLU® Not licensed for use in children and adolescents under 18 years.

FLUVIRIN® Not licensed for use in children under 4 years.

- **CONTRA-INDICATIONS** Preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

FLUENZ TETRA® Active wheezing · concomitant use with antiviral therapy for influenza · concomitant use with salicylates · severe asthma

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Concomitant use with antiviral therapy for influenza Avoid influenza antiviral agents for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the influenza antiviral agent.

ENZIRA® Child under 5 years—increased risk of febrile convulsions

- **CAUTIONS** Increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available

ENZIRA® Child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available

- **INTERACTIONS** → Appendix 1: live vaccines

● **SIDE-EFFECTS**

- ▶ **Common or very common**
- ▶ With intramuscular use Chills · hyperhidrosis · local reactions · pain
- ▶ With intranasal use Nasal complaints
- ▶ **Uncommon**
- ▶ With intranasal use Epistaxis · face oedema
- ▶ **Frequency not known**
- ▶ With intramuscular use Angioedema · encephalomyelitis · extensive swelling of vaccinated limb · febrile seizure · nerve disorders · nervous system disorder · paraesthesia · presyncope · shock · skin eruption generalised · syncope · thrombocytopenia · vasculitis
- ▶ With intranasal use Guillain-Barre syndrome

- **ALLERGY AND CROSS-SENSITIVITY** Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.

- **PREGNANCY** Inactivated vaccines not known to be harmful.

FLUENZ TETRA® Avoid in pregnancy.

- **BREAST FEEDING** Inactivated vaccines not known to be harmful.

FLUENZ TETRA® Avoid in breast-feeding.

- **PRESCRIBING AND DISPENSING INFORMATION**

FLUARIX TETRA® Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**

FLUENZ TETRA® Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

Influenza vaccine

● **INDICATIONS AND DOSE**

Annual immunisation against seasonal influenza

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 6 months–17 years: 0.5 mL for 1 dose

▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 2–17 years: 0.1 mL for 1 dose, dose to be administered into each nostril

Annual immunisation against seasonal influenza (for children who have not received seasonal influenza vaccine previously)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 6 months–9 years: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, after at least 4 weeks

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Gelatin, gentamicin

► **Fluenz Tetra** (AstraZeneca UK Ltd) ▼

Fluenz Tetra vaccine nasal suspension 0.2ml unit dose | 10 unit dose [PoM] £180.00

Suspension for injection

EXCIPIENTS: May contain Gentamicin, kanamycin, neomycin penicillins, polymyxin b

► **Influenza vaccine (Non-proprietary)**

Influenza vaccine (split virion, inactivated) suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £5.22–£6.59 | 10 pre-filled disposable injection [PoM] £52.20–£65.90
Quadrivalent vaccine (split virion, inactivated) suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £8.00 | 10 pre-filled disposable injection [PoM] £80.00

► **Agrippal** (Seqirus Vaccines Ltd)

Agrippal vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £6.59 | 10 pre-filled disposable injection [PoM] £65.90

► **Enzira** (Pfizer Ltd)

Enzira vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £5.25 | 10 pre-filled disposable injection [PoM] £52.50

► **Fluarix Tetra** (GlaxoSmithKline UK Ltd) ▼

Fluarix Tetra vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £9.94 | 10 pre-filled disposable injection [PoM] £99.40

► **Imuvac** (Mylan)

Imuvac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £6.59 | 10 pre-filled disposable injection [PoM] £65.90

► **Influvac Sub-unit** (Mylan)

Influvac Sub-unit vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £5.22 | 10 pre-filled disposable injection [PoM] £52.20

F 788

Japanese encephalitis vaccine

● INDICATIONS AND DOSE

Immunisation against Japanese encephalitis

► BY INTRAMUSCULAR INJECTION

- Child 2 months–2 years: 0.25 mL every 28 days for 2 doses, anterolateral thigh is preferred site of injection in infants, the subcutaneous route may be used for patients with bleeding disorders
- Child 3–17 years: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site in older children; anterolateral thigh is preferred in infants, the subcutaneous route may be used for patients with bleeding disorders

● SIDE-EFFECTS

Abdominal pain · cough · influenza like illness

● PREGNANCY

Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Japanese encephalitis vaccine (Non-proprietary)**

Japanese encephalitis GCVC vaccine solution for injection 1ml vials | 1 vial [S]
Japanese encephalitis GCVC vaccine solution for injection 20ml vials | 1 vial [S]
Japanese encephalitis GCVC vaccine solution for injection 10ml vials | 1 vial [S]

Suspension for injection

► **Ixiaro** (Valneva UK Ltd)

Ixiaro vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £59.50

Measles, mumps and rubella vaccine, live

F 788

● INDICATIONS AND DOSE

Primary immunisation against measles, mumps, and rubella (first dose)

- BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- Child 12–13 months: 0.5 mL for 1 dose

Primary immunisation against measles, mumps, and rubella (second dose)

- BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- Child 40 months–5 years: 0.5 mL for 1 dose

Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)

- BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- Females of childbearing potential: (consult product literature or local protocols)

Children presenting for pre-school booster, who have not received the primary immunisation (first dose) | Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course | Control of measles outbreak | Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation

- BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- Child 6 months–17 years: (consult product literature or local protocols)

● UNLICENSED USE

Not licensed for use in children under 9 months.

IMPORTANT SAFETY INFORMATION

MMR VACCINATION AND BOWEL DISEASE OR AUTISM

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/immunisation.

● CAUTIONS

Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion—leave an interval of at least 3 months before MMR immunisation

CAUTIONS, FURTHER INFORMATION

- Administration with other vaccines MMR vaccine should not be administered on the same day as yellow fever vaccine; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

MMR and varicella-zoster vaccine can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

● INTERACTIONS

→ Appendix 1: live vaccines

● SIDE-EFFECTS

- **Uncommon** Increased risk of infection · rhinorrhoea

- **Frequency not known** Anaphylactoid reaction · angioedema · arthritis · ataxia · cough · encephalopathy · eye inflammation · meningitis asepti · nerve deafness · nerve disorders · oculomotor nerve paralysis · oedema · panniculitis · papillitis · paraesthesia · regional lymphadenopathy · respiratory disorders · seizures · Stevens-Johnson syndrome · subacute sclerosing panencephalitis · syncope · throat pain · thrombocytopenia · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Malaise, fever, or a rash can occur after the first dose of MMR vaccine—most commonly about a week after vaccination and lasting about 2 to 3 days. Febrile seizures occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection).

Idiopathic thrombocytopenic purpura Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. Samples should be sent to the Virus Reference Laboratory of the Health Protection Agency.

Frequency of side effects Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

- **ALLERGY AND CROSS-SENSITIVITY** MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.
- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from health organisations or ImmForm www.immform.dh.gov.uk.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

EXCIPIENTS: May contain Gelatin, neomycin

- **M-M-RVAXPRO** (Merck Sharp & Dohme Ltd)

M-M-RVAXPRO vaccine powder and solvent for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £11.00

Powder and solvent for solution for injection

EXCIPIENTS: May contain Neomycin

- **Priorix** (GlaxoSmithKline UK Ltd)

Priorix vaccine powder and solvent for solution for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £7.64

788

Rabies vaccine

● INDICATIONS AND DOSE

Pre-exposure prophylaxis

- BY INTRAMUSCULAR INJECTION

- Child: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region or anterolateral thigh in infants, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months

and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel

Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)

- BY INTRAMUSCULAR INJECTION

- Child: 1 mL after 1 year for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies

Pre-exposure prophylaxis booster dose (for patients at infrequent risk of exposure)

- BY INTRAMUSCULAR INJECTION

- Child: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region or anterolateral thigh in infants

Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine)

- BY INTRAMUSCULAR INJECTION

- Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete)

- BY INTRAMUSCULAR INJECTION

- Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk

- **INTERACTIONS** → Appendix 1: rabies vaccine

● SIDE-EFFECTS

- **Common or very common** Asthenia · gastrointestinal discomfort
- **Rare or very rare** Anaphylactic shock · angioedema · chills · encephalitis · Guillain-Barre syndrome · hyperhidrosis · paraesthesia · presyncope · syncope · vertigo
- **PREGNANCY** Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

EXCIPIENTS: May contain Neomycin

- **Rabipur** (GlaxoSmithKline UK Ltd)

Rabipur vaccine powder and solvent for solution for injection 1ml vials | 1 vial [PoM] £34.56

Rabipur vaccine powder and solvent for solution for injection 1ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £34.56

Rotavirus vaccine

11-Dec-2017

- **DRUG ACTION** Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

● INDICATIONS AND DOSE

Immunisation against gastro-enteritis caused by rotavirus

► BY MOUTH

- Child 6–23 weeks: 1.5 mL for 2 doses separated by an interval of at least 4 weeks, first dose must be given between 6–14 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

IMPORTANT SAFETY INFORMATION

PUBLIC HEALTH ENGLAND: UPDATE TO GREEN BOOK (OCTOBER 2017)

Public Health England advises that immunisation with live vaccines should be delayed until 6 months of age in children born to mothers who received immunosuppressive biological therapy during pregnancy. In practice, this means that children born to mothers who were on immunosuppressive biological therapy during pregnancy will not be eligible to receive rotavirus vaccine.

- **CONTRA-INDICATIONS** History of intussusception · predisposition to intussusception · severe combined immunosuppression

CONTRA-INDICATIONS, FURTHER INFORMATION

- **Immunosuppression** With the exception of severe combined immunodeficiency (and children born to mothers who received immunosuppressive biological therapy during pregnancy, see *Important safety information*), rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.

- **CAUTIONS** Diarrhoea (postpone vaccination) · immunosuppressed close contacts · vomiting (postpone vaccination)

CAUTIONS, FURTHER INFORMATION The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.

- **INTERACTIONS** → Appendix 1: live vaccines

● SIDE-EFFECTS

- **Uncommon** Abdominal pain · dermatitis · gastrointestinal disorders
- **Frequency not known** Apnoea · gastroenteritis · haematochezia

- **PATIENT AND CARER ADVICE** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- **Rotarix** (GlaxoSmithKline UK Ltd)
Rotarix vaccine live oral suspension 1.5ml pre-filled syringes | 1 unit dose [PoM] £34.76
Rotarix vaccine live oral suspension 1.5ml tube | 1 tube [PoM] £34.76

Tick-borne encephalitis vaccine, inactivated

● INDICATIONS AND DOSE

Initial immunisation against tick-borne encephalitis

► BY INTRAMUSCULAR INJECTION

- Child 1–15 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1–3 months for 1 dose, then 0.25 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region or anterolateral thigh in infants, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- Child 16–17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

Immunisation against tick-borne encephalitis, booster doses

► BY INTRAMUSCULAR INJECTION

- Child 1–17 years: First dose to be given within 3 years after initial course completed and then every 3–5 years, dose to be administered in deltoid region or anterolateral thigh in infants (consult product literature)

● SIDE-EFFECTS

- **Common or very common** Restlessness · sleep disorder
- **Uncommon** Chills · gastrointestinal discomfort
- **Rare or very rare** Asthenia · dyspnoea · encephalitis · erythema · eye pain · gait abnormal · hyperhidrosis · influenza like illness · meningism · motor dysfunction · musculoskeletal stiffness · nerve disorders · oedema · pain · seizures · sensory disorder · tinnitus · vertigo · vision disorders
- **ALLERGY AND CROSS-SENSITIVITY** Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Gentamicin, neomycin

► TicoVac (Pfizer Ltd)

TicoVac Junior vaccine suspension for injection 0.25ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £28.00
TicoVac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £32.00

Varicella-zoster vaccine

● INDICATIONS AND DOSE

VARILRIX®

Prevention of varicella infection (chickenpox)

► BY SUBCUTANEOUS INJECTION

- Child 1–17 years: 0.5 mL every 4–6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh

continued →

VARIVAX®

Prevention of varicella infection (chickenpox)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1–12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
- ▶ Child 13–17 years: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region

Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1–12 years: 0.5 mL every 12 weeks for 2 doses, to be administered into the deltoid region (or higher anterolateral thigh in young children)

- **CAUTIONS** Post-vaccination close contact with susceptible individuals

CAUTIONS, FURTHER INFORMATION Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

- ▶ Administration with MMR vaccine Varicella–zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

- **INTERACTIONS** → Appendix 1: live vaccines

● **SIDE-EFFECTS**

- ▶ **Uncommon** Cough · drowsiness · increased risk of infection
- ▶ **Rare or very rare** Abdominal pain · conjunctivitis · Kawasaki disease · seizure · stroke · thrombocytopenia · vasculitis

- **CONCEPTION AND CONTRACEPTION** Avoid pregnancy for 3 months after vaccination.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

EXCIPIENTS: May contain Gelatin, neomycin

- ▶ **Varivax** (Merck Sharp & Dohme Ltd)
Varivax vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial [PoM] £30.28

Powder and solvent for solution for injection

EXCIPIENTS: May contain Neomycin

- ▶ **Varilrix** (GlaxoSmithKline UK Ltd)
Varilrix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial [PoM] £27.31

Yellow fever vaccine, live● **INDICATIONS AND DOSE****Immunisation against yellow fever**

- ▶ BY DEEP SUBCUTANEOUS INJECTION
- ▶ Child 6–8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
- ▶ Child 9 months–17 years: 0.5 mL for 1 dose

- **CONTRA-INDICATIONS** Children under 6 months · history of thymus dysfunction

● **CAUTIONS**● **CAUTIONS, FURTHER INFORMATION**

- ▶ Administration with MMR vaccine Yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

- **INTERACTIONS** → Appendix 1: live vaccines

● **SIDE-EFFECTS**

- ▶ **Common or very common** Asthenia · crying · drowsiness
- ▶ **Uncommon** Abdominal pain
- ▶ **Rare or very rare** Rhinitis · yellow fever vaccine-associated neurotropic disease · yellow fever vaccine-associated viscerotropic disease
- ▶ **Frequency not known** Anaphylactoid reaction · angioedema · influenza like illness · paraesthesia

SIDE-EFFECTS, FURTHER INFORMATION Very rare vaccine-associated adverse effects may occur, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity.

- **ALLERGY AND CROSS-SENSITIVITY** Yellow fever vaccine should only be considered under the guidance of a specialist in individuals with evidence of previous anaphylactic reaction to egg.
- **PREGNANCY** Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.
- **BREAST FEEDING** Avoid; seek specialist advice if exposure to virus cannot be avoided.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- ▶ **Stamaril** (Sanofi Pasteur)
Stamaril vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial [PoM] £33.10

General anaesthesia

Anaesthesia (general)

Overview

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated children and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using 'rapid sequence induction').

Total intravenous anaesthesia

This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations; specific models with paediatric pharmacokinetic data should be used for children.

Drugs used for intravenous anaesthesia

Propofol p. 805, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures.

Thiopental sodium p. 221 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect particularly in neonates and recovery is much slower.

Etomidate p. 804 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 820 causes less hypotension than thiopental sodium and propofol during induction. It is sometimes used in children requiring repeat anaesthesia (such as for serial burns dressings), however recovery is relatively slow and there is a high incidence of extraneous muscle movements. Ketamine can cause hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 220 or midazolam p. 223.

Inhalational anaesthetics

Inhalational anaesthetics include gases and volatile liquids. *Gaseous anaesthetics* require suitable equipment for storage and administration. *Volatile liquid anaesthetics* are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 808 is being administered.

Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isoflurane p. 807 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise. Systemic arterial pressure and cardiac

output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is not recommended for induction of anaesthesia in infants and children of all ages because of the occurrence of cough, breath-holding, desaturation, increased secretions, and laryngospasm. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 807 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 808 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia.

Nitrous oxide

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, it is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (*Entonox*[®], *Equanox*[®]) is used. Self-administration using a demand valve may be used in children who are able to self-regulate their intake (usually over 5 years of age) for painful dressing changes, as an aid to postoperative physiotherapy, for wound debridement and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in children with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 813 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in children at high risk of malignant hyperthermia.

Dantrolene sodium p. 821 is used in the treatment of malignant hyperthermia.

Sedation, anaesthesia, and resuscitation in dental practice

Overview

Sedation for dental procedures should be limited to conscious sedation whenever possible. Nitrous oxide p. 808 alone and midazolam p. 223 are effective for many children.

For details of anaesthesia, sedation, and resuscitation in dental practice see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care*; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated

documents. Further details can also be found in *Standards for Conscious Sedation in the Provision of Dental Care*; report of an Intercollegiate Advisory Committee for Sedation in Dentistry, 2015 www.rcseng.ac.uk/fds/Documents/dental-sedation-report-2015-web-v2.pdf.

Surgery and long-term medication

Overview

The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about **all** drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include drugs for epilepsy, asthma, immunosuppression, and metabolic, endocrine and cardiovascular disorders (but see potassium sparing diuretics). Expert advice is required for children receiving antivirals for HIV infection. See general advice on surgery in children with diabetes in Diabetes, surgery and medical illness p. 450.

Children taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 95 or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives, see Contraceptives, hormonal p. 493. If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

ANAESTHETICS, GENERAL > INTRAVENOUS

Etomidate

• INDICATIONS AND DOSE

Induction of anaesthesia

► BY SLOW INTRAVENOUS INJECTION

- Child 1 month–14 years: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds for children in whom hypotension might be hazardous), increased if necessary to 400 micrograms/kg
- Child 15–17 years: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds for children in whom hypotension might be hazardous)

- **UNLICENSED USE** *Hypnomidate*® licensed for use in children (age range not specified by manufacturer). *Etomidate-Lipuro*® not licensed for children under 6 months except for imperative indications during inpatient treatment. Doses in *BNF for Children* may differ from those in the product literature.

IMPORTANT SAFETY INFORMATION

Etomidate should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS** Acute circulatory failure (shock) · adrenal insufficiency · Avoid in Acute porphyrias p. 603 · cardiovascular disease · fixed cardiac output · hypovolaemia
- **CAUTIONS, FURTHER INFORMATION**
 - Adrenal insufficiency Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.
- **INTERACTIONS** → Appendix 1: etomidate
- **SIDE-EFFECTS**
 - **Common or very common** Apnoea · hypotension · movement disorders · nausea · respiratory disorders · skin reactions · vascular disorders · vomiting
 - **Uncommon** Arrhythmias · cough · hiccups · hypersalivation · hypertension · muscle rigidity · neuromuscular dysfunction · nystagmus
 - **Frequency not known** Adrenal insufficiency · atrioventricular block · cardiac arrest · embolism and thrombosis · seizures · shock · Stevens-Johnson syndrome · trismus
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - **Pain on injection** Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.
 - **Extraneous muscle movements** Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT**
 - **Dose adjustments** Reduce dose in liver cirrhosis.
- **DIRECTIONS FOR ADMINISTRATION** To be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous).
- **PATIENT AND CARER ADVICE**
 - **Driving and skilled tasks** Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.
- **MEDICINAL FORMS**
 - There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Propylene glycol

- **Hypnomidate** (Piramal Critical Care Ltd)
Etomidate 2 mg per 1 ml Hypnomidate 20mg/10ml solution for injection ampoules | 5 ampoule (PoM) £6.90

Emulsion for injection

- **Etomidate-Lipuro** (B.Braun Medical Ltd)
Etomidate 2 mg per 1 ml Etomidate-Lipuro 20mg/10ml emulsion for injection ampoules | 10 ampoule (PoM) £16.09

Propofol

● INDICATIONS AND DOSE

Induction of anaesthesia using 0.5% or 1% injection

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- Child 1 month–16 years: Usual dose 2.5–4 mg/kg, dose adjusted according to age, body-weight and response
- Child 17 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response

Induction of anaesthesia using 2% injection

- **BY INTRAVENOUS INFUSION**
- Child 3–16 years: Usual dose 2.5–4 mg/kg, dose adjusted according to age, body-weight and response
- Child 17 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response

Maintenance of anaesthesia using 1% injection

- **BY CONTINUOUS INTRAVENOUS INFUSION**
- Child 1 month–16 years: Usual dose 9–15 mg/kg/hour, dose adjusted according to age, body-weight and response
- Child 17 years: Usual dose 4–12 mg/kg/hour, adjusted according to response

Maintenance of anaesthesia using 2% injection

- **BY CONTINUOUS INTRAVENOUS INFUSION**
- Child 3–16 years: Usual dose 9–15 mg/kg/hour, dose adjusted according to age, body-weight and response
- Child 17 years: Usual dose 4–12 mg/kg/hour, adjusted according to response

Sedation of ventilated patients in intensive care using 1% or 2% injection

- **BY CONTINUOUS INTRAVENOUS INFUSION**
- Child 16–17 years: Usual dose 0.3–4 mg/kg/hour, adjusted according to response

Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection

- **BY SLOW INTRAVENOUS INJECTION**
- Child 1 month–16 years: Initially 1–2 mg/kg, dose and rate of administration adjusted according to desired level of sedation and response
- Child 17 years: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection

- **INITIALLY BY INTRAVENOUS INFUSION**
- Child 17 years: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required)

Maintenance of sedation for surgical and diagnostic procedures using 1% injection

- **INITIALLY BY INTRAVENOUS INFUSION**
- Child 1 month–16 years: Usual dose 1.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) up to 1 mg/kg, (if rapid increase in sedation required)
- Child 17 years: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by continued →

(by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required)

Maintenance of sedation for surgical and diagnostic procedures using 2% injection

► INITIALLY BY INTRAVENOUS INFUSION

- Child 3–16 years: Usual dose 1.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response
- Child 17 years: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, using 0.5% or 1% injection (if rapid increase in sedation required)

IMPORTANT SAFETY INFORMATION

Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Children under 16 years receiving intensive care

CONTRA-INDICATIONS, FURTHER INFORMATION

Use in intensive care associated with a risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure).

- **CAUTIONS** Acute circulatory failure (shock) · cardiac impairment · cardiovascular disease · epilepsy · fixed cardiac output · hypotension · hypovolaemia · raised intracranial pressure · respiratory impairment
- **INTERACTIONS** → Appendix 1: propofol
- **SIDE-EFFECTS**
 - **Common or very common** Apnoea · arrhythmias · headache · hypotension · pain · nausea · vomiting
 - **Uncommon** Thrombosis
 - **Rare or very rare** Epileptiform seizure (may be delayed) · pancreatitis · post procedural complications · pulmonary oedema · sexual disinhibition · urine discolouration
 - **Frequency not known** Drug use disorders · dyskinesia · euphoric mood · heart failure · hepatomegaly · hyperkalaemia · hyperlipidaemia · metabolic acidosis · renal failure · respiratory depression · rhabdomyolysis

SIDE-EFFECTS, FURTHER INFORMATION

Bradycardia Bradycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.

Pain on injection Pain on injection can be reduced by intravenous lidocaine.

Propofol infusion syndrome Prolonged infusion of propofol doses exceeding 4mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.

- **PREGNANCY** May depress neonatal respiration if used during delivery.
Dose adjustments Max. dose for maintenance of anaesthesia 6 mg/kg/hour.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.

- **DIRECTIONS FOR ADMINISTRATION** Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%. 0.5% **emulsion** for injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL. 1% **emulsion** for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (*Diprivan*®) or (*Propofol-Lipuro*®) or Sodium chloride 0.9% (*Propofol-Lipuro*® only); dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation. 2% **emulsion** for infusion; do not dilute.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Emulsion for infusion

► Propofol (Non-proprietary)

Propofol 10 mg per 1 ml Propofol 500mg/50ml emulsion for infusion vials | 1 vial [PoM] £3.00 (Hospital only)
Propofol-Lipuro 1% emulsion for infusion 50ml vials | 10 vial [PoM] £97.56 (Hospital only)

Propofol 1g/100ml emulsion for infusion vials | 1 vial [PoM] £4.00 (Hospital only)

Propofol 20 mg per 1 ml Propofol 1g/50ml emulsion for infusion vials | 1 vial [PoM] £3.50 (Hospital only)

► Diprivan (Aspen Pharma Trading Ltd)

Propofol 10 mg per 1 ml Diprivan 1% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £10.68

Propofol 20 mg per 1 ml Diprivan 2% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £15.16

Emulsion for injection

► Propofol (Non-proprietary)

Propofol 5 mg per 1 ml Propofol-Lipuro 0.5% emulsion for injection 20ml ampoules | 5 ampoule [PoM] £15.15

ANAESTHETICS, GENERAL > VOLATILE LIQUID

Volatile halogenated anaesthetics

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Susceptibility to malignant hyperthermia
- **CAUTIONS** Can trigger malignant hyperthermia · neuromuscular disease (inhalational anaesthetics are very rarely associated with hyperkalaemia, resulting in cardiac arrhythmias and death) · raised intracranial pressure (can increase cerebrospinal pressure)

● SIDE-EFFECTS

- ▶ **Common or very common** Agitation · apnoea · arrhythmias · chills · coagulation disorder · conjunctivitis · cough · dizziness · drowsiness · fever · headache · hepatic disorders · hypersalivation · hypertension · hypotension · nausea · respiratory disorders · temperature regulation disorders · vomiting
- ▶ **Uncommon** Asthma · atrioventricular block · confusion · hypoxia · muscle complaints · myocardial infarction · myocardial ischaemia · vasodilation
- ▶ **Frequency not known** Abdominal pain · asthenia · breath holding · carboxyhaemoglobinemia · cardiac arrest · chest discomfort · cognitive impairment · delirium · dyspnoea · dystonia · electrolyte imbalance · haemorrhage · heart failure · ileus · intracranial pressure increased · malaise · metabolic acidosis · mood altered (that can last several days) · myoglobinuria · nephritis tubulointerstitial · oedema · pancreatitis · QT interval prolongation · rhabdomyolysis · seizure · shock · skin reactions · ventricular dysfunction · visual acuity decreased

- **ALLERGY AND CROSS-SENSITIVITY** Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.

- **DIRECTIONS FOR ADMINISTRATION** Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

F 806

Desflurane

● INDICATIONS AND DOSE

Induction of anaesthesia (but not recommended)

▶ BY INHALATION

- ▶ Child 12–17 years: 4–11 %, to be inhaled through specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide-oxygen)

▶ BY INHALATION

- ▶ Neonate: 2–6 %, to be inhaled through a specifically calibrated vaporiser.
- ▶ Child: 2–6 %, to be inhaled through a specifically calibrated vaporiser

Maintenance of anaesthesia (in oxygen or oxygen-enriched air)

▶ BY INHALATION

- ▶ Neonate: 2.5–8.5 %, to be inhaled through a specifically calibrated vaporiser.
- ▶ Child: 2.5–8.5 %, to be inhaled through a specifically calibrated vaporiser

- **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

▶ Desflurane (Non-proprietary)

Desflurane 1 ml per 1 ml Desflurane volatile liquid | 240 ml [PoM] (Hospital only)

F 806

Isoflurane

● INDICATIONS AND DOSE

Induction of anaesthesia (in oxygen or nitrous oxide-oxygen) (but indication not recommended in infants and children of all ages)

▶ BY INHALATION

- ▶ Neonate: Initially 0.5 %, increased to 3 %, adjusted according to response, administered using specifically calibrated vaporiser.

- ▶ Child: Initially 0.5 %, increased to 3 %, adjusted according to response, administered using specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide-oxygen)

▶ BY INHALATION

- ▶ Neonate: 1–2.5 %, to be administered using specifically calibrated vaporiser; an additional 0.5–1 % may be required when given with oxygen alone.

- ▶ Child: 1–2.5 %, to be administered using specifically calibrated vaporiser; an additional 0.5–1 % may be required when given with oxygen alone

Maintenance of anaesthesia in caesarean section (in nitrous oxide-oxygen)

▶ BY INHALATION

- ▶ Child: 0.5–0.75 %, to be administered using specifically calibrated vaporiser

IMPORTANT SAFETY INFORMATION

Isoflurane is not recommended for induction of anaesthesia in infants and children of all ages because of the occurrence of cough, breath-holding, desaturation, increased secretions, and laryngospasm.

- **CAUTIONS** Children under 2 years—limited experience
- **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

▶ Isoflurane (Non-proprietary)

Isoflurane 1 ml per 1 ml Isoflurane inhalation vapour | 250 ml [PoM] £35.29 (Hospital only)
Isoflurane volatile liquid | 250 ml [P] £47.50 (Hospital only)

▶ AErrane (Baxter Healthcare Ltd)

Isoflurane 1 ml per 1 ml AErrane volatile liquid | 250 ml [P] (Hospital only)

Nitrous oxide

• INDICATIONS AND DOSE

Maintenance of anaesthesia in conjunction with other anaesthetic agents

► BY INHALATION

► Neonate: 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen.

► Child: 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen

Analgesia

► BY INHALATION

► Neonate: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient's needs.

► Child: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient's needs

IMPORTANT SAFETY INFORMATION

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

• **CAUTIONS** Entrapped air following recent underwater dive • pneumothorax • presence of intracranial air after head injury • recent intra-ocular gas injection

CAUTIONS, FURTHER INFORMATION Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

• **INTERACTIONS** → Appendix 1: nitrous oxide

• **SIDE-EFFECTS** Abdominal distension • addiction • agranulocytosis • disorientation • dizziness • euphoric mood • megaloblastic anaemia • middle ear damage • myeloneuropathy • nausea • paraesthesia • sedation • subacute combined cord degeneration • tympanic membrane perforation • vomiting

SIDE-EFFECTS, FURTHER INFORMATION Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B₁₂; neurological toxic effects can occur without preceding overt haematological changes. Depression of white cell formation may also occur.

• **PREGNANCY** May depress neonatal respiration if used during delivery.

• **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

• MONITORING REQUIREMENTS

► Assessment of plasma-vitamin B₁₂ concentration should be considered in those at risk of deficiency, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia.

► Nitrous oxide should **not** be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.

• **DIRECTIONS FOR ADMINISTRATION** For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (*Entonox*®, *Equanox*®) is used.

• **HANDLING AND STORAGE** Exposure of theatre staff to nitrous oxide should be minimised (risk of serious side-effects).

• PATIENT AND CARER ADVICE

Sevoflurane

• INDICATIONS AND DOSE

Induction of anaesthesia (in oxygen or nitrous oxide-oxygen)

► BY INHALATION

► Neonate: Up to 4 %, adjusted according to response, to be administered using specifically calibrated vaporiser.

► Child: Initially 0.5–1 %, then increased to up to 8 %, increased gradually, according to response, to be administered using specifically calibrated vaporiser

Maintenance of anaesthesia (in oxygen or nitrous oxide-oxygen)

► BY INHALATION

► Neonate: 0.5–2 %, adjusted according to response, to be administered using specifically calibrated vaporiser.

► Child: 0.5–3 %, adjusted according to response, to be administered using specifically calibrated vaporiser

• **CAUTIONS** Susceptibility to QT-interval prolongation

• **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

• **PREGNANCY** May depress neonatal respiration if used during delivery.

• **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

• **RENAL IMPAIRMENT** Use with caution.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

► Sevoflurane (Non-proprietary)

Sevoflurane 1 ml per 1 ml Sevoflurane volatile liquid | 250 ml [PoM]

£123.00 (Hospital only)

1 Anaesthesia adjuvants

Pre-medication and peri-operative drugs

Drugs that affect gastric pH

Regurgitation and aspiration of gastric contents (Mendelson's syndrome) can be a complication of general anaesthesia, particularly in obstetrics and in gastro-oesophageal reflux disease; prophylaxis against acid aspiration is not routinely used in children but may be required in high-risk cases.

An **H₂-receptor antagonist** can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure.

Antimuscarinic drugs

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 648 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol p. 805 and suxamethonium chloride p. 813.

Atropine sulfate p. 810 is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. Atropine sulfate may have a role in cardiopulmonary resuscitation.

Hyoscine hydrobromide p. 266 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyrronium bromide p. 811 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising muscle relaxants.

Glycopyrronium bromide or hyoscine hydrobromide are also used to control excessive secretions in upper airways or hypersalivation in palliative care and in children unable to control posture or with abnormal swallowing reflex; effective dose varies and tolerance may develop. The intramuscular route should be avoided if possible. Hyoscine hydrobromide transdermal patches may also be used.

Sedative drugs

Premedication

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a **benzodiazepine**. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures. Oral administration is preferred if possible; the rectal route should only be used in exceptional circumstances.

Premedicants can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Oral midazolam p. 223 is the most common premedicant for children; temazepam p. 821 may be used in older children. The antihistamine alimemazine tartrate p. 177 is occasionally used orally, but when given alone it may cause postoperative restlessness in the presence of pain.

Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used for sedation prior to clinical procedures and for sedation in intensive care.

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil p. 840 is used to antagonise the effects of benzodiazepines.

Midazolam, a water-soluble benzodiazepine, is the preferred benzodiazepine for premedication and for sedation for clinical procedures in children. It has a fast onset of action, and recovery is faster than for other benzodiazepines. Recovery may be longer in children with a low cardiac output, or after repeated dosing.

Midazolam can be given by mouth [unlicensed], but its bitter acidic taste may need to be disguised. It can also be given buccally [unlicensed indication] or intranasally [unlicensed]. Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs. It can cause severe disinhibition and restlessness in some children. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur.

Temazepam is given by mouth for premedication in older children and has a short duration of action. Anxiolytic and sedative effects last about 90 minutes, although there may be residual drowsiness. Temazepam is rarely used for dental procedures in children.

Lorazepam p. 222 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Peri-operative use of diazepam p. 220 is not recommended in children; onset and magnitude of response are unreliable, and paradoxical effects may occur. Diazepam is not used for dental procedures in children.

Antagonists for central and respiratory depression

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by an opioid antagonist. Naloxone hydrochloride p. 842 given intravenously immediately reverses opioid-induced respiratory depression but the dose may have to be repeated because of its **short duration of action**.

Intramuscular injection of naloxone hydrochloride produces a more gradual and prolonged effect but absorption may be erratic. Care is required in children requiring pain relief because naloxone hydrochloride also antagonises the analgesic effect of opioids.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resedated.

Neonates

Naloxone hydrochloride is used in newborn infants to reverse respiratory depression and sedation resulting from the use of opioids by the mother, usually for pain during labour. In neonates the effects of opioids may persist for up to 48 hours and in such cases naloxone hydrochloride is often given by intramuscular injection for its prolonged effect. In severe respiratory depression after birth, breathing should first be established (using artificial means if necessary) and naloxone hydrochloride administered only if use of opioids by the mother is thought to cause the respiratory depression: the infant should be monitored

closely and further doses of naloxone hydrochloride administered as necessary.

ANTIMUSCARINICS

F 489

Atropine sulfate

● INDICATIONS AND DOSE

Bradycardia due to acute massive overdosage of beta-blockers

- BY INTRAVENOUS INJECTION
- Child: 40 micrograms/kg (max. per dose 3 mg)

Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)

- BY INTRAVENOUS INJECTION
- Child: 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning

Premedication

- BY INTRAVENOUS INJECTION
 - Neonate: 10 micrograms/kg, to be administered immediately before induction of anaesthesia.
 - Child 1 month–11 years: 20 micrograms/kg, to be administered immediately before induction of anaesthesia (minimum 100 micrograms, max. 600 micrograms)
 - Child 12–17 years: 300–600 micrograms, to be administered immediately before induction of anaesthesia
 - BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
 - Neonate: 10 micrograms/kg, to be administered 30–60 minutes before induction of anaesthesia.
 - Child 1 month–11 years: 10–30 micrograms/kg, to be administered 30–60 minutes before induction of anaesthesia (minimum 100 micrograms, max. 600 micrograms)
 - Child 12–17 years: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
 - BY MOUTH
 - Neonate: 20–40 micrograms/kg, to be administered 1–2 hours before induction of anaesthesia.
 - Child: 20–40 micrograms/kg (max. per dose 900 micrograms), to be administered 1–2 hours before induction of anaesthesia
- Intra-operative bradycardia**
- BY INTRAVENOUS INJECTION
 - Neonate: 10–20 micrograms/kg.
 - Child 1 month–11 years: 20 micrograms/kg
 - Child 12–17 years: 300–600 micrograms, larger doses may be used in emergencies
- Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block**
- BY INTRAVENOUS INJECTION
 - Neonate: 20 micrograms/kg.
 - Child 1 month–11 years: 20 micrograms/kg (max. per dose 1.2 mg)
 - Child 12–17 years: 0.6–1.2 mg

- **UNLICENSED USE** Not licensed for use in children under 12 years for intra-operative bradycardia or by intravenous route for premedication. Not licensed for use by oral route.

IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **INTERACTIONS** → Appendix 1: atropine
- **SIDE-EFFECTS**
 - Common or very common
 - With intravenous use Anhidrosis · anxiety · bronchial secretion decreased · dysphagia · gastrointestinal disorders · hallucination · hyperthermia · movement disorders · speech disorder · taste loss · thirst · urticaria · visual impairment
 - Rare or very rare
 - With intravenous use Angina pectoris · arrhythmias · hypertensive crisis · seizure
 - Frequency not known
 - With intravenous use Insomnia
 - With oral use Angle closure glaucoma · bronchial secretion altered · chest pain · dysphagia · fever · increased gastric reflux · thirst
- **PREGNANCY** Not known to be harmful; manufacturer advises caution.
- **BREAST FEEDING** May suppress lactation; small amount present in milk—manufacturer advises caution.
- **MONITORING REQUIREMENTS**
 - Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, injection solution may be given orally.
- **EXCEPTIONS TO LEGAL CATEGORY**
 - With intramuscular use or intravenous use or subcutaneous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, solution for infusion

Tablet

► Atropine sulfate (Non-proprietary)

Atropine sulfate 600 microgram Atropine 600microgram tablets | 28 tablet [PoM] £52.92 DT = £52.92

Solution for injection

► Atropine sulfate (Non-proprietary)

Atropine sulfate 100 microgram per 1 ml Atropine 500micrograms/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £13.00 | 10 pre-filled disposable injection [PoM] £130.00

Atropine sulfate 200 microgram per 1 ml Atropine 1mg/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £7.08–£13.00 | 10 pre-filled disposable injection [PoM] £130.00

Atropine sulfate 300 microgram per 1 ml Atropine 3mg/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £7.08–£13.00 DT = £7.11 | 10 pre-filled disposable injection [PoM] £130.00

Atropine sulfate 400 microgram per 1 ml Atropine 400micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £90.30 DT = £90.30

Atropine sulfate 600 microgram per 1 ml Atropine 600micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £11.71 DT = £11.71

Atropine 600micrograms/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £7.08

Atropine sulfate 1 mg per 1 ml Atropine 1mg/1ml solution for injection ampoules | 10 ampoule [PoM] £83.61 DT = £83.61

489

Glycopyrronium bromide

13-Sep-2017

(Glycopyrrolate)

● INDICATIONS AND DOSE

Premedication at induction

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Neonate: 5 micrograms/kg.

- Child 1 month–11 years: 4–8 micrograms/kg (max. per dose 200 micrograms)
- Child 12–17 years: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms)

Intra-operative bradycardia

► BY INTRAVENOUS INJECTION

► Neonate: 10 micrograms/kg, repeated if necessary.

► Child: 4–8 micrograms/kg (max. per dose 200 micrograms), repeated if necessary

Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block

► BY INTRAVENOUS INJECTION

► Neonate: 10 micrograms/kg.

- Child 1 month–11 years: 10 micrograms/kg (max. per dose 500 micrograms)
- Child 12–17 years: 10–15 micrograms/kg, alternatively, 200 micrograms per 1 mg of neostigmine to be administered

Control of upper airways secretion | Hypersalivation

► BY MOUTH

► Child: 40–100 micrograms/kg 3–4 times a day (max. per dose 2 mg), adjusted according to response, dose to be administered using tablets or injection solution, see *Directions for administration*

► BY SUBCUTANEOUS INFUSION

► Child 1 month–11 years: 12–40 micrograms/kg (max. per dose 1.2 mg) over 24 hours

► Child 12–17 years: 0.6–1.2 mg/24 hours

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Child 1 month–11 years: 4–10 micrograms/kg 4 times a day (max. per dose 200 micrograms) as required

► Child 12–17 years: 200 micrograms every 4 hours as required

SIALANAR® ORAL SOLUTION

Severe sialorrhoea (chronic pathological drooling)

► BY MOUTH

► Child 3–17 years: (consult product literature)

- **UNLICENSED USE** Not licensed for use in control of upper airways secretion and hypersalivation.

IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

● CAUTIONS

SIALANAR® ORAL SOLUTION Compromised blood-brain barrier—monitor for behavioural changes

- **INTERACTIONS** → Appendix 1: glycopyrronium

● SIDE-EFFECTS

► With oral use Angle closure glaucoma · anhidrosis · arrhythmias · bronchial secretion decreased · dysphagia ·

gastrointestinal hypomotility · mydriasis · photophobia · speech disorder · thirst · urinary urgency

- With parenteral use Angle closure glaucoma · anhidrosis · bradycardia · bronchial secretion decreased · mydriasis · photophobia · urinary urgency

● PREGNANCY

SIALANAR® ORAL SOLUTION Manufacturer advises avoid—no information available.

● BREAST FEEDING

SIALANAR® ORAL SOLUTION Manufacturer advises avoid—no information available.

● RENAL IMPAIRMENT

SIALANAR® ORAL SOLUTION Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

Dose adjustments Manufacturer advises reduce dose by 30% if estimated glomerular filtration rate is 30–89 mL/minute/1.73 m²—consult product literature.

● DIRECTIONS FOR ADMINISTRATION

- With oral use for Control of upper airways secretion or Hypersalivation For administration *by mouth*, injection solution may be given or crushed tablets suspended in water.

SIALANAR® ORAL SOLUTION Doses should be given at least 1 hour before or 2 hours after food, or at consistent times with respect to food if co-administration with food is required—high-fat food should be avoided; for administration by a nasogastric or feeding tube, flush with 10 mL of water immediately after dosing.

- **PRESCRIBING AND DISPENSING INFORMATION** Tablets may be available on a named-patient basis from specialist importing companies.

● PATIENT AND CARER ADVICE

SIALANAR® ORAL SOLUTION Manufacturer advises patients and their carers should be informed to stop treatment and seek medical advice if constipation, urinary retention, pneumonia, allergic reaction, pyrexia, or changes in behaviour occur; treatment should also be stopped and medical advice sought in very hot weather.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2017) that glycopyrronium bromide (*Sialanar*®) is accepted for use within NHS Scotland for the symptomatic treatment of severe sialorrhoea (chronic pathological drooling) in children and adolescents aged 3 years and older with chronic neurological disorders.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

- **Glycopyrronium bromide (Non-proprietary)**

Glycopyrronium bromide 1 mg Glycopyrronium bromide 1mg tablets | 30 tablet [PoM] £180.00-£230.77 DT = £230.54

Glycopyrronium bromide 2 mg Glycopyrronium bromide 2mg tablets | 30 tablet [PoM] £198.00-£254.24 DT = £254.23

Solution for injection

- **Glycopyrronium bromide (Non-proprietary)**

Glycopyrronium bromide 200 microgram per 1 ml Glycopyrronium bromide 200micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £5.72-£14.00 DT = £12.22
Glycopyrronium bromide 600micrograms/3ml solution for injection ampoules | 3 ampoule [PoM] £8.00 | 10 ampoule [PoM] £9.61-£13.97

Oral solution

- **Glycopyrronium bromide (Non-proprietary)**

Glycopyrronium bromide 200 microgram per 1 ml Glycopyrronium bromide 1mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £91.00 DT = £91.00

► **Sialanar** (Proveca Ltd)

Glycopyrronium bromide 400 microgram per 1 ml Sialanar
320micrograms/ml oral solution sugar-free | 250 ml [PoM] £320.00
DT = £320.00

1.1 Neuromuscular blockade

Neuromuscular blockade

Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Children who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 648. Non-depolarising neuromuscular blocking drugs can be divided into the **aminosteroid** group, comprising pancuronium bromide p. 815, rocuronium bromide p. 815, and vecuronium bromide p. 816, and the **benzylisoquinolinium** group, comprising atracurium besilate p. 813, cisatracurium p. 814, and mivacurium p. 814.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride p. 813. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in children with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute. Neonates may be more sensitive to the effects of atracurium besilate and lower doses may be required.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects. In children aged 1 month to 12 years, cisatracurium has a shorter duration of action and produces faster spontaneous recovery.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection. In children under 12 years mivacurium has a faster onset, shorter duration of action, and produces more rapid spontaneous recovery.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in children receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension. The half-life of pancuronium bromide is prolonged in neonates; neonates should receive postoperative intermittent positive pressure ventilation.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity. In most children, the duration of action of rocuronium bromide may be shorter than in adults; however, in neonates and children under 2 years, usual doses may produce a more prolonged action.

Vecuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects. In most children, the duration of action of vecuronium bromide may be shorter than in adults; however, in neonates and children under 2 years, usual doses may produce a more prolonged action.

Depolarising neuromuscular blocking drugs

Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required e.g. with tracheal intubation. Neonates and young children are less sensitive to suxamethonium chloride and a higher dose may be required. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. Bradycardia may occur; premedication with atropine sulfate p. 810 reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Children with myasthenia gravis are resistant to suxamethonium chloride but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

NEUROMUSCULAR BLOCKING DRUGS > DEPOLARISING

Suxamethonium chloride

(Succinylcholine chloride)

- **DRUG ACTION** Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

● INDICATIONS AND DOSE

Neuromuscular blockade (short duration) during surgery

► BY INTRAVENOUS INJECTION

- Neonate: 2 mg/kg, produces 5–10 minutes neuromuscular blockade.

- Child 1–11 months: 2 mg/kg
- Child 1–17 years: 1 mg/kg

► BY INTRAMUSCULAR INJECTION

- Neonate: Up to 4 mg/kg, produces 10–30 minutes neuromuscular blockade.

- Child 1–11 months: Up to 5 mg/kg
- Child 1–11 years: Up to 4 mg/kg (max. per dose 150 mg)

PHARMACOKINETICS

- Intramuscular injection has a duration of onset of 2–3 minutes.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Duchenne muscular dystrophy · family history of malignant hyperthermia · hyperkalaemia · low plasma-cholinesterase activity (including severe liver disease) · major trauma · neurological disease involving acute wasting of major muscle · personal or family history of congenital myotonic disease · prolonged immobilisation (risk of hyperkalaemia) · severe burns

- **CAUTIONS** Cardiac disease · neuromuscular disease · raised intra-ocular pressure (avoid in penetrating eye injury) · respiratory disease · severe sepsis (risk of hyperkalaemia)

- **INTERACTIONS** → Appendix 1: suxamethonium

● SIDE-EFFECTS

- **Common or very common** Arrhythmias · flushing · muscle contractions involuntary · myoglobinaemia · myoglobinuria · rash
 - **Rare or very rare** Apnoea · cardiac arrest · hypersensitivity · malignant hyperthermia · respiratory disorders · trismus
- SIDE-EFFECTS, FURTHER INFORMATION** Premedication with atropine reduces bradycardia associated with suxamethonium use.

- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

- **PREGNANCY** Mildly prolonged maternal neuromuscular blockade may occur.

- **BREAST FEEDING** Unlikely to be present in breast milk in significant amounts (ionised at physiological pH). Breast-feeding may be resumed once the mother recovered from neuromuscular block.

- **HEPATIC IMPAIRMENT** Prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

► Suxamethonium chloride (Non-proprietary)

Suxamethonium chloride 50 mg per 1 ml Suxamethonium chloride 100mg/2ml solution for injection ampoules | 10 ampoule [PoM] £28.80–£50.00

► Anectine (Aspen Pharma Trading Ltd)

Suxamethonium chloride 50 mg per 1 ml Anectine 100mg/2ml solution for injection ampoules | 5 ampoule [PoM] £3.57

NEUROMUSCULAR BLOCKING DRUGS > NON-DEPOLARISING

Non-depolarising neuromuscular blocking drugs

IMPORTANT SAFETY INFORMATION

Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CAUTIONS** Burns (resistance can develop, increased doses may be required) · cardiovascular disease (reduce rate of administration) · electrolyte disturbances (response unpredictable) · fluid disturbances (response unpredictable) · hypothermia (activity prolonged, lower doses required) · myasthenia gravis (activity prolonged, lower doses required) · neuromuscular disorders (response unpredictable)

● SIDE-EFFECTS

- **Common or very common** Flushing · hypotension
 - **Uncommon** Bronchospasm · hypersensitivity · skin reactions · tachycardia
 - **Rare or very rare** Circulatory collapse · muscle weakness · myopathy (after prolonged use in intensive care) · shock
- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

- **PREGNANCY** Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

- **BREAST FEEDING** Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

► above

Atracurium besilate (Atracurium besylate)

● INDICATIONS AND DOSE

Neuromuscular blockade (short to intermediate duration) for surgery

► INITIALLY BY INTRAVENOUS INJECTION

- Neonate: Initially 300–500 micrograms/kg, followed by (by intravenous injection) 100–200 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–400 micrograms/kg/hour, adjusted according to response.

continued →

- ▶ Child: Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg, repeated if necessary, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour, adjusted according to response

Neuromuscular blockade during intensive care

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Neonate: Initially 300–500 micrograms/kg, followed by (by intravenous injection) 100–200 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–400 micrograms/kg/hour, adjusted according to response, higher doses may be necessary.
- ▶ Child: Initially 300–600 micrograms/kg, initial dose is optional, then (by intravenous infusion) 270–1770 micrograms/kg/hour; (by intravenous infusion) usual dose 650–780 micrograms/kg/hour

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **UNLICENSED USE** Not licensed for use in neonates.
- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

● SIDE-EFFECTS

- ▶ Rare or very rare Cardiac arrest
- ▶ Frequency not known Seizure

SIDE-EFFECTS, FURTHER INFORMATION Hypotension, skin flushing, and bronchospasm is associated with histamine release. Manufacturer advises minimising effects of histamine release by administering over 1 minute in patients with cardiovascular disease or sensitivity to hypotension. Neonates may be more sensitive to the effects of atracurium and lower doses may be required.

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute to a concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent.

Neonatal intensive care, dilute 60 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; minimum concentration of 500 micrograms/mL, maximum concentration of 5 mg/mL; an intravenous infusion rate of 0.1 mL/hour provides a dose of 120 micrograms/kg/hour.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Atracurium besilate (Non-proprietary)**

Atracurium besilate 10 mg per 1 mL Atracurium besilate 250mg/25mL solution for injection vials | 1 vial [PoM] £16.50 (Hospital only)

Atracurium besilate 25mg/2.5mL solution for injection ampoules | 5 ampoule [PoM] £9.25 (Hospital only) | 5 ampoule [PoM] £9.25 Atracurium besilate 50mg/5mL solution for injection ampoules | 5 ampoule [PoM] £17.50 (Hospital only) | 5 ampoule [PoM] £17.50

- ▶ **Tracrium** (Aspen Pharma Trading Ltd)

Atracurium besilate 10 mg per 1 mL Tracrium 250mg/25mL solution for injection vials | 2 vial [PoM] £25.81 Tracrium 25mg/2.5mL solution for injection ampoules | 5 ampoule [PoM] £8.28 Tracrium 50mg/5mL solution for injection ampoules | 5 ampoule [PoM] £15.02

Cisatracurium

F 813

● INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Child 1 month–1 year: Initially 150 micrograms/kg, then (by intravenous injection) 30 micrograms/kg every 20 minutes as required
- ▶ Child 2–11 years: Initially 150 micrograms/kg, 80–100 micrograms/kg if not for intubation, then (by intravenous injection) 20 micrograms/kg every 10 minutes as required, alternatively (by intravenous injection) initially 150 micrograms/kg, followed by (by intravenous infusion) 180 micrograms/kg/hour, (by intravenous infusion) reduced to 60–120 micrograms/kg/hour, adjusted according to response
- ▶ Child 12–17 years: Initially 150 micrograms/kg, then (by intravenous injection) 30 micrograms/kg every 20 minutes as required, alternatively (by intravenous injection) initially 150 micrograms/kg, followed by (by intravenous infusion) 180 micrograms/kg/hour, (by intravenous infusion) reduced to 60–120 micrograms/kg/hour, adjusted according to response

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

● SIDE-EFFECTS

- ▶ Common or very common Bradycardia

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute to a concentration of 0.1–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pancuronium bromide

● INDICATIONS AND DOSE

Neuromuscular blockade (long duration) during surgery

▶ BY INTRAVENOUS INJECTION

- ▶ Neonate: Initially 100 micrograms/kg, then 50 micrograms/kg, repeated if necessary.
- ▶ Child: Initially 100 micrograms/kg, then 20 micrograms/kg, repeated if necessary

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS** Apnoea · arrhythmia · hypersalivation · increased cardiac output · miosis
- SIDE-EFFECTS, FURTHER INFORMATION** Pancuronium lacks histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia.
- **HEPATIC IMPAIRMENT** Possibly slower onset, higher dose requirement, and prolonged recovery time.

- **RENAL IMPAIRMENT** Use with caution; prolonged duration of block.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give undiluted or dilute in Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Pancuronium bromide (Non-proprietary)

Pancuronium bromide 2 mg per 1 ml Pancuronium bromide 4mg/2ml solution for injection ampoules | 10 ampoule [PoM] £50.00 (Hospital only)

F 813

Rocuronium bromide

● INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Neonate: Initially 600 micrograms/kg, then (by intravenous injection) 150 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–600 micrograms/kg/hour, adjusted according to response.
- ▶ Child: Initially 600 micrograms/kg, then (by intravenous injection) 150 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–600 micrograms/kg/hour, adjusted according to response

Assisted ventilation in intensive care

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Child: Initially 600 micrograms/kg, initial dose is optional, then (by intravenous infusion) 300–600 micrograms/kg/hour for first hour, then (by intravenous infusion), adjusted according to response

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- **UNLICENSED USE** Not licensed for use in children for assisted ventilation in intensive care.
- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Angioedema · face oedema · hypersensitivity · malignant hyperthermia · paralysis · rash erythematous
- **HEPATIC IMPAIRMENT**
 - Dose adjustments Reduce dose.
- **RENAL IMPAIRMENT**
 - Dose adjustments Reduce maintenance dose; prolonged paralysis.
- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* or via drip tubing, may be diluted with Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Rocuronium bromide (Non-proprietary)

Rocuronium bromide 10 mg per 1 ml Rocuronium bromide 50mg/5ml solution for injection ampoules | 10 ampoule [PoM] £24.00
Rocuronium bromide 50mg/5ml solution for injection vials | 10 vial [PoM] £28.00–£30.00
Rocuronium bromide 100mg/10ml solution for injection vials | 10 vial [PoM] £57.00–£57.90

- ▶ **Esmeron** (Merck Sharp & Dohme Ltd)
Rocuronium bromide 10 mg per 1 mL Esmeron 50mg/5mL solution for injection vials | 10 vial [PoM] £28.92 (Hospital only)
Esmeron 100mg/10mL solution for injection vials | 10 vial [PoM] £57.85 (Hospital only)

F 813

Vecuronium bromide

• INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Neonate: Initially 80 micrograms/kg, then (by intravenous injection) 30–50 micrograms/kg, adjusted according to response.

- ▶ Child: Initially 80–100 micrograms/kg, then (by intravenous injection) 20–30 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 0.8–1.4 micrograms/kg/minute, adjusted according to response

Assisted ventilation in intensive care

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Neonate: Initially 80 micrograms/kg, then (by intravenous injection) 30–50 micrograms/kg, adjusted according to response, alternatively (by intravenous injection) initially 80 micrograms/kg, then (by intravenous infusion) 0.8–1.4 micrograms/kg/minute, adjusted according to response, risk of accumulation—consider interruption of infusion.

- ▶ Child: Initially 80–100 micrograms/kg, initial dose is optional, then (by intravenous infusion) 0.8–1.4 micrograms/kg/minute, adjusted according to response, (by intravenous infusion) increased if necessary up to 3 micrograms/kg/minute

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- **UNLICENSED USE** Not licensed for assisted ventilation in intensive care.
- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS**
 - ▶ Rare or very rare Angioedema · face oedema · hypersensitivity · paralysis · rash erythematous
- **HEPATIC IMPAIRMENT** Use with caution in significant impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION** Reconstitute each vial with 5 mL Water for Injections to give 2 mg/mL solution; alternatively reconstitute with up to 10 mL Glucose 5% or Sodium Chloride 0.9% or Water for Injections—unsuitable for further dilution if not reconstituted with Water for Injections. For *continuous intravenous infusion*, dilute reconstituted solution to a concentration up to 40 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; reconstituted solution can also be given via drip tubing.
 - ▶ *Neonatal intensive care*, reconstitute each vial with 5 mL Water for Injections to give a 2 mg/mL solution. Dilute 5 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.5 mL/hour provides a dose of 50 micrograms/kg/hour; minimum concentration of 40 micrograms/mL.

- **MEDICINAL FORMS**
No licensed medicines listed.

1.2 Neuromuscular blockade reversal

Neuromuscular blockade reversal

Neuromuscular blockade reversal

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium bromide p. 811 or alternatively atropine sulfate, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

Other drugs for reversal of neuromuscular blockade

Sugammadex p. 817 is a modified gamma cyclodextrin that can be used in children for the routine reversal of neuromuscular blockade induced by rocuronium bromide.

ANTICHOLINESTERASES

Neostigmine with glycopyrronium bromide

The properties listed below are those particular to the combination only. For the properties of the components please consider, neostigmine p. 648, glycopyrronium bromide p. 811.

• INDICATIONS AND DOSE

Reversal of non-depolarising neuromuscular blockade

▶ BY INTRAVENOUS INJECTION

- ▶ Child: 0.02 mL/kg, repeated if necessary, alternatively dilute to 1 in 10 solution and give 0.2 mL/kg; maximum 2 mL per course

- **INTERACTIONS** → Appendix 1: glycopyrronium · neostigmine
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, may be diluted with Sodium Chloride 0.9%, give over 10–30 seconds
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Neostigmine with glycopyrronium bromide (Non-proprietary)**
Glycopyrronium bromide 500 microgram per 1 mL, Neostigmine metilsulfate 2.5 mg per 1 mL Neostigmine 2.5mg/1mL / Glycopyrronium bromide 500micrograms/1mL solution for injection ampoules | 10 ampoule [PoM] £11.50

ANTIDOTES AND CHELATORS**Sugammadex****● INDICATIONS AND DOSE****Routine reversal of neuromuscular blockade induced by rocuronium****► BY INTRAVENOUS INJECTION**

- Child 2–17 years: 2 mg/kg (consult product literature)

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CAUTIONS** Cardiovascular disease (recovery may be delayed) · pre-existing coagulation disorders · recurrence of neuromuscular blockade— monitor respiratory function until fully recovered · use of anticoagulants (unrelated to surgery) · wait 24 hours before re-administering rocuronium
- **INTERACTIONS** → Appendix 1: sugammadex
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · arrhythmias · cough · dizziness · headache · nausea · skin reactions · taste altered · vomiting
 - **Uncommon** Hypersensitivity
 - **Frequency not known** Bronchospasm
- **PREGNANCY** Use with caution—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection dose may be diluted to a concentration of 10 mg/mL with Sodium Chloride 0.9%.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium*, has advised (February 2013) that sugammadex (*Bridion*®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Sodium

- **Bridion** (Merck Sharp & Dohme Ltd)

Sugammadex (as Sugammadex sodium) 100 mg per 1 ml Bridion 500mg/5ml solution for injection vials | 10 vial [POM] £1,491.00 (Hospital only)
Bridion 200mg/2ml solution for injection vials | 10 vial [POM] £596.40 (Hospital only)

1.3 Peri-operative analgesia**Peri-operative analgesia****Non-opioid analgesics**

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

Diclofenac sodium p. 652, diclofenac potassium p. 651, ibuprofen p. 655, paracetamol p. 271, and ketorolac trometamol below, are used to relieve postoperative pain in children; diclofenac sodium and paracetamol can be given

parenterally and rectally as well as by mouth. Ketorolac trometamol is given by intravenous injection.

Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to children who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; see general notes on opioid analgesics and their use in postoperative pain.

See the management of opioid-induced respiratory depression in Pre-medication and peri-operative drugs p. 809.

Intra-operative analgesia

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil p. 818, fentanyl p. 279, and remifentanyl p. 819 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect.

In contrast to other opioids which are metabolised in the liver, remifentanyl undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanyl should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanyl.

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS**Ketorolac trometamol****● INDICATIONS AND DOSE****Short-term management of moderate to severe acute postoperative pain only****► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**

- Child 16–17 years (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
- Child 16–17 years (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
- **BY INTRAVENOUS INJECTION**
- Child 6 months–15 years: Initially 0.5–1 mg/kg (max. per dose 15 mg), then 500 micrograms/kg every 6 hours (max. per dose 15 mg) as required for maximum duration of treatment 2 days; maximum 60 mg per day

- **UNLICENSED USE** Not licensed for use in children under 16 years.

- **CONTRA-INDICATIONS** Active or history of gastro-intestinal bleeding · active or history of gastro-intestinal ulceration · coagulation disorders · complete or partial syndrome of nasal polyps · confirmed or suspected cerebrovascular bleeding · dehydration · following operations with high risk of haemorrhage or incomplete

haemostasis · haemorrhagic diatheses · history of gastro-intestinal perforation · hypovolaemia · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS** Agranulocytosis · angioedema · anxiety · aplastic anaemia · appetite decreased · asthenia · asthma · azotaemia · bradycardia · burping · chest pain · concentration impaired · confusion · constipation · Crohn's disease aggravated · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · euphoric mood · fever · flank pain · fluid retention · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · hearing impairment · heart failure · hepatic disorders · hyperhidrosis · hyperkinesia · hypersensitivity · hypertension · hypotension · infertility female · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · musculoskeletal disorder · myalgia · myocardial infarction · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral disorders · pallor · palpitations · pancreatitis · paraesthesia · perforation · photosensitivity reaction · platelet aggregation inhibition · psychotic disorder · pulmonary oedema · renal impairment · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · sleep disorders · stroke · taste altered · thinking abnormal · thirst · thrombocytopenia · ulcer · urinary disorders · vertigo · visual impairment · vomiting · weight increased · wound haemorrhage

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 650.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if serum creatinine greater than 160 micromol/litre. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration. Max. 60 mg daily by intramuscular injection or intravenous injection.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give over at least 15 seconds.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Ketorolac trometamol (Non-proprietary)

Ketorolac trometamol 30 mg per 1 ml Ketorolac 30mg/1ml solution for injection ampoules | 5 ampoules **[PoM]** £4.00 (Hospital only) | 5 ampoules **[PoM]** £4.00 | 6 ampoules **[PoM]** £6.56

Ketorolac trometamol 30 mg per 1 ml Toradol 30mg/1ml solution for injection ampoules | 5 ampoules **[PoM]** £5.36

ANALGESICS > OPIOIDS

F 273

Alfentanil

● INDICATIONS AND DOSE

Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures

► BY INTRAVENOUS INJECTION

- **Neonate:** Initially 5–20 micrograms/kg, dose to be administered over 30 seconds; supplemental doses up to 10 micrograms/kg.

- **Child:** Initially 10–20 micrograms/kg, dose to be administered over 30 seconds; supplemental doses up to 10 micrograms/kg

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures

► BY INTRAVENOUS INFUSION

- **Neonate:** Initially 10–50 micrograms/kg, dose to be administered over 10 minutes, followed by 30–60 micrograms/kg/hour.

- **Child:** Initially 50–100 micrograms/kg, dose to be administered over 10 minutes, followed by 30–120 micrograms/kg/hour, usual dose with intravenous anaesthetic, 60 micrograms/kg/hour

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

PHARMACOKINETICS

- Half-life is prolonged in neonates and accumulation is likely with prolonged use. Clearance may be increased in children 1 month–12 years and higher infusion doses might be needed.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- **Repeated intra-operative doses** Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

- **INTERACTIONS** → Appendix 1: opioids

● SIDE-EFFECTS

- **Common or very common** Apnoea · chills · fatigue · hypertension · movement disorders · muscle rigidity
- **Uncommon** Arrhythmia · coma · hiccups · hypercapnia · pain · post procedural complications · respiratory disorders · skin reactions
- **Rare or very rare** Agitation · crying · epistaxis · vascular pain
- **Frequency not known** Cardiac arrest · cough · disorientation · fever · loss of consciousness · seizure

SIDE-EFFECTS, FURTHER INFORMATION Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

- **BREAST FEEDING** Present in milk—withhold breast-feeding for 24 hours.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **DIRECTIONS FOR ADMINISTRATION** 5 mg/mL injection to be diluted before use. For *continuous or intermittent intravenous infusion* dilute in Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

Remifentanil

● INDICATIONS AND DOSE

Analgesia and enhancement of anaesthesia at induction (initial bolus injection)

▶ **BY INTRAVENOUS INFUSION**

- ▶ Child 12–17 years: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, if child is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose

▶ **BY INTRAVENOUS INFUSION**

- ▶ Child 12–17 years: 30–60 micrograms/kg/hour, if child is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)

▶ **BY INTRAVENOUS INFUSION**

- ▶ Child 1 month–11 years: Initially 0.1–1 microgram/kg, dose to be administered over at least 30 seconds (omitted if not required)
- ▶ Child 12–17 years: Initially 0.1–1 microgram/kg, dose to be administered over at least 30 seconds (omitted if not required)

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial bolus dose

▶ **BY INTRAVENOUS INFUSION**

- ▶ Neonate: 24–60 micrograms/kg/hour, additional doses of 1 microgram/kg can be given by *intravenous injection* during the intravenous infusion.

- ▶ Child 1 month–11 years: 3–78 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, additional doses can be given by *intravenous injection* during the intravenous infusion
- ▶ Child 12–17 years: 3–120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, additional doses can be given by *intravenous injection* during the intravenous infusion

Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia

▶ **BY INTRAVENOUS INFUSION**

- ▶ Child 12–17 years: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5–6 micrograms/kg/hour

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **UNLICENSED USE** Not licensed for use in children under 1 year.

- **CONTRA-INDICATIONS** Analgesia in conscious patients

- **INTERACTIONS** → Appendix 1: opioids

● **SIDE-EFFECTS**

- ▶ **Common or very common** Apnoea · muscle rigidity · post procedural complications

- ▶ **Uncommon** Hypoxia

- ▶ **Rare or very rare** Cardiac arrest

- ▶ **Frequency not known** Agitation · atrioventricular block · hypertension · seizure

SIDE-EFFECTS, FURTHER INFORMATION In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by plasma esterases; it has short duration of action which is independent of dose and duration of infusion.

Muscle rigidity Remifentanil can cause muscle rigidity that can be managed by the use of neuromuscular blocking drugs.

- **PREGNANCY** No information available.

- **BREAST FEEDING** Avoid breast-feeding for 24 hours after administration—present in milk in *animal* studies.

● **RENAL IMPAIRMENT**

Dose adjustments No dose adjustment necessary in renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, reconstitute to a concentration of 1 mg/mL; for *continuous intravenous infusion*, dilute further with Glucose 5% or Sodium Chloride 0.9% to a concentration of 20–25 micrograms/mL for child 1–12 years or 20–250 micrograms/mL (usually 50 micrograms/mL) for child 12–18 years.

● **PRESCRIBING AND DISPENSING INFORMATION**

Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

1.4 Peri-operative sedation

Conscious sedation for clinical procedures

Overview

Sedation of children during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure and whether the child is cooperative; some procedures are safer and more successful under anaesthesia.

Midazolam p. 223 and chloral hydrate p. 294 are suitable for sedating children for painless procedures, such as imaging. For painful procedures, alternative choices include nitrous oxide p. 808, local anaesthesia, ketamine below, or concomitant use of sedation with **opioid** or **non-opioid analgesia**.

ANAESTHETICS, GENERAL ► NMDA RECEPTOR ANTAGONISTS

Ketamine

● INDICATIONS AND DOSE

Induction and maintenance of anaesthesia for short procedures

► BY INTRAMUSCULAR INJECTION

- Neonate: 4 mg/kg, adjusted according to response, a dose of 4 mg/kg usually produces 15 minutes of surgical anaesthesia.

- Child: 4–13 mg/kg, adjusted according to response, a dose of 4 mg/kg sufficient for some diagnostic procedures, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia

► BY INTRAVENOUS INJECTION

- Neonate: 1–2 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia.

- Child 1 month–11 years: 1–2 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia

- Child 12–17 years: 1–4.5 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia

Induction and maintenance of anaesthesia for long procedures

► INITIALLY BY INTRAVENOUS INJECTION

- Neonate: Initially 0.5–2 mg/kg, followed by (by continuous intravenous infusion) 8 micrograms/kg/minute, adjusted according to response, doses up to 30 micrograms/kg/minute may be used to produce deep anaesthesia.

- Child: Initially 0.5–2 mg/kg, followed by (by continuous intravenous infusion) 10–45 micrograms/kg/minute, adjusted according to response

Sedation prior to invasive or painful procedures

► BY INTRAVENOUS INJECTION

- Child: 1–2 mg/kg for 1 dose

IMPORTANT SAFETY INFORMATION

Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 603 • eclampsia • head trauma • hypertension • pre-eclampsia • raised intracranial pressure • severe cardiac disease • stroke

- **CAUTIONS** Acute circulatory failure (shock) • cardiovascular disease • dehydration • fixed cardiac output • hallucinations • head injury • hypertension • hypovolaemia • increased cerebrospinal fluid pressure • intracranial mass lesions • nightmares • predisposition to seizures • psychotic disorders • raised intra-ocular pressure • respiratory tract infection • thyroid dysfunction

- **INTERACTIONS** → Appendix 1: ketamine

● SIDE-EFFECTS

- **Common or very common** Anxiety • behaviour abnormal • confusion • diplopia • hallucination • muscle tone increased • nausea • nystagmus • skin reactions • sleep disorders • tonic clonic movements • vomiting
- **Uncommon** Appetite decreased • arrhythmias • hypotension • respiratory disorders
- **Rare or very rare** Apnoea • cystitis • cystitis haemorrhagic • delirium • dysphoria • flashback • hypersalivation
- **Frequency not known** Drug-induced liver injury

SIDE-EFFECTS, FURTHER INFORMATION Incidence of hallucinations can be reduced by premedication with a benzodiazepine (such as midazolam).

- **PREGNANCY** May depress neonatal respiration if used during delivery.

- **BREAST FEEDING** Avoid for at least 12 hours after last dose.

● HEPATIC IMPAIRMENT

Dose adjustments Consider dose reduction.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9%. For *continuous intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see *Drugs and driving* under Guidance on prescribing p. 1.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

► **Ketamine (Non-proprietary)**

Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml Ketamine

500mg/10ml solution for injection vials | 10 vial [PoM] £70.00 [CD2]

► **Ketalar (Pfizer Ltd)**

Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml Ketalar
200mg/20ml solution for injection vials | 1 vial [PoM] £5.06 (Hospital only) [CD2]

Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml Ketalar
500mg/10ml solution for injection vials | 1 vial [PoM] £8.77 (Hospital only) [CD2]

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

F 218

Temazepam

● INDICATIONS AND DOSE

Premedication before surgery or investigatory procedures

► BY MOUTH

- Child 12–17 years: 10–20 mg, to be taken 1 hour before procedure

- **UNLICENSED USE** Tablets not licensed for use in children.

- **CONTRA-INDICATIONS** CNS depression · compromised airway · hyperkinesia · obsessional state · phobic states · respiratory depression

- **CAUTIONS** Hypoalbuminaemia · muscle weakness · organic brain changes

CAUTIONS, FURTHER INFORMATION

- **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- **INTERACTIONS** → Appendix 1: temazepam

- **SIDE-EFFECTS** Dreaming excessive · drug abuse · dry mouth · hypersalivation · speech slurred

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Can precipitate coma. Avoid in severe impairment.

Dose adjustments Start with smaller initial doses or reduce dose.

● **RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe impairment.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Temazepam Tablets and Oral Solution may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 19

► **Temazepam (Non-proprietary)**

Temazepam 2 mg per 1 ml Temazepam 10mg/5ml oral solution
sugar free sugar-free | 300 ml [PoM] £184.50 DT = £169.44 [CD3]

Tablet

CAUTIONARY AND ADVISORY LABELS 19

► **Temazepam (Non-proprietary)**

Temazepam 10 mg Temazepam 10mg tablets | 28 tablet [PoM]

£35.00 DT = £1.36 [CD3] | 500 tablet [PoM] £24.29–£624.82 [CD3]

Temazepam 20 mg Temazepam 20mg tablets | 28 tablet [PoM]

£35.00 DT = £1.43 [CD3] | 250 tablet [PoM] £12.77–£307.94 [CD3]

2 Malignant hyperthermia

MUSCLE RELAXANTS > DIRECTLY ACTING

15

Anaesthesia

Dantrolene sodium

- **DRUG ACTION** Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

● INDICATIONS AND DOSE

Malignant hyperthermia

► BY RAPID INTRAVENOUS INJECTION

- Child: Initially 2–3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course

Chronic severe spasticity of voluntary muscle

► BY MOUTH

- Child 5–11 years: Initially 500 micrograms/kg once daily for 7 days, then increased to 500 micrograms/kg/dose 3 times a day, then increased in steps of 500 micrograms/kg/dose every 7 days (max. per dose 2 mg/kg 3–4 times a day) until satisfactory response; maximum 400 mg per day
- Child 12–17 years: Initially 25 mg once daily for 7 days, then increased to 25 mg 3 times a day, then increased in steps of 500 micrograms/kg/dose every 7 days (max. per dose 2 mg/kg 3–4 times a day) until satisfactory response; maximum 400 mg per day

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

● **CONTRA-INDICATIONS**

- With oral use Acute muscle spasm · avoid when spasticity is useful, for example, locomotion

● **CAUTIONS**

- With intravenous use Avoid extravasation (risk of tissue necrosis)
- With oral use Females (hepatotoxicity) · history of liver disorders (hepatotoxicity) · if doses greater than 400 mg daily (hepatotoxicity) · impaired cardiac function · impaired pulmonary function · therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks

- **INTERACTIONS** → Appendix 1: dantrolene

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Abdominal pain · hepatic disorders · nausea · respiratory disorders · skin reactions · speech disorder · vomiting

- ▶ **Uncommon** Crystalluria · hyperhidrosis
- ▶ **Frequency not known** Arrhythmias · dizziness · drowsiness

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With oral use Appetite decreased · chills · confusion · depression · eosinophilia · fever · headache · insomnia · nervousness · pericarditis · visual impairment
- ▶ **Uncommon**
 - ▶ With oral use Constipation · dysphagia · haemorrhage · heart failure aggravated · urinary disorders
- ▶ **Frequency not known**
 - ▶ With intravenous use Gastrointestinal haemorrhage · heart failure · pulmonary oedema · seizure
 - ▶ With oral use Asthenia · diarrhoea · dyspnoea · hypertension · malaise

● PREGNANCY

- ▶ With intravenous use Use only if potential benefit outweighs risk.
- ▶ With oral use Avoid use in chronic spasticity—embryotoxic in animal studies.

● BREAST FEEDING

- ▶ With intravenous use Present in milk—use only if potential benefit outweighs risk.
- ▶ With oral use Present in milk—manufacturer advises avoid use in chronic spasticity.

- **HEPATIC IMPAIRMENT** Avoid—may cause severe liver damage (injection may be used in an emergency for malignant hyperthermia).

● MONITORING REQUIREMENTS

- ▶ With oral use Test liver function before and at intervals during therapy.

● PATIENT AND CARER ADVICE

- ▶ Hepatotoxicity
- ▶ With oral use Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.
- ▶ **Driving and skilled tasks** ▶ With oral use Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Powder for solution for injection

- ▶ **Dantrium** (Norgine Pharmaceuticals Ltd)
Dantrolene sodium 20 mg Dantrium Intravenous 20mg powder for solution for injection vials | 12 vial (PoM) £612.00 (Hospital only) | 36 vial (PoM) £1,836.00 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Dantrium** (Norgine Pharmaceuticals Ltd)
Dantrolene sodium 25 mg Dantrium 25mg capsules | 100 capsule (PoM) £16.87 DT = £16.87
Dantrolene sodium 100 mg Dantrium 100mg capsules | 100 capsule (PoM) £43.07 DT = £43.07

Local anaesthesia

Anaesthesia (local)

Local anaesthetic drugs

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These

factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier's block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 824 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Levobupivacaine p. 825, an isomer of bupivacaine hydrochloride, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 826 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should **not** usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 136) is about 90 minutes.

Application of a mixture of lidocaine and prilocaine (EMLA[®]) under an occlusive dressing provides surface anaesthesia for 1–2 hours. EMLA[®] does not appear to be effective in providing local anaesthesia for heel lancing in neonates.

Prilocaine hydrochloride p. 829 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride.

Ropivacaine hydrochloride p. 830 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 831, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. Tetracaine is effective for 4–6 hours after a single application in most children. It is not recommended prior to neonatal heel lancing.

Tetracaine is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

Administration by injection

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The child's age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

NHS Improvement has advised (September 2016) that, prior to administration, all injectable medicines must be drawn directly from their original ampoule or container into a syringe and should **never** be decanted into gallipots or open containers. This is to avoid the risk of medicines being confused with other substances, e.g. skin disinfectants, and to reduce the risk of contamination.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidural anaesthesia is combined with general anaesthesia for certain surgical procedures in children.

Vasoconstrictors in combination with local anaesthetics

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline/epinephrine, and it is not advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products.

In children with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local anaesthetic may be hazardous. For these children an anaesthetic without adrenaline/epinephrine should be used.

Dental anaesthesia

Lidocaine hydrochloride is widely used in dental procedures; it is most often used in combination with adrenaline/epinephrine. Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine. The amide-type local anaesthetics articaine and mepivacaine hydrochloride p. 829 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine, and articaine is available with adrenaline/epinephrine. In children with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in children with coronary artery disease.

Toxicity induced by local anaesthesia

For management of toxicity see Severe local anaesthetic-induced cardiovascular toxicity below.

Severe local anaesthetic-induced cardiovascular toxicity

Overview

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed.

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as *Intralipid*® [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over

1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity – Accompanying notes.

ANAESTHETICS, LOCAL

Adrenaline with articaine hydrochloride

(Carticaine hydrochloride with epinephrine)

● INDICATIONS AND DOSE

Infiltration anaesthesia in dentistry

► BY REGIONAL ADMINISTRATION

- Child 4–17 years: Consult expert dental sources

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **CONTRA-INDICATIONS** Application to damaged skin · application to the middle ear (may cause ototoxicity) · complete heart block · injection into infected tissues · injection into inflamed tissues · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block)

CONTRA-INDICATIONS, FURTHER INFORMATION

- Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- **CAUTIONS** Arrhythmias · cardiovascular disease · cerebrovascular disease · children (consider dose reduction) · cor pulmonale · debilitated patients (consider dose reduction) · diabetes mellitus · epilepsy · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · hypovolaemia · impaired cardiac conduction · impaired respiratory function · ischaemic heart disease · myasthenia gravis · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · pheochromocytoma · prostate disorders ·

psychoneurosis · severe angina · shock · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

- Use of vasoconstrictors In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

- **INTERACTIONS** → Appendix 1: articaïne · sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS** Face oedema · gingivitis · headache · nausea · sensation abnormal

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The toxicity mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

● ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaïne, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Avoid breast-feeding for 48 hours after administration.

- **HEPATIC IMPAIRMENT** Use with caution; increased risk of side-effects in severe impairment.

- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS** Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfites

- **Septanest** (Septodont Ltd)

Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 ml, Articaïne hydrochloride 40 mg per 1 ml Septanest 1 in 100,000 solution for injection cartridges | 50 cartridge (PoM) £24.95

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Articaïne hydrochloride 40 mg per 1 ml Septanest 1 in 200,000 solution for injection cartridges | 50 cartridge (PoM) £24.95

Bupivacaine hydrochloride

● INDICATIONS AND DOSE

Surgical anaesthesia | Acute pain

- BY REGIONAL ADMINISTRATION

- Child: Doses adjusted according to child's physical status and nature of procedure, seek expert advice (consult product literature or local protocols)

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway

management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

- Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease · cerebral atheroma · children (consider dose reduction) · debilitated patients (consider dose reduction) · epilepsy · hypertension · hypotension · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · myocardial depression may be more severe and more resistant to treatment · shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

● SIDE-EFFECTS

- **Common or very common** Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · urinary retention · vomiting

- **Uncommon** Neurotoxicity

- **Rare or very rare** Arachnoiditis · cardiac arrest · diplopia · nerve disorders · paraplegia · paresis · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

● ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaïne, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.

Dose adjustments Use lower doses for intrathecal use during late pregnancy.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

LMX 4[®]

Anaesthesia before venous cannulation or venepuncture

► TO THE SKIN

- Child 1–2 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes
- Child 3–11 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
- Child 1–17 years: Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

IMPORTANT SAFETY INFORMATION

► When used by local infiltration

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

Lidocaine hydrochloride

(Lignocaine hydrochloride)

• INDICATIONS AND DOSE

Infiltration anaesthesia

► BY LOCAL INFILTRATION

- Neonate: Up to 3 mg/kg, dose to be given according to patient's weight and nature of procedure, dose may be repeated not more often than every 4 hours, 3 mg/kg equivalent to 0.3 mL/kg of 1% solution.
- Child 1 month–11 years: Up to 3 mg/kg, dose to be given according to patient's weight and nature of procedure, dose may be repeated not more often than every 4 hours, 3 mg/kg equivalent to 0.3 mL/kg of 1% solution
- Child 12–17 years: (max. per dose 200 mg), dose to be given according to child's weight and nature of procedure, dose may be repeated not more often than every 4 hours

DOSES AT EXTREMES OF BODY-WEIGHT

- When used by local infiltration To avoid excessive dosage in obese patients, weight-based doses for non-emergency indications may need to be calculated on the basis of ideal body-weight.

Intravenous regional anaesthesia and nerve block

► BY REGIONAL ADMINISTRATION

- Child: Seek expert advice

Dental anaesthesia

► BY REGIONAL ADMINISTRATION

- Child: Seek expert advice

Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis) |

Lubricant in cystoscopy | Lubricant in proctoscopy

► TO THE SKIN USING OINTMENT

- Child: Apply 1–2 mL as required, avoid long-term use

• CONTRA-INDICATIONS

- When used by regional administration Application to the middle ear (can cause ototoxicity) • avoid injection into infected tissues • avoid injection into inflamed tissues • preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) • should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

- When used by regional administration Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

• CAUTIONS

- When used by regional administration Children (consider dose reduction) • debilitated patients (consider dose reduction) • epilepsy • hypovolaemia • impaired cardiac conduction • impaired respiratory function • myasthenia gravis • shock

• INTERACTIONS → Appendix 1: antiarrhythmics

- **SIDE-EFFECTS** Anxiety • arrhythmias • atrioventricular block • cardiac arrest • circulatory collapse • confusion • dizziness • drowsiness • euphoric mood • headache • hypotension (may lead to cardiac arrest) • loss of consciousness • methaemoglobinaemia • muscle twitching • myocardial contractility decreased • nausea • neurological effects • nystagmus • pain • psychosis • respiratory disorders • seizure • sensation abnormal • temperature sensation altered • tinnitus • tremor • vision blurred • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

Methaemoglobinaemia Methylthioninium chloride can be used for the treatment of drug-induced methaemoglobinaemia.

● ALLERGY AND CROSS-SENSITIVITY

- **Hypersensitivity and cross-sensitivity** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

- **BREAST FEEDING** Present in milk but amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.

- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

● MONITORING REQUIREMENTS

- With systemic use Monitor ECG and have resuscitation facilities available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, ointment

Solution for injection► **Lidocaine hydrochloride (Non-proprietary)**

Lidocaine hydrochloride 5 mg per 1 ml Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule [PoM] £7.00

Lidocaine hydrochloride 10 mg per 1 ml Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule [PoM] £11.21

Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule [PoM] £4.40 DT = £4.40

Lidocaine 100mg/10ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule [PoM] £8.80

Lidocaine 200mg/20ml (1%) solution for injection vials | 10 vial [PoM] £19.00

Lidocaine 200mg/20ml (1%) solution for injection ampoules | 10 ampoule [PoM] £7.00–£9.63 DT = £9.63

Lidocaine 50mg/5ml (1%) solution for injection ampoules | 10 ampoule [PoM] £2.59–£3.10 DT = £2.59

Lidocaine 20mg/2ml (1%) solution for injection ampoules | 10 ampoule [PoM] £3.50 DT = £2.20

Lidocaine 50mg/5ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule [PoM] £6.00

Lidocaine hydrochloride 20 mg per 1 ml Lidocaine 100mg/5ml (2%) solution for injection ampoules | 10 ampoule [PoM] £2.70–£3.80 DT = £2.70

Lidocaine 400mg/20ml (2%) solution for injection vials | 10 vial [PoM] £19.50

Lidocaine 200mg/10ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule [PoM] £14.95

Lidocaine 40mg/2ml (2%) solution for injection ampoules | 10 ampoule [PoM] £4.00 DT = £2.37

Lidocaine 100mg/5ml (2%) solution for injection Sure-Amp ampoules | 20 ampoule [PoM] £6.00

Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 ampoule [PoM] £8.00–£9.90 DT = £9.90

Cream

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

► **LMX 4** (Ferndale Pharmaceuticals Ltd)

Lidocaine 40 mg per 1 gram LMX 4 cream | 5 gram [P] £2.98 DT = £2.98 | 30 gram [P] £14.90 DT = £14.90

Ointment► **Lidocaine hydrochloride (Non-proprietary)**

Lidocaine hydrochloride 50 mg per 1 gram Lidocaine 5% ointment | 15 gram [P] £6.50 DT = £6.18

Lidocaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 826, adrenaline/epinephrine p. 136.

● INDICATIONS AND DOSE**Local anaesthesia**► **BY LOCAL INFILTRATION**

- Child 12–17 years: Dosed according to the type of nerve block required (consult product literature)

IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **INTERACTIONS** → Appendix 1: antiarrhythmics - sympathomimetics, vasoconstrictor

● PROFESSION SPECIFIC INFORMATION**Dental information**

A variety of lidocaine injections with adrenaline is available in dental cartridges.

Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

EXCIPIENTS: May contain Sulfites

► **Lignospan Special** (Septodont Ltd)

Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml,

Lidocaine hydrochloride 20 mg per 1 ml Lignospan Special 2%

injection 2.2ml cartridges | 50 cartridge [PoM] £21.95

Lignospan Special 2% injection 1.8ml cartridges | 50 cartridge [PoM] £21.95

Adrenaline 100micrograms/20ml (1 in 200,000) solution for injection vials | 5 vial [PoM] £8.85 DT = £8.85

Lidocaine with cetrimide

27-Apr-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 826.

● INDICATIONS AND DOSE**Anaesthesia and disinfection in dental practice**► **TO MUCOUS MEMBRANES USING OROMUCOSAL SPRAY**

- Child 4–17 years: 10–20 mg, no more than 30 mg should be applied to the same quadrant of the buccal cavity—consult product literature, dose expressed as lidocaine

continued →

Anaesthesia in dental practice

- ▶ TO MUCOUS MEMBRANES USING DENTAL GEL
- ▶ Child 4–17 years: Apply 100–500 mg, use cotton pellet for application to dried mucosa, dose expressed as weight of gel

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 metered dose of Xylonor® spray is equivalent to 10 mg of lidocaine.
- ▶ 2 millimetres of Xylonor® gel is approximately equivalent to 100 mg of gel (approximately equivalent to 5 mg of lidocaine).

- **CAUTIONS** Sepsis (risk of rapid systemic absorption) • traumatised mucosa (risk of rapid systemic absorption)

- **INTERACTIONS** → Appendix 1: antiarrhythmics

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oromucosal gel

- ▶ **Xylonor** (Septodont Ltd)
Cetrimide 1.5 mg per 1 gram, Lidocaine 50 mg per 1 gram Xylonor 5% gel sugar-free | 15 gram [PoM] £4.00

Spray

- ▶ **Xylonor** (Septodont Ltd)
Cetrimide 100 microgram per 1 gram, Lidocaine 10 mg per 1 gram Xylonor 10% spray sugar-free | 36 gram [PoM] £20.15

Lidocaine with phenylephrine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 826, phenylephrine hydrochloride p. 125.

● INDICATIONS AND DOSE**Anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 12–17 years: Up to 8 sprays

- **INTERACTIONS** → Appendix 1: antiarrhythmics • sympathomimetics, vasoconstrictor

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

- ▶ **Lidocaine with phenylephrine (Non-proprietary)**
Phenylephrine hydrochloride 5 mg per 1 ml, Lidocaine hydrochloride 50 mg per 1 ml Lidocaine 5% / Phenylephrine 0.5% nasal spray | 2.5 ml [PoM] £12.90 DT = £12.90

Lidocaine with prilocaine

14-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 826, prilocaine hydrochloride p. 829.

● INDICATIONS AND DOSE**Anaesthesia before minor skin procedures including venepuncture**

- ▶ TO THE SKIN
- ▶ Neonate: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day.

- ▶ Child 1–2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day
- ▶ Child 3–11 months: Apply up to 2 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- ▶ Child 1–11 years: Apply 1–5 hours before procedure, a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- ▶ Child 12–17 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)

Anaesthesia on genital skin before injection of local anaesthetics**▶ TO THE SKIN**

- ▶ Child 12–17 years: Apply under occlusive dressing for 15 minutes (males) or 60 minutes (females) before procedure

Anaesthesia before surgical treatment of lesions on genital mucosa**▶ TO THE SKIN**

- ▶ Child 12–17 years: Apply up to 10 g, to be applied 5–10 minutes before procedure, maximum dose should be proportionally reduced in adolescents with body-weight less than 20 kg

Anaesthesia before cervical curettage**▶ TO THE SKIN**

- ▶ Child 12–17 years: Apply 10 g in lateral vaginal fornices for 10 minutes

- **CONTRA-INDICATIONS** Use in child less than 37 weeks corrected gestational age

- **INTERACTIONS** → Appendix 1: anaesthetics, local • antiarrhythmics

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: EMLA cream for local anaesthesia www.medicinesforchildren.org.uk/emla-cream-for-local-anaesthesia

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

- ▶ **Lidocaine with prilocaine (Non-proprietary)**
Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram Lidocaine 2.5% / Prilocaine 2.5% cream | 5 gram [P] £
- ▶ **Denela** (Teva UK Ltd)

- ▶ **Nulbia** (Glenmark Pharmaceuticals Europe Ltd)
Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram Nulbia 5% cream | 5 gram [P] £1.58 | 25 gram [P] £7.88 | 30 gram [P] £8.61 DT = £12.30

Mepivacaine hydrochloride

● INDICATIONS AND DOSE

Infiltration anaesthesia and nerve block in dentistry

- ▶ Child 3–17 years: Consult expert dental sources

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease · children (consider dose reduction) · debilitated patients (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

● **SIDE-EFFECTS**

- ▶ **Common or very common** Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · vomiting
- ▶ **Uncommon** Neurotoxicity
- ▶ **Rare or very rare** Arachnoiditis · cardiac arrest · diplopia · nerve disorders · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

● **ALLERGY AND CROSS-SENSITIVITY**

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaïne, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Use with caution in early pregnancy.

- **BREAST FEEDING** Use with caution.

- **HEPATIC IMPAIRMENT** Use with caution; increased risk of side-effects in severe impairment.

- **RENAL IMPAIRMENT** Use with caution; increased risk of side-effects.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Scandonest plain** (Septodont Ltd)

Mepivacaine hydrochloride 30 mg per 1 mL Scandonest plain 3% solution for injection 2.2mL cartridges | 50 cartridge [PoM] £21.95

Mepivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride above, adrenaline/epinephrine p. 136.

● **INDICATIONS AND DOSE**

Infiltration anaesthesia and nerve block in dentistry

- ▶ **BY LOCAL INFILTRATION**
- ▶ Child: (consult product literature)

IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **INTERACTIONS** → Appendix 1: anaesthetics, local · sympathomimetics, vasoconstrictor

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfites

- ▶ **Scandonest special** (Septodont Ltd)

Adrenaline 10 microgram per 1 mL, Mepivacaine hydrochloride 20 mg per 1 mL Scandonest special 2% solution for injection 2.2mL cartridges | 50 cartridge [PoM] £21.95

Prilocaine hydrochloride

● **INDICATIONS AND DOSE**

CITANEST 1%®

Infiltration anaesthesia | Nerve block

- ▶ **BY REGIONAL ADMINISTRATION**

- ▶ Child 6 months–11 years: Up to 5 mg/kg, dose adjusted according to site of administration and response; maximum 400 mg per course
- ▶ Child 12–17 years: 100–200 mg/minute, alternatively, may be given in incremental doses; dose adjusted according to site of administration and response; maximum 400 mg per course

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acquired methaemoglobinaemia · anaemia · application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid

injection into inflamed tissues · complete heart block · congenital methaemoglobinemia · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ **Injection site** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease · children (consider dose reduction) · debilitated patients (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · neonates and infants under 6 months are particularly susceptible to methaemoglobinemia · severe or untreated hypertension · shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · vomiting
- ▶ **Uncommon** Neurotoxicity
- ▶ **Rare or very rare** Cardiac arrest · methaemoglobinemia · nerve disorders
- ▶ **Frequency not known** Diplopia · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

Methaemoglobinemia Methaemoglobinemia can be treated with an intravenous injection of methylthioninium chloride.

● ALLERGY AND CROSS-SENSITIVITY

- **Hypersensitivity and cross-sensitivity** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinemia reported).

Dose adjustments Use lower doses for intrathecal use during late pregnancy.

- **BREAST FEEDING** Present in milk but not known to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

Dose adjustments Lower doses may be required for intrathecal anaesthesia.

- **RENAL IMPAIRMENT** Use with caution.

Dose adjustments Lower doses may be required for intrathecal anaesthesia.

Tetracaine

(Amethocaine)

• INDICATIONS AND DOSE

Anaesthesia before venepuncture or venous cannulation

▶ TO THE SKIN

- ▶ **Neonate:** Apply contents of tube (or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation.
- ▶ **Child 1 month–4 years:** Apply contents of up to 1 tube (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation
- ▶ **Child 5–17 years:** Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation

- **UNLICENSED USE** Not licensed for use in neonates.
- **CONTRA-INDICATIONS** Should not be applied to damaged skin

- **INTERACTIONS** → Appendix 1: anaesthetics, local

- **SIDE-EFFECTS** Oedema · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION The systemic toxicity of local anaesthetics mainly involves the central nervous system; systemic side effects unlikely as minimal absorption following topical application.

• ALLERGY AND CROSS-SENSITIVITY

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **BREAST FEEDING** Not known to be harmful.

Poisoning, emergency treatment

Overview

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either **TOXBASE** or the **UK National Poisons Information Service** be consulted when there is doubt about the degree of risk or about management.

Most childhood poisoning is accidental. Other causes include intentional overdose, drug abuse, iatrogenic and deliberate poisoning. The drugs most commonly involved in childhood poisoning are paracetamol p. 271, ibuprofen p. 655, orally ingested creams, aspirin p. 91, iron preparations, cough medicines, and the contraceptive pill.

Hospital admission

Children who have features of poisoning should generally be admitted to hospital. Children who have taken poisons with delayed actions should also be admitted, even if they appear well. Delayed-action poisons include aspirin, iron, paracetamol, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, *Lomotil*®) p. 48; the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the **UK National Poisons Information Service** on the following number: Tel: 0344 892 0111.

Advice on laboratory analytical services can be obtained from **TOXBASE** or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours).

General care

It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients

require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The **National Poisons Information Service** should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

The potential for pulmonary aspiration of gastric contents should be considered.

Blood pressure

Hypotension is common in severe poisoning with central nervous system depressants; if severe, this may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 589 or a colloid. Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service or a paediatric intensive care unit.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with

sympathomimetic drugs such as amfetamines, phencyclidine, and cocaine.

Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

Body temperature

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate rewarming as clinically indicated.

Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with **tepid** water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require **urgent** hospitalisation for assessment and supportive treatment.

Convulsions during poisoning

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 222 or diazepam p. 220 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 223 can be given by the buccal route or diazepam can be administered as a rectal solution.

Methaemoglobinaemia

Drug- or chemical-induced methaemoglobinaemia should be treated with **methylthioninium chloride** p. 843 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthioninium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylthioninium chloride can itself cause methaemoglobinaemia.

Poison removal and elimination

Prevention of absorption

Given by mouth, **charcoal, activated** p. 839 can adsorb many poisons in the gastro-intestinal system, thereby reducing their absorption. The **sooner** it is given the **more effective** it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

A second dose may occasionally be required when blood-drug concentration continues to rise suggesting delayed drug release or delayed gastric emptying.

Active elimination techniques

Repeated doses of **charcoal, activated** by mouth may *enhance the elimination* of some drugs after they have been absorbed; repeated doses are given after overdose with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing, it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should **not** be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalinisation of the urine for salicylates.

Removal from the gastro-intestinal tract

Gastric lavage is rarely required as benefit rarely outweighs risk; advice should be sought from the National Poisons Information Service if a significant quantity of iron or lithium has been ingested within the previous hour.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with lithium salts, and if illicit drugs are carried in the gastro-intestinal tract ('body-packing'). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

The administration of **laxatives** alone has no role in the management of the poisoned child and is not a recommended method of gut decontamination. The routine use of a laxative in combination with charcoal, activated has mostly been abandoned. Laxatives should not be administered to young children because of the likelihood of fluid and electrolyte imbalance.

Alcohol, acute intoxication

Acute intoxication with **alcohol** (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

Aspirin poisoning

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young, and clinical and biochemical assessment is necessary. Generally, the clinical

severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis, convulsions, respiratory failure, pulmonary oedema or persistently high plasma-salicylate concentrations unresponsive to urinary alkalinisation.

Opioid poisoning

Opioids (narcotic analgesics) cause varying degrees of coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 842 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. All children should be observed for at least 6 hours after the last dose of naloxone. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required. Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate p. 586 or magnesium sulfate p. 597, or both. Arrhythmias may occur for up to 12 hours.

Paracetamol poisoning

In cases of intravenous paracetamol poisoning contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, children who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese children who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 843 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth [unlicensed route] is an alternative

if intravenous access is not possible—contact the National Poisons Information Service for advice.

Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylcysteine should be considered in all paracetamol overdoses, and advice should be sought from the National Poisons Information Service.

Acute overdose

Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg paracetamol taken in less than 1 hour. Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour.

Children who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of charcoal, activated p. 839 should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Children at risk of liver damage and, therefore, requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line ('treatment line') joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours. Acetylcysteine treatment should commence immediately in children:

- whose plasma-paracetamol concentration falls on or above the *treatment line* on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylcysteine can be discontinued if the plasma-paracetamol concentration is later reported to be below the *treatment line* on the paracetamol treatment graph, provided that the child is asymptomatic and liver function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the *treatment line* on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

'Staggered' overdose, uncertain time of overdose, or therapeutic excess

A 'staggered' overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a 'staggered' overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, children who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; for some children this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose. Clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g.

Paracetamol overdose treatment graph

Patients whose plasma-paracetamol concentrations are on or above the **treatment line** should be treated with acetylcysteine by intravenous infusion.

The prognostic accuracy after 15 hours is uncertain, but a plasma-paracetamol concentration on or above the treatment line should be regarded as carrying a serious risk of liver damage.

Graph reproduced courtesy of Medicines and Healthcare products Regulatory Agency

carbamazepine p. 196, efavirenz p. 413, nevirapine p. 414, phenobarbital p. 216, phenytoin p. 205, primidone p. 217, rifabutin p. 364, rifampicin p. 364, St John's wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Children with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient's risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

Antidepressant poisoning

Tricyclic and related antidepressants

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer.

Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam p. 220 given by mouth is usually adequate to sedate delirious patients but large doses may be required.

Selective serotonin re-uptake inhibitors (SSRIs)

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam p. 222, diazepam p. 220, or buccal midazolam p. 223 (see *Convulsions*). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

Antimalarial poisoning

Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Antipsychotic poisoning

Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 256 or diazepam (emulsion preferred).

Second-generation antipsychotic drugs

Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 839 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

Benzodiazepine poisoning

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 840 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in children with a reduced level of consciousness.

Beta blockers poisoning

Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in children with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdosage can vary from one beta-blocker to another; propranolol overdosage in particular may cause coma and convulsions.

Acute massive overdosage must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine sulfate p. 810 is required to treat bradycardia. Cardiogenic shock unresponsive to atropine sulfate is probably best treated with an intravenous injection of glucagon p. 465 [unlicensed] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion. If glucagon is not available, intravenous isoprenaline (available from 'special-

order' manufacturers or specialist importing companies) is an alternative. A cardiac pacemaker can be used to increase the heart rate.

Calcium-channel blockers poisoning

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 593 or calcium gluconate p. 594 is given by injection; atropine sulfate is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Iron salts poisoning

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 578, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

Lithium poisoning

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the child's depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g.

by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

Stimulant-drug poisoning

Amfetamines

Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam p. 220 or lorazepam p. 222; advice should be sought from the National Poisons Information Service on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine

Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves cooling measures for hyperthermia (see Body temperature); agitation, hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy

Ecstasy (methylenedioxymethamphetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use and syndrome of inappropriate antidiuretic hormone secretion (SIADH) can occur.

Treatment of methylenedioxymethamphetamine poisoning is supportive, with diazepam to control persistent convulsions and close monitoring including ECG. For the management of agitation, seek specialist advice. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

'Liquid ecstasy' is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

Theophylline poisoning

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of charcoal, activated p. 839 can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 264 may be effective for severe vomiting that is resistant to other antiemetics. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 601 and may be so severe as to require high doses under ECG monitoring. Convulsions should be controlled by intravenous administration of lorazepam or diazepam (see Convulsions). For the management of agitation associated with theophylline overdosage, seek specialist advice.

Provided the child does **not** suffer from asthma, a short-acting beta-blocker can be administered intravenously to

reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

Cyanide poisoning

Oxygen should be administered to children with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 839 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should **not** be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 839 followed by sodium thiosulfate p. 839 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin (Cyanokit®—no other preparation of hydroxocobalamin is suitable) p. 575 can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

Ethylene glycol and methanol poisoning

Fomepizole (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, **ethanol** (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metal poisoning

Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases poisoning

Carbon monoxide

Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The patient should be moved to fresh air, the airway cleared, and high-flow **oxygen** 100% administered as soon as available. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The child should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 141. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, and ammonia

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS spray poisoning

CS spray, which is used for riot control, irritates the eyes (hence 'tear gas') and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents poisoning

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of **nerve agents**, kits ('NAAS pods') containing **pralidoxime chloride p. 840** can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Pesticide poisoning

Organophosphorus insecticides

Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the child to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 810 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

Snake bites and animal stings

Snake bites

Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (*Vipera berus*). The

bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with adrenaline/epinephrine p. 136. Indications for European viper snake venom antiserum treatment p. 844 include **systemic envenoming**, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those children who present with clinical features of **severe envenoming** (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the European viper snake venom antiserum is recommended; if symptoms of **systemic envenoming** persist contact the National Poisons Information Service.

Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the European viper snake venom antiserum.

European viper snake venom antiserum is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

Insect stings

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible.

Anaphylactic reactions require immediate treatment with intramuscular **adrenaline/epinephrine**; self-administered (or administered by a carer) intramuscular adrenaline/epinephrine (e.g. *EpiPen*®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an **oral antihistamine** or a **topical corticosteroid** may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

Marine stings

The severe pain of weeverfish (*Trachinus vipera*) and Portuguese man-o'-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-o'-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should **not** be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

Other poisons

Consult either the National Poisons Information Service day and night or TOXBASE.

The **National Poisons Information Service** (Tel: 0344 892 0111) will provide specialist advice on all aspects of poisoning day and night.

1 Active elimination from the gastro-intestinal tract

ANTIDOTES AND CHELATORS > INTESTINAL ADSORBENTS

Charcoal, activated

• INDICATIONS AND DOSE

Reduction of absorption of poisons in the gastro-intestinal system

► BY MOUTH

► Neonate: 1 g/kg.

► Child 1 month–11 years: 1 g/kg (max. per dose 50 g)

► Child 12–17 years: 50 g

Active elimination of poisons

► BY MOUTH

► Neonate: 1 g/kg every 4 hours, dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy.

► Child 1 month–11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy

► Child 12–17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy

• **CAUTIONS** Comatose patient (risk of aspiration—ensure airway is protected) · drowsy patient (risk of aspiration—ensure airway protected) · reduced gastrointestinal motility (risk of obstruction)

• **SIDE-EFFECTS** Bezoar · constipation · diarrhoea · gastrointestinal disorders

• **DIRECTIONS FOR ADMINISTRATION** Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

► **Charcodote** (Teva UK Ltd)

Activated charcoal 200 mg per 1 ml Charcodote 200mg/ml oral suspension sugar-free | 250 ml **P** £11.88

Granules

► **Carbomix** (Kent Pharmaceuticals Ltd)

Activated charcoal 813 mg per 1 gram Carbomix 81.3% granules sugar-free | 50 gram **P** £11.90

2 Chemical toxicity

2.1 Cyanide toxicity

ANTIDOTES AND CHELATORS

Dicobalt edetate

• INDICATIONS AND DOSE

Severe poisoning with cyanides

► BY INTRAVENOUS INJECTION

► Child: Consult the National Poisons Information Service

• **CAUTIONS** Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness

• **SIDE-EFFECTS** Reflex tachycardia · vomiting

• **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Dicobalt edetate (Non-proprietary)**

Dicobalt edetate 15 mg per 1 ml Dicobalt edetate 300mg/20ml solution for injection ampoules | 6 ampoule **PoM** £117.20

Sodium nitrite

16-Mar-2018

• INDICATIONS AND DOSE

Poisoning with cyanides (used in conjunction with sodium thiosulfate)

► BY INTRAVENOUS INJECTION

► Child: Consult the National Poisons Information Service

• **SIDE-EFFECTS** Arrhythmias · dizziness · headache · hypotension · palpitations

• **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Sodium nitrite (Non-proprietary)**

Sodium nitrite 30 mg per 1 ml Sodium nitrite 300mg/10ml solution for injection vials | 1 vial **PoM** **S**

Sodium thiosulfate

16-Mar-2018

• INDICATIONS AND DOSE

Poisoning with cyanides

► BY INTRAVENOUS INJECTION

► Child: Consult the National Poisons Information Service

DOSE EQUIVALENCE AND CONVERSION

► 12.5 g equates to 50 mL of a 25% solution or 25 mL of a 50% solution.

• **SIDE-EFFECTS** Disorientation · feeling hot · headache · hypotension · nausea · taste salty · vomiting

• **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection▶ **Sodium thiosulfate (Non-proprietary)**

Sodium thiosulfate 250 mg/kg, per 1 ml Sodium thiosulfate 12.5g/50ml solution for injection vials | 1 vial **[PoM]** 

2.2 Organophosphorus toxicity

Other drugs used for Organophosphorus toxicity Atropine sulfate, p. 810

ANTIDOTES AND CHELATORS**Pralidoxime chloride****INDICATIONS AND DOSE**

Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

▶ **BY INTRAVENOUS INFUSION**

▶ **Child:** Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day

● **UNLICENSED USE** Pralidoxime chloride doses may differ from those in product literature.

Licensed for use in children (age range not specified by manufacturer).

● **CONTRA-INDICATIONS** Poisoning with carbamates • poisoning with organophosphorus compounds without anticholinesterase activity

● **CAUTIONS** Myasthenia gravis

● **SIDE-EFFECTS** Dizziness • drowsiness • headache • hyperventilation • muscle weakness • nausea • tachycardia • visual impairment

● **RENAL IMPAIRMENT** Use with caution.

● **DIRECTIONS FOR ADMINISTRATION** The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.

For intravenous infusion, reconstitute each vial with 20 mL Water for Injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.

● **PRESCRIBING AND DISPENSING INFORMATION** Available from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh Ambulance Services for Mid West and South East Wales)—see TOXBASE for list of designated centres).

● **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection▶ **Protopam Chloride (Imported (United States))**

Pralidoxime chloride 1 gram Protopam Chloride 1g powder for solution for injection vials | 6 vial **[PoM]** 

3 Drug toxicity**3.1 Benzodiazepine toxicity****ANTIDOTES AND CHELATORS > BENZODIAZEPINE ANTAGONISTS****Flumazenil****INDICATIONS AND DOSE****Reversal of sedative effects of benzodiazepines**▶ **BY INTRAVENOUS INJECTION**

▶ **Neonate:** 10 micrograms/kg every 1 minute if required, dose to be administered over 15 seconds.

▶ **Child:** 10 micrograms/kg every 1 minute (max. per dose 200 micrograms) if required, dose to be administered over 15 seconds; maximum 1 mg per course; maximum 50 micrograms/kg per course

Reversal of sedative effects of benzodiazepines (if drowsiness recurs after injection)▶ **BY INTRAVENOUS INFUSION**

▶ **Neonate:** 2–10 micrograms/kg/hour, adjusted according to response.

▶ **Child:** 2–10 micrograms/kg/hour (max. per dose 400 micrograms/hour), adjusted according to response

Reversal of sedative effects of benzodiazepines in intensive care▶ **BY INTRAVENOUS INJECTION**

▶ **Child:** 10 micrograms/kg every 1 minute (max. per dose 200 micrograms) if required, dose to be administered over 15 seconds; maximum 2 mg per course; maximum 50 micrograms/kg per course

● **UNLICENSED USE** Not licensed for use in children under 1 year. Not licensed for use by intravenous infusion in children. Not licensed for use in children in intensive care.

IMPORTANT SAFETY INFORMATION

Flumazenil should only be administered by, or under the direct supervision of, personnel experienced in its use.

● **CONTRA-INDICATIONS** Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

● **CAUTIONS** Avoid rapid injection following major surgery • avoid rapid injection in high-risk or anxious patients • benzodiazepine dependence (may precipitate withdrawal symptoms) • children • ensure neuromuscular blockade cleared before giving • head injury (rapid reversal of benzodiazepine sedation may cause convulsions) • history of panic disorders (risk of recurrence) • prolonged benzodiazepine therapy for epilepsy (risk of convulsions) • short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours)

SIDE-EFFECTS

▶ **Common or very common** Anxiety • diplopia • dry mouth • eye disorders • flushing • headache • hiccups • hyperhidrosis • hyperventilation • hypotension • insomnia • nausea • palpitations • paraesthesia • speech disorder • tremor • vertigo • vomiting

▶ **Uncommon** Abnormal hearing • arrhythmias • chest pain • chills • cough • dyspnoea • nasal congestion • seizure (more common in patients with epilepsy)

▶ **Frequency not known** Withdrawal syndrome

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Avoid breast-feeding for 24 hours.

● HEPATIC IMPAIRMENT

Dose adjustments Carefully titrate dose.

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Flumazenil (Non-proprietary)

Flumazenil 100 microgram per 1 ml Flumazenil 500micrograms/5ml solution for injection ampoules | 5 ampoule [PoM] £65.50–£70.00

3.2 Digoxin toxicity

ANTIDOTES AND CHELATORS > ANTIBODIES

Digoxin-specific antibody

● INDICATIONS AND DOSE

Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary

► BY INTRAVENOUS INFUSION

- Child: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► DigiFab (BTG International Ltd)

Digoxin-specific antibody fragments 40 mg DigiFab 40mg powder for solution for infusion vials | 1 vial [PoM] £750.00 (Hospital only)

3.3 Heparin toxicity

ANTIDOTES AND CHELATORS

Protamine sulfate

● INDICATIONS AND DOSE

Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (less than 30 minutes lapsed since overdosage)

► BY INTRAVENOUS INJECTION

- Child: 1 mg (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (if 30–60 minutes lapsed since overdosage)

► BY INTRAVENOUS INJECTION

- Child: 500–750 micrograms (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (if 60–120 minutes lapsed since overdosage)

► BY INTRAVENOUS INJECTION

- Child: 375–500 micrograms (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (if over 120 minutes lapsed since overdosage)

► BY INTRAVENOUS INJECTION

- Child: 250–375 micrograms (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

Overdosage with subcutaneous injection of unfractionated heparin

► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child: (max. per dose 50 mg), 50–100% of the total dose to be given by intravenous injection (rate not exceeding 5 mg/minute), then give any remainder of dose by intravenous infusion over 8–16 hours, 1 mg neutralises approx. 100 units of unfractionated heparin

Overdosage with subcutaneous injection of low molecular weight heparin

► BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION

- Child: (max. per dose 50 mg), to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute or by continuous intravenous infusion, 1 mg neutralises approx. 100 units of low molecular weight heparin, consult product literature of low molecular weight heparin for details

- **CAUTIONS** Excessive doses can have an anticoagulant effect

● SIDE-EFFECTS

- **Rare or very rare** Hypertension · pulmonary oedema non-cardiogenic

- **Frequency not known** Acute pulmonary vasoconstriction · back pain · bradycardia · circulatory collapse · dyspnoea · fatigue · feeling hot · flushing · nausea · pulmonary hypertension · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Caution if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy and who may have antibodies to protamine).

- **MONITORING REQUIREMENTS** Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.

- **DIRECTIONS FOR ADMINISTRATION** May be diluted if necessary with Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Protamine sulfate (Non-proprietary)

Protamine sulfate 10 mg per 1 ml Protamine sulfate 100mg/10ml solution for injection ampoules | 5 ampoule [PoM] [S] Protamine sulfate 50mg/5ml solution for injection ampoules | 10 ampoule [PoM] £49.55

3.4 Opioid toxicity

OPIOID RECEPTOR ANTAGONISTS

Naloxone hydrochloride

● INDICATIONS AND DOSE

Overdosage with opioids

► BY INTRAVENOUS INJECTION

► Neonate: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a max. of 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates, doses can be given by subcutaneous or intramuscular routes but only if intravenous route is not feasible; intravenous administration has more rapid onset of action.

► Child 1 month–11 years: Initially 100 micrograms/kg (max. per dose 2 mg), if no response, repeat at intervals of 1 minute to a max. of 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates, doses can be given by subcutaneous or intramuscular routes but only if intravenous route is not feasible; intravenous administration has more rapid onset of action

► Child 12–17 years: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates, doses can be given by subcutaneous or intramuscular routes but only if intravenous route is not feasible; intravenous administration has more rapid onset of action

► BY CONTINUOUS INTRAVENOUS INFUSION

► Neonate: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative *intravenous injection* dose is that which maintained satisfactory ventilation for at least 15 minutes.

► Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative *intravenous injection* dose is that which maintained satisfactory ventilation for at least 15 minutes

Reversal of postoperative respiratory depression

► INITIALLY BY INTRAVENOUS INJECTION

► Neonate: 1 microgram/kg, repeated every 2–3 minutes if required.

► Child 1 month–11 years: 1 microgram/kg, repeated every 2–3 minutes if required

► Child 12–17 years: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours

Reversal of respiratory and CNS depression resulting from opioid administration to mother during labour

► BY INTRAMUSCULAR INJECTION

► Neonate: 200 micrograms, alternatively 60 micrograms/kg, to be given as a single dose at birth.

► BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

► Neonate: 10 micrograms/kg, repeated every 2–3 minutes if required.

PHARMACOKINETICS

► Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

● **UNLICENSED USE** Naloxone doses in BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Doses used in acute opioid overdosage may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use.

● **CAUTIONS** Cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported) · maternal physical dependence on opioids (may precipitate withdrawal in newborn) · pain · physical dependence on opioids (precipitates withdrawal)

CAUTIONS, FURTHER INFORMATION

► Titration of dose In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia.

● SIDE-EFFECTS

► **Common or very common** Arrhythmias · dizziness · headache · hypertension · hypotension · nausea · vomiting
 ► **Uncommon** Diarrhoea · dry mouth · hyperhidrosis · hyperventilation · pain · tremor
 ► **Rare or very rare** Anxiety · cardiac arrest · erythema multiforme · pulmonary oedema · seizure
 ► **Frequency not known** Analgesia reversed · asthenia · chills · death · dyspnoea · fever · irritability · nasal complaints · piloerection · withdrawal syndrome · yawning

● **PREGNANCY** Use only if potential benefit outweighs risk.

● **BREAST FEEDING** Not orally bioavailable.

● **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute to a concentration of up to 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Naloxone hydrochloride (Non-proprietary)

Naloxone hydrochloride 20 microgram per 1 mL Naloxone 40micrograms/2mL solution for injection ampoules | 10 ampoule (PoM) £55.00

Naloxone hydrochloride 400 microgram per 1 mL Naloxone 400micrograms/1mL solution for injection ampoules | 10 ampoule (PoM) £41.00–£53.70

Naloxone hydrochloride 1 mg per 1 mL Naloxone 2mg/2mL solution for injection pre-filled syringes | 1 pre-filled disposable injection (PoM) £16.80

3.5 Paracetamol toxicity

ANTIDOTES AND CHELATORS

Acetylcysteine

03-Apr-2018

● INDICATIONS AND DOSE

Paracetamol overdose

► BY INTRAVENOUS INFUSION

- Neonate: Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%.
- Child (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%
- Child (body-weight 20–39 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%
- Child (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%

Meconium ileus

► BY MOUTH

- Neonate: 200–400 mg up to 3 times a day if required.

Treatment of distal intestinal obstructive syndrome

► BY MOUTH

- Child 1 month–1 year: 0.4–3 g as a single dose
- Child 2–6 years: 2–3 g as a single dose
- Child 7–17 years: 4–6 g as a single dose

Prevention of distal intestinal obstruction syndrome

► BY MOUTH

- Child 1 month–1 year: 100–200 mg 3 times a day
- Child 2–11 years: 200 mg 3 times a day
- Child 12–17 years: 200–400 mg 3 times a day

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, a ceiling weight of 110 kg should be used when calculating the dose for paracetamol overdose.

- **UNLICENSED USE** Not licensed for use in meconium ileus or for distal intestinal obstructive syndrome in children with cystic fibrosis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: INTRAVENOUS ACETYL-CYSTEINE FOR PARACETAMOL OVERDOSE: REMINDER OF AUTHORISED DOSE REGIMEN; POSSIBLE NEED FOR CONTINUED TREATMENT (JANUARY 2017)

The authorised dose regimen for acetylcysteine in paracetamol overdose is 3 consecutive intravenous infusions given over a total of 21 hours.

Continued treatment (given at the dose and rate as used in the third infusion) may be necessary depending on the clinical evaluation of the individual patient.

● CAUTIONS

- With intravenous use Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) · atopy · may slightly increase INR · may slightly increase prothrombin time
- With oral use Asthma · history of peptic ulceration

● SIDE-EFFECTS

- With parenteral use Acidosis · anaphylactoid reaction · angioedema · anxiety · arrhythmias · cardiac arrest · chest discomfort · cough · cyanosis · eye pain · eye swelling · generalised seizure · hyperhidrosis · hypertension · hypotension · joint disorders · malaise · nausea · pain facial · respiratory disorders · skin reactions · syncope · thrombocytopenia · vasodilation · vision blurred · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Anaphylactoid reactions (with intravenous use) can be managed by suspending treatment and initiating appropriate management. Treatment may then be restarted at lower rate.

● DIRECTIONS FOR ADMINISTRATION

- With oral use For oral administration, use oral granules, or dilute injection solution (200 mg/mL) to a concentration of 50 mg/mL; orange or blackcurrant juice or cola drink may be used as a diluent to mask the bitter taste.
- With intravenous use Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if Glucose 5% unsuitable.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: effervescent tablet, granules

Granules

CAUTIONARY AND ADVISORY LABELS 13

- **A-CYS** (Ennogen Healthcare Ltd)

Acetylcysteine 200 mg A-CYS 200mg granules sachets | 20 sachet £75.00

Solution for infusion

ELECTROLYTES: May contain Sodium

- **Acetylcysteine (Non-proprietary)**

Acetylcysteine 200 mg per 1 mL Acetylcysteine 2g/10mL solution for infusion ampoules | 10 ampoule **[PoM]** £21.26–£24.99 DT = £21.26

- **Parvolex** (Phoenix Labs Ltd)

Acetylcysteine 200 mg per 1 mL Parvolex 2g/10mL concentrate for solution for infusion ampoules | 10 ampoule **[PoM]** £22.50 DT = £21.26

4 Methaemoglobinaemia

ANTIDOTES AND CHELATORS

Methylthioninium chloride

(Methylene blue)

● INDICATIONS AND DOSE

Drug- or chemical-induced methaemoglobinaemia

► BY SLOW INTRAVENOUS INJECTION

- Neonate: Seek advice from National Poisons Information Service.

- Child 1–2 months: Seek advice from National Poisons Information Service
- Child 3 months–17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

Aniline- or dapsone-induced methaemoglobinaemia

► BY SLOW INTRAVENOUS INJECTION

- Child 3 months–17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, continued →

to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course

- **CAUTIONS** Children under 3 months (more susceptible to methaemoglobinaemia from high doses of methylthioninium) · chlorate poisoning (reduces efficacy of methylthioninium) · G6PD deficiency (seek advice from National Poisons Information Service) · methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service) · pulse oximetry may give false estimation of oxygen saturation
- **INTERACTIONS** → Appendix 1: methylthioninium chloride
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anxiety · chest pain · dizziness · headache · hyperhidrosis · nausea · pain in extremity · paraesthesia · skin reactions · taste altered · urine discolouration · vomiting
 - ▶ **Frequency not known** Aphasia · arrhythmias · confusion · faeces discoloured · fever · haemolytic anaemia · hyperbilirubinaemia (in infants) · hypertension · hypotension · mydriasis · tremor
- **PREGNANCY** No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.
- **RENAL IMPAIRMENT**

Dose adjustments Use with caution in severe impairment; dose reduction may be required.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, may be diluted with Glucose 5% to minimise injection-site pain; not compatible with Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ **Methylthioninium chloride (Non-proprietary)**

Methylthioninium chloride 5 mg per 1 ml Methylthioninium chloride Proveblue 50mg/10ml solution for injection ampoules | 5 ampoule (PoM) £196.89

Severe systemic envenoming from snake bites in patients presenting with clinical features

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Child: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

- **DIRECTIONS FOR ADMINISTRATION** By *intravenous injection* given over 10–15 minutes or by *intravenous infusion* over 30 minutes after diluting in sodium chloride 0.9% (use 5 mL diluent/kg body-weight).
- **PRESCRIBING AND DISPENSING INFORMATION** To order, email immform@dh.gsi.gov.uk.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **European viper snake venom antiserum (Non-proprietary)**

European viper snake venom antiserum 100 mg per 1 ml Viper venom antiserum, European (equine) 1g/10ml solution for injection vials | 1 vial (PoM) £

5 Snake bites

IMMUNE SERA AND IMMUNOGLOBULINS › ANTITOXINS

European viper snake venom antiserum

● INDICATIONS AND DOSE

Systemic envenoming from snake bites | Marked local envenoming

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

Appendix 1

Interactions

Changes have been made to the interactions content in BNF publications. For more information, see www.bnf.org/new-bnf-interactions/.

Two or more drugs given at the same time can exert their effects independently or they can interact. Interactions may be beneficial and exploited therapeutically; this type of interaction is not within the scope of this appendix. Many interactions are harmless, and even those that are potentially harmful can often be managed, allowing the drugs to be used safely together. Nevertheless, adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse reactions to drugs p. 13), as for other adverse drug reactions.

Potentially harmful drug interactions may occur in only a small number of patients, but the true incidence is often hard to establish. Furthermore the severity of a harmful interaction is likely to vary from one patient to another. Patients at increased risk from drug interactions include the elderly and those with impaired renal or hepatic function.

Interactions can result in the potentiation or antagonism of one drug by another, or result in another effect, such as renal impairment. Drug interactions may develop either through pharmacokinetic or pharmacodynamic mechanisms.

Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They might be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs.

Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or decreasing the amount of drug available to produce its pharmacological effects. Pharmacokinetic interactions occurring with one drug do not necessarily occur uniformly across a group of related drugs.

Affecting absorption The rate of absorption and the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless a rapid effect is required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, can result in ineffective therapy.

Affecting distribution *Due to changes in protein binding:* To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing the proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces

more than transient potentiation because this increased concentration of free drug will usually be eliminated.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides but these interactions become clinically relevant mainly because warfarin metabolism is also inhibited.

Induction or inhibition of drug transporter proteins: Drug transporter proteins, such as P-glycoprotein, actively transport drugs across biological membranes. Transporters can be induced or inhibited, resulting in changes in the concentrations of drugs that are substrates for the transporter. For example, rifampicin induces P-glycoprotein, particularly in the gut wall, resulting in decreased plasma concentrations of digoxin, a P-glycoprotein substrate.

Affecting metabolism Many drugs are metabolised in the liver. Drugs are either metabolised by phase I reactions (oxidation, reduction, or hydrolysis) or by phase II reactions (e.g. glucuronidation).

Phase I reactions are mainly carried out by the cytochrome P450 family of isoenzymes, of which CYP3A4 is the most important isoenzyme involved in the metabolism of drugs. Induction of cytochrome P450 isoenzymes by one drug can increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducing drug, plasma concentrations increase and toxicity can occur.

Conversely when one drug inhibits cytochrome P450 isoenzymes, it can decrease the metabolism of another, leading to higher plasma concentrations, resulting in an increased effect with a risk of toxicity.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. With knowledge of which isoenzymes are involved in a drug's metabolism, it is possible to predict whether certain pharmacokinetic interactions will occur. For example, carbamazepine is a potent inducer of CYP3A4, ketoconazole is potent inhibitor of CYP3A4, and midazolam is a substrate of CYP3A4. Carbamazepine reduces midazolam concentrations, and it is therefore likely that other drugs that are potent inducers of CYP3A4 will interact similarly with midazolam. Ketoconazole, however, increases midazolam concentrations, and it can be predicted that other drugs that are potent inhibitors of CYP3A4 will interact similarly.

Less is known about the enzymes involved in phase II reactions. These include UDP-glucuronyltransferases which, for example, might be induced by rifampicin, resulting in decreased metabolism of mycophenolate (a substrate for this enzyme) to its active form, mycophenolic acid.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible. Changes in urinary pH can also affect the reabsorption of a small number of drugs, including methenamine.

A1

Interactions | Appendix 1

Relative importance of interactions

Levels of severity: Most interactions have been assigned a severity; this describes the likely effect of an unmanaged interaction on the patient.

Severe—the result may be a life-threatening event or have a permanent detrimental effect.

Moderate—the result could cause considerable distress or partially incapacitate a patient; they are unlikely to be life-threatening or result in long-term effects.

Mild—the result is unlikely to cause concern or incapacitate the majority of patients.

Unknown—used for those interactions that are predicted, but there is insufficient evidence to hazard a guess at the outcome.

Levels of evidence: Most interactions have been assigned a rating to indicate the weight of evidence behind the interaction.

Study—for interactions where the information is based on formal study including those for other drugs with same

mechanism (e.g. known inducers, inhibitors, or substrates of cytochrome P450 isoenzymes or P-glycoprotein).

Anecdotal—interactions based on either a single case report or a limited number of case reports.

Theoretical—interactions that are predicted based on sound theoretical considerations. The information may have been derived from *in vitro* studies or based on the way other members in the same class act.

Action messages: Each interaction describes the effect that occurs, and the action to be taken, either based on manufacturer's advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. **Pharmacodynamic interactions**, with the exception of interactions with drugs that may prolong the QT interval, do not have an action message included as these will depend on individual patient circumstances.

Appendix 1 structure

A1

Interactions | Appendix 1

1 Drugs

Drugs are listed alphabetically. If a drug is a member of a drug class, all interactions for that drug will be listed under the drug class entry; in this case the drug entry provides direction to the relevant drug class where its interactions can be found.

Within a drug or drug class entry, interactions are listed alphabetically by the interacting drug or drug class. The interactions describe the effect that occurs, and the action to be taken, either based on manufacturer's advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. If two drugs have a pharmacodynamic effect in addition to a pharmacokinetic interaction, a cross-reference to the relevant pharmacodynamic effect table is included at the end of the pharmacokinetic message.

2 Drug classes

The drugs that are members of a drug class are listed underneath the drug class entry in a blue box. Interactions for the class are then listed alphabetically by the interacting drug or drug class. If the interaction only applies to certain drugs in the class, these drugs will be shown in brackets after the drug class name.

3 Supplementary information

If a drug has additional important information to be considered, this is shown in a blue box underneath the drug or drug class entry. This information might be food and lifestyle advice (including smoking and alcohol consumption), relate to the pharmacology of the drug or applicability of interactions to certain routes of administration, or it might be advice about separating administration times.

TABLE 1

Name of pharmacodynamic effect

Explanation of the effect

Drug	Drug	Drug
Drug	Drug	Drug

4 Pharmacodynamic effects

Tables at the beginning of Appendix 1 cover pharmacodynamic effects. If a drug is included in one or more of these tables, this will be indicated at the top of the list of interactions for the drug or drug class. In addition to the list of interactions for a drug or drug class, these tables should always be consulted.

Each table describes the relevant pharmacodynamic effect and lists those drugs that are commonly associated with the effect. Concurrent use of two or more drugs from the same table is expected to increase the risk of the pharmacodynamic effect occurring. Please note these tables are not exhaustive.

TABLE 1

Drugs that cause hepatotoxicity

The following is a list of some drugs that cause hepatotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

alcohol (beverage)	dantrolene	itraconazole	minocycline	tetracycline
alectinib	demeclocycline	leflunomide	oxytetracycline	tigecycline
asparaginase	didanosine	lenalidomide	paracetamol	trabectedin
atorvastatin	doxycycline	lomitapide	pegaspargase	valproate
carbamazepine	flucloxacillin	lymecycline	pravastatin	vincristine
clavulanic acid	fluconazole	mercaptopurine	rosuvastatin	
crisantaspase	fluvastatin	methotrexate	simvastatin	
dactinomycin	isoniazid	micalfugin	sulfasalazine	

TABLE 2

Drugs that cause nephrotoxicity

The following is a list of some drugs that cause nephrotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

aceclofenac	ceftazidime	etodolac	methotrexate	telavancin
acemetacin	ceftriaxone	etoricoxib	nabumetone	tenofovir disoproxil
aciclovir	cefuroxime	fenoprofen	naproxen	tenoxicam
amikacin	ceftiofur	flurbiprofen	neomycin	tiaprofenic acid
amphotericin	ceftriaxone	foscarnet	oxaliplatin	tobramycin
bacitracin	cefuroxime	ganciclovir	parecoxib	tolfenamic acid
capreomycin	celecoxib	gentamicin	pemetrexed	trimethoprim
carboplatin	ciclosporin	ibuprofen	penicillamine	valaciclovir
cefaclor	cisplatin	ifosfamide	pentamidine	valganciclovir
cefadroxil	colistimethate (particularly intravenous)	indometacin	piroxicam	vancomycin
cefalexin	dexibuprofen	ketoprofen	polymyxins	zidovudine
cefixime	dexketoprofen	ketorolac	streptomycin	zoledronic acid
cefotaxime	diclofenac	mefenamic acid	sulindac	
cefradine		meloxicam	tacrolimus	

TABLE 3

Drugs with anticoagulant effects

The following is a list of drugs that have anticoagulant effects. Concurrent use of two or more drugs from this list might increase the risk of bleeding; concurrent use of drugs with antiplatelet effects (see table of drugs with antiplatelet effects) might also increase this risk.

acenocoumarol	dabigatran	fondaparinux	phenindione	urokinase
alteplase	dalteparin	glucose	rivaroxaban	warfarin
apixaban	danaparoid	heparin (unfractionated)	streptokinase	
argatroban	edoxaban	nicotinic acid	tenecteplase	
bivalirudin	enoxaparin	omega-3-acid ethyl esters	tinzaparin	

TABLE 4

Drugs with antiplatelet effects

The following is a list of drugs that have antiplatelet effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of bleeding; concurrent use of drugs with anticoagulant effects (see table of drugs with anticoagulant effects) might also increase this risk.

abciximab	dapoxetine	etoricoxib	mefenamic acid	sulindac
aceclofenac	dasatinib	fenoprofen	meloxicam	tenoxicam
acemetacin	dexibuprofen	flouxetine	nabumetone	tiaprofenic acid
anagrelide	dexketoprofen	flurbiprofen	naproxen	ticagrelor
aspirin	diclofenac	fluvoxamine	parecoxib	tirofiban
bevacizumab	dipyridamole	ibrutinib	paroxetine	tolfenamic acid
cangrelor	duloxetine	ibuprofen	piroxicam	trastuzumab
celecoxib	epoprostenol	iloprost	prasugrel	trastuzumab emtansine
cilostazol	efitibatide	indometacin	regorafenib	venlafaxine
citalopram	escitalopram	ketoprofen	sertraline	vortioxetine
clopidogrel	etodolac	ketorolac	sulfapyrazone	

TABLE 5

Drugs that cause thromboembolism

The following is a list of some drugs that cause thromboembolism (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

bleomycin	epoetin zeta	pentostatin	toremifene	vinflunine
cyclophosphamide	flourouracil	pomalidomide	tranexamic acid	vinorelbine
darbepoetin alfa	fulvestrant	raloxifene	tretinoin	
doxorubicin	lenalidomide	tamoxifen	vinblastine	
epoetin alfa	methotrexate	thalidomide	vincristine	
epoetin beta				

TABLE 6**Drugs that cause bradycardia**

The following is a list of drugs that cause bradycardia (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

acebutolol	carvedilol	fentanyl	nadolol	rivastigmine
alectinib	celiprolol	fingolimod	neбиволol	selegiline
alfentanil	cisatracurium	flecainide	neostigmine	sotalol
amiodarone	clonidine	galantamine	oxprenolol	sufentanil
apraclonidine	crizotinib	ivabradine	pasireotide	thalidomide
atenolol	digoxin	labetalol	pindolol	timolol
betaxolol	diltiazem	levobunolol	propranolol	tizanidine
bisoprolol	donepezil	methadone	pyridostigmine	verapamil
brimonidine	esmolol	metoprolol	remifentanyl	

TABLE 7**Drugs that cause first dose hypotension**

The following is a list of some drugs that can cause first-dose hypotension (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

alfuzosin	eprosartan	isosorbide dinitrate	prazosin	trandolapril
azilsartan	fosinopril	isosorbide mononitrate	quinapril	valsartan
candesartan	glyceryl trinitrate	lisinopril	ramipril	
captopril	imidapril	losartan	tamsulosin	
doxazosin	indoramin	olmesartan	telmisartan	
enalapril	irbesartan	perindopril	terazosin	

TABLE 8**Drugs that cause hypotension**

The following is a list of some drugs that cause hypotension (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

acebutolol	chlorpromazine	haloperidol	moxisylyte	riociguat
alcohol (beverage)	chlortalidone	hydralazine	moxonidine	risperidone
alfuzosin	clevidipine	hydrochlorothiazide	nadolol	ropinirole
aliskiren	clomipramine	hydroflumethiazide	neбиволol	rotigotine
alprostadil	clonidine	imidapril	nicardipine	sacubitril
amantadine	clozapine	imipramine	nicorandil	sapropterin
amitriptyline	clozapine	indapamide	nifedipine	selegiline
amlodipine	cyclopenthiiazide	indoramin	nimodipine	sevoflurane
apomorphine	dapagliflozin	irbesartan	nitrous oxide	sildenafil
apraclonidine	desflurane	isocarboxazid	nortriptyline	sodium nitroprusside
aripiprazole	diazoxide	isoflurane	olanzapine	sodium oxybate
asenapine	diltiazem	isosorbide dinitrate	olmesartan	sotalol
atenolol	dipyridamole	isosorbide mononitrate	oxprenolol	spironolactone
avanafil	dosulepin	ketamine	paliperidone	sulpiride
azilsartan	doxazosin	labetalol	pergolide	tadalafil
baclofen	doxepin	lacidipine	pericyazine	tamsulosin
bendroflumethiazide	droperidol	lercanidipine	perindopril	valsartan
benperidol	empagliflozin	levobunolol	perphenazine	terazosin
betaxolol	enalapril	levodopa	phenelzine	thiopental
bisoprolol	eplerenone	levomepromazine	pimozide	timolol
bortezomib	eprosartan	lisinopril	pindolol	tizanidine
brimonidine	esmolol	lofepramine	pramipexole	torasemide
bromocriptine	etomidate	lofexidine	prazosin	trandolapril
bumetanide	felodipine	losartan	prochlorperazine	tranylcypromine
cabergoline	flupentixol	loxapine	promazine	trifluoperazine
canagliflozin	fluphenazine	lurasidone	propofol	trimipramine
candesartan	fosinopril	methoxyflurane	propofol	valsartan
captopril	furosemide	methyldopa	quetiapine	varidenafil
carvedilol	glyceryl trinitrate	metolazone	quinagolide	verapamil
celiprolol	guanethidine	metoprolol	quinapril	xipamide
chlorthiazide	guanfacine	minoxidil	ramipril	zuclopenthixol

TABLE 9**Drugs that prolong the QT interval**

The following is a list of some drugs that prolong the QT-interval (note that this list is not exhaustive). In general, manufacturers advise that the use of two or more drugs that are associated with QT prolongation should be avoided. Increasing age, female sex, cardiac disease, and some metabolic disturbances (notably hypokalaemia) predispose to QT prolongation—concurrent use of drugs that reduce serum potassium might further increase this risk (see table of drugs that reduce serum potassium).

Drugs that are not known to prolong the QT interval but are predicted (by the manufacturer) to increase the risk of QT prolongation include: domperidone, fingolimod, granisetron, ivabradine, mefloquine, mizolastine, palonosetron, and intravenous pentamidine. Most manufacturers advise avoiding concurrent use with drugs that prolong the QT interval.

amifampridine	clarithromycin	fluphenazine	panobinostat	telavancin
amiodarone	clomipramine	haloperidol	pasireotide	tetrabenazine
amisulpride	crizotinib	hydroxyzine	pazopanib	tizanidine
anagrelide	dasatinib	inotuzumab ozogamicin	pimozide	tolterodine
apomorphine	delamanid	lapatinib	quinine	toremifene
arsenic trioxide	disopyramide	levomepromazine	ranolazine	vandetanib
artemether	dronedarone	lithium	ribociclib	varidenafil
artemimol	droperidol	lofedidine	risperidone	vemurafenib
bedaquiline	efavirenz	methadone	saquinavir	venlafaxine
bosutinib	eribulin	moxifloxacin	sildenafil	vinflunine
cabozantinib	erythromycin	nilotinib	sorafenib	voriconazole
ceritinib	escitalopram	ondansetron	sotalol	zuclopenthixol
chlormpromazine	flecainide	osimertinib	sulpiride	
citalopram	fluconazole	paliperidone	sunitinib	

TABLE 10**Drugs with antimuscarinic effects**

The following is a list of some drugs that have antimuscarinic effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of these effects occurring.

acridinium	cyclopentolate	haloperidol	orphenadrine	tiotropium
amantadine	cyproheptadine	homatropine	oxybutynin	tolterodine
amitriptyline	darifenacin	hydroxyzine	perphenazine	trifluoperazine
atropine	dicycloverine	hyoscine	pimozide	trihexyphenidyl
baclofen	dimenhydrinate	imipramine	prochlorperazine	trimipramine
chlorphenamine	disopyramide	ipratropium	procyclidine	tropicamide
chlormpromazine	dosulepin	levomepromazine	promethazine	trospium
clemastine	doxepin	lofepramine	propafenone	umeclidinium
clomipramine	fesoterodine	loxapine	propantheline	
clozapine	flavoxate	nefopam	propiverine	
cyclizine	glycopyrronium	nortriptyline	solifenacin	

TABLE 11**Drugs with CNS depressant effects**

The following is a list of some drugs with CNS depressant effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of CNS depressant effects, such as drowsiness, which might affect the ability to perform skilled tasks (see 'Drugs and Driving' in Guidance on Prescribing p. 1).

agomelatine	clomethiazole	isoflurane	moxonidine	quetiapine
alcohol (beverage)	clonazepam	ketamine	nabilone	remifentanyl
alfentanil	clonidine	ketotifen	nitrazepam	risperidone
alimemazine	clonidine	lamotrigine	nitrous oxide	ropivacaine
alprazolam	codeine	levetiracetam	olanzapine	sevoflurane
amisulpride	cyclizine	levomepromazine	oxazepam	sodium oxybate
apraclonidine	cyproheptadine	lidocaine	oxycodone	sufentanil
aripiprazole	desflurane	lofedidine	paliperidone	sulpiride
articaïne	dexmedetomidine	loperidol	papaveretum	tapentadol
asenapine	diamorphine	lorazepam	pentazocine	temazepam
baclofen	diazepam	lormetazepam	perampanel	tetracaine
benperidol	dihydrocodeine	loxapine	pericyazine	thalidomide
brimonidine	dipipanone	lurasidone	perphenazine	thiopental
buclizine	droperidol	melatonin	perthidine	tizanidine
bupivacaine	etomidate	mepivacaine	phenobarbital	tramadol
buprenorphine	fentanyl	meprobamate	pimozide	trazodone
cannabis extract	flupentixol	mepizatinol	piptifen	trifluoperazine
chloral hydrate	fluphenazine	methadone	pregabalin	venlafaxine
chlordiazepoxide	flurazepam	methocarbamol	prilocaline	zaleplon
chlorphenamine	gabapentin	methoxyflurane	primidone	zolidem
chlormpromazine	guanfacine	mianserin	prochlorperazine	zopiclone
cinnarizine	haloperidol	midazolam	promazine	zuclopenthixol
clemastine	hydromorphone	mirtazapine	promethazine	
clobazam	hydroxyzine	morphine	propofol	

TABLE 12**Drugs that cause peripheral neuropathy**

The following is a list of some drugs that cause peripheral neuropathy (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amiodarone	didanosine	isoniazid	phenytoin	vindesine
bortezomib	disulfiram	lamivudine	stavudine	vinflunine
brentuximab vedotin	docetaxel	metronidazole	thalidomide	vinorelbine
cabazitaxel	eribulin	nitrofurantoin	vinblastine	
cisplatin	fosphenytoin	paclitaxel	vincristine	

TABLE 13**Drugs that cause serotonin syndrome**

The following is a list of some drugs that cause serotonin syndrome (note that this list is not exhaustive). See 'Serotonin Syndrome' and 'Monoamine-Oxidase Inhibitors' under Antidepressant drugs p. 235 for more information and for specific advice on avoiding monoamine-oxidase inhibitors during and after administration of other serotonergic drugs.

almotriptan	fentanyl	methadone	pethidine	tapentadol
bupropion	fluoxetine	methylthioninium chloride	phenelzine	tramadol
bupirone	fluvoxamine	mianserin	procarbazine	tranylcypromine
citalopram	frovatriptan	mirtazapine	rasagiline	trazodone
clomipramine	granisetron	moclobemide	rizatriptan	tryptophan
dapoxetine	imipramine	naratriptan	safinamide	venlafaxine
dexamfetamine	isocarboxazid	ondansetron	selegiline	vortioxetine
duloxetine	linezolid	palonosetron	sertraline	zolmitriptan
eletriptan	lisdexamfetamine	paroxetine	St John's Wort	
escitalopram	lithium	pentazocine	sumatriptan	

TABLE 14**Antidiabetic drugs**

The following is a list of antidiabetic drugs (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase the risk of hypoglycaemia.

acarbose	dulaglutide	glimepiride	lixisenatide	saxagliptin
albiglutide	empagliflozin	glipizide	metformin	sitagliptin
alogliptin	exenatide	insulins	netglinide	tolbutamide
canagliflozin	glibenclamide	linagliptin	pioglitazone	vildagliptin
dapagliflozin	gliclazide	liraglutide	repaglinide	

TABLE 15**Drugs that cause myelosuppression**

The following is a list of some drugs that cause myelosuppression (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

afatinib	carmustine	everolimus	nilotinib	rituximab
afibercept	ceritinib	fludarabine	nivolumab	ruixolitinib
alemtuzumab	cetuximab	flurouracil	obinutuzumab	siltuximab
amsacrine	chlorambucil	ganciclovir	ofatumumab	sorafenib
anakinra	cisplatin	gefitinib	olanzapine	sulfadiazine
arsenic trioxide	cladribine	gemcitabine	olaparib	sulfasalazine
asparaginase	clofarabine	hydroxycarbamide	olsalazine	sunitinib
axitinib	clozapine	ibrutinib	oxaliplatin	temozolomide
azacitidine	co-trimoxazole	idarubicin	paclitaxel	temsirolimus
azathioprine	crisantaspase	idelalisib	panitumumab	thalidomide
balsalazide	crizotinib	ifosfamide	panobinostat	thiotepa
belimumab	cyclophosphamide	imatinib	pazopanib	tioguanine
bendamustine	cytarabine	interferon alfa	pegaspargase	topotecan
bevacizumab	dabrafenib	interferon beta	peginterferon alfa	trabectedin
bleomycin	dacarbazine	irinotecan	peginterferon beta-1a	trastuzumab emtansine
blinatumomab	dactinomycin	leflunomide	pemetrexed	treosulfan
bortezomib	dasatinib	lenalidomide	pentamidine	valganciclovir
bosutinib	daunorubicin	linezolid	pentostatin	vinblastine
brentuximab vedotin	decitabine	lomustine	pixantrone	vincristine
busulfan	deferiprone	melfalan	pomalidomide	vindesine
cabazitaxel	docetaxel	mercaptopurine	primaquine	vinflunine
cabozantinib	doxorubicin	methotrexate	procarbazine	vinorelbine
canakinumab	epirubicin	mitomycin	propylthiouracil	vismodegib
capecitabine	eribulin	mitotane	pyrimethamine	zidovudine
carbimazole	estramustine	mitoxantrone	raltitrexed	
carboplatin	ethosuximide	mycophenolate	ramucirumab	
carfilzomib	etoposide	nelarabine	regorafenib	

TABLE 16

Drugs that increase serum potassium

The following is a list of some drugs that increase serum potassium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyperkalaemia (hyperkalaemia is particularly notable when ACE inhibitors or angiotensin-II receptor antagonists are given with spironolactone or eplerenone).

aceclofenac	dexketoprofen	fenoprofen	meloxicam	sulindac
acemetacin	diclofenac	flurbiprofen	nabumetone	tacrolimus
aliskiren	drospirenone	heparin (unfractionated)	naproxen	telmisartan
amiloride	enalapril	ibuprofen	olmesartan	tenoxicam
azilsartan	enoxaparin	imipramine	parecoxib	tiaprofenic acid
candesartan	eplerenone	indometacin	perindopril	tinzaparin
captopril	epoetin alfa	irbesartan	piroxicam	tolfenamic acid
celecoxib	epoetin beta	ketoprofen	potassium canrenoate	tolvaptan
ciclosporin	epoetin zeta	ketorolac	potassium chloride	trandolapril
dalteparin	eprosartan	lisinopril	quinapril	triamterene
darbepoetin alfa	etodolac	losartan	ramipril	trimethoprim
dexibuprofen	etoricoxib	mefenamic acid	spironolactone	valsartan

TABLE 17

Drugs that reduce serum potassium

The following is a list of some drugs that reduce serum potassium concentrations (note that this list is not exhaustive and that other drugs can cause hypokalaemia in overdose). Concurrent use of two or more drugs from this list might increase the risk of hypokalaemia. Hypokalaemia can increase the risk of torsade de pointes, which might be additive with the effects of drugs that prolong the QT interval (see table of drugs that prolong the QT interval).

aminophylline	bumetanide	fludrocortisone	indapamide	salmeterol
amphotericin	chlorothiazide	formoterol	methylprednisolone	terbutaline
bambuterol	chlorthalidone	furosemide	metolazone	theophylline
beclomethasone	clonidine	hydrochlorothiazide	olodaterol	torasemide
bendroflumethiazide	cyclopenthiadiazide	hydrocortisone	prednisolone	triamcinolone
betamethasone	deflazacort	hydroflumethiazide	prednisone	vilanterol
budesonide	dexamethasone	indacaterol	salbutamol	xipamide

TABLE 18

Drugs that cause hyponatraemia

The following is a list of some drugs that reduce sodium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyponatraemia.

aceclofenac	clonidine	etodolac	indometacin	sertraline
acemetacin	cyclopenthiadiazide	etoricoxib	ketoprofen	sodium picosulfate
amiloride	dapoxetine	fenoprofen	ketorolac	spironolactone
amitriptyline	desmopressin	fluoxetine	mefenamic acid	sulindac
bendroflumethiazide	dexibuprofen	flurbiprofen	metolazone	tenoxicam
bumetanide	dexketoprofen	fluvoxamine	nabumetone	tiaprofenic acid
carbamazepine	diclofenac	furosemide	naproxen	tolfenamic acid
celecoxib	dosulepin	hydrochlorothiazide	nortriptyline	torasemide
chlorothiazide	doxepin	hydroflumethiazide	parecoxib	triamterene
chlorthalidone	duloxetine	ibuprofen	paroxetine	trimethoprim
citalopram	eplerenone	imipramine	piroxicam	trimipramine
clomipramine	escitalopram	indapamide		xipamide

TABLE 19

Drugs that cause ototoxicity

The following is a list of some drugs that cause ototoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amikacin	cisplatin	oxaliplatin	torasemide	vindesine
bumetanide	furosemide	streptomycin	vancomycin	vinflunine
capreomycin	gentamicin	telavancin	vinblastine	vinorelbine
carboplatin	neomycin	tobramycin	vincristine	

TABLE 20

Drugs with neuromuscular blocking effects

The following is a list of some drugs with neuromuscular blocking effects (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amikacin	cisatracurium	neomycin	pyridostigmine	tobramycin
atracurium	colistimethate	neostigmine	rocuronium	vecuronium
botulinum toxin type A	gentamicin	pancuronium	streptomycin	
botulinum toxin type B	mivacurium	polymyxins	suxamethonium	

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

Abacavir

- Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **abacavir**. [Moderate] Theoretical
- HIV-protease inhibitors (**tipranavir**) slightly decrease the exposure to **abacavir**. Avoid. [Severe] Study

Abatacept

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **abatacept**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Abciximab → see TABLE 4 p. 847 (antiplatelet effects)

Abiraterone

GENERAL INFORMATION Caution with concurrent chemotherapy—safety and efficacy not established.

- Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- Abiraterone** is predicted to increase the exposure to **beta blockers**, selective (**metoprolol**). [Moderate] Study
- Cobicistat** is predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- Abiraterone** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- Enzalutamide** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- Idelalisib** is predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- Macrolides (**clarithromycin**) are predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- Mitotane** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- Abiraterone** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- Rifampicin** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- Abiraterone** potentially increases the exposure to **venlafaxine**. [Severe] Theoretical

Acarbose → see TABLE 14 p. 850 (antidiabetic drugs)

- Acarbose** decreases the concentration of **digoxin**. [Moderate] Study
- Pancreatin** is predicted to decrease the effects of **acarbose**. Avoid. [Moderate] Theoretical

ACE inhibitors → see TABLE 7 p. 848 (first-dose hypotension), TABLE 8 p. 848 (hypotension), TABLE 16 p. 851 (increased serum potassium)

- captopril • enalapril • fosinopril • imidapril • lisinopril • perindopril • quinapril • ramipril • trandolapril
- ACE inhibitors** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients. [Severe] Study → Also see TABLE 8 p. 848 → Also see TABLE 16 p. 851
- ACE inhibitors** are predicted to increase the risk of hypersensitivity and haematological reactions when given with **allopurinol**. [Severe] Anecdotal
- ACE inhibitors** are predicted to increase the risk of anaemia and/or leucopenia when given with **azathioprine**. [Severe] Anecdotal
- ACE inhibitors** are predicted to decrease the efficacy of **icatifant** and **icatifant** is predicted to decrease the efficacy of **ACE inhibitors**. Avoid. [Moderate] Theoretical
- ACE inhibitors** are predicted to increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Anecdotal

- ACE inhibitors** are predicted to increase the risk of hypersensitivity when given with **sodium aurothiomalate**. [Severe] Anecdotal
- Quinapril** (tablet) decreases the absorption of oral **tetracyclines** (**tetracycline**). Avoid. [Moderate] Study

Acetabulol → see beta blockers, selective

Acetofenac → see NSAIDs

Acemetacin → see NSAIDs

Acemecoumarol → see coumarins

Acetazolamide

- Acetazolamide** potentially increases the risk of toxicity when given with **antiepileptics** (**valproate**). [Severe] Study
- Acetazolamide** potentially increases the risk of overheating and dehydration when given with **antiepileptics** (**zonisamide**). Avoid in children. [Severe] Theoretical
- Acetazolamide** increases the risk of severe toxic reaction when given with **aspirin** (high-dose). [Severe] Study
- Acetazolamide** alters the concentration of **lithium**. [Severe] Anecdotal
- Acetazolamide** is predicted to decrease the efficacy of **methenamine**. Avoid. [Moderate] Theoretical
- Acetazolamide** increases the urinary excretion of **methotrexate**. [Moderate] Study

Aciclovir → see TABLE 2 p. 847 (nephrotoxicity)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Aciclovir** increases the exposure to **aminophylline**. Monitor and adjust dose. [Severe] Anecdotal
- Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **aciclovir**. [Moderate] Theoretical
- Aciclovir** is predicted to increase the exposure to **theophylline**. Monitor and adjust dose. [Severe] Theoretical
- Acitretin** → see retinoids
- Acridinium** → see TABLE 10 p. 849 (antimuscarinics)
- Acrivastine** → see antihistamines, non-sedating
- Adalimumab** → see monoclonal antibodies
- Adapalene** → see retinoids

Adefovir

- Ataluren** increases the exposure to **adefovir**. [Moderate] Study

Adenosine → see antiarrhythmics

Adrenaline/epinephrine → see sympathomimetics, vasoconstrictor

Afatinib → see TABLE 15 p. 850 (myelosuppression)

- Antiarrhythmics (**amiodarone**, **dronedarone**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- Antiepileptics (**carbamazepine**) are predicted to decrease the exposure to **afatinib**. [Moderate] Study
- Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- Calcium channel blockers (**verapamil**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- Ciclosporin** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- HIV-protease inhibitors (**lopinavir**, **ritonavir**, **saquinavir**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- Lapatinib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- Macrolides** are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- Ranolazine** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- Rifampicin** is predicted to decrease the exposure to **afatinib**. [Moderate] Study
- St John's Wort** is predicted to decrease the exposure to **afatinib**. [Moderate] Study
- Vemurafenib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study

Aflibercept → see TABLE 15 p. 850 (myelosuppression)

Agalsidase

- **Aminoglycosides** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Antiarrhythmics (amiodarone)** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Antimalarials (chloroquine)** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Hydroxychloroquine** is predicted to decrease the effects of agalsidase. [Moderate] Theoretical

Agomelatine → see TABLE 11 p. 849 (CNS depressant effects)

- Dose adjustment might be necessary if smoking started or stopped during treatment.
- Caution with concomitant use of drugs associated with hepatic injury.

- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **Combined hormonal contraceptives** are predicted to increase the exposure to agomelatine. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **Leflunomide** is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to agomelatine. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **SSRIs (fluvoxamine)** very markedly increase the exposure to agomelatine. Avoid. [Severe] Study
- **Teriflunomide** is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical

Albendazole

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the concentration of albendazole. [Moderate] Study
- **H₂ receptor antagonists (cimetidine)** decrease the clearance of albendazole. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** decrease the exposure to albendazole. [Moderate] Study
- **Albendazole** slightly decreases the exposure to **levamisole** and **levamisole** moderately decreases the exposure to **albendazole**. [Moderate] Study

Albiglutide → see TABLE 14 p. 850 (antidiabetic drugs)

Alcohol (beverage) → see TABLE 1 p. 847 (hepatotoxicity), TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

- **Alcohol (beverage)** potentially increases the risk of visual disturbances when given with **antiepileptics (retigabine)**. [Moderate] Study
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **antifungals, azoles (ketoconazole)**. Avoid. [Moderate] Anecdotal
- **Alcohol (beverage)** causes serious, potentially fatal, CNS depression when given with **clomethiazole**. Avoid. [Severe] Study → Also see TABLE 11 p. 849
- **Alcohol (beverage)** (in those who drink heavily) potentially decreases the anticoagulant effect of **coumarins**. [Severe] Study
- **Alcohol (beverage)** (excessive consumption) potentially increases the risk of gastrointestinal side-effects when given with **dimethyl fumarate**. Avoid. [Moderate] Theoretical
- **Alcohol (beverage)** causes an extremely unpleasant systemic reaction when given with **disulfiram**. Avoid for at least 24 hours before and up to 14 days after stopping treatment. [Severe] Study
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **griseofulvin**. [Moderate] Anecdotal
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **levamisole**. [Moderate] Study
- **Alcohol (beverage)** (excessive consumption) potentially increases the risk of lactic acidosis when given with **metformin**. Avoid excessive alcohol consumption. [Moderate] Theoretical
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **metronidazole**. Avoid for at least 48 hours stopping treatment. [Moderate] Study

- **Alcohol (beverage)** causes rapid release of **opioids (hydromorphone, morphine)** (from extended-release preparations). Avoid. [Severe] Study → Also see TABLE 11 p. 849
- **Alcohol (beverage)** (in those who drink heavily) causes severe liver damage when given with **paracetamol**. [Severe] Study → Also see TABLE 1 p. 847
- **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical **pimecrolimus**. [Moderate] Study
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **procarbazine**. [Moderate] Anecdotal
- **Alcohol (beverage)** potentially increases the concentration of **retinoids (acitretin)**. Avoid and for 2 months after stopping acitretin. [Moderate] Study
- **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical **tacrolimus**. [Moderate] Study
- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **tinidazole**. Avoid for 72 hours stopping treatment. [Moderate] Theoretical

Aldosterone antagonists → see TABLE 18 p. 851 (hyponatraemia), TABLE 8 p. 848 (hypotension), TABLE 16 p. 851 (increased serum potassium)

eplerenone • spironolactone

- **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Theoretical
- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical → Also see TABLE 18 p. 851
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Appetitant** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study → Also see TABLE 8 p. 848
- **Cobicistat** is predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Eplerenone** very slightly increases the exposure to **digoxin**. [Mild] Study
- **Spironolactone** increases the concentration of **digoxin**. Monitor and adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical
- **HIV-protease inhibitors** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Idelalisib** is predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Imatinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Eplerenone** potentially increases the concentration of **lithium**. Avoid. [Moderate] Theoretical
- **Spironolactone** potentially increases the concentration of **lithium**. [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Mitotane** is predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical
- **Spironolactone** is predicted to decrease the effects of **mitotane**. Avoid. [Severe] Anecdotal
- **Netupitant** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study

A1

Interactions | Appendix 1

Aldosterone antagonists (continued)

- ▶ **Rifampicin** is predicted to decrease the exposure to **eplerenone**. Avoid. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to slightly decrease the exposure to **eplerenone**. Avoid. [Moderate] Study

Alectinib → see TABLE 6 p. 848 (bradycardia), TABLE 1 p. 847 (hepatotoxicity)

Alemtuzumab → see monoclonal antibodies

Alendronic acid → see bisphosphonates

Alfacalcidol → see vitamin D substances

Alfentanil → see opioids

Alfuzosin → see alpha blockers

Alimemazine → see antihistamines, sedating

Aliskiren → see TABLE 8 p. 848 (hypotension), TABLE 16 p. 851 (increased serum potassium)

FOOD AND LIFESTYLE Avoid apple juice and orange juice as they greatly decrease aliskiren concentrations and plasma renin activity.

- ▶ **ACE inhibitors** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients. [Severe] Study → Also see TABLE 8 p. 848 → Also see TABLE 16 p. 851

- ▶ **Angiotensin-II receptor antagonists** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients. [Severe] Study → Also see TABLE 8 p. 848 → Also see TABLE 16 p. 851

- ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **aliskiren**. [Severe] Study

- ▶ **Antiepileptics (carbamazepine)** decrease the exposure to **aliskiren**. [Moderate] Study

- ▶ **Antifungals, azoles (itraconazole)** markedly increase the exposure to **aliskiren**. Avoid. [Severe] Study

- ▶ **Antifungals, azoles (ketoconazole)** moderately increase the exposure to **aliskiren**. [Moderate] Study

- ▶ **Calcium channel blockers (verapamil)** moderately increase the exposure to **aliskiren**. [Moderate] Study → Also see TABLE 8 p. 848

- ▶ **Ceritinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical

- ▶ **Ciclosporin** markedly increases the exposure to **aliskiren**. Avoid. [Severe] Study → Also see TABLE 16 p. 851

- ▶ **Eliglustat** is predicted to increase the exposure to **aliskiren**. Adjust dose. [Moderate] Study

- ▶ **Grapefruit juice** moderately decreases the exposure to **aliskiren**. Avoid. [Severe] Study

- ▶ **HIV-protease inhibitors (ritonavir, saquinavir)** are predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical

- ▶ **Lapatinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical

- ▶ **Aliskiren** slightly decreases the exposure to **loop diuretics (furosemide)**. [Moderate] Study → Also see TABLE 8 p. 848

- ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical

- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **aliskiren**. [Moderate] Study

- ▶ **Mirabegron** is predicted to increase the exposure to **aliskiren**. [Mild] Theoretical

- ▶ **Ranolazine** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical

- ▶ **Rifampicin** decreases the exposure to **aliskiren**. [Moderate] Study

- ▶ **St John's Wort** decreases the exposure to **aliskiren**. [Moderate] Study

- ▶ **Statins (atorvastatin)** slightly to moderately increase the exposure to **aliskiren**. [Moderate] Study

- ▶ **Velpatasvir** is predicted to increase the exposure to **aliskiren**. [Severe] Theoretical

- ▶ **Vemurafenib** is predicted to increase the exposure to **aliskiren**. Use with caution and adjust dose. [Moderate] Theoretical

Alitretonin → see retinoids

Alkylating agents → see TABLE 15 p. 850 (myelosuppression), TABLE 2 p. 847 (neurotoxicity), TABLE 5 p. 847 (thromboembolism)

bendamustine • busulfan • carmustine • chlorambucil • cyclophosphamide • dacarbazine • estramustine • ifosfamide • lomustine • melphalan • temozolomide • thiopeta • treosulfan

- ▶ **Antacids** are predicted to decrease the absorption of **estramustine**. Avoid. [Moderate] Study
- ▶ **Antifungals, azoles (isavuconazole)** are predicted to increase the exposure to **cyclophosphamide**. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole)** increase the risk of busulfan toxicity when given with **busulfan**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **busulfan**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Oral calcium salts** decrease the absorption of **estramustine**. [Severe] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **alkylating agents**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Metronidazole** increases the risk of toxicity when given with **busulfan**. [Severe] Study
- ▶ **Paracetamol** is predicted to decrease the clearance of **busulfan**. [Moderate] Theoretical
- ▶ **Cyclophosphamide** (high-dose) increases the risk of toxicity when given with **pentostatin**. Avoid. [Severe] Anecdotal → Also see TABLE 15 p. 850 → Also see TABLE 5 p. 847
- ▶ **Rolapitant** is predicted to increase the exposure to **bendamustine**. Avoid or monitor. [Moderate] Study
- ▶ **Cyclophosphamide** increases the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] Study

Allopurinol

- ▶ **ACE inhibitors** are predicted to increase the risk of hypersensitivity and haematological reactions when given with **allopurinol**. [Severe] Anecdotal
- ▶ **Allopurinol** potentially increases the risk of haematological toxicity when given with **azathioprine**. Adjust **azathioprine** dose, p. 518. [Severe] Study
- ▶ **Allopurinol** is predicted to decrease the effects of **capecitabine**. Avoid. [Severe] Study
- ▶ **Allopurinol** moderately increases the exposure to **didanosine**. Avoid. [Severe] Study
- ▶ **Allopurinol** potentially increases the risk of haematological toxicity when given with **mercaptopurine**. Adjust **mercaptopurine** dose, p. 543. [Severe] Study
- ▶ **Allopurinol** increases the risk of skin rash when given with **penicillins (amoxicillin, ampicillin)**. [Moderate] Study
- ▶ **Allopurinol** is predicted to increase the risk of hyperuricaemia when given with **pyrazinamide**. [Moderate] Theoretical
- ▶ **Thiazide diuretics** are predicted to increase the risk of hypersensitivity reactions when given with **allopurinol**. [Severe] Theoretical

Almotriptan → see TABLE 13 p. 850 (serotonin syndrome)

- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** increase the exposure to **almotriptan**. [Mild] Study
- ▶ **Cobicistat** increases the exposure to **almotriptan**. [Mild] Study
- ▶ **Almotriptan** is predicted to increase the risk of vasoconstriction when given with **ergotamine**. Ergotamine should be taken at least 24 hours before or 6 hours after **almotriptan**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** increase the exposure to **almotriptan**. [Mild] Study
- ▶ **Idelalisib** increases the exposure to **almotriptan**. [Mild] Study
- ▶ **Macrolides (clarithromycin)** increase the exposure to **almotriptan**. [Mild] Study

Alogliptin → see TABLE 14 p. 850 (antidiabetic drugs)

Alpha blockers → see TABLE 7 p. 848 (first-dose hypotension), TABLE 8 p. 848 (hypotension)

alfuzosin • doxazosin • indoramin • prazosin • tamsulosin • terazosin

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **doxazosin**. [Moderate] Study

- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **Aprepitant** is predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical → Also see TABLE 8 p. 848
 - ▶ **Cobicistat** is predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **doxazosin**. [\[Moderate\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **doxazosin**. [\[Moderate\]](#) Study
 - ▶ **Idelalisib** is predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **doxazosin**. [\[Moderate\]](#) Study
 - ▶ **Imatinib** is predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **doxazosin**. [\[Moderate\]](#) Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the effects of **indoramin**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 848
 - ▶ **Netupitant** is predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
 - ▶ **Nilotinib** is predicted to increase the exposure to **tamsulosin**. [\[Moderate\]](#) Theoretical
 - ▶ **Alpha blockers** cause significant hypotensive effects when given with **phosphodiesterase type-5 inhibitors**. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. [\[Severe\]](#) Study → Also see TABLE 8 p. 848
 - ▶ **Ribociclib** (high-dose) is predicted to increase the exposure to **alfuzosin**. Avoid. [\[Moderate\]](#) Theoretical
- Alpha tocopherol** → see vitamin E substances
Alpha tocopheryl acetate → see vitamin E substances
Alprazolam → see TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Theoretical → Also see TABLE 11 p. 849
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** moderately increase the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **alprazolam**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **Aprepitant** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
 - ▶ **Cobicistat** moderately increases the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** moderately increase the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Idelalisib** moderately increases the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Imatinib** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
 - ▶ **Alprazolam** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** moderately increase the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to **alprazolam**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **Netupitant** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
 - ▶ **Rifampicin** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **SSRIs (fluvoxamine)** moderately increase the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **St John's Wort** moderately decreases the exposure to **alprazolam**. [\[Moderate\]](#) Study
- Alprostadil** → see TABLE 8 p. 848 (hypotension)
Alteplase → see TABLE 3 p. 847 (anticoagulant effects)
Aluminium hydroxide → see antacids
Amantadine → see dopamine receptor agonists
Ambrisentan
- ▶ **Ciclosporin** moderately increases the exposure to **ambrisentan**. Adjust **ambrisentan** dose. [\[Moderate\]](#) Study
 - ▶ **Rifampicin** transiently increases the exposure to **ambrisentan**. [\[Moderate\]](#) Study
- Amfetamines** → see TABLE 13 p. 850 (serotonin syndrome)
- dexamfetamine • lisdexamfetamine
- ▶ **Amfetamines** are predicted to decrease the effects of **apraclonidine**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Amfetamines** are predicted to increase the risk of side-effects when given with **atomoxetine**. [\[Severe\]](#) Theoretical
 - ▶ **Dexamfetamine** decreases the effects of **guanethidine**. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (ritonavir, tipranavir)** are predicted to increase the exposure to **amfetamines**. [\[Severe\]](#) Theoretical
 - ▶ **Moclobemide** is predicted to increase the risk of a hypertensive crisis when given with **amfetamines**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 850
 - ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with **amfetamines**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Anecdotal → Also see TABLE 13 p. 850
 - ▶ **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of severe hypertension when given with **amfetamines**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 850
 - ▶ **Monoamine-oxidase B inhibitors (safinamide)** are predicted to increase the risk of severe hypertension when given with **amfetamines**. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 850
 - ▶ **Nabilone** is predicted to increase the risk of cardiovascular side-effects when given with **amfetamines**. [\[Severe\]](#) Theoretical
 - ▶ **Phenothiazines** are predicted to decrease the effects of **amfetamines**. [\[Moderate\]](#) Study
 - ▶ **Amfetamines** are predicted to decrease the effects of **phenothiazines (chlorpromazine)**. [\[Moderate\]](#) Study
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **amfetamines**. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 850
- Amifampridine** → see TABLE 9 p. 849 (QT-interval prolongation)
Amikacin → see aminoglycosides
Amiloride → see potassium-sparing diuretics

Aminoglycosides → see TABLE 2 p. 847 (nephrotoxicity), TABLE 19 p. 851 (ototoxicity), TABLE 20 p. 851 (neuromuscular blocking effects)

amikacin • gentamicin • streptomycin • tobramycin

- ▶ **Aminoglycosides** are predicted to decrease the effects of **agalsidase**. Avoid. [Moderate] Theoretical
- ▶ **Antifungals, azoles (miconazole)** potentially decrease the exposure to tobramycin. [Moderate] Anecdotal
- ▶ **Ataluren** is predicted to increase the risk of nephrotoxicity when given with intravenous aminoglycosides. Avoid. [Severe] Study
- ▶ **Aminoglycosides** increase the risk of hypocalcaemia when given with **bisphosphonates**. [Moderate] Anecdotal → Also see TABLE 2 p. 847
- ▶ **Aminoglycosides** potentially increase the concentration of **digoxin**. Monitor and adjust dose. [Mild] Study
- ▶ **Loop diuretics** increase the risk of nephrotoxicity when given with aminoglycosides. Avoid. [Moderate] Study → Also see TABLE 19 p. 851
- ▶ **Aminoglycosides** are predicted to decrease the effects of **neostigmine**. [Moderate] Theoretical → Also see TABLE 20 p. 851
- ▶ **Aminoglycosides** are predicted to decrease the effects of **pyridostigmine**. [Moderate] Theoretical → Also see TABLE 20 p. 851

Aminophylline → see TABLE 17 p. 851 (reduced serum potassium)

FOOD AND LIFESTYLE Smoking can increase aminophylline clearance and increased doses of aminophylline are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.

- ▶ **Aciclovir** increases the exposure to aminophylline. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Aminophylline** is predicted to decrease the efficacy of antiarrhythmics (**adenosine**). Separate administration by 24 hours. [Mild] Theoretical
- ▶ **Antiepileptics (fosphenytoin)** are predicted to decrease the exposure to aminophylline. Adjust dose. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital)** are predicted to decrease the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- ▶ **Antiepileptics (phenytoin)** decrease the exposure to aminophylline. Adjust dose. [Moderate] Study
- ▶ **Antiepileptics (primidone)** are predicted to increase the clearance of aminophylline. Adjust dose. [Moderate] Theoretical
- ▶ **Antiepileptics (stiripentol)** are predicted to increase the exposure to aminophylline. Avoid. [Moderate] Theoretical
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. [Severe] Theoretical
- ▶ **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- ▶ **Aminophylline** increases the risk of agitation when given with **doxapram**. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of aminophylline. Adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** decrease the exposure to aminophylline. Adjust dose. [Moderate] Study
- ▶ **Interferons** are predicted to slightly increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- ▶ **Iron chelators (deferasirox)** are predicted to increase the exposure to aminophylline. Avoid. [Moderate] Theoretical
- ▶ **Isoniazid** is predicted to affect the clearance of aminophylline. [Severe] Theoretical
- ▶ **Leflunomide** decreases the exposure to aminophylline. Adjust dose. [Moderate] Study
- ▶ **Aminophylline** is predicted to decrease the concentration of **lithium**. [Moderate] Theoretical
- ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to aminophylline. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- ▶ **Aminophylline** is predicted to decrease the exposure to macrolides (**erythromycin**). Adjust dose. [Severe] Study

- ▶ **Methotrexate** is predicted to decrease the clearance of aminophylline. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (blinatumomab)** are predicted to transiently increase the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (sarilumab)** potentially affect the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Pentoxifylline** is predicted to increase the concentration of aminophylline. Use with caution or avoid. [Severe] Theoretical
- ▶ **Quinolones (ciprofloxacin, norfloxacin)** are predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the exposure to aminophylline. Adjust dose. [Moderate] Study
- ▶ **Aminophylline** is predicted to slightly increase the exposure to **roflumilast**. Avoid. [Moderate] Theoretical
- ▶ **SSRIs (fluvoxamine)** moderately to markedly increase the exposure to aminophylline. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the concentration of aminophylline. [Severe] Theoretical
- ▶ **Sympathomimetics, vasoconstrictor (ephedrine)** increase the risk of side-effects when given with aminophylline. Avoid in children. [Moderate] Study
- ▶ **Teriflunomide** decreases the exposure to aminophylline. Adjust dose. [Moderate] Study
- ▶ **Valaciclovir** is predicted to increase the exposure to aminophylline. [Severe] Anecdotal

Aminosalicilic acid

- ▶ **Aminosalicilic acid** is predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (**prilocaine**). Use with caution or avoid. [Severe] Theoretical
- ▶ **Aminosalicilic acid** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical

Amiodarone → see antiarrhythmics

Amisulpride → see TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Amisulpride** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Amisulpride** is predicted to decrease the effects of **levodopa**. Avoid. [Severe] Theoretical

Amtricitryline → see tricyclic antidepressants

Amiodipine → see calcium channel blockers

Amoxicillin → see penicillins

Amphotericin → see TABLE 2 p. 847 (nephrotoxicity), TABLE 17 p. 851 (reduced serum potassium)

- ▶ **Amphotericin** increases the risk of toxicity when given with **flucytosine**. [Severe] Study
- ▶ **Micafungin** slightly increases the exposure to amphotericin. Avoid or monitor toxicity. [Moderate] Study
- ▶ **Sodium stibogluconate** increases the risk of cardiovascular side-effects when given with amphotericin. Separate administration by 14 days. [Severe] Study

Ampicillin → see penicillins

Amscrine → see TABLE 15 p. 850 (myelosuppression)

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amscrine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Anaesthetics, local → see TABLE 11 p. 849 (CNS depressant effects)

bupivacaine • levobupivacaine • mepivacaine • oxybuprocaine • prilocaine • proxymetacaine • ropivacaine • tetracaine

- ▶ **Aminosalicilic acid** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Anaesthetics, local** are predicted to increase the risk of cardiodepression when given with **antiarrhythmics**. [Severe] Theoretical → Also see TABLE 11 p. 849
- ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to increase the risk of

methaemoglobinaemia when given with topical **prilocaline**.

Use with caution or avoid. [Severe] Theoretical → Also see TABLE 11 p. 849

- ▶ **Antiepileptics (phenytoin)** are predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
- ▶ **Antimalarials (chloroquine, primaquine)** are predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaline**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Dapsone** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaline**. Use with caution or avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
- ▶ **Metoclopramide** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaline**. Avoid. [Severe] Theoretical
- ▶ **Nitratres** are predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaline**. Avoid. [Severe] Theoretical
- ▶ **Nitrofurantoin** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaline**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Paracetamol** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaline**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
- ▶ **Sodium nitroprusside** is predicted to increase the risk of methaemoglobinaemia when given with topical **prilocaline**. Use with caution or avoid. [Severe] Theoretical
- ▶ **SSRIs (fluvoxamine)** decrease the clearance of **ropivacaine**. Avoid prolonged use. [Moderate] Study
- ▶ **Sulfonamides** potentially increase the risk of methaemoglobinaemia when given with topical **prilocaline**. Use with caution or avoid. [Severe] Anecdotal
- ▶ **Teriflunomide** is predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical

Anagrelide → see TABLE 9 p. 849 (QT-interval prolongation), TABLE 4 p. 847 (antiplatelet effects)

- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
- ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical → Also see TABLE 4 p. 847
- ▶ **Anakinra** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **anakinra**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Angiotensin-II receptor antagonists → see TABLE 7 p. 848 (first-dose hypotension), TABLE 8 p. 848 (hypotension), TABLE 16 p. 851 (increased serum potassium)

azilsartan • candesartan • eprosartan • irbesartan • losartan • olmesartan • telmisartan • valsartan

- ▶ **Angiotensin-II receptor antagonists** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients. [Severe] Study → Also see TABLE 8 p. 848 → Also see TABLE 16 p. 851
- ▶ **Angiotensin-II receptor antagonists** potentially increase the concentration of **lithium**. Monitor concentration and adjust dose. [Severe] Anecdotal

Antacids

aluminium hydroxide • magnesium carbonate • magnesium trisilicate

SEPARATION OF ADMINISTRATION Antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- ▶ **Antacids** are predicted to decrease the absorption of **alkylating agents (estramustine)**. Avoid. [Moderate] Study

- ▶ **Antacids** decrease the absorption of **antiepileptics (gabapentin)**. **Gabapentin** should be taken 2 hours after **antacids**. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **antifungals, azoles (itraconazole)** (capsule). **Antacids** should be taken 1 hour before or 2 hours after **itraconazole**. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **antifungals, azoles (ketoconazole)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **antihistamines, non-sedating (fexofenadine)**. Separate administration by 2 hours. [Mild] Study
- ▶ **Antacids** decrease the absorption of **antimalarials (chloroquine)**. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **antimalarials (proguanil)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **aspirin** (high-dose). [Moderate] Study
- ▶ **Antacids** decrease the absorption of **bisphosphonates (alendronic acid)**. **Alendronic acid** should be taken at least 30 minutes before **antacids**. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **bisphosphonates (ibandronic acid)**. Avoid **antacids** for at least 6 hours before or 1 hour after **ibandronic acid**. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **bisphosphonates (risedronate)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **bisphosphonates (sodium clodronate)**. Avoid **antacids** for 2 hours before or 1 hour after **sodium clodronate**. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **bosutinib**. **Bosutinib** should be taken at least 12 hours before **antacids**. [Moderate] Theoretical
- ▶ **Antacids** are predicted to decrease the absorption of **ceritinib**. Separate administration by 2 hours. [Moderate] Theoretical
- ▶ **Oral aluminium hydroxide** decreases the absorption of **chenodeoxycholic acid**. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **cholic acid**. Separate administration by 5 hours. [Mild] Theoretical
- ▶ **Antacids** are predicted to decrease the absorption of **corticosteroids (deflazacort)**. Separate administration by 2 hours. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **corticosteroids (dexamethasone)**. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **dasatinib**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Aluminium hydroxide** is predicted to decrease the absorption of **deferiprone**. Avoid. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **digoxin**. Separate administration by 2 hours. [Mild] Study
- ▶ **Antacids** are predicted to decrease the absorption of **dipyridamole** (immediate release tablets). [Moderate] Theoretical
- ▶ **Antacids** moderately decrease the exposure to **dolutegravir**. **Dolutegravir** should be taken 2 hours before or 6 hours after **antacids**. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **antacids**. [Severe] Study
- ▶ **Antacids** moderately decrease the exposure to **elvitegravir**. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Aluminium hydroxide** increases the risk of blocked enteral or nasogastric tubes when given with **enteral feeds**. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **erlotinib**. **Antacids** should be taken 4 hours before or 2 hours after **erlotinib**. [Moderate] Theoretical
- ▶ **Antacids** slightly to moderately decrease the exposure to **fibrates (gemfibrozil)**. [Moderate] Study
- ▶ **Antacids** are predicted to slightly decrease the exposure to **gefitinib**. [Moderate] Theoretical
- ▶ **Antacids** are predicted to decrease the absorption of **HIV-protease inhibitors (atazanavir)**. **Atazanavir** should be taken 2 hours before or 1 hour after **antacids**. [Severe] Theoretical

Antacids (continued)

- ▶ **Antacids** are predicted to decrease the absorption of **HIV-protease inhibitors (tipranavir)**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **hydroxychloroquine**. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **iron (oral)**. **Iron (oral)** should be taken 1 hour before or 2 hours after antacids. [Moderate] Study
- ▶ **Aluminium hydroxide** is predicted to decrease the exposure to **iron chelators (deferasirox)**. Avoid. [Moderate] Theoretical
- ▶ **Antacids** are predicted to decrease the absorption of **lapatinib**. Avoid. [Moderate] Theoretical
- ▶ **Antacids** are predicted to decrease the exposure to **ledipasvir**. Separate administration by 4 hours. [Moderate] Theoretical
- ▶ **Antacids** decrease the exposure to **mycophenolate**. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **nilotinib**. Separate administration by at least 2 hours. [Moderate] Theoretical
- ▶ **Magnesium trisilicate** decreases the absorption of **nitrofurantoin**. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **pazopanib**. **Pazopanib** should be taken 1 hour before or 2 hours after antacids. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **penicillamine**. Separate administration by 2 hours. [Mild] Study
- ▶ **Antacids** decrease the absorption of **phenothiazines**. [Moderate] Anecdotal
- ▶ **Antacids** increase the risk of metabolic alkalosis when given with **polystyrene sulfonate**. [Severe] Anecdotal
- ▶ **Antacids** decrease the absorption of **quinolones**. **Quinolones** should be taken 2 hours before or 4 hours after antacids. [Moderate] Study
- ▶ **Antacids** slightly decrease the exposure to **raltegravir**. Avoid. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **rifampicin**. **Rifampicin** should be taken 1 hour before antacids. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the exposure to **rilpivirine**. **Antacids** should be taken 2 hours before or 4 hours after rilpivirine. [Severe] Theoretical
- ▶ **Antacids** slightly decrease the exposure to **riociguat**. **Antacids** should be taken 2 hours before or 1 hour after riociguat. [Mild] Study
- ▶ **Antacids** moderately decrease the absorption of **statins (rosuvastatin)**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **sulpiride**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **tetracyclines**. Separate administration by 2 to 3 hours. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **thyroid hormones (levothyroxine)**. Separate administration by at least 4 hours. [Moderate] Anecdotal
- ▶ **Antacids** are predicted to decrease the absorption of **ursodeoxycholic acid**. Separate administration by 2 hours. [Moderate] Theoretical
- ▶ **Antacids** are predicted to decrease the concentration of **velpatasvir**. Separate administration by 4 hours. [Moderate] Theoretical

Antazoline → see antihistamines, sedating

Anthracyclines → see TABLE 15 p. 850 (myelosuppression), TABLE 5 p. 847 (thromboembolism)

daunorubicin · doxorubicin · epirubicin · idarubicin · mitoxantrone · pixantrone

GENERAL INFORMATION Caution is necessary with concurrent use of cardiotoxic drugs, or drugs that reduce cardiac contractility.

- ▶ **Calcium channel blockers (verapamil)** moderately increase the exposure to **doxorubicin**. [Moderate] Study
- ▶ **Ciclosporin** increases the concentration of anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone). [Severe] Study

- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **epirubicin**. Avoid. [Moderate] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **anthracyclines**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Anthracyclines** are predicted to increase the risk of cardiotoxicity when given with **monoclonal antibodies (trastuzumab, trastuzumab emtansine)**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Rolapitant** is predicted to increase the exposure to anthracyclines (**doxorubicin**, **mitoxantrone**). Avoid or monitor. [Moderate] Study

Antiarrhythmics → see TABLE 6 p. 848 (bradycardia), TABLE 12 p. 850 (peripheral neuropathy), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects), TABLE 10 p. 849 (antimuscarinics)

adenosine · amiodarone · disopyramide · dronedarone · flecainide · lidocaine · propafenone

- ▶ Amiodarone has a long half-life; there is potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped.
- ▶ Since systemic absorption can follow topical application of **lidocaine**, the possibility of interactions should be borne in mind.

- ▶ Antiarrhythmics (**amiodarone**, **dronedarone**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Amiodarone** is predicted to decrease the effects of **agalsidase**. Avoid. [Moderate] Theoretical
- ▶ **Amiodarone** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose. [Severe] Study
- ▶ Antiarrhythmics (**amiodarone**, **dronedarone**) are predicted to increase the exposure to **aliskiren**. [Severe] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **alprazolam**. [Severe] Study
- ▶ **Aminophylline** is predicted to decrease the efficacy of **adenosine**. Separate administration by 24 hours. [Mild] Theoretical
- ▶ **Anaesthetics, local** are predicted to increase the risk of cardiodepression when given with antiarrhythmics. [Severe] Theoretical → Also see TABLE 11 p. 849
- ▶ Antiarrhythmics (**propafenone**) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (**amiodarone**). Monitor and adjust dose. [Severe] Theoretical
- ▶ Antiarrhythmics (**amiodarone**) increase the concentration of antiarrhythmics (**flecainide**). Adjust **flecainide** dose and monitor side effects. [Severe] Study → Also see TABLE 6 p. 848 → Also see TABLE 9 p. 849
- ▶ Antiarrhythmics (**propafenone**) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (**lidocaine**). [Moderate] Study
- ▶ Antiarrhythmics (**dronedarone**) are predicted to increase the exposure to antiarrhythmics (**propafenone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Amiodarone** increases the risk of bradycardia when given with **anticholinesterases, centrally acting**. [Moderate] Anecdotal → Also see TABLE 6 p. 848
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the efficacy of **propafenone**. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **lidocaine**. [Severe] Anecdotal
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to antiarrhythmics (**disopyramide**, **dronedarone**). Avoid. [Severe] Study

- ▶ **Amiodarone** is predicted to slightly increase the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor and adjust dose. [Severe] Study → Also see TABLE 12 p. 850
- ▶ **Antifungals, azoles (fluconazole)** are predicted to increase the exposure to **dronedarone**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **disopyramide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** very markedly increase the exposure to **dronedarone**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **disopyramide**. Use with caution and adjust dose. [Severe] Theoretical
- ▶ **Antifungals, azoles (posaconazole)** are predicted to increase the exposure to antiarrhythmics (**disopyramide, dronedarone**). Avoid. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine, mizolastine)**. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **Aprepitant** increases the exposure to **dronedrone**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine)** are predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, non-selective**. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 848 → Also see TABLE 9 p. 849
- ▶ **Propafenone** is predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, non-selective (labetalol, levobunolol, nadolol, oxprenolol, pindolol, sotalol)**. Use with caution or avoid. [Severe] Study
- ▶ **Propafenone** increases the risk of cardiovascular side-effects when given with **beta blockers, non-selective (propranolol)**. Use with caution or avoid. [Severe] Study
- ▶ **Propafenone** is predicted to increase the exposure to **beta blockers, non-selective (timolol)** and **beta blockers, non-selective (timolol)** are predicted to increase the risk of cardiodepression when given with **propafenone**. [Severe] Anecdotal
- ▶ **Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine)** are predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, selective**. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 848
- ▶ **Propafenone** is predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, selective (acebutolol, atenolol, betaxolol, bisoprolol, celiprolol, esmolol)**. Use with caution or avoid. [Severe] Study
- ▶ **Propafenone** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. [Moderate] Study
- ▶ **Propafenone** is predicted to increase the exposure to **beta blockers, selective (nebivolol)** and **beta blockers, selective (nebivolol)** are predicted to increase the risk of cardiodepression when given with **propafenone**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **dronedrone**. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Dronedarone** is predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Caffeine citrate** decreases the efficacy of **adenosine**. Separate administration by 24 hours. [Mild] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** increase the exposure to **dronedrone** and **dronedrone** increases the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Calcium channel blockers (verapamil)** increase the risk of cardiodepression when given with **flecainide**. [Severe] Anecdotal → Also see TABLE 6 p. 848
- ▶ **Dronedarone** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Amiodarone** is predicted to increase the risk of cardiodepression when given with **calcium channel blockers (diltiazem, verapamil)**. Avoid. [Severe] Theoretical → Also see TABLE 6 p. 848
- ▶ **Disopyramide** is predicted to increase the risk of cardiodepression when given with **calcium channel blockers (verapamil)**. [Severe] Theoretical
- ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Amiodarone** increases the concentration of **ciclosporin**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Dronedarone** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Ciclosporin** increases the exposure to **dronedrone**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** very markedly increases the exposure to **dronedrone**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **colchicine**. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Amiodarone** increases the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Propafenone** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Amiodarone** increases the exposure to **dabigatran**. Adjust dabigatran dose. [Moderate] Study
- ▶ **Dronedarone** slightly increases the exposure to **dabigatran**. Avoid. [Severe] Study
- ▶ **Daclatasvir** is predicted to increase the risk of severe bradycardia or heart block when given with **amiodarone**. Refer to specialist literature. [Severe] Anecdotal
- ▶ **Dronedarone** is predicted to slightly increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Darifenacin** is predicted to increase the concentration of **flecainide**. [Moderate] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to moderately increase the exposure to **digoxin**. Monitor and adjust digoxin dose, p. 81. [Severe] Study → Also see TABLE 6 p. 848

Antiarrhythmics (continued)

- ▶ **Propafenone** increases the concentration of **digoxin**. Monitor and adjust dose. [Severe] Study
- ▶ **Dipyridamole** increases the exposure to **adenosine**. Avoid or adjust dose. [Severe] Study
- ▶ **Dronedaron** increases the risk of QT-prolongation when given with **domeperidone**. Avoid. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Severe] Anecdotal
- ▶ **Dronedaron** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Amiodarone** slightly increases the exposure to **edoxaban**. [Severe] Study
- ▶ **Dronedaron** slightly increases the exposure to **edoxaban**. Adjust **edoxaban** dose. [Severe] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **dronedaron**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ Antiarrhythmics (**dronedaron**, **propafenone**) are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to antiarrhythmics (**disopyramide**, **dronedaron**). Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the efficacy of **propafenone**. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **gefatinib**. [Moderate] Theoretical
- ▶ **Dronedaron** potentially increases the exposure to **glecaprevir**. [Moderate] Theoretical
- ▶ **Grapefruit juice** increases the exposure to **amiodarone**. Avoid. [Moderate] Study
- ▶ **Grapefruit juice** moderately increases the exposure to **dronedaron**. Avoid. [Severe] Study
- ▶ **Grapefruit juice** increases the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **amiodarone**. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **flecainide**. Monitor and adjust dose. [Mild] Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **lidocaine**. Monitor and adjust dose. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **amiodarone**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **disopyramide**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** very markedly increase the exposure to **dronedaron**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **lidocaine**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ **Amiodarone** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **amiodarone**. Avoid. [Moderate] Theoretical
- ▶ **Idelalisib** very markedly increases the exposure to **dronedaron**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **dronedaron**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Ledipasvir** increases the risk of severe bradycardia or heart block when given with **amiodarone**. Refer to specialist literature. [Severe] Anecdotal
- ▶ **Amiodarone** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **loperamide**. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **lurasidone**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** very markedly increase the exposure to **dronedaron**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **lidocaine**. [Moderate] Theoretical
- ▶ **Macrolides (erythromycin)** are predicted to moderately increase the exposure to **dronedaron**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to antiarrhythmics (**disopyramide**, **dronedaron**). Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the efficacy of **propafenone**. [Moderate] Study
- ▶ **Dronedaron** increases the risk of neutropenia when given with **monoclonal antibodies (brentuximab vedotin)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **dronedaron**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **NSAIDs (celecoxib)** are predicted to increase the exposure to antiarrhythmics (**flecainide**, **propafenone**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical

- ▶ **Dronedaron** is predicted to increase the exposure to **opioids** (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Amiodarone** is predicted to increase the concentration of **opioids** (**fentanyl**). [Moderate] Theoretical → Also see TABLE 6 p. 848
- ▶ **Dronedaron** is predicted to increase the exposure to **opioids** (**methadone**, **sufentanil**). [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Dronedaron** is predicted to increase the exposure to **oxybutynin**. [Mild] Theoretical
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **panobinostat**. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Dronedaron** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Propafenone** is predicted to increase the anticoagulant effect of **phenindione**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**avanafil**). Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**sildenafil**). Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**tadalafil**). [Severe] Theoretical
- ▶ **Amiodarone** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**vardefanil**). Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Dronedaron** potentially increases the exposure to **pibrentasvir**. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Propafenone** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ **Quinolones** (**ciprofloxacin**) slightly increase the exposure to **lidocaine**. [Mild] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **ranolazine**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Amiodarone** is predicted to increase the exposure to **retinoids** (**alitretinoin**). Adjust **alitretinoin** dose. [Moderate] Theoretical
- ▶ **Ribociclib** (high-dose) is predicted to increase the exposure to **amiodarone**. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Dronedaron** is predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Rifampicin** is predicted to decrease the exposure to antiarrhythmics (**disopyramide**, **dronedaron**). Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the efficacy of **propafenone**. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **riparoxaban**. Avoid. [Moderate] Theoretical
- ▶ **Rolapitant** is predicted to increase the exposure to **propafenone**. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
- ▶ **Simeprevir** is predicted to increase the concentration of **amiodarone**. Refer to specialist literature. [Severe] Anecdotal
- ▶ **Dronedaron** is predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ **Amiodarone** is predicted to increase the concentration of **sirolimus**. [Severe] Anecdotal
- ▶ **Dronedaron** increases the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ **Sofosbuvir** is predicted to increase the risk of severe bradycardia or heart block when given with **amiodarone**. Refer to specialist literature. [Severe] Anecdotal
- ▶ **SSRIs** (**fluvoxamine**) are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **SSRIs** (**citalopram**, **escitalopram**, **fluoxetine**, **fluvoxamine**, **paroxetine**, **sertraline**). [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Dronedaron** is predicted to increase the exposure to **SSRIs** (**dapoxetine**). Adjust **dapoxetine** dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **dronedaron**. Avoid. [Severe] Theoretical
- ▶ **Amiodarone** is predicted to increase the risk of rhabdomyolysis when given with **statins** (**atorvastatin**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **statins** (**atorvastatin**). Monitor and adjust dose. [Severe] Study
- ▶ **Amiodarone** is predicted to increase the exposure to **statins** (**fluvastatin**). [Severe] Theoretical
- ▶ **Dronedaron** slightly increases the exposure to **statins** (**rosuvastatin**). Adjust dose. [Severe] Study
- ▶ **Amiodarone** increases the risk of rhabdomyolysis when given with **statins** (**simvastatin**). Adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **statins** (**simvastatin**). Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Amiodarone** is predicted to increase the exposure to **sulfonylureas**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Lidocaine** is predicted to increase the effects of **suxamethonium**. [Moderate] Study
- ▶ **Amiodarone** is predicted to increase the concentration of **tacrolimus**. [Severe] Anecdotal
- ▶ **Dronedaron** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **taxanes** (**cabazitaxel**). [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **taxanes** (**paclitaxel**). [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical
- ▶ **Theophylline** decreases the efficacy of **adenosine**. Separate administration by 24 hours. [Mild] Study
- ▶ **Amiodarone** is predicted to increase the risk of thyroid dysfunction when given with **thyroid hormones**. Avoid. [Moderate] Study
- ▶ **Amiodarone** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ **Dronedaron** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **tricyclic antidepressants**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Propafenone** is predicted to increase the concentration of **tricyclic antidepressants**. [Moderate] Theoretical → Also see TABLE 10 p. 849
- ▶ **Dronedaron** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ **Amiodarone** is predicted to increase the concentration of **velpatasvir**. Avoid or monitor. [Moderate] Theoretical
- ▶ **Amiodarone** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study

Antiarrhythmics (continued)

- ▶ **Dronedrone** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Dronedrone** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study

Anticholinesterases, centrally acting → see TABLE 6 p. 848 (bradycardia)

donepezil · galantamine · rivastigmine

- ▶ **Antiarrhythmics (amiodarone)** increase the risk of bradycardia when given with **anticholinesterases, centrally acting**. [Moderate] Anecdotal → Also see TABLE 6 p. 848
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **donepezil**. [Mild] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. [Moderate] Anecdotal → Also see TABLE 6 p. 848
- ▶ **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with **beta blockers, selective**. [Moderate] Anecdotal → Also see TABLE 6 p. 848
- ▶ **Bupropion** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** increase the risk of bradycardia when given with **anticholinesterases, centrally acting**. [Moderate] Anecdotal → Also see TABLE 6 p. 848
- ▶ **Cinacalcet** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **donepezil**. [Mild] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **donepezil**. [Mild] Study
- ▶ **Anticholinesterases, centrally acting** are predicted to decrease the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Theoretical → Also see TABLE 6 p. 848
- ▶ **Rifampicin** is predicted to decrease the exposure to **donepezil**. [Mild] Study
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Anticholinesterases, centrally acting** increase the effects of **suxamethonium**. [Moderate] Theoretical
- ▶ **Terbinafine** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study

Antiepileptics → see TABLE 1 p. 847 (hepatotoxicity), TABLE 18 p. 851 (hyponatraemia), TABLE 15 p. 850 (myelosuppression), TABLE 12 p. 850 (peripheral neuropathy), TABLE 11 p. 849 (CNS depressant effects)

brivaracetam · carbamazepine · eslicarbazepine · ethosuximide · fosphenytoin · gabapentin · lacosamide · lamotrigine · levetiracetam · oxcarbazepine · paraldehyde · perampanel · phenobarbital · phenytoin · pregabalin · primidone · retigabine · rufinamide · stiripentol · tiagabine · topiramate · valproate · vigabatrin · zonisamide

FOOD AND LIFESTYLE Avoiding milk or dairy products, carbonated drinks, and fruit juices at the same time as stiripentol.

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **abacavir**. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical

- ▶ **Acetazolamide** potentially increases the risk of toxicity when given with **valproate**. [Severe] Study
- ▶ **Acetazolamide** potentially increases the risk of overheating and dehydration when given with **zonisamide**. Avoid in children. [Severe] Theoretical
- ▶ **Carbamazepine** is predicted to decrease the exposure to **afatinib**. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the concentration of **albendazole**. [Moderate] Study
- ▶ **Alcohol (beverage)** potentially increases the risk of visual disturbances when given with **retigabine**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Moderate] Theoretical → Also see TABLE 18 p. 851
- ▶ **Carbamazepine** decreases the exposure to **aliskiren**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **alprazolam**. Adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 849
- ▶ **Fosphenytoin** is predicted to decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Phenobarbital** is predicted to decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Phenytoin** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Primidone** is predicted to increase the clearance of **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Stiripentol** is predicted to increase the exposure to **aminophylline**. Avoid. [Moderate] Theoretical
- ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 11 p. 849
- ▶ **Phenytoin** is predicted to decrease the exposure to **anaesthetics, local (ropivacaine)**. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **gabapentin**. **Gabapentin** should be taken 2 hours after **antacids**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **antiarrhythmics (disopyramide, dronedarone)**. Avoid. [Severe] Study
- ▶ **Antiarrhythmics (amiodarone)** are predicted to slightly increase the concentration of antiepileptics (**fosphenytoin, phenytoin**). Monitor and adjust dose. [Severe] Study → Also see TABLE 12 p. 850
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **antiarrhythmics (lidocaine)**. [Severe] Anecdotal
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the efficacy of **antiarrhythmics (propafenone)**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **anticholinesterases, centrally acting (donepezil)**. [Mild] Study
- ▶ **Antiepileptics (carbamazepine)** decrease the concentration of antiepileptics (**brivaracetam**). [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** decrease the concentration of antiepileptics (**brivaracetam**). [Moderate] Study
- ▶ **Antiepileptics (lamotrigine)** potentially increase the concentration of antiepileptics (**carbamazepine**) and antiepileptics (**carbamazepine**) decrease the concentration of antiepileptics (**lamotrigine**). Adjust **lamotrigine** dose and monitor **carbamazepine** concentration, p. 202, p. 196. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital)** affect the concentration of antiepileptics (**carbamazepine**) and antiepileptics (**carbamazepine**) increase the concentration of antiepileptics (**phenobarbital**). Adjust dose. [Moderate] Study

- ▶ Antiepileptics (**topiramate**) increase the risk of carbamazepine toxicity when given with antiepileptics (**carbamazepine**). [Moderate] Study
- ▶ Antiepileptics (**stiripentol**) increase the concentration of antiepileptics (**carbamazepine**, **phenobarbital**). Avoid in Dravet syndrome. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**) slightly decrease the exposure to antiepileptics (**eslicarbazepine**, **oxcarbazepine**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**oxcarbazepine**) are predicted to increase the concentration of antiepileptics (**fosphenytoin**). Monitor concentration and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**stiripentol**) are predicted to increase the concentration of antiepileptics (**fosphenytoin**). [Severe] Study
- ▶ Antiepileptics (**carbamazepine**) affect the concentration of antiepileptics (**fosphenytoin**, **phenytoin**) and antiepileptics (**fosphenytoin**, **phenytoin**) decrease the concentration of antiepileptics (**carbamazepine**). Monitor and adjust dose. [Severe] Study
- ▶ Antiepileptics (**eslicarbazepine**) increase the exposure to antiepileptics (**fosphenytoin**, **phenytoin**) and antiepileptics (**fosphenytoin**, **phenytoin**) decrease the exposure to antiepileptics (**eslicarbazepine**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**valproate**) affect the concentration of antiepileptics (**fosphenytoin**, **phenytoin**) and antiepileptics (**fosphenytoin**, **phenytoin**) decrease the concentration of antiepileptics (**valproate**). [Severe] Study
- ▶ Antiepileptics (**vigabatrin**) decrease the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). [Mild] Study
- ▶ Antiepileptics (**fosphenytoin**) decrease the concentration of antiepileptics (**lamotrigine**). Monitor and adjust **lamotrigine** dose, p. 202. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **phenytoin**, **primidone**) decrease the concentration of antiepileptics (**lamotrigine**). Monitor and adjust **lamotrigine** dose, p. 202. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ Antiepileptics (**valproate**) increase the exposure to antiepileptics (**lamotrigine**). Adjust **lamotrigine** dose and monitor rash, p. 202. [Severe] Study
- ▶ Antiepileptics (**lamotrigine**) are predicted to increase the concentration of antiepileptics (**oxcarbazepine**) and antiepileptics (**oxcarbazepine**) are predicted to decrease the concentration of antiepileptics (**lamotrigine**). Monitor side effects and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**) are predicted to decrease the exposure to antiepileptics (**perampanel**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**oxcarbazepine**) decrease the concentration of antiepileptics (**perampanel**) and antiepileptics (**perampanel**) increase the concentration of antiepileptics (**oxcarbazepine**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to antiepileptics (**perampanel**). Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ Antiepileptics (**phenytoin**) increase the concentration of antiepileptics (**phenobarbital**) and antiepileptics (**phenobarbital**) affect the concentration of antiepileptics (**phenytoin**). [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin**) increase the concentration of antiepileptics (**phenobarbital**, **primidone**) and antiepileptics (**phenobarbital**, **primidone**) affect the concentration of antiepileptics (**fosphenytoin**). [Moderate] Study
- ▶ Antiepileptics (**oxcarbazepine**) are predicted to increase the concentration of antiepileptics (**phenytoin**). Monitor concentration and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**stiripentol**) are predicted to increase the concentration of antiepileptics (**phenytoin**). Avoid in Dravet syndrome. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**) potentially decrease the concentration of antiepileptics (**primidone**) and antiepileptics (**primidone**) potentially decrease the concentration of antiepileptics (**carbamazepine**). Adjust dose. [Moderate] Anecdotal
- ▶ Antiepileptics (**phenytoin**) increase the concentration of antiepileptics (**primidone**) and antiepileptics (**primidone**) affect the concentration of antiepileptics (**phenytoin**). [Moderate] Study
- ▶ Antiepileptics (**stiripentol**) are predicted to increase the concentration of antiepileptics (**phenytoin**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**valproate**) increase the exposure to antiepileptics (**rufinamide**). Adjust **rufinamide** dose, p. 207. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) decrease the exposure to antiepileptics (**tiagabine**). Monitor and adjust **tiagabine** dose, p. 211. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) decrease the concentration of antiepileptics (**topiramate**) and antiepileptics (**topiramate**) increase the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the concentration of antiepileptics (**topiramate**). [Mild] Study
- ▶ Antiepileptics (**phenobarbital**) decrease the concentration of antiepileptics (**valproate**) and antiepileptics (**valproate**) increase the concentration of antiepileptics (**phenobarbital**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**topiramate**) increase the risk of toxicity when given with antiepileptics (**valproate**). [Severe] Study
- ▶ Antiepileptics (**carbamazepine**) slightly to moderately decrease the concentration of antiepileptics (**zonisamide**) and antiepileptics (**zonisamide**) affect the concentration of antiepileptics (**carbamazepine**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) slightly to moderately decrease the concentration of antiepileptics (**zonisamide**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the concentration of antiepileptics (**zonisamide**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**topiramate**) potentially increase the risk of overheating and dehydration when given with antiepileptics (**zonisamide**). Avoid in children. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to very slightly increase the exposure to **perampanel**. [Mild] Study
- ▶ Antifungals, azoles (**miconazole**) increase the risk of carbamazepine toxicity when given with **carbamazepine**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ Antifungals, azoles (**miconazole**) increase the risk of phenytoin toxicity when given with **fosphenytoin**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ Antifungals, azoles (**miconazole**) increase the risk of phenytoin toxicity when given with **phenytoin**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Carbamazepine** is predicted to decrease the efficacy of antifungals, azoles (**fluconazole**) and antifungals, azoles (**fluconazole**) increase the concentration of **carbamazepine**. Avoid or monitor **carbamazepine** concentration and adjust dose accordingly, p. 196. [Severe] Theoretical → Also see TABLE 1 p. 847
- ▶ Antifungals, azoles (**fluconazole**) increase the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). Monitor concentration and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to antifungals, azoles (**isavuconazole**). Avoid. [Severe] Study
- ▶ **Fosphenytoin** very markedly decreases the exposure to antifungals, azoles (**itraconazole**). Avoid and for 14 days after stopping **fosphenytoin**, p. 199. [Moderate] Study

Antiepileptics (continued)

- ▶ **Phenobarbital** decreases the concentration of **antifungals, azoles (itraconazole)**. Avoid and for 14 days after stopping **phenobarbital**, p. 216. [Moderate] Study
- ▶ **Phenytoin** very markedly decreases the exposure to **antifungals, azoles (itraconazole)**. Avoid and for 14 days after stopping **phenytoin**, p. 205. [Moderate] Study
- ▶ **Primidone** is predicted to decrease the concentration of **antifungals, azoles (itraconazole)**. [Moderate] Theoretical
- ▶ **Carbamazepine** is predicted to decrease the efficacy of **antifungals, azoles (itraconazole, voriconazole)** and **antifungals, azoles (itraconazole, voriconazole)** increase the concentration of **carbamazepine**. Avoid or adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 847
- ▶ **Carbamazepine** is predicted to decrease the efficacy of **antifungals, azoles (ketoconazole)** and **antifungals, azoles (ketoconazole)** slightly increase the concentration of **carbamazepine**. Avoid or monitor **carbamazepine** concentration and adjust dose accordingly, p. 196. [Moderate] Study
- ▶ **Phenobarbital** is predicted to decrease the concentration of **antifungals, azoles (ketoconazole)**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) decrease the exposure to **antifungals, azoles (ketoconazole)**. Avoid. [Moderate] Study
- ▶ **Primidone** is predicted to decrease the concentration of **antifungals, azoles (ketoconazole, posaconazole)**. Avoid. [Moderate] Study
- ▶ **Carbamazepine** is predicted to decrease the efficacy of **antifungals, azoles (posaconazole)** and **antifungals, azoles (posaconazole)** increase the concentration of **carbamazepine**. Avoid. [Moderate] Theoretical
- ▶ **Phenobarbital** is predicted to decrease the concentration of **antifungals, azoles (posaconazole)**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) are predicted to decrease the exposure to **antifungals, azoles (posaconazole)**. Avoid. [Moderate] Study
- ▶ **Fosphenytoin** decreases the exposure to **antifungals, azoles (voriconazole)** and **antifungals, azoles (voriconazole)** increase the exposure to **fosphenytoin**. Avoid or adjust **voriconazole** dose and monitor **phenytoin** concentration, p. 377. [Moderate] Study
- ▶ **Phenytoin** decreases the exposure to **antifungals, azoles (voriconazole)** and **antifungals, azoles (voriconazole)** increase the exposure to **phenytoin**. Avoid or adjust **voriconazole** dose and monitor **phenytoin** concentration, p. 377, p. 205. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the concentration of **antifungals, azoles (voriconazole)**. Avoid. [Moderate] Theoretical
- ▶ **Antihistamines, sedating (hydroxyzine)** potentially increase the risk of overheating and dehydration when given with **zonisamide**. Avoid in children. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **antimalarials (artemether)** (with lumefantrine). Avoid. [Severe] Study
- ▶ **Antimalarials (pyrimethamine)** increase the risk of haematological toxicity when given with antiepileptics (**fosphenytoin, phenytoin**). [Severe] Study
- ▶ **Antimalarials (pyrimethamine)** are predicted to increase the risk of haematological toxicity when given with antiepileptics (**phenobarbital, primidone**). [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the concentration of **antimalarials (piperaquine)**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, phenobarbital, primidone**) potentially increase the risk of toxicity when given with **antimalarials (quinine)**. [Unknown] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to moderately decrease the exposure to **apixaban**. Use with caution or avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) moderately decrease the exposure to **apremilast**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **aprepitant**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to moderately decrease the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **bazedoxifene**. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) decrease the exposure to **bedaquiline**. Avoid. [Severe] Study
- ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **beta blockers, non-selective (carvedilol, labetalol)**. [Moderate] Theoretical
- ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **beta blockers, non-selective (propranolol)**. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **beta blockers, selective (acebutolol, bisoprolol, metoprolol, nebivolol)**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) slightly decrease the exposure to **bortezomib**. Avoid. [Severe] Study → Also see TABLE 12 p. 850
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) affect the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **bupropion**. [Severe] Study
- ▶ **Valproate** increases the exposure to **bupropion**. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **bupirone**. Use with caution and adjust dose. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) moderately decrease the exposure to **cabozantinib**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) are predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem)** increase the concentration of **carbamazepine** and **carbamazepine** is predicted to decrease the exposure to **calcium channel blockers (diltiazem)**. Monitor concentration and adjust dose. [Severe] Anecdotal
- ▶ **Calcium channel blockers (verapamil)** increase the concentration of **carbamazepine** and **carbamazepine** is predicted to decrease the exposure to **calcium channel blockers (verapamil)**. [Severe] Anecdotal
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** potentially increase the concentration of antiepileptics (**fosphenytoin, phenytoin**) and antiepileptics (**fosphenytoin, phenytoin**) are predicted to decrease the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **cannabis extract**. Avoid. [Severe] Theoretical → Also see TABLE 11 p. 849

- ▶ **Capecitabine** increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal
- ▶ **Carbapenems** decrease the concentration of valproate. Avoid. [Severe] Anecdotal
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the concentration of **caspofungin**. Adjust caspofungin dose, p. 372. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study
- ▶ Antiepileptics (phenobarbital, primidone) are predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Antiepileptics (phenobarbital, primidone) decrease the concentration of **chloramphenicol**. [Moderate] Study
- ▶ Intravenous **chloramphenicol** increases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) affect the concentration of intravenous **chloramphenicol**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Chlordiazepoxide** affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Study
- ▶ Phenobarbital decreases the effects of **cholic acid**. Avoid. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of **ciclosporin**. [Severe] Study
- ▶ Oxcarbazepine decreases the concentration of **ciclosporin**. [Severe] Anecdotal
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the effects of **cilostazol**. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
- ▶ Carbamazepine is predicted to increase the risk of haematological toxicity when given with oral **cladribine**. [Moderate] Theoretical
- ▶ **Clobazam** potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal
- ▶ **Stiripentol** increases the concentration of **clobazam**. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Clonazepam** potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal
- ▶ Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **clozapine**. [Moderate] Anecdotal → Also see TABLE 11 p. 849
- ▶ Carbamazepine is predicted to increase the risk of myelosuppression when given with **clozapine**. Avoid. [Severe] Anecdotal
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ Oxcarbazepine is predicted to decrease the concentration of **cobicistat**. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to very slightly increase the exposure to **perampanel**. [Mild] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **Combined hormonal contraceptives** alter the exposure to **lamotrigine**. Adjust dose. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, prednisone, triamcinolone). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **corticosteroids (fluticasone)**. [Unknown] Theoretical
- ▶ Antiepileptics (fosphenytoin, phenytoin) are predicted to alter the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ Antiepileptics (phenobarbital, primidone) decrease the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ Carbamazepine decreases the effects of **coumarins**. Monitor and adjust dose. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ Carbamazepine is predicted to decrease the exposure to **dabigatran**. Avoid. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to **daclatasvir**. Avoid. [Severe] Study
- ▶ Oxcarbazepine is predicted to decrease the exposure to **daclatasvir**. Avoid. [Severe] Theoretical
- ▶ **Danazol** moderately increases the concentration of carbamazepine. Monitor and adjust dose. [Severe] Study
- ▶ Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **dasabuvir**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study
- ▶ **Lamotrigine** is predicted to increase the risk of hyponatraemia when given with **desmopressin**. [Severe] Theoretical
- ▶ Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Desogestrel** is predicted to increase the exposure to **lamotrigine**. [Moderate] Study
- ▶ **Diazepam** potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- ▶ **Diazoxide** decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of **diazoxide**. Monitor concentration and adjust dose. [Moderate] Anecdotal
- ▶ Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of **digoxin**. [Moderate] Anecdotal
- ▶ **Disulfiram** increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 12 p. 850
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ Oxcarbazepine is predicted to decrease the exposure to **dolutegravir**. Adjust dose. [Severe] Theoretical
- ▶ Phenytoin is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
- ▶ Carbamazepine is predicted to decrease the exposure to **edoxaban**. [Moderate] Study

Antiepileptics (continued)

- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) slightly decrease the exposure to **efavirenz** and **efavirenz** affects the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). [Severe] Theoretical
- ▶ Carbamazepine slightly decreases the exposure to **efavirenz** and **efavirenz** slightly decreases the exposure to carbamazepine. [Severe] Study
- ▶ Phenobarbital is predicted to decrease the exposure to **efavirenz** and **efavirenz** affects the concentration of phenobarbital. [Severe] Theoretical
- ▶ **Efavirenz** is predicted to affect the efficacy of **primidone** and **primidone** is predicted to slightly decrease the exposure to **efavirenz**. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Enteral feeds** decrease the absorption of **phenytoin**. [Severe] Study
- ▶ **Enzalutamide** is predicted to slightly decrease the exposure to **brivaracetam**. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **perampanel**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **erlotinib**. Avoid or adjust erlotinib dose. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **eslicarbazepine**, **fosphenytoin**, **oxcarbazepine**, **perampanel**, **phenobarbital**, **phenytoin**, **primidone**, **rufinamide**, **topiramate**) are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the efficacy of **etoposide**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) moderately decrease the exposure to **exemestane**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **fingolimod**. [Moderate] Study
- ▶ **Fluorouracil** increases the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). Monitor concentration and adjust dose. [Severe] Anecdotal
- ▶ **Folates** are predicted to decrease the concentration of antiepileptics (**fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**). Monitor concentration and adjust dose. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **fosaprepitant**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **gefitinib**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to moderately decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ Antiepileptics (**eslicarbazepine**, **oxcarbazepine**) potentially decrease the exposure to **glecaprevir**. Avoid. [Severe] Theoretical
- ▶ **Valproate** potentially opposes the effects of **glycerol phenylbutyrate**. [Moderate] Theoretical
- ▶ **Grapefruit juice** slightly increases the exposure to carbamazepine. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ Antiepileptics (**phenobarbital**, **primidone**) decrease the effects of **griseofulvin**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the concentration of **guanfacine**. Adjust guanfacine dose, p. 231. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Oxcarbazepine** is predicted to decrease the concentration of **guanfacine**. Monitor and adjust guanfacine dose, p. 231. [Moderate] Theoretical
- ▶ **Guanfacine** increases the concentration of **valproate**. Monitor and adjust dose. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** transiently increase the concentration of carbamazepine. Monitor concentration and adjust dose. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). Monitor concentration and adjust dose. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) decrease the concentration of **haloperidol**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Haloperidol** potentially increases the risk of overheating and dehydration when given with **zonisamide**. Avoid in children. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** slightly decrease the exposure to **lamotrigine**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to affect the exposure to antiepileptics (**fosphenytoin**, **phenytoin**) and antiepileptics (**fosphenytoin**, **phenytoin**) decrease the concentration of **HIV-protease inhibitors**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to affect the concentration of antiepileptics (**phenobarbital**, **primidone**) and antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the concentration of **HIV-protease inhibitors**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to carbamazepine and carbamazepine is predicted to decrease the exposure to **HIV-protease inhibitors**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to very slightly increase the exposure to **perampanel**. [Mild] Study
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the concentration of **valproate**. [Severe] Anecdotal
- ▶ Antiepileptics (**carbamazepine**, **eslicarbazepine**, **fosphenytoin**, **oxcarbazepine**, **perampanel**, **phenobarbital**, **phenytoin**, **primidone**, **rufinamide**, **topiramate**) are predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- ▶ **Hormone replacement therapy** is predicted to alter the exposure to **lamotrigine**. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **ibrutinib**. Avoid or adjust ibrutinib dose. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to very slightly increase the exposure to **perampanel**. [Mild] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study
- ▶ **Oxcarbazepine** decreases the exposure to **imatinib**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure

- to iron chelators (**deferasirox**). Monitor serum ferritin and adjust dose. [Moderate] Theoretical
- ▶ **Isoniazid** increases the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). [Moderate] Study → Also see TABLE 12 p. 850
 - ▶ **Isoniazid** markedly increases the concentration of **carbamazepine** and **carbamazepine** increases the risk of hepatotoxicity when given with **isoniazid**. Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 1 p. 847
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to moderately to markedly decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **ixazomib**. Avoid. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
 - ▶ **Carbamazepine** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
 - ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) decrease the effects of **levodopa**. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine**, **eslicarbazepine**, **fosphenytoin**, **oxcarbazepine**, **perampanel**, **phenobarbital**, **phenytoin**, **primidone**, **rufinamide**, **topiramate**) are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **linagliptin**. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine**, **oxcarbazepine**) are predicted to increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 847
 - ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) decrease the effects of loop diuretics (**furosemide**). [Moderate] Study
 - ▶ **Lumacaftor** is predicted to decrease the exposure to antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**). Avoid. [Severe] Theoretical
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **lurasidone**. Avoid. [Moderate] Study → Also see TABLE 11 p. 849
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **macitentan**. Avoid. [Severe] Study
 - ▶ **Macrolides (clarithromycin)** slightly increase the concentration of **carbamazepine**. Monitor concentration and adjust dose. [Severe] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to very slightly increase the exposure to **perampanel**. [Mild] Study
 - ▶ **Macrolides (erythromycin)** markedly increase the concentration of **carbamazepine**. Monitor concentration and adjust dose. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
 - ▶ **Phenytoin** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Levetiracetam** decreases the clearance of **methotrexate**. [Severe] Anecdotal
 - ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the exposure to **metronidazole**. [Moderate] Study
 - ▶ Antiepileptics (**fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the effects of **metyrapone**. Avoid. [Moderate] Study
 - ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the exposure to **mianserin**. [Moderate] Study → Also see TABLE 11 p. 849
 - ▶ **Carbamazepine** markedly decreases the exposure to **mianserin**. Adjust dose. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **midostaurin**. Avoid. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
 - ▶ **Mitotane** is predicted to decrease the exposure to **perampanel**. Monitor and adjust dose. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine**, **phenobarbital**, **primidone**) are predicted to decrease the exposure to **modafinil**. [Mild] Theoretical
 - ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) are predicted to decrease the exposure to **modafinil** and **modafinil** is predicted to increase the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). Monitor concentration and adjust dose. [Moderate] Theoretical
 - ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to increase the effects of **monoamine-oxidase A and B inhibitors**, **irreversible**. [Severe] Theoretical
 - ▶ **Carbamazepine** is predicted to increase the risk of severe toxic reaction when given with **monoamine-oxidase A and B inhibitors**, **irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
 - ▶ **Carbamazepine** is predicted to decrease the effects of monoclonal antibodies (**brentuximab vedotin**). [Severe] Theoretical
 - ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to antiepileptics (**fosphenytoin**, **phenytoin**). Monitor and adjust dose. [Moderate] Theoretical
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **montelukast**. [Mild] Study
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to slightly decrease the exposure to **nateglinide**. [Mild] Study
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **netupitant**. Avoid. [Severe] Study
 - ▶ **Carbamazepine** is predicted to decrease the effects of (but acute use increases the effects of) **neuromuscular blocking drugs**, **non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium)**. Monitor and adjust dose. [Moderate] Study
 - ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) decrease the effects of (but acute use increases the effects of) **neuromuscular blocking drugs**, **non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium)**. [Moderate] Study
 - ▶ **Nevirapine** is predicted to decrease the concentration of antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) and antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the concentration of **nevirapine**. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
 - ▶ **Carbamazepine** is predicted to decrease the exposure to **nintedanib**. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **nitisnone**. Adjust dose. [Moderate] Theoretical
 - ▶ Antiepileptics (**carbamazepine**, **eslicarbazepine**, **fosphenytoin**, **oxcarbazepine**, **perampanel**, **phenobarbital**, **phenytoin**, **primidone**, **rufinamide**, **topiramate**) are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal

Antiepileptics (continued)

- ▶ Carbamazepine potentially decreases the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ Phenytoin is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ Carbamazepine is predicted to decrease the exposure to **ombitasvir**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **ondansetron**. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **opioids (alfentanil, fentanyl)**. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **opioids (buprenorphine)**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 849
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study → Also see TABLE 11 p. 849
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **opioids (oxycodone)**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ Carbamazepine decreases the concentration of **opioids (tramadol)**. Adjust dose. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study
- ▶ **Oxybutynin** potentially increases the risk of overheating and dehydration when given with **zonisamide**. Avoid in children. [Severe] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **palbociclib**. Avoid. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **paliperidone**. Monitor and adjust dose. [Severe] Study → Also see TABLE 11 p. 849
- ▶ Valproate slightly increases the exposure to **paliperidone**. Adjust dose. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **panobinostat**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to **paracetamol**. [Moderate] Study → Also see TABLE 1 p. 847
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **pazopanib**. Avoid. [Severe] Theoretical
- ▶ Valproate increases the risk of side-effects when given with **penicillins (pivmecillinam)**. Avoid. [Severe] Anecdotal
- ▶ Phenothiazines (**chlorpromazine**) decrease the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) decrease the concentration of **phenothiazines (chlorpromazine)**. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (avanafil, tadalafil)**. Avoid. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (sildenafil, vardenafil)**. [Moderate] Theoretical

- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ Antiepileptics (eslicarbazepine, oxcarbazepine) potentially decrease the exposure to **pibrentasvir**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to **pirfenidone**. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to **pitolisant**. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **ponatinib**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to **praziquantel**. Avoid. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone) are predicted to increase the risk of hypersensitivity reactions when given with **procarbazine**. [Severe] Anecdotal
- ▶ **Fosphenytoin** is predicted to increase the risk of hypersensitivity when given with **procarbazine**. [Severe] Anecdotal
- ▶ Valproate potentially increases the concentration of **propofol**. Adjust dose. [Severe] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **quetiapine**. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ Valproate potentially increases the risk of neutropenia when given with **quetiapine**. [Moderate] Study
- ▶ **Quinolones (ciprofloxacin)** affect the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- ▶ Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to affect the exposure to **raltegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ Carbamazepine is predicted to affect the exposure to **raltegravir**. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **ranolazine**. Avoid. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **reboxetine**. [Moderate] Anecdotal
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **repaglinide**. Monitor blood glucose and adjust dose. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- ▶ Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to **rifampicin** and **rifampicin** is predicted to decrease the exposure to antiepileptics (phenobarbital, primidone). Use with caution and adjust dose. [Moderate] Study
- ▶ **Rifampicin** decreases the concentration of antiepileptics (fosphenytoin, phenytoin). Use with caution and adjust dose. [Moderate] Study
- ▶ **Rifampicin** slightly decreases the exposure to **brivaracetam**. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** markedly increases the clearance of **lamotrigine**. Adjust lamotrigine dose, p. 202. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **perampanel**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to **rilpivirine**. Avoid. [Severe] Study
- ▶ Oxcarbazepine is predicted to decrease the concentration of **rilpivirine**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure

- to **risperidone**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to **rivaroxaban**. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
 - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **roflumilast**. Avoid. [Moderate] Study
 - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to **rolapitant**. Avoid. [Severe] Study
 - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Study
 - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to **saxagliptin**. [Moderate] Study
 - Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the exposure to the active metabolite of **selexipag**. Adjust dose. [Moderate] Study
 - Valproate** is predicted to increase the exposure to **selexipag**. [Unknown] Theoretical
 - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **simeprevir**. Avoid. [Severe] Study
 - Oxcarbazepine** is predicted to decrease the exposure to **simeprevir**. Avoid. [Severe] Theoretical
 - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of **sirolimus**. Avoid. [Severe] Study
 - Valproate** increases the exposure to **sodium oxybate**. Adjust sodium oxybate dose. [Moderate] Study
 - Valproate** potentially decreases the effects of **sodium phenylbutyrate**. [Moderate] Anecdotal
 - Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **sofosbuvir**. Avoid. [Severe] Theoretical
 - Carbamazepine** is predicted to decrease the exposure to **sofosbuvir**. Avoid. [Severe] Study
 - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **solifenacin**. [Moderate] Theoretical
 - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **sorafenib**. [Moderate] Theoretical
 - SSRIs** (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Severe] Anecdotal
 - SSRIs** (sertraline) potentially increase the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal
 - Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of **SSRIs** (paroxetine). [Moderate] Study
 - St John's Wort** is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. [Severe] Theoretical
 - St John's Wort** is predicted to decrease the exposure to **brivaracetam**. [Moderate] Theoretical
 - St John's Wort** is predicted to decrease the concentration of **carbamazepine**. Monitor and adjust dose. [Moderate] Theoretical
 - St John's Wort** is predicted to decrease the exposure to **perampanel**. Monitor and adjust dose. [Moderate] Theoretical
 - St John's Wort** is predicted to decrease the exposure to **tiagabine**. Avoid. [Mild] Theoretical
 - Antiepileptics (carbamazepine, eslicarbazepine) are predicted to decrease the exposure to **statins** (atorvastatin). Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 847
 - Antiepileptics (fosphenytoin, phenytoin) potentially decrease the exposure to **statins** (atorvastatin, simvastatin). [Moderate] Anecdotal
 - Carbamazepine** moderately decreases the exposure to **statins** (simvastatin). Monitor and adjust dose. [Severe] Study → Also see TABLE 1 p. 847

- Eslicarbazepine** moderately decreases the exposure to **statins** (simvastatin). Monitor and adjust dose. [Moderate] Study
- Sulfapyrazone** increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Moderate] Study
- Sulfonamides** (sulfadiazine) are predicted to increase the concentration of **fosphenytoin**. Monitor and adjust dose. [Moderate] Study
- Sulfonamides** (sulfadiazine) increase the concentration of **phenytoin**. Monitor and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **sunitinib**. Avoid or adjust sunitinib dose. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) increase the effects of **suxamethonium**. [Moderate] Study
- Carbamazepine** increases the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **taxanes** (cabazitaxel, paclitaxel). Avoid. [Severe] Study → Also see TABLE 12 p. 850
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **taxanes** (docetaxel). [Severe] Theoretical → Also see TABLE 12 p. 850
- Tegافر** potentially increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to **tetracyclines** (doxycycline). Monitor and adjust dose. [Moderate] Study → Also see TABLE 1 p. 847
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to increase the clearance of **theophylline**. Adjust dose. [Moderate] Theoretical
- Carbamazepine** potentially increases the clearance of **theophylline** and **theophylline** decreases the exposure to **carbamazepine**. Adjust dose. [Moderate] Anecdotal
- Stiripentol** is predicted to increase the exposure to **theophylline**. Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to increase the risk of hypothyroidism when given with **thyroid hormones**. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of **thyroid hormones**. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to **ticagrelor**. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **tivozanib**. [Severe] Study
- Antiepileptics (fosphenytoin, phenytoin) moderately decrease the exposure to **tizanidine**. [Mild] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **tofacitinib**. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **tolvaptan**. Avoid. [Severe] Study
- Antiepileptics (fosphenytoin, phenytoin) increase the clearance of **topotecan**. [Moderate] Study

Antiepileptics (continued)

- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **torsemide**. Adjust dose. [Moderate] Study
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical → Also see TABLE 1 p. 847
- Carbamazepine decreases the concentration of **trazodone**. Adjust dose. [Moderate] Anecdotal
- Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **tricyclic antidepressants**. [Moderate] Study
- Carbamazepine decreases the exposure to **tricyclic antidepressants**. Adjust dose. [Moderate] Study → Also see TABLE 18 p. 851
- Tricyclic antidepressants (**clomipramine, imipramine**) potentially increase the risk of overheating and dehydration when given with **zonisamide**. Avoid in children. [Severe] Theoretical
- Trimethoprim increases the concentration of antiepileptics (**fosphenytoin, phenytoin**). [Moderate] Study
- Antiepileptics (**carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate**) decrease the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **vandetanib**. Avoid. [Moderate] Study
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
- Oxcarbazepine is predicted to decrease the exposure to **velpatasvir**. Avoid. [Severe] Theoretical
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **venurafenib**. Avoid. [Severe] Theoretical
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **vinca alkaloids (vinblastine, vincristine, vindesine)**. [Severe] Theoretical → Also see TABLE 1 p. 847 → Also see TABLE 12 p. 850
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **vinca alkaloids (vinflunine)**. Avoid. [Severe] Theoretical → Also see TABLE 12 p. 850
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **vinca alkaloids (vinorelbine)**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 12 p. 850
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **vismodegib**. Avoid. [Moderate] Theoretical
- Antiepileptics (**fosphenytoin, phenytoin**) decrease the effects of **vitamin D substances**. [Moderate] Study
- Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the effects of **vitamin D substances**. [Moderate] Theoretical
- Carbamazepine is predicted to decrease the effects of **vitamin D substances**. [Moderate] Study
- Antiepileptics (**phenobarbital, primidone**) potentially increase the risk of nephrotoxicity when given with **volatile halogenated anaesthetics (methoxyflurane)**. Avoid. [Severe] Theoretical → Also see TABLE 11 p. 849
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Study
- Oxcarbazepine is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- Valproate slightly increases the exposure to **zidovudine**. [Moderate] Study

- Carbamazepine moderately decreases the exposure to **zolidem**. [Moderate] Study
- Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 849

Antifungals, azoles → see TABLE 1 p. 847 (hepatotoxicity), TABLE 9 p. 849 (QT-interval prolongation)

clotrimazole • fluconazole • isavuconazole • itraconazole • ketoconazole • miconazole • posaconazole • voriconazole

- In general, **fluconazole** interactions relate to multiple-dose treatment.
- The use of carbonated drinks, such as cola, improves **itraconazole, ketoconazole, and posaconazole** bioavailability.
- Since systemic absorption can follow topical application, the possibility of interactions with topical **ketoconazole** should be borne in mind.
- Interactions of **miconazole** apply to the oral gel formulation, as a sufficient quantity can be absorbed to cause systemic effects. Systemic absorption from intravaginal and topical formulations might also occur.

- Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- Antifungals, azoles (**itraconazole, ketoconazole**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- Alcohol (beverage) potentially causes a disulfiram-like reaction when given with **ketoconazole**. Avoid. [Moderate] Anecdotal
- Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust eplerenone dose. [Severe] Study
- Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to markedly increase the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Severe] Study
- Itaconazole markedly increases the exposure to **aliskiren**. Avoid. [Severe] Study
- Ketoconazole moderately increases the exposure to **aliskiren**. [Moderate] Study
- Itaconazole increases the risk of busulfan toxicity when given with **alkylating agents (busulfan)**. Monitor and adjust dose. [Moderate] Study
- Miconazole is predicted to increase the concentration of **alkylating agents (busulfan)**. Use with caution and adjust dose. [Moderate] Theoretical
- Isavuconazole is predicted to increase the exposure to **alkylating agents (cyclophosphamide)**. [Moderate] Study
- Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) increase the exposure to **almotriptan**. [Mild] Study
- Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] Study
- Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **alpha blockers (doxazosin)**. [Moderate] Study
- Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
- Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **aprazolam**. [Severe] Study
- Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) moderately increase the exposure to **aprazolam**. Avoid. [Moderate] Study
- Miconazole is predicted to increase the exposure to **aprazolam**. Use with caution and adjust dose. [Moderate] Theoretical
- Miconazole potentially decreases the exposure to **aminoglycosides (tobramycin)**. [Moderate] Anecdotal

- ▶ **Antacids** decrease the absorption of **itraconazole** (capsule). Antacids should be taken 1 hour before or 2 hours after **itraconazole**. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **ketoconazole**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Miconazole** is predicted to increase the exposure to **antiarrhythmics (disopyramide)**. Use with caution and adjust dose. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **antiarrhythmics (disopyramide)**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Posaconazole** is predicted to increase the exposure to **antiarrhythmics (disopyramide, dronedarone)**. Avoid. [Severe] Theoretical
- ▶ **Fluconazole** is predicted to increase the exposure to **antiarrhythmics (dronedarone)**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) very markedly increase the exposure to **antiarrhythmics (dronedarone)**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **anticholinesterases, centrally acting (galantamine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the efficacy of **fluconazole** and **fluconazole** increases the concentration of **antiepileptics (carbamazepine)**. Avoid or monitor **carbamazepine** concentration and adjust dose accordingly. [Severe] Theoretical → Also see TABLE 1 p. 847
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the efficacy of **ketoconazole** and **ketoconazole** slightly increases the concentration of **antiepileptics (carbamazepine)**. Avoid or monitor **carbamazepine** concentration and adjust dose accordingly. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the efficacy of **posaconazole** and **posaconazole** increases the concentration of **antiepileptics (carbamazepine)**. Avoid. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Study
- ▶ **Antiepileptics (fosphenytoin)** very markedly decrease the exposure to **itraconazole**. Avoid and for 14 days after stopping **fosphenytoin**. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin)** decrease the exposure to **voriconazole** and **voriconazole** increases the exposure to **antiepileptics (fosphenytoin)**. Avoid or adjust **voriconazole** dose p. 377 and monitor phenytoin concentration. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** decrease the exposure to **ketoconazole**. Avoid. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **posaconazole**. Avoid. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital)** decrease the concentration of **itraconazole**. Avoid and for 14 days after stopping **phenobarbital**. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital)** are predicted to decrease the concentration of **ketoconazole**. Avoid. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital)** are predicted to decrease the concentration of **posaconazole**. Avoid. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the concentration of **voriconazole**. Avoid. [Moderate] Theoretical
- ▶ **Antiepileptics (phenytoin)** very markedly decrease the exposure to **itraconazole**. Avoid and for 14 days after stopping **phenytoin**. [Moderate] Study
- ▶ **Antiepileptics (phenytoin)** decrease the exposure to **voriconazole** and **voriconazole** increases the exposure to **antiepileptics (phenytoin)**. Avoid or adjust **voriconazole** dose p. 377 and monitor **phenytoin** concentration. [Moderate] Study
- ▶ **Antiepileptics (primidone)** are predicted to decrease the concentration of **itraconazole**. [Moderate] Theoretical
- ▶ **Miconazole** increases the risk of carbamazepine toxicity when given with **antiepileptics (carbamazepine)**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Miconazole** increases the risk of phenytoin toxicity when given with **antiepileptics (fosphenytoin)**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Fluconazole** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the efficacy of antifungals, azoles (**itraconazole**, **voriconazole**) and antifungals, azoles (**itraconazole**, **voriconazole**) increase the concentration of **antiepileptics (carbamazepine)**. Avoid or adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 847
- ▶ **Antiepileptics (primidone)** are predicted to decrease the concentration of antifungals, azoles (**ketoconazole**, **posaconazole**). Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to very slightly increase the exposure to **antiepileptics (perampanel)**. [Mild] Study
- ▶ **Miconazole** increases the risk of phenytoin toxicity when given with **antiepileptics (phenytoin)**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ Antifungals, azoles (**fluconazole**) are predicted to increase the exposure to antifungals, azoles (**isavuconazole**). [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to antifungals, azoles (**isavuconazole**). Avoid or monitor side effects. [Severe] Study
- ▶ Antifungals, azoles (**posaconazole**) are predicted to increase the exposure to antifungals, azoles (**isavuconazole**). [Moderate] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [Moderate] Study
- ▶ **Ketoconazole** increases the exposure to **antimalarials (mefloquine)**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **itraconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **antimalarials (mefloquine)**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical
- ▶ **Itraconazole** is predicted to increase the exposure to **apixaban**. Avoid. [Severe] Theoretical
- ▶ **Ketoconazole** slightly to moderately increases the exposure to **apixaban**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **aprepitant**. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **isavuconazole**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to slightly increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study

Antifungals, azoles (continued)

- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **beta₂ agonists (salmeteterol)**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) slightly increase the exposure to **bortezomib**. [Moderate] Study
- ▶ **Fluconazole** is predicted to increase the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Theoretical
- ▶ **Itraconazole** is predicted to increase the exposure to **bosentan**. [Moderate] Theoretical
- ▶ **Ketoconazole** moderately increases the exposure to **bosentan**. [Moderate] Study
- ▶ **Voriconazole** is predicted to increase the exposure to **bosentan**. Avoid. [Severe] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Isavuconazole** slightly increases the exposure to **bupropion**. Adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **bupirone**. Adjust **bupirone** dose. [Severe] Study
- ▶ **Miconazole** is predicted to increase the concentration of **bupirone**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) slightly increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **isavuconazole**. [Moderate] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to **calcium channel blockers (amlodipine, clevidipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil)**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Fluconazole** (high-dose) is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Moderate] Theoretical
- ▶ **Posaconazole** is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **calcium channel blockers (lercanidipine)**. Avoid. [Severe] Study

- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Miconazole** increases the concentration of **ciclosporin**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **cilostazol**. Adjust **cilostazol** dose. [Moderate] Study
- ▶ **Fluconazole** is predicted to increase the exposure to **cilostazol**. Adjust **cilostazol** dose. [Moderate] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to **cilostazol**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **voriconazole**) potentially increase the exposure to **clobazam**. Adjust dose. [Moderate] Theoretical
- ▶ **Fluconazole** is predicted to decrease the efficacy of **clopidogrel**. Avoid. [Severe] Theoretical
- ▶ **Voriconazole** is predicted to decrease the efficacy of **clopidogrel**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to antifungals, azoles (**fluconazole**, **posaconazole**). [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to antifungals, azoles (**itraconazole**, **ketoconazole**). Adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **isavuconazole**. Avoid or monitor side effects. [Severe] Study
- ▶ **Cobicistat** is predicted to affect the exposure to **voriconazole**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **miconazole**, **posaconazole**) are predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **colchicine**. Avoid potent inhibitors of CYP3A4 or adjust **colchicine** dose. [Severe] Study
- ▶ **Corticosteroids (prednisone)** potentially decrease the exposure to **isavuconazole**. Use with caution or avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **corticosteroids (beclomethasone)** (risk with beclomethasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, prednisone, triamcinolone)**. Avoid or monitor side effects. [Severe] Study
- ▶ **Miconazole** is predicted to increase the concentration of **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Fluconazole** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study

- ▶ **Itraconazole** potentially increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Ketoconazole** potentially increases the anticoagulant effect of **coumarins (warfarin)**. Monitor INR and adjust dose. [Severe] Anecdotal
- ▶ **Miconazole** greatly increases the anticoagulant effect of **coumarins**. MHRA advises avoid unless INR can be monitored closely; monitor for signs of bleeding. [Severe] Study
- ▶ **Itraconazole** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to moderately increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole, ketoconazole**) are predicted to increase the exposure to **dabigatran**. Avoid. [Severe] Study
- ▶ **Isavuconazole** is predicted to increase the exposure to **dabigatran**. Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to moderately increase the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to slightly increase the exposure to **darifenacin**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to markedly to very markedly increase the exposure to **darifenacin**. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to markedly increase the exposure to **dasatinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) very slightly increase the exposure to **delamanid**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**fluconazole, voriconazole**) moderately increase the exposure to **diazepam**. Monitor and adjust dose. [Moderate] Study
- ▶ **Didanosine** (buffered) decreases the exposure to antifungals, azoles (**itraconazole, ketoconazole**). Separate administration by 2 hours. [Severe] Study → Also see TABLE 1 p. 847
- ▶ **Isavuconazole** slightly increases the exposure to **digoxin**. Monitor and adjust dose. [Moderate] Study
- ▶ **Itraconazole** is predicted to markedly increase the concentration of **digoxin**. Monitor and adjust dose. [Severe] Study
- ▶ **Ketoconazole** is predicted to markedly increase the concentration of **digoxin**. [Severe] Study
- ▶ **Posaconazole** is predicted to increase the concentration of **digoxin**. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole**) increase the risk of QT-prolongation when given with **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole**) are predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Ketoconazole** moderately increases the exposure to **drosiprenone**. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. [Moderate] Theoretical
- ▶ **Itraconazole** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **Ketoconazole** slightly increases the exposure to **edoxaban**. Adjust **edoxaban** dose. [Severe] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Theoretical
- ▶ **Efavirenz** slightly decreases the exposure to **itraconazole**. Avoid and for 14 days after stopping **efavirenz**. [Moderate] Study
- ▶ **Efavirenz** moderately decreases the exposure to **ketoconazole**. [Severe] Study
- ▶ **Efavirenz** slightly decreases the exposure to **posaconazole**. Avoid. [Moderate] Study
- ▶ **Efavirenz** moderately decreases the exposure to **voriconazole** and **voriconazole** slightly increases the exposure to **efavirenz**. Adjust dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) slightly to moderately increase the exposure to **elbasvir**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to markedly increase the exposure to **eletriptan**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole**) are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to **ergometrine**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to **ergotamine**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to slightly increase the exposure to **erlotinib**. Use with caution and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **foseterodine**. Adjust **foseterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to moderately increase the exposure to **foseterodine**. Adjust **foseterodine** dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole**) are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **fosaprepitant**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **gefitinib**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **gefitinib**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole**) potentially increase the exposure to **glecaprevir**. [Moderate] Theoretical

Antifungals, azoles (continued)

- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [Severe] Study
- Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- H₂ receptor antagonists** are predicted to decrease the absorption of **itraconazole**. Administer **itraconazole** capsules with an acidic beverage. [Moderate] Study
- H₂ receptor antagonists** are predicted to decrease the absorption of **ketoconazole**. Administer **ketoconazole** with an acidic beverage. [Moderate] Study
- H₂ receptor antagonists** are predicted to decrease the exposure to **posaconazole**. Avoid use of **posaconazole** oral suspension. [Moderate] Study
- Itraconazole** increases the concentration of **haloperidol**. [Moderate] Study
- Fluconazole** slightly increases the exposure to **HIV-protease inhibitors (tipranavir)**. Avoid or adjust dose. [Moderate] Study
- HIV-protease inhibitors** are predicted to increase the exposure to **isavuconazole**. Avoid or monitor side effects. [Severe] Study
- HIV-protease inhibitors** are predicted to increase the exposure to **itraconazole**. Use with caution and adjust dose. [Severe] Study
- HIV-protease inhibitors** are predicted to increase the exposure to **ketoconazole**. Use with caution and adjust dose. [Moderate] Study
- Miconazole** is predicted to increase the concentration of **HIV-protease inhibitors**. Use with caution and adjust dose. [Moderate] Theoretical
- Posaconazole** is predicted to increase the exposure to **HIV-protease inhibitors**. [Moderate] Study
- HIV-protease inhibitors** are predicted to affect the exposure to **voriconazole** and **voriconazole** potentially affects the exposure to **HIV-protease inhibitors**. [Severe] Study → Also see TABLE 9 p. 849
- Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4. [Severe] Study
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to very markedly increase the exposure to **ibrutinib**. Avoid potent inhibitors of CYP3A4 or adjust **ibrutinib** dose. [Severe] Study
- Idelalisib** is predicted to increase the exposure to **isavuconazole**. Avoid or monitor side effects. [Severe] Study
- Antifungals, azoles (**fluconazole**, **posaconazole**) are predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **imatinib**. [Moderate] Study
- Imatinib** is predicted to decrease the exposure to **isavuconazole**. [Moderate] Theoretical
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** p. 186 or **lumacaftor** with **ivacaftor** p. 187 dose with potent inhibitors of CYP3A4. [Severe] Study
- Lanthanum** is predicted to decrease the absorption of **ketoconazole**. Separate administration by at least 2 hours. [Moderate] Theoretical

- Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 849
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849
- Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical → Also see TABLE 1 p. 847
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study → Also see TABLE 1 p. 847
- Clotrimazole** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- Lumacaftor** is predicted to decrease the exposure to antifungals, azoles (**itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**). Avoid or monitor efficacy. [Moderate] Theoretical
- Lumacaftor** is predicted to decrease the exposure to **fluconazole**. Adjust dose. [Mild] Theoretical
- Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **lurasidone**. [Moderate] Study
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **lurasidone**. Avoid. [Severe] Study
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **macitentan**. [Moderate] Study
- Macrolides (clarithromycin)** are predicted to increase the exposure to **isavuconazole**. Avoid or monitor side effects. [Severe] Study
- Macrolides (erythromycin)** are predicted to increase the exposure to **isavuconazole**. [Moderate] Theoretical
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **maraviroc**. Adjust dose. [Severe] Study
- Metoclopramide** potentially decreases the absorption of **posaconazole** (oral suspension). [Moderate] Study
- Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [Severe] Study
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
- Miconazole** is predicted to increase the exposure to intravenous **midazolam**. Use with caution and adjust dose. [Moderate] Theoretical
- Miconazole** is predicted to increase the exposure to oral **midazolam**. Avoid. [Moderate] Theoretical
- Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment. [Moderate] Study
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- Mitotane** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Study
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **modafinil**. [Mild] Theoretical
- Antifungals, azoles (**itraconazole**, **ketoconazole**) increase the risk of neutropenia when given with **monoclonal antibodies (brentuximab vedotin)**. Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **monoclonal antibodies (trastuzumab emtansine)**. Avoid. [Severe] Theoretical
- Isavuconazole** increases the exposure to **mycophenolate**. [Moderate] Study

- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **netupitant**. [Moderate] Study
- ▶ **Netupitant** is predicted to decrease the exposure to **isavuconazole**. [Moderate] Theoretical
- ▶ **Fluconazole** slightly to moderately increases the exposure to **nevirapine**. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** moderately decreases the exposure to **itraconazole**. Avoid and for 14 days after stopping **nevirapine**. [Moderate] Study
- ▶ **Nevirapine** moderately decreases the exposure to **ketoconazole**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **voriconazole** and **voriconazole** increases the exposure to **nevirapine**. Monitor and adjust dose. [Severe] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **posaconazole**) are predicted to increase the exposure to **nilotinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **nitisone**. Adjust dose. [Moderate] Theoretical
- ▶ **Fluconazole** moderately increases the exposure to **NSAIDs** (**celecoxib**). Adjust **celecoxib** dose. [Moderate] Study
- ▶ **Voriconazole** slightly increases the exposure to **NSAIDs** (**diclofenac**). Monitor and adjust dose. [Moderate] Study
- ▶ **Voriconazole** moderately increases the exposure to **NSAIDs** (**ibuprofen**). Adjust dose. [Moderate] Study
- ▶ **Fluconazole** increases the exposure to **NSAIDs** (**parecoxib**). Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Study
- ▶ **Miconazole** is predicted to increase the exposure to **opioids** (**alfentanil**). Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **opioids** (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **opioids** (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**, **sufentanil**). Monitor and adjust dose. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **opioids** (**methadone**). Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **opioids** (**methadone**, **sufentanil**). [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **oxybutynin**. [Mild] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **oxybutynin**. [Mild] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **palbociclib**. Avoid or adjust **palbociclib** dose. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Posaconazole** is predicted to increase the exposure to **panobinostat**. Adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- ▶ **Posaconazole** is predicted to increase the exposure to **paritaprevir** (with ritonavir and ombitasvir) and **paritaprevir** (with ritonavir and ombitasvir) is predicted to increase the exposure to **posaconazole**. Avoid. [Severe] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Miconazole** greatly increases the anticoagulant effect of **phenindione**. [Severe] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**avanafil**). Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**avanafil**, **ildenafil**). Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Miconazole** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**sildenafil**). Use with caution and adjust dose. [Severe] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**sildenafil**). Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**sildenafil**). Avoid potent inhibitors of CYP3A4 or adjust **sildenafil** dose, p. 120. [Severe] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**ildenafil**). Use with caution or avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**ildenafil**). Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) potentially increase the exposure to **pirofenavir**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **pimozide**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Miconazole** is predicted to increase the exposure to **pimozide**. Avoid. [Moderate] Theoretical
- ▶ **Pioglitazone** potentially decreases the exposure to **isavuconazole**. Use with caution or avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **praziquantel**. [Mild] Study
- ▶ **Proton pump inhibitors** decrease the absorption of **itraconazole**. Administer **itraconazole** capsules with an acidic beverage. [Moderate] Study
- ▶ **Proton pump inhibitors** decrease the absorption of **ketoconazole**. Administer **ketoconazole** with an acidic beverage. [Moderate] Study

Antifungals, azoles (continued)

- ▶ **Proton pump inhibitors** decrease the absorption of **posaconazole** (oral suspension). Avoid. [Moderate] Study
- ▶ **Voriconazole** increases the exposure to **proton pump inhibitors (esomeprazole, omeprazole)**. Adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **quetiapine**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **ranolazine**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **ranolazine**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **reboxetine**. Avoid. [Moderate] Study
- ▶ **Miconazole** is predicted to increase the concentration of **reboxetine**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **repaglinide**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, itraconazole, ketoconazole, miconazole, voriconazole**) are predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust alitretinoin dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole, ketoconazole, voriconazole**) are predicted to increase the risk of tretinoin toxicity when given with **retinoids (tretinoin)**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole, posaconazole**) increase the concentration of **rifabutin** and **rifabutin** decreases the concentration of antifungals, azoles (**itraconazole, posaconazole**). Avoid. [Severe] Study
- ▶ **Fluconazole** increases the risk of uveitis when given with **rifabutin**. Adjust dose. [Severe] Study
- ▶ **Rifabutin** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Theoretical
- ▶ **Ketoconazole** is predicted to increase the concentration of **rifabutin** and **rifabutin** is predicted to decrease the concentration of **ketoconazole**. Avoid. [Severe] Theoretical
- ▶ **Miconazole** is predicted to increase the concentration of **rifabutin**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Rifabutin** decreases the concentration of **voriconazole** and **voriconazole** increases the concentration of **rifabutin**. Avoid or adjust **voriconazole** dose, p. 377. [Severe] Study
- ▶ **Rifampicin** slightly decreases the exposure to **fluconazole**. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Study
- ▶ **Rifampicin** markedly decreases the exposure to **itraconazole**. Avoid and for 14 days after stopping **rifampicin**. [Moderate] Study
- ▶ **Rifampicin** markedly decreases the exposure to **ketoconazole** and **ketoconazole** potentially decreases the exposure to **rifampicin**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **posaconazole**. Avoid. [Moderate] Anecdotal
- ▶ **Rifampicin** very markedly decreases the exposure to **voriconazole**. Avoid. [Moderate] Study
- ▶ **Itraconazole** is predicted to increase the exposure to **riociguat**. Avoid. [Moderate] Study

- ▶ **Ketoconazole** moderately increases the exposure to **riociguat**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole, ketoconazole**) are predicted to moderately increase the exposure to **rivaroxaban**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **ruixolitinib**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **ruixolitinib**. Adjust dose and monitor side effects. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **saxagliptin**. [Mild] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **saxagliptin**. [Moderate] Study
- ▶ **Fluconazole** is predicted to increase the exposure to **selexipag**. [Unknown] Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole**) are predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) increase the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the concentration of **sirolimus**. Avoid. [Severe] Study
- ▶ **Miconazole** is predicted to increase the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ Oral **sodium bicarbonate** decreases the absorption of **ketoconazole**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **solifenacin**. Adjust **solifenacin** or **tamsulosin** with **solifenacin** dose; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Voriconazole** is predicted to increase the exposure to **SSRIs (citalopram)**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to moderately increase the exposure to **SSRIs (dapoxetine)**. Avoid potent inhibitors of CYP3A4 or adjust **dapoxetine** dose. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Theoretical
- ▶ **St John's Wort** moderately decreases the exposure to **voriconazole**. Avoid. [Moderate] Study
- ▶ **Miconazole** potentially increases the exposure to **statins (atorvastatin)**. [Severe] Anecdotal
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Severe] Study → Also see TABLE 1 p. 847
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **statins (atorvastatin)**. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study → Also see TABLE 1 p. 847
- ▶ Antifungals, azoles (**fluconazole, miconazole**) are predicted to increase the exposure to **statins (fluvastatin)**. [Severe] Theoretical → Also see TABLE 1 p. 847
- ▶ **Miconazole** is predicted to increase the exposure to **statins (simvastatin)**. Avoid. [Severe] Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **statins (simvastatin)**. Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study → Also see TABLE 1 p. 847
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **statins (simvastatin)**. Avoid. [Severe] Study → Also see TABLE 1 p. 847

- ▶ Antifungals, azoles (**fluconazole**, **miconazole**) are predicted to increase the exposure to **sulfonyleureas**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Voriconazole** is predicted to increase the concentration of **sulfonyleureas**. Use with caution and adjust dose. [Moderate] Study
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study → Also see TABLE 9 p. 849
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the concentration of **tacrolimus**. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
 - ▶ **Miconazole** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Theoretical
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
 - ▶ **Miconazole** is predicted to increase the concentration of **taxanes (docetaxel)**. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **taxanes (docetaxel)**. Avoid or adjust dose. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **taxanes (paclitaxel)**. [Severe] Theoretical
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **ticagrelor**. Avoid. [Severe] Study
 - ▶ Antifungals, azoles (**fluconazole**, **itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose. [Moderate] Study
 - ▶ **Isavuconazole** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
 - ▶ **Posaconazole** is predicted to increase the exposure to **tofacitinib**. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **tolterodine**. [Mild] Theoretical → Also see TABLE 9 p. 849
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **topotecan**. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **toremifene**. [Moderate] Theoretical → Also see TABLE 9 p. 849
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 1 p. 847
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical → Also see TABLE 9 p. 849
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **venlafaxine**. [Moderate] Study → Also see TABLE 9 p. 849
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 1 p. 847 → Also see TABLE 9 p. 849
 - ▶ **Miconazole** is predicted to increase the concentration of **vinca alkaloids**. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**clotrimazole**, **ketoconazole**) are predicted to decrease the exposure to **vitamin D substances (colecalciferol)**. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **vitamin D substances (paricalcitol)**. [Moderate] Study
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- Antihistamines, non-sedating** → see TABLE 9 p. 849 (QT-interval prolongation)
- acrivastine • azelastine • bilastine • cetirizine • desloratadine • fexofenadine • levocetirizine • loratadine • mizolastine • rupatadine
- FOOD AND LIFESTYLE** Apple juice and orange juice decrease the exposure to fexofenadine.
- ▶ **Antacids** decrease the absorption of **fexofenadine**. Separate administration by 2 hours. [Mild] Study
 - ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
 - ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to antihistamines, non-sedating (**fexofenadine**, **mizolastine**). [Severe] Theoretical
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **mizolastine**. [Severe] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **mizolastine**. Avoid. [Severe] Study
 - ▶ Antifungals, azoles (**miconazole**) are predicted to increase the exposure to **mizolastine**. Avoid. [Moderate] Theoretical
 - ▶ **Aprepitant** is predicted to increase the exposure to **mizolastine**. [Severe] Theoretical
 - ▶ **Aprepitant** is predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
 - ▶ **Antihistamines, non-sedating** are predicted to decrease the effects of **betahistine**. [Moderate] Theoretical

Antihistamines, non-sedating (continued)

- ▶ **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to **mizolastine**. [Severe] Theoretical
- ▶ **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
- ▶ **Ceritinib** is predicted to increase the exposure to **fexofenadine**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **mizolastine**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **mizolastine**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
- ▶ **Mizolastine** is predicted to increase the risk of QT-prolongation when given with **drugs that prolong the QT interval**. Avoid. [Severe] Theoretical
- ▶ **Eliglustat** is predicted to increase the exposure to **fexofenadine**. Adjust dose. [Moderate] Study
- ▶ **Grapefruit juice** slightly decreases the exposure to **bilastine**. **Bilastine** should be taken 1 hour before or 2 hours after **grapefruit juice**. [Moderate] Study
- ▶ **Grapefruit juice** increases the exposure to **rupatadine**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **mizolastine**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **mizolastine**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **mizolastine**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
- ▶ **Lapatinib** is predicted to increase the exposure to **fexofenadine**. [Moderate] Theoretical
- ▶ **Macrolides** (**clarithromycin**) are predicted to increase the exposure to **mizolastine**. Avoid. [Severe] Study
- ▶ **Macrolides** (**clarithromycin**, **erythromycin**) are predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
- ▶ **Macrolides** (**erythromycin**) are predicted to increase the exposure to **mizolastine**. [Severe] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **fexofenadine**. [Mild] Theoretical
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of antimuscarinic side-effects when given with **antihistamines, non-sedating**. Avoid. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **mizolastine**. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **mizolastine**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **bilastine**. [Moderate] Theoretical
- ▶ **Rifampicin** increases the clearance of **fexofenadine**. [Moderate] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **fexofenadine**. [Severe] Theoretical

Antihistamines, sedating → see TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects), TABLE 10 p. 849 (antimuscarinics)

alimemazine • antazoline • buclizine • chlorphenamine • cinnarizine • clemastine • cyclizine • cyproheptadine • hydroxyzine • ketotifen • pizotifen • promethazine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **ketotifen**, the possibility of interactions should be borne in mind.

- ▶ **Hydroxyzine** potentially increases the risk of overheating and dehydration when given with **antiepileptics** (**zonisamide**). Avoid in children. [Severe] Theoretical
- ▶ **Antihistamines, sedating** are predicted to decrease the effects of **betahistine**. [Moderate] Theoretical
- ▶ **Cyproheptadine** decreases the effects of **metypapone**. Avoid. [Moderate] Study
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of antimuscarinic side-effects when given with **antihistamines, sedating**. Avoid. [Severe] Theoretical
- ▶ **Antihistamines, sedating** are predicted to decrease the efficacy of **pitolisant**. [Unknown] Theoretical
- ▶ **Cyproheptadine** potentially decreases the effects of **SSRIs**. [Moderate] Anecdotal

Antimalarials → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)

artemether • arteminol • atovaquone • chloroquine • lumefantrine • mefloquine • piperaquine • primaquine • proguanil • pyrimethamine • quinine

PHARMACOLOGY Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped.

- ▶ **Chloroquine** is predicted to decrease the effects of **agalsidase**. Avoid. [Moderate] Theoretical
- ▶ Antimalarials (**chloroquine**, **primaquine**) are predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local** (**prilocaine**). Use with caution or avoid. [Severe] Theoretical
- ▶ **Antacids** decrease the absorption of **chloroquine**. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Antacids** are predicted to decrease the absorption of **proguanil**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Antiarrhythmics** (**dronedronone**) are predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **artemether** (with lumefantrine). Avoid. [Severe] Study
- ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the concentration of **piperaquine**. Avoid. [Moderate] Theoretical
- ▶ **Antiepileptics** (**carbamazepine**, **phenobarbital**, **primidone**) potentially increase the risk of toxicity when given with **quinine**. [Unknown] Study
- ▶ **Pyrimethamine** increases the risk of haematological toxicity when given with **antiepileptics** (**fosphenytoin**, **phenytoin**). [Severe] Study
- ▶ **Pyrimethamine** is predicted to increase the risk of haematological toxicity when given with **antiepileptics** (**phenobarbital**, **primidone**). [Severe] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **itraconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **mefloquine**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**ketoconazole**) increase the exposure to **mefloquine**. [Moderate] Study
- ▶ Antimalarials (**proguanil**) are predicted to increase the risk of side-effects when given with antimalarials (**pyrimethamine**). [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- ▶ **Mefloquine** is predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. [Severe] Theoretical
- ▶ **Mefloquine** is predicted to increase the risk of bradycardia when given with **beta blockers, selective**. [Severe] Theoretical
- ▶ **Mefloquine** is predicted to increase the risk of bradycardia when given with **calcium channel blockers**. [Severe] Theoretical
- ▶ **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- ▶ **Calcium salts** (**calcium carbonate**) decrease the absorption of **chloroquine**. Separate administration by at least 4 hours. [Moderate] Study

- **Calcium salts (calcium carbonate)** are predicted to decrease the absorption of **proguanil**. Separate administration by at least 2 hours. [Moderate] Study
- **Chloroquine** is predicted to decrease the efficacy of oral **cholera vaccine**. [Moderate] Study
- **Cobicistat** is predicted to increase the concentration of **piperazine**. [Severe] Theoretical
- **Crizotinib** is predicted to increase the concentration of **piperazine**. [Severe] Theoretical
- Antimalarials (**chloroquine**, **primaquine**) are predicted to increase the risk of methaemoglobinemia when given with **dapsone**. [Severe] Theoretical
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **digoxin**. [Severe] Theoretical
- **Quinine** increases the concentration of **digoxin**. Monitor and adjust **digoxin** dose, p. 81. [Severe] Anecdotal
- **Mefloquine** is predicted to increase the risk of QT-prolongation when given with **drugs that prolong the QT interval**. [Severe] Theoretical
- **Efavirenz** decreases the concentration of **artemether**. [Severe] Study → Also see TABLE 9 p. 849
- **Efavirenz** moderately decreases the exposure to **atovaquone**. Avoid. [Moderate] Study
- **Efavirenz** affects the exposure to **proguanil**. Avoid. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to **artemether** (with lumefantrine). Avoid. [Severe] Study
- **Enzalutamide** is predicted to decrease the concentration of **piperazine**. Avoid. [Moderate] Theoretical
- **Etravirine** decreases the exposure to **artemether**. [Moderate] Study
- **Grapefruit juice** increases the exposure to **artemether**. [Unknown] Study
- **Grapefruit juice** is predicted to increase the concentration of **piperazine**. Avoid. [Severe] Theoretical
- **H₂ receptor antagonists (cimetidine)** decrease the clearance of **chloroquine**. [Moderate] Study
- **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **quinine**. [Moderate] Study
- **HIV-protease inhibitors** decrease the exposure to **atovaquone**. Avoid if boosted with ritonavir. [Moderate] Study
- **HIV-protease inhibitors** are predicted to increase the concentration of **piperazine**. [Severe] Theoretical
- **HIV-protease inhibitors** are predicted to decrease the exposure to **proguanil**. Avoid. [Moderate] Study
- **HIV-protease inhibitors** are predicted to affect the exposure to **quinine**. [Severe] Study → Also see TABLE 9 p. 849
- **Idelalisib** is predicted to increase the concentration of **piperazine**. [Severe] Theoretical
- **Imatinib** is predicted to increase the concentration of **piperazine**. [Severe] Theoretical
- **Lanthanum** is predicted to decrease the absorption of **chloroquine**. Separate administration by at least 2 hours. [Moderate] Theoretical
- **Chloroquine** is predicted to decrease the exposure to **laronidase**. Avoid simultaneous administration. [Severe] Theoretical
- **Macrolides (clarithromycin, erythromycin)** are predicted to increase the concentration of **piperazine**. [Severe] Theoretical
- **Mepacrine** is predicted to increase the concentration of **primaquine**. Avoid. [Moderate] Theoretical
- **Pyrimethamine** is predicted to increase the risk of side-effects when given with **methotrexate**. [Severe] Theoretical → Also see TABLE 15 p. 850
- **Metoclopramide** decreases the concentration of **atovaquone**. Avoid. [Moderate] Study
- **Mitotane** is predicted to decrease the exposure to **artemether** (with lumefantrine). Avoid. [Severe] Study
- **Mitotane** is predicted to decrease the concentration of **piperazine**. Avoid. [Moderate] Theoretical
- **Netupitant** is predicted to increase the concentration of **piperazine**. [Severe] Theoretical
- **Nilotinib** is predicted to increase the concentration of **piperazine**. [Severe] Theoretical
- **Pyrimethamine** is predicted to increase the risk of side-effects when given with **pemetrexed**. [Severe] Theoretical → Also see TABLE 15 p. 850
- **Chloroquine** is predicted to increase the risk of haematological toxicity when given with **penicillamine**. Avoid. [Severe] Theoretical
- **Chloroquine** moderately decreases the exposure to **praziquantel**. Use with caution and adjust dose. [Moderate] Study
- **Chloroquine** decreases the efficacy of **rabies vaccine**. Avoid. [Moderate] Study
- **Rifabutin** slightly decreases the exposure to **atovaquone**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **artemether** (with lumefantrine). Avoid. [Severe] Study
- **Rifampicin** moderately decreases the exposure to **atovaquone** and **atovaquone** slightly increases the exposure to **rifampicin**. Avoid. [Moderate] Study
- **Rifampicin** moderately decreases the exposure to **mefloquine**. [Severe] Study
- **Rifampicin** is predicted to decrease the concentration of **piperazine**. Avoid. [Moderate] Theoretical
- **Rifampicin** decreases the exposure to **quinine**. [Severe] Study
- **St John's Wort** is predicted to decrease the concentration of **piperazine**. Avoid. [Moderate] Theoretical
- **Pyrimethamine** increases the risk of side-effects when given with **sulfonamides**. [Severe] Study → Also see TABLE 15 p. 850
- **Tetracyclines (tetracycline)** decrease the concentration of **atovaquone**. [Moderate] Study
- **Pyrimethamine** increases the risk of side-effects when given with **trimethoprim**. [Severe] Study
- **Pyrimethamine** is predicted to increase the risk of side-effects when given with **zidovudine**. [Severe] Theoretical → Also see TABLE 15 p. 850
- Apixaban** → see TABLE 3 p. 847 (anticoagulant effects)
- **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **apixaban**. Use with caution or avoid. [Severe] Study
- **Antifungals, azoles (itraconazole)** are predicted to increase the exposure to **apixaban**. Avoid. [Severe] Theoretical
- **Antifungals, azoles (ketoconazole)** slightly to moderately increase the exposure to **apixaban**. Avoid. [Severe] Study
- **Calcium channel blockers (verapamil)** are predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- **Enzalutamide** is predicted to moderately decrease the exposure to **apixaban**. Use with caution or avoid. [Severe] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **apixaban**. Avoid. [Severe] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to **apixaban**. [Severe] Theoretical
- **Macrolides (erythromycin)** are predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- **Mitotane** is predicted to moderately decrease the exposure to **apixaban**. Use with caution or avoid. [Severe] Study
- **Rifampicin** is predicted to moderately decrease the exposure to **apixaban**. Use with caution or avoid. [Severe] Study
- **St John's Wort** is predicted to decrease the exposure to **apixaban**. Use with caution or avoid. [Moderate] Theoretical
- Apomorphine** → see dopamine receptor agonists
- Apraclonidine** → see TABLE 6 p. 848 (bradycardia), TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)
- **Amfetamines** are predicted to decrease the effects of **apraclonidine**. Avoid. [Severe] Theoretical
- **Methyphenidate** is predicted to decrease the effects of **apraclonidine**. Avoid. [Severe] Theoretical
- **Sympathomimetics, inotropic** are predicted to decrease the effects of **apraclonidine**. Avoid. [Severe] Theoretical
- **Sympathomimetics, vasoconstrictor** are predicted to decrease the effects of **apraclonidine**. Avoid. [Severe] Theoretical
- Apremilast**
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** moderately decrease the exposure to **apremilast**. Avoid. [Severe] Study

Apremilast (continued)

- ▶ **Enzalutamide** moderately decreases the exposure to **apremilast**. Avoid. [Severe] Study
- ▶ **Mitotane** moderately decreases the exposure to **apremilast**. Avoid. [Severe] Study
- ▶ **Rifampicin** moderately decreases the exposure to **apremilast**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **apremilast**. Avoid. [Severe] Theoretical

Aprepitant

- ▶ **Aprepitant** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **alprazolam**. [Severe] Study
- ▶ **Aprepitant** increases the exposure to **antiarrhythmics (dronedronarone)**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to **aprepitant**. Avoid. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **aprepitant**. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **aprepitant** and **aprepitant** is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical
- ▶ **Aprepitant** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **aprepitant**. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Aprepitant** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **Aprepitant** moderately increases the exposure to **corticosteroids (dexamethasone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Aprepitant** decreases the anticoagulant effect of **coumarins**. [Moderate] Study
- ▶ **Aprepitant** is predicted to slightly increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **dasatinib**. [Severe] Study
- ▶ **Aprepitant** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Aprepitant** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Aprepitant** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to markedly decrease the exposure to **aprepitant**. Avoid. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **gefitinib**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **aprepitant**. [Moderate] Study
- ▶ **Aprepitant** is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- ▶ **Aprepitant** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **aprepitant**. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **lapatinib**. [Moderate] Study
- ▶ **Aprepitant** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **lurasidone**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **aprepitant**. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **aprepitant**. Avoid. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **nilotinib**. [Moderate] Theoretical

- ▶ **Aprepitant** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Aprepitant** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **opioids** (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **opioids** (**methadone**, **sufentanil**). [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **oxybutynin**. [Mild] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**avanafil**). Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**sildenafil**). Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**tadalafil**). [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**ildenafil**). Adjust dose. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **ranolazine**. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **ribociclib**. [Moderate] Study
- ▶ **Rifampicin** is predicted to markedly decrease the exposure to **aprepitant**. Avoid. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **roxatitinib**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ **Aprepitant** increases the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **SSRIs** (**dapoxetine**). Adjust **dapoxetine** dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **aprepitant**. Avoid. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **statins** (**atorvastatin**). Monitor and adjust dose. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **statins** (**simvastatin**). Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **taxanes** (**cabazitaxel**). [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Aprepitant** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Aprepitant** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Argatroban** → see TABLE 3 p. 847 (anticoagulant effects)
- ▶ **Ranibizumab** is predicted to increase the risk of bleeding events when given with **argatroban**. [Severe] Theoretical
- Aripiprazole** → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)
 - ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to moderately decrease the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study → Also see TABLE 11 p. 849
 - ▶ **Antifungals**, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to slightly increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **Bupropion** is predicted to moderately increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **Cinacalcet** is predicted to moderately increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **Cobicistat** is predicted to slightly increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **Aripiprazole** is predicted to decrease the effects of **dopamine receptor agonists**. [Moderate] Theoretical → Also see TABLE 8 p. 848
 - ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to slightly increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **Idelalisib** is predicted to slightly increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **Aripiprazole** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848
 - ▶ **Macrolides** (**clarithromycin**) are predicted to slightly increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **Mitotane** is predicted to moderately decrease the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **Rifampicin** is predicted to moderately decrease the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **SSRIs** (**fluoxetine**, **paroxetine**) are predicted to moderately increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
 - ▶ **Terbinafine** is predicted to moderately increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
- Arsenic trioxide** → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)
- Artemether** → see antimalarials
- Artenimol** → see antimalarials
- Articaine** → see TABLE 11 p. 849 (CNS depressant effects)
- Ascorbic acid**
 - ▶ **Ascorbic acid** is predicted to increase the risk of cardiovascular side-effects when given with **deferiprone**. [Severe] Theoretical
 - ▶ **Ascorbic acid** is predicted to increase the risk of cardiovascular side-effects when given with **iron chelators** (**desferrioxamine**). [Severe] Theoretical
- Asenapine** → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)
 - ▶ **Asenapine** is predicted to decrease the effects of **dopamine receptor agonists**. Adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 848
 - ▶ **Asenapine** is predicted to decrease the effects of **levodopa**. Adjust dose. [Severe] Theoretical → Also see TABLE 8 p. 848
 - ▶ **SSRIs** (**fluvoxamine**) increase the exposure to **asenapine**. [Moderate] Study
 - ▶ **SSRIs** (**paroxetine**) moderately increase the exposure to **asenapine**. [Moderate] Study
- Asparaginase** → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression)

Asparaginase (continued)

- ▶ **Asparaginase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Asparaginase** affects the efficacy of **methotrexate**. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Asparaginase** potentially increases the risk of neurotoxicity when given with **vinca alkaloids** (**vincristine**). Vincristine should be taken 3 to 24 hours before **asparaginase**, p. 550. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Aspirin** → see TABLE 4 p. 847 (antiplatelet effects)
- ▶ **Acetazolamide** increases the risk of severe toxic reaction when given with **aspirin** (high-dose). [Severe] Study
- ▶ **Acids** decrease the absorption of **aspirin** (high-dose). [Moderate] Study
- ▶ **Aspirin** (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with **bisphosphonates** (**alendronic acid**, **ibandronic acid**). [Moderate] Study
- ▶ **Aspirin** (high-dose) is predicted to increase the risk of renal impairment when given with **bisphosphonates** (**sodium clodronate**). [Severe] Theoretical
- ▶ **Corticosteroids** are predicted to decrease the concentration of **aspirin** (high-dose) and **aspirin** (high-dose) increases the risk of gastrointestinal bleeding when given with **corticosteroids**. [Moderate] Study
- ▶ **Aspirin** (high-dose) increases the risk of renal impairment when given with **daptomycin**. [Moderate] Theoretical
- ▶ **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **aspirin** (high-dose). [Severe] Theoretical
- ▶ **Aspirin** (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with **iron chelators** (**deferasirox**). [Severe] Theoretical
- ▶ **Aspirin** (high-dose) is predicted to increase the risk of toxicity when given with **methotrexate**. [Severe] Theoretical
- ▶ **Aspirin** is predicted to increase the risk of gastrointestinal perforation when given with **nicorandil**. [Severe] Theoretical
- ▶ **Aspirin** (high-dose) potentially increases the exposure to **pemetrexed**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Aspirin** decreases the effects of **sulfinpyrazone**. [Moderate] Study → Also see TABLE 4 p. 847
- ▶ **Aspirin** (high-dose) increases the risk of acute renal failure when given with **thiazide diuretics**. [Severe] Theoretical
- ▶ **Zidovudine** increases the risk of haematological toxicity when given with **aspirin** (high-dose). [Severe] Study

Ataluren

- ▶ **Ataluren** increases the exposure to **adefovir**. [Moderate] Study
- ▶ **Ataluren** is predicted to increase the risk of nephrotoxicity when given with intravenous **aminoglycosides**. Avoid. [Severe] Study
- ▶ **Rifampicin** decreases the exposure to **ataluren**. [Moderate] Study
- ▶ **Atazanavir** → see HIV-protease inhibitors
- ▶ **Atenolol** → see beta blockers, selective
- ▶ **Atezolizumab** → see monoclonal antibodies

Atomoxetine

- ▶ **Amfetamines** are predicted to increase the risk of side-effects when given with **atomoxetine**. [Severe] Theoretical
- ▶ **Atomoxetine** is predicted to increase the risk of cardiovascular side-effects when given with **beta₂ agonists** (high-dose). [Moderate] Study
- ▶ **Bupropion** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
- ▶ **Cinacalcet** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **atomoxetine**. Adjust dose. [Moderate] Theoretical
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of side-effects when given with **atomoxetine**. Avoid and for 2 weeks after stopping the MAOI. [Severe] Theoretical
- ▶ **Panobinostat** is predicted to increase the exposure to **atomoxetine**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **SSRIs** (**fluoxetine**, **paroxetine**) are predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
- ▶ **Terbinafine** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
- ▶ **Atorvastatin** → see statins
- ▶ **Atovaquone** → see antimalarials
- ▶ **Atracurium** → see neuromuscular blocking drugs, non-depolarising
- ▶ **Atropine** → see TABLE 10 p. 849 (antimuscarinics)
- ▶ **Atropine** increases the risk of severe hypertension when given with **sympathomimetics**, **vasoconstrictor** (**phenylephrine**). [Severe] Study
- ▶ **Avanafil** → see phosphodiesterase type-5 inhibitors
- ▶ **Avelumab** → see monoclonal antibodies
- ▶ **Axitinib** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Antiarrhythmics** (**dronedaron**) are predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **Antifungals**, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Antifungals**, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **Axitinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Efavirenz** is predicted to decrease the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Macrolides** (**clarithromycin**) are predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **Macrolides** (**erythromycin**) are predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Nevupitant** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Axitinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Azaticitidine** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Azathioprine** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **ACE inhibitors** are predicted to increase the risk of anaemia and/or leucopenia when given with **azathioprine**. [Severe] Anecdotal
- ▶ **Allopurinol** potentially increases the risk of haematological toxicity when given with **azathioprine**. Adjust **azathioprine** dose, p. 518. [Severe] Study
- ▶ **Azathioprine** decreases the anticoagulant effect of **coumarins**. [Moderate] Study

- **Febuxostat** is predicted to increase the exposure to azathioprine. Avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with azathioprine (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Azelastine** → see antihistamines, non-sedating
- Azilsartan** → see angiotensin-II receptor antagonists
- Azithromycin** → see macrolides
- Bacillus Calmette-Guérin vaccine** → see live vaccines
- Bacitracin** → see TABLE 2 p. 847 (nephrotoxicity)
- Baclofen** → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects), TABLE 10 p. 849 (antismuscarinics)
- **Baclofen** is predicted to increase the risk of side-effects when given with **levodopa**. [Severe] Anecdotal → Also see TABLE 8 p. 848
- Balsalazide** → see TABLE 15 p. 850 (myelosuppression)
- **Balsalazide** is predicted to decrease the concentration of **digoxin**. [Moderate] Theoretical
- Bambuterol** → see beta₂ agonists
- Baricitinib**
 - **Leflunomide** potentially increases the exposure to baricitinib. [Moderate] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with baricitinib. Avoid. [Severe] Theoretical
- **Teriflunomide** potentially increases the exposure to baricitinib. [Moderate] Theoretical
- Basiliximab** → see monoclonal antibodies
- Bazedoxifene**
 - Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical
 - **Rifampicin** is predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical
- Beclomethasone** → see corticosteroids
- Bedaquiline** → see TABLE 9 p. 849 (QT-interval prolongation)
- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 849
- Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) decrease the exposure to bedaquiline. Avoid. [Severe] Study
- Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 849
- Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 849
- **Aprepitant** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- **Bosentan** is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
- Calcium channel blockers (**diltiazem**, **verapamil**) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- **Clofazimine** potentially increases the risk of QT-prolongation when given with bedaquiline. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study
- **Crizotinib** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 849
- **Efavirenz** is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- **Enzalutamide** decreases the exposure to bedaquiline. Avoid. [Severe] Study
- **Etravirine** is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 849
- **Idelalisib** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study
- **Imatinib** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

- **Macrolides (clarithromycin)** are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 849
- **Macrolides (erythromycin)** are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 849
- **Mitotane** decreases the exposure to bedaquiline. Avoid. [Severe] Study
- **Netupitant** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- **Nevirapine** is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 849
- **Rifampicin** decreases the exposure to bedaquiline. Avoid. [Severe] Study
- **St John's Wort** is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study

Bee venom extract

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

Belatacept

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belatacept. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Belimumab** → see monoclonal antibodies
- Bendamustine** → see alkylating agents
- Bendroflumethiazide** → see thiazide diuretics
- Benperidol** → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)
- **Benperidol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
- **Benperidol** is predicted to decrease the effects of **guanethidine**. [Moderate] Theoretical → Also see TABLE 8 p. 848
- **Benperidol** is predicted to decrease the effects of **levodopa**. [Severe] Study → Also see TABLE 8 p. 848
- Benralizumab** → see monoclonal antibodies
- Benzydamine** → see NSAIDs
- Benzylenicillin** → see penicillins

Beta blockers, non-selective → see TABLE 6 p. 848 (bradycardia), TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation)

carvedilol · labetalol · levobunolol · nadolol · oxprenolol · pindolol · propranolol · sotalol · timolol

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **levobunolol** and **timolol**, the possibility of interactions should be borne in mind.

- **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with **aminophylline**. Avoid. [Severe] Theoretical
- **Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine)** are predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, non-selective**. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 848 → Also see TABLE 9 p. 849
- **Antiarrhythmics (propafenone)** increase the risk of cardiovascular side-effects when given with **propranolol**. Use with caution or avoid. [Severe] Study
- **Antiarrhythmics (propafenone)** are predicted to increase the exposure to **timolol** and **timolol** is predicted to increase the risk of cardiodepression when given with **antiarrhythmics (propafenone)**. [Severe] Anecdotal
- **Antiarrhythmics (propafenone)** are predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, non-selective (labetalol, levobunolol, nadolol, oxprenolol, pindolol, sotalol)**. Use with caution or avoid. [Severe] Study
- **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. [Moderate] Anecdotal → Also see TABLE 6 p. 848

Beta blockers, non-selective (continued)

- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to **propranolol**. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to beta blockers, non-selective (**carvedilol, labetalol**). [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to **nadolol**. [Moderate] Study
- ▶ **Antimalarials (mefloquine)** are predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. [Severe] Theoretical
- ▶ **Calcium channel blockers (diltiazem)** are predicted to increase the risk of cardiodepression when given with **beta blockers, non-selective**. [Severe] Study → Also see TABLE 6 p. 848 → Also see TABLE 8 p. 848
- ▶ Intravenous **calcium channel blockers (verapamil)** increase the risk of cardiovascular side-effects when given with **beta blockers, non-selective**. Avoid. [Severe] Study → Also see TABLE 6 p. 848 → Also see TABLE 8 p. 848
- ▶ Oral **calcium channel blockers (verapamil)** increase the risk of cardiovascular side-effects when given with **beta blockers, non-selective**. [Severe] Study → Also see TABLE 6 p. 848 → Also see TABLE 8 p. 848
- ▶ **Ciclosporin** is predicted to increase the exposure to **nadolol**. [Moderate] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **propranolol**. Adjust dose. [Moderate] Study
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergometrine**. [Severe] Study
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergotamine**. [Severe] Study
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **nadolol**. [Moderate] Study
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of bradycardia when given with **lanreotide**. [Moderate] Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **nadolol**. [Moderate] Study
- ▶ **Macrolides** are predicted to increase the exposure to **nadolol**. [Moderate] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **nadolol**. [Moderate] Study
- ▶ **Rifampicin** moderately decreases the exposure to **carvedilol**. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **propranolol**. Monitor and adjust dose. [Moderate] Study
- ▶ **Propranolol** slightly to moderately increases the exposure to **rizatriptan**. Adjust rizatriptan dose and separate administration by at least 2 hours. [Moderate] Study
- ▶ **SSRIs (fluvoxamine)** moderately increase the concentration of **propranolol**. [Moderate] Study
- ▶ **Beta blockers, non-selective** increase the risk of hypertension and bradycardia when given with **sympathomimetics, inotropic (dobutamine)**. [Severe] Theoretical
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of hypertension and bradycardia when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Severe] Study
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with **theophylline**. Avoid. [Severe] Theoretical
- ▶ **Vemurafenib** is predicted to increase the exposure to **nadolol**. [Moderate] Study

Beta blockers, selective → see TABLE 6 p. 848 (bradycardia), TABLE 8 p. 848 (hypotension)

acebutolol • atenolol • betaxolol • bisoprolol • celiprolol • esmolol • metoprolol • nebivolol

- ▶ Since systemic absorption can follow topical application of **betaxolol**, the possibility of interactions should be borne in mind.
- ▶ Orange juice greatly decreases the exposure to **celiprolol**.
- ▶ **Abiraterone** is predicted to increase the exposure to **metoprolol**. [Moderate] Study

- ▶ **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with **aminophylline**. Avoid. [Severe] Theoretical
- ▶ **Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine)** are predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, selective**. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 848
- ▶ **Antiarrhythmics (propafenone)** are predicted to increase the exposure to **metoprolol**. [Moderate] Study
- ▶ **Antiarrhythmics (propafenone)** are predicted to increase the exposure to **nebivolol** and **nebivolol** is predicted to increase the risk of cardiodepression when given with **antiarrhythmics (propafenone)**. Avoid. [Severe] Theoretical
- ▶ **Antiarrhythmics (propafenone)** are predicted to increase the risk of cardiovascular side-effects when given with **beta blockers, selective (acebutolol, atenolol, betaxolol, bisoprolol, celiprolol, esmolol)**. Use with caution or avoid. [Severe] Study
- ▶ **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with **beta blockers, selective**. [Moderate] Anecdotal → Also see TABLE 6 p. 848
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to **beta blockers, selective (acebutolol, bisoprolol, metoprolol, nebivolol)**. [Moderate] Study
- ▶ **Antimalarials (mefloquine)** are predicted to increase the risk of bradycardia when given with **beta blockers, selective**. [Severe] Theoretical
- ▶ **Bupropion** is predicted to increase the exposure to **beta blockers, selective (metoprolol, nebivolol)**. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem)** are predicted to increase the risk of cardiodepression when given with **beta blockers, selective**. [Severe] Study → Also see TABLE 6 p. 848 → Also see TABLE 8 p. 848
- ▶ Intravenous **calcium channel blockers (verapamil)** increase the risk of cardiovascular side-effects when given with **beta blockers, selective**. Avoid. [Severe] Study → Also see TABLE 6 p. 848 → Also see TABLE 8 p. 848
- ▶ Oral **calcium channel blockers (verapamil)** increase the risk of cardiovascular side-effects when given with **beta blockers, selective**. [Severe] Study → Also see TABLE 6 p. 848 → Also see TABLE 8 p. 848
- ▶ **Cinacalcet** is predicted to increase the exposure to **beta blockers, selective (metoprolol, nebivolol)**. [Moderate] Study
- ▶ **Duloxetine** is predicted to increase the exposure to **metoprolol**. [Moderate] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **metoprolol**. Adjust dose. [Moderate] Study
- ▶ **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergometrine**. [Severe] Study
- ▶ **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergotamine**. [Severe] Study
- ▶ **Grapefruit juice** greatly decreases the exposure to **celiprolol**. [Moderate] Study
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **metoprolol**. [Moderate] Study
- ▶ **Beta blockers, selective** are predicted to increase the risk of bradycardia when given with **lanreotide**. [Moderate] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **metoprolol**. [Moderate] Study
- ▶ **Panobinostat** is predicted to increase the exposure to **metoprolol**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Panobinostat** is predicted to increase the exposure to **nebivolol**. Monitor and adjust dose. [Mild] Theoretical
- ▶ **Rifampicin** slightly decreases the exposure to **beta blockers, selective (bisoprolol, metoprolol)**. [Mild] Study
- ▶ **Rifampicin** moderately decreases the exposure to **celiprolol**. [Moderate] Study
- ▶ **Rolapitant** is predicted to moderately increase the exposure to **metoprolol**. [Severe] Study
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **beta blockers, selective (metoprolol, nebivolol)**. [Moderate] Study

- **Beta blockers, selective** increase the risk of hypertension and bradycardia when given with **sympathomimetics, inotropic (dobutamine)**. [Moderate] Theoretical
- **Beta blockers, selective** are predicted to increase the risk of hypertension and bradycardia when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Severe] Study
- **Terbinafine** is predicted to increase the exposure to beta blockers, selective (**metoprolol, nebivolol**). [Moderate] Study
- **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with **theophylline**. Avoid. [Severe] Theoretical

Beta₂ agonists → see TABLE 17 p. 851 (reduced serum potassium)

bambuterol • formoterol • indacaterol • olodaterol • salbutamol • salmeterol • terbutaline • vilanterol

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **salmeterol**. Avoid. [Severe] Study
- **Atomoxetine** is predicted to increase the risk of cardiovascular side-effects when given with **beta₂ agonists** (high-dose). [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to **salmeterol**. Avoid. [Severe] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to **salmeterol**. Avoid. [Severe] Study
- **Idelalisib** is predicted to increase the exposure to **salmeterol**. Avoid. [Severe] Study
- **Beta₂ agonists** are predicted to increase the risk of glaucoma when given with **ipratropium**. [Moderate] Anecdotal
- **Beta₂ agonists** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to **salmeterol**. Avoid. [Severe] Study
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of cardiovascular side-effects when given with **beta₂ agonists**. [Moderate] Anecdotal
- **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of severe hypertension when given with **beta₂ agonists**. Avoid. [Severe] Theoretical
- **Monoamine-oxidase B inhibitors (safinamide)** are predicted to increase the risk of severe hypertension when given with **beta₂ agonists**. [Severe] Theoretical

Betahistine

- **Antihistamines, non-sedating** are predicted to decrease the effects of **betahistine**. [Moderate] Theoretical
- **Antihistamines, sedating** are predicted to decrease the effects of **betahistine**. [Moderate] Theoretical

Betamethasone → see corticosteroids

Betaxolol → see beta blockers, selective

Bevacizumab → see monoclonal antibodies

Bexarotene → see retinoids

Bezafibrate → see fibrates

Bicalutamide

- **Bicalutamide** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical

Bilastine → see antihistamines, non-sedating

Bisoprolol → see beta blockers, selective

Bisphosphonates → see TABLE 2 p. 847 (nephrotoxicity)

alendronic acid • ibandronic acid • pamidronate • risedronate • sodium clodronate • zoledronic acid

- **Aminoglycosides** increase the risk of hypocalcaemia when given with **bisphosphonates**. [Moderate] Anecdotal → Also see TABLE 2 p. 847
- **Antacids** decrease the absorption of **alendronic acid**. **Alendronic acid** should be taken at least 30 minutes before **antacids**. [Moderate] Study
- **Antacids** are predicted to decrease the absorption of **ibandronic acid**. Avoid **antacids** for at least 6 hours before or 1 hour after **ibandronic acid**. [Moderate] Theoretical
- **Antacids** decrease the absorption of **risedronate**. Separate administration by at least 2 hours. [Moderate] Study

- **Antacids** decrease the absorption of **sodium clodronate**. Avoid **antacids** for 2 hours before or 1 hour after **sodium clodronate**. [Moderate] Study

- **Aspirin** (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with **bisphosphonates (alendronic acid, ibandronic acid)**. [Moderate] Study
- **Aspirin** (high-dose) is predicted to increase the risk of renal impairment when given with **sodium clodronate**. [Severe] Theoretical
- Oral **calcium salts** decrease the absorption of **alendronic acid**. **Alendronic acid** should be taken at least 30 minutes before **calcium salts**. [Moderate] Study
- Oral **calcium salts** are predicted to decrease the absorption of oral **ibandronic acid**. Avoid **calcium salts** for at least 6 hours before or 1 hour after **ibandronic acid**. [Moderate] Theoretical
- Oral **calcium salts** decrease the absorption of **risedronate**. Separate administration by at least 2 hours. [Moderate] Study
- Oral **calcium salts** decrease the absorption of **sodium clodronate**. Avoid **calcium salts** for 2 hours before or 1 hour after **sodium clodronate**. [Moderate] Study
- **Iron (oral)** is predicted to decrease the absorption of oral **ibandronic acid**. Avoid **iron (oral)** for at least 6 hours before or 1 hour after **ibandronic acid**. [Moderate] Theoretical
- **Iron (oral)** decreases the absorption of **risedronate**. Separate administration by at least 2 hours. [Moderate] Study
- **Iron (oral)** decreases the absorption of **sodium clodronate**. Avoid **iron (oral)** for 2 hours before or 1 hour after **sodium clodronate**. [Moderate] Study
- **Bisphosphonates** are predicted to increase the risk of gastrointestinal bleeding when given with **iron chelators (deferasirox)**. [Severe] Theoretical
- Oral **magnesium** decreases the absorption of **alendronic acid**. **Alendronic acid** should be taken at least 30 minutes before **magnesium**. [Moderate] Study
- Oral **magnesium** is predicted to decrease the absorption of oral **ibandronic acid**. Avoid **magnesium** for at least 6 hours before or 1 hour after **ibandronic acid**. [Moderate] Theoretical
- Oral **magnesium** decreases the absorption of **risedronate**. Separate administration by at least 2 hours. [Moderate] Study
- Oral **magnesium** decreases the absorption of **sodium clodronate**. Avoid **magnesium** for 2 hours before or 1 hour after **sodium clodronate**. [Moderate] Study
- **NSAIDs** are predicted to increase the risk of gastrointestinal irritation when given with **bisphosphonates (alendronic acid, ibandronic acid)**. [Moderate] Study
- **NSAIDs** are predicted to increase the risk of renal impairment when given with **sodium clodronate**. [Severe] Theoretical
- **Bisphosphonates** are predicted to decrease the effects of **parathyroid hormone**. Avoid. [Moderate] Study
- Oral **zinc** decreases the absorption of oral **alendronic acid**. **Zinc** should be taken at least 30 minutes before **alendronic acid**. [Moderate] Study
- Oral **zinc** is predicted to decrease the absorption of oral **ibandronic acid**. Avoid **zinc** for at least 6 hours before or 1 hour after **ibandronic acid**. [Moderate] Theoretical
- Oral **zinc** decreases the absorption of oral **risedronate**. Separate administration by at least 2 hours. [Moderate] Study
- Oral **zinc** decreases the absorption of oral **sodium clodronate**. Avoid **zinc** for 2 hours before or 1 hour after **sodium clodronate**. [Moderate] Study

Bivalirudin → see TABLE 3 p. 847 (anticoagulant effects)

- **Ranibizumab** is predicted to increase the risk of bleeding events when given with **bivalirudin**. [Moderate] Theoretical

Bleomycin → see TABLE 15 p. 850 (myelosuppression), TABLE 5 p. 847 (thromboembolism)

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **bleomycin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Monoclonal antibodies (brentuximab vedotin)** increase the risk of pulmonary toxicity when given with **bleomycin**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- **Platinum compounds (cisplatin)** increase the risk of pulmonary toxicity when given with **bleomycin**. [Severe] Study → Also see TABLE 15 p. 850

Blinatumomab → see monoclonal antibodies

Bortezomib → see TABLE 8 p. 848 (hypotension), TABLE 15 p. 850 (myelosuppression), TABLE 12 p. 850 (peripheral neuropathy)

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) slightly decrease the exposure to **bortezomib**. Avoid. [Severe] Study → Also see TABLE 12 p. 850
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) slightly increase the exposure to **bortezomib**. [Moderate] Study
- ▶ **Cobicistat** slightly increases the exposure to **bortezomib**. [Moderate] Study
- ▶ **Enzalutamide** slightly decreases the exposure to **bortezomib**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** slightly increase the exposure to **bortezomib**. [Moderate] Study
- ▶ **Idelalisib** slightly increases the exposure to **bortezomib**. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Macrolides** (**clarithromycin**) slightly increase the exposure to **bortezomib**. [Moderate] Study
- ▶ **Mitotane** slightly decreases the exposure to **bortezomib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Rifampicin** slightly decreases the exposure to **bortezomib**. Avoid. [Severe] Study

Bosentan

- ▶ **Bosentan** is predicted to decrease the exposure to antiarrhythmics (**dronedaron**). [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) affect the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**) are predicted to increase the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**) are predicted to increase the exposure to **bosentan**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**ketoconazole**) moderately increase the exposure to **bosentan**. [Moderate] Study
- ▶ Antifungals, azoles (**voriconazole**) are predicted to increase the exposure to **bosentan**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to antifungals, azoles (**isavuconazole**). Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **bedaquiline**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **cabozantinib**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to calcium channel blockers (**amlodipine**, **felodipine**, **lacidipine**, **lercanidipine**, **nicardipine**, **nifedipine**, **nimodipine**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to calcium channel blockers (**diltiazem**, **verapamil**). [Moderate] Theoretical
- ▶ Cephalosporins (**ceftibiprole**) are predicted to increase the exposure to **bosentan**. [Moderate] Theoretical
- ▶ **Bosentan** moderately decreases the exposure to **ciclosporin** and **ciclosporin** moderately increases the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **Bosentan** decreases the anticoagulant effect of **coumarins**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **dasatinib**. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Bosentan** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Bosentan** is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **eliglustat**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** affects the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **gefitinib**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **bosentan**. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- ▶ **Bosentan** is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **imatinib**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **ivacaftor**. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Macrolides** (**clarithromycin**) are predicted to increase the exposure to **bosentan**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **maraviroc**. Avoid. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the concentration of **midazolam**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** affects the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **netupitant**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Bosentan** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Bosentan** decreases the exposure to **opioids** (**methadone**). Monitor and adjust dose. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **osimertinib**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **paritaprevir** (with **ritonavir** and **ombitasvir**). Avoid. [Severe] Study
- ▶ **Bosentan** decreases the exposure to **phosphodiesterase type-5 inhibitors**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **quetiapine**. [Moderate] Study

- ▶ **Bosentan** is predicted to decrease the exposure to **ribociclib**.
[Moderate] Study
- ▶ **Rifampicin** affects the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **rilpivirine**.
Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **rolapitant**.
Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **ruxolitinib**.
Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **simeprevir**.
Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the concentration of **sirolimus** and **sirolimus** potentially increases the concentration of **bosentan**. Avoid. [Severe] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **bosentan**. Avoid. [Moderate] Theoretical
- ▶ **Bosentan** slightly decreases the exposure to **statins** (**atorvastatin**). [Mild] Study
- ▶ **Bosentan** moderately decreases the exposure to **statins** (**simvastatin**). [Moderate] Study
- ▶ **Bosentan** increases the risk of hepatotoxicity when given with **sulfonylureas** (**glibenclamide**). Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the concentration of **tacrolimus** and **tacrolimus** potentially increases the concentration of **bosentan**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **taxanes** (**cabazitaxel**). Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **ticagrelor**.
[Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **tofacinib**.
[Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **tolvaptan**.
[Moderate] Theoretical
- ▶ **Bosentan** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Bosentan** is predicted to decrease the exposure to **velpatasvir**.
Avoid. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **venetoclax**.
Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- Bosutinib** → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)
- ▶ **Antacids** are predicted to decrease the absorption of **bosutinib**.
Bosutinib should be taken at least 12 hours before antacids.
[Moderate] Theoretical
- ▶ **Antiarrhythmics** (**dronedarone**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles** (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles** (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **bosutinib**.
Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Aprepitant** is predicted to increase the exposure to **bosutinib**.
Avoid or adjust dose. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **bosutinib**.
Avoid. [Severe] Theoretical
- ▶ **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose.
[Severe] Theoretical
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study
- ▶ **Bosutinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **bosutinib**.
Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Efavirenz** is predicted to decrease the exposure to **bosutinib**.
Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Enzalutamide** is predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [Severe] Study
- ▶ **Etravirine** is predicted to decrease the exposure to **bosutinib**.
Avoid. [Severe] Theoretical
- ▶ **Fosaprepitant** is predicted to increase the exposure to **bosutinib**. [Severe] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **bosutinib**. Avoid. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **bosutinib**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **bosutinib**.
Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Macrolides** (**clarithromycin**) are predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides** (**erythromycin**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Mitotane** is predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Modafinil** is predicted to decrease the exposure to **bosutinib**.
Avoid. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **bosutinib**.
Avoid or adjust dose. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **bosutinib**.
Avoid. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **bosutinib**.
Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Bosutinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **bosutinib**.
Avoid. [Severe] Theoretical
- ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **bosutinib**. [Moderate] Study
- ▶ **Rifampicin** is predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **bosutinib**.
Avoid. [Severe] Theoretical
- Botulinum toxin type A** → see TABLE 20 p. 851 (neuromuscular blocking effects)
- Botulinum toxin type B** → see TABLE 20 p. 851 (neuromuscular blocking effects)

Bowel cleansing preparations

SEPARATION OF ADMINISTRATION Other oral drugs should not be taken 1 hour before, or after, administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

Brentuximab vedotin → see monoclonal antibodies

Brimonidine → see TABLE 6 p. 848 (bradycardia), TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

Brinzolamide

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Brivaracetam → see antiepileptics

Brodalumab → see monoclonal antibodies

Bromfenac → see NSAIDs

Bromocriptine → see dopamine receptor agonists

Bucazine → see antihistamines, sedating

Budesonide → see corticosteroids

Bumetanide → see loop diuretics

Bupivacaine → see anaesthetics, local

Buprenorphine → see opioids

Bupropion → see TABLE 13 p. 850 (serotonin syndrome)

► **Bupropion** is predicted to increase the exposure to anticholinesterases, centrally acting (**galantamine**). Monitor and adjust dose. [Moderate] Study

► Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to markedly decrease the exposure to **bupropion**. [Severe] Study

► Antiepileptics (**valproate**) increase the exposure to **bupropion**. [Severe] Study

► Antifungals, azoles (**isavuconazole**) slightly increase the exposure to **bupropion**. Adjust dose. [Moderate] Study

► **Bupropion** is predicted to moderately increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study

► **Bupropion** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study

► **Bupropion** is predicted to increase the exposure to **beta blockers**, selective (**metoprolol**, **nebivolol**). [Moderate] Study

► **Bupropion** is predicted to slightly increase the exposure to **darifenacin**. [Mild] Study

► **Bupropion** increases the risk of side-effects when given with dopamine receptor agonists (**amantadine**). [Moderate] Study

► **Efavirenz** is predicted to decrease the exposure to **bupropion**. [Moderate] Study

► **Bupropion** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study

► HIV-protease inhibitors (**ritonavir**) are predicted to decrease the exposure to **bupropion**. [Moderate] Study

► **Bupropion** increases the risk of side-effects when given with **levodopa**. [Moderate] Study

► **Bupropion** is predicted to increase the risk of intraoperative hypertension when given with **linezolid**. [Severe] Anecdotal → Also see TABLE 13 p. 850

► **Methylthionium chloride** is predicted to increase the risk of severe hypertension when given with **bupropion**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850

► **Moclobemide** is predicted to increase the risk of severe hypertension when given with **bupropion**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850

► Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of severe hypertension when given with **bupropion**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850

► Monoamine-oxidase B inhibitors are predicted to increase the risk of severe hypertension when given with **bupropion**. Avoid. [Moderate] Theoretical → Also see TABLE 13 p. 850

► **Bupropion** is predicted to decrease the efficacy of opioids (**codeine**). [Moderate] Theoretical

► **Bupropion** is predicted to decrease the efficacy of opioids (**tramadol**). [Severe] Study → Also see TABLE 13 p. 850

► **Bupropion** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study

► **Rifampicin** is predicted to decrease the exposure to **bupropion**. [Moderate] Study

► **Bupropion** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study

► **Bupropion** is predicted to increase the exposure to SSRIs (**dapoxetine**). [Moderate] Theoretical → Also see TABLE 13 p. 850

► **Bupropion** is predicted to decrease the efficacy of **tamoxifen**. Avoid. [Severe] Study

► **Bupropion** is predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 13 p. 850

► **Bupropion** is predicted to increase the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 13 p. 850

Buspiron → see TABLE 13 p. 850 (serotonin syndrome)

► Antiarrhythmics (**dronedaron**) are predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study

► Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **bupirone**. Use with caution and adjust dose. [Severe] Study

► Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study

► Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **bupirone**. Adjust **bupirone** dose. [Severe] Study

► Antifungals, azoles (**miconazole**) are predicted to increase the concentration of **bupirone**. Use with caution and adjust dose. [Moderate] Theoretical

► **Aprepitant** is predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study

► Calcium channel blockers (**diltiazem**, **verapamil**) are predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study

► **Cobicistat** is predicted to increase the exposure to **bupirone**. Adjust **bupirone** dose. [Severe] Study

► **Crizotinib** is predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study

► **Enzalutamide** is predicted to decrease the exposure to **bupirone**. Use with caution and adjust dose. [Severe] Study

► **Grapefruit juice** increases the exposure to **bupirone**. Avoid. [Mild] Study

► HIV-protease inhibitors are predicted to increase the exposure to **bupirone**. Adjust **bupirone** dose. [Severe] Study

► **Idelalisib** is predicted to increase the exposure to **bupirone**. Adjust **bupirone** dose. [Severe] Study

► **Imatinib** is predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study

► **Bupirone** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850

► Macrolides (**clarithromycin**) are predicted to increase the exposure to **bupirone**. Adjust **bupirone** dose. [Severe] Study

► Macrolides (**erythromycin**) are predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study

► **Mitotane** is predicted to decrease the exposure to **bupirone**. Use with caution and adjust dose. [Severe] Study

► **Bupirone** is predicted to increase the risk of elevated blood pressure when given with **monoamine-oxidase A and B inhibitors**, irreversible. Avoid. [Severe] Anecdotal → Also see TABLE 13 p. 850

► **Netupitant** is predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study

► **Nilotinib** is predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study

► **Rifampicin** is predicted to decrease the exposure to **bupirone**. Use with caution and adjust dose. [Severe] Study

Busulfan → see alkylating agents

Cabazitaxel → see taxanes

Cabergoline → see dopamine receptor agonists

Cabozantinib → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)

► Antiarrhythmics (**dronedaron**) are predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849

► Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) moderately decrease the exposure to **cabozantinib**. Avoid. [Moderate] Study

► Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849

► Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) slightly increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 849

► **Aprepitant** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical

► **Bosentan** is predicted to decrease the exposure to **cabozantinib**. [Moderate] Theoretical

► Calcium channel blockers (**diltiazem**, **verapamil**) are predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical

- **Cobicistat** slightly increases the exposure to **cabozantinib**. [Moderate] Study
- **Cabozantinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- **Crizotinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- **Efavirenz** is predicted to decrease the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- **Enzalutamide** moderately decreases the exposure to **cabozantinib**. Avoid. [Moderate] Study
- **Grapefruit juice** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical
- **HIV-protease inhibitors** slightly increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 849
- **Idelalisib** slightly increases the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 15 p. 850
- **Imatinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- **Macrolides (clarithromycin)** slightly increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 849
- **Macrolides (erythromycin)** are predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- **Mitotane** moderately decreases the exposure to **cabozantinib**. Avoid. [Moderate] Study → Also see TABLE 15 p. 850
- **Netupitant** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical
- **Nevirapine** is predicted to decrease the exposure to **cabozantinib**. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- **Cabozantinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- **Rifampicin** moderately decreases the exposure to **cabozantinib**. Avoid. [Moderate] Study
- **St John's Wort** is predicted to decrease the exposure to **cabozantinib**. [Moderate] Theoretical

Caffeine citrate

- **Caffeine citrate** decreases the efficacy of **antiarrhythmics (adenosine)**. Separate administration by 24 hours. [Mild] Study
- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- **Leflunomide** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- **SSRIs (fluvoxamine)** markedly decrease the clearance of **caffeine citrate**. Monitor and adjust dose. [Severe] Study
- **Teriflunomide** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- **Caffeine citrate** decreases the clearance of **theophylline**. [Moderate] Study

Calcipotriol → see vitamin D substances

Calcitonin (salmon)

- **Calcitonin (salmon)** decreases the concentration of **lithium**. Monitor concentration and adjust dose. [Moderate] Study

Calcitriol → see vitamin D substances

Calcium acetate → see calcium salts

Calcium carbonate → see calcium salts

Calcium channel blockers → see TABLE 6 p. 848 (bradycardia), TABLE 8 p. 848 (hypotension)

amlodipine • clevidipine • diltiazem • felodipine • lacidipine • lercanidipine • nicardipine • nifedipine • nimodipine • verapamil

- **Verapamil** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose. [Severe] Study → Also see TABLE 8 p. 848

- **Verapamil** moderately increases the exposure to **aliskiren**. [Moderate] Study → Also see TABLE 8 p. 848
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical → Also see TABLE 8 p. 848
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **alprazolam**. [Severe] Study
- **Verapamil** moderately increases the exposure to **anthracyclines (doxorubicin)**. [Moderate] Study
- **Antiarrhythmics (disopyramide)** are predicted to increase the risk of cardiodepression when given with **verapamil**. [Severe] Theoretical
- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Study
- **Antiarrhythmics (amiodarone)** are predicted to increase the risk of cardiodepression when given with calcium channel blockers (**diltiazem, verapamil**). Avoid. [Severe] Theoretical → Also see TABLE 6 p. 848
- **Calcium channel blockers (diltiazem, verapamil)** increase the exposure to **antiarrhythmics (dronedarone)** and **antiarrhythmics (dronedarone)** increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [Moderate] Study
- **Verapamil** increases the risk of cardiodepression when given with **antiarrhythmics (flecainide)**. [Severe] Anecdotal → Also see TABLE 6 p. 848
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- **Calcium channel blockers (diltiazem, verapamil)** increase the risk of bradycardia when given with **anticholinesterases, centrally acting**. [Moderate] Anecdotal → Also see TABLE 6 p. 848
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Study
- **Diltiazem** increases the concentration of **antiepileptics (carbamazepine)** and **antiepileptics (carbamazepine)** are predicted to decrease the exposure to **diltiazem**. Monitor concentration and adjust dose. [Severe] Anecdotal
- **Verapamil** increases the concentration of **antiepileptics (carbamazepine)** and **antiepileptics (carbamazepine)** are predicted to decrease the exposure to **verapamil**. [Severe] Anecdotal
- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [Severe] Study
- **Calcium channel blockers (diltiazem, verapamil)** potentially increase the concentration of **antiepileptics (fosphenytoin, phenytoin)** and **antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [Severe] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **lercanidipine**. Avoid. [Severe] Study
- **Antifungals, azoles (miconazole)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, clevidipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil**). Use with caution and adjust dose. [Moderate] Theoretical
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole, voriconazole)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Study
- **Antifungals, azoles (fluconazole)** (high-dose) are predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [Moderate] Theoretical

- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the risk of ergotism when given with **ergometrine**. [\[Severe\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the risk of ergotism when given with **ergotamine**. [\[Severe\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **erlotinib**. [\[Moderate\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [\[Mild\]](#) Study
- ▶ **Verapamil** is predicted to increase the exposure to **fidaxomicin**. Avoid. [\[Moderate\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **figulimod**. Avoid. [\[Moderate\]](#) Theoretical → Also see [TABLE 6 p. 848](#)
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **gefinitinib**. [\[Moderate\]](#) Theoretical
- ▶ **Grapefruit juice** very slightly increases the exposure to **amlopidine**. Avoid. [\[Mild\]](#) Study
- ▶ **Grapefruit juice** increases the exposure to calcium channel blockers (**nifedipine, verapamil**). Avoid. [\[Mild\]](#) Study
- ▶ **Grapefruit juice** increases the exposure to **felodipine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **lercanidipine**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Grapefruit juice** increases the exposure to **nicardipine**. [\[Mild\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [\[Moderate\]](#) Theoretical → Also see [TABLE 8 p. 848](#)
- ▶ **H₂ receptor antagonists (cimetidine)** (high-dose) are predicted to increase the exposure to **lercanidipine**. [\[Moderate\]](#) Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** moderately increase the exposure to **nifedipine**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **verapamil**. [\[Moderate\]](#) Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to calcium channel blockers (**diltiazem, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to calcium channel blockers (**amlopidine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **lercanidipine**. Avoid. [\[Severe\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to calcium channel blockers (**amlopidine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **lercanidipine**. Avoid. [\[Severe\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **imatinitib**. [\[Moderate\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to calcium channel blockers (**amlopidine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ivabradine**. Avoid. [\[Moderate\]](#) Study → Also see [TABLE 6 p. 848](#)
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [\[Severe\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the risk of neurotoxicity when given with **lithium**. [\[Severe\]](#) Anecdotal
- ▶ Calcium channel blockers (**amlopidine, lacidipine**) are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **lomitapide**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **lurasidone**. [\[Moderate\]](#) Study → Also see [TABLE 8 p. 848](#)
- ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **lercanidipine**. Avoid. [\[Severe\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **diltiazem**. [\[Severe\]](#) Theoretical
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **verapamil**. [\[Severe\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to calcium channel blockers (**amlopidine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to calcium channel blockers (**amlopidine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
- ▶ Intravenous **magnesium** potentially increases the risk of hypotension when given with calcium channel blockers (**amlopidine, cleveldipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil**) (in pregnant women). [\[Severe\]](#) Anecdotal
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [\[Severe\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **midostaurin**. [\[Moderate\]](#) Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to calcium channel blockers (**amlopidine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to calcium channel blockers. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [\[Moderate\]](#) Study
- ▶ **Netupitant** is predicted to increase the exposure to calcium channel blockers (**amlopidine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Nevirapine** is predicted to decrease the exposure to calcium channel blockers (**amlopidine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Moderate\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **nilotinib**. [\[Moderate\]](#) Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to calcium channel blockers (**amlopidine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Verapamil** is predicted to increase the exposure to **nintedanib**. [\[Moderate\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [\[Moderate\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [\[Moderate\]](#) Study → Also see [TABLE 6 p. 848](#)

Calcium channel blockers (continued)

- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **opioids (methadone, sufentanil)**. [\[Moderate\]](#) Theoretical → Also see [TABLE 6 p. 848](#)
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **oxybutynin**. [\[Mild\]](#) Theoretical
- Verapamil** is predicted to increase the exposure to **panobinostat**. Adjust dose. [\[Moderate\]](#) Theoretical
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **pazopanib**. [\[Moderate\]](#) Theoretical
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose. [\[Moderate\]](#) Theoretical → Also see [TABLE 8 p. 848](#)
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4. p. 120. [\[Moderate\]](#) Study → Also see [TABLE 8 p. 848](#)
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [\[Severe\]](#) Theoretical → Also see [TABLE 8 p. 848](#)
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [\[Severe\]](#) Theoretical → Also see [TABLE 8 p. 848](#)
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see [TABLE 8 p. 848](#)
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **quetiapine**. Avoid. [\[Moderate\]](#) Study → Also see [TABLE 8 p. 848](#)
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ranolazine**. [\[Severe\]](#) Study
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ribociclib**. [\[Moderate\]](#) Study
- Rifampicin** is predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- Rifampicin** greatly decreases the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
- Rifampicin** moderately decreases the exposure to **nifedipine**. Avoid. [\[Severe\]](#) Study
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **roxolitinib**. [\[Moderate\]](#) Theoretical
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- Calcium channel blockers (**diltiazem, verapamil**) increase the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate inhibitors of CYP3A4. [\[Moderate\]](#) Theoretical
- St John's Wort** is predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- St John's Wort** is predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Moderate\]](#) Theoretical
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [\[Severe\]](#) Study
- Amlodipine** slightly increases the exposure to **statins (simvastatin)**. Adjust **simvastatin** dose. p. 134. [\[Mild\]](#) Study
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **statins (simvastatin)**. Use with caution and adjust **simvastatin** dose. p. 134. [\[Severe\]](#) Study
- Sulfapyrazone** decreases the exposure to **verapamil**. [\[Moderate\]](#) Study
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **sunitinib**. [\[Moderate\]](#) Theoretical

- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of **tacrolimus**. [\[Severe\]](#) Study
- Nicardipine** potentially increases the concentration of **tacrolimus**. Monitor concentration and adjust dose. [\[Severe\]](#) Anecdotal
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **taxanes (cabazitaxel)**. [\[Moderate\]](#) Theoretical
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of **temsirolimus**. [\[Moderate\]](#) Theoretical
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **tofacitinib**. [\[Moderate\]](#) Study
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **tolterodine**. [\[Mild\]](#) Theoretical
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **tolvaptan**. Adjust dose. [\[Moderate\]](#) Study
- Verapamil** is predicted to increase the exposure to **topotecan**. [\[Severe\]](#) Study
- Verapamil** is predicted to increase the concentration of **trametinib**. [\[Moderate\]](#) Theoretical
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **trazodone**. [\[Moderate\]](#) Theoretical
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [\[Moderate\]](#) Study
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [\[Severe\]](#) Study
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **vinca alkaloids**. [\[Severe\]](#) Theoretical
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **zopiclone**. Adjust dose. [\[Moderate\]](#) Study

Calcium chloride → see calcium salts

Calcium gluconate → see calcium salts

Calcium lactate → see calcium salts

Calcium phosphate → see calcium salts

Calcium salts

calcium acetate • calcium carbonate • calcium chloride • calcium gluconate • calcium lactate • calcium phosphate

SEPARATION OF ADMINISTRATION Calcium carbonate-containing antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- Oral calcium salts decrease the absorption of **alkylating agents (estramustine)**. [\[Severe\]](#) Study
- Calcium carbonate decreases the absorption of **antimalarials (chloroquine)**. Separate administration by at least 4 hours. [\[Moderate\]](#) Study
- Calcium carbonate is predicted to decrease the absorption of **antimalarials (proguanil)**. Separate administration by at least 2 hours. [\[Moderate\]](#) Study
- Oral calcium salts decrease the absorption of **bisphosphonates (alendronic acid)**. Alendronic acid should be taken at least 30 minutes before calcium salts. [\[Moderate\]](#) Study
- Oral calcium salts are predicted to decrease the absorption of oral **bisphosphonates (ibandronic acid)**. Avoid calcium salts for at least 6 hours before or 1 hour after **ibandronic acid**. [\[Moderate\]](#) Theoretical
- Oral calcium salts decrease the absorption of **bisphosphonates (risedronate)**. Separate administration by at least 2 hours. [\[Moderate\]](#) Study
- Oral calcium salts decrease the absorption of **bisphosphonates (sodium clodronate)**. Avoid calcium salts for 2 hours before or 1 hour after **sodium clodronate**. [\[Moderate\]](#) Study
- Cephalosporins (ceftriaxone)** increase the risk of cardio-respiratory arrest when given with calcium chloride. Avoid. [\[Severe\]](#) Anecdotal
- Cephalosporins (ceftriaxone)** increase the risk of cardio-respiratory arrest when given with intravenous **calcium gluconate**. Avoid. [\[Severe\]](#) Anecdotal

- ▶ Intravenous **calcium salts** increase the concentration of **digoxin**. Avoid. [Moderate] Anecdotal
- ▶ Oral **calcium salts** decrease the absorption of **dolutegravir**. **Dolutegravir** should be taken 2 hours before or 6 hours after **calcium salts**. [Moderate] Study
- ▶ Oral **calcium salts** decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **calcium salts**. [Severe] Study
- ▶ **Calcium carbonate** decreases the absorption of **hydroxychloroquine**. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Calcium carbonate** decreases the absorption of **iron (oral)**. **Calcium carbonate** should be taken 1 hour before or 2 hours after **iron (oral)**. [Moderate] Study
- ▶ **Calcium carbonate** is predicted to decrease the exposure to **ledipasvir**. Separate administration by 4 hours. [Moderate] Theoretical
- ▶ **Calcium carbonate** decreases the absorption of **quinolones (ciprofloxacin)**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Calcium carbonate** decreases the absorption of **quinolones (norfloxacin)**. **Norfloxacin** should be taken 2 hours before or 4 hours after **calcium carbonate**. [Moderate] Study
- ▶ **Calcium carbonate** greatly decreases the exposure to **raltegravir** (high-dose). Avoid. [Severe] Study
- ▶ **Calcium carbonate** is predicted to slightly decrease the exposure to **rilpivirine**. **Calcium carbonate** should be taken 2 hours before or 4 hours after **rilpivirine**. [Severe] Theoretical
- ▶ **Calcium carbonate** is predicted to decrease the absorption of **tetracyclines**. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- ▶ **Thiazide diuretics** increase the risk of hypercalcaemia when given with **calcium salts**. [Severe] Anecdotal
- ▶ Oral **calcium salts** are predicted to decrease the absorption of **thyroid hormones (levothyroxine)**. Separate administration by at least 4 hours. [Moderate] Anecdotal
- ▶ **Calcium carbonate** is predicted to decrease the concentration of **velpatasvir**. Separate administration by 4 hours. [Moderate] Anecdotal
- ▶ Oral **calcium salts** decrease the absorption of **zinc**. [Moderate] Study
- Canagliflozin** → see TABLE 14 p. 850 (antidiabetic drugs), TABLE 8 p. 848 (hypotension)
- ▶ **Rifampicin** moderately decreases the exposure to **canagliflozin**. Adjust **canagliflozin** dose. [Moderate] Study
- Canakinumab** → see monoclonal antibodies
- Candesartan** → see angiotensin-II receptor antagonists
- Cangrelor** → see TABLE 4 p. 847 (antiplatelet effects)
- Cannabis extract** → see TABLE 11 p. 849 (CNS depressant effects)
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **cannabis extract**. Avoid. [Severe] Theoretical → Also see TABLE 11 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **cannabis extract**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **cannabis extract**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **cannabis extract**. Avoid. [Severe] Theoretical
- Capecitabine** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Allopurinol** is predicted to decrease the effects of **capecitabine**. Avoid. [Severe] Study

- ▶ **Capecitabine** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. [Severe] Anecdotal
- ▶ **Capecitabine** increases the effects of **coumarins**. Monitor INR and adjust dose. [Moderate] Anecdotal
- ▶ **Folates** are predicted to increase the risk of toxicity when given with **capecitabine**. [Severe] Anecdotal
- ▶ **H₂ receptor antagonists (cimetidine)** are predicted to slightly increase the exposure to **capecitabine**. [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **capecitabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Metronidazole** is predicted to increase the risk of **capecitabine** toxicity when given with **capecitabine**. [Severe] Theoretical
- Capreomycin** → see TABLE 2 p. 847 (nephrotoxicity), TABLE 19 p. 851 (ototoxicity)

Captopril → see ACE inhibitors

Carbamazepine → see antiepileptics

Carbapenems

ertapenem • imipenem • meropenem

- ▶ **Carbapenems** decrease the concentration of **antiepileptics (valproate)**. Avoid. [Severe] Anecdotal
- ▶ **Ganciclovir** is predicted to increase the risk of seizures when given with **imipenem**. Avoid. [Severe] Anecdotal
- ▶ **Valganciclovir** is predicted to increase the risk of seizures when given with **imipenem**. Avoid. [Severe] Anecdotal

Carbidopa

- ▶ **Iron (oral)** is predicted to decrease the exposure to **carbidopa**. [Moderate] Theoretical

Carbimazole → see TABLE 15 p. 850 (myelosuppression)

- ▶ **Carbimazole** affects the concentration of **digoxin**. Monitor and adjust dose. [Moderate] Theoretical

- ▶ **Carbimazole** decreases the effects of **metypapone**. Avoid. [Moderate] Theoretical

Carboplatin → see platinum compounds

Carfilzomib → see TABLE 15 p. 850 (myelosuppression)

Carmustine → see alkylating agents

Carvedilol → see beta blockers, non-selective

Caspofungin

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenytoin**) are predicted to decrease the concentration of **caspofungin**. Adjust **caspofungin** dose, p. 372. [Moderate] Theoretical
- ▶ **Ciclosporin** slightly increases the exposure to **caspofungin**. [Severe] Study
- ▶ **Corticosteroids (dexamethasone)** are predicted to decrease the concentration of **caspofungin**. Adjust **caspofungin** dose, p. 372. [Moderate] Theoretical
- ▶ **Efavirenz** is predicted to decrease the concentration of **caspofungin**. Adjust dose. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **caspofungin**. Adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the concentration of **caspofungin**. Adjust **caspofungin** dose, p. 372. [Moderate] Study

Cefaclor → see cephalosporins

Cefadroxil → see cephalosporins

Cefalexin → see cephalosporins

Cefixime → see cephalosporins

Cefotaxime → see cephalosporins

Cefradine → see cephalosporins

Ceftaroline → see cephalosporins

Ceftazidime → see cephalosporins

Ceftobiprole → see cephalosporins

Ceftolozane → see cephalosporins

Ceftriaxone → see cephalosporins

Cefuroxime → see cephalosporins

Celecoxib → see NSAIDs

Celiprolol → see beta blockers, selective

Cephalosporins → see TABLE 2 p. 847 (nephrotoxicity)

cefaclor • cefadroxil • cefalexin • cefixime • cefotaxime • cefradine • ceftaroline • ceftazidime • ceftobiprole • ceftolozane • ceftriaxone • cefuroxime

- ▶ **Ceftobiprole** is predicted to increase the exposure to **bosentan**. [Moderate] Theoretical

Cephalosporins (continued)

- ▶ **Ceftriaxone** increases the risk of cardio-respiratory arrest when given with **calcium salts** (**calcium chloride**). Avoid. [Severe] Anecdotal
- ▶ **Ceftriaxone** increases the risk of cardio-respiratory arrest when given with intravenous **calcium salts** (**calcium gluconate**). Avoid. [Severe] Anecdotal
- ▶ **Ceftriaxone** potentially increases the risk of bleeding events when given with **coumarins**. [Severe] Anecdotal
- ▶ **Ceftriaxone** potentially increases the risk of bleeding events when given with **phenindione**. [Severe] Anecdotal
- ▶ **Ceftobiprole** is predicted to increase the concentration of **statins**. [Moderate] Theoretical
- ▶ **Ceftobiprole** is predicted to increase the concentration of **sulfonylureas** (**glibenclamide**). [Moderate] Theoretical
- Ceritinib** → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)
- ▶ **Ceritinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical
- ▶ **Antacids** are predicted to decrease the absorption of **ceritinib**. Separate administration by 2 hours. [Moderate] Theoretical
- ▶ **Antiarrhythmics** (**amiodarone**, **dronedarone**) are predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles** (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles** (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Ceritinib** is predicted to increase the exposure to **antihistamines, non-sedating** (**fexofenadine**). [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical
- ▶ **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **ciclosporin**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose. [Severe] Study
- ▶ **Ceritinib** is predicted to increase the exposure to **colchicine**. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **coumarins** (**warfarin**). Avoid. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Ceritinib** is predicted to increase the exposure to **dabigatran**. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the risk of bradycardia when given with **digoxin**. Avoid. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **edoxaban**. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study
- ▶ **Ceritinib** is predicted to increase the exposure to **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **everolimus**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ceritinib**. Avoid. [Severe] Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **ceritinib**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850

- ▶ **Lapatinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Ceritinib** is predicted to increase the exposure to **loperamide**. [Moderate] Theoretical
- ▶ **Macrolides** (**azithromycin**, **erythromycin**) are predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Macrolides** (**clarithromycin**) are predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Mitotane** is predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Netupitant** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Ceritinib** is predicted to increase the exposure to **NSAIDs** (**celecoxib**, **diclofenac**). Adjust dose. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **opioids** (**alfentanil**, **fentanyl**). Avoid. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **ceritinib**. [Moderate] Theoretical
- ▶ **Ranolazine** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Rifampicin** is predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study
- ▶ **Ceritinib** is predicted to increase the exposure to **sirolimus**. Avoid. [Severe] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **sulfonylureas** (**glimepiride**). Adjust dose. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **tacrolimus**. Avoid. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **taxanes** (**paclitaxel**). [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Ceritinib** is predicted to increase the exposure to **topotecan**. [Moderate] Theoretical → Also see TABLE 15 p. 850

Certolizumab pegol → see monoclonal antibodies

Cetirizine → see antihistamines, non-sedating

Cetuximab → see monoclonal antibodies

Chenodeoxycholic acid

- ▶ Oral **antacids** (**aluminium hydroxide**) decrease the absorption of **chenodeoxycholic acid**. [Moderate] Study
- ▶ **Antiepileptics** (**phenobarbital**, **primidone**) are predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Ciclosporin** is predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Oral **combined hormonal contraceptives** potentially decrease the efficacy of **chenodeoxycholic acid**. Avoid. [Moderate] Theoretical
- ▶ **Sirolimus** is predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [Moderate] Theoretical

Chloral hydrate → see TABLE 11 p. 849 (CNS depressant effects)

- ▶ Intravenous **loop diuretics** (**furosemide**) potentially increase the risk of sweating, variable blood pressure, and tachycardia when given after **chloral hydrate**. [Moderate] Anecdotal

Chlorambucil → see alkylating agents

Chloramphenicol

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Antiepileptics** (**phenobarbital**, **primidone**) decrease the concentration of **chloramphenicol**. [Moderate] Study
- ▶ Intravenous **chloramphenicol** increases the concentration of **antiepileptics** (**fosphenytoin**, **phenytoin**) and **antiepileptics** (**fosphenytoin**, **phenytoin**) affect the concentration of intravenous **chloramphenicol**. Monitor concentration and adjust dose. [Severe] Study

- ▶ **Chloramphenicol** potentially increases the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ **Chloramphenicol** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Chloramphenicol** decreases the efficacy of intravenous **iron (injectable)**. [Moderate] Anecdotal
- ▶ **Chloramphenicol** decreases the efficacy of oral **iron (oral)**. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the concentration of **chloramphenicol**. [Moderate] Study
- ▶ **Chloramphenicol** is predicted to increase the exposure to **sulfonyleureas**. [Severe] Study
- ▶ **Chloramphenicol** increases the concentration of **tacrolimus**. [Severe] Study
- Chlordiazepoxide** → see TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Chlordiazepoxide** affects the concentration of **antiepileptics (phenytoin, phenytoin)**. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **chlordiazepoxide**. [Moderate] Theoretical
- Chloroquine** → see antimalarials
- Chlorothiazide** → see TABLE 18 p. 851 (hyponatraemia), TABLE 8 p. 848 (hypotension), TABLE 17 p. 851 (reduced serum potassium)
- Chlorphenamine** → see antihistamines, sedating
- Chlorpromazine** → see phenothiazines
- Chlortalidone** → see thiazide diuretics
- Cholera vaccine**
 - ▶ **Antimalarials (chloroquine)** decrease the efficacy of oral **cholera vaccine**. [Moderate] Study
 - ▶ **Hydroxylchloroquine** is predicted to decrease the efficacy of oral **cholera vaccine**. [Moderate] Theoretical
- Cholic acid**
 - ▶ **Antacids** are predicted to decrease the absorption of **cholic acid**. Separate administration by 5 hours. [Mild] Theoretical
 - ▶ **Antiepileptics (phenobarbital)** decrease the effects of **cholic acid**. Avoid. [Moderate] Study
 - ▶ **Ciclosporin** affects the concentration of **cholic acid**. Avoid. [Moderate] Study
- Choline salicylate**
 - ▶ **Corticosteroids** are predicted to decrease the concentration of **choline salicylate**. [Moderate] Study
- Ciclesonide** → see corticosteroids
- Ciclosporin** → see TABLE 2 p. 847 (nephrotoxicity), TABLE 16 p. 851 (increased serum potassium)

- ▶ Pomelo juice is predicted to increase ciclosporin exposure, and purple grape juice is predicted to decrease ciclosporin exposure.
 - ▶ Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
- ▶ **Ciclosporin** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Ciclosporin** markedly increases the exposure to **aliskiren**. Avoid. [Severe] Study → Also see TABLE 16 p. 851
- ▶ **Ciclosporin** moderately increases the exposure to **ambrisentan**. Adjust **ambrisentan** dose. [Moderate] Study
- ▶ **Ciclosporin** increases the concentration of **anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone)**. [Severe] Study
- ▶ **Antiarrhythmics (amiodarone)** increase the concentration of **ciclosporin**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Antiarrhythmics (dronedrone)** increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Ciclosporin** increases the exposure to **antiarrhythmics (dronedrone)**. Avoid. [Severe] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the concentration of **ciclosporin**. [Severe] Study
- ▶ **Antiepileptics (oxcarbazepine)** decrease the concentration of **ciclosporin**. [Severe] Anecdotal
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Antifungals, azoles (miconazole)** increase the concentration of **ciclosporin**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Aprepitant** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [Moderate] Study
- ▶ **Bosentan** moderately decreases the exposure to **ciclosporin** and **ciclosporin** moderately increases the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, nifedipine, verapamil)** increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Ciclosporin** moderately increases the exposure to **calcium channel blockers (lercanidipine)**. Use with caution or avoid. [Severe] Study
- ▶ **Ciclosporin** slightly increases the exposure to **caspofungin**. [Severe] Study
- ▶ **Ceritinib** is predicted to increase the exposure to **ciclosporin**. Avoid. [Severe] Theoretical
- ▶ **Ciclosporin** is predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Ciclosporin** affects the concentration of **cholic acid**. Avoid. [Moderate] Study
- ▶ **Cobicistat** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Ciclosporin** increases the exposure to **colchicine**. Avoid or adjust **colchicine** dose. [Severe] Study
- ▶ **Crizotinib** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **dabigatran**. Avoid. [Severe] Theoretical
- ▶ **Danazol** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Ciclosporin** is predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **darifenacin**. Avoid. [Moderate] Theoretical
- ▶ **Ciclosporin** increases the concentration of **digoxin**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Ciclosporin** slightly increases the exposure to **edoxaban**. Adjust **edoxaban** dose. [Severe] Study
- ▶ **Efavirenz** decreases the concentration of **ciclosporin**. Monitor concentration and adjust dose. [Moderate] Study
- ▶ **Ciclosporin** increases the exposure to **eluxadoline**. Avoid. [Moderate] Study
- ▶ **Enzalutamide** decreases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Ciclosporin** increases the exposure to **etoposide**. Monitor and adjust dose. [Severe] Study
- ▶ **Ciclosporin** moderately increases the exposure to **everolimus**. Avoid or adjust dose. [Severe] Study
- ▶ **Ciclosporin** moderately increases the exposure to **ezetimibe** and **ezetimibe** slightly increases the exposure to **ciclosporin**. [Moderate] Study
- ▶ **Fibrates (bezafibrate)** are predicted to increase the risk of nephrotoxicity when given with **ciclosporin**. [Severe] Theoretical
- ▶ **Fibrates (fenofibrate)** increase the risk of nephrotoxicity when given with **ciclosporin**. [Severe] Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Ciclosporin** increases the exposure to **glecaprevir**. Avoid or monitor. [Severe] Study
- ▶ **Grapefruit juice** increases the concentration of **ciclosporin**. Avoid. [Severe] Study
- ▶ **Ciclosporin** greatly increases the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of **ciclosporin**. [Mild] Study
- ▶ **HIV-protease inhibitors** increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Idelalisib** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Imatinib** increases the concentration of **ciclosporin**. [Severe] Study

Cyclosporin (continued)

- ▶ **Lanreotide** is predicted to decrease the absorption of oral cyclosporin. Adjust dose. [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cyclosporin. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Cyclosporin** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to cyclosporin. Avoid. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin, erythromycin)** increase the concentration of cyclosporin. [Severe] Study
- ▶ **Cyclosporin** is predicted to decrease the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** decreases the concentration of cyclosporin. [Severe] Study
- ▶ **Monoclonal antibodies (blinatumomab)** are predicted to transiently increase the exposure to cyclosporin. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (sarilumab)** potentially affect the exposure to cyclosporin. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to cyclosporin. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Netupitant** increases the concentration of cyclosporin. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of cyclosporin. [Moderate] Study
- ▶ **Nilotinib** increases the concentration of cyclosporin. [Severe] Study
- ▶ **Cyclosporin** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Cyclosporin** increases the concentration of **NSAIDs (diclofenac)**. [Severe] Study → Also see TABLE 2 p. 847 → Also see TABLE 16 p. 851
- ▶ **Octreotide** decreases the absorption of oral cyclosporin. Adjust cyclosporin dose, p. 519. [Severe] Anecdotal
- ▶ **Palbociclib** is predicted to increase the exposure to cyclosporin. Adjust dose. [Moderate] Theoretical
- ▶ **Cyclosporin** is predicted to increase the exposure to **panobinostat**. Adjust dose. [Moderate] Theoretical
- ▶ **Pasireotide** is predicted to decrease the absorption of oral cyclosporin. Adjust dose. [Severe] Theoretical
- ▶ **Cyclosporin** increases the exposure to **pibrentasvir**. Avoid or monitor. [Severe] Study
- ▶ **Pitolisant** is predicted to decrease the exposure to cyclosporin. Avoid. [Severe] Theoretical
- ▶ **Cyclosporin** is predicted to increase the concentration of **ranolazine** and **ranolazine** is predicted to increase the concentration of cyclosporin. [Moderate] Theoretical
- ▶ **Cyclosporin** moderately increases the exposure to **repaglinide**. [Moderate] Study
- ▶ **Ribociclib** is predicted to increase the exposure to cyclosporin. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the concentration of cyclosporin. [Severe] Study
- ▶ **Cyclosporin** very markedly increases the exposure to **rifaximin**. [Severe] Study
- ▶ **Cyclosporin** is predicted to increase the exposure to **riociguat**. [Moderate] Theoretical
- ▶ **Cyclosporin** moderately increases the exposure to **sirolimus**. Separate administration by 4 hours. [Severe] Study
- ▶ **St John's Wort** decreases the concentration of cyclosporin. Avoid. [Moderate] Study
- ▶ **Cyclosporin** very markedly increases the exposure to **statins (atorvastatin)**. Avoid or adjust atorvastatin dose, p. 132. [Severe] Study
- ▶ **Cyclosporin** moderately increases the exposure to **statins (fluvastatin)**. [Severe] Study
- ▶ **Cyclosporin** markedly to very markedly increases the exposure to **statins (pravastatin)**. Adjust dose. [Severe] Study
- ▶ **Cyclosporin** markedly increases the exposure to **statins (rosuvastatin, simvastatin)**. Avoid. [Severe] Study

- ▶ **Sulfinpyrazole** decreases the concentration of cyclosporin. [Severe] Study
- ▶ **Cyclosporin** increases the concentration of **tacrolimus**. Avoid. [Severe] Study → Also see TABLE 2 p. 847 → Also see TABLE 16 p. 851
- ▶ **Cyclosporin** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study
- ▶ **Cyclosporin** increases the exposure to **tofacitinib**. Avoid. [Severe] Study
- ▶ **Cyclosporin** is predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Cyclosporin** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Ursodeoxycholic acid** affects the concentration of cyclosporin. Use with caution and adjust dose. [Severe] Anecdotal
- ▶ **Cyclosporin** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
- ▶ **Vitamin E substances** affect the exposure to cyclosporin. [Moderate] Study
- ▶ **Cyclosporin** increases the concentration of **voxilaprevir**. Avoid. [Severe] Study

Cilostazol → see TABLE 4 p. 847 (antiplatelet effects)

GENERAL INFORMATION Concurrent use with 2 or more antiplatelets or anticoagulants is contra-indicated.

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to alter the effects of cilostazol. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole)** are predicted to increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to cilostazol. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to alter the effects of cilostazol. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Study
- ▶ **Cilostazol** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Study
- ▶ **Macrolides (erythromycin)** slightly increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Study
- ▶ **Mitotane** is predicted to alter the effects of cilostazol. [Moderate] Theoretical
- ▶ **Moclobemide** is predicted to increase the exposure to cilostazol. [Moderate] Theoretical
- ▶ **Proton pump inhibitors (esomeprazole)** are predicted to increase the exposure to cilostazol. [Moderate] Theoretical
- ▶ **Proton pump inhibitors (omeprazole)** are predicted to increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to alter the effects of cilostazol. [Moderate] Theoretical
- ▶ **SSRIs (fluoxetine, fluvoxamine)** are predicted to increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Theoretical → Also see TABLE 4 p. 847
- ▶ **St John's Wort** is predicted to alter the effects of cilostazol. [Moderate] Theoretical

Cimetidine → see H₂ receptor antagonists**Cinacalcet**

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment.

- ▶ **Cinacalcet** is predicted to increase the exposure to anticholinesterases, centrally acting (**galantamine**). Monitor and adjust dose. [Moderate] Study

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Cinacalcet** is predicted to moderately increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 249. [Moderate] Study
- ▶ **Cinacalcet** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
- ▶ **Cinacalcet** is predicted to increase the exposure to **beta blockers**, selective (**metoprolol**, **nebivolol**). [Moderate] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Cinacalcet** is predicted to slightly increase the exposure to **darifenacin**. [Mild] Study
- ▶ **Cinacalcet** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
- ▶ **Cinacalcet** increases the risk of hypocalcaemia when given with **etelcalcetide**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Macrolides** (**clarithromycin**) are predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
- ▶ **Cinacalcet** is predicted to decrease the efficacy of **opioids** (**codeine**). [Moderate] Theoretical
- ▶ **Cinacalcet** is predicted to decrease the efficacy of **opioids** (**tramadol**). [Severe] Study
- ▶ **Cinacalcet** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
- ▶ **Cinacalcet** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
- ▶ **SSRIs** (**fluvoxamine**) are predicted to increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Theoretical
- ▶ **Cinacalcet** is predicted to increase the exposure to **SSRIs** (**dapoxetine**). [Moderate] Theoretical
- ▶ **Cinacalcet** is predicted to decrease the efficacy of **tamoxifen**. Avoid. [Severe] Study
- ▶ **Cinacalcet** is predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [Severe] Study
- ▶ **Cinacalcet** is predicted to increase the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study

Cinnarizine → see antihistamines, sedating

Ciprofibrate → see fibrates

Ciprofloxacin → see quinolones

Cisatracurium → see neuromuscular blocking drugs, non-depolarising

Cisplatin → see platinum compounds

Citalopram → see SSRIs

Cladribine → see TABLE 15 p. 850 (myelosuppression)

SEPARATION OF ADMINISTRATION Oral cladribine might affect the absorption of concurrently administered drugs—consider separating administration by at least 3 hours.

- ▶ Antiepileptics (**carbamazepine**) are predicted to increase the risk of haematological toxicity when given with oral **cladribine**. [Moderate] Theoretical

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **cladribine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Clarithromycin → see macrolides

Clavulanic acid → see TABLE 1 p. 847 (hepatotoxicity)

Clemastine → see antihistamines, sedating

Clevidipine → see calcium channel blockers

Clindamycin

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Clindamycin** increases the effects of **neuromuscular blocking drugs**, non-depolarising. [Severe] Anecdotal
- ▶ **Clindamycin** increases the effects of **suxamethonium**. [Severe] Anecdotal
- ▶ **Clobazam** → see TABLE 11 p. 849 (CNS depressant effects)
- ▶ Antiepileptics (**stiripentol**) increase the concentration of **clobazam**. [Severe] Study
- ▶ **Clobazam** potentially affects the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). [Severe] Anecdotal
- ▶ Antifungals, azoles (**fluconazole**, **voriconazole**) potentially increase the exposure to **clobazam**. Adjust dose. [Moderate] Theoretical
- ▶ **Moclobemide** potentially increases the exposure to **clobazam**. Adjust dose. [Moderate] Theoretical
- ▶ **Proton pump inhibitors** (**esomeprazole**, **omeprazole**) potentially increase the exposure to **clobazam**. Adjust dose. [Moderate] Theoretical
- ▶ **SSRIs** (**fluoxetine**, **fluvoxamine**) potentially increase the exposure to **clobazam**. Adjust dose. [Moderate] Theoretical
- ▶ **Clofarabine** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **clofarabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Clofazimine**
- ▶ **Clofazimine** potentially increases the risk of QT-prolongation when given with **bedaquiline**. [Severe] Study
- ▶ **Clomethiazole** → see TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Alcohol** (**beverage**) causes serious, potentially fatal, CNS depression when given with **clomethiazole**. Avoid. [Severe] Study → Also see TABLE 11 p. 849
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) decrease the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Enzalutamide** decreases the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** decreases the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study
- ▶ **Clomipramine** → see tricyclic antidepressants
- ▶ **Clonazepam** → see TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Clonazepam** potentially affects the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). [Severe] Anecdotal
- ▶ **Clonidine** → see TABLE 6 p. 848 (bradycardia), TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Tricyclic antidepressants** decrease the antihypertensive effects of **clonidine**. Monitor and adjust dose. [Moderate] Anecdotal → Also see TABLE 8 p. 848
- ▶ **Clopamide** → see thiazide diuretics
- ▶ **Clopidogrel** → see TABLE 4 p. 847 (antiplatelet effects)
- ▶ Antifungals, azoles (**fluconazole**) are predicted to decrease the efficacy of **clopidogrel**. Avoid. [Severe] Theoretical
- ▶ Antifungals, azoles (**voriconazole**) are predicted to decrease the efficacy of **clopidogrel**. Avoid. [Moderate] Study
- ▶ **Clopidogrel** is predicted to increase the exposure to **dabrafenib**. [Moderate] Theoretical
- ▶ **Clopidogrel** moderately increases the exposure to **enzalutamide**. Avoid or adjust **enzalutamide** dose. [Severe] Study
- ▶ **Grapefruit juice** markedly decreases the exposure to **clopidogrel**. [Severe] Study
- ▶ **Moclobemide** is predicted to decrease the efficacy of **clopidogrel**. Avoid. [Moderate] Study
- ▶ **Clopidogrel** is predicted to moderately increase the exposure to **montelukast**. [Moderate] Study
- ▶ **Clopidogrel** increases the exposure to **pioglitazone**. Monitor blood glucose and adjust dose. [Severe] Study
- ▶ **Proton pump inhibitors** (**esomeprazole**, **omeprazole**) are predicted to decrease the efficacy of **clopidogrel**. Avoid. [Moderate] Study

Clopidogrel (continued)

- ▶ **Clopidogrel** increases the exposure to **repaglinide**. Avoid. [Severe] Study
- ▶ **Clopidogrel** is predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust alitretinoin dose. [Moderate] Theoretical
- ▶ **Clopidogrel** is predicted to increase the exposure to **selexipag**. Adjust dose. [Moderate] Study
- ▶ **SSRIs (fluoxetine, fluvoxamine)** are predicted to decrease the efficacy of clopidogrel. Avoid. [Severe] Theoretical → Also see TABLE 4 p. 847
- ▶ **Clopidogrel** increases the exposure to **statins (rosuvastatin)**. Adjust rosuvastatin dose, p. 133. [Moderate] Study
- ▶ **Clopidogrel** is predicted to increase the concentration of **taxanes (paclitaxel)**. [Severe] Anecdotal

Clotrimazole → see antifungals, azoles

Clozapine → see TABLE 8 p. 848 (hypotension), TABLE 15 p. 850 (myelosuppression), TABLE 11 p. 849 (CNS depressant effects), TABLE 10 p. 849 (antimuscarinics)

- ▶ Dose adjustment might be necessary if smoking started or stopped during treatment.
- ▶ Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.

- ▶ **Antiepileptics (carbamazepine)** are predicted to increase the risk of myelosuppression when given with **clozapine**. Avoid. [Severe] Anecdotal
- ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **clozapine**. [Moderate] Anecdotal → Also see TABLE 11 p. 849
- ▶ **Combined hormonal contraceptives** increase the concentration of **clozapine**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Clozapine** is predicted to decrease the effects of **dopamine receptor agonists**. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 10 p. 849
- ▶ **Enzalutamide** is predicted to decrease the exposure to **clozapine**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to affect the exposure to **clozapine**. Avoid. [Severe] Theoretical
- ▶ **Iron chelators (deferasirox)** are predicted to increase the exposure to **clozapine**. Avoid. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to decrease the exposure to **clozapine**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Clozapine** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Macrolides (erythromycin)** potentially increase the risk of toxicity when given with **clozapine**. [Severe] Anecdotal
- ▶ **Quinolones (ciprofloxacin)** increase the concentration of **clozapine**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Rifampicin** decreases the exposure to **clozapine**. [Severe] Anecdotal
- ▶ **SSRIs (fluvoxamine)** increase the concentration of **clozapine**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Teriflunomide** is predicted to decrease the exposure to **clozapine**. [Moderate] Theoretical

Co-trimoxazole → see sulfonamides

Cobicistat

- ▶ **Cobicistat** is predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Severe] Study
- ▶ **Cobicistat** increases the exposure to **almotriptan**. [Mild] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **alpha blockers (doxazosin)**. [Moderate] Study
- ▶ **Cobicistat** moderately increases the exposure to **alprazolam**. Avoid. [Moderate] Study
- ▶ **Cobicistat** very markedly increases the exposure to **antiarrhythmics (dronedarone)**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **anticholinesterases, centrally acting (galantamine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Antiepileptics (oxcarbazepine)** are predicted to decrease the concentration of **cobicistat**. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to very slightly increase the exposure to **antiepileptics (perampanel)**. [Mild] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **antifungals, azoles (fluconazole, posaconazole)**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. Avoid or monitor side effects. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **antifungals, azoles (itraconazole, ketoconazole)**. Adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to affect the exposure to **antifungals, azoles (voriconazole)**. Avoid. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **aprepitant**. [Moderate] Study
- ▶ **Cobicistat** is predicted to slightly increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 249. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **beta₂ agonists (salmeterol)**. Avoid. [Severe] Study
- ▶ **Cobicistat** slightly increases the exposure to **bortezomib**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **buspirone**. Adjust buspirone dose. [Severe] Study
- ▶ **Cobicistat** slightly increases the exposure to **cabozantinib**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **calcium channel blockers (ercanidipine)**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **ceritinib**. Avoid or adjust ceritinib dose. [Severe] Study
- ▶ **Cobicistat** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **cilostazol**. Adjust cilostazol dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **colchicine**. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study
- ▶ **Cobicistat** is predicted to decrease the efficacy of **combined hormonal contraceptives**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **corticosteroids (beclometasone)** (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical

- ▶ **Cobicistat** is predicted to increase the exposure to corticosteroids (**betamethasone**, **budesonide**, **ciclesonide**, **deflazacort**, **dexamethasone**, **fludrocortisone**, **fluticasone**, **hydrocortisone**, **methylprednisolone**, **mometasone**, **prednisolone**, **prednisone**, **triamcinolone**). Avoid or monitor side effects. [Severe] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **crizotinib**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **dasatinib**. Avoid. [Severe] Study
- ▶ **Cobicistat** very slightly increases the exposure to **delamanid**. [Severe] Study
- ▶ **Cobicistat** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Cobicistat** increases the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Cobicistat** is predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. [Moderate] Theoretical
- ▶ **Efavirenz** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** slightly to moderately increases the exposure to **elbasvir**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **eletriptan**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to slightly increase the exposure to **erlotinib**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **fosaprepitant**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **gefitinib**. [Moderate] Study
- ▶ **Cobicistat** potentially increases the exposure to **glecaprevir**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **Cobicistat** is predicted to very markedly increase the exposure to **ibrutinib**. Avoid potent inhibitors of CYP3A4 or adjust **ibrutinib** dose. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** p. 186 or **lumacaftor** with **ivacaftor** p. 187 dose with potent inhibitors of CYP3A4. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **lurasidone**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **macitentan**. [Moderate] Study
- ▶ **Cobicistat** markedly increases the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **Cobicistat** is predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
- ▶ **Cobicistat** is predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **modafinil**. [Mild] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **monoclonal antibodies (trastuzumab emtansine)**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **netupitant**. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil)**. Monitor and adjust dose. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **oxybutynin**. [Mild] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **palbociclib**. Avoid or adjust **palbociclib** dose. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil, vardenafil)**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Avoid potent inhibitors of CYP3A4 or adjust **sildenafil** dose, p. 120. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. Use with caution or avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **praziquantel**. [Mild] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **quetiapine**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **ranolazine**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **reboxetine**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **repaglinide**. [Moderate] Study

Cobicistat (continued)

- **Cobicistat** is predicted to increase the exposure to **retinoids** (**alitretinoin**). Adjust **alitretinoin** dose. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose. [Moderate] Study
- **Rifabutin** decreases the concentration of **cobicistat** and **cobicistat** increases the exposure to **rifabutin**. Avoid or adjust dose. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- **Cobicistat** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to **roxlutinib**. Adjust dose and monitor side effects. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to **saxagliptin**. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- **Cobicistat** is predicted to increase the concentration of **sirolimus**. Avoid. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to **solifenacin**. Adjust **solifenacin** or **tamsulosin** with **solifenacin** dose; avoid in hepatic and renal impairment. [Severe] Study
- **Cobicistat** is predicted to moderately increase the exposure to **SSRIs** (**dapoxetine**). Avoid potent inhibitors of CYP3A4 or adjust **dapoxetine** dose. [Severe] Study
- **St John's Wort** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- **Cobicistat** is predicted to increase the exposure to **statins** (**atorvastatin**). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to **statins** (**simvastatin**). Avoid. [Severe] Study
- **Cobicistat** is predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study
- **Cobicistat** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to **taxanes** (**cabazitaxel**). Avoid. [Severe] Study
- **Cobicistat** is predicted to moderately increase the exposure to **taxanes** (**docetaxel**). Avoid or adjust dose. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to **taxanes** (**paclitaxel**). [Severe] Theoretical
- **Cobicistat** is predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- **Cobicistat** is predicted to markedly increase the exposure to **ticagrelor**. Avoid. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to **toremifene**. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical
- **Cobicistat** is predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- **Cobicistat** is predicted to slightly increase the exposure to **tricyclic antidepressants**. [Mild] Study
- **Cobicistat** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical
- **Cobicistat** is predicted to increase the exposure to **venetoclax**. Avoid potent inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to **venlafaxine**. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- **Cobicistat** is predicted to increase the exposure to **vitamin D substances** (**paricalcitol**). [Moderate] Study

- **Cobicistat** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical

Cobimetinib

- **Antiarrhythmics** (**dronedarone**) are predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- **Antifungals**, azoles (**fluconazole**, **isavuconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- **Antifungals**, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- **Aprepitant** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- **Bosentan** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- **Cobicistat** is predicted to markedly increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- **Grapefruit juice** is predicted to increase the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- **HIV-protease inhibitors** are predicted to markedly increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- **Idelalisib** is predicted to markedly increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- **Imatinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- **Macrolides** (**clarithromycin**) are predicted to markedly increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- **Macrolides** (**erythromycin**) are predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- **Mitotane** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- **Netupitant** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- **Nevirapine** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- **St John's Wort** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical

Codeine → see opioids

Colchicine

- **Antiarrhythmics** (**dronedarone**) are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Antifungals**, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Antifungals**, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **colchicine**. Avoid potent inhibitors of CYP3A4 or adjust **colchicine** dose. [Severe] Study
- **Aprepitant** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Ceritinib** is predicted to increase the exposure to **colchicine**. [Moderate] Theoretical

- ▶ **Ciclosporin** increases the exposure to **colchicine**. Avoid or adjust **colchicine** dose. [Severe] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **colchicine**. Avoid potent inhibitors of CYP3A4 or adjust **colchicine** dose. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Eliglustat** is predicted to increase the exposure to **colchicine**. Avoid or adjust **colchicine** dose. [Severe] Theoretical
 - ▶ **Colchicine** increases the risk of rhabdomyolysis when given with **fibrates**. [Severe] Anecdotal
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **colchicine**. Avoid potent inhibitors of CYP3A4 or adjust **colchicine** dose. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **colchicine**. Avoid potent inhibitors of CYP3A4 or adjust **colchicine** dose. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Lapatinib** is predicted to increase the exposure to **colchicine**. Avoid or adjust **colchicine** dose. [Moderate] Theoretical
 - ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to **colchicine**. Avoid or adjust **colchicine** dose. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **colchicine**. Avoid potent inhibitors of CYP3A4 or adjust **colchicine** dose. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Mirabegron** is predicted to increase the exposure to **colchicine**. [Mild] Theoretical
 - ▶ **Netupitant** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Ranolazine** is predicted to increase the exposure to **colchicine**. Avoid or adjust **colchicine** dose. [Severe] Theoretical
 - ▶ **Rolapitant** is predicted to increase the exposure to **colchicine**. [Moderate] Study
 - ▶ **Colchicine** increases the risk of rhabdomyolysis when given with **statins**. [Severe] Anecdotal
 - ▶ **Velpatasvir** is predicted to increase the exposure to **colchicine**. [Severe] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **colchicine**. Avoid or adjust **colchicine** dose. [Severe] Theoretical
- Calcitriol** → see vitamin D substances
- Calcifediol**

SEPARATION OF ADMINISTRATION Manufacturer advises take 4 hours before, or after, other drugs.

Colestipol

SEPARATION OF ADMINISTRATION Manufacturer advises take other drugs at least 1 hour before, or 4 hours after, colestipol.

Colestyramine

SEPARATION OF ADMINISTRATION Manufacturer advises take other drugs at least 1 hour before, or 4–6 hours after, colestyramine.

Colistimethate → see TABLE 2 p. 847 (nephrotoxicity), TABLE 20 p. 851 (neuromuscular blocking effects)

Combined hormonal contraceptives

- ▶ Combined hormonal contraceptives are predicted to increase the exposure to **agomelatine**. [Moderate] Study
- ▶ Combined hormonal contraceptives are predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ Combined hormonal contraceptives are predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **eslicarbazepine**, **fosphenytoin**, **oxcarbazepine**, **perampanel**, **phenobarbital**, **phenytoin**,

- primidone**, **rufinamide**, **topiramate**) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ Combined hormonal contraceptives alter the exposure to antiepileptics (**lamotrigine**). Adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ Oral combined hormonal contraceptives potentially decrease the efficacy of **chenodeoxycholic acid**. Avoid. [Moderate] Theoretical
- ▶ Combined hormonal contraceptives increase the concentration of **clozapine**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Cobicistat** is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Study
- ▶ Combined hormonal contraceptives increase the risk of raised liver function tests when given with **dasabuvir**. Avoid. [Severe] Study
- ▶ Combined hormonal contraceptives are predicted to increase the exposure to **dopamine receptor agonists (ropinirole)**. Adjust dose. [Moderate] Study
- ▶ **Efavirenz** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ Combined hormonal contraceptives slightly increase the exposure to **erlotinib**. Monitor side effects and adjust dose. [Moderate] Study
- ▶ **Fosaprepitant** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **Griseofulvin** potentially decreases the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **HIV-protease inhibitors (atazanavir)** (unboosted) increase the exposure to combined hormonal contraceptives. Adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with **lenalidomide**. Avoid. [Severe] Theoretical
- ▶ Oral combined hormonal contraceptives slightly increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ Combined hormonal contraceptives are predicted to increase the exposure to **loxapine**. Avoid. [Unknown] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ Combined hormonal contraceptives are predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
- ▶ Combined hormonal contraceptives decrease the effects of **metrapone**. Avoid. [Moderate] Theoretical
- ▶ **Modafinil** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ Combined hormonal contraceptives slightly increase the exposure to **monoamine-oxidase B inhibitors (rasagiline)**. [Moderate] Study
- ▶ Combined hormonal contraceptives increase the exposure to **monoamine-oxidase B inhibitors (selegiline)**. Avoid. [Severe] Study
- ▶ **Monoclonal antibodies (sarilumab)** potentially decrease the exposure to combined hormonal contraceptives. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **NSAIDs (etoricoxib)** slightly increase the exposure to combined hormonal contraceptives. [Moderate] Study

Combined hormonal contraceptives (continued)

- ▶ **Paritaprevir** (with ritonavir and ombitasvir) increases the risk of raised liver function tests when given with **combined hormonal contraceptives**. Avoid. [Severe] Study
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **pirfenidone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Pitolisant** is predicted to decrease the efficacy of **combined hormonal contraceptives**. Avoid. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **pomalidomide**. Avoid. [Severe] Theoretical
- ▶ **Rifabutin** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **roflumilast**. [Moderate] Theoretical
- ▶ **St John's Wort** decreases the efficacy of **combined hormonal contraceptives**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Sugammadex** is predicted to decrease the exposure to oral **combined hormonal contraceptives**. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **thalidomide**. Avoid. [Severe] Study
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** increase the exposure to **tizanidine**. Avoid. [Moderate] Study
- ▶ **Ulipristal** is predicted to decrease the efficacy of **combined hormonal contraceptives**. Avoid. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **zolmitriptan**. Adjust zolmitriptan dose, p. 292. [Moderate] Theoretical

Corticosteroids → see TABLE 17 p. 851 (reduced serum potassium)

beclomethasone • betamethasone • budesonide • ciclesonide • deflazacort • dexamethasone • fludrocortisone • fluticasone • hydrocortisone • methylprednisolone • mometasone • prednisolone • prednisone • triamcinolone

- ▶ Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified.
- ▶ With intravitreal use of **dexamethasone** in adults: caution with concurrent administration of anticoagulant or antiplatelet drugs—increased risk of haemorrhagic events.

- ▶ **Antacids** are predicted to decrease the absorption of **deflazacort**. Separate administration by 2 hours. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **dexamethasone**. [Moderate] Study
- ▶ **Antiarhythmics (dronedarone)** are predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **fluticasone**. [Unknown] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to corticosteroids (**budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, prednisone, triamcinolone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **beclomethasone** (risk with beclomethasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical

- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **methylprednisolone**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to corticosteroids (**betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, prednisone, triamcinolone**). Avoid or monitor side effects. [Severe] Study
- ▶ **Prednisone** potentially decreases the exposure to **antifungals, azoles (isavuconazole)**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Aprepitant** moderately increases the exposure to **dexamethasone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Corticosteroids** are predicted to decrease the concentration of **aspirin** (high-dose) and **aspirin** (high-dose) increases the risk of gastrointestinal bleeding when given with corticosteroids. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dexamethasone** is predicted to decrease the concentration of **caspofungin**. Adjust caspofungin dose, p. 372. [Moderate] Theoretical
- ▶ **Corticosteroids** are predicted to decrease the concentration of **choline salicylate**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **beclomethasone** (risk with beclomethasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to corticosteroids (**betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, prednisone, triamcinolone**). Avoid or monitor side effects. [Severe] Study
- ▶ **Corticosteroids** are predicted to increase the effects of **coumarins**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to corticosteroids (**budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, prednisone, triamcinolone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **fluticasone**. [Unknown] Theoretical
- ▶ **Corticosteroids** increase the risk of gastrointestinal perforation when given with **erlotinib**. [Severe] Theoretical
- ▶ **Fosaprepitant** is predicted to increase the exposure to corticosteroids (**dexamethasone, methylprednisolone**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Corticosteroids** potentially oppose the effects of **glycerol phenylbutyrate**. [Moderate] Theoretical
- ▶ **Grapefruit juice** moderately increases the exposure to oral **budesonide**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **beclomethasone** (risk with beclomethasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to corticosteroids (**betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, prednisone, triamcinolone**). Avoid or monitor side effects. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **beclomethasone** (risk with beclomethasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to corticosteroids (**betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, prednisone, triamcinolone**). Avoid or monitor side effects. [Severe] Study

- ▶ **Imatinib** is predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Corticosteroids** are predicted to increase the risk of gastrointestinal bleeding when given with **iron chelators (deferriroxiol)**. [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **corticosteroids** (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to corticosteroids (**methylprednisolone**, **prednisone**). Adjust dose. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **beclomethasone** (risk with beclomethasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to corticosteroids (**betamethasone**, **budesonide**, **ciclesonide**, **deflazacort**, **dexamethasone**, **fludrocortisone**, **fluticasone**, **hydrocortisone**, **methylprednisolone**, **mometasone**, **prednisolone**, **prednisone**, **triamcinolone**). Avoid or monitor side effects. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Corticosteroids** are predicted to decrease the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical
- ▶ **Mifepristone** is predicted to decrease the efficacy of corticosteroids. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to corticosteroids (**budesonide**, **deflazacort**, **dexamethasone**, **fludrocortisone**, **hydrocortisone**, **methylprednisolone**, **prednisolone**, **prednisone**, **triamcinolone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **fluticasone**. [Unknown] Theoretical
- ▶ Corticosteroids (**betamethasone**, **deflazacort**, **dexamethasone**, **hydrocortisone**, **methylprednisolone**, **prednisolone**, **prednisone**) are predicted to decrease the efficacy of **monoclonal antibodies (atezolizumab, ipilimumab, nivolumab, pembrolizumab)**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to corticosteroids (**dexamethasone**, **methylprednisolone**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **dexamethasone**. Adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Corticosteroids** are predicted to decrease the effects of **neuromuscular blocking drugs, non-depolarising**. [Severe] Anecdotal
- ▶ **Corticosteroids** increase the risk of gastrointestinal perforation when given with **nicorandil**. [Severe] Anecdotal
- ▶ **Nilotinib** is predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **NSAIDs** increase the risk of gastrointestinal bleeding when given with **corticosteroids**. [Severe] Study
- ▶ **Corticosteroids** are predicted to increase the effects of **phenindione**. [Moderate] Anecdotal
- ▶ **Dexamethasone** decreases the exposure to **praziquantel**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to corticosteroids (**budesonide**, **deflazacort**, **dexamethasone**, **fludrocortisone**, **hydrocortisone**, **methylprednisolone**, **prednisolone**, **prednisone**, **triamcinolone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **fluticasone**. [Unknown] Theoretical
- ▶ **Corticosteroids** potentially decrease the effects of **sodium phenylbutyrate**. [Moderate] Anecdotal
- ▶ **Corticosteroids** are predicted to decrease the effects of **somatropin**. [Moderate] Theoretical

- ▶ **Corticosteroids** are predicted to decrease the effects of **suxamethonium**. [Severe] Anecdotal

Coumarins → see TABLE 3 p. 847 (anticoagulant effects)

acenocoumarol · warfarin

FOOD AND LIFESTYLE The effects of coumarins can be reduced or abolished by vitamin K, including that found in health foods, food supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control. Pomegranate increases the INR in response to **warfarin** and is predicted to increase the INR in response to **acenocoumarol**.

- ▶ **Alcohol (beverage)** (in those who drink heavily) potentially decreases the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Antiarrhythmics (amiodarone)** increase the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Antiarrhythmics (propafenone)** increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** decrease the effects of **coumarins**. Monitor and adjust dose. [Severe] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to alter the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ **Antiepileptics (phenobarbital, primidone)** decrease the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole)** increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole)** potentially increase the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Antifungals, azoles (ketoconazole)** potentially increase the anticoagulant effect of **warfarin**. Monitor INR and adjust dose. [Severe] Anecdotal
- ▶ **Antifungals, azoles (miconazole)** greatly increase the anticoagulant effect of **coumarins**. MHRA advises avoid unless INR can be monitored closely; monitor for signs of bleeding. [Severe] Study
- ▶ **Antifungals, azoles (voriconazole)** increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ **Aprepitant** decreases the anticoagulant effect of **coumarins**. [Moderate] Study
- ▶ **Axitinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Azathioprine** decreases the anticoagulant effect of **coumarins**. [Moderate] Study
- ▶ **Bosentan** decreases the anticoagulant effect of **coumarins**. [Moderate] Study
- ▶ **Bosutinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Cabozantinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Capecitabine** increases the effects of **coumarins**. Monitor INR and adjust dose. [Moderate] Anecdotal
- ▶ **Cephalosporins (ceftriaxone)** potentially increase the risk of bleeding events when given with **coumarins**. [Severe] Anecdotal
- ▶ **Ceritinib** is predicted to increase the exposure to **warfarin**. Avoid. [Severe] Theoretical
- ▶ **Chloramphenicol** potentially increases the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ **Corticosteroids** are predicted to increase the effects of **coumarins**. [Moderate] Study
- ▶ **Cranberry juice** potentially increases the anticoagulant effect of **warfarin**. Avoid. [Severe] Anecdotal
- ▶ **Crizotinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the anticoagulant effect of **coumarins**. [Severe] Theoretical
- ▶ **Danazol** potentially increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Dasatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical

Coumarins (continued)

- ▶ **Disulfiram** increases the anticoagulant effect of coumarins. Monitor and adjust dose. [Severe] Study
- ▶ **Efavirenz** is predicted to affect the concentration of coumarins. Adjust dose. [Moderate] Theoretical
- ▶ **Elvitegravir** is predicted to decrease the anticoagulant effect of coumarins. [Moderate] Theoretical
- ▶ **Enteral feeds** (vitamin-K containing) potentially decrease the anticoagulant effect of coumarins. [Severe] Anecdotal
- ▶ **Enzalutamide** potentially decreases the exposure to coumarins. Avoid or adjust dose and monitor INR. [Severe] Study
- ▶ **Erlotinib** increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- ▶ **Etravirine** increases the anticoagulant effect of coumarins. [Moderate] Theoretical
- ▶ **Fibrates** are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study
- ▶ **Fluorouracil** increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- ▶ **Fosaprepitant** is predicted to decrease the anticoagulant effect of coumarins. [Moderate] Theoretical
- ▶ **Gefitinib** is predicted to increase the anticoagulant effect of coumarins. [Severe] Anecdotal
- ▶ **Glucagon** increases the anticoagulant effect of warfarin. [Severe] Study
- ▶ **Glucosamine** increases the anticoagulant effect of warfarin. Avoid. [Moderate] Anecdotal
- ▶ **Griseofulvin** potentially decreases the anticoagulant effect of coumarins. [Moderate] Anecdotal
- ▶ **H₂ receptor antagonists (cimetidine)** increase the anticoagulant effect of coumarins. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to affect the anticoagulant effect of coumarins. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- ▶ **Ivacaftor** is predicted to increase the anticoagulant effect of warfarin. [Severe] Theoretical
- ▶ **Ivermectin** potentially increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- ▶ **Lapatinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- ▶ **Leflunomide** increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- ▶ **Lomitapide** increases the exposure to warfarin. Monitor INR and adjust dose. [Severe] Study
- ▶ **Macrolides (clarithromycin, erythromycin)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Anecdotal
- ▶ **Mercaptopurine** decreases the anticoagulant effect of coumarins. [Moderate] Anecdotal
- ▶ **Metronidazole** increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study
- ▶ **Monoclonal antibodies (blinatumomab)** are predicted to transiently increase the exposure to warfarin. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (sarilumab)** potentially affect the exposure to warfarin. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to warfarin. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Nandrolone** is predicted to increase the anticoagulant effect of coumarins. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Nevirapine** potentially alters the anticoagulant effect of coumarins. [Severe] Anecdotal
- ▶ **Nilotinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- ▶ **Obeticholic acid** decreases the anticoagulant effect of warfarin. [Severe] Study
- ▶ **Oxymetholone** increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- ▶ **Paracetamol** increases the anticoagulant effect of coumarins. [Moderate] Study
- ▶ **Pazopanib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical

- ▶ **Penicillins** potentially alter the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Anecdotal
- ▶ **Pitolisant** is predicted to decrease the exposure to warfarin. [Unknown] Theoretical
- ▶ **Ponatinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- ▶ **Quinolones** increase the anticoagulant effect of coumarins. [Severe] Anecdotal
- ▶ **Ranibizumab** increases the risk of bleeding events when given with coumarins. [Severe] Theoretical
- ▶ **Regorafenib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Study
- ▶ **Rifampicin** decreases the anticoagulant effect of coumarins. [Severe] Study
- ▶ **Ruxolitinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- ▶ **Sorafenib** increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- ▶ **St John's Wort** decreases the anticoagulant effect of coumarins. Avoid. [Severe] Anecdotal
- ▶ **Statins (fluvastatin, rosuvastatin)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study
- ▶ **Sucralfate** potentially decreases the effects of warfarin. Separate administration by 2 hours. [Moderate] Anecdotal
- ▶ **Sulfinpyrazone** increases the anticoagulant effect of coumarins. Avoid. [Severe] Study
- ▶ **Sulfonamides (sulfadiazine)** are predicted to increase the anticoagulant effect of coumarins. [Severe] Theoretical
- ▶ **Sulfonamides (sulfamethoxazole)** increase the anticoagulant effect of coumarins. [Severe] Study
- ▶ **Sunitinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- ▶ **Tamoxifen** increases the anticoagulant effect of coumarins. [Severe] Study
- ▶ **Tegafur** increases the anticoagulant effect of coumarins. [Moderate] Theoretical
- ▶ **Teriflunomide** affects the anticoagulant effect of coumarins. [Severe] Study
- ▶ **Tetracyclines** increase the risk of bleeding events when given with coumarins. [Moderate] Anecdotal
- ▶ **Tinidazole** is predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Theoretical
- ▶ **Toremifene** is predicted to increase the anticoagulant effect of coumarins. [Severe] Theoretical
- ▶ **Trimethoprim** is predicted to increase the anticoagulant effect of coumarins. [Severe] Study
- ▶ **Vandetanib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- ▶ **Venetoclax** slightly increases the exposure to warfarin. [Moderate] Study

Cranberry juice

- ▶ **Cranberry juice** potentially increases the anticoagulant effect of coumarins (warfarin). Avoid. [Severe] Anecdotal

Crisantaspase → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression)

- ▶ **Crisantaspase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Crisantaspase** affects the efficacy of **methotrexate**. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Crisantaspase** potentially increases the risk of neurotoxicity when given with **vinca alkaloids (vincristine)**. Vincristine should be taken 3 to 24 hours before **crisantaspase**, p. 551. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850

Crizotinib → see TABLE 6 p. 848 (bradycardia), TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)

GENERAL INFORMATION Caution with concurrent use of drugs that cause gastrointestinal perforation—discontinue treatment if gastrointestinal perforation occurs.

- ▶ **Crizotinib** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust eplerenone dose. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **alprazolam**. [Severe] Study

- ▶ **Crizotinib** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the concentration of **antimalarials (piperazine)**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Crizotinib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ **Bosentan** is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Crizotinib** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **crizotinib**. Avoid. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to slightly increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Crizotinib** increases the risk of QT-prolongation when given with **domeperidone**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Crizotinib** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Crizotinib** is predicted to increase the exposure to **fosetoridine**. Adjust **fosetoridine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **gefitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Crizotinib** potentially decreases the exposure to **glecaprevir**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Crizotinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical → Also see TABLE 6 p. 848
- ▶ **Crizotinib** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **lurasidone**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Crizotinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Crizotinib** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 848
- ▶ **Crizotinib** is predicted to increase the exposure to **opioids (methadone, sufentanil)**. [Moderate] Theoretical → Also see TABLE 6 p. 848 → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the exposure to **oxybutynin**. [Mild] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [Severe] Theoretical

Crizotinib (continued)

- ▶ **Crizotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [\[Severe\]](#) Theoretical → Also see [TABLE 9 p. 849](#)
 - ▶ **Crizotinib** potentially decreases the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Crizotinib** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see [TABLE 9 p. 849](#)
 - ▶ **Pitolisant** is predicted to decrease the exposure to crizotinib. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Crizotinib** is predicted to increase the exposure to **quetiapine**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **ranolazine**. [\[Severe\]](#) Study → Also see [TABLE 9 p. 849](#)
 - ▶ **Crizotinib** is predicted to increase the exposure to **ribociclib**. [\[Moderate\]](#) Study → Also see [TABLE 9 p. 849](#)
 - ▶ **Rifampicin** is predicted to markedly decrease the exposure to crizotinib. Avoid. [\[Severe\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **ruxolitinib**. [\[Moderate\]](#) Theoretical → Also see [TABLE 15 p. 850](#)
 - ▶ **Crizotinib** is predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Crizotinib** increases the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate inhibitors of CYP3A4. [\[Moderate\]](#) Theoretical
 - ▶ **St John's Wort** is predicted to decrease the exposure to crizotinib. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Crizotinib** is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [\[Severe\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **statins (simvastatin)**. Use with caution and adjust **simvastatin** dose, p. 134. [\[Severe\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **sunitinib**. [\[Moderate\]](#) Theoretical → Also see [TABLE 15 p. 850](#) → Also see [TABLE 9 p. 849](#)
 - ▶ **Crizotinib** is predicted to increase the concentration of **tacrolimus**. [\[Severe\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [\[Moderate\]](#) Theoretical → Also see [TABLE 15 p. 850](#)
 - ▶ **Crizotinib** is predicted to increase the concentration of **temsirolimus**. [\[Moderate\]](#) Theoretical → Also see [TABLE 15 p. 850](#)
 - ▶ **Crizotinib** is predicted to increase the exposure to **tofacitinib**. [\[Moderate\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **tolterodine**. [\[Mild\]](#) Theoretical → Also see [TABLE 9 p. 849](#)
 - ▶ **Crizotinib** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **trazodone**. [\[Moderate\]](#) Theoretical
 - ▶ **Crizotinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [\[Moderate\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [\[Severe\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **vinca alkaloids**. [\[Severe\]](#) Theoretical → Also see [TABLE 15 p. 850](#) → Also see [TABLE 9 p. 849](#)
 - ▶ **Crizotinib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [\[Moderate\]](#) Study
- Cyclizine** → see antihistamines, sedating
- Cyclophenthiadiazide** → see thiazide diuretics
- Cyclopentolate** → see [TABLE 10 p. 849](#) (antimuscarinics)
- Cyclophosphamide** → see alkylating agents
- Cycloserine**
- ▶ **Cycloserine** increases the risk of CNS toxicity when given with **isoniazid**. Monitor and adjust dose. [\[Moderate\]](#) Study
- Cyproheptadine** → see antihistamines, sedating
- Cytarabine** → see [TABLE 15 p. 850](#) (myelosuppression)
- ▶ **Cytarabine** decreases the concentration of **flucytosine**. Avoid. [\[Severe\]](#) Study

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **cytarabine**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
- Dabigatran** → see [TABLE 3 p. 847](#) (anticoagulant effects)
- ▶ **Antiarrhythmics (amiodarone)** increase the exposure to **dabigatran**. Adjust **dabigatran** dose. [\[Moderate\]](#) Study
 - ▶ **Antiarrhythmics (dronedarone)** slightly increase the exposure to **dabigatran**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to **dabigatran**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antifungals, azoles (isavuconazole)** are predicted to increase the exposure to **dabigatran**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to **dabigatran**. Avoid. [\[Severe\]](#) Study
 - ▶ **Calcium channel blockers (verapamil)** increase the exposure to **dabigatran**. Adjust **dabigatran** dose. [\[Severe\]](#) Study
 - ▶ **Ceritinib** is predicted to increase the exposure to **dabigatran**. [\[Moderate\]](#) Theoretical
 - ▶ **Ciclosporin** is predicted to increase the exposure to **dabigatran**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Elbasvir** is predicted to increase the concentration of **dabigatran**. [\[Moderate\]](#) Theoretical
 - ▶ **Eliglustat** is predicted to increase the exposure to **dabigatran**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **Glecaprevir** (with pibrentasvir) increases the exposure to **dabigatran**. Avoid. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **dabigatran**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Lapatinib** is predicted to increase the exposure to **dabigatran**. [\[Severe\]](#) Theoretical
 - ▶ **Macrolides** are predicted to increase the exposure to **dabigatran**. [\[Moderate\]](#) Theoretical
 - ▶ **Mirabegron** is predicted to increase the exposure to **dabigatran**. [\[Severe\]](#) Theoretical
 - ▶ **Pibrentasvir** (with glecaprevir) increases the exposure to **dabigatran**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Pitolisant** is predicted to decrease the exposure to **dabigatran**. [\[Unknown\]](#) Theoretical
 - ▶ **Ranolazine** is predicted to increase the exposure to **dabigatran**. [\[Severe\]](#) Theoretical
 - ▶ **Rifampicin** is predicted to decrease the exposure to **dabigatran**. Avoid. [\[Severe\]](#) Study
 - ▶ **Rolapitant** is predicted to increase the exposure to **dabigatran**. [\[Moderate\]](#) Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to **dabigatran**. Avoid. [\[Severe\]](#) Study
 - ▶ **Velpatasvir** is predicted to increase the exposure to **dabigatran**. [\[Severe\]](#) Theoretical
 - ▶ **Vemurafenib** increases the exposure to **dabigatran**. Use with caution and adjust dose. [\[Severe\]](#) Theoretical
 - ▶ **Voxilaprevir** is predicted to increase the concentration of **dabigatran**. Avoid. [\[Severe\]](#) Study
- Dabrafenib** → see [TABLE 15 p. 850](#) (myelosuppression)
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **dabrafenib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **Clopidogrel** is predicted to increase the exposure to **dabrafenib**. [\[Moderate\]](#) Theoretical
 - ▶ **Cobicistat** is predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **Dabrafenib** is predicted to decrease the anticoagulant effect of **coumarins**. [\[Severe\]](#) Theoretical
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **dabrafenib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Fibrates (gemfibrozil)** are predicted to increase the exposure to **dabrafenib**. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [\[Moderate\]](#) Study

- **Idelalisib** is predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study → Also see TABLE 15 p. 850
- **Macrolides (clarithromycin)** are predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- **Dabrafenib** decreases the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study
- **Mitotane** is predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 850
- **Rifampicin** is predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical
- Dacarbazine** → see alkylating agents
- Daclatasvir**
 - **Daclatasvir** is predicted to increase the risk of severe bradycardia or heart block when given with **antiarrhythmics (amiodarone)**. Refer to specialist literature. [Severe] Anecdotal
 - **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **daclatasvir**. Avoid. [Severe] Study
 - **Antiepileptics (oxcarbazepine)** are predicted to decrease the exposure to **daclatasvir**. Avoid. [Severe] Theoretical
 - **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Study
 - **Bosentan** is predicted to decrease the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Theoretical
 - **Cobicistat** is predicted to moderately increase the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Study
 - **Daclatasvir** slightly increases the concentration of **digoxin**. [Severe] Study
 - **Efavirenz** is predicted to decrease the exposure to **daclatasvir**. Adjust dose. [Severe] Study
 - **Enzalutamide** is predicted to moderately decrease the exposure to **daclatasvir**. Avoid. [Severe] Study
 - **Etravirine** is predicted to decrease the exposure to **daclatasvir**. Avoid. [Moderate] Theoretical
 - **HIV-protease inhibitors** are predicted to moderately increase the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Study
 - **Idelalisib** is predicted to moderately increase the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Study
 - **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Study
 - **Mitotane** is predicted to moderately decrease the exposure to **daclatasvir**. Avoid. [Severe] Study
 - **Nevirapine** is predicted to decrease the exposure to **daclatasvir**. Avoid. [Severe] Theoretical
 - **Rifampicin** is predicted to moderately decrease the exposure to **daclatasvir**. Avoid. [Severe] Study
 - **St John's Wort** is predicted to decrease the exposure to **daclatasvir**. Avoid. [Severe] Theoretical
- Dactinomycin** → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression)
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dactinomycin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Dairy products**
 - **Dairy products** are predicted to decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **dairy products**. [Severe] Theoretical
 - **Dairy products** decrease the exposure to **tetracyclines (demeclocycline, oxytetracycline, tetracycline)**. Avoid. [Moderate] Study
- Dalteparin** → see low molecular-weight heparins
- Danaparoid** → see TABLE 3 p. 847 (anticoagulant effects)
- **Ranibizumab** is predicted to increase the risk of bleeding events when given with **danaparoid**. [Severe] Theoretical
- Danazol**
 - **Danazol** moderately increases the concentration of **antiepileptics (carbamazepine)**. Monitor and adjust dose. [Severe] Study

- **Danazol** increases the concentration of **ciclosporin**. [Severe] Study
- **Danazol** potentially increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- **Danazol** is predicted to increase the risk of rhabdomyolysis when given with **statins (atorvastatin)**. [Severe] Theoretical
- **Danazol** increases the risk of rhabdomyolysis when given with **statins (simvastatin)**. Avoid. [Severe] Anecdotal
- **Danazol** potentially increases the concentration of **tacrolimus**. [Severe] Anecdotal
- Dantrolene** → see TABLE 1 p. 847 (hepatotoxicity)
- Intravenous **dantrolene** potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with **calcium channel blockers (diltiazem, verapamil)**. Avoid. [Severe] Anecdotal
- Dapagliflozin** → see TABLE 14 p. 850 (antidiabetic drugs), TABLE 8 p. 848 (hypotension)
- Dapoxetine** → see SSRIs
- Dapsone**
 - **Aminosalicylic acid** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
 - **Dapsone** is predicted to increase the risk of methaemoglobinaemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [Severe] Theoretical
 - **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
 - **Antimalarials (chloroquine, primaquine)** are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
 - **Nitrates** are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
 - **Nitrofurantoin** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
 - **Paracetamol** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
 - **Rifabutin** decreases the exposure to **dapsone**. [Moderate] Study
 - **Rifampicin** decreases the exposure to **dapsone**. [Moderate] Study
 - **Sodium nitroprusside** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
 - **Sulfonamides** are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
 - **Dapsone** increases the exposure to **trimethoprim** and **trimethoprim** increases the exposure to **dapsone**. [Severe] Study
- Daptomycin**
 - **Aspirin** (high-dose) increases the risk of renal impairment when given with **daptomycin**. [Moderate] Theoretical
 - **Ciclosporin** is predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical
 - **Fibrates** are predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical
 - **NSAIDs** increase the risk of renal impairment when given with **daptomycin**. [Moderate] Theoretical
 - **Statins** are predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical
- Daratimumab** → see monoclonal antibodies
- Darbepoetin alfa** → see TABLE 5 p. 847 (thromboembolism), TABLE 16 p. 851 (increased serum potassium)
- Darifenacin** → see TABLE 10 p. 849 (antimuscarinics)
- **Antiarrhythmics (dronedaron)** are predicted to slightly increase the exposure to **darifenacin**. [Moderate] Study
- **Darifenacin** is predicted to increase the concentration of **antiarrhythmics (flecainide)**. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical

Darifenacin (continued)

- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to slightly increase the exposure to darifenacin. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
 - ▶ **Aprepitant** is predicted to slightly increase the exposure to darifenacin. [Moderate] Study
 - ▶ **Bupropion** is predicted to slightly increase the exposure to darifenacin. [Mild] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to slightly increase the exposure to darifenacin. [Moderate] Study
 - ▶ **Ciclosporin** is predicted to increase the exposure to darifenacin. Avoid. [Moderate] Theoretical
 - ▶ **Cinacalcet** is predicted to slightly increase the exposure to darifenacin. [Mild] Study
 - ▶ **Cobicistat** is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
 - ▶ **Crizotinib** is predicted to slightly increase the exposure to darifenacin. [Moderate] Study
 - ▶ **Enzalutamide** is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
 - ▶ **Grapefruit juice** is predicted to increase the exposure to darifenacin. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
 - ▶ **Imatinib** is predicted to slightly increase the exposure to darifenacin. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to slightly increase the exposure to darifenacin. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
 - ▶ **Netupitant** is predicted to slightly increase the exposure to darifenacin. [Moderate] Study
 - ▶ **Nilotinib** is predicted to slightly increase the exposure to darifenacin. [Moderate] Study
 - ▶ **Rifampicin** is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to slightly increase the exposure to darifenacin. [Mild] Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
 - ▶ **Terbinafine** is predicted to slightly increase the exposure to darifenacin. [Mild] Study
 - ▶ **Darifenacin** is predicted to increase the exposure to **tricyclic antidepressants**. [Moderate] Theoretical → Also see TABLE 10 p. 849
- Darunavir** → see HIV-protease inhibitors
- Dasabuvir**
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
 - ▶ **Combined hormonal contraceptives** increase the risk of raised liver function tests when given with dasabuvir. Avoid. [Severe] Study
 - ▶ **Enzalutamide** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
 - ▶ **Fibrates (gemfibrozil)** very markedly increase the exposure to dasabuvir. Avoid. [Severe] Study
 - ▶ **Dasabuvir** (with ombitasvir, paritaprevir and ritonavir) increases the concentration of **loop diuretics (furosemide)**. Adjust dose. [Moderate] Study
 - ▶ **Rifampicin** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
 - ▶ **St John's Wort** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
 - ▶ **Dasabuvir** increases the exposure to **statins (rosuvastatin)**. Adjust rosuvastatin dose, p. 133. [Moderate] Study

Dasatinib → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation), TABLE 4 p. 847 (antiplatelet effects)

- ▶ **Antacids** decrease the absorption of dasatinib. Separate administration by at least 2 hours. [Moderate] Study
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to dasatinib. Avoid. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Aprepitant** is predicted to increase the exposure to dasatinib. [Severe] Study
 - ▶ **Bosentan** is predicted to decrease the exposure to dasatinib. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to dasatinib. [Severe] Study
 - ▶ **Cobicistat** is predicted to markedly increase the exposure to dasatinib. Avoid. [Severe] Study
 - ▶ **Dasatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
 - ▶ **Crizotinib** is predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
 - ▶ **Efavirenz** is predicted to decrease the exposure to dasatinib. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Enzalutamide** is predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study
 - ▶ **Grapefruit juice** is predicted to increase the exposure to dasatinib. Avoid. [Moderate] Theoretical
 - ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to dasatinib. Avoid. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to dasatinib. Avoid. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Idelalisib** is predicted to markedly increase the exposure to dasatinib. Avoid. [Severe] Study → Also see TABLE 15 p. 850
 - ▶ **Imatinib** is predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 15 p. 850
 - ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to dasatinib. Avoid. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Mitotane** is predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study → Also see TABLE 15 p. 850
 - ▶ **Netupitant** is predicted to increase the exposure to dasatinib. [Severe] Study
 - ▶ **Nevirapine** is predicted to decrease the exposure to dasatinib. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
 - ▶ **Dasatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
 - ▶ **Pitolisant** is predicted to decrease the exposure to dasatinib. Avoid. [Severe] Theoretical
 - ▶ **Proton pump inhibitors** are predicted to slightly to moderately decrease the exposure to dasatinib. Avoid. [Severe] Study
 - ▶ **Rifampicin** is predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to dasatinib. [Severe] Study
 - ▶ **Dasatinib** is predicted to increase the exposure to **statins (simvastatin)**. [Moderate] Theoretical
- Daunorubicin** → see anthracyclines
- Decitabine** → see TABLE 15 p. 850 (myelosuppression)
- Deferasirox** → see iron chelators
- Deferiprone** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Antacids (aluminium hydroxide)** are predicted to decrease the absorption of deferiprone. Avoid. [Moderate] Theoretical
 - ▶ **Ascorbic acid** is predicted to increase the risk of cardiovascular side-effects when given with deferiprone. [Severe] Theoretical

Deflazacort → see corticosteroids

Delamanid → see TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** very slightly increase the exposure to **delamanid**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Cobicistat** very slightly increases the exposure to **delamanid**. [Severe] Study
- ▶ **Enzalutamide** is predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** very slightly increase the exposure to **delamanid**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Idelalisib** very slightly increases the exposure to **delamanid**. [Severe] Study

▶ **Macrolides (clarithromycin)** very slightly increase the exposure to **delamanid**. [Severe] Study → Also see TABLE 9 p. 849

▶ **Mitotane** is predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study

▶ **Rifampicin** is predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study

Demeclocycline → see tetracyclines

Desferrioxamine → see iron chelators

Desflurane → see volatile halogenated anaesthetics

Desloratadine → see antihistamines, non-sedating

Desmopressin → see TABLE 18 p. 851 (hyponatraemia)

▶ **Antiepileptics (lamotrigine)** are predicted to increase the risk of hyponatraemia when given with **desmopressin**. [Severe] Theoretical

▶ **Loperamide** greatly increases the absorption of oral **desmopressin** (and possibly sublingual). [Moderate] Study

▶ **Phenothiazines (chlorpromazine)** are predicted to increase the risk of hyponatraemia when given with **desmopressin**. [Severe] Theoretical

Desogestrel

- ▶ **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampamil, phenobarbital, phenytoin, primidone, rifinamide, topiramate)** are predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Desogestrel** is predicted to increase the exposure to **antiepileptics (lamotrigine)**. [Moderate] Study
- ▶ **Aprepitant** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Efavirenz** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Fosaprepitant** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Griseofulvin** potentially decreases the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Modafinil** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Rifabutin** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical

- ▶ **St John's Wort** is predicted to decrease the efficacy of **desogestrel**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Sugammadex** is predicted to decrease the exposure to **desogestrel**. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
- ▶ **Ulipristal** is predicted to decrease the efficacy of **desogestrel**. Avoid. [Severe] Theoretical

Dexamethasone → see corticosteroids

Dexamfetamine → see amfetamines

Dexibuprofen → see NSAIDs

Dextketoprofen → see NSAIDs

Dexmedetomidine → see TABLE 11 p. 849 (CNS depressant effects)

Dextrazoxane → see iron chelators

Diamorphine → see opioids

Diazepam → see TABLE 11 p. 849 (CNS depressant effects)

▶ **Diazepam** potentially affects the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Severe] Study

▶ **Antifungals, azoles (fluconazole, voriconazole)** moderately increase the exposure to **diazepam**. Monitor and adjust dose. [Moderate] Study

▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **diazepam**. Avoid. [Moderate] Theoretical

▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to **diazepam**. Monitor and adjust dose. [Moderate] Theoretical

▶ **Rifampicin** moderately decreases the exposure to **diazepam**. Avoid. [Moderate] Study

▶ **SSRIs (fluvoxamine)** moderately increase the exposure to **diazepam**. [Moderate] Study

Diazoxide → see TABLE 8 p. 848 (hypotension)

▶ **Diazoxide** decreases the concentration of **antiepileptics (fosphenytoin, phenytoin)** and **antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the effects of **diazoxide**. Monitor concentration and adjust dose. [Moderate] Anecdotal

▶ **Diazoxide** increases the risk of severe hypotension when given with **hydralazine**. [Severe] Study → Also see TABLE 8 p. 848

Diclofenac → see NSAIDs

Dicycloverine → see TABLE 10 p. 849 (antimuscarinics)

Didanosine → see TABLE 1 p. 847 (hepatotoxicity), TABLE 12 p. 850 (peripheral neuropathy)

ROUTE-SPECIFIC INFORMATION Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.

- ▶ **Allopurinol** moderately increases the exposure to **didanosine**. Avoid. [Severe] Study
- ▶ **Didanosine** (buffered) decreases the exposure to **antifungals, azoles (itraconazole, ketoconazole)**. Separate administration by 2 hours. [Severe] Study → Also see TABLE 1 p. 847
- ▶ **Febuxostat** is predicted to increase the exposure to **didanosine**. [Severe] Theoretical
- ▶ **Ganciclovir** is predicted to increase the exposure to **didanosine**. [Moderate] Study
- ▶ **HIV-protease inhibitors (tipranavir)** decrease the exposure to **didanosine**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Didanosine** (buffered) decreases the exposure to **HIV-protease inhibitors (atazanavir)**. **Didanosine** should be taken 2 hours after **atazanavir**. [Severe] Study
- ▶ **Didanosine** (buffered) is predicted to decrease the exposure to **HIV-protease inhibitors (darunavir)** boosted with **ritonavir**. **Didanosine** should be taken 1 hour before or 2 hours after **darunavir**. [Moderate] Theoretical
- ▶ **Hydroxycarbamide** increases the risk of toxicity when given with **didanosine**. Avoid. [Severe] Study
- ▶ **Isoniazid** is predicted to increase the risk of peripheral neuropathy when given with **didanosine**. [Severe] Theoretical → Also see TABLE 1 p. 847 → Also see TABLE 12 p. 850
- ▶ **Didanosine** is predicted to increase the risk of pancreatitis when given with **pentamidine**. Avoid. [Severe] Study
- ▶ **Didanosine** (buffered) is predicted to greatly decrease the exposure to oral **quinolones**. **Didanosine** should be taken 2 hours after **quinolones**. [Moderate] Study
- ▶ **Ribavirin** is predicted to increase the exposure to **didanosine**. Avoid. [Severe] Study

Didanosine (continued)

- ▶ **Didanosine** increases the risk of toxicity when given with **stavudine**. Avoid. [Severe] Study → Also see TABLE 12 p. 850
- ▶ **Tenofovir disoproxil** increases the risk of toxicity when given with **didanosine**. Avoid. [Severe] Study
- ▶ **Valganciclovir** is predicted to increase the exposure to **didanosine**. [Moderate] Study

Digoxin → see TABLE 6 p. 848 (bradycardia)

GENERAL INFORMATION Drugs that reduce serum potassium are predicted to increase the risk of digoxin toxicity, see TABLE 17 p. 851.

- ▶ **Acarbose** decreases the concentration of **digoxin**. [Moderate] Study
- ▶ **Aldosterone antagonists (eplerenone)** very slightly increase the exposure to **digoxin**. [Mild] Study
- ▶ **Aldosterone antagonists (spironolactone)** increase the concentration of **digoxin**. Monitor and adjust dose. [Moderate] Study
- ▶ **Aminoglycosides** potentially increase the concentration of **digoxin**. Monitor and adjust dose. [Mild] Study
- ▶ **Antacids** decrease the absorption of **digoxin**. Separate administration by 2 hours. [Mild] Study
- ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to moderately increase the exposure to **digoxin**. Monitor and adjust **digoxin** dose, p. 81. [Severe] Study → Also see TABLE 6 p. 848
- ▶ **Antiarrhythmics (propafenone)** increase the concentration of **digoxin**. Monitor and adjust dose. [Severe] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the concentration of **digoxin**. [Moderate] Anecdotal
- ▶ **Antifungals, azoles (isavuconazole)** slightly increase the exposure to **digoxin**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole)** are predicted to markedly increase the concentration of **digoxin**. Monitor and adjust dose. [Severe] Study
- ▶ **Antifungals, azoles (ketoconazole)** are predicted to markedly increase the concentration of **digoxin**. [Severe] Study
- ▶ **Antifungals, azoles (posaconazole)** are predicted to increase the concentration of **digoxin**. [Severe] Study
- ▶ **Antimalarials (mefloquine)** are predicted to increase the risk of bradycardia when given with **digoxin**. [Severe] Theoretical
- ▶ **Antimalarials (quinine)** increase the concentration of **digoxin**. Monitor and adjust **digoxin** dose, p. 81. [Severe] Anecdotal
- ▶ **Balsalazide** is predicted to decrease the concentration of **digoxin**. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** increase the concentration of **digoxin**. Monitor and adjust dose. [Severe] Study → Also see TABLE 6 p. 848
- ▶ **Intravenous calcium salts** increase the concentration of **digoxin**. Avoid. [Moderate] Anecdotal
- ▶ **Carbamazepine** affects the concentration of **digoxin**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the risk of bradycardia when given with **digoxin**. Avoid. [Severe] Theoretical
- ▶ **Ciclosporin** increases the concentration of **digoxin**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Daclatasvir** slightly increases the concentration of **digoxin**. [Severe] Study
- ▶ **Eliglustat** increases the exposure to **digoxin**. Adjust dose. [Moderate] Study
- ▶ **Glecaprevir** (with pibrentasvir) increases the exposure to **digoxin**. [Moderate] Study
- ▶ **HIV-protease inhibitors (ritonavir)** increase the concentration of **digoxin**. Adjust dose and monitor concentration. [Severe] Study
- ▶ **Ivacaftor** slightly increases the exposure to **digoxin**. [Moderate] Study
- ▶ **Lapatinib** is predicted to increase the exposure to **digoxin**. [Moderate] Theoretical
- ▶ **Macrolides** increase the concentration of **digoxin**. [Severe] Anecdotal
- ▶ **Mirabegron** slightly increases the exposure to **digoxin**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Neomycin** decreases the absorption of **digoxin**. [Moderate] Study
- ▶ **Neuromuscular blocking drugs, non-depolarising (pancuronium)** are predicted to increase the risk of cardiovascular side-effects when given with **digoxin**. [Severe] Anecdotal

- ▶ **NSAIDs (indometacin)** increase the concentration of **digoxin**. [Severe] Study
- ▶ **Penicillamine** potentially decreases the concentration of **digoxin**. Separate administration by 2 hours. [Severe] Anecdotal
- ▶ **Pibrentasvir** (with glecaprevir) increases the exposure to **digoxin**. [Moderate] Study
- ▶ **Pitolisant** is predicted to decrease the exposure to **digoxin**. [Unknown] Theoretical
- ▶ **Ranolazine** increases the concentration of **digoxin**. [Moderate] Study
- ▶ **Rifampicin** decreases the concentration of **digoxin**. [Moderate] Study
- ▶ **Rolapitant** slightly increases the exposure to **digoxin**. [Moderate] Study
- ▶ **St John's Wort** decreases the concentration of **digoxin**. Avoid. [Severe] Anecdotal
- ▶ **Sucralfate** decreases the absorption of **digoxin**. Separate administration by 2 hours. [Severe] Anecdotal
- ▶ **Sulfasalazine** decreases the concentration of **digoxin**. [Moderate] Study
- ▶ **Suxamethonium** is predicted to increase the risk of cardiovascular side-effects when given with **digoxin**. [Severe] Anecdotal
- ▶ **Thyroid hormones** are predicted to affect the concentration of **digoxin**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Ticagrelor** increases the concentration of **digoxin**. [Moderate] Study
- ▶ **Tolvaptan** increases the concentration of **digoxin**. [Mild] Study
- ▶ **Trimethoprim** increases the concentration of **digoxin**. [Moderate] Study
- ▶ **Vandetanib** slightly increases the exposure to **digoxin**. Monitor ECG and adjust dose. [Moderate] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **digoxin**. [Severe] Study
- ▶ **Vitamin D substances** are predicted to increase the risk of toxicity when given with **digoxin**. [Severe] Theoretical

Dihydrocodeine → see opioids

Dihydratachysterol → see vitamin D substances

Diltiazem → see calcium channel blockers

Dimenhydrinate → see TABLE 10 p. 849 (antimuscarinics)

Dimethyl fumarate

- ▶ **Alcohol (beverage)** (excessive consumption) potentially increases the risk of gastrointestinal side-effects when given with **dimethyl fumarate**. Avoid. [Moderate] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dimethyl fumarate**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Diphenoxylate → see opioids

Dipipanone → see opioids

Dipyridamole → see TABLE 8 p. 848 (hypotension), TABLE 4 p. 847 (antiplatelet effects)

- ▶ **Antacids** are predicted to decrease the absorption of **dipyridamole** (immediate release tablets). [Moderate] Theoretical
- ▶ **Dipyridamole** increases the exposure to **antiarrhythmics (adenosine)**. Avoid or adjust dose. [Severe] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **dipyridamole** (immediate release tablets). [Moderate] Theoretical
- ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **dipyridamole** (immediate release tablets). [Moderate] Theoretical

Disopyramide → see antiarrhythmics

Disulfiram → see TABLE 12 p. 850 (peripheral neuropathy)

- ▶ **Alcohol (beverage)** causes an extremely unpleasant systemic reaction when given with **disulfiram**. Avoid for at least 24 hours before and up to 14 days after stopping treatment. [Severe] Study

▶ **Disulfiram** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 12 p. 850

▶ **Disulfiram** increases the anticoagulant effect of **coumarins**. Monitor and adjust dose. [Severe] Study

▶ **Disulfiram** increases the risk of acute psychoses when given with **metronidazole**. [Severe] Study → Also see TABLE 12 p. 850

- ▶ **Disulfiram** is predicted to increase the anticoagulant effect of **phenindione**. [Severe] Theoretical

Dobutamine → see sympathomimetics, inotropic

Docetaxel → see taxanes

Dolutegravir

- ▶ **Antacids** moderately decrease the exposure to **dolutegravir**. **Dolutegravir** should be taken 2 hours before or 6 hours after **antacids**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Antiepileptics (oxcarbazepine)** are predicted to decrease the exposure to **dolutegravir**. Adjust dose. [Severe] Theoretical
- ▶ **Bosentan** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Oral calcium salts** decrease the absorption of **dolutegravir**. **Dolutegravir** should be taken 2 hours before or 6 hours after **calcium salts**. [Moderate] Study
- ▶ **Efavirenz** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Enzalutamide** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Etravirine** moderately decreases the exposure to **dolutegravir**. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
- ▶ **HIV-protease inhibitors (fosamprenavir)** boosted with ritonavir slightly decrease the exposure to **dolutegravir**. Avoid if resistant to HIV-integrase inhibitors. [Severe] Study
- ▶ **HIV-protease inhibitors (tipranavir)** moderately decrease the exposure to **dolutegravir**. Refer to specialist literature. [Severe] Study
- ▶ **Iron (oral)** decreases the absorption of **dolutegravir**. **Dolutegravir** should be taken 2 hours before or 6 hours after **iron (oral)**. [Moderate] Study
- ▶ **Dolutegravir** slightly to moderately increases the exposure to **metformin**. Use with caution and adjust dose. [Severe] Study
- ▶ **Mitotane** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Nevirapine** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Rifampicin** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **St John's Wort** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Sucralfate** decreases the absorption of **dolutegravir**. [Moderate] Study

Domperidone → see TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **Antiarrhythmics (dronedaron)** increase the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** increase the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Aprepitant** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** increase the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Cobicistat** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Crizotinib** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Domperidone** is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (**bromocriptine, cabergoline**). [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** increase the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Idelalisib** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Imatinib** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Macrolides (clarithromycin, erythromycin)** increase the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study

- ▶ **Netupitant** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Nilotinib** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study

Donepezil → see anticholinesterases, centrally acting

Dopamine → see sympathomimetics, inotropic

Dopamine receptor agonists → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 10 p. 849 (antimuscarinics)

amantadine • apomorphine • bromocriptine • cabergoline • pergolide • pramipexole • quinagolide • ropinirole • rotigotine

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment with **ropinirole**.

- ▶ **Amisulpride** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the concentration of **cabergoline**. [Severe] Anecdotal
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** increase the exposure to **bromocriptine**. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Aripiprazole** is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Asenapine** is predicted to decrease the effects of dopamine receptor agonists. Adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Benperidol** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Bupropion** increases the risk of side-effects when given with **amantadine**. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal → Also see TABLE 8 p. 848
- ▶ **Clozapine** is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 10 p. 849
- ▶ **Cobicistat** increases the exposure to **bromocriptine**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **ropinirole**. Adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Domperidone** is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (**bromocriptine, cabergoline**). [Moderate] Theoretical
- ▶ Dopamine receptor agonists (**cabergoline**) are predicted to increase the risk of ergotism when given with dopamine receptor agonists (**bromocriptine**). Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ Dopamine receptor agonists (**bromocriptine, cabergoline**) are predicted to increase the risk of ergotism when given with dopamine receptor agonists (**pergolide**). Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ Dopamine receptor agonists (**amantadine**) are predicted to increase the exposure to dopamine receptor agonists

Dopamine receptor agonists (continued)

(pramipexole). Adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 848

- ▶ **Droperidol** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849
- ▶ **Ergometrine** is predicted to increase the risk of ergotism when given with dopamine receptor agonists (cabergoline, pergolide). Avoid. [Moderate] Theoretical
- ▶ **Ergotamine** is predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical
- ▶ **Ergotamine** is predicted to increase the risk of ergotism when given with pergolide. [Moderate] Theoretical
- ▶ **Flupentixol** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Apomorphine** is predicted to increase the risk of severe hypotension when given with **granisetron**. [Severe] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to pramipexole. Adjust dose. [Moderate] Study
- ▶ **Haloperidol** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849 → Also see TABLE 10 p. 849
- ▶ **HIV-protease inhibitors** increase the exposure to bromocriptine. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- ▶ **Hormone replacement therapy** decreases the clearance of ropinirole. Monitor and adjust dose. [Moderate] Study
- ▶ **Idelalisib** increases the exposure to bromocriptine. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- ▶ **Imatinib** is predicted to increase the exposure to bromocriptine. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- ▶ **Loxapine** is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 10 p. 849
- ▶ **Macrolides (clarithromycin)** increase the exposure to bromocriptine. [Severe] Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the concentration of cabergoline. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to bromocriptine. [Severe] Theoretical
- ▶ **Amantadine** increases the risk of CNS toxicity when given with memantine. Use with caution or avoid. [Severe] Theoretical
- ▶ **Memantine** is predicted to increase the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). [Moderate] Theoretical
- ▶ **Metoclopramide** is predicted to decrease the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). Avoid. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to bromocriptine. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- ▶ **Nilotinib** is predicted to increase the exposure to bromocriptine. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- ▶ **Olanzapine** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Apomorphine** increases the risk of severe hypotension when given with **ondansetron**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Paliperidone** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849
- ▶ **Apomorphine** is predicted to increase the risk of severe hypotension when given with **palonosetron**. [Severe] Theoretical

- ▶ **Phenothiazines** are predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849 → Also see TABLE 10 p. 849
- ▶ **Pimozide** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849 → Also see TABLE 10 p. 849
- ▶ **Quetiapine** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
- ▶ **Risperidone** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849
- ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
- ▶ **Sulpiride** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849
- ▶ **Sympathomimetics, vasoconstrictor (isometheptene)** potentially increase the risk of side-effects when given with bromocriptine. Avoid. [Severe] Anecdotal
- ▶ **Zuclopenthixol** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849

Dorzolamide

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Dosulepin → see tricyclic antidepressants

Doxapram

- ▶ **Aminophylline** increases the risk of agitation when given with doxapram. [Moderate] Study
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the effects of doxapram. [Moderate] Theoretical
- ▶ **Theophylline** increases the risk of agitation when given with doxapram. [Moderate] Study

Doxazosin → see alpha blockers

Doxepin → see tricyclic antidepressants

Doxorubicin → see anthracyclines

Doxycycline → see tetracyclines

Dronedarone → see antiarrhythmics

Droperidol → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Droperidol** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849

▶ **Droperidol** is predicted to decrease the effects of **guanethidine**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 848

▶ **Droperidol** decreases the effects of **levodopa**. [Severe] Study → Also see TABLE 8 p. 848

▶ **Drosiprenone** → see TABLE 16 p. 851 (increased serum potassium)

▶ **Antifungals, azoles (ketoconazole)** moderately increase the exposure to drosiprenone. [Severe] Study

Dulaglutide → see TABLE 14 p. 850 (antidiabetic drugs)

Duloxetine → see TABLE 18 p. 851 (hyponatraemia), TABLE 13 p. 850 (serotonin syndrome), TABLE 4 p. 847 (antiplatelet effects)

▶ **Antiepileptics (phenytoin)** are predicted to decrease the exposure to duloxetine. [Moderate] Theoretical

▶ **Duloxetine** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. [Moderate] Study

▶ **Duloxetine** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study

▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to duloxetine. [Moderate] Theoretical

▶ **Leflunomide** is predicted to decrease the exposure to duloxetine. [Moderate] Theoretical

▶ **Duloxetine** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study

▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to duloxetine. Avoid. [Moderate] Theoretical

- ▶ **Rifampicin** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
- ▶ **SSRIs (fluvoxamine)** markedly increase the exposure to **duloxetine**. Avoid. [Severe] Study → Also see TABLE 18 p. 851 → Also see TABLE 13 p. 850 → Also see TABLE 4 p. 847
- ▶ **Teriflunomide** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical

Dupilumab → see monoclonal antibodies

Dutasteride

- ▶ **Antiarrhythmics (dronedarone)** are predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. [Moderate] Theoretical
- ▶ **Appetitant** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. [Moderate] Theoretical
- ▶ **Idealisib** is predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. [Moderate] Theoretical
- ▶ **Macrolides (erythromycin)** are predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Netupitant** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Nilotinib** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study

Eculizumab → see monoclonal antibodies

Edoxaban → see TABLE 3 p. 847 (anticoagulant effects)

- ▶ **Antiarrhythmics (amiodarone)** slightly increase the exposure to **edoxaban**. [Severe] Study
 - ▶ **Antiarrhythmics (dronedarone)** slightly increase the exposure to **edoxaban**. Adjust **edoxaban** dose. [Severe] Study
 - ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to **edoxaban**. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole)** are predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
 - ▶ **Antifungals, azoles (ketoconazole)** slightly increase the exposure to **edoxaban**. Adjust **edoxaban** dose. [Severe] Study
 - ▶ **Calcium channel blockers (verapamil)** are predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
 - ▶ **Ceritinib** is predicted to increase the exposure to **edoxaban**. [Moderate] Theoretical
 - ▶ **Ciclosporin** slightly increases the exposure to **edoxaban**. Adjust **edoxaban** dose. [Severe] Study
 - ▶ **Eliglustat** is predicted to increase the exposure to **edoxaban**. Adjust dose. [Moderate] Study
 - ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
 - ▶ **Lapatinib** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
 - ▶ **Macrolides (azithromycin, clarithromycin)** are predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
 - ▶ **Macrolides (erythromycin)** slightly increase the exposure to **edoxaban**. Adjust **edoxaban** dose. [Severe] Study
 - ▶ **Mirabegron** is predicted to increase the exposure to **edoxaban**. [Mild] Theoretical
 - ▶ **Ranolazine** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
 - ▶ **Rifampicin** is predicted to decrease the exposure to **edoxaban**. [Moderate] Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to **edoxaban**. [Moderate] Study
 - ▶ **Velpatasvir** is predicted to increase the exposure to **edoxaban**. [Severe] Theoretical
 - ▶ **Vemurafenib** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
 - ▶ **Voxilaprevir** is predicted to increase the concentration of **edoxaban**. Avoid. [Severe] Theoretical
- Efavirenz** → see TABLE 9 p. 849 (QT-interval prolongation)
- ▶ **Efavirenz** is predicted to decrease the exposure to **antiarrhythmics (dronedarone)**. [Severe] Theoretical → Also see TABLE 9 p. 849
 - ▶ **Antiepileptics (carbamazepine)** slightly decrease the exposure to **efavirenz** and **efavirenz** slightly decreases the exposure to **antiepileptics (carbamazepine)**. [Severe] Study
 - ▶ **Antiepileptics (fosphenytoin, phenytoin)** slightly decrease the exposure to **efavirenz** and **efavirenz** affects the concentration of **antiepileptics (fosphenytoin, phenytoin)**. [Severe] Theoretical
 - ▶ **Antiepileptics (phenobarbital)** are predicted to decrease the exposure to **efavirenz** and **efavirenz** affects the concentration of **antiepileptics (phenobarbital)**. [Severe] Theoretical
 - ▶ **Efavirenz** is predicted to affect the efficacy of **antiepileptics (primidone)** and **antiepileptics (primidone)** are predicted to slightly decrease the exposure to **efavirenz**. [Severe] Theoretical
 - ▶ **Efavirenz** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. Avoid. [Severe] Theoretical
 - ▶ **Efavirenz** slightly decreases the exposure to **antifungals, azoles (itraconazole)**. Avoid and for 14 days after stopping **efavirenz**. [Moderate] Study
 - ▶ **Efavirenz** moderately decreases the exposure to **antifungals, azoles (ketoconazole)**. [Severe] Study
 - ▶ **Efavirenz** slightly decreases the exposure to **antifungals, azoles (posaconazole)**. Avoid. [Moderate] Study
 - ▶ **Efavirenz** moderately decreases the exposure to **antifungals, azoles (voriconazole)** and **antifungals, azoles (voriconazole)** slightly increase the exposure to **efavirenz**. Adjust dose. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Efavirenz** decreases the concentration of **antimalarials (artemether)**. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Efavirenz** moderately decreases the exposure to **antimalarials (atovaquone)**. Avoid. [Moderate] Study
 - ▶ **Efavirenz** affects the exposure to **antimalarials (proguanil)**. Avoid. [Moderate] Study
 - ▶ **Efavirenz** is predicted to decrease the exposure to **axitinib**. [Moderate] Theoretical
 - ▶ **Efavirenz** is predicted to decrease the exposure to **bedaquiline**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Efavirenz** is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
 - ▶ **Efavirenz** is predicted to decrease the exposure to **bupropion**. [Moderate] Study
 - ▶ **Efavirenz** is predicted to decrease the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
 - ▶ **Efavirenz** is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Efavirenz** is predicted to decrease the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Moderate] Theoretical
 - ▶ **Efavirenz** is predicted to decrease the concentration of **caspofungin**. Adjust dose. [Moderate] Study
 - ▶ **Efavirenz** decreases the concentration of **ciclosporin**. Monitor concentration and adjust dose. [Moderate] Study
 - ▶ **Efavirenz** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
 - ▶ **Efavirenz** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
 - ▶ **Efavirenz** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
 - ▶ **Efavirenz** is predicted to affect the concentration of **coumarins**. Adjust dose. [Moderate] Theoretical

Efavirenz (continued)

- Efavirenz is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- Efavirenz is predicted to decrease the exposure to **daclatasvir**. Adjust dose. [Severe] Study
- Efavirenz is predicted to decrease the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 849
- Efavirenz is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- Efavirenz decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- Efavirenz is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- Efavirenz is predicted to decrease the exposure to **eliglustat**. [Moderate] Theoretical
- Efavirenz is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- Efavirenz is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical
- Efavirenz is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Study
- Efavirenz is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- Efavirenz is predicted to decrease the exposure to **gefitinib**. Avoid. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- Efavirenz is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- Efavirenz is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- Efavirenz decreases the exposure to **HIV-protease inhibitors**. Refer to specialist literature. [Severe] Study → Also see TABLE 9 p. 849
- Efavirenz is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- Efavirenz is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to **imatinib**. [Moderate] Study
- Efavirenz is predicted to decrease the exposure to **ivacaftor**. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- Efavirenz is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [Moderate] Theoretical
- Efavirenz decreases the exposure to **macrolides (clarithromycin)**. [Moderate] Study → Also see TABLE 9 p. 849
- Efavirenz decreases the exposure to **maraviroc**. Refer to specialist literature. [Severe] Theoretical
- Efavirenz is predicted to alter the effects of **midazolam**. Avoid. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to **netupitant**. [Moderate] Theoretical
- **Nevirapine** decreases the concentration of **efavirenz**. Avoid. [Severe] Study
- Efavirenz is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- Efavirenz is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- Efavirenz is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- Efavirenz decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study → Also see TABLE 9 p. 849

- Efavirenz is predicted to decrease the exposure to **osimertinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
 - Efavirenz is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
 - Efavirenz is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors**. [Moderate] Theoretical → Also see TABLE 9 p. 849
 - Efavirenz is predicted to decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
 - **Pitolisant** is predicted to decrease the exposure to **efavirenz**. [Unknown] Theoretical
 - Efavirenz is predicted to decrease the exposure to **quetiapine**. [Moderate] Study
 - Efavirenz is predicted to decrease the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
 - Efavirenz slightly decreases the exposure to **rifabutin**. Adjust dose. [Severe] Study
 - **Rifampicin** slightly decreases the exposure to **efavirenz**. Adjust dose. [Severe] Study
 - Efavirenz is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical
 - Efavirenz is predicted to decrease the exposure to **rolapitant**. Avoid. [Severe] Study
 - Efavirenz is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Theoretical
 - Efavirenz is predicted to decrease the exposure to **simeprevir**. Avoid. [Severe] Study
 - Efavirenz is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Theoretical
 - **St John's Wort** is predicted to decrease the concentration of **efavirenz**. Avoid. [Severe] Theoretical
 - Efavirenz slightly decreases the exposure to **statins (atorvastatin)**. [Mild] Study
 - Efavirenz moderately decreases the exposure to **statins (simvastatin)**. [Moderate] Study
 - Efavirenz is predicted to decrease the concentration of **tacrolimus**. Monitor and adjust dose. [Moderate] Theoretical
 - Efavirenz is predicted to decrease the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
 - Efavirenz is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
 - Efavirenz is predicted to decrease the exposure to **ticagrelor**. [Moderate] Theoretical
 - Efavirenz is predicted to decrease the exposure to **tofacitinib**. [Moderate] Study
 - Efavirenz is predicted to decrease the exposure to **tolvaptan**. [Moderate] Theoretical
 - Efavirenz decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
 - Efavirenz is predicted to decrease the exposure to **velpatasvir**. Avoid. [Moderate] Theoretical
 - Efavirenz is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
 - Efavirenz is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- ## Elbasvir
- Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
 - Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) slightly to moderately increase the exposure to **elbasvir**. Avoid. [Moderate] Study
 - **Bosentan** is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [Severe] Study
 - **Cobicistat** slightly to moderately increases the exposure to **elbasvir**. Avoid. [Moderate] Study
 - **Elbasvir** is predicted to increase the concentration of **dabigatran**. [Moderate] Theoretical
 - Efavirenz is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [Severe] Study
 - **Enzalutamide** is predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
 - **Etravirine** is predicted to decrease the exposure to **elbasvir**. Avoid. [Unknown] Theoretical

- ▶ **HIV-protease inhibitors** slightly to moderately increase the exposure to **elbasvir**. Avoid. [Moderate] Study
- ▶ **Idelalisib** slightly to moderately increases the exposure to **elbasvir**. Avoid. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** slightly to moderately increase the exposure to **elbasvir**. Avoid. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **Modafinil** is predicted to decrease the exposure to **elbasvir**. Avoid. [Unknown] Theoretical
- ▶ **Nevirapine** is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **Elbasvir** potentially increases the exposure to **statins (atorvastatin)**. Adjust atorvastatin dose, p. 132. [Moderate] Study
- ▶ **Elbasvir** is predicted to increase the exposure to **statins (fluvastatin)**. Adjust fluvastatin dose, p. 132. [Unknown] Theoretical
- ▶ **Elbasvir** increases the exposure to **statins (rosuvastatin)**. Adjust rosuvastatin dose, p. 133. [Moderate] Study
- ▶ **Elbasvir** is predicted to increase the exposure to **statins (simvastatin)**. Adjust simvastatin dose, p. 134. [Unknown] Theoretical
- ▶ **Elbasvir** is predicted to increase the concentration of **sunitinib**. Use with caution and adjust dose. [Moderate] Theoretical
- Eletriptan** → see TABLE 13 p. 850 (serotonin syndrome)
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **eletriptan**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **eletriptan**. Avoid. [Severe] Study
- ▶ **Eletriptan** increases the risk of vasoconstriction when given with **ergotamine**. Separate administration by 24 hours. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **eletriptan**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **eletriptan**. Avoid. [Severe] Study
- ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **eletriptan**. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** moderately increase the exposure to **eletriptan**. Avoid. [Moderate] Study
- Eliglustat**
- ▶ **Abraterone** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **aliskiren**. Adjust dose. [Moderate] Study
- ▶ **Antiarrhythmics (dronedarone, propafenone)** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. Adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **atomoxetine**. Adjust dose. [Moderate] Theoretical
- ▶ **Eliglustat** is predicted to increase the exposure to **beta blockers, non-selective (propranolol)**. Adjust dose. [Moderate] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. Adjust dose. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **eliglustat**. [Moderate] Theoretical
- ▶ **Bupropion** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Cinacalcet** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **colchicine**. Avoid or adjust colchicine dose. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **dabigatran**. Adjust dose. [Moderate] Study
- ▶ **Eliglustat** increases the exposure to **digoxin**. Adjust dose. [Moderate] Study
- ▶ **Duloxetine** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **edoxaban**. Adjust dose. [Moderate] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **eliglustat**. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **everolimus**. Adjust dose. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **eliglustat**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **loperamide**. Adjust dose. [Moderate] Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ **Moclobemide** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **eliglustat**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **phenothiazines (perphenazine)**. Adjust dose. [Moderate] Theoretical
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **sirolimus**. Adjust dose. [Moderate] Study
- ▶ **SRRs (fluoxetine, paroxetine)** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **St John's Wort** is predicted to increase the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **taxanes (paclitaxel)**. Adjust dose. [Moderate] Study
- ▶ **Terbinafine** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **tolterodine**. Adjust dose. [Moderate] Theoretical
- ▶ **Eliglustat** is predicted to increase the exposure to **topotecan**. Adjust dose. [Moderate] Study

Eliglustat (continued)

- ▶ **Eliglustat** is predicted to increase the exposure to **tricyclic antidepressants (nortriptyline)**. Adjust dose. [Moderate] Theoretical

Elotuzumab → see monoclonal antibodies

Eltrombopag

- ▶ **Antacids** decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **antacids**. [Severe] Study
- ▶ Oral **calcium salts** decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **calcium salts**. [Severe] Study
- ▶ **Dairy products** are predicted to decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **dairy products**. [Severe] Theoretical
- ▶ **Iron (oral)** is predicted to decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **iron (oral)**. [Severe] Theoretical
- ▶ **Selenium** is predicted to decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **selenium**. [Severe] Theoretical
- ▶ **Eltrombopag** is predicted to increase the exposure to **statins**. Monitor and adjust dose. [Moderate] Study
- ▶ **Zinc** is predicted to decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **zinc**. [Severe] Theoretical

Eluxadolone

- ▶ **Ciclosporin** increases the exposure to **eluxadolone**. Avoid. [Moderate] Study
- ▶ **Fibrates (gemfibrozil)** are predicted to increase the exposure to **eluxadolone**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (atazanavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **eluxadolone**. Avoid. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to increase the exposure to **eluxadolone**. Avoid. [Moderate] Theoretical
- ▶ **Eluxadolone** is predicted to increase the exposure to **statins**. [Moderate] Study

Elvitegravir

- ▶ **Antacids** moderately decrease the exposure to **elvitegravir**. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Elvitegravir** is predicted to decrease the anticoagulant effect of **coumarins**. [Moderate] Theoretical
- ▶ **Efavirenz** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (atazanavir, lopinavir)** (boosted with ritonavir) increase the concentration of **elvitegravir**. Refer to specialist literature. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **St John's Wort** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical

Empagliflozin → see TABLE 14 p. 850 (antidiabetic drugs), TABLE 8 p. 848 (hypotension)

Enalapril → see ACE inhibitors

Enoxaparin → see low molecular-weight heparins

Entacapone

- ▶ **Iron (oral)** is predicted to decrease the absorption of **entacapone**. Separate administration by at least 2 hours. [Moderate] Theoretical
- ▶ **Entacapone** increases the exposure to **levodopa**. Monitor side effects and adjust dose. [Moderate] Study
- ▶ **Entacapone** is predicted to increase the exposure to **methyl dopa**. [Moderate] Theoretical

- ▶ **Entacapone** is predicted to increase the risk of elevated blood pressure when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Theoretical
- ▶ **Entacapone** is predicted to increase the risk of cardiovascular side-effects when given with **sympathomimetics, inotropic**. [Moderate] Theoretical
- ▶ **Entacapone** is predicted to increase the risk of cardiovascular side-effects when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Moderate] Study

Enteral feeds

- ▶ **Antacids (aluminium hydroxide)** increase the risk of blocked enteral or nasogastric tubes when given with **enteral feeds**. [Moderate] Study
- ▶ **Enteral feeds** decrease the absorption of **antiepileptics (phenytoin)**. [Severe] Study
- ▶ **Enteral feeds** (vitamin-K containing) potentially decrease the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Enteral feeds** (vitamin-K containing) potentially decrease the effects of **phenindione**. [Severe] Theoretical
- ▶ **Enteral feeds** decrease the exposure to **quinolones (ciprofloxacin)**. [Moderate] Study
- ▶ **Sucralose** increases the risk of blocked enteral or nasogastric tubes when given with **enteral feeds**. Separate administration by 1 hour. [Moderate] Study
- ▶ **Enteral feeds** decrease the exposure to **theophylline**. [Moderate] Study

Enzalutamide

GENERAL INFORMATION Caution with concurrent chemotherapy—safety and efficacy not established.

- ▶ **Enzalutamide** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **antiarrhythmics (disopyramide, dronedarone)**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the efficacy of **antiarrhythmics (propafenone)**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **anticholinesterases, centrally acting (donepezil)**. [Mild] Study
- ▶ **Enzalutamide** is predicted to slightly decrease the exposure to **antiepileptics (brivaracetam)**. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **antiepileptics (perampanel)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **antimalarials (artemether)** (with lumefantrine). Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the concentration of **antimalarials (piperaquine)**. Avoid. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **apixaban**. Use with caution or avoid. [Severe] Study
- ▶ **Enzalutamide** moderately decreases the exposure to **apremilast**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to markedly decrease the exposure to **aprepitant**. Avoid. [Moderate] Study
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 249. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **Enzalutamide** decreases the exposure to **bedaquiline**. Avoid. [Severe] Study
- ▶ **Enzalutamide** slightly decreases the exposure to **bortezomib**. Avoid. [Severe] Study
- ▶ **Enzalutamide** affects the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [Severe] Study

- ▶ **Enzalutamide** is predicted to decrease the exposure to **buprisone**. Use with caution and adjust dose. [Severe] Study
- ▶ **Enzalutamide** moderately decreases the exposure to **cabozantinib**. Avoid. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **cannabis extract**. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study
- ▶ **Enzalutamide** decreases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Enzalutamide** is predicted to alter the effects of **cilostazol**. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** decreases the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study
- ▶ **Clopidogrel** moderately increases the exposure to **enzalutamide**. Avoid or adjust **enzalutamide** dose. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **clozapine**. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, prednisone, triamcinolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **corticosteroids (fluticasone)**. [Unknown] Theoretical
- ▶ **Enzalutamide** potentially decreases the exposure to **coumarins**. Avoid or adjust dose and monitor INR. [Severe] Study
- ▶ **Enzalutamide** is predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **daclatasvir**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **dasabuvir**. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study
- ▶ **Enzalutamide** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- ▶ **Enzalutamide** moderately decreases the exposure to **exemestane**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study
- ▶ **Fibrates (gemfibrozil)** moderately increase the exposure to **enzalutamide**. Avoid or adjust **enzalutamide** dose. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **finigolimod**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **fosaprepitant**. Avoid. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **gefitinib**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **Enzalutamide** decreases the concentration of **haloperidol**. Adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **ibrutinib**. Avoid or adjust **ibrutinib** dose. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **ixazomib**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **linagliptin**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **lurasidone**. Avoid. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **macitentan**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **midostaurin**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **montelukast**. [Mild] Study
- ▶ **Enzalutamide** is predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ **Enzalutamide** is predicted to slightly decrease the exposure to **nateglinide**. [Mild] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **netupitant**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **nitisone**. Adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **ondansetron**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **opioids (alfentanil, fentanyl)**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **opioids (buprenorphine)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **opioids (oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **palbociclib**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **paliperidone**. Monitor and adjust dose. [Severe] Study

Enzalutamide (continued)

- ▶ Enzalutamide is predicted to decrease the exposure to **panobinostat**. Avoid. [Moderate] Theoretical
- ▶ Enzalutamide is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **pazopanib**. Avoid. [Severe] Theoretical
- ▶ Enzalutamide is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (avanafil, tadalafil)**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (sildenafil, vardenafil)**. [Moderate] Theoretical
- ▶ Enzalutamide is predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to moderately decrease the exposure to **pitolisant**. [Moderate] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **ponatinib**. Avoid. [Moderate] Theoretical
- ▶ Enzalutamide is predicted to markedly decrease the exposure to **praziquantel**. Avoid. [Moderate] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **quetiapine**. [Moderate] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **ranolazine**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **reboxetine**. [Moderate] Anecdotal
- ▶ Enzalutamide is predicted to decrease the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **repaglinide**. Monitor blood glucose and adjust dose. [Moderate] Study
- ▶ Enzalutamide is predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- ▶ Enzalutamide markedly decreases the exposure to **rilpivirine**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **risperidone**. Adjust dose. [Moderate] Study
- ▶ Enzalutamide is predicted to moderately decrease the exposure to **rivaroxaban**. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **roflumilast**. Avoid. [Moderate] Study
- ▶ Enzalutamide is predicted to markedly decrease the exposure to **rolapitant**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **ruixolitinib**. Monitor and adjust dose. [Moderate] Study
- ▶ Enzalutamide is predicted to moderately decrease the exposure to **saxagliptin**. [Moderate] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the concentration of **sirolimus**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **solifenacin**. [Moderate] Theoretical
- ▶ Enzalutamide is predicted to decrease the exposure to **sorafenib**. [Moderate] Theoretical
- ▶ Enzalutamide is predicted to decrease the exposure to **statins (simvastatin)**. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study
- ▶ Enzalutamide decreases the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **taxanes (cabazitaxel, paclitaxel)**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **taxanes (docetaxel)**. [Severe] Theoretical
- ▶ Enzalutamide is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Study
- ▶ Enzalutamide decreases the exposure to **tetracyclines (doxycycline)**. Monitor and adjust dose. [Moderate] Study
- ▶ Enzalutamide is predicted to markedly decrease the exposure to **ticagrelor**. Avoid. [Severe] Study

- ▶ Enzalutamide is predicted to decrease the exposure to **tivozanib**. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **tofacitinib**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **tolvaptan**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **torsemide**. Adjust dose. [Moderate] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical
- ▶ Enzalutamide is predicted to markedly decrease the exposure to **ulipristal**. Avoid and for 4 weeks after stopping **ulipristal**. [Severe] Theoretical
- ▶ Enzalutamide is predicted to decrease the exposure to **vandetanib**. Avoid. [Moderate] Study
- ▶ Enzalutamide is predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **vemurafenib**. Avoid. [Severe] Theoretical
- ▶ Enzalutamide is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **vinca alkaloids (vinblastine, vincristine, vindesine)**. [Severe] Theoretical
- ▶ Enzalutamide is predicted to decrease the exposure to **vinca alkaloids (vinflunine)**. Avoid. [Severe] Theoretical
- ▶ Enzalutamide is predicted to decrease the exposure to **vinca alkaloids (vinorelbine)**. Use with caution or avoid. [Severe] Theoretical
- ▶ Enzalutamide is predicted to decrease the exposure to **vismodegib**. Avoid. [Moderate] Theoretical
- ▶ Enzalutamide is predicted to decrease the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study
- ▶ Enzalutamide is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Study
- ▶ Enzalutamide is predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Ephedrine** → see sympathomimetics, vasoconstrictor
- Epirubicin** → see anthracyclines
- Eplerenone** → see aldosterone antagonists
- Epoetin alfa** → see TABLE 5 p. 847 (thromboembolism), TABLE 16 p. 851 (increased serum potassium)
- Epoetin beta** → see TABLE 5 p. 847 (thromboembolism), TABLE 16 p. 851 (increased serum potassium)
- Epoetin zeta** → see TABLE 5 p. 847 (thromboembolism), TABLE 16 p. 851 (increased serum potassium)
- Epoprostenol** → see TABLE 4 p. 847 (antiplatelet effects)
- Eprosartan** → see angiotensin-II receptor antagonists
- Eptifibatide** → see TABLE 4 p. 847 (antiplatelet effects)
- Ergocalciferol** → see vitamin D substances
- Ergometrine**
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
 - ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **ergometrine**. Avoid. [Moderate] Theoretical
 - ▶ **Aprepitant** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
 - ▶ **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergometrine**. [Severe] Study
 - ▶ **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergometrine**. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
 - ▶ **Cobicistat** is predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical

- ▶ **Crizotinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
 - ▶ **Ergometrine** is predicted to increase the risk of ergotism when given with **dopamine receptor agonists (cabergoline, pergolide)**. Avoid. [Moderate] Theoretical
 - ▶ **Grapefruit juice** is predicted to increase the exposure to **ergometrine**. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
 - ▶ **Imatinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
 - ▶ **Macrolides (erythromycin)** are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
 - ▶ **Netupitant** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
 - ▶ **Nilotinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
 - ▶ **Ergometrine** potentially increases the risk of peripheral vasoconstriction when given with **sympathomimetics, inotropic (dopamine)**. Avoid. [Severe] Anecdotal
 - ▶ **Ergometrine** is predicted to increase the risk of peripheral vasoconstriction when given with **sympathomimetics, vasoconstrictor (noradrenaline/norepinephrine)**. [Severe] Anecdotal
- Ergotamine**

- ▶ **Almotriptan** is predicted to increase the risk of vasoconstriction when given with **ergotamine**. **Ergotamine** should be taken at least 24 hours before or 6 hours after **almotriptan**. [Severe] Theoretical
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **ergotamine**. Avoid. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergotamine**. [Severe] Study
- ▶ **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergotamine**. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Ergotamine** is predicted to increase the risk of ergotism when given with **dopamine receptor agonists (bromocriptine, cabergoline)**. Avoid. [Moderate] Theoretical
- ▶ **Ergotamine** is predicted to increase the risk of ergotism when given with **dopamine receptor agonists (pergolide)**. [Moderate] Theoretical
- ▶ **Efavirenz** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical

- ▶ **Eletriptan** increases the risk of vasoconstriction when given with **ergotamine**. Separate administration by 24 hours. [Severe] Study
 - ▶ **Enzalutamide** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
 - ▶ **Grapefruit juice** is predicted to increase the exposure to **ergotamine**. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
 - ▶ **Imatinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
 - ▶ **Macrolides (erythromycin)** are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
 - ▶ **Mitotane** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
 - ▶ **Naratriptan** is predicted to increase the risk of vasoconstriction when given with **ergotamine**. Separate administration by 24 hours. [Severe] Theoretical
 - ▶ **Netupitant** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
 - ▶ **Nevirapine** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
 - ▶ **Nilotinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
 - ▶ **Palbociclib** is predicted to increase the exposure to **ergotamine**. Adjust dose. [Moderate] Theoretical
 - ▶ **Ribociclib (high-dose)** is predicted to increase the exposure to **ergotamine**. Avoid. [Moderate] Theoretical
 - ▶ **Rifampicin** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
 - ▶ **Rizatriptan** is predicted to increase the risk of vasoconstriction when given with **ergotamine**. **Ergotamine** should be taken at least 24 hours before or 6 hours after **rizatriptan**. [Severe] Theoretical
 - ▶ **St John's Wort** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
 - ▶ **Sumatriptan** increases the risk of vasoconstriction when given with **ergotamine**. **Ergotamine** should be taken at least 24 hours before or 6 hours after **sumatriptan**. [Severe] Study
 - ▶ **Ticagrelor** is predicted to increase the exposure to **ergotamine**. Avoid. [Severe] Theoretical
- Eribulin** → see TABLE 15 p. 850 (myelosuppression), TABLE 12 p. 850 (peripheral neuropathy), TABLE 9 p. 849 (QT-interval prolongation)

Erlotinib

FOOD AND LIFESTYLE Dose adjustment may be necessary if smoking started or stopped during treatment.

- ▶ **Antacids** are predicted to decrease the absorption of **erlotinib**. **Antacids** should be taken 4 hours before or 2 hours after **erlotinib**. [Moderate] Theoretical
- ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to slightly increase the exposure to **erlotinib**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **aspirin** (high-dose). [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical

Erlotinib (continued)

- ▶ **Cobicistat** is predicted to slightly increase the exposure to **erlotinib**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Combined hormonal contraceptives** slightly increase the exposure to **erlotinib**. Monitor side effects and adjust dose. [Moderate] Study
 - ▶ **Corticosteroids** increase the risk of gastrointestinal perforation when given with **erlotinib**. [Severe] Theoretical
 - ▶ **Erlotinib** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
 - ▶ **Crizotinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
 - ▶ **Efavirenz** is predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose. [Severe] Study
 - ▶ **Grapefruit juice** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
 - ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **erlotinib**. **Erlotinib** should be taken 2 hours before or 10 hours after **H₂ receptor antagonists**. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to slightly increase the exposure to **erlotinib**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Idelalisib** is predicted to slightly increase the exposure to **erlotinib**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
 - ▶ **Lapatinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
 - ▶ **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to **erlotinib**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose. [Severe] Study
 - ▶ **Netupitant** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
 - ▶ **Nevirapine** is predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical
 - ▶ **Nilotinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
 - ▶ **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **NSAIDs**. [Severe] Theoretical
 - ▶ **Erlotinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
 - ▶ **Proton pump inhibitors** are predicted to slightly decrease the exposure to **erlotinib**. Avoid. [Moderate] Study
 - ▶ **Quinolones (ciprofloxacin)** slightly increase the exposure to **erlotinib**. Monitor side effects and adjust dose. [Moderate] Study
 - ▶ **Ranolazine** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
 - ▶ **Rifampicin** is predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose. [Severe] Study
 - ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **erlotinib**. Monitor side effects and adjust dose. [Moderate] Theoretical
 - ▶ **St John's Wort** is predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- Ertapenem** → see carbapenems
- Erythromycin** → see macrolides
- Escitalopram** → see SSRIs
- Eslicarbazepine** → see antiepileptics
- Esmolol** → see beta blockers, selective
- Esomeprazole** → see proton pump inhibitors
- Estramustine** → see alkylating agents
- Etanercept**
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etanercept**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Etelcalcetide

- ▶ **Cinacalcet** increases the risk of hypocalcaemia when given with **etelcalcetide**. Avoid. [Severe] Theoretical

Ethambutol

- ▶ **Isoniazid** increases the risk of optic neuropathy when given with **ethambutol**. [Severe] Anecdotal

Ethosuximide → see antiepileptics

Etodolac → see NSAIDs

- ▶ **Etomidate** → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

Etonogestrel

- ▶ **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Apripitant** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Bosentan** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Efavirenz** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Fosaprepitant** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Griseofulvin** decreases the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Modafinil** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Nevirapine** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Rifabutin** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Rifampicin** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **St John's Wort** is predicted to decrease the efficacy of **etonogestrel**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Sugammadex** is predicted to decrease the efficacy of **etonogestrel**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Ulipristal** is predicted to decrease the efficacy of **etonogestrel**. Avoid. [Severe] Theoretical
- Etoposide** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the efficacy of **etoposide**. [Moderate] Study
 - ▶ **Ciclosporin** increases the exposure to **etoposide**. Monitor and adjust dose. [Severe] Study
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etoposide**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Etoricoxib** → see NSAIDs
- Etravirine**
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Theoretical
 - ▶ **Etravirine** decreases the exposure to **antimalarials (artemether)**. [Moderate] Study
 - ▶ **Etravirine** is predicted to decrease the exposure to **bedaquiline**. Avoid. [Severe] Theoretical
 - ▶ **Bosentan** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Study

- ▶ **Etravirine** is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical
 - ▶ **Etravirine** increases the anticoagulant effect of **coumarins**. [Moderate] Theoretical
 - ▶ **Etravirine** is predicted to decrease the exposure to **daclatasvir**. Avoid. [Moderate] Theoretical
 - ▶ **Etravirine** moderately decreases the exposure to **dolutegravir**. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
 - ▶ **Efavirenz** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Study
 - ▶ **Etravirine** is predicted to decrease the exposure to **elbasvir**. Avoid. [Unknown] Theoretical
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Theoretical
 - ▶ **Etravirine** is predicted to decrease the exposure to **grazoprevir**. Avoid. [Mid] Theoretical
 - ▶ **HIV-protease inhibitors (tipranavir)** decrease the exposure to **etravirine**. Avoid. [Severe] Study
 - ▶ **Etravirine** increases the exposure to **HIV-protease inhibitors (fosamprenavir)** (boosted with ritonavir). Refer to specialist literature. [Moderate] Study
 - ▶ **Etravirine** decreases the exposure to **macrolides (clarithromycin)**. [Severe] Study
 - ▶ **Etravirine** (with a boosted protease inhibitor) increases the exposure to **maraviroc**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Theoretical
 - ▶ **Nevirapine** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Study
 - ▶ **Etravirine** moderately decreases the exposure to **phosphodiesterase type-5 inhibitors**. Adjust dose. [Moderate] Study
 - ▶ **Rifabutin** decreases the exposure to **etravirine**. [Moderate] Study
 - ▶ **Rifampicin** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Theoretical
 - ▶ **Etravirine** is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical
 - ▶ **Etravirine** is predicted to decrease the exposure to **simeprevir**. Avoid. [Moderate] Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Study
 - Everolimus** → see TABLE 15 p. 850 (myelosuppression)
 - ▶ **Antiarrhythmics (dronedrone)** are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
 - ▶ **Appetant** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Bosentan** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Certinib** is predicted to increase the exposure to **everolimus**. [Moderate] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Ciclosporin** moderately increases the exposure to **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **Cobicistat** is predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
 - ▶ **Efavirenz** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **Eliglustat** is predicted to increase the exposure to **everolimus**. Adjust dose. [Moderate] Study
 - ▶ **Enzalutamide** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **Grapefruit juice** is predicted to increase the exposure to **everolimus**. Avoid. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
 - ▶ **Imatinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
 - ▶ **Lapatinib** is predicted to increase the exposure to **everolimus**. [Moderate] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **everolimus**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Everolimus** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **everolimus**. Avoid. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Mirabegron** is predicted to increase the exposure to **everolimus**. [Mid] Theoretical
 - ▶ **Mitotane** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 850
 - ▶ **Netupitant** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Nevirapine** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
 - ▶ **Palbociclib** is predicted to increase the exposure to **everolimus**. Adjust dose. [Moderate] Theoretical
 - ▶ **Pitolisant** is predicted to decrease the exposure to **everolimus**. Avoid. [Severe] Theoretical
 - ▶ **Ribociclib** is predicted to increase the exposure to **everolimus**. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ **Rifampicin** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **St John's Wort** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **Velpatasvir** is predicted to increase the exposure to **everolimus**. [Severe] Theoretical
 - Exemestane**
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** moderately decrease the exposure to **exemestane**. [Moderate] Study
 - ▶ **Enzalutamide** moderately decreases the exposure to **exemestane**. [Moderate] Study
 - ▶ **Mitotane** moderately decreases the exposure to **exemestane**. [Moderate] Study
 - ▶ **Rifampicin** moderately decreases the exposure to **exemestane**. [Moderate] Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to **exemestane**. [Moderate] Theoretical
 - Exenatide** → see TABLE 14 p. 850 (antidiabetic drugs)
- SEPARATION OF ADMINISTRATION** With standard-release exenatide: some orally administered drugs should be taken at least 1 hour before, or 4 hours after, exenatide injection.
- Ezetimibe**
 - ▶ **Ciclosporin** moderately increases the exposure to **ezetimibe** and **ezetimibe** slightly increases the exposure to **ciclosporin**. [Moderate] Study
 - ▶ **Fibrates** are predicted to increase the risk of gallstones when given with **ezetimibe**. [Severe] Theoretical
 - ▶ **Ezetimibe** potentially increases the risk of rhabdomyolysis when given with **statins**. [Severe] Anecdotal
 - Famotidine** → see H₂ receptor antagonists

Fampridine

- ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of fampridine. Avoid. [Severe] Theoretical

Febuxostat

- ▶ **Febuxostat** is predicted to increase the exposure to **azathioprine**. Avoid. [Severe] Theoretical
- ▶ **Febuxostat** is predicted to increase the exposure to **didanosine**. [Severe] Theoretical
- ▶ **Febuxostat** is predicted to increase the exposure to **mercaptopurine**. Avoid. [Severe] Theoretical

Felbinac → see NSAIDs

Felodipine → see calcium channel blockers

Fenofibrate → see fibrates

Fenoprofen → see NSAIDs

Fentanyl → see opioids

Ferric carboxymaltose → see iron (injectable)

Ferric maltol → see iron (oral)

Ferrous fumarate → see iron (oral)

Ferrous gluconate → see iron (oral)

Ferrous sulfate → see iron (oral)

Fesoterodine → see TABLE 10 p. 849 (antimuscarinics)

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study

- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study

- ▶ **Aprepitant** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- ▶ **Cobicistat** is predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study

- ▶ **Crizotinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- ▶ **Enzalutamide** is predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study

- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study

- ▶ **Idelalisib** is predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study

- ▶ **Imatinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study

- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- ▶ **Mitotane** is predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study

- ▶ **Netupitant** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- ▶ **Nilotinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study

- ▶ **Rifampicin** is predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study

- ▶ **St John's Wort** is predicted to decrease the exposure to **fesoterodine**. Avoid. [Severe] Theoretical

Fexofenadine → see antihistamines, non-sedating

Fibrates

bezafibrate · ciprofibrate · fenofibrate · gemfibrozil

- ▶ **Antacids** slightly to moderately decrease the exposure to **gemfibrozil**. [Moderate] Study

- ▶ **Bezafibrate** is predicted to increase the risk of nephrotoxicity when given with **ciclosporin**. [Severe] Theoretical

- ▶ **Fenofibrate** increases the risk of nephrotoxicity when given with **ciclosporin**. [Severe] Study

- ▶ **Colchicine** increases the risk of rhabdomyolysis when given with fibrates. [Severe] Anecdotal

- ▶ **Fibrates** are predicted to increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study

- ▶ **Gemfibrozil** is predicted to increase the exposure to **dabrafenib**. [Moderate] Theoretical

- ▶ **Fibrates** are predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical

- ▶ **Gemfibrozil** very markedly increases the exposure to **dasabuvir**. Avoid. [Severe] Study

- ▶ **Gemfibrozil** is predicted to increase the exposure to **eluxadoline**. Avoid. [Moderate] Theoretical

- ▶ **Gemfibrozil** moderately increases the exposure to **enzalutamide**. Avoid or adjust **enzalutamide** dose. [Severe] Study

- ▶ **Fibrates** are predicted to increase the risk of gallstones when given with **ezetimibe**. [Severe] Theoretical

- ▶ **Fibrates** are predicted to increase the risk of hypoglycaemia when given with **insulins**. [Moderate] Theoretical

- ▶ **Gemfibrozil** is predicted to moderately increase the exposure to **montelukast**. [Moderate] Study

- ▶ **Fibrates** are predicted to increase the anticoagulant effect of **phenindione**. Monitor INR and adjust dose. [Severe] Study

- ▶ **Gemfibrozil** increases the exposure to **pioglitazone**. Monitor blood glucose and adjust dose. [Severe] Study

- ▶ **Gemfibrozil** increases the exposure to **repaglinide**. Avoid. [Severe] Study

- ▶ **Gemfibrozil** is predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust **alitretinoin** dose. [Moderate] Theoretical

- ▶ **Gemfibrozil** increases the concentration of **retinoids (bexarotene)**. Avoid. [Severe] Study

- ▶ **Gemfibrozil** increases the exposure to **selexipag**. Avoid. [Severe] Study

- ▶ **Ciprofibrate** increases the risk of rhabdomyolysis when given with **statins (atorvastatin)**. Avoid or adjust dose. [Severe] Study

- ▶ **Bezafibrate** increases the risk of rhabdomyolysis when given with **statins (atorvastatin, fluvastatin)**. [Severe] Study

- ▶ **Fenofibrate** increases the risk of rhabdomyolysis when given with **statins (atorvastatin, simvastatin)**. Adjust **fenofibrate** dose, p. 131. [Severe] Anecdotal

- ▶ **Ciprofibrate** increases the risk of rhabdomyolysis when given with **statins (fluvastatin)**. [Severe] Study

- ▶ **Fenofibrate** is predicted to increase the risk of rhabdomyolysis when given with **statins (fluvastatin)**. Adjust **fenofibrate** dose, p. 131. [Severe] Theoretical

- ▶ **Fenofibrate** is predicted to increase the risk of rhabdomyolysis when given with **statins (pravastatin)**. Avoid. [Severe] Theoretical

- ▶ **Fibrates (bezafibrate, ciprofibrate)** increase the risk of rhabdomyolysis when given with **statins (pravastatin)**. Avoid. [Severe] Study

- ▶ **Fenofibrate** increases the risk of rhabdomyolysis when given with **statins (rosuvastatin)**. Adjust **fenofibrate** and **rosuvastatin** doses, p. 131, p. 133. [Severe] Anecdotal

- ▶ **Fibrates (bezafibrate, ciprofibrate)** increase the risk of rhabdomyolysis when given with **statins (rosuvastatin)**. Adjust **rosuvastatin** dose, p. 133. [Severe] Study

- ▶ Fibrates (**bezafibrate**, **ciprofibrate**) increase the risk of rhabdomyolysis when given with **statins** (**simvastatin**). Adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Gemfibrozil** increases the risk of rhabdomyolysis when given with **statins**. Avoid. [Severe] Anecdotal
- ▶ Fibrates are predicted to increase the risk of hypoglycaemia when given with **sulfonylureas**. [Moderate] Theoretical
- ▶ **Gemfibrozil** is predicted to increase the concentration of **taxanes** (**paclitaxel**). [Severe] Anecdotal
- ▶ Fibrates are predicted to decrease the efficacy of **ursodeoxycholic acid**. Avoid. [Severe] Theoretical

Fidaxomicin

- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ Calcium channel blockers (**verapamil**) are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ HIV-protease inhibitors (**lopinavir**, **ritonavir**, **saquinavir**) are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Lapatinib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Macrolides** are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Vemurafenib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study

Fingolimod → see TABLE 6 p. 848 (bradycardia), TABLE 9 p. 849 (QT-interval prolongation)

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **fingolimod**. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem**, **verapamil**) are predicted to increase the exposure to **fingolimod**. Avoid. [Moderate] Theoretical → Also see TABLE 6 p. 848
- ▶ **Enzalutamide** is predicted to decrease the exposure to **fingolimod**. [Moderate] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fingolimod**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **fingolimod**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **fingolimod**. [Moderate] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **fingolimod**. Avoid. [Moderate] Theoretical

Flavoxate → see TABLE 10 p. 849 (antimuscarinics)

Flecainide → see antiarrhythmics

Flucoxacinillin → see penicillins

Fluconazole → see antifungals, azoles

Flucytosine

- ▶ **Amphotericin** increases the risk of toxicity when given with **flucytosine**. [Severe] Study
- ▶ **Cytarabine** decreases the concentration of **flucytosine**. Avoid. [Severe] Study

Fludarabine → see TABLE 15 p. 850 (myelosuppression)

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fludarabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

- ▶ **Fludarabine** increases the risk of pulmonary toxicity when given with **pentostatin**. Avoid. [Severe] Study → Also see TABLE 15 p. 850

Fludrocortisone → see corticosteroids

Fluocinolone

ROUTE-SPECIFIC INFORMATION With intravitreal use in adults: caution with concurrent administration of anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage).

Fluorouracil → see TABLE 15 p. 850 (myelosuppression), TABLE 5 p. 847 (thromboembolism)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Fluorouracil** increases the concentration of **antiepileptics** (**fosphenytoin**, **phenytoin**). Monitor concentration and adjust dose. [Severe] Anecdotal
- ▶ **Fluorouracil** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Folates** (**folic acid**) are predicted to increase the risk of toxicity when given with **fluorouracil**. Avoid. [Severe] Theoretical
- ▶ **Folates** (**folic acid**) are predicted to increase the risk of toxicity when given with **fluorouracil**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **H₂ receptor antagonists** (**cimetidine**) slightly increase the exposure to **fluorouracil**. [Severe] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fluorouracil**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Metronidazole** increases the risk of toxicity when given with **fluorouracil**. [Severe] Study

Fluoxetine → see SSRIs

Flupentixol → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Flupentixol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Flupentixol** decreases the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 848

Fluphenazine → see phenothiazines

Flurazepam → see TABLE 11 p. 849 (CNS depressant effects)

- ▶ HIV-protease inhibitors (**ritonavir**) are predicted to increase the exposure to **flurazepam**. Avoid. [Moderate] Theoretical

Flurbiprofen → see NSAIDs

Fluticasone → see corticosteroids

Fluvastatin → see statins

Fluvoxamine → see SSRIs

Folates

folic acid · folic acid · levofolinic acid

- ▶ **Folates** are predicted to decrease the concentration of **antiepileptics** (**fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**). Monitor concentration and adjust dose. [Severe] Study
- ▶ **Folates** are predicted to increase the risk of toxicity when given with **capecitabine**. [Severe] Anecdotal
- ▶ **Folic acid** is predicted to increase the risk of toxicity when given with **fluorouracil**. Avoid. [Severe] Theoretical
- ▶ **Folinic acid** is predicted to increase the risk of toxicity when given with **fluorouracil**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Folates** are predicted to alter the effects of **ralitrexed**. Avoid. [Moderate] Study
- ▶ **Sulfasalazine** is predicted to decrease the absorption of **folates**. [Moderate] Study
- ▶ **Folates** are predicted to increase the risk of toxicity when given with **tegafur**. [Severe] Theoretical

Folic acid → see folates

Folinic acid → see folates

Fondaparinux → see TABLE 3 p. 847 (anticoagulant effects)

Formoterol → see beta₂ agonists

Fosamprenavir → see HIV-protease inhibitors

Fosaprepitant

- ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **fosaprepitant**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **fosaprepitant**. [Moderate] Theoretical
- ▶ **Fosaprepitant** is predicted to increase the exposure to **bosutinib**. [Severe] Theoretical

Fosaprepitant (continued)

- **Cobicistat** is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical
- Fosaprepitant is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- Fosaprepitant is predicted to increase the exposure to **corticosteroids (dexamethasone, methylprednisolone)**. Monitor and adjust dose. [Moderate] Theoretical
- Fosaprepitant is predicted to decrease the anticoagulant effect of **coumarins**. [Moderate] Theoretical
- Fosaprepitant is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
- Fosaprepitant is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- Fosaprepitant is predicted to increase the concentration of **guanfacine**. [Moderate] Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical
- Fosaprepitant is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- Fosaprepitant is predicted to slightly increase the exposure to **ibrutinib**. [Moderate] Theoretical
- **Idelalisib** is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical
- Fosaprepitant is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- Fosaprepitant is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical
- Fosaprepitant slightly increases the exposure to **midazolam**. [Moderate] Study
- **Mitotane** is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
- Fosaprepitant is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- Fosaprepitant is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
- **St John's Wort** is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
- Fosaprepitant decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- **Foscarnet** → see TABLE 2 p. 847 (nephrotoxicity)
- Foscarnet increases the risk of hypocalcaemia when given with **pentamidine**. [Severe] Anecdotal → Also see TABLE 2 p. 847
- **Fosinopril** → see ACE inhibitors
- **Fosphenytoin** → see antiepileptics
- **Frovatriptan** → see TABLE 13 p. 850 (serotonin syndrome)
- **SSRIs (fluvoxamine)** increase the concentration of **froatriptan**. [Severe] Study → Also see TABLE 13 p. 850
- **Fulvestrant** → see TABLE 5 p. 847 (thromboembolism)
- **Furosemide** → see loop diuretics
- **Fusidic acid**
- Fusidic acid increases the risk of rhabdomyolysis when given with **statins**. Avoid. [Severe] Anecdotal
- **Gabapentin** → see antiepileptics
- **Galantamine** → see anticholinesterases, centrally acting
- **Ganciclovir** → see TABLE 15 p. 850 (myelosuppression), TABLE 2 p. 847 (nephrotoxicity)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- **Ganciclovir** is predicted to increase the exposure to **didanosine**. [Moderate] Study
- **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **ganciclovir**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- **Gefitinib** → see TABLE 15 p. 850 (myelosuppression)
- **Antacids** are predicted to slightly decrease the exposure to gefitinib. [Moderate] Theoretical
- **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to gefitinib. [Moderate] Study
- **Aprepitant** is predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- **Bosentan** is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the exposure to gefitinib. [Moderate] Study
- **Gefitinib** is predicted to increase the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- **Crizotinib** is predicted to increase the exposure to gefitinib. [Moderate] Theoretical → Also see TABLE 15 p. 850
- **Efavirenz** is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- **H₂ receptor antagonists** are predicted to slightly to moderately decrease the exposure to gefitinib. [Moderate] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to gefitinib. [Moderate] Study
- **Idelalisib** is predicted to increase the exposure to gefitinib. [Moderate] Study → Also see TABLE 15 p. 850
- **Imatinib** is predicted to increase the exposure to gefitinib. [Moderate] Theoretical → Also see TABLE 15 p. 850
- **Macrolides (clarithromycin)** are predicted to increase the exposure to gefitinib. [Moderate] Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- **Mitotane** is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- **Netupitant** is predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- **Nevirapine** is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to gefitinib. [Moderate] Theoretical → Also see TABLE 15 p. 850
- **Gefitinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- **Proton pump inhibitors** are predicted to decrease the exposure to gefitinib. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- **St John's Wort** is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- **Gemcitabine** → see TABLE 15 p. 850 (myelosuppression)
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **gemcitabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Gemfibrozil** → see fibrates
- **Gentamicin** → see aminoglycosides
- **Glecaprevir**
- **Antiarrhythmics (dronedaron)** potentially increase the exposure to glecaprevir. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to glecaprevir. Avoid. [Severe] Study

- ▶ Antiepileptics (**eslicarbazepine**, **oxcarbazepine**) potentially decrease the exposure to **glecaprevir**. Avoid. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) potentially increase the exposure to **glecaprevir**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Ciclosporin** increases the exposure to **glecaprevir**. Avoid or monitor. [Severe] Study
- ▶ **Cobicistat** potentially increases the exposure to **glecaprevir**. [Moderate] Theoretical
- ▶ **Crizotinib** potentially decreases the exposure to **glecaprevir**. Avoid. [Severe] Theoretical
- ▶ **Glecaprevir** (with **pibrentasvir**) increases the exposure to **dabigatran**. Avoid. [Moderate] Study
- ▶ **Glecaprevir** (with **pibrentasvir**) increases the exposure to **digoxin**. [Moderate] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ HIV-protease inhibitors (**atazanavir**, **darunavir**, **lopinavir**) (boosted with **ritonavir**) increase the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ HIV-protease inhibitors (**ritonavir**) potentially increase the exposure to **glecaprevir**. [Severe] Theoretical
- ▶ **Lumacaftor** potentially decreases the exposure to **glecaprevir**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Rifampicin** markedly affects the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Glecaprevir** (with **pibrentasvir**) increases the exposure to **statins** (**atorvastatin**, **simvastatin**). Avoid. [Moderate] Study
- ▶ **Glecaprevir** (with **pibrentasvir**) is predicted to increase the exposure to **statins** (**fluvastatin**). [Moderate] Theoretical
- ▶ **Glecaprevir** (with **pibrentasvir**) increases the exposure to **statins** (**pravastatin**). Use with caution and adjust **pravastatin** dose. [Moderate] Study
- ▶ **Glecaprevir** (with **pibrentasvir**) increases the exposure to **statins** (**rosuvastatin**). Use with caution and adjust **rosuvastatin** dose. p. 133. [Moderate] Study
- Glibenclamide** → see sulfonylureas
- Glliclazide** → see sulfonylureas
- Glimepiride** → see sulfonylureas
- Glipizide** → see sulfonylureas
- Glucagon**
- ▶ **Glucagon** increases the anticoagulant effect of **coumarins** (**warfarin**). [Severe] Study
- Glucosamine**
- ▶ **Glucosamine** increases the anticoagulant effect of **coumarins** (**warfarin**). Avoid. [Moderate] Anecdotal
- Glucose** → see TABLE 3 p. 847 (anticoagulant effects)
- Glycerol phenylbutyrate**
- ▶ Antiepileptics (**valproate**) potentially oppose the effects of **glycerol phenylbutyrate**. [Moderate] Theoretical
- ▶ **Corticosteroids** potentially oppose the effects of **glycerol phenylbutyrate**. [Moderate] Theoretical
- ▶ **Haloperidol** potentially opposes the effects of **glycerol phenylbutyrate**. [Moderate] Theoretical
- Glyceryl trinitrate** → see nitrates
- Glycopyrronium** → see TABLE 10 p. 849 (antimuscarinics)
- Golimimab** → see monoclonal antibodies
- Granisetron** → see TABLE 13 p. 850 (serotonin syndrome), TABLE 9 p. 849 (QT-interval prolongation)
- ▶ **Dopamine receptor agonists** (**apomorphine**) are predicted to increase the risk of severe hypotension when given with **granisetron**. [Severe] Theoretical
- Grapefruit juice**
- ▶ **Grapefruit juice** moderately decreases the exposure to **aliskiren**. Avoid. [Severe] Study
- ▶ **Grapefruit juice** increases the exposure to **antiarrhythmics** (**amiodarone**). Avoid. [Moderate] Study
- ▶ **Grapefruit juice** moderately increases the exposure to **antiarrhythmics** (**dronedrone**). Avoid. [Severe] Study
- ▶ **Grapefruit juice** increases the exposure to **antiarrhythmics** (**propafenone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Grapefruit juice** slightly increases the exposure to **antiepileptics** (**carbamazepine**). Monitor and adjust dose. [Moderate] Study
- ▶ **Grapefruit juice** slightly decreases the exposure to **antihistamines, non-sedating** (**bilastine**). **Bilastine** should be taken 1 hour before or 2 hours after **grapefruit juice**. [Moderate] Study
- ▶ **Grapefruit juice** increases the exposure to **antihistamines, non-sedating** (**rupatadine**). Avoid. [Moderate] Study
- ▶ **Grapefruit juice** increases the exposure to **antimalarials** (**artemether**). [Unknown] Study
- ▶ **Grapefruit juice** is predicted to increase the concentration of **antimalarials** (**piperaquine**). Avoid. [Severe] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Grapefruit juice** greatly decreases the exposure to **beta blockers, selective** (**celiprolol**). [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **bosutinib**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit juice** increases the exposure to **buspirone**. Avoid. [Mild] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical
- ▶ **Grapefruit juice** very slightly increases the exposure to **calcium channel blockers** (**amlodipine**). Avoid. [Mild] Study
- ▶ **Grapefruit juice** increases the exposure to **calcium channel blockers** (**felodipine**). Avoid. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **calcium channel blockers** (**lercanidipine**). Avoid. [Moderate] Theoretical
- ▶ **Grapefruit juice** increases the exposure to **calcium channel blockers** (**nicardipine**). [Mild] Study
- ▶ **Grapefruit juice** increases the exposure to **calcium channel blockers** (**nifedipine**, **verapamil**). Avoid. [Mild] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ceritinib**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit juice** increases the concentration of **ciclosporin**. Avoid. [Severe] Study
- ▶ **Grapefruit juice** markedly decreases the exposure to **clopidogrel**. [Severe] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit juice** moderately increases the exposure to oral **corticosteroids** (**budesonide**). Avoid. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **dasatinib**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **eliglustat**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ergometrine**. [Severe] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ergotamine**. [Severe] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **everolimus**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **guanfacine**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ibrutinib**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ivabradine**. Avoid. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ivacaftor**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical

Grapefruit juice (continued)

- ▶ Grapefruit juice is predicted to increase the exposure to **lurasidone**. Avoid. [Severe] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **naloxegol**. Avoid. [Moderate] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **palbociclib**. Avoid. [Severe] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **pazopanib**. Avoid. [Severe] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors**. Use with caution or avoid. [Moderate] Study
- ▶ Grapefruit juice increases the exposure to **pimozide**. Avoid. [Severe] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **ponatinib**. [Moderate] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **praziquantel**. [Moderate] Study
- ▶ Grapefruit juice is predicted to increase the exposure to **quetiapine**. Avoid. [Severe] Theoretical
- ▶ Grapefruit juice is predicted to increase the concentration of **ranolazine**. Avoid. [Severe] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **ribociclib**. Avoid. [Moderate] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **ruxolitinib**. [Severe] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **saxagliptin**. [Mild] Theoretical
- ▶ Grapefruit juice increases the concentration of **sirolimus**. Avoid. [Moderate] Study
- ▶ Grapefruit juice moderately increases the exposure to **SSRIs (sertraline)**. Avoid. [Moderate] Study
- ▶ Grapefruit juice increases the exposure to **statins (atorvastatin)**. [Mild] Study
- ▶ Grapefruit juice increases the exposure to **statins (simvastatin)**. Avoid. [Severe] Study
- ▶ Grapefruit juice is predicted to increase the exposure to **sunitinib**. Avoid. [Moderate] Theoretical
- ▶ Grapefruit juice increases the concentration of **tacrolimus**. Avoid. [Severe] Study
- ▶ Grapefruit juice is predicted to increase the concentration of **temsirolimus**. Use with caution or avoid. [Moderate] Theoretical
- ▶ Grapefruit juice moderately increases the exposure to **ticagrelor**. [Moderate] Study
- ▶ Grapefruit juice increases the exposure to **tolvaptan**. Avoid. [Moderate] Study
- ▶ Grapefruit juice is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Theoretical
- ▶ Grapefruit juice is predicted to increase the exposure to **venetoclax**. Avoid. [Severe] Theoretical

Grass pollen extract

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

Grazoprevir

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Ciclosporin** greatly increases the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study

- ▶ **Efavirenz** is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Etravirine** is predicted to decrease the exposure to grazoprevir. Avoid. [Mild] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Macrolides (clarithromycin)** are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Modafinil** is predicted to decrease the exposure to grazoprevir. Avoid. [Unknown] Theoretical
- ▶ **Nevirapine** is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ **Grazoprevir** increases the exposure to **statins (atorvastatin)**. Adjust atorvastatin dose, p. 132. [Moderate] Study
- ▶ **Grazoprevir** is predicted to increase the exposure to **statins (fluvastatin)**. Adjust fluvastatin dose, p. 132. [Unknown] Theoretical
- ▶ **Grazoprevir** increases the exposure to **statins (rosuvastatin)**. Adjust rosuvastatin dose, p. 133. [Moderate] Study
- ▶ **Grazoprevir** is predicted to increase the exposure to **statins (simvastatin)**. Adjust simvastatin dose, p. 134. [Unknown] Theoretical
- ▶ **Grazoprevir** is predicted to increase the concentration of **sunitinib**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Grazoprevir** increases the exposure to **tacrolimus**. [Moderate] Study

Griseofulvin

- ▶ **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with griseofulvin. [Moderate] Anecdotal
- ▶ Antiepileptics (**phenobarbital**, **primidone**) decrease the effects of griseofulvin. [Moderate] Study
- ▶ **Griseofulvin** potentially decreases the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Griseofulvin** potentially decreases the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ **Griseofulvin** potentially decreases the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Griseofulvin** decreases the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Griseofulvin** potentially decreases the efficacy of oral **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Griseofulvin** potentially decreases the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Griseofulvin** potentially decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal

Guanethidine → see TABLE 8 p. 848 (hypotension)

- ▶ **Amfetamines (dexamfetamine)** decrease the effects of guanethidine. [Severe] Study
- ▶ **Benperidol** is predicted to decrease the effects of guanethidine. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Droperidol** is predicted to decrease the effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Haloperidol** is predicted to decrease the antihypertensive effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 848

- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to decrease the antihypertensive effects of **guanethidine**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Phenothiazines** are predicted to decrease the antihypertensive effects of **guanethidine**. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Guanethidine** is predicted to increase the effects of sympathomimetics, inotropic (**dopamine**). [Severe] Theoretical
- ▶ **Guanethidine** is predicted to increase the effects of sympathomimetics, vasoconstrictor (**adrenaline/epinephrine, noradrenaline/norepinephrine**). [Moderate] Study
- ▶ **Guanethidine** increases the effects of sympathomimetics, vasoconstrictor (**metaraminol**). [Severe] Anecdotal
- ▶ **Guanethidine** increases the effects of sympathomimetics, vasoconstrictor (**phenylephrine**). [Severe] Study
- ▶ **Tricyclic antidepressants** are predicted to decrease the antihypertensive effects of **guanethidine**. [Moderate] Study → Also see TABLE 8 p. 848
- Guanfacine** → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Antiepileptics (oxcarbazepine)** are predicted to decrease the concentration of **guanfacine**. Monitor and adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Guanfacine** increases the concentration of **antiepileptics (valproate)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, isavuconazole, posaconazole)** are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Chloramphenicol** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Efavirenz** is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **Fosaprepitant** is predicted to increase the concentration of **guanfacine**. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **guanfacine**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study

- ▶ **Netupitant** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **St John's Wort** is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical

Guselkumab → see monoclonal antibodies

H₂ receptor antagonists

cimetidine • famotidine • nizatidine • ranitidine

- ▶ **Cimetidine** decreases the clearance of **albendazole**. [Moderate] Study
- ▶ **Cimetidine** increases the concentration of **aminophylline**. Adjust dose. [Severe] Study
- ▶ **Cimetidine** slightly increases the exposure to **anthracyclines (epirubicin)**. Avoid. [Moderate] Study
- ▶ **Cimetidine** increases the exposure to **antiarrhythmics (amiodarone)**. [Moderate] Study
- ▶ **Cimetidine** slightly increases the exposure to **antiarrhythmics (flecainide)**. Monitor and adjust dose. [Mild] Study
- ▶ **Cimetidine** increases the exposure to **antiarrhythmics (lidocaine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Cimetidine** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Cimetidine** transiently increases the concentration of **antiepileptics (carbamazepine)**. Monitor concentration and adjust dose. [Moderate] Study
- ▶ **Cimetidine** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **antifungals, azoles (itraconazole)**. Administer itraconazole capsules with an acidic beverage. [Moderate] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **antifungals, azoles (ketoconazole)**. Administer ketoconazole with an acidic beverage. [Moderate] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **antifungals, azoles (posaconazole)**. Avoid use of posaconazole oral suspension. [Moderate] Study
- ▶ **Cimetidine** decreases the clearance of **antimalarials (chloroquine)**. [Moderate] Study
- ▶ **Cimetidine** slightly increases the exposure to **antimalarials (quinine)**. [Moderate] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **bosutinib**. [Moderate] Theoretical
- ▶ **Cimetidine** slightly increases the exposure to **calcium channel blockers (diltiazem, nifedipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Cimetidine (high-dose)** is predicted to increase the exposure to **calcium channel blockers (lercanidipine)**. [Moderate] Theoretical
- ▶ **Cimetidine** moderately increases the exposure to **calcium channel blockers (nifedipine)**. Monitor and adjust dose. [Severe] Study
- ▶ **Cimetidine** increases the exposure to **calcium channel blockers (verapamil)**. [Moderate] Study
- ▶ **Cimetidine** is predicted to slightly increase the exposure to **capecitabine**. [Severe] Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **ceritinib**. [Moderate] Theoretical
- ▶ **Cimetidine** increases the concentration of **ciclosporin**. [Mild] Study
- ▶ **Cimetidine** increases the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **dasatinib**. Avoid. [Moderate] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **dipyridamole** (immediate release tablets). [Moderate] Theoretical
- ▶ **Cimetidine** slightly increases the exposure to **dopamine receptor agonists (pramipexole)**. Adjust dose. [Moderate] Study

H₂ receptor antagonists (continued)

- ▶ H₂ receptor antagonists are predicted to decrease the exposure to **erlotinib**. Erlotinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate] Study
- ▶ Cimetidine increases the concentration of **fampridine**. Avoid. [Severe] Theoretical
- ▶ Cimetidine slightly increases the exposure to **fluorouracil**. [Severe] Study
- ▶ H₂ receptor antagonists are predicted to slightly to moderately decrease the exposure to **gefitinib**. [Moderate] Study
- ▶ H₂ receptor antagonists decrease the exposure to **HIV-protease inhibitors (atazanavir)**. Monitor and adjust dose. [Moderate] Study
- ▶ Cimetidine is predicted to decrease the clearance of **hydroxychloroquine**. [Moderate] Theoretical
- ▶ H₂ receptor antagonists are predicted to decrease the absorption of **lapatinib**. Avoid. [Moderate] Theoretical
- ▶ H₂ receptor antagonists are predicted to decrease the exposure to **ledipasvir**. Adjust dose, see ledipasvir with sofosbuvir p. 401. [Moderate] Study
- ▶ H₂ receptor antagonists (**cimetidine**, **ranitidine**) are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ Cimetidine slightly increases the exposure to **macrolides (erythromycin)**. [Moderate] Study
- ▶ Cimetidine increases the concentration of **mebendazole**. [Moderate] Study
- ▶ Cimetidine slightly increases the exposure to **metformin**. Monitor and adjust dose. [Moderate] Study
- ▶ Cimetidine slightly increases the exposure to **mirtazapine**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Cimetidine increases the exposure to **moclobemide**. Adjust moclobemide dose. [Mild] Study
- ▶ H₂ receptor antagonists are predicted to decrease the absorption of **nilotinib**. H₂ receptor antagonists should be taken 10 hours before or 2 hours after nilotinib, p. 560. [Mild] Theoretical
- ▶ Cimetidine increases the concentration of **opioids (alfentanil)**. Use with caution and adjust dose. [Severe] Study
- ▶ Cimetidine increases the exposure to **opioids (fentanyl)**. [Moderate] Study
- ▶ H₂ receptor antagonists are predicted to decrease the exposure to **pazopanib**. H₂ receptor antagonists should be taken 10 hours before or 2 hours after pazopanib. [Moderate] Theoretical
- ▶ Cimetidine increases the exposure to **phenindione**. [Severe] Anecdotal
- ▶ Cimetidine moderately increases the exposure to **praziquantel**. [Moderate] Study
- ▶ H₂ receptor antagonists are predicted to decrease the exposure to **rilpivirine**. H₂ receptor antagonists should be taken 12 hours before or 4 hours after rilpivirine. [Severe] Study
- ▶ Cimetidine slightly increases the exposure to **roflumilast**. [Moderate] Study
- ▶ H₂ receptor antagonists potentially decrease the exposure to **sofosbuvir**. Adjust dose, see ledipasvir with sofosbuvir p. 401, sofosbuvir with velpatasvir, and sofosbuvir with velpatasvir and voxilaprevir. [Moderate] Study
- ▶ Cimetidine slightly increases the exposure to **SSRIs (citalopram, escitalopram)**. Adjust dose. [Moderate] Study
- ▶ Cimetidine slightly increases the exposure to **SSRIs (paroxetine, sertraline)**. [Moderate] Study
- ▶ Cimetidine is predicted to increase the risk of toxicity when given with **tegafur**. [Severe] Theoretical
- ▶ Cimetidine increases the concentration of **theophylline**. Adjust dose. [Severe] Study
- ▶ Cimetidine increases the exposure to **tricyclic antidepressants**. [Moderate] Study
- ▶ H₂ receptor antagonists are predicted to decrease the concentration of **velpatasvir**. Adjust dose, see sofosbuvir with velpatasvir. [Moderate] Study
- ▶ Cimetidine slightly increases the exposure to **venlafaxine**. [Mild] Study
- ▶ Cimetidine slightly increases the exposure to **zolmitriptan**. Adjust zolmitriptan dose, p. 292. [Mild] Study

Haloperidol → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects), TABLE 10 p. 849 (antimuscarinics)

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment.

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) decrease the concentration of **haloperidol**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
 - ▶ **Haloperidol** potentially increases the risk of overheating and dehydration when given with **antiepileptics (zonisamide)**. Avoid in children. [Severe] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**) increase the concentration of **haloperidol**. [Moderate] Study
 - ▶ **Haloperidol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849 → Also see TABLE 10 p. 849
 - ▶ **Enzalutamide** decreases the concentration of **haloperidol**. Adjust dose. [Moderate] Study
 - ▶ **Haloperidol** potentially opposes the effects of **glycerol phenylbutyrate**. [Moderate] Theoretical
 - ▶ **Haloperidol** is predicted to decrease the antihypertensive effects of **guanethidine**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 848
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **haloperidol**. [Severe] Theoretical
 - ▶ **Haloperidol** decreases the effects of **levodopa**. [Severe] Study → Also see TABLE 8 p. 848
 - ▶ **Mitotane** decreases the concentration of **haloperidol**. Adjust dose. [Moderate] Study
 - ▶ **Rifampicin** decreases the concentration of **haloperidol**. Adjust dose. [Moderate] Study
 - ▶ **Haloperidol** potentially decreases the effects of **sodium phenylbutyrate**. [Moderate] Anecdotal
 - ▶ **SSRIs (fluoxetine)** increase the concentration of **haloperidol**. Adjust dose. [Moderate] Anecdotal
 - ▶ **SSRIs (fluvoxamine)** increase the concentration of **haloperidol**. Adjust dose. [Moderate] Study
 - ▶ **Venlafaxine** slightly increases the exposure to **haloperidol**. [Severe] Study → Also see TABLE 9 p. 849 → Also see TABLE 11 p. 849
- Heparin (unfractionated)** → see TABLE 16 p. 851 (increased serum potassium), TABLE 3 p. 847 (anticoagulant effects)
- ▶ **Ranibizumab** increases the risk of bleeding events when given with **heparin (unfractionated)**. [Severe] Theoretical
- HIV-protease inhibitors** → see TABLE 9 p. 849 (QT-interval prolongation)

atazanavir • darunavir • fosamprenavir • lopinavir • ritonavir • saquinavir • tipranavir

- ▶ Caution on concurrent use of **atazanavir**, **lopinavir** with **ritonavir**, or **ritonavir** with drugs that prolong the PR interval.
- ▶ Concurrent use of **saquinavir** with drugs that prolong the PR interval is contra-indicated.
- ▶ Caution with concurrent use of **tipranavir** with drugs that increase risk of bleeding.

- ▶ **Tipranavir** slightly decreases the exposure to **abacavir**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Ritonavir** is predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Ritonavir** decreases the exposure to **albendazole**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir, saquinavir)** are predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** increase the exposure to **almotriptan**. [Mild] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] Study

- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **alpha blockers (doxazosin)**. [Moderate] Study
- ▶ **HIV-protease inhibitors** moderately increase the exposure to **alprazolam**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors (ritonavir, tipranavir)** are predicted to increase the exposure to **amfetamines**. [Severe] Theoretical
- ▶ **Ritonavir** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Ritonavir** is predicted to decrease the exposure to **anaesthetics, local (ropivacaine)**. [Moderate] Theoretical
- ▶ **Antacids** are predicted to decrease the absorption of **atazanavir**. Atazanavir should be taken 2 hours before or 1 hour after antacids. [Severe] Theoretical
- ▶ **Antacids** are predicted to decrease the absorption of **tipranavir**. Separate administration by 2 hours. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antiarrhythmics (amiodarone)**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antiarrhythmics (disopyramide)**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** very markedly increase the exposure to **antiarrhythmics (dronedarone)**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antiarrhythmics (lidocaine)**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **anticholinesterases, centrally acting (galantamine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antiepileptics (carbamazepine)** and **antiepileptics (carbamazepine)** are predicted to decrease the exposure to **HIV-protease inhibitors**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to affect the exposure to **antiepileptics (fosphenytoin, phenytoin)** and **antiepileptics (fosphenytoin, phenytoin)** decrease the concentration of **HIV-protease inhibitors**. [Severe] Theoretical
- ▶ **Ritonavir** slightly decreases the exposure to **antiepileptics (lamotrigine)**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to very slightly increase the exposure to **antiepileptics (perampanel)**. [Mild] Study
- ▶ **HIV-protease inhibitors** are predicted to affect the concentration of **antiepileptics (phenobarbital, primidone)** and **antiepileptics (phenobarbital, primidone)** are predicted to decrease the concentration of **HIV-protease inhibitors**. [Severe] Theoretical
- ▶ **Ritonavir** is predicted to decrease the concentration of **antiepileptics (valproate)**. [Severe] Anecdotal
- ▶ **Antifungals, azoles (fluconazole)** slightly increase the exposure to **tipranavir**. Avoid or adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (micronazole)** are predicted to increase the concentration of **HIV-protease inhibitors**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (posaconazole)** are predicted to increase the exposure to **HIV-protease inhibitors**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. Avoid or monitor side effects. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antifungals, azoles (itraconazole)**. Use with caution and adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antifungals, azoles (ketoconazole)**. Use with caution and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to affect the exposure to **antifungals, azoles (voriconazole)** and **antifungals, azoles (voriconazole)** potentially affect the exposure to **HIV-protease inhibitors**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** decrease the exposure to **antimalarials (atovaquone)**. Avoid if boosted with ritonavir. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to decrease the exposure to **antimalarials (proguanil)**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to affect the exposure to **antimalarials (quinine)**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Ritonavir** is predicted to increase the exposure to **apixaban**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **aprepitant**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to slightly increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 249. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [Moderate] Study
- ▶ **Ritonavir** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **beta₂ agonists (salmeterol)**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** slightly increase the exposure to **bortezomib**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **bosentan**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Ritonavir** is predicted to decrease the exposure to **bupropion**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **buprion**. Adjust buprion dose. [Severe] Study
- ▶ **HIV-protease inhibitors** slightly increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Ritonavir** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **calcium channel blockers (lercanidipine)**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ceritinib**. Avoid or adjust ceritinib dose. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **cilostazol**. Adjust cilostazol dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Ritonavir** is predicted to affect the exposure to **clozapine**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **colchicine**. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose. [Severe] Study

HIV-protease inhibitors (continued)

- ▶ **Atazanavir** (unboosted) increases the exposure to **combined hormonal contraceptives**. Adjust dose. [Severe] Study
- ▶ **Ritonavir** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **corticosteroids (beclomethasone)** (risk with beclomethasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, prednisone, triamcinolone)**. Avoid or monitor side effects. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to affect the anticoagulant effect of **coumarins**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **dabigatran**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **daclatasvir**. Adjust daclatasvir dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **dasatinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** very slightly increase the exposure to **delamanid**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Ritonavir** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Ritonavir** is predicted to increase the exposure to **diazepam**. Avoid. [Moderate] Theoretical
- ▶ **Didanosine** (buffered) decreases the exposure to **atazanavir**. **Didanosine** should be taken 2 hours after **atazanavir**. [Severe] Study
- ▶ **Didanosine** (buffered) is predicted to decrease the exposure to **darunavir** (boosted with ritonavir). **Didanosine** should be taken 1 hour before or 2 hours after **darunavir**. [Moderate] Theoretical
- ▶ **Tipranavir** decreases the exposure to **didanosine**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Ritonavir** increases the concentration of **digoxin**. Adjust dose and monitor concentration. [Severe] Study
- ▶ **Fosamprenavir** (boosted with ritonavir) slightly decreases the exposure to **dolutegravir**. Avoid if resistant to HIV-integrase inhibitors. [Severe] Study
- ▶ **Tipranavir** moderately decreases the exposure to **dolutegravir**. Refer to specialist literature. [Severe] Study
- ▶ **HIV-protease inhibitors** increase the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Ritonavir** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **Efavirenz** decreases the exposure to **HIV-protease inhibitors**. Refer to specialist literature. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** slightly to moderately increase the exposure to **elbasvir**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **eletriptan**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **eluxadoline**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (atazanavir, lopinavir)** (boosted with ritonavir) increase the concentration of **elvitegravir**. Refer to specialist literature. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to slightly increase the exposure to **erlotinib**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Ritonavir** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Etravirine** increases the exposure to **fosamprenavir** (boosted with ritonavir). Refer to specialist literature. [Moderate] Study
- ▶ **Tipranavir** decreases the exposure to **etravirine**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **fesoterodine**. Adjust fesoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Ritonavir** is predicted to increase the exposure to **flurazepam**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **fosaprepitant**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **gefinitib**. [Moderate] Study
- ▶ **HIV-protease inhibitors (atazanavir, darunavir, lopinavir)** (boosted with ritonavir) increase the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Ritonavir** potentially increases the exposure to **glecaprevir**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **guanfacine**. Adjust guanfacine dose, p. 231. [Moderate] Study
- ▶ **H₂ receptor antagonists** decrease the exposure to **atazanavir**. Monitor and adjust dose. [Moderate] Study
- ▶ **Ritonavir** is predicted to increase the exposure to **haloperidol**. [Severe] Theoretical
- ▶ **Ritonavir** is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- ▶ **HIV-protease inhibitors** are predicted to very markedly increase the exposure to **ibrutinib**. Avoid potent inhibitors of CYP3A4 or adjust ibrutinib dose. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **imatinitib**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- ▶ **Ritonavir** is predicted to decrease the exposure to **iron chelators (deferasirox)**. Monitor serum ferritin and adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ivacaftor**. Adjust ivacaftor p. 186 or lumacaftor with ivacaftor p. 187 dose with potent inhibitors of CYP3A4. [Severe] Study

- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Ritonavir** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **lurasidone**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **macitentan**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** increase the exposure to **saquinavir** and **saquinavir** increases the exposure to **macrolides (clarithromycin)**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **saquinavir**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Atazanavir** is predicted to increase the exposure to **macrolides (clarithromycin)**. Adjust dose in renal impairment. [Severe] Study
- ▶ **Ritonavir** increases the exposure to **macrolides (clarithromycin)**. Adjust dose in renal impairment. [Severe] Study
- ▶ **Tipranavir** (boosted with ritonavir) increases the exposure to **macrolides (clarithromycin)** and **macrolides (clarithromycin)** increase the exposure to **tipranavir** (boosted with ritonavir). Monitor; adjust dose in renal impairment. [Severe] Study
- ▶ **HIV-protease inhibitors (darunavir, fosamprenavir, lopinavir)** (boosted with ritonavir) are predicted to increase the exposure to **macrolides (clarithromycin)**. Adjust dose in renal impairment. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, tipranavir)** are predicted to increase the exposure to **macrolides (erythromycin)**. [Severe] Theoretical
- ▶ **Darunavir** (boosted with ritonavir) markedly increases the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **Maraviroc** potentially decreases the exposure to **fosamprenavir** and **fosamprenavir** potentially decreases the exposure to **maraviroc**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir, saquinavir)** moderately to markedly increase the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **Lopinavir** (boosted with ritonavir) moderately increases the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **Ritonavir** markedly increases the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **Ritonavir** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **mirabegron**. Adjust mirabegron dose in hepatic and renal impairment. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **modafinil**. [Mild] Theoretical
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the risk of neutropenia when given with **monoclonal antibodies (brentuximab vedotin)**. Monitor and adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **monoclonal antibodies (trastuzumab emtansine)**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **netupitant**. [Moderate] Study
- ▶ **Nevirapine** decreases the exposure to **HIV-protease inhibitors**. Refer to specialist literature. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **nitisnone**. Adjust dose. [Moderate] Theoretical
- ▶ **Ritonavir** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Ritonavir** is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil)**. Monitor and adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors** (boosted with ritonavir) are predicted to decrease the exposure to **opioids (methadone)**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Ritonavir** is predicted to decrease the concentration of **opioids (morphine)**. [Moderate] Theoretical
- ▶ **Ritonavir** increases the risk of CNS toxicity when given with **opioids (pethidine)**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **oxybutynin**. [Mild] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **palbociclib**. Avoid or adjust **palbociclib** dose. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil, vardenafil)**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Avoid potent inhibitors of CYP3A4 or adjust **sildenafil** dose, p. 120. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. Use with caution or avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir, lopinavir)** (boosted with ritonavir) increase the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ **Ritonavir** potentially increases the exposure to **pibrentasvir**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **pimozide**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Ritonavir** is predicted to decrease the exposure to **pirfenidone**. [Moderate] Theoretical
- ▶ **Ritonavir** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **praziquantel**. [Mild] Study
- ▶ **Proton pump inhibitors** decrease the exposure to **atazanavir**. Avoid or adjust dose. [Severe] Study
- ▶ **Proton pump inhibitors** increase the exposure to **saquinavir**. Avoid. [Severe] Study
- ▶ **Tipranavir** decreases the exposure to **proton pump inhibitors**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **quetiapine**. Avoid. [Severe] Study
- ▶ **Atazanavir** increases the exposure to **raltegravir** (high-dose). Avoid. [Moderate] Study

HIV-protease inhibitors (continued)

- ▶ Darunavir increases the risk of rash when given with **raltegravir**. [Moderate] Study
- ▶ Fosamprenavir (boosted with ritonavir) decreases the exposure to **raltegravir** and **raltegravir** decreases the exposure to fosamprenavir (boosted with ritonavir). Avoid. [Severe] Study
- ▶ Tipranavir (boosted with ritonavir) is predicted to decrease the exposure to **raltegravir** (high-dose). Avoid. [Moderate] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **ranolazine**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **rebexetine**. Avoid. [Moderate] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **repaglinide**. [Moderate] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust alitretinoin dose. [Moderate] Theoretical
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **ribociclib**. Avoid or adjust ribociclib dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) (boosted with ritonavir) increase the exposure to **rifabutin**. Monitor and adjust dose. [Severe] Study
- ▶ Ritonavir markedly increases the exposure to **rifabutin**. Avoid or adjust dose. [Severe] Study
- ▶ **Rifampicin** is predicted to moderately to markedly decrease the exposure to HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir). Avoid. [Severe] Study
- ▶ **Rifampicin** slightly decreases the exposure to **ritonavir**. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **tipranavir**. Avoid. [Severe] Study
- ▶ Ritonavir is predicted to increase the exposure to **riociguat**. Avoid. [Moderate] Theoretical
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ Ritonavir moderately increases the exposure to **rivaroxaban**. Avoid. [Severe] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **roxolitinib**. Adjust dose and monitor side effects. [Moderate] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **saxagliptin**. [Moderate] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ HIV-protease inhibitors are predicted to increase the concentration of **sirolimus**. Avoid. [Severe] Study
- ▶ Tipranavir is predicted to decrease the exposure to **sofosbuvir**. Avoid. [Severe] Theoretical
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **solifenacin**. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study
- ▶ HIV-protease inhibitors are predicted to moderately increase the exposure to **SSRIs (dapoxetine)**. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to HIV-protease inhibitors. Avoid. [Severe] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **statins (atorvastatin)**. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- ▶ HIV-protease inhibitors slightly to moderately increase the exposure to **statins (rosuvastatin)**. Avoid or adjust dose. [Severe] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **statins (simvastatin)**. Avoid. [Severe] Study
- ▶ HIV-protease inhibitors are predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust sunitinib dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ HIV-protease inhibitors are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study

- ▶ HIV-protease inhibitors are predicted to increase the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
- ▶ HIV-protease inhibitors are predicted to moderately increase the exposure to **taxanes (docetaxel)**. Avoid or adjust dose. [Severe] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **taxanes (paclitaxel)**. [Severe] Theoretical
- ▶ HIV-protease inhibitors are predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ HIV-protease inhibitors (atazanavir, darunavir) increase the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Study
- ▶ Tipranavir is predicted to affect the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical
- ▶ Ritonavir is predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study
- ▶ HIV-protease inhibitors are predicted to markedly increase the exposure to **ticagrelor**. Avoid. [Severe] Study
- ▶ Ritonavir moderately decreases the exposure to **tizanidine**. [Mild] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **tofacinib**. Adjust tofacitinib dose. [Moderate] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study
- ▶ HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **torsemide**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical
- ▶ HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ HIV-protease inhibitors are predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- ▶ HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to **tricyclic antidepressants**. [Moderate] Theoretical
- ▶ HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- ▶ Ritonavir decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **venetoclax**. Avoid potent inhibitors of CYP3A4 or adjust venetoclax dose. [Severe] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **venlafaxine**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **vitamin D substances (paricalcitol)**. [Moderate] Study
- ▶ Atazanavir (boosted with ritonavir) increases the concentration of **voxilaprevir**. Avoid. [Severe] Study
- ▶ Lopinavir is predicted to increase the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- ▶ Tipranavir slightly decreases the exposure to **zidovudine**. Avoid. [Moderate] Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical

Homatropine → see TABLE 10 p. 849 (antimuscarinics)

Hormone replacement therapy

- ▶ Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rifinamide, topiramate) are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- ▶ Hormone replacement therapy is predicted to alter the exposure to antiepileptics (lamotrigine). [Moderate] Theoretical

- ▶ **Aprepitant** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
 - ▶ **Bosentan** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
 - ▶ **Hormone replacement therapy** decreases the clearance of dopamine receptor agonists (**ropinirole**). Monitor and adjust dose. [Moderate] Study
 - ▶ **Efavirenz** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
 - ▶ **Fosaprepitant** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
 - ▶ **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with **lenalidomide**. [Severe] Theoretical
 - ▶ **Modafinil** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
 - ▶ **Hormone replacement therapy** is predicted to increase the exposure to monoamine-oxidase B inhibitors (**selegiline**). Avoid. [Moderate] Study
 - ▶ **Nevirapine** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
 - ▶ **NSAIDs (etoricoxib)** slightly increase the exposure to hormone replacement therapy. [Moderate] Study
 - ▶ **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with **pomalidomide**. [Severe] Theoretical
 - ▶ **Rifabutin** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
 - ▶ **Rifampicin** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
 - ▶ **St John's Wort** is predicted to decrease the efficacy of hormone replacement therapy. [Moderate] Theoretical
 - ▶ **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with **thalidomide**. [Severe] Theoretical
 - ▶ **Oral hormone replacement therapy** is predicted to decrease the effects of **thyroid hormones**. [Moderate] Theoretical
- Hydralazine** → see TABLE 8 p. 848 (hypotension)
- ▶ **Diazoxide** increases the risk of severe hypotension when given with hydralazine. [Severe] Study → Also see TABLE 8 p. 848
- Hydrochlorothiazide** → see thiazide diuretics
- Hydrocortisone** → see corticosteroids
- Hydroflumethiazide** → see thiazide diuretics
- Hydromorphone** → see opioids
- Hydroxycarbamide** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Hydroxycarbamide** increases the risk of toxicity when given with **didanosine**. Avoid. [Severe] Study
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with hydroxycarbamide. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Hydroxycarbamide** increases the risk of toxicity when given with **stavudine**. Avoid. [Severe] Study
- Hydroxychloroquine**
- ▶ **Hydroxychloroquine** is predicted to decrease the effects of **agalsidase**. [Moderate] Theoretical
 - ▶ **Antacids** decrease the absorption of **hydroxychloroquine**. Separate administration by at least 4 hours. [Moderate] Study
 - ▶ **Calcium salts (calcium carbonate)** decrease the absorption of **hydroxychloroquine**. Separate administration by at least 4 hours. [Moderate] Study
 - ▶ **Hydroxychloroquine** is predicted to decrease the efficacy of oral **cholera vaccine**. [Moderate] Theoretical
 - ▶ **H₂ receptor antagonists (cimetidine)** are predicted to decrease the clearance of **hydroxychloroquine**. [Moderate] Theoretical
 - ▶ **Lanthanum** is predicted to decrease the absorption of **hydroxychloroquine**. Separate administration by at least 2 hours. [Moderate] Theoretical
 - ▶ **Hydroxychloroquine** is predicted to decrease the exposure to **larotidine**. Avoid simultaneous administration. [Severe] Theoretical

- ▶ **Hydroxychloroquine** is predicted to increase the risk of haematological toxicity when given with **penicillamine**. Avoid. [Severe] Theoretical
 - ▶ **Hydroxychloroquine** is predicted to decrease efficacy **rabies vaccine**. [Moderate] Theoretical
- Hydroxyzine** → see antihistamines, sedating
- Hyoscine** → see TABLE 10 p. 849 (antimuscarinics)
- Ibandronic acid** → see bisphosphonates
- Ibrutinib** → see TABLE 15 p. 850 (myelosuppression), TABLE 4 p. 847 (antiplatelet effects)
- FOOD AND LIFESTYLE** Avoid food or drink containing bitter (Seville) oranges as they are predicted to increase the exposure to ibrutinib.
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose. [Severe] Theoretical
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ibrutinib. Avoid or adjust ibrutinib dose. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to very markedly increase the exposure to ibrutinib. Avoid potent inhibitors of CYP3A4 or adjust ibrutinib dose. [Severe] Study
 - ▶ **Aprepitant** is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Cobicistat** is predicted to very markedly increase the exposure to ibrutinib. Avoid potent inhibitors of CYP3A4 or adjust ibrutinib dose. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study → Also see TABLE 15 p. 850
 - ▶ **Enzalutamide** is predicted to decrease the exposure to ibrutinib. Avoid or adjust ibrutinib dose. [Severe] Study
 - ▶ **Fosaprepitant** is predicted to slightly increase the exposure to ibrutinib. [Moderate] Theoretical
 - ▶ **Grapefruit juice** is predicted to increase the exposure to ibrutinib. Avoid. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to very markedly increase the exposure to ibrutinib. Avoid potent inhibitors of CYP3A4 or adjust ibrutinib dose. [Severe] Study
 - ▶ **Idelalisib** is predicted to very markedly increase the exposure to ibrutinib. Avoid potent inhibitors of CYP3A4 or adjust ibrutinib dose. [Severe] Study → Also see TABLE 15 p. 850
 - ▶ **Imatinib** is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study → Also see TABLE 15 p. 850
 - ▶ **Macrolides (clarithromycin)** are predicted to very markedly increase the exposure to ibrutinib. Avoid potent inhibitors of CYP3A4 or adjust ibrutinib dose. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to ibrutinib. Avoid or adjust ibrutinib dose. [Severe] Study → Also see TABLE 15 p. 850
 - ▶ **Netupitant** is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study → Also see TABLE 15 p. 850
 - ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose. [Severe] Theoretical
 - ▶ **Rifampicin** is predicted to decrease the exposure to ibrutinib. Avoid or adjust ibrutinib dose. [Severe] Study

Ibrutinib (continued)

- ▶ **St John's Wort** is predicted to decrease the exposure to ibrutinib. Avoid. [Severe] Theoretical

Ibuprofen → see NSAIDs

Icatibant

- ▶ **ACE inhibitors** are predicted to decrease the efficacy of icatibant and icatibant is predicted to decrease the efficacy of **ACE inhibitors**. Avoid. [Moderate] Theoretical

Idarubicin → see anthracyclines

Idelalisib → see TABLE 15 p. 850 (myelosuppression)

- ▶ **Idelalisib** is predicted to increase the exposure to **abiraterone**. [Severe] Theoretical

- ▶ **Idelalisib** is predicted to markedly increase the exposure to

- ▶ **aldosterone antagonists (eplerenone)**. Avoid. [Severe] Study

- ▶ **Idelalisib** increases the exposure to **almotriptan**. [Mild] Study

- ▶ **Idelalisib** is predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **alpha blockers (doxazosin)**. [Moderate] Study

- ▶ **Idelalisib** moderately increases the exposure to **alprazolam**. Avoid. [Moderate] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **antiarrhythmics (amiodarone)**. Avoid. [Moderate] Theoretical

- ▶ **Idelalisib** very markedly increases the exposure to **antiarrhythmics (dronedrone)**. Avoid. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **anticholinesterases, centrally acting (galantamine)**. Monitor and adjust dose. [Moderate] Study

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study

- ▶ **Idelalisib** is predicted to very slightly increase the exposure to **antiepileptics (perampanel)**. [Mild] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. Avoid or monitor side effects. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study

- ▶ **Idelalisib** is predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical

- ▶ **Idelalisib** is predicted to markedly increase the exposure to **aprepitant**. [Moderate] Study

- ▶ **Idelalisib** is predicted to slightly increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 249. [Moderate] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 850

- ▶ **Idelalisib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **beta₂ agonists (salmeterol)**. Avoid. [Severe] Study

- ▶ **Idelalisib** slightly increases the exposure to **bortezomib**. [Moderate] Study → Also see TABLE 15 p. 850

- ▶ **Bosentan** is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical

- ▶ **Idelalisib** is predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 850

- ▶ **Idelalisib** is predicted to increase the exposure to **buspirone**. Adjust buspirone dose. [Severe] Study

- ▶ **Idelalisib** slightly increases the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 15 p. 850

- ▶ **Idelalisib** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study

- ▶ **Idelalisib** is predicted to markedly increase the exposure to **calcium channel blockers (lercandipine)**. Avoid. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. [Moderate] Theoretical

- ▶ **Idelalisib** is predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose. [Severe] Study → Also see TABLE 15 p. 850

- ▶ **Idelalisib** increases the concentration of **ciclosporin**. [Severe] Study

- ▶ **Idelalisib** is predicted to moderately increase the exposure to **cilostazol**. Adjust **cilostazol** dose. [Moderate] Study

- ▶ **Idelalisib** is predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study

- ▶ **Idelalisib** is predicted to markedly increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **colchicine**. Avoid potent inhibitors of CYP3A4 or adjust **colchicine** dose. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **corticosteroids (beclometasone)** (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical

- ▶ **Idelalisib** is predicted to increase the exposure to **corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, prednisone, triamcinolone)**. Avoid or monitor side effects. [Severe] Study

- ▶ **Idelalisib** is predicted to moderately increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 15 p. 850

- ▶ **Idelalisib** is predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study → Also see TABLE 15 p. 850

- ▶ **Idelalisib** is predicted to moderately increase the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Study

- ▶ **Idelalisib** is predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study

- ▶ **Idelalisib** is predicted to markedly increase the exposure to **dasatinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850

- ▶ **Idelalisib** very slightly increases the exposure to **delamanid**. [Severe] Study

- ▶ **Idelalisib** increases the risk of QT-prolongation when given with **domeperidone**. Avoid. [Severe] Study

- ▶ **Idelalisib** increases the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal

- ▶ **Idelalisib** is predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. [Moderate] Theoretical

- ▶ **Efavirenz** is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical

- ▶ **Idelalisib** slightly to moderately increases the exposure to **elbasvir**. Avoid. [Moderate] Study

- ▶ **Idelalisib** is predicted to markedly increase the exposure to **elotriptan**. Avoid. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study

- ▶ **Enzalutamide** is predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical

- ▶ **Idelalisib** is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical

- ▶ **Idelalisib** is predicted to slightly increase the exposure to **erlotinib**. Use with caution and adjust dose. [Moderate] Study

- ▶ **Idelalisib** is predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study → Also see TABLE 15 p. 850

- ▶ **Idelalisib** is predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **fosaprepitant**. [Moderate] Theoretical

- ▶ **Idelalisib** is predicted to increase the exposure to **gefitinib**. [Moderate] Study → Also see TABLE 15 p. 850

- ▶ **Idelalisib** is predicted to markedly increase the exposure to **grazoprevir**. Avoid. [Severe] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **Idelalisib** is predicted to very markedly increase the exposure to **ibrutinib**. Avoid potent inhibitors of CYP3A4 or adjust **ibrutinib** dose. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **imatinib**. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** p. 186 or **lumacaftor with ivacaftor** p. 187 dose with potent inhibitors of CYP3A4. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **lurasidone**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **macitentan**. [Moderate] Study
- ▶ **Idelalisib** markedly increases the exposure to **maraviroc**. Adjust dose. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
- ▶ **Idelalisib** is predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **modafinil**. [Mild] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **monoclonal antibodies (trastuzumab emtansine)**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **netupitant**. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **nitisnone**. Adjust dose. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil)**. Monitor and adjust dose. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **opioids (methadone)**. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **oxybutynin**. [Mild] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **palbociclib**. Avoid or adjust **palbociclib** dose. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil, vardenafil)**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Avoid potent inhibitors of CYP3A4 or adjust **sildenafil** dose, p. 120. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. Use with caution or avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **praziquantel**. [Mild] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **quetiapine**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **ranolazine**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **reboxetine**. Avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **repaglinide**. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust **alitretinoin** dose. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **roxolitinib**. Adjust dose and monitor side effects. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **saxagliptin**. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the concentration of **sirolimus**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **solifenacin**. Adjust **solifenacin** or **tamsulosin** with **solifenacin** dose; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **SSRIs (dapoxetine)**. Avoid potent inhibitors of CYP3A4 or adjust **dapoxetine** dose. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **statins (atorvastatin)**. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **statins (simvastatin)**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **taxanes (docetaxel)**. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **ticagrelor**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study

Idelalisib (continued)

- ▶ **Idelalisib** is predicted to increase the exposure to **toremifene**. [Moderate] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Idelalisib** is predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **venetoclax**. Avoid potent inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **venlafaxine**. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Idelalisib** is predicted to increase the exposure to **vitamin D substances (paricalcitol)**. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- Ilofamide** → see alkylating agents
- Iloprost** → see TABLE 4 p. 847 (antiplatelet effects)
- Imatinib** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Imatinib** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
 - ▶ **Imatinib** is predicted to increase the exposure to **alprazolam**. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **antiarrhythmics (dronedrone)**. [Severe] Theoretical
 - ▶ **Imatinib** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study
 - ▶ **Antiepileptics (oxcarbazepine)** decrease the exposure to **imatinib**. Avoid. [Moderate] Study
 - ▶ **Antifungals, azoles (fluconazole, posaconazole)** are predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **imatinib**. [Moderate] Study
 - ▶ **Imatinib** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. [Moderate] Theoretical
 - ▶ **Imatinib** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical
 - ▶ **Imatinib** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical
 - ▶ **Aprepitant** is predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
 - ▶ **Asparaginase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [Severe] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Imatinib** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Imatinib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical
 - ▶ **Bosentan** is predicted to decrease the exposure to **imatinib**. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Imatinib** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
 - ▶ **Imatinib** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine,**

lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

- ▶ **Imatinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Imatinib** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Crisantaspase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to slightly increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Imatinib** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Imatinib** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- ▶ **Imatinib** is predicted to increase the exposure to **gefitinib**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Grapefruit juice** is predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to increase the exposure to **imatinib**. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **lapatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **lurasidone**. [Moderate] Study

- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **opioids (methadone, sufentanil)**. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **oxybutynin**. [Mild] Theoretical
- ▶ **Imatinib** increases the risk of hepatotoxicity when given with **paracetamol**. [Severe] Anecdotal
- ▶ **Imatinib** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Pegaspargase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **ranolazine**. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **ribociclib**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **roxolitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
- ▶ **Imatinib** is predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ **Imatinib** increases the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **statins (simvastatin)**. Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Tedizolid** is predicted to increase the exposure to **imatinib**. Avoid. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Imidapril** → see ACE inhibitors
- Imipenem** → see carbapenems
- Imipramine** → see tricyclic antidepressants
- Indacaterol** → see beta₂ agonists
- Indapamide** → see thiazide diuretics
- Indometacin** → see NSAIDs
- Indoramin** → see alpha blockers
- Infliximab** → see monoclonal antibodies
- Influenza vaccine (live)** → see live vaccines
- Inotuzumab ozogamicin** → see monoclonal antibodies
- Insulins** → see TABLE 14 p. 850 (antidiabetic drugs)
- ▶ **Fibrates** are predicted to increase the risk of hypoglycaemia when given with **insulins**. [Moderate] Theoretical
- Interferon alfa** → see interferons
- Interferon beta** → see interferons
- Interferons** → see TABLE 15 p. 850 (myelosuppression)

interferon alfa • interferon beta • peginterferon alfa

- ▶ **Interferons** are predicted to slightly increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Interferon alfa** is predicted to increase the risk of peripheral neuropathy when given with **telbivudine**. Avoid. [Severe] Theoretical
- ▶ **Peginterferon alfa** increases the risk of peripheral neuropathy when given with **telbivudine**. Avoid. [Severe] Study
- ▶ **Interferons** slightly increase the exposure to **theophylline**. Adjust dose. [Moderate] Study
- Ipilimumab** → see monoclonal antibodies
- Ipratropium** → see TABLE 10 p. 849 (antimuscarinics)
- ▶ **Beta₂ agonists** are predicted to increase the risk of glaucoma when given with **ipratropium**. [Moderate] Anecdotal
- Irbesartan** → see angiotensin-II receptor antagonists
- Irinotecan** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study → Also see TABLE 15 p. 850

Irinotecan (continued)

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **irinotecan**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Irinotecan** is predicted to decrease the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **irinotecan**. [Unknown] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **irinotecan**. Avoid or monitor. [Moderate] Study
- ▶ **St John's Wort** slightly decreases the exposure to **irinotecan**. Avoid. [Severe] Study
- ▶ **Irinotecan** is predicted to increase the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] Theoretical

Iron (injectable)

ferric carboxymaltose · iron dextran · iron isomaltoside 1000 · iron sucrose

- ▶ **Chloramphenicol** decreases the efficacy of intravenous iron (injectable). [Moderate] Anecdotal

Iron (oral)

ferric maltol · ferrous fumarate · ferrous gluconate · ferrous sulfate · polysaccharide-iron complex · sodium feredetate

- ▶ **Antacids** decrease the absorption of **iron (oral)**. **Iron (oral)** should be taken 1 hour before or 2 hours after **antacids**. [Moderate] Study
- ▶ **Iron (oral)** is predicted to decrease the absorption of oral **bisphosphonates (ibandronic acid)**. Avoid **iron (oral)** for at least 6 hours before or 1 hour after **ibandronic acid**. [Moderate] Theoretical
- ▶ **Iron (oral)** decreases the absorption of **bisphosphonates (risedronate)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Iron (oral)** decreases the absorption of **bisphosphonates (sodium clodronate)**. Avoid **iron (oral)** for 2 hours before or 1 hour after **sodium clodronate**. [Moderate] Study
- ▶ **Calcium salts (calcium carbonate)** decrease the absorption of **iron (oral)**. **Calcium carbonate** should be taken 1 hour before or 2 hours after **iron (oral)**. [Moderate] Study
- ▶ **Iron (oral)** is predicted to decrease the exposure to **carbidopa**. [Moderate] Theoretical
- ▶ **Chloramphenicol** decreases the efficacy of oral **iron (oral)**. [Moderate] Theoretical
- ▶ **Iron (oral)** decreases the absorption of **dolutegravir**. **Dolutegravir** should be taken 2 hours before or 6 hours after **iron (oral)**. [Moderate] Study
- ▶ **Iron (oral)** is predicted to decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **iron (oral)**. [Severe] Theoretical
- ▶ **Iron (oral)** is predicted to decrease the absorption of **entacapone**. Separate administration by at least 2 hours. [Moderate] Theoretical
- ▶ **Iron (oral)** decreases the absorption of **levodopa**. [Moderate] Study
- ▶ **Iron (oral)** decreases the effects of **methyldopa**. [Moderate] Study
- ▶ **Iron (oral)** is predicted to decrease the absorption of **penicillamine**. Separate administration by at least 2 hours. [Mild] Study
- ▶ **Iron (oral)** decreases the exposure to **quinolones**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Iron (oral)** decreases the absorption of **tetracyclines**. **Tetracyclines** should be taken 2 to 3 hours after **iron (oral)**. [Moderate] Study
- ▶ **Iron (oral)** decreases the absorption of **thyroid hormones (levothyroxine)**. Separate administration by at least 4 hours. [Moderate] Study

- ▶ **Trientine** potentially decreases the absorption of **iron (oral)**. [Moderate] Theoretical
- ▶ **Zinc** is predicted to decrease the efficacy of **iron (oral)** and **iron (oral)** is predicted to decrease the efficacy of **zinc**. [Moderate] Study

Iron chelators

deferasirox · desferrioxamine · dextrazoxane

- ▶ **Deferasirox** is predicted to increase the exposure to **aminophylline**. Avoid. [Moderate] Theoretical
- ▶ **Antacids (aluminium hydroxide)** are predicted to decrease the exposure to **deferasirox**. Avoid. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **deferasirox**. Monitor serum ferritin and adjust dose. [Moderate] Theoretical
- ▶ **Ascorbic acid** is predicted to increase the risk of cardiovascular side-effects when given with **desferrioxamine**. [Severe] Theoretical
- ▶ **Aspirin** (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with **deferasirox**. [Severe] Theoretical
- ▶ **Bisphosphonates** are predicted to increase the risk of gastrointestinal bleeding when given with **deferasirox**. [Severe] Theoretical
- ▶ **Deferasirox** is predicted to increase the exposure to **clozapine**. Avoid. [Moderate] Theoretical
- ▶ **Corticosteroids** are predicted to increase the risk of gastrointestinal bleeding when given with **deferasirox**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **deferasirox**. Monitor serum ferritin and adjust dose. [Moderate] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dextrazoxane**. Avoid. [Severe] Theoretical
- ▶ **NSAIDs** are predicted to increase the risk of gastrointestinal bleeding when given with **deferasirox**. [Severe] Theoretical
- ▶ **Deferasirox** moderately increases the exposure to **repaglinide**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **deferasirox**. Monitor serum ferritin and adjust dose. [Moderate] Study
- ▶ **Deferasirox** is predicted to increase the exposure to **selexipag**. Adjust dose. [Moderate] Study
- ▶ **Deferasirox** increases the exposure to **theophylline**. Avoid. [Moderate] Study
- ▶ **Deferasirox** is predicted to increase the exposure to **tizanidine**. Avoid. [Moderate] Theoretical

Iron dextran → see iron (injectable)

Iron isomaltoside 1000 → see iron (injectable)

Iron sucrose → see iron (injectable)

Isavuconazole → see antifungals, azoles

Isoconazole → see monoamine-oxidase A and B inhibitors, irreversible

Isoflurane → see volatile halogenated anaesthetics

Isometheptene → see sympathomimetics, vasoconstrictor

Isoniazid → see TABLE 1 p. 847 (hepatotoxicity), TABLE 12 p. 850 (peripheral neuropathy)

FOOD AND LIFESTYLE Avoid tyramine or histamine rich foods, as tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

- ▶ **Isoniazid** is predicted to affect the clearance of **aminophylline**. [Severe] Theoretical
- ▶ **Isoniazid** markedly increases the concentration of **antiepileptics (carbamazepine)** and **antiepileptics (carbamazepine)** increase the risk of hepatotoxicity when given with **isoniazid**. Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 1 p. 847
- ▶ **Isoniazid** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. [Moderate] Study → Also see TABLE 12 p. 850
- ▶ **Cycloserine** increases the risk of CNS toxicity when given with **isoniazid**. Monitor and adjust dose. [Moderate] Study

- ▶ **Isoniazid** is predicted to increase the risk of peripheral neuropathy when given with **didanosine**. [Severe] Theoretical → Also see TABLE 1 p. 847 → Also see TABLE 12 p. 850
- ▶ **Isoniazid** increases the risk of optic neuropathy when given with **ethambutol**. [Severe] Anecdotal
- ▶ **Isoniazid** decreases the effects of **levodopa**. [Moderate] Study
- ▶ **Isoniazid** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Unknown] Theoretical → Also see TABLE 1 p. 847
- ▶ **Isoniazid** is predicted to increase the risk of peripheral neuropathy when given with **stavudine**. [Severe] Theoretical → Also see TABLE 12 p. 850
- ▶ **Isoniazid** is predicted to affect the clearance of **theophylline**. [Severe] Anecdotal
- ▶ **Isoniazid** potentially increases the risk of nephrotoxicity when given with **volatile halogenated anaesthetics (methoxyflurane)**. Avoid. [Severe] Theoretical
- Isoorbide dinitrate** → see nitrates
- Isoorbide mononitrate** → see nitrates
- Isotretinoin** → see retinoids
- Itraconazole** → see antifungals, azoles
- Ivabradine** → see TABLE 6 p. 848 (bradycardia), TABLE 9 p. 849 (QT-interval prolongation)
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Apprepitant** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **ivabradine**. Avoid. [Moderate] Study → Also see TABLE 6 p. 848
- ▶ **Cobicistat** is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical → Also see TABLE 6 p. 848
- ▶ **Enzalutamide** is predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ivabradine**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **St John's Wort** decreases the exposure to **ivabradine**. Avoid. [Moderate] Study
- Ivacaftor**
 - FOOD AND LIFESTYLE** Avoid bitter (Seville) oranges as they are predicted to increase the exposure to **ivacaftor**.
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately to markedly decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** p. 186 or **lumacaftor with ivacaftor** p. 187 dose with potent inhibitors of CYP3A4. [Severe] Study
- ▶ **Apprepitant** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **ivacaftor**. [Severe] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** p. 186 or **lumacaftor with ivacaftor** p. 187 dose with potent inhibitors of CYP3A4. [Severe] Study
- ▶ **Ivacaftor** is predicted to increase the anticoagulant effect of **coumarins (warfarin)**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Ivacaftor** slightly increases the exposure to **digoxin**. [Moderate] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **ivacaftor**. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to moderately to markedly decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ivacaftor**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** p. 186 or **lumacaftor with ivacaftor** p. 187 dose with potent inhibitors of CYP3A4. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** p. 186 or **lumacaftor with ivacaftor** p. 187 dose with potent inhibitors of CYP3A4. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Ivacaftor** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** p. 186 or **lumacaftor with ivacaftor** p. 187 dose with potent inhibitors of CYP3A4. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Mitotane** is predicted to moderately to markedly decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **ivacaftor**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Rifampicin** is predicted to moderately to markedly decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **ivacaftor**. [Severe] Theoretical

Ivermectin

- ▶ **Ivermectin** potentially increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Levamisole** increases the exposure to **ivermectin**. [Moderate] Study

Ixazomib

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to ixazomib. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to ixazomib. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to ixazomib. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to ixazomib. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to ixazomib. Avoid. [Severe] Theoretical

Ixekizumab → see monoclonal antibodies

Kaolin

- ▶ **Kaolin** is predicted to decrease the absorption of **tetracyclines**. [Moderate] Theoretical

Ketamine → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Memantine** is predicted to increase the risk of CNS side-effects when given with **ketamine**. Avoid. [Severe] Theoretical

Ketoconazole → see antifungals, azoles

Ketoprofen → see NSAIDs

Ketorolac → see NSAIDs

Ketotifen → see antihistamines, sedating

Labetalol → see beta blockers, non-selective

Lacidipine → see calcium channel blockers

Lacosamide → see antiepileptics

Lamivudine → see TABLE 12 p. 850 (peripheral neuropathy)

- ▶ **Trimethoprim** slightly increases the exposure to **lamivudine**. [Moderate] Study

Lamotrigine → see antiepileptics

Laureotide

- ▶ **Beta blockers, non-selective** are predicted to increase the risk of bradycardia when given with **laureotide**. [Moderate] Theoretical

- ▶ **Beta blockers, selective** are predicted to increase the risk of bradycardia when given with **laureotide**. [Moderate] Theoretical

- ▶ **Laureotide** is predicted to decrease the absorption of oral **ciclosporin**. Adjust dose. [Severe] Theoretical

Lansoprazole → see proton pump inhibitors

Lanthanum

- ▶ **Lanthanum** is predicted to decrease the absorption of **antifungals, azoles (ketoconazole)**. Separate administration by at least 2 hours. [Moderate] Theoretical

- ▶ **Lanthanum** is predicted to decrease the absorption of **antimalarials (chloroquine)**. Separate administration by at least 2 hours. [Moderate] Theoretical

- ▶ **Lanthanum** is predicted to decrease the absorption of **hydroxychloroquine**. Separate administration by at least 2 hours. [Moderate] Theoretical

- ▶ **Lanthanum** moderately decreases the exposure to **quinolones**. Quinolones should be taken 2 hours before or 4 hours after **lanthanum**. [Moderate] Study

- ▶ **Lanthanum** is predicted to decrease the absorption of **tetracyclines**. Separate administration by 2 hours. [Moderate] Theoretical

- ▶ **Lanthanum** decreases the absorption of **thyroid hormones**. Separate administration by 2 hours. [Moderate] Study

Lapatinib → see TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **Lapatinib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study

- ▶ **Lapatinib** is predicted to increase the exposure to **alsikiren**. [Moderate] Theoretical

- ▶ **Antacids** are predicted to decrease the absorption of **lapatinib**. Avoid. [Moderate] Theoretical

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 849

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study

- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 849

- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849

- ▶ **Lapatinib** is predicted to increase the exposure to

antihistamines, non-sedating (**fxefenadine**). [Moderate] Theoretical

- ▶ **Aprepitant** is predicted to increase the exposure to **lapatinib**. [Moderate] Study

- ▶ **Lapatinib** is predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [Moderate] Study

- ▶ **Bosentan** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study

- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **lapatinib**. [Moderate] Study

- ▶ **Lapatinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849

- ▶ **Cobicistat** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study

- ▶ **Lapatinib** is predicted to increase the exposure to **colchicine**. Avoid or adjust **colchicine** dose. [Moderate] Theoretical

- ▶ **Lapatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical

- ▶ **Crizotinib** is predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 849

- ▶ **Lapatinib** is predicted to increase the exposure to **dabigatran**. [Severe] Theoretical

- ▶ **Lapatinib** is predicted to increase the exposure to **digoxin**. [Moderate] Theoretical

- ▶ **Lapatinib** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical

- ▶ **Efavirenz** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849

- ▶ **Enzalutamide** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study

- ▶ **Lapatinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical

- ▶ **Lapatinib** is predicted to increase the exposure to **everolimus**. [Moderate] Theoretical

- ▶ **Lapatinib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study

- ▶ **Grapefruit juice** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Theoretical

- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **lapatinib**. Avoid. [Moderate] Theoretical

- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849

- ▶ **Idelalisib** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study

- ▶ **Imatinib** is predicted to increase the exposure to **lapatinib**. [Moderate] Study

- ▶ **Lapatinib** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical

- ▶ **Lapatinib** is predicted to increase the exposure to **loperamide**. [Moderate] Theoretical

- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849

- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 849

- ▶ **Mitotane** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study

- ▶ **Netupitant** is predicted to increase the exposure to **lapatinib**. [Moderate] Study

- ▶ **Nevirapine** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study

- ▶ **Nilotinib** is predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 849

- ▶ **Lapatinib** is predicted to increase the exposure to **nintedanib**. [Moderate] Study

- ▶ **Lapatinib** is predicted to increase the exposure to **panobinostat**. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 849

- ▶ **Lapatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical

- ▶ **Rifampicin** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study

- ▶ **Lapatinib** is predicted to increase the exposure to **sirolimus**. [Moderate] Theoretical

- ▶ **St John's Wort** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
- ▶ **Lapatinib** slightly increases the exposure to **taxanes** (**paclitaxel**). [Severe] Study
- ▶ **Tedizolid** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Lapatinib** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical

Larotidase

- ▶ **Antimalarials** (**chloroquine**) are predicted to decrease the exposure to **larotidase**. Avoid simultaneous administration. [Severe] Theoretical
- ▶ **Hydroxychloroquine** is predicted to decrease the exposure to **larotidase**. Avoid simultaneous administration. [Severe] Theoretical

Ledipasvir

- ▶ **Antacids** are predicted to decrease the exposure to **ledipasvir**. Separate administration by 4 hours. [Moderate] Theoretical
- ▶ **Ledipasvir** increases the risk of severe bradycardia or heart block when given with **antiarrhythmics** (**amiodarone**). Refer to specialist literature. [Severe] Anecdotal
- ▶ **Antiepileptics** (**carbamazepine**) are predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
- ▶ **Calcium salts** (**calcium carbonate**) are predicted to decrease the exposure to **ledipasvir**. Separate administration by 4 hours. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **ledipasvir**. Adjust dose, see **ledipasvir** with **sofosbuvir** p. 401. [Moderate] Study
- ▶ **Proton pump inhibitors** are predicted to decrease the exposure to **ledipasvir**. Adjust dose, see **ledipasvir** with **sofosbuvir** p. 401. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
- ▶ **Ledipasvir** moderately increases the exposure to **simeprevir** and **simeprevir** slightly increases the exposure to **ledipasvir**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
- ▶ **Ledipasvir** is predicted to increase the exposure to **statins** (**atorvastatin**, **fluvastatin**, **pravastatin**, **simvastatin**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Ledipasvir** is predicted to increase the exposure to **statins** (**rosuvastatin**). Avoid. [Severe] Theoretical
- ▶ **Ledipasvir** (with **sofosbuvir**) slightly increases the exposure to **tenofovir disoproxil**. [Moderate] Study

Leflunomide → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression)

PHARMACOLOGY Leflunomide has a long half-life; washout procedure recommended before switching to other DMARDs (consult product literature).

- ▶ **Leflunomide** is predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Leflunomide** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Leflunomide** is predicted to decrease the exposure to **anaesthetics, local** (**ropivacaine**). [Moderate] Theoretical
- ▶ **Leflunomide** potentially increases the exposure to **baricitinib**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- ▶ **Leflunomide** is predicted to decrease the exposure to **clozapine**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Leflunomide** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Leflunomide** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **leflunomide**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

- ▶ **Leflunomide** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **montelukast**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Leflunomide** is predicted to increase the exposure to **pioglitazone**. [Moderate] Study
- ▶ **Leflunomide** is predicted to decrease the exposure to **pirfenidone**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **repaglinide**. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the exposure to **selexipag**. Adjust dose. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **statins** (**rosuvastatin**). Adjust dose. [Moderate] Study → Also see TABLE 1 p. 847
- ▶ **Leflunomide** is predicted to increase the concentration of **taxanes** (**paclitaxel**). [Severe] Anecdotal → Also see TABLE 15 p. 850
- ▶ **Leflunomide** is predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study
- ▶ **Leflunomide** moderately decreases the exposure to **tizanidine**. [Mild] Study

Lenalidomide → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression), TABLE 5 p. 847 (thromboembolism)

- ▶ **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **lenalidomide**. Avoid. [Severe] Theoretical
- ▶ **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with **lenalidomide**. [Severe] Theoretical

Lercanidipine → see calcium channel blockers

Levamisole

- ▶ **Albendazole** slightly decreases the exposure to **levamisole** and **levamisole** moderately decreases the exposure to **albendazole**. [Moderate] Study
- ▶ **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **levamisole**. [Moderate] Study
- ▶ **Levamisole** increases the exposure to **ivermectin**. [Moderate] Study

Levetiracetam → see antiepileptics

Levobunolol → see beta blockers, non-selective

Levobupivacaine → see anaesthetics, local

Levocetirizine → see antihistamines, non-sedating

Levodopa → see TABLE 8 p. 848 (hypotension)

GENERAL INFORMATION Drugs with antimuscarinic effects might reduce the absorption of **levodopa**.

- ▶ **Amisulpride** is predicted to decrease the effects of **levodopa**. Avoid. [Severe] Theoretical
- ▶ **Antiepileptics** (**fosphenytoin**, **phenytoin**) decrease the effects of **levodopa**. [Moderate] Study
- ▶ **Aripiprazole** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Asenapine** is predicted to decrease the effects of **levodopa**. Adjust dose. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Baclofen** is predicted to increase the risk of side-effects when given with **levodopa**. [Severe] Anecdotal → Also see TABLE 8 p. 848
- ▶ **Benperidol** is predicted to decrease the effects of **levodopa**. [Severe] Study → Also see TABLE 8 p. 848
- ▶ **Bupropion** increases the risk of side-effects when given with **levodopa**. [Moderate] Study
- ▶ **Clozapine** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Droperidol** decreases the effects of **levodopa**. [Severe] Study → Also see TABLE 8 p. 848
- ▶ **Entacapone** increases the exposure to **levodopa**. Monitor side effects and adjust dose. [Moderate] Study
- ▶ **Flupentixol** decreases the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Haloperidol** decreases the effects of **levodopa**. [Severe] Study → Also see TABLE 8 p. 848
- ▶ **Iron (oral)** decreases the absorption of **levodopa**. [Moderate] Study

Levodopa (continued)

- ▶ **Isoniazid** decreases the effects of **levodopa**. [Moderate] Study
- ▶ **Levodopa** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ **Loxapine** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Lurasidone** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Mementine** is predicted to increase the effects of **levodopa**. [Moderate] Theoretical
- ▶ **Metoclopramide** decreases the effects of **levodopa**. Avoid. [Moderate] Study
- ▶ **Levodopa** increases the risk of side-effects when given with **moclobemide**. [Moderate] Study
- ▶ **Levodopa** increases the risk of a hypertensive crisis when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Study → Also see TABLE 8 p. 848
- ▶ **Monoamine-oxidase B inhibitors** are predicted to increase the effects of **levodopa**. Adjust dose. [Mild] Study → Also see TABLE 8 p. 848
- ▶ **Olanzapine** decreases the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Anecdotal → Also see TABLE 8 p. 848
- ▶ **Opicapone** increases the exposure to **levodopa**. Adjust dose. [Moderate] Study
- ▶ **Paliperidone** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Phenothiazines** decrease the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Study → Also see TABLE 8 p. 848
- ▶ **Pimozide** decreases the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Quetiapine** decreases the effects of **levodopa**. [Severe] Anecdotal → Also see TABLE 8 p. 848
- ▶ **Risperidone** is predicted to decrease the effects of **levodopa**. Avoid or adjust dose. [Severe] Anecdotal → Also see TABLE 8 p. 848
- ▶ **Sulpiride** is predicted to decrease the effects of **levodopa**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Tetrabenazine** is predicted to decrease the effects of **levodopa**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Tolcapone** increases the exposure to **levodopa**. Monitor and adjust dose. [Moderate] Study
- ▶ **Tryptophan** greatly decreases the concentration of **levodopa**. [Moderate] Study
- ▶ **Zuclopenthixol** is predicted to decrease the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 848

Levofloxacin → see quinolones**Levofolinic acid** → see folates**Levomopromazine** → see phenothiazines**Levonorgestrel**

- ▶ Antiepileptics (**carbamazepine**, **eslicarbazepine**, **fosphenytoin**, **oxcarbazepine**, **perampanel**, **phenobarbital**, **phenytoin**, **primidone**, **rufinamide**, **topiramate**) are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Efavirenz** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Fosaprepitant** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Griseofulvin** potentially decreases the efficacy of oral **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the efficacy of **levonorgestrel**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Modafinil** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Rifabutin** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **St John's Wort** is predicted to decrease the efficacy of **levonorgestrel**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Sugammadex** is predicted to decrease the exposure to **levonorgestrel**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Ulipristal** is predicted to decrease the efficacy of **levonorgestrel**. Avoid. [Severe] Theoretical

Levothyroxine → see thyroid hormones**Lidocaine** → see antiarrhythmics**Linagliptin** → see TABLE 14 p. 850 (antidiabetic drugs)

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **linagliptin**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **linagliptin**. [Moderate] Study
- ▶ **Linagliptin** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **linagliptin**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **linagliptin**. [Moderate] Study

Linezolid → see TABLE 15 p. 850 (myelosuppression), TABLE 13 p. 850 (serotonin syndrome)

FOOD AND LIFESTYLE Patients taking linezolid should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- ▶ **Beta₂ agonists** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ **Bupropion** is predicted to increase the risk of intraoperative hypertension when given with **linezolid**. [Severe] Anecdotal → Also see TABLE 13 p. 850
- ▶ **Buspirone** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Levodopa** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** increase the exposure to **linezolid**. [Moderate] Anecdotal
- ▶ **Methylenediphenidate** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ **Moclobemide** is predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping **moclobemide**. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase B inhibitors (safinamide)** are predicted to increase the risk of side-effects when given with **linezolid**.

Avoid and for 1 week after stopping **safinamide**. [Severe]

Theoretical → Also see TABLE 13 p. 850

- ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** slightly decreases the exposure to **linezolid**.

[Moderate] Study

- ▶ **Sympathomimetics, inotropic** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ Sympathomimetics, vasoconstrictor (**adrenaline/epinephrine, ephedrine, isometheptene, noradrenaline/norepinephrine, phenylephrine**) are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ Sympathomimetics, vasoconstrictor (**pseudoephedrine**) increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Study

Liothyronine → see thyroid hormones

Liraglutide → see TABLE 14 p. 850 (antidiabetic drugs)

Lisdexamfetamine → see amfetamines

Lisinopril → see ACE inhibitors

Lithium → see TABLE 13 p. 850 (serotonin syndrome), TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **ACE inhibitors** are predicted to increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Acetazolamide** alters the concentration of **lithium**. [Severe] Anecdotal
- ▶ **Aldosterone antagonists (eplerenone)** potentially increase the concentration of **lithium**. Avoid. [Moderate] Theoretical
- ▶ **Aldosterone antagonists (spironolactone)** potentially increase the concentration of **lithium**. [Moderate] Study
- ▶ **Aminophylline** is predicted to decrease the concentration of **lithium**. [Moderate] Theoretical
- ▶ **Angiotensin-II receptor antagonists** potentially increase the concentration of **lithium**. Monitor concentration and adjust dose. [Severe] Anecdotal
- ▶ **Antiepileptics (carbamazepine, oxcarbazepine)** are predicted to increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal
- ▶ **Calcitonin (salmon)** decreases the concentration of **lithium**. Monitor concentration and adjust dose. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal
- ▶ **Loop diuretics** increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Study
- ▶ **Methyldopa** increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal
- ▶ **NSAIDs** increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Study
- ▶ **Phenothiazines** potentially increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 849
- ▶ **Potassium-sparing diuretics (triamterene)** potentially increase the clearance of **lithium**. [Moderate] Study
- ▶ **Quetiapine** potentially increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal
- ▶ **Risperidone** potentially increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 849
- ▶ **Sodium bicarbonate** decreases the concentration of **lithium**. [Severe] Anecdotal
- ▶ **Sulpiride** potentially increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 849
- ▶ **Theophylline** is predicted to decrease the concentration of **lithium**. Monitor concentration and adjust dose. [Moderate] Anecdotal
- ▶ **Thiazide diuretics** increase the concentration of **lithium**. Avoid or adjust dose and monitor concentration. [Severe] Study
- ▶ **Tricyclic antidepressants** potentially increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 13 p. 850 → Also see TABLE 9 p. 849
- ▶ **Zuclopenthixol** potentially increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 849

Live vaccines

Bacillus Calmette-Guérin vaccine · **influenza vaccine (live)** · **measles, mumps and rubella vaccine, live** · **rotavirus vaccine** · **typhoid vaccine, oral** · **varicella-zoster vaccine** · **yellow fever vaccine, live**

GENERAL INFORMATION **Oral typhoid vaccine** is inactivated by concurrent administration of antibacterials or antimalarials: antibacterials should be avoided for 3 days before and after oral typhoid vaccination; **mefloquine** should be avoided for at least 12 hours before or after oral typhoid vaccination; for other antimalarials oral typhoid vaccine vaccination should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which can be given concurrently).

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **abatacept**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **alkylating agents**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **amsacrine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **anakinra**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **anthracyclines**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **azathioprine** (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **baricitinib**. Avoid. [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **belatacept**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **bleomycin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **capecitabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **ciclosporin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **cladribine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **clofarabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **corticosteroids** (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **cytarabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Live vaccines (continued)

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dactinomycin**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dimethyl fumarate**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etanercept**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etoposide**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **everolimus**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fingolimod**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fludarabine**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fluorouracil**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **gemcitabine**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **hydroxycarbamide**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **irinotecan**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **iron chelators (dextrazoxane)**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **leflunomide**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mercaptopurine** (high-dose). Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **methotrexate** (high-dose). Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mitomycin**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **monoclonal antibodies**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mycophenolate**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **pemetrexed**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **platinum compounds**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **procabazine**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **raltitrexed**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **sirolimus**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tacrolimus**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **taxanes (docetaxel, paclitaxel)**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tegafur**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **temsirolimus**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **teriflunomide**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tioguanine**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** potentially increase the risk of generalised infection (possibly life-threatening) when given with **tofacitinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **topotecan**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **trabectedin**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Venetoclax** potentially decreases the efficacy of **live vaccines**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **vinca alkaloids**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
- Lixisenatide** → see TABLE 14 p. 850 (antidiabetic drugs)
- SEPARATION OF ADMINISTRATION** Some orally administered drugs should be taken at least 1 hour before, or 4 hours after, lixisenatide injection.
- Lofepamine** → see tricyclic antidepressants
- Lofexidine** → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects)
- Lomitapide** → see TABLE 1 p. 847 (hepatotoxicity)
- FOOD AND LIFESTYLE** Bitter (Seville) orange is predicted to increase the exposure to lomitapide; separate administration by 12 hours.
- ▶ **Alprazolam** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical

- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 847
 - ▶ **Antifungals, azoles (clotrimazole)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical → Also see TABLE 1 p. 847
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study → Also see TABLE 1 p. 847
 - ▶ **Aprepitant** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
 - ▶ **Bicalutamide** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (amlodipine, lacidipine)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
 - ▶ **Ciclosporin** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Cilostazol** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Cobicistat** is predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
 - ▶ **Oral combined hormonal contraceptives** slightly increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Lomitapide** increases the exposure to **coumarins (warfarin)**. Monitor INR and adjust dose. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Everolimus** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Fosaprepitant** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Grapefruit juice** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **H₂ receptor antagonists (cimetidine, ranitidine)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
 - ▶ **Isoniazid** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Unknown] Theoretical → Also see TABLE 1 p. 847
 - ▶ **Ivacaftor** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Lapatinib** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Linagliptin** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Netupitant** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
 - ▶ **Nilotinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
 - ▶ **Pazopanib** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Peppermint oil** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Propiverine** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Ranolazine** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Rifampicin** is predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **SSRIs (fluoxetine)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Unknown] Theoretical
 - ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Lomitapide** increases the exposure to **statins (atorvastatin)**. Adjust **lomitapide** dose or separate administration by 12 hours. [Mid] Study → Also see TABLE 1 p. 847
 - ▶ **Lomitapide** increases the exposure to **statins (simvastatin)**. Monitor and adjust **simvastatin** dose, p. 134. [Moderate] Study → Also see TABLE 1 p. 847
 - ▶ **Tacrolimus** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Ticagrelor** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Tolvaptan** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - Lomustine** → see alkylating agents
 - Loop diuretics** → see TABLE 18 p. 851 (hyponatraemia), TABLE 8 p. 848 (hypotension), TABLE 19 p. 851 (ototoxicity), TABLE 17 p. 851 (reduced serum potassium)
- bumetanide · furosemide · torasemide
- ▶ **Aliskiren** slightly decreases the exposure to **furosemide**. [Moderate] Study → Also see TABLE 8 p. 848
 - ▶ **Loop diuretics** increase the risk of nephrotoxicity when given with **aminoglycosides**. Avoid. [Moderate] Study → Also see TABLE 19 p. 851
 - ▶ **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of **furosemide**. [Moderate] Study
 - ▶ **Intravenous furosemide** potentially increases the risk of sweating, variable blood pressure, and tachycardia when given after **chloral hydrate**. [Moderate] Anecdotal
 - ▶ **Dasabuvir** (with ombitasvir, paritaprevir and ritonavir) increases the concentration of **furosemide**. Adjust dose. [Moderate] Study
 - ▶ **Loop diuretics** increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Study
 - ▶ **Paritaprevir** (with ritonavir and ombitasvir) is predicted to increase the exposure to **furosemide**. Adjust dose. [Moderate] Theoretical
 - ▶ **Reboxetine** is predicted to increase the risk of hypokalaemia when given with **loop diuretics**. [Moderate] Theoretical
- Loperamide**
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **loperamide**. [Severe] Theoretical
 - ▶ **Certinib** is predicted to increase the exposure to **loperamide**. [Moderate] Theoretical
 - ▶ **Loperamide** greatly increases the absorption of oral **desmopressin** (and possibly sublingual). [Moderate] Study
 - ▶ **Eliglustat** is predicted to increase the exposure to **loperamide**. Adjust dose. [Moderate] Study
 - ▶ **Lapatinib** is predicted to increase the exposure to **loperamide**. [Moderate] Theoretical

Loperamide (continued)

- ▶ **Mirabegron** is predicted to increase the exposure to loperamide. [Mild] Theoretical
- ▶ **Opicapone** is predicted to increase the exposure to loperamide. Avoid. [Moderate] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to loperamide. [Severe] Theoretical

Lopinavir → see HIV-protease inhibitors**Loprazolam** → see TABLE 11 p. 849 (CNS depressant effects)**Loratadine** → see antihistamines, non-sedating**Lorazepam** → see TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Rifampicin** increases the clearance of **lorazepam**. [Moderate] Study

Lormetazepam → see TABLE 11 p. 849 (CNS depressant effects)**Losartan** → see angiotensin-II receptor antagonists
Low molecular-weight heparins → see TABLE 16 p. 851 (increased serum potassium), TABLE 3 p. 847 (anticoagulant effects)

dalteparin · enoxaparin · tinzaparin

- ▶ **Ranibizumab** increases the risk of bleeding events when given with low molecular-weight heparins. [Severe] Theoretical

Loxapine → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects), TABLE 10 p. 849 (antimuscarinics)

- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical
- ▶ Loxapine is predicted to decrease the effects of **dopamine receptor agonists**. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 10 p. 849

- ▶ Loxapine is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848

- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical

- ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical

Lumacaftor

- ▶ Lumacaftor is predicted to decrease the exposure to antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**). Avoid. [Severe] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to antifungals, azoles (**fluconazole**). Adjust dose. [Mild] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to antifungals, azoles (**itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**). Avoid or monitor efficacy. [Moderate] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to **ciclosporin**. Avoid. [Severe] Theoretical
- ▶ Lumacaftor is predicted to decrease the efficacy of **combined hormonal contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to **corticosteroids (methylprednisolone, prednisone)**. Adjust dose. [Severe] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to **everolimus**. Avoid. [Severe] Theoretical
- ▶ Lumacaftor potentially decreases the exposure to **glecaprevir**. Avoid. [Severe] Theoretical
- ▶ Lumacaftor is predicted to decrease the efficacy of **levonorgestrel**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to **macrolides (clarithromycin, erythromycin)**. [Moderate] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to **midazolam**. Avoid. [Severe] Theoretical
- ▶ Lumacaftor potentially decreases the exposure to **pibrentasvir**. Avoid. [Severe] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to **rifabutin**. Adjust dose. [Moderate] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to **sirolimus**. Avoid. [Severe] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to **tacrolimus**. Avoid. [Severe] Theoretical
- ▶ Lumacaftor is predicted to decrease the exposure to **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ Lumacaftor is predicted to decrease the efficacy of **ulipristal**. Use additional contraceptive precautions. [Severe] Theoretical

Lumefantrine → see antimalarials**Lurasidone** → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to lurasidone. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to lurasidone. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to lurasidone. Avoid. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to lurasidone. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to lurasidone. [Moderate] Study → Also see TABLE 8 p. 848
- ▶ **Cobicistat** is predicted to increase the exposure to lurasidone. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to lurasidone. [Moderate] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to lurasidone. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to lurasidone. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to lurasidone. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to lurasidone. [Moderate] Study
- ▶ **Lurasidone** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to lurasidone. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to lurasidone. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to lurasidone. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to lurasidone. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical

Lymecycline → see tetracyclines**Macitentan**

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to macitentan. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to macitentan. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to macitentan. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to macitentan. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to macitentan. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to macitentan. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to macitentan. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to macitentan. Avoid. [Severe] Study

- ▶ **Rifampicin** is predicted to decrease the exposure to **macitentan**. Avoid. [\[Severe\]](#) Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **macitentan**. Avoid. [\[Severe\]](#) Theoretical

Macrolides → see TABLE 9 p. 849 (QT-interval prolongation)

azithromycin · clarithromycin · erythromycin

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Clarithromycin** is predicted to increase the exposure to **abiraterone**. [\[Severe\]](#) Theoretical
- ▶ **Macrolides** are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose. [\[Severe\]](#) Study
- ▶ **Azithromycin** is predicted to increase the exposure to **aliskiren**. [\[Moderate\]](#) Theoretical
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **aliskiren**. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** increases the exposure to **almotriptan**. [\[Mild\]](#) Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **alpha blockers (doxazosin)**. [\[Moderate\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** moderately increases the exposure to **alprazolam**. Avoid. [\[Moderate\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Azithromycin** is predicted to increase the exposure to **aminophylline**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **aminophylline**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Aminophylline** is predicted to decrease the exposure to **erythromycin**. Adjust dose. [\[Severe\]](#) Study
- ▶ **Clarithromycin** very markedly increases the exposure to **antiarrhythmics (dronedarone)**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to moderately increase the exposure to **antiarrhythmics (dronedarone)**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 849
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **antiarrhythmics (lidocaine)**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **anticholinesterases, centrally acting (galantamine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** slightly increases the concentration of **antiepileptics (carbamazepine)**. Monitor concentration and adjust dose. [\[Severe\]](#) Study
- ▶ **Erythromycin** markedly increases the concentration of **antiepileptics (carbamazepine)**. Monitor concentration and adjust dose. [\[Severe\]](#) Study
- ▶ **Clarithromycin** is predicted to very slightly increase the exposure to **antiepileptics (perampamel)**. [\[Mild\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. Avoid or monitor side effects. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [\[Severe\]](#) Theoretical
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [\[Severe\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **apixaban**. [\[Severe\]](#) Theoretical
- ▶ **Erythromycin** is predicted to increase the exposure to **apixaban**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **aprepitant**. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to slightly increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 249. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **axitinib**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical → Also see TABLE 9 p. 849
- ▶ **Macrolides** are predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **beta₂ agonists (salmeterol)**. Avoid. [\[Severe\]](#) Study
- ▶ **Clarithromycin** slightly increases the exposure to **bortezomib**. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **bosentan**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **buspirone**. Adjust buspirone dose. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** slightly increases the exposure to **cabozantinib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **cabozantinib**. [\[Moderate\]](#) Theoretical → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **calcium channel blockers (diltiazem)**. [\[Severe\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [\[Severe\]](#) Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **calcium channel blockers (lercanidipine)**. Avoid. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **calcium channel blockers (verapamil)**. [\[Severe\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **ceritinib**. Avoid or adjust ceritinib dose. [\[Severe\]](#) Study → Also see TABLE 9 p. 849
- ▶ **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to **ceritinib**. [\[Moderate\]](#) Theoretical → Also see TABLE 9 p. 849
- ▶ **Macrolides (clarithromycin, erythromycin)** increase the concentration of **ciclosporin**. [\[Severe\]](#) Study

Macrolides (continued)

- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **cilostazol**. Adjust **cilostazol** dose. [Moderate] Study
- ▶ **Erythromycin** slightly increases the exposure to **cilostazol**. Adjust **cilostazol** dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Erythromycin** potentially increases the risk of toxicity when given with **clozapine**. [Severe] Anecdotal
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **colchicine**. Avoid or adjust **colchicine** dose. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **colchicine**. Avoid potent inhibitors of CYP3A4 or adjust **colchicine** dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **corticosteroids (beclomethasone)** (risk with beclomethasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, prednisone, triamcinolone)**. Avoid or monitor side effects. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Macrolides (**clarithromycin, erythromycin**) increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Anecdotal
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides** are predicted to increase the exposure to **dabigatran**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **daclatasvir**. Adjust **daclatasvir** dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to slightly increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **dasatinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** very slightly increases the exposure to **delamanid**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides** increase the concentration of **digoxin**. [Severe] Anecdotal
- ▶ Macrolides (**clarithromycin, erythromycin**) increase the risk of QT-prolongation when given with **domeperidone**. Avoid. [Severe] Study
- ▶ **Clarithromycin** increases the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ Macrolides (**clarithromycin, erythromycin**) are predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. Avoid. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. [Moderate] Theoretical
- ▶ **Erythromycin** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Erythromycin** slightly increases the exposure to **edoxaban**. Adjust **edoxaban** dose. [Severe] Study
- ▶ Macrolides (**azithromycin, clarithromycin**) are predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **Efavirenz** decreases the exposure to **clarithromycin**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** slightly to moderately increases the exposure to **elbasvir**. Avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **eletriptan**. Avoid. [Severe] Study
- ▶ **Erythromycin** moderately increases the exposure to **eletriptan**. Avoid. [Moderate] Study
- ▶ Macrolides (**clarithromycin, erythromycin**) are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Erythromycin** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Erythromycin** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to slightly increase the exposure to **erlotinib**. Use with caution and adjust dose. [Moderate] Study
- ▶ Macrolides (**azithromycin, erythromycin**) are predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Etravirine** decreases the exposure to **clarithromycin**. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- ▶ **Macrolides** are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **fosaprepitant**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **gefitinib**. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **gefitinib**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **erythromycin**. [Moderate] Study
- ▶ **HIV-protease inhibitors (atazanavir)** are predicted to increase the exposure to **clarithromycin**. Adjust dose in renal impairment. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, tipranavir)** are predicted to increase the exposure to **erythromycin**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (darunavir, fosamprenavir, lopinavir)** (boosted with ritonavir) are predicted to increase the exposure to **clarithromycin**. Adjust dose in renal impairment. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** increase the exposure to **clarithromycin**. Adjust dose in renal impairment. [Severe] Study
- ▶ **HIV-protease inhibitors (tipranavir)** (boosted with ritonavir) increase the exposure to **clarithromycin** and **clarithromycin** increases the exposure to **HIV-protease inhibitors (tipranavir)** (boosted with ritonavir). Monitor; adjust dose in renal impairment. [Severe] Study

- ▶ **Clarithromycin** increases the exposure to **HIV-protease inhibitors (saquinavir)** and **HIV-protease inhibitors (saquinavir)** increase the exposure to **clarithromycin**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **HIV-protease inhibitors (saquinavir)**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to very markedly increase the exposure to **ibrutinib**. Avoid potent inhibitors of CYP3A4 or adjust **ibrutinib** dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** p. 186 or **lumacaftor with ivacaftor** p. 187 dose with potent inhibitors of CYP3A4. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** increases the exposure to **linezolid**. [Moderate] Anecdotal
- ▶ **Azithromycin** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to macrolides (**clarithromycin, erythromycin**). [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **lurasidone**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **lurasidone**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **macitentan**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **maraviroc**. Adjust dose. [Severe] Study
- ▶ **Clarithromycin** is predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Clarithromycin** is predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **modafinil**. [Mild] Theoretical
- ▶ **Clarithromycin** increases the risk of neutropenia when given with **monoclonal antibodies (brentuximab vedotin)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **monoclonal antibodies (trastuzumab emtansine)**. Avoid. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **netupitant**. [Moderate] Study
- ▶ **Nevirapine** decreases the exposure to **clarithromycin**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **nilotinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Macrolides** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **nitisone**. Adjust dose. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical
- ▶ **Erythromycin** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil)**. Monitor and adjust dose. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the concentration of **opioids (methadone)**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **opioids (methadone, sufentanil)**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **oxybutynin**. [Mild] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **oxybutynin**. [Mild] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **palbociclib**. Avoid or adjust **palbociclib** dose. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to **panobinostat**. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil, vardenafil)**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Avoid potent inhibitors of CYP3A4 or adjust **sildenafil** dose, p. 120. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. Use with caution or avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [Severe] Theoretical

Macrolides (continued)

- ▶ **Erythromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **praziquantel**. [Mild] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **quetiapine**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **ranolazine**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **ranolazine**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **reboxetine**. Avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **repaglinide**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust **alitretinoin** dose. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Azithromycin** increases the risk of neutropenia when given with **rifabutin**. [Severe] Study
- ▶ **Clarithromycin** increases the risk of uveitis when given with **rifabutin**. Adjust dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the risk of uveitis when given with **rifabutin**. Adjust dose. [Severe] Theoretical
- ▶ **Rifampicin** decreases the concentration of **clarithromycin**. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **roxolitinib**. Adjust dose and monitor side effects. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **roxolitinib**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **saxagliptin**. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the concentration of **sirolimus**. Avoid. [Severe] Study
- ▶ **Erythromycin** increases the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **solifenacin**. Adjust **solifenacin** or **tamsulosin** with **solifenacin** dose; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **SSRIs (dapoxetine)**. Avoid potent inhibitors of CYP3A4 or adjust **dapoxetine** dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **statins (atorvastatin)**. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Severe] Study
- ▶ **Clarithromycin** moderately increases the exposure to **statins (pravastatin)**. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **statins (pravastatin)**. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **statins (simvastatin)**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **statins (simvastatin)**. Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Clarithromycin** is predicted to slightly increase the exposure to **sulfonylureas**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **taxanes (docetaxel)**. Avoid or adjust dose. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ **Erythromycin** is predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical
- ▶ **Erythromycin** decreases the clearance of **theophylline** and **theophylline** potentially decreases the clearance of **erythromycin**. Adjust dose. [Severe] Study
- ▶ **Macrolides (azithromycin, clarithromycin)** are predicted to increase the exposure to **theophylline**. Adjust dose. [Moderate] Anecdotal
- ▶ **Azithromycin** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **ticagrelor**. Avoid. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **tofacinib**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Erythromycin** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Macrolides** are predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **toremifene**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical
- ▶ **Macrolides** are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Azithromycin** decreases the exposure to **venetoclax**. [Mild] Study

- ▶ **Clarithromycin** is predicted to increase the exposure to **venetoclax**. Avoid potent inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **venlafaxine**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ Macrolides (**clarithromycin**, **erythromycin**) are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Clarithromycin** is predicted to increase the exposure to **vitamin D substances (paricalcitol)**. [Moderate] Study
- ▶ **Clarithromycin** decreases the absorption of **zidovudine**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- ▶ **Erythromycin** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study

Magnesium

- ▶ Oral **magnesium** decreases the absorption of **bisphosphonates (alendronic acid)**. **Alendronic acid** should be taken at least 30 minutes before **magnesium**. [Moderate] Study
- ▶ Oral **magnesium** is predicted to decrease the absorption of oral **bisphosphonates (ibandronic acid)**. Avoid **magnesium** for at least 6 hours before or 1 hour after **ibandronic acid**. [Moderate] Theoretical
- ▶ Oral **magnesium** decreases the absorption of **bisphosphonates (risedronate)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Oral **magnesium** decreases the absorption of **bisphosphonates (sodium clodronate)**. Avoid **magnesium** for 2 hours before or 1 hour after **sodium clodronate**. [Moderate] Study
- ▶ Intravenous **magnesium** potentially increases the risk of hypotension when given with **calcium channel blockers (amlodipine, cleveldipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil)** (in pregnant women). [Severe] Anecdotal
- ▶ Intravenous **magnesium** increases the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Study
- ▶ Intravenous **magnesium** is predicted to increase the effects of **suxamethonium**. [Moderate] Study

Magnesium carbonate → see antacids

Magnesium trisilicate → see antacids

Maraviroc

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **maraviroc**. Adjust dose. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **maraviroc**. Avoid. [Moderate] Theoretical
- ▶ **Cobicistat** markedly increases the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **Efavirenz** decreases the exposure to **maraviroc**. Refer to specialist literature. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
- ▶ **Etravirine** (with a boosted protease inhibitor) increases the exposure to **maraviroc**. Avoid or adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors (atazanavir, saquinavir)** moderately to markedly increase the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **HIV-protease inhibitors (darunavir)** (boosted with ritonavir) markedly increase the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **HIV-protease inhibitors (lopinavir)** (boosted with ritonavir) moderately increase the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** markedly increase the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **Maraviroc** potentially decreases the exposure to **HIV-protease inhibitors (fosamprenavir)** and **HIV-protease inhibitors**

(**fosamprenavir**) potentially decrease the exposure to **maraviroc**. Avoid. [Severe] Study

- ▶ **Idelalisib** markedly increases the exposure to **maraviroc**. Adjust dose. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **maraviroc**. Adjust dose. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
 - ▶ **Rifampicin** is predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to **maraviroc**. Avoid. [Severe] Theoretical
- Measles, mumps and rubella vaccine, live** → see live vaccines
- Mebendazole**
- ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of **mebendazole**. [Moderate] Study

Medroxyprogesterone

- ▶ **Sugammadex** is predicted to decrease the exposure to **medroxyprogesterone**. Use additional contraceptive precautions. [Severe] Theoretical

Mefenamic acid → see NSAIDs

Mefloquine → see antimalarials

Melatonin → see TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Antiepileptics (phenytoin)** are predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **SSRIs (fluvoxamine)** very markedly increase the exposure to **melatonin**. Avoid. [Severe] Study
- ▶ **Teriflunomide** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical

Meloxicam → see NSAIDs

Melphalan → see alkylating agents

Memantine

- ▶ **Dopamine receptor agonists (amantadine)** increase the risk of CNS toxicity when given with **memantine**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Memantine** is predicted to increase the effects of **dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine)**. [Moderate] Theoretical
- ▶ **Memantine** is predicted to increase the risk of CNS side-effects when given with **ketamine**. Avoid. [Severe] Theoretical
- ▶ **Memantine** is predicted to increase the effects of **levodopa**. [Moderate] Theoretical

Mepacrine

- ▶ **Mepacrine** is predicted to increase the concentration of **antimalarials (primaquine)**. Avoid. [Moderate] Theoretical

Mepivacaine → see anaesthetics, local

Meprobamate → see TABLE 11 p. 849 (CNS depressant effects)

Meptazinol → see opioids

Mercaptopurine → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression)

- ▶ **Allopurinol** potentially increases the risk of haematological toxicity when given with **mercaptopurine**. Adjust **mercaptopurine** dose, p. 543. [Severe] Study
- ▶ **Mercaptopurine** decreases the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ **Febuxostat** is predicted to increase the exposure to **mercaptopurine**. Avoid. [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mercaptopurine** (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Meropenem → see carbapenems

Mesalazine

ROUTE-SPECIFIC INFORMATION The manufacturers of some mesalazine gastro-resistant and modified-release medicines (Asacol MR tablets, Ipocol, Salofalk granules) suggest that preparations that lower stool pH (e.g. lactulose) might prevent the release of mesalazine.

Metaraminol → see sympathomimetics, vasoconstrictor

Metformin → see TABLE 14 p. 850 (antidiabetic drugs)

- ▶ **Alcohol (beverage)** (excessive consumption) potentially increases the risk of lactic acidosis when given with **metformin**. Avoid excessive alcohol consumption. [Moderate] Theoretical
- ▶ **Dolutegravir** slightly to moderately increases the exposure to **metformin**. Use with caution and adjust dose. [Severe] Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **metformin**. Monitor and adjust dose. [Moderate] Study
- ▶ **Pitolisant** is predicted to increase the exposure to **metformin**. [Unknown] Theoretical
- ▶ **Vandetanib** slightly increases the exposure to **metformin**. Monitor and adjust dose. [Moderate] Study

Methadone → see opioids

Methenamine

- ▶ **Acetazolamide** is predicted to decrease the efficacy of **methenamine**. Avoid. [Moderate] Theoretical
- ▶ **Potassium citrate** is predicted to decrease the efficacy of **methenamine**. Avoid. [Moderate] Theoretical
- ▶ **Sodium bicarbonate** is predicted to decrease the efficacy of **methenamine**. Avoid. [Moderate] Theoretical
- ▶ **Sodium citrate** is predicted to decrease the efficacy of **methenamine**. Avoid. [Moderate] Theoretical

Methocarbamol → see TABLE 11 p. 849 (CNS depressant effects)

Methotrexate → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression), TABLE 2 p. 847 (nephrotoxicity), TABLE 5 p. 847 (thromboembolism)

- ▶ **Acetazolamide** increases the urinary excretion of **methotrexate**. [Moderate] Study
- ▶ **Methotrexate** is predicted to decrease the clearance of **aminophylline**. [Moderate] Theoretical
- ▶ **Antiepileptics (levetiracetam)** decrease the clearance of **methotrexate**. [Severe] Anecdotal
- ▶ **Antimalarials (pyrimethamine)** are predicted to increase the risk of side-effects when given with **methotrexate**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Asparaginase** affects the efficacy of **methotrexate**. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Aspirin** (high-dose) is predicted to increase the risk of toxicity when given with **methotrexate**. [Severe] Theoretical
- ▶ **Crisantaspase** affects the efficacy of **methotrexate**. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **methotrexate** (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **NSAIDs** are predicted to increase the risk of toxicity when given with **methotrexate**. Monitor and adjust dose. [Severe] Study → Also see TABLE 2 p. 847
- ▶ **Pegaspargase** affects the efficacy of **methotrexate**. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Penicillins** are predicted to increase the risk of toxicity when given with **methotrexate**. [Severe] Theoretical → Also see TABLE 1 p. 847
- ▶ **Proton pump inhibitors** decrease the clearance of **methotrexate** (high-dose). Use with caution or avoid. [Severe] Study
- ▶ **Quinolones (ciprofloxacin)** potentially increase the risk of toxicity when given with **methotrexate**. Avoid. [Severe] Anecdotal
- ▶ **Regorafenib** is predicted to increase the exposure to **methotrexate**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Retinoids (acitretin)** are predicted to increase the concentration of **methotrexate**. Avoid. [Moderate] Anecdotal
- ▶ **Rolapitant** is predicted to increase the exposure to **methotrexate**. Avoid or monitor. [Moderate] Study
- ▶ **Methotrexate** is predicted to decrease the efficacy of **sapropterin**. [Moderate] Theoretical

- ▶ **Sulfonamides** are predicted to increase the exposure to **methotrexate**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Tedizolid** is predicted to increase the exposure to **methotrexate**. Avoid. [Moderate] Theoretical
- ▶ **Methotrexate** is predicted to increase the risk of toxicity when given with **tegafur**. [Severe] Theoretical
- ▶ **Methotrexate** decreases the clearance of **theophylline**. [Moderate] Study
- ▶ **Trimethoprim** is predicted to increase the risk of side-effects when given with **methotrexate**. Avoid. [Severe] Theoretical → Also see TABLE 2 p. 847

Methoxyflurane → see volatile halogenated anaesthetics

Methyldopa → see TABLE 8 p. 848 (hypotension)

- ▶ **Entacapone** is predicted to increase the exposure to **methyldopa**. [Moderate] Theoretical
- ▶ **Iron (oral)** decreases the effects of **methyldopa**. [Moderate] Study
- ▶ **Methyldopa** increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to alter the antihypertensive effects of **methyldopa**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 848

Methylphenidate

- ▶ **Methylphenidate** is predicted to decrease the effects of **apraclonidine**. Avoid. [Severe] Theoretical
- ▶ **Methylphenidate** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ **Methylphenidate** is predicted to increase the risk of a hypertensive crisis when given with **moclobemide**. [Severe] Theoretical
- ▶ **Methylphenidate** is predicted to increase the risk of a hypertensive crisis when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- ▶ **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of a hypertensive crisis when given with **methylphenidate**. Avoid. [Severe] Theoretical
- ▶ **Risperidone** increases the risk of dyskinesias when given with **methylphenidate**. [Severe] Anecdotal

Methylprednisolone → see corticosteroids

Methylthioninium chloride → see TABLE 13 p. 850 (serotonin syndrome)

- ▶ **Methylthioninium chloride** is predicted to increase the risk of severe hypertension when given with **bupropion**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850

Metoclopramide

- ▶ **Metoclopramide** is predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**. Avoid. [Severe] Theoretical
- ▶ **Metoclopramide** potentially decreases the absorption of **antifungals, azoles (posaconazole)** (oral suspension). [Moderate] Study
- ▶ **Metoclopramide** decreases the concentration of **antimalarials (atovaquone)**. Avoid. [Moderate] Study
- ▶ **Metoclopramide** is predicted to decrease the effects of dopamine receptor agonists (**apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine**). Avoid. [Moderate] Study
- ▶ **Metoclopramide** decreases the effects of **levodopa**. Avoid. [Moderate] Study
- ▶ **Metoclopramide** is predicted to increase the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Theoretical
- ▶ **Metoclopramide** increases the effects of **suxamethonium**. [Moderate] Study

Metolazone → see thiazide diuretics

Metoprolol → see beta blockers, selective

Metronidazole → see TABLE 12 p. 850 (peripheral neuropathy)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **metronidazole**. Avoid for at least 48 hours stopping treatment. [Moderate] Study

- ▶ **Metronidazole** increases the risk of toxicity when given with alkylating agents (**busulfan**). [Severe] Study
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to **metronidazole**. [Moderate] Study
- ▶ **Metronidazole** is predicted to increase the risk of capecitabine toxicity when given with **capecitabine**. [Severe] Theoretical
- ▶ **Metronidazole** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study
- ▶ **Disulfiram** increases the risk of acute psychoses when given with **metronidazole**. [Severe] Study → Also see TABLE 12 p. 850
- ▶ **Metronidazole** increases the risk of toxicity when given with **fluorouracil**. [Severe] Study
- Metyrapone**
 - ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the effects of metyrapone. Avoid. [Moderate] Study
 - ▶ **Antihistamines, sedating (cyproheptadine)** decrease the effects of metyrapone. Avoid. [Moderate] Study
 - ▶ **Carbamazole** decreases the effects of metyrapone. Avoid. [Moderate] Theoretical
 - ▶ **Combined hormonal contraceptives** decrease the effects of metyrapone. Avoid. [Moderate] Theoretical
 - ▶ **Phenothiazines (chlorpromazine)** decrease the effects of metyrapone. Avoid. [Moderate] Theoretical
 - ▶ **Propylthiouracil** is predicted to decrease the effects of metyrapone. Avoid. [Moderate] Theoretical
 - ▶ **Tricyclic antidepressants (amitriptyline)** decrease the effects of metyrapone. Avoid. [Moderate] Theoretical
- Mianserin** → see TABLE 13 p. 850 (serotonin syndrome), TABLE 11 p. 849 (CNS depressant effects)
 - ▶ **Antiepileptics (carbamazepine)** markedly decrease the exposure to mianserin. Adjust dose. [Moderate] Study
 - ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to mianserin. [Moderate] Study → Also see TABLE 11 p. 849
 - ▶ **Mianserin** is predicted to increase the risk of toxicity when given with **moclobemide**. Avoid and for 1 week after stopping mianserin. [Severe] Theoretical → Also see TABLE 13 p. 850
 - ▶ **Mianserin** is predicted to increase the risk of toxicity when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850
 - ▶ **Mianserin** is predicted to decrease the efficacy of **pitolisant**. [Unknown] Theoretical
 - ▶ **Mianserin** decreases the effects of **sympathomimetics, vasoconstrictor (ephedrine)**. [Severe] Anecdotal
- Micafungin** → see TABLE 1 p. 847 (hepatotoxicity)
 - ▶ **Micafungin** slightly increases the exposure to **amphotericin**. Avoid or monitor toxicity. [Moderate] Study
- Miconazole** → see antifungals, azoles
- Midazolam** → see TABLE 11 p. 849 (CNS depressant effects)
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. [Severe] Study
 - ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to intravenous midazolam. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to oral midazolam. Avoid. [Moderate] Theoretical
 - ▶ **Aprepitant** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
 - ▶ **Bosentan** is predicted to decrease the concentration of midazolam. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
 - ▶ **Cobicistat** is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
 - ▶ **Dabrafenib** decreases the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
 - ▶ **Efavirenz** is predicted to alter the effects of midazolam. Avoid. [Moderate] Theoretical
 - ▶ **Enzalutamide** is predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
 - ▶ **Fosaprepitant** slightly increases the exposure to midazolam. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. [Severe] Study
 - ▶ **Idelalisib** is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
 - ▶ **Lumacaftor** is predicted to decrease the exposure to midazolam. Avoid. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
 - ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Netupitant** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
 - ▶ **Nevirapine** decreases the concentration of midazolam. Monitor and adjust dose. [Moderate] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
 - ▶ **Palbociclib** increases the exposure to midazolam. [Moderate] Study
 - ▶ **Ribociclib** moderately increases the exposure to midazolam. Avoid. [Moderate] Study
 - ▶ **Rifampicin** is predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
 - ▶ **St John's Wort** moderately decreases the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
 - ▶ **Telotristat ethyl** decreases the exposure to midazolam. [Moderate] Study
- Midodrine** → see sympathomimetics, vasoconstrictor
- Midostaurin**
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. [Severe] Study
 - ▶ **Aprepitant** is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Cobicistat** is predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Enzalutamide** is predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study

Midostaurin (continued)

- ▶ **HIV-protease inhibitors** are predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Idelalisib** is predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **midostaurin**. Avoid. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **midostaurin**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **midostaurin**. Avoid. [Severe] Theoretical

Mifamurtide

- ▶ **Ciclosporin** is predicted to decrease the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical
- ▶ **Corticosteroids** are predicted to decrease the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical
- ▶ **NSAIDs** (high-dose) are predicted to decrease the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical
- ▶ **Pimecrolimus** is predicted to decrease the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical
- ▶ **Sirolimus** is predicted to decrease the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical
- ▶ **Tacrolimus** is predicted to affect the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical

Mifepristone

- ▶ **Mifepristone** is predicted to decrease the efficacy of **corticosteroids**. Use with caution and adjust dose. [Moderate] Theoretical

Minocycline → see tetracyclines

Minoxidil → see TABLE 8 p. 848 (hypotension)

Mirabegron

- ▶ **Mirabegron** is predicted to increase the exposure to **aliskiren**. [Mild] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment. [Moderate] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. [Mild] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment. [Moderate] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **colchicine**. [Mild] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **dabigatran**. [Severe] Theoretical
- ▶ **Mirabegron** slightly increases the exposure to **digoxin**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **edoxaban**. [Mild] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **everolimus**. [Mild] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment. [Moderate] Study

- ▶ **Mirabegron** is predicted to increase the exposure to **loperamide**. [Mild] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment. [Moderate] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **sirolimus**. [Mild] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Mild] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **topotecan**. [Mild] Theoretical

Mirtazapine → see TABLE 13 p. 850 (serotonin syndrome), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **mirtazapine**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study
- ▶ **Mirtazapine** is predicted to decrease the efficacy of **pitolisant**. [Unknown] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study

Mitomycin → see TABLE 15 p. 850 (myelosuppression), TABLE 5 p. 847 (thromboembolism)

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mitomycin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Mitotane** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Mitotane** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- ▶ **Aldosterone antagonists (spironolactone)** are predicted to decrease the effects of **mitotane**. Avoid. [Severe] Anecdotal
- ▶ **Mitotane** is predicted to decrease the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **antiarrhythmics (disopyramide, dronedarone)**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the efficacy of **antiarrhythmics (propafenone)**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **anticholinesterases, centrally acting (donepezil)**. [Mild] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **antiepileptics (perampamil)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **antimalarials (artemether)** (with lumefantrine). Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the concentration of **antimalarials (piperaquine)**. Avoid. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to moderately decrease the exposure to **apixaban**. Use with caution or avoid. [Severe] Study
- ▶ **Mitotane** moderately decreases the exposure to **apremilast**. Avoid. [Severe] Study

- ▶ **Mitotane** is predicted to markedly decrease the exposure to **aprepitant**. Avoid. [Moderate] Study
- ▶ **Mitotane** is predicted to moderately decrease the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 249. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** decreases the exposure to **bedaquiline**. Avoid. [Severe] Study
- ▶ **Mitotane** slightly decreases the exposure to **bortezomib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** affects the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to **buspirone**. Use with caution and adjust dose. [Severe] Study
- ▶ **Mitotane** moderately decreases the exposure to **cabozantinib**. Avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **cannabis extract**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** decreases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Mitotane** is predicted to alter the effects of **cilostazol**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** decreases the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, prednisone, triamcinolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **corticosteroids (fluticasone)**. [Unknown] Theoretical
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to moderately decrease the exposure to **daclatasvir**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study
- ▶ **Mitotane** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **erlotinib**. Avoid or adjust erlotinib dose. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **etavirine**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** moderately decreases the exposure to **exemestane**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **fingolimod**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **fosaprepitant**. Avoid. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **gefitinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the concentration of **guanfacine**. Adjust guanfacine dose, p. 231. [Moderate] Study
- ▶ **Mitotane** decreases the concentration of **haloperidol**. Adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **ibrutinib**. Avoid or adjust ibrutinib dose. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to moderately to markedly decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **ixazomib**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **linagliptin**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **lurasidone**. Avoid. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **macitentan**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **midostaurin**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **montelukast**. [Mild] Study
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ **Mitotane** is predicted to slightly decrease the exposure to **nateglinide**. [Mild] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **netupitant**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to **ondansetron**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **opioids (alfentanil, fentanyl)**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **opioids (buprenorphine)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **opioids (oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **palbociclib**. Avoid. [Severe] Study

Mitotane (continued)

- ▶ Mitotane is predicted to decrease the exposure to **paliperidone**. Monitor and adjust dose. [Severe] Study
- ▶ Mitotane is predicted to decrease the exposure to **panobinostat**. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ Mitotane is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ Mitotane is predicted to decrease the exposure to **pazopanib**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ Mitotane is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (avanafil, tadalafil)**. Avoid. [Severe] Study
- ▶ Mitotane is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (sildenafil, vardenafil)**. [Moderate] Theoretical
- ▶ Mitotane is predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ Mitotane is predicted to moderately decrease the exposure to **pitolisant**. [Moderate] Study
- ▶ Mitotane is predicted to decrease the exposure to **ponatinib**. Avoid. [Moderate] Theoretical
- ▶ Mitotane is predicted to markedly decrease the exposure to **praziquantel**. Avoid. [Moderate] Study
- ▶ Mitotane is predicted to decrease the exposure to **quetiapine**. [Moderate] Study
- ▶ Mitotane is predicted to decrease the exposure to **ranolazine**. Avoid. [Severe] Study
- ▶ Mitotane is predicted to decrease the exposure to **reboxetine**. [Moderate] Anecdotal
- ▶ Mitotane is predicted to decrease the exposure to **regorafenib**. Avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ Mitotane is predicted to decrease the exposure to **repaglinide**. Monitor blood glucose and adjust dose. [Moderate] Study
- ▶ Mitotane is predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- ▶ Mitotane markedly decreases the exposure to **rilpivirine**. Avoid. [Severe] Study
- ▶ Mitotane is predicted to decrease the exposure to **risperidone**. Adjust dose. [Moderate] Study
- ▶ Mitotane is predicted to moderately decrease the exposure to **rivaroxaban**. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ Mitotane is predicted to decrease the exposure to **roflumilast**. Avoid. [Moderate] Study
- ▶ Mitotane is predicted to markedly decrease the exposure to **rolapitant**. Avoid. [Severe] Study
- ▶ Mitotane is predicted to decrease the exposure to **roxatitinib**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ Mitotane is predicted to moderately decrease the exposure to **saxagliptin**. [Moderate] Study
- ▶ Mitotane is predicted to decrease the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ Mitotane is predicted to decrease the concentration of **sirolimus**. Avoid. [Severe] Study
- ▶ Mitotane is predicted to decrease the exposure to **solifenacin**. [Moderate] Theoretical
- ▶ Mitotane is predicted to decrease the exposure to **sorafenib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ Mitotane is predicted to decrease the exposure to **statins (simvastatin)**. [Severe] Study
- ▶ Mitotane is predicted to decrease the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ Mitotane decreases the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ Mitotane is predicted to decrease the exposure to **taxanes (cabazitaxel, paclitaxel)**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ Mitotane is predicted to decrease the exposure to **taxanes (docetaxel)**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ Mitotane is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Study → Also see TABLE 15 p. 850

- ▶ Mitotane decreases the exposure to **tetracyclines (doxycycline)**. Monitor and adjust dose. [Moderate] Study
 - ▶ Mitotane is predicted to markedly decrease the exposure to **ticagrelor**. Avoid. [Severe] Study
 - ▶ Mitotane is predicted to decrease the exposure to **tivozanib**. [Severe] Study
 - ▶ Mitotane is predicted to decrease the exposure to **tofacitinib**. Avoid. [Severe] Study
 - ▶ Mitotane is predicted to decrease the exposure to **tolvaptan**. Avoid. [Severe] Study
 - ▶ Mitotane is predicted to decrease the exposure to **toremifene**. Adjust dose. [Moderate] Study
 - ▶ Mitotane is predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
 - ▶ Mitotane is predicted to decrease the exposure to **vandetanib**. Avoid. [Moderate] Study
 - ▶ Mitotane is predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
 - ▶ Mitotane is predicted to decrease the exposure to **vemurafenib**. Avoid. [Severe] Theoretical
 - ▶ Mitotane is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
 - ▶ Mitotane is predicted to decrease the exposure to **vinca alkaloids (vinblastine, vincristine, vindesine)**. [Severe] Theoretical → Also see TABLE 15 p. 850
 - ▶ Mitotane is predicted to decrease the exposure to **vinca alkaloids (vinflunine)**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
 - ▶ Mitotane is predicted to decrease the exposure to **vinca alkaloids (vinorelbine)**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
 - ▶ Mitotane is predicted to decrease the exposure to **vismodegib**. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 850
 - ▶ Mitotane is predicted to decrease the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study
 - ▶ Mitotane is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Study
 - ▶ Mitotane is predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Mitoxantrone** → see anthracyclines
- Mivacurium** → see neuromuscular blocking drugs, non-depolarising
- Mizolastine** → see antihistamines, non-sedating
- Moclobemide** → see TABLE 13 p. 850 (serotonin syndrome)

FOOD AND LIFESTYLE Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, *Bovril*®, *Oxo*®, *Marmite*® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- ▶ Moclobemide is predicted to increase the risk of a hypertensive crisis when given with **amfetamines**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ Moclobemide is predicted to increase the risk of severe hypertension when given with **bupropion**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ Moclobemide is predicted to increase the exposure to **cilostazol**. [Moderate] Theoretical
- ▶ Moclobemide potentially increases the exposure to **clobazam**. Adjust dose. [Moderate] Theoretical
- ▶ Moclobemide is predicted to decrease the efficacy of **clopidogrel**. Avoid. [Moderate] Study
- ▶ Moclobemide is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Theoretical
- ▶ H₂ receptor antagonists (**cimetidine**) increase the exposure to moclobemide. Adjust moclobemide dose. [Mild] Study
- ▶ **Levodopa** increases the risk of side-effects when given with moclobemide. [Moderate] Study
- ▶ Moclobemide is predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping moclobemide. [Severe] Theoretical → Also see TABLE 13 p. 850

- ▶ **Methylphenidate** is predicted to increase the risk of a hypertensive crisis when given with **moclobemide**. [Severe] Theoretical
 - ▶ **Mianserin** is predicted to increase the risk of toxicity when given with **moclobemide**. Avoid and for 1 week after stopping **mianserin**. [Severe] Theoretical → Also see TABLE 13 p. 850
 - ▶ **Moclobemide** is predicted to increase the effects of **monoamine-oxidase B inhibitors (rasagiline, selegiline)**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850
 - ▶ **Moclobemide** is predicted to increase the risk of side-effects when given with **monoamine-oxidase B inhibitors (safinamide)**. Avoid and for 1 week after stopping **safranamide**. [Severe] Theoretical → Also see TABLE 13 p. 850
 - ▶ **Opicapone** is predicted to increase the risk of elevated blood pressure when given with **moclobemide**. Avoid. [Severe] Theoretical
 - ▶ **Moclobemide** increases the risk of side-effects when given with **phenothiazines (levomepromazine)**. [Moderate] Study
 - ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **moclobemide**. Avoid. [Severe] Theoretical
 - ▶ **Moclobemide** moderately increases the exposure to **rizatriptan**. Avoid. [Moderate] Study → Also see TABLE 13 p. 850
 - ▶ **Moclobemide** moderately increases the exposure to **sumatriptan**. Avoid. [Moderate] Study → Also see TABLE 13 p. 850
 - ▶ **Moclobemide** is predicted to increase the risk of a hypertensive crisis when given with **sympathomimetics, vasoconstrictor (ephedrine, isometheptene, phenylephrine, pseudoephedrine)**. Avoid. [Severe] Study
 - ▶ **Tricyclic antidepressants** are predicted to increase the risk of severe toxic reaction when given with **moclobemide**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850
 - ▶ **Moclobemide** slightly increases the exposure to **zolmitriptan**. Adjust **zolmitriptan** dose, p. 292. [Moderate] Study → Also see TABLE 13 p. 850
- Modafinil**
- ▶ **Antiepileptics (carbamazepine, phenobarbital, primidone)** are predicted to decrease the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **modafinil** and **modafinil** is predicted to increase the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Modafinil** is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical
 - ▶ **Cobicistat** is predicted to increase the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Modafinil** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
 - ▶ **Modafinil** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Modafinil** is predicted to decrease the exposure to **elbasvir**. Avoid. [Unknown] Theoretical
 - ▶ **Modafinil** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Modafinil** is predicted to decrease the exposure to **grazoprevir**. Avoid. [Unknown] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Modafinil** is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
 - ▶ **Idelalisib** is predicted to increase the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Modafinil** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **modafinil**. [Mild] Theoretical

- ▶ **Modafinil** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Rifampicin** is predicted to decrease the exposure to **modafinil**. [Moderate] Theoretical
- ▶ **Modafinil** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Modafinil** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical

Mometasone → see corticosteroids

Monoamine-oxidase A and B inhibitors, irreversible → see TABLE 8 p. 848 (hypotension), TABLE 13 p. 850 (serotonin syndrome)

isocarboxazid • phenelzine • tranylcypromine

FOOD AND LIFESTYLE Potentially life-threatening hypertensive crisis can develop in those taking MAOIs who eat tyramine-rich food (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines) or foods containing dopa (such as broad bean pods). Avoid tyramine-rich or dopa-rich food or drinks with, or for 2 to 3 weeks after stopping, the MAOI.

- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the effects of **alpha blockers (indoramin)**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with **amfetamines**. Avoid and for 14 days after stopping the MAOI. [Severe] Anecdotal → Also see TABLE 13 p. 850
- ▶ **Antiepileptics (carbamazepine)** are predicted to increase the risk of severe toxic reaction when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to increase the effects of **monoamine-oxidase A and B inhibitors, irreversible**. [Severe] Theoretical
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of antimuscarinic side-effects when given with **antihistamines, non-sedating**. Avoid. [Severe] Theoretical
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of antimuscarinic side-effects when given with **antihistamines, sedating**. Avoid. [Severe] Theoretical
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of side-effects when given with **atomoxetine**. Avoid and for 2 weeks after stopping the MAOI. [Severe] Theoretical
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of cardiovascular side-effects when given with **beta₂ agonists**. [Moderate] Anecdotal
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of severe hypertension when given with **bupropion**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Buspirone** is predicted to increase the risk of elevated blood pressure when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Anecdotal → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the effects of **doxapram**. [Moderate] Theoretical
- ▶ **Entacapone** is predicted to increase the risk of elevated blood pressure when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Theoretical
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to decrease the antihypertensive effects of **guanethidine**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Levodopa** increases the risk of a hypertensive crisis when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Study → Also see TABLE 8 p. 848

A1

Interactions | Appendix 1

Monoamine-oxidase A and B inhibitors, irreversible (continued)

- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to alter the antihypertensive effects of **methylidopa**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Methylphenidate** is predicted to increase the risk of a hypertensive crisis when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- ▶ **Mianserin** is predicted to increase the risk of toxicity when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of side-effects when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase B inhibitors (safinamide)** are predicted to increase the risk of side-effects when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Nefopam** is predicted to increase the risk of serious elevations in blood pressure when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Theoretical
- ▶ **Opicapone** is predicted to increase the risk of elevated blood pressure when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Theoretical
- ▶ **Opioids** are predicted to increase the risk of CNS excitation or depression when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Study → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of neuroleptic malignant syndrome when given with **phenothiazines**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Pholcodine** is predicted to increase the risk of CNS excitation or depression when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Theoretical
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to **rizatriptan**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to **sumatriptan**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with **sympathomimetics, inotropic**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with **sympathomimetics, vasoconstrictor**. Avoid and for 14 days after stopping the MAOI. [Severe] Study
- ▶ **Tetrabenazine** is predicted to increase the risk of CNS toxicity when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- ▶ **Tolcapone** is predicted to increase the effects of **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Theoretical
- ▶ **Tricyclic antidepressants** are predicted to increase the risk of severe toxic reaction when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 13 p. 850

- ▶ **Tryptophan** increases the risk of side-effects when given with **monoamine-oxidase A and B inhibitors, irreversible**. [Severe] Anecdotal → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to **zolmitriptan**. [Severe] Theoretical → Also see TABLE 13 p. 850

Monoamine-oxidase B inhibitors → see TABLE 6 p. 848 (bradycardia), TABLE 8 p. 848 (hypotension), TABLE 13 p. 850 (serotonin syndrome)

rasagiline · safinamide · selegiline ·

FOOD AND LIFESTYLE Hypertension is predicted to occur when high-dose **selegiline** is taken with tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- ▶ **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of severe hypertension when given with **amfetamines**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Safinamide** is predicted to increase the risk of severe hypertension when given with **amfetamines**. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of severe hypertension when given with **beta₂ agonists**. Avoid. [Severe] Theoretical
- ▶ **Safinamide** is predicted to increase the risk of severe hypertension when given with **beta₂ agonists**. [Severe] Theoretical
- ▶ **Monoamine-oxidase B inhibitors** are predicted to increase the risk of severe hypertension when given with **bupropion**. Avoid. [Moderate] Theoretical → Also see TABLE 13 p. 850
- ▶ **Combined hormonal contraceptives** slightly increase the exposure to **rasagiline**. [Moderate] Study
- ▶ **Combined hormonal contraceptives** increase the exposure to **selegiline**. Avoid. [Severe] Study
- ▶ **Hormone replacement therapy** is predicted to increase the exposure to **selegiline**. Avoid. [Moderate] Study
- ▶ **Monoamine-oxidase B inhibitors** are predicted to increase the effects of **levodopa**. Adjust dose. [Mild] Study → Also see TABLE 8 p. 848
- ▶ **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Safinamide** is predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of a hypertensive crisis when given with **methylphenidate**. Avoid. [Severe] Theoretical
- ▶ **Moclobemide** is predicted to increase the effects of monoamine-oxidase B inhibitors (**rasagiline, selegiline**). Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Moclobemide** is predicted to increase the risk of side-effects when given with **safinamide**. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of side-effects when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 13 p. 850
- ▶ **Safinamide** is predicted to increase the risk of side-effects when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Rasagiline** is predicted to increase the risk of side-effects when given with **opioids (pethidine)**. Avoid and for 14 days after stopping rasagiline. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Safinamide** is predicted to increase the risk of side-effects when given with **opioids (pethidine)**. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Selegiline** increases the risk of side-effects when given with **opioids (pethidine)**. Avoid. [Severe] Anecdotal → Also see TABLE 13 p. 850

- ▶ **Quinolones (ciprofloxacin)** slightly increase the exposure to **rasagiline**. [Moderate] Study
 - ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase B inhibitors (**rasagiline**, **selegiline**). Avoid. [Severe] Theoretical
 - ▶ **Monoamine-oxidase B inhibitors** are predicted to increase the risk of a hypertensive crisis when given with **sympathomimetics**, **inotropic**. Avoid. [Severe] Anecdotal
 - ▶ **Monoamine-oxidase B inhibitors** are predicted to increase the risk of a hypertensive crisis when given with **sympathomimetics**, **vasoconstrictor**. Avoid. [Severe] Anecdotal
- Monoclonal antibodies** → see TABLE 15 p. 850 (myelosuppression), TABLE 12 p. 850 (peripheral neuropathy), TABLE 9 p. 849 (QT-interval prolongation), TABLE 4 p. 847 (antiplatelet effects)

adalimumab • alemtuzumab • atezolizumab • avelumab • basiliximab • belimumab • benralizumab • bevacizumab • blinatumomab • brentuximab vedotin • brodalumab • canakinumab • certolizumab pegol • cetuximab • daratumumab • dupilumab • eculizumab • elotuzumab • golimumab • guselkumab • infliximab • inotuzumab • ozogamicin • ipilimumab • ixekizumab • natalizumab • necitumab • nivolumab • obinutuzumab • ocrelizumab • ofatumumab • olaratumab • panitumumab • pembrolizumab • pertuzumab • ramucirumab • rituximab • sarilumab • secukinumab • siltuximab • tocilizumab • trastuzumab • trastuzumab emtansine • ustekinumab • vedolizumab

- ▶ **Tocilizumab** is predicted to decrease the exposure to **alprazolam**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Blinatumomab** is predicted to transiently increase the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Sarilumab** potentially affects the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Anthracyclines** are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (**trastuzumab**, **trastuzumab emtansine**). Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Antiarrhythmics (dronedarone)** increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the effects of **brentuximab vedotin**. [Severe] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **antiepileptics (fosphenytoin, phenytoin)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole)** increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **trastuzumab emtansine**. Avoid. [Severe] Theoretical
- ▶ **Brentuximab vedotin** increases the risk of pulmonary toxicity when given with **bleomycin**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Tocilizumab** is predicted to decrease the exposure to **calcium channel blockers**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Blinatumomab** is predicted to transiently increase the exposure to **ciclosporin**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Sarilumab** potentially affects the exposure to **ciclosporin**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **ciclosporin**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **trastuzumab emtansine**. Avoid. [Severe] Theoretical
- ▶ **Sarilumab** potentially decreases the exposure to **combined hormonal contraceptives**. [Severe] Theoretical
- ▶ **Corticosteroids (betamethasone, deflazacort, dexamethasone, hydrocortisone, methylprednisolone, prednisolone, prednisone)** are predicted to decrease the efficacy of monoclonal antibodies (**atezolizumab**, **ipilimumab**, **nivolumab**, **pembrolizumab**). Use with caution or avoid. [Severe] Theoretical

- ▶ **Tocilizumab** is predicted to decrease the exposure to **corticosteroids (dexamethasone, methylprednisolone)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Blinatumomab** is predicted to transiently increase the exposure to **coumarins (warfarin)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Sarilumab** potentially affects the exposure to **coumarins (warfarin)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **coumarins (warfarin)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **diazepam**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **trastuzumab emtansine**. Avoid. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **trastuzumab emtansine**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **monoclonal antibodies**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **trastuzumab emtansine**. Avoid. [Severe] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the effects of **brentuximab vedotin**. [Severe] Study
- ▶ **Sarilumab** potentially affects the exposure to **sirolimus**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Sarilumab** is predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. [Moderate] Study
- ▶ **Tocilizumab** is predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Sarilumab** potentially affects the exposure to **tacrolimus**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Blinatumomab** is predicted to transiently increase the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Sarilumab** potentially affects the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical

Montelukast

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **montelukast**. [Mild] Study
- ▶ **Clopidogrel** is predicted to moderately increase the exposure to **montelukast**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **montelukast**. [Mild] Study
- ▶ **Fibrates (gemfibrozil)** are predicted to moderately increase the exposure to **montelukast**. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the exposure to **montelukast**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **montelukast**. [Mild] Study
- ▶ **Opicapone** is predicted to increase the exposure to **montelukast**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **montelukast**. [Mild] Study
- ▶ **Teriflunomide** is predicted to increase the exposure to **montelukast**. [Moderate] Theoretical

Morphine → see opioids

Moxifloxacin → see quinolones

Moxislylte → see TABLE 8 p. 848 (hypotension)

Moxonidine → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

Moxonidine (continued)

- ▶ **Tricyclic antidepressants** are predicted to decrease the effects of **moxonidine**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848

Mycophenolate → see TABLE 15 p. 850 (myelosuppression)

- ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **aciclovir**. [Moderate] Theoretical
 - ▶ **Antacids** decrease the exposure to **mycophenolate**. [Moderate] Study
 - ▶ **Antifungals, azoles (isavuconazole)** increase the exposure to **mycophenolate**. [Moderate] Study
 - ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **ganciclovir**. [Moderate] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mycophenolate**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Rifampicin** decreases the concentration of **mycophenolate**. Monitor and adjust dose. [Severe] Study
 - ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **valaciclovir**. [Moderate] Theoretical
 - ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **valganciclovir**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- Nabilone** → see TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Nabilone** is predicted to increase the risk of cardiovascular side-effects when given with **amfetamines**. [Severe] Theoretical
- Nabumetone** → see NSAIDs
- Nadolol** → see beta blockers, non-selective
- Nalmefene**

GENERAL INFORMATION Discontinue treatment 1 week before anticipated use of opioids; if emergency analgesia is required during treatment, an increased dose of opioid analgesic might be necessary (monitor for opioid intoxication).

- ▶ **Nalmefene** is predicted to decrease the efficacy of **opioids**. Avoid. [Severe] Theoretical

Naloxegol

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Enzalutamide** is predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **naloxegol**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study

- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Rifampicin** is predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **naloxegol**. Avoid. [Moderate] Theoretical

Naltrexone

GENERAL INFORMATION Avoid concurrent use of opioids.

Nandrolone

- ▶ **Nandrolone** is predicted to increase the anticoagulant effect of **coumarins**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Nandrolone** is predicted to increase the anticoagulant effect of **phenindione**. Monitor and adjust dose. [Severe] Theoretical

Naproxen → see NSAIDs**Naratriptan** → see TABLE 13 p. 850 (serotonin syndrome)

- ▶ **Naratriptan** is predicted to increase the risk of vasoconstriction when given with **ergotamine**. Separate administration by 24 hours. [Severe] Theoretical

Natalizumab → see monoclonal antibodies**Nateglinide** → see TABLE 14 p. 850 (antidiabetic drugs)

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to slightly decrease the exposure to **nateglinide**. [Mid] Study
- ▶ **Enzalutamide** is predicted to slightly decrease the exposure to **nateglinide**. [Mid] Study
- ▶ **Mitotane** is predicted to slightly decrease the exposure to **nateglinide**. [Mid] Study
- ▶ **Rifampicin** is predicted to slightly decrease the exposure to **nateglinide**. [Mid] Study
- ▶ **Sulfinpyrazone** slightly increases the exposure to **nateglinide**. [Mid] Study

Nebivolol → see beta blockers, selective**Necitumumab** → see monoclonal antibodies**Nefopam** → see TABLE 10 p. 849 (antimuscarinics)

- ▶ **Nefopam** is predicted to increase the risk of serious elevations in blood pressure when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Theoretical

Nelarabine → see TABLE 15 p. 850 (myelosuppression)**Neomycin** → see TABLE 2 p. 847 (nephrotoxicity), TABLE 19 p. 851 (ototoxicity), TABLE 20 p. 851 (neuromuscular blocking effects)

- ▶ **Neomycin** decreases the absorption of **digoxin**. [Moderate] Study
- ▶ **Neomycin** moderately decreases the exposure to **sorafenib**. [Moderate] Study

Neostigmine → see TABLE 6 p. 848 (bradycardia), TABLE 20 p. 851 (neuromuscular blocking effects)

- ▶ **Aminoglycosides** are predicted to decrease the effects of **neostigmine**. [Moderate] Theoretical → Also see TABLE 20 p. 851

Nepafenac → see NSAIDs**Netupitant**

- ▶ **Netupitant** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **alprazolam**. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **netupitant**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **netupitant**. [Moderate] Study
- ▶ **Netupitant** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical

- ▶ **Netupitant** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the concentration of **antimalarials (piperazine)**. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **netupitant**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical
- ▶ **Netupitant** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **netupitant**. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **colchicine**. Adjust colchicine dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **corticosteroids (dexamethasone)**. Adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to slightly increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **dasatinib**. [Severe] Study
- ▶ **Netupitant** increases the risk of QT-prolongation when given with **domeperidone**. Avoid. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Netupitant** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **netupitant**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **netupitant**. Avoid. [Severe] Study
- ▶ **Netupitant** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **fesoterodine**. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- ▶ **Netupitant** is predicted to increase the exposure to **gefitinib**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the concentration of **guanfacine**. Adjust guanfacine dose, p. 231. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **netupitant**. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **ibrutinib**. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **netupitant**. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **ivabradine**. Adjust ivabradine dose. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **ivacaftor**. Adjust ivacaftor dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **lapatinib**. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **lurasidone**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **netupitant**. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **netupitant**. Avoid. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **naloxegol**. Adjust naloxegol dose and monitor side effects. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **netupitant**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **nilotinib**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **opioids (methadone, sufentanil)**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **oxybutynin**. [Mild] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust avanafil dose. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **ranolazine**. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **ribociclib**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **netupitant**. Avoid. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
- ▶ **Netupitant** is predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ **Netupitant** increases the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical

Netupitant (continued)

- ▶ **St John's Wort** is predicted to decrease the exposure to **netupitant**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **statins (simvastatin)**. Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study

Neuromuscular blocking drugs, non-depolarising → see TABLE 6 p. 848 (bradycardia), TABLE 20 p. 851 (neuromuscular blocking effects)

atracurium • cisatracurium • mivacurium • pancuronium • rocuronium • vecuronium

- ▶ **Anticholinesterases, centrally acting** are predicted to decrease the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Theoretical → Also see TABLE 6 p. 848
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the effects of (but acute use increases the effects of) **neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of (but acute use increases the effects of) **neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium)**. [Moderate] Study
- ▶ **Clindamycin** increases the effects of **neuromuscular blocking drugs, non-depolarising**. [Severe] Anecdotal
- ▶ **Corticosteroids** are predicted to decrease the effects of **neuromuscular blocking drugs, non-depolarising**. [Severe] Anecdotal
- ▶ **Pancuronium** is predicted to increase the risk of cardiovascular side-effects when given with **digoxin**. [Severe] Anecdotal
- ▶ **Irinotecan** is predicted to decrease the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Theoretical
- ▶ Intravenous **magnesium** increases the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Study
- ▶ **Metoclopramide** is predicted to increase the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Theoretical
- ▶ **Penicillins (piperacillin)** increase the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Study
- ▶ **SSRIs** potentially increase the risk of prolonged neuromuscular blockade when given with **mivacurium**. [Unknown] Theoretical

Nevirapine

- ▶ **Nevirapine** is predicted to decrease the exposure to **antiarrhythmics (dronedarone)**. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the concentration of **antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** and **antienileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **nevirapine**. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole)** slightly to moderately increase the exposure to **nevirapine**. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** moderately decreases the exposure to **antifungals, azoles (itraconazole)**. Avoid and for 14 days after stopping **nevirapine**. [Moderate] Study
- ▶ **Nevirapine** moderately decreases the exposure to **antifungals, azoles (ketonazole)**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **antifungals, azoles (voriconazole)** and **antifungals, azoles (voriconazole)** increase the exposure to **nevirapine**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **bedaquiline**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **cabozantinib**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the concentration of **casopfungin**. Adjust dose. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the concentration of **ciclosporin**. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **Nevirapine** potentially alters the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Nevirapine** is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **dactasvir**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **dasatinib**. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Nevirapine** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Nevirapine** decreases the concentration of **efavirenz**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **eliglustat**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **gefatinib**. Avoid. [Severe] Theoretical

- ▶ **Nevirapine** is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- ▶ **Nevirapine** decreases the exposure to **HIV-protease inhibitors**. Refer to specialist literature. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- ▶ **Nevirapine** is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **imatinib**. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **ivacaftor**. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Nevirapine** decreases the exposure to **macrolides (clarithromycin)**. [Moderate] Study
- ▶ **Nevirapine** decreases the concentration of **midazolam**. Monitor and adjust dose. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **netupitant**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Nevirapine** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Nevirapine** decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **osimertinib**. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **quetiapine**. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **ribociclib**. [Moderate] Study
- ▶ **Rifampicin** decreases the concentration of **nevirapine**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **rolapitant**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the concentration of **nevirapine**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** slightly decreases the exposure to **statins (atorvastatin)**. [Mild] Study
- ▶ **Nevirapine** moderately decreases the exposure to **statins (simvastatin)**. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **tacrolimus**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **ticagrelor**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **tolvaptan**. [Moderate] Theoretical
- ▶ **Nevirapine** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Nevirapine** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the concentration of **zidovudine**. Refer to specialist literature. [Severe] Theoretical
- Nicardipine** → see calcium channel blockers
- Nicorandil** → see TABLE 8 p. 848 (hypotension)
- ▶ **Aspirin** is predicted to increase the risk of gastrointestinal perforation when given with **nicorandil**. [Severe] Theoretical
- ▶ **Corticosteroids** increase the risk of gastrointestinal perforation when given with **nicorandil**. [Severe] Anecdotal
- ▶ **Nicorandil** is predicted to increase the risk of gastrointestinal perforation when given with **NSAIDs**. [Severe] Theoretical
- ▶ **Nicorandil** is predicted to increase the risk of hypotension when given with **phosphodiesterase type-5 inhibitors**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 848
- Nicotinic acid** → see TABLE 3 p. 847 (anticoagulant effects)
- ▶ **Nicotinic acid** is predicted to increase the risk of rhabdomyolysis when given with **statins**. [Severe] Theoretical
- Nifedipine** → see calcium channel blockers
- Nilotinib** → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)
- ▶ **Nilotinib** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **alprazolam**. [Severe] Study
- ▶ **Antacids** are predicted to decrease the absorption of **nilotinib**. Separate administration by at least 2 hours. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, posaconazole)** are predicted to increase the exposure to **nilotinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **nilotinib**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Nilotinib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ **Bosentan** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study

Nilotinib (continued)

- ▶ **Nilotinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **nilotinib**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Nilotinib** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to slightly increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Nilotinib** increases the risk of QT-prolongation when given with **domperidone**. Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Nilotinib** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Nilotinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment. [Mild] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **gefitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Grapefruit juice** is predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 231. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **nilotinib**. **H₂ receptor antagonists** should be taken 10 hours before or 2 hours after **nilotinib**. [Mild] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Nilotinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose with moderate inhibitors of CYP3A4, p. 186. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **lurasidone**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **nilotinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Nilotinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **nilotinib**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Nilotinib** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **opioids (methadone, sufentanil)**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **oxybutynin**. [Mild] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **ranolazine**. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **roxolitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Nilotinib** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ **Nilotinib** increases the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study

- ▶ **Nilotinib** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **statins (simvastatin)**. Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Nilotinib** is predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Nilotinib** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Nilotinib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study

Nimodipine → see calcium channel blockers

Nintedanib

- ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to **nintedanib**. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Calcium channel blockers (verapamil)** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Lapatinib** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Macrolides** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **nintedanib**. [Moderate] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **nintedanib**. [Moderate] Study
- ▶ **Vemurafenib** is predicted to increase the exposure to **nintedanib**. [Moderate] Study

Nitisinone

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical

- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical

Nitrates → see TABLE 7 p. 848 (first-dose hypotension), TABLE 8 p. 848 (hypotension)

glyceryl trinitrate · isosorbide dinitrate · isosorbide mononitrate

PHARMACOLOGY Drugs with antimuscarinic effects can cause dry mouth, which can reduce the effectiveness of sublingual glyceryl trinitrate tablets.

- ▶ **Nitrates** are predicted to increase the risk of methaemoglobinaemia when given with topical **anaesthetics, local (prilocaine)**. Avoid. [Severe] Theoretical
- ▶ **Nitrates** are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
- ▶ **Nitrates** potentially increase the risk of hypotension when given with **phosphodiesterase type-5 inhibitors**. Avoid. [Severe] Study → Also see TABLE 8 p. 848

Nitrazepam → see TABLE 11 p. 849 (CNS depressant effects)

▶ **Rifampicin** increases the clearance of **nitrazepam**. [Moderate] Study

Nitrofurantoin → see TABLE 12 p. 850 (peripheral neuropathy)

- ▶ **Nitrofurantoin** is predicted to increase the risk of methaemoglobinaemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Antacids (magnesium trisilicate)** decrease the absorption of **nitrofurantoin**. [Moderate] Study
- ▶ **Nitrofurantoin** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical

Nitrous oxide → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

Nivolumab → see monoclonal antibodies

Nizatidine → see H₂ receptor antagonists

Noradrenaline/norepinephrine → see sympathomimetics, vasoconstrictor

Norethisterone

- ▶ **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Aprepitant** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Bosentan** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Efavirenz** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Fosaprepitant** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Griseofulvin** potentially decreases the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Modafinil** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Nevirapine** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal

Norethisterone (continued)

- ▶ **Rifabutin** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Rifampicin** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **St John's Wort** is predicted to decrease the efficacy of **norethisterone**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Sugamadex** is predicted to decrease the exposure to **norethisterone**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Ulipristal** is predicted to decrease the efficacy of **norethisterone**. Avoid. [Severe] Theoretical

Norfloraxacin → see quinolones**Nortriptyline** → see tricyclic antidepressants

- NSAIDs** → see TABLE 18 p. 851 (hyponatraemia), TABLE 2 p. 847 (nephrotoxicity), TABLE 16 p. 851 (increased serum potassium), TABLE 4 p. 847 (antiplatelet effects)

aceclofenac · acemetacin · benzydamine · bromfenac · celecoxib · dexibuprofen · dextetopropfen · diclofenac · etodolac · etoricoxib · felbinac · fenoprofen · flurbiprofen · ibuprofen · indometacin · ketoprofen · ketorolac · mefenamic acid · meloxicam · nabumetone · naproxen · nepafenac · parecoxib · piroxicam · sulindac · tenoxicam · tiaprofenic acid · tolfenamic acid

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Celecoxib** is predicted to increase the exposure to **antiarrhythmics (flecainide, propafenone)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole)** moderately increase the exposure to **celecoxib**. Adjust **celecoxib** dose. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole)** increase the exposure to **parecoxib**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (voriconazole)** slightly increase the exposure to **diclofenac**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (voriconazole)** moderately increase the exposure to **ibuprofen**. Adjust dose. [Moderate] Study
- ▶ **NSAIDs** are predicted to increase the risk of gastrointestinal irritation when given with **bisphosphonates (alendronic acid, ibandronic acid)**. [Moderate] Study
- ▶ **NSAIDs** are predicted to increase the risk of renal impairment when given with **bisphosphonates (sodium clodronate)**. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to NSAIDs (celecoxib, diclofenac). Adjust dose. [Moderate] Theoretical
- ▶ **Ciclosporin** increases the concentration of **diclofenac**. [Severe] Study → Also see TABLE 2 p. 847 → Also see TABLE 16 p. 851
- ▶ **Etoricoxib** slightly increases the exposure to **combined hormonal contraceptives**. [Moderate] Study
- ▶ **NSAIDs** increase the risk of gastrointestinal bleeding when given with **corticosteroids**. [Severe] Study
- ▶ **NSAIDs** increase the risk of renal impairment when given with **daptomycin**. [Moderate] Theoretical
- ▶ **Indometacin** increases the concentration of **digoxin**. [Severe] Study
- ▶ **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **NSAIDs**. [Severe] Theoretical
- ▶ **Etoricoxib** slightly increases the exposure to **hormone replacement therapy**. [Moderate] Study
- ▶ **NSAIDs** are predicted to increase the risk of gastrointestinal bleeding when given with **iron chelators (deferisirox)**. [Severe] Theoretical
- ▶ **NSAIDs** increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Study
- ▶ **NSAIDs** are predicted to increase the risk of toxicity when given with **methotrexate**. Monitor and adjust dose. [Severe] Study → Also see TABLE 2 p. 847
- ▶ **NSAIDs** (high-dose) are predicted to decrease the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical
- ▶ **Nicorandil** is predicted to increase the risk of gastrointestinal perforation when given with **NSAIDs**. [Severe] Theoretical

- ▶ **NSAIDs** are predicted to increase the exposure to **pemetrexed**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 2 p. 847
- ▶ **NSAIDs** potentially increase the risk of seizures when given with **quinolones**. [Severe] Theoretical
- ▶ **Regorafenib** is predicted to increase the exposure to **mefenamic acid**. Avoid. [Moderate] Theoretical → Also see TABLE 4 p. 847
- ▶ **Rifampicin** moderately decreases the exposure to NSAIDs (celecoxib, diclofenac, etoricoxib). [Moderate] Study
- ▶ **NSAIDs** increase the risk of acute renal failure when given with **thiazide diuretics**. [Severe] Theoretical → Also see TABLE 18 p. 851
- ▶ **Zidovudine** increases the risk of haematological toxicity when given with **NSAIDs**. [Severe] Study → Also see TABLE 2 p. 847

Obeticholic acid

- ▶ **Obeticholic acid** decreases the anticoagulant effect of **coumarins (warfarin)**. [Severe] Study
- ▶ **Obeticholic acid** is predicted to increase the exposure to **theophylline**. [Severe] Theoretical
- ▶ **Obeticholic acid** is predicted to increase the exposure to **tizanidine**. [Severe] Theoretical
- Obinutuzumab** → see monoclonal antibodies
- Ocrelizumab** → see monoclonal antibodies
- Ocreotide**
 - ▶ **Ocreotide** decreases the absorption of oral **ciclosporin**. Adjust ciclosporin dose, p. 519. [Severe] Anecdotal
 - ▶ **Ocreotide** (short-acting) decreases the exposure to **telotristat ethyl**. **Telotristat ethyl** should be taken at least 30 minutes before **ocreotide**. [Moderate] Study

Ofatumumab → see monoclonal antibodies**Oflaxacin** → see quinolones

- Olanzapine** → see TABLE 8 p. 848 (hypotension), TABLE 15 p. 850 (myelosuppression), TABLE 11 p. 849 (CNS depressant effects)

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment.

- ▶ **Antiepileptics (carbamazepine)** potentially decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (phenytoin)** are predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Olanzapine** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Leflunomide** is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Olanzapine** decreases the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Anecdotal → Also see TABLE 8 p. 848
- ▶ **Rifampicin** is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ **SSRIs (fluvoxamine)** moderately increase the exposure to **olanzapine**. Adjust dose. [Severe] Anecdotal
- ▶ **Teriflunomide** is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study

Olaparib → see TABLE 15 p. 850 (myelosuppression)

FOOD AND LIFESTYLE Bitter (Seville) orange is predicted to increase the exposure to olaparib.

- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical

- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Efavirenz** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Study
- ▶ **Idealisib** is predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Netupitant** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Rifampicin** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- Olaratumab** → see monoclonal antibodies
- Olmesartan** → see angiotensin-II receptor antagonists
- Olodaterol** → see beta₂ agonists
- Olisalazine** → see TABLE 15 p. 850 (myelosuppression)
- Ombitasvir**
 - ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to **ombitasvir**. Avoid. [Severe] Theoretical
 - ▶ **Rifampicin** is predicted to decrease the exposure to **ombitasvir**. Avoid. [Severe] Theoretical
 - ▶ **St John's Wort** is predicted to decrease the exposure to **ombitasvir**. Avoid. [Severe] Theoretical
- Omega-3-acid ethyl esters** → see TABLE 3 p. 847 (anticoagulant effects)
- Omeprazole** → see proton pump inhibitors
- Ondansetron** → see TABLE 13 p. 850 (serotonin syndrome), TABLE 9 p. 849 (QT-interval prolongation)
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **ondansetron**. [Moderate] Study
 - ▶ **Dopamine receptor agonists (apomorphine)** increase the risk of severe hypotension when given with **ondansetron**. Avoid. [Severe] Study → Also see TABLE 9 p. 849

- ▶ **Enzalutamide** is predicted to decrease the exposure to **ondansetron**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **ondansetron**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **ondansetron**. [Moderate] Study

Opicapone

- ▶ **Opicapone** increases the exposure to **levodopa**. Adjust dose. [Moderate] Study
- ▶ **Opicapone** is predicted to increase the exposure to **loperamide**. Avoid. [Moderate] Study
- ▶ **Opicapone** is predicted to increase the risk of elevated blood pressure when given with **moclobemide**. Avoid. [Severe] Theoretical
- ▶ **Opicapone** is predicted to increase the risk of elevated blood pressure when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Theoretical
- ▶ **Opicapone** is predicted to increase the exposure to **montelukast**. Avoid. [Moderate] Study
- ▶ **Opicapone** is predicted to increase the exposure to **pioglitazone**. Avoid. [Moderate] Study
- ▶ **Opicapone** is predicted to increase the exposure to **repaglinide**. Avoid. [Moderate] Study
- ▶ **Opicapone** is predicted to increase the risk of cardiovascular side-effects when given with **sympathomimetics, inotropic**. [Severe] Theoretical
- ▶ **Opicapone** is predicted to increase the risk of cardiovascular side-effects when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Severe] Theoretical

Opioids → see TABLE 6 p. 848 (bradycardia), TABLE 13 p. 850 (serotonin syndrome), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects)

alfentanil • buprenorphine • codeine • diamorphine • dihydrocodeine • diphenoxylate • dipipanone • fentanyl • hydromorphone • meptazinol • methadone • morphine • oxycodone • papaveretum • pentazocine • pethidine • remifentanyl • sufentanyl • tapentadol • tramadol

- ▶ **Alcohol (beverage)** causes rapid release of opioids (**hydromorphone, morphine**) (from extended-release preparations). Avoid. [Severe] Study → Also see TABLE 11 p. 849
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the concentration of **fentanyl**. [Moderate] Theoretical → Also see TABLE 6 p. 848
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to opioids (**methadone, sufentanyl**). [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiepileptics (carbamazepine)** decrease the concentration of **tramadol**. Adjust dose. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **buprenorphine**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 849
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the exposure to **methadone**. Monitor and adjust dose. [Severe] Study → Also see TABLE 11 p. 849
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **oxycodone**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to opioids (**alfentanil, fentanyl**). [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **methadone**. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **alfentanil**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to opioids (**alfentanil,**

Opioids (continued)

- buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**, **sufentanil**). Monitor and adjust dose. [Severe] Study
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to opioids (**methadone**, **sufentanil**). [Moderate] Theoretical → Also see TABLE 9 p. 849
 - ▶ **Aprepitant** is predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study
 - ▶ **Aprepitant** is predicted to increase the exposure to opioids (**methadone**, **sufentanil**). [Moderate] Theoretical
 - ▶ **Bosentan** decreases the exposure to **methadone**. Monitor and adjust dose. [Severe] Study
 - ▶ **Bupropion** is predicted to decrease the efficacy of **codeine**. [Moderate] Theoretical
 - ▶ **Bupropion** is predicted to decrease the efficacy of **tramadol**. [Severe] Study → Also see TABLE 13 p. 850
 - ▶ **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 848
 - ▶ **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to opioids (**methadone**, **sufentanil**). [Moderate] Theoretical → Also see TABLE 6 p. 848
 - ▶ **Ceritinib** is predicted to increase the exposure to opioids (**alfentanil**, **fentanyl**). Avoid. [Severe] Theoretical
 - ▶ **Cinacalcet** is predicted to decrease the efficacy of **codeine**. [Moderate] Theoretical
 - ▶ **Cinacalcet** is predicted to decrease the efficacy of **tramadol**. [Severe] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**, **sufentanil**). Monitor and adjust dose. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 848
 - ▶ **Crizotinib** is predicted to increase the exposure to opioids (**methadone**, **sufentanil**). [Moderate] Theoretical → Also see TABLE 6 p. 848 → Also see TABLE 9 p. 849
 - ▶ **Efavirenz** decreases the exposure to **methadone**. Monitor and adjust dose. [Severe] Study → Also see TABLE 9 p. 849
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **buprenorphine**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Enzalutamide** decreases the exposure to **methadone**. Monitor and adjust dose. [Severe] Study
 - ▶ **Enzalutamide** is predicted to decrease the exposure to opioids (**alfentanil**, **fentanyl**). [Moderate] Study
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **oxycodone**. Monitor and adjust dose. [Moderate] Study
 - ▶ **H₂ receptor antagonists** (**cimetidine**) increase the concentration of **alfentanil**. Use with caution and adjust dose. [Severe] Study
 - ▶ **H₂ receptor antagonists** (**cimetidine**) increase the exposure to **fentanyl**. [Moderate] Study
 - ▶ **HIV-protease inhibitors** (boosted with **ritonavir**) are predicted to decrease the exposure to **methadone**. [Moderate] Study → Also see TABLE 9 p. 849
 - ▶ **HIV-protease inhibitors** (**ritonavir**) are predicted to decrease the concentration of **morphine**. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** (**ritonavir**) increase the risk of CNS toxicity when given with **pethidine**. Avoid. [Severe] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**, **sufentanil**). Monitor and adjust dose. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **methadone**. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**, **sufentanil**). Monitor and adjust dose. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study

- ▶ **Imatinib** is predicted to increase the exposure to opioids (**methadone**, **sufentanil**). [Moderate] Theoretical
- ▶ **Macrolides** (**clarithromycin**) are predicted to increase the concentration of **methadone**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Macrolides** (**erythromycin**) are predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Macrolides** (**clarithromycin**) are predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**, **sufentanil**). Monitor and adjust dose. [Severe] Study
- ▶ **Macrolides** (**erythromycin**) are predicted to increase the exposure to opioids (**methadone**, **sufentanil**). [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Mitotane** is predicted to decrease the exposure to **buprenorphine**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** decreases the exposure to **methadone**. Monitor and adjust dose. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to opioids (**alfentanil**, **fentanyl**). [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **oxycodone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Opioids** are predicted to increase the risk of CNS excitation or depression when given with **monoamine-oxidase A and B inhibitors**, **irreversible**. Avoid. [Severe] Study → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase B inhibitors** (**rasagiline**) are predicted to increase the risk of side-effects when given with **pethidine**. Avoid and for 14 days after stopping **rasagiline**. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase B inhibitors** (**safinamide**) are predicted to increase the risk of side-effects when given with **pethidine**. Avoid and for 1 week after stopping **safinamide**. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase B inhibitors** (**selegiline**) increase the risk of side-effects when given with **pethidine**. Avoid. [Severe] Anecdotal → Also see TABLE 13 p. 850
- ▶ **Nalmefene** is predicted to decrease the efficacy of **opioids**. Avoid. [Severe] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to opioids (**methadone**, **sufentanil**). [Moderate] Theoretical
- ▶ **Nevirapine** decreases the exposure to **methadone**. Monitor and adjust dose. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to opioids (**alfentanil**, **buprenorphine**, **fentanyl**, **oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to opioids (**methadone**, **sufentanil**). [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Opioids** (**buprenorphine**) are predicted to increase the risk of opiate withdrawal when given with opioids (**alfentanil**). [Severe] Theoretical → Also see TABLE 11 p. 849
- ▶ **Opioids** (**pentazocine**) are predicted to increase the risk of opiate withdrawal when given with opioids (**alfentanil**, **codeine**, **diamorphine**, **dihydrocodeine**, **dipipanone**, **fentanyl**, **hydromorphone**, **meptazinol**, **methadone**, **morphine**, **oxycodone**, **papaveretum**). [Severe] Theoretical → Also see TABLE 13 p. 850 → Also see TABLE 11 p. 849
- ▶ **Opioids** (**buprenorphine**) are predicted to increase the risk of opiate withdrawal when given with opioids (**codeine**, **diamorphine**, **dihydrocodeine**, **dipipanone**, **fentanyl**, **hydromorphone**, **meptazinol**, **methadone**, **morphine**, **oxycodone**, **papaveretum**, **pentazocine**, **pethidine**, **remifentanil**, **sufentanil**, **tapentadol**, **tramadol**). [Severe] Theoretical → Also see TABLE 11 p. 849 → Also see TABLE 13 p. 850
- ▶ **Opioids** (**pentazocine**) are predicted to increase the risk of opiate withdrawal when given with opioids (**pethidine**, **remifentanil**, **tapentadol**, **tramadol**). [Severe] Theoretical → Also see TABLE 11 p. 849 → Also see TABLE 13 p. 850
- ▶ **Opioids** (**pentazocine**) are predicted to increase the risk of opiate withdrawal when given with opioids (**sufentanil**). [Severe] Anecdotal → Also see TABLE 11 p. 849

- ▶ **Palbociclib** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Adjust dose. [Moderate] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to morphine. [Unknown] Theoretical
- ▶ **Ribociclib** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the exposure to methadone. Monitor and adjust dose. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to opioids (codeine, morphine). [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to oxycodone. Monitor and adjust dose. [Moderate] Study
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to decrease the efficacy of codeine. [Moderate] Theoretical
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to decrease the efficacy of tramadol. [Severe] Study → Also see TABLE 13 p. 850
- ▶ **St John's Wort** decreases the exposure to methadone. Monitor and adjust dose. [Severe] Study → Also see TABLE 13 p. 850
- ▶ **St John's Wort** moderately decreases the exposure to oxycodone. Adjust dose. [Moderate] Study
- ▶ **Terbinafine** is predicted to decrease the efficacy of codeine. [Moderate] Theoretical
- ▶ **Terbinafine** is predicted to decrease the efficacy of tramadol. [Severe] Study

Orlistat

SEPARATION OF ADMINISTRATION Orlistat might affect the absorption of concurrently administered drugs—consider separating administration. Particular care should be taken with antiepileptics, antiretrovirals, and drugs that have a narrow therapeutic index.

Orphenadrine → see TABLE 10 p. 849 (antimuscarinics)

Osimertinib → see TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to osimertinib. [Moderate] Theoretical
- ▶ **Efavirenz** is predicted to decrease the exposure to osimertinib. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study
- ▶ **Mitotane** is predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to osimertinib. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to osimertinib. Avoid. [Moderate] Theoretical
- ▶ Osimertinib slightly increases the exposure to **statins (rosuvastatin)**. [Moderate] Study

Oxaliplatin → see platinum compounds

Oxazepam → see TABLE 11 p. 849 (CNS depressant effects)

Oxcarbazepine → see antiepileptics

Oxprenolol → see beta blockers, non-selective

Oxybuprocaine → see anaesthetics, local

Oxybutynin → see TABLE 10 p. 849 (antimuscarinics)

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- ▶ Oxybutynin potentially increases the risk of overheating and dehydration when given with **antiepileptics (zonisamide)**. Avoid in children. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to oxybutynin. [Mild] Study
- ▶ **Aprepitant** is predicted to increase the exposure to oxybutynin. [Mild] Theoretical

- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to oxybutynin. [Mild] Study
- ▶ **Crizotinib** is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to oxybutynin. [Mild] Study
- ▶ **Idelalisib** is predicted to increase the exposure to oxybutynin. [Mild] Study
- ▶ **Imatinib** is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to oxybutynin. [Mild] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to oxybutynin. [Mild] Theoretical

Oxycodone → see opioids

Oxymetholone

- ▶ Oxymetholone increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ Oxymetholone increases the anticoagulant effect of **phenindione**. [Severe] Anecdotal

Oxytetracycline → see tetracyclines

Paclitaxel → see taxanes

Palbociclib

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
- ▶ **Palbociclib** is predicted to increase the exposure to **ciclosporin**. Adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study
- ▶ **Palbociclib** is predicted to increase the exposure to **ergotamine**. Adjust dose. [Moderate] Theoretical
- ▶ **Palbociclib** is predicted to increase the exposure to **everolimus**. Adjust dose. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to palbociclib. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
- ▶ **Palbociclib** increases the exposure to **midazolam**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study
- ▶ **Palbociclib** is predicted to increase the exposure to **opioids (alfentanil, fentanyl)**. Adjust dose. [Moderate] Theoretical
- ▶ **Palbociclib** is predicted to increase the exposure to **pimozide**. Adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study
- ▶ **Palbociclib** is predicted to increase the exposure to **sirolimus**. Adjust dose. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Theoretical
- ▶ **Palbociclib** is predicted to increase the exposure to **tacrolimus**. Adjust dose. [Moderate] Theoretical
- ▶ **Paliperidone** → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study → Also see TABLE 11 p. 849

Paliperidone (continued)

- ▶ **Antiepileptics (valproate)** slightly increase the exposure to paliperidone. Adjust dose. [Moderate] Study
- ▶ **Paliperidone** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849
- ▶ **Enzalutamide** is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study
- ▶ **Paliperidone** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Mitotane** is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to paliperidone. [Severe] Theoretical

Palonosetron → see TABLE 13 p. 850 (serotonin syndrome), TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **Dopamine receptor agonists (apomorphine)** are predicted to increase the risk of severe hypotension when given with palonosetron. [Severe] Theoretical

Pamidronate → see bisphosphonates

Pancreatin

- ▶ **Pancreatin** is predicted to decrease the effects of **acarbose**. Avoid. [Moderate] Theoretical

Pancuronium → see neuromuscular blocking drugs, non-depolarising

Panitumumab → see monoclonal antibodies

Panobinostat → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)

FOOD AND LIFESTYLE Avoid pomegranate, pomegranate juice, and star fruit as they are predicted to increase panobinostat exposure.

- ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (posaconazole)** are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical
- ▶ **Panobinostat** is predicted to increase the exposure to **atomoxetine**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Panobinostat** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Panobinostat** is predicted to increase the exposure to **beta blockers, selective (nebivolol)**. Monitor and adjust dose. [Mild] Theoretical
- ▶ **Calcium channel blockers (verapamil)** are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Lapatinib** is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 849

- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Mitotane** is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Panobinostat** is predicted to increase the exposure to **phenothiazines (perphenazine)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Panobinostat** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Ranolazine** is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Rifampicin** is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- ▶ **Vemurafenib** is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 849

Pantoprazole → see proton pump inhibitors

Papaveretum → see opioids

Paracetamol → see TABLE 1 p. 847 (hepatotoxicity)

- ▶ **Alcohol (beverage)** (in those who drink heavily) causes severe liver damage when given with paracetamol. [Severe] Study → Also see TABLE 1 p. 847

- ▶ **Paracetamol** is predicted to decrease the clearance of **alkylating agents (busulfan)**. [Moderate] Theoretical

- ▶ **Paracetamol** is predicted to increase the risk of methaemoglobinaemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [Severe] Theoretical

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the exposure to paracetamol. [Moderate] Study → Also see TABLE 1 p. 847

- ▶ **Paracetamol** increases the anticoagulant effect of **coumarins**. [Moderate] Study

- ▶ **Paracetamol** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical

- ▶ **Imatinib** increases the risk of hepatotoxicity when given with paracetamol. [Severe] Anecdotal

- ▶ **Paracetamol** is predicted to increase the anticoagulant effect of **phenindione**. [Severe] Theoretical

- ▶ **Pitolisant** is predicted to decrease the exposure to paracetamol. [Unknown] Theoretical

- ▶ **Rifampicin** decreases the exposure to paracetamol. [Moderate] Study

Paraldehyde → see antiepileptics

Parathyroid hormone

- ▶ **Bisphosphonates** are predicted to decrease the effects of parathyroid hormone. Avoid. [Moderate] Study

Paracetamol → see NSAIDs

Paricalcitol → see vitamin D substances

Paritaprevir

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- ▶ **Antifungals, azoles (posaconazole)** are predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir) and paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to **antifungals, azoles (posaconazole)**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- ▶ **Paritaprevir** (with ritonavir and ombitasvir) increases the risk of raised liver function tests when given with **combined hormonal contraceptives**. Avoid. [Severe] Study

- ▶ **Efavirenz** is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- ▶ **Paritaprevir** (with ritonavir and ombitasvir) is predicted to increase the exposure to **loop diuretics (furosemide)**. Adjust dose. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ **Paritaprevir** (with ritonavir and ombitasvir) is predicted to increase the exposure to **statins (fluvastatin)**. Avoid. [Moderate] Theoretical
- ▶ **Paritaprevir** (with ritonavir and ombitasvir) increases the exposure to **statins (pravastatin)**. Adjust pravastatin dose. [Moderate] Study
- ▶ **Paritaprevir** (with ritonavir and ombitasvir) increases the exposure to **statins (rosuvastatin)**. Adjust rosuvastatin dose, p. 133. [Moderate] Study
- ▶ **Paroxetine** → see SSRIs
- ▶ **Pasireotide** → see TABLE 6 p. 848 (bradycardia), TABLE 9 p. 849 (QT-interval prolongation)
- ▶ **Pasireotide** is predicted to decrease the absorption of oral **ciclosporin**. Adjust dose. [Severe] Theoretical
- Patiromer**

SEPARATION OF ADMINISTRATION Manufacturer advises take 3 hours before, or after, other drugs.
- ▶ **Pazopanib** → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)
- ▶ **Antacids** are predicted to decrease the absorption of **pazopanib**. **Pazopanib** should be taken 1 hour before or 2 hours after antacids. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **pazopanib**. Avoid. [Severe] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Appetitant** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose. [Moderate] Study
- ▶ **Pazopanib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Enzalutamide** is predicted to decrease the exposure to **pazopanib**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **pazopanib**. Avoid. [Severe] Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **pazopanib**. **H₂ receptor antagonists** should be taken 10 hours before or 2 hours after **pazopanib**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Pazopanib** is predicted to increase the exposure to **lomitinipide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Mitotane** is predicted to decrease the exposure to **pazopanib**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Neutropin** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Pazopanib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Proton pump inhibitors** are predicted to decrease the exposure to **pazopanib**. Avoid or administer concurrently without food. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **pazopanib**. Avoid. [Severe] Theoretical
- ▶ **Pegaspargase** → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression)
- ▶ **Pegaspargase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Pegaspargase** affects the efficacy of **methotrexate**. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Pegaspargase** potentially increases the risk of neurotoxicity when given with **vinca alkaloids (vincristine)**. Vincristine should be taken 3 to 24 hours before **pegaspargase**. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Peginterferon alfa** → see interferons
- ▶ **Peginterferon beta-1a** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Pembrolizumab** → see monoclonal antibodies
- ▶ **Pemetrexed** → see TABLE 15 p. 850 (myelosuppression), TABLE 2 p. 847 (nephrotoxicity)
- ▶ **Antimalarials (pyrimethamine)** are predicted to increase the risk of side-effects when given with **pemetrexed**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Aspirin** (high-dose) potentially increases the exposure to **pemetrexed**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **pemetrexed**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **NSAIDs** are predicted to increase the exposure to **pemetrexed**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 2 p. 847
- Penicillamine** → see TABLE 2 p. 847 (nephrotoxicity)
- ▶ **Antacids** decrease the absorption of **penicillamine**. Separate administration by 2 hours. [Mild] Study
- ▶ **Antimalarials (chloroquine)** are predicted to increase the risk of haematological toxicity when given with **penicillamine**. Avoid. [Severe] Theoretical
- ▶ **Penicillamine** potentially decreases the concentration of **digoxin**. Separate administration by 2 hours. [Severe] Anecdotal
- ▶ **Hydroxychloroquine** is predicted to increase the risk of haematological toxicity when given with **penicillamine**. Avoid. [Severe] Theoretical

Penicillamine (continued)

- **Iron (oral)** is predicted to decrease the absorption of **penicillamine**. Separate administration by at least 2 hours. [\[Mild\]](#) Study
- **Sodium aurothiomalate** potentially increases the risk of side-effects when given with **penicillamine** (in those who have had previous adverse reactions to gold). Avoid. [\[Severe\]](#) Study
- **Zinc** is predicted to decrease the absorption of **penicillamine**. [\[Mild\]](#) Theoretical

Penicillins → see TABLE 1 p. 847 (hepatotoxicity)

amoxicillin · ampicillin · benzylpenicillin · flucloxacillin · phenoxymethylpenicillin · piperacillin · pivmecillinam · temocillin · ticarcillin

- **Allopurinol** increases the risk of skin rash when given with **penicillins (amoxicillin, ampicillin)**. [\[Moderate\]](#) Study
- **Antiepileptics (valproate)** increase the risk of side-effects when given with **pivmecillinam**. Avoid. [\[Severe\]](#) Anecdotal
- **Penicillins** potentially alter the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [\[Severe\]](#) Anecdotal
- **Penicillins** are predicted to increase the risk of toxicity when given with **methotrexate**. [\[Severe\]](#) Theoretical → Also see TABLE 1 p. 847
- **Piperacillin** increases the effects of **neuromuscular blocking drugs, non-depolarising**. [\[Moderate\]](#) Study
- **Penicillins** are predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Piperacillin** increases the effects of **suxamethonium**. [\[Moderate\]](#) Study

Pentamidine → see TABLE 15 p. 850 (myelosuppression), TABLE 2 p. 847 (nephrotoxicity), TABLE 9 p. 849 (QT-interval prolongation)

- **Didanosine** is predicted to increase the risk of pancreatitis when given with **pentamidine**. Avoid. [\[Severe\]](#) Study
- Intravenous **pentamidine** potentially increases the risk of QT-prolongation when given with **drugs that prolong the QT interval**. [\[Severe\]](#) Anecdotal
- **Foscarnet** increases the risk of hypocalcaemia when given with **pentamidine**. [\[Severe\]](#) Anecdotal → Also see TABLE 2 p. 847

Pentazocine → see opioids

Pentostatin → see TABLE 15 p. 850 (myelosuppression), TABLE 5 p. 847 (thromboembolism)

- **Alkylating agents (cyclophosphamide)** (high-dose) increase the risk of toxicity when given with **pentostatin**. Avoid. [\[Severe\]](#) Anecdotal → Also see TABLE 15 p. 850 → Also see TABLE 5 p. 847
- **Fludarabine** increases the risk of pulmonary toxicity when given with **pentostatin**. Avoid. [\[Severe\]](#) Study → Also see TABLE 15 p. 850

Pentoxifylline

- **Pentoxifylline** is predicted to increase the concentration of **aminophylline**. Use with caution or avoid. [\[Severe\]](#) Theoretical
- **Quinolones (ciprofloxacin)** very slightly increase the exposure to **pentoxifylline**. [\[Moderate\]](#) Study
- **SSRIs (fluvoxamine)** are predicted to increase the exposure to **pentoxifylline**. [\[Moderate\]](#) Theoretical
- **Pentoxifylline** increases the concentration of **theophylline**. Monitor and adjust dose. [\[Severe\]](#) Study

Peppermint oil

- **Peppermint oil** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical

Perampanel → see antiepileptics

Pergolide → see dopamine receptor agonists

Pericyazine → see phenothiazines

Perindopril → see ACE inhibitors

Perphenazine → see phenothiazines

Pertuzumab → see monoclonal antibodies

Pethidine → see opioids

Phenelzine → see monoamine-oxidase A and B inhibitors, irreversible

Phenindione → see TABLE 3 p. 847 (anticoagulant effects)

FOOD AND LIFESTYLE The effects of phenindione can be reduced or abolished by vitamin K, including that found in health foods, food supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control.

- **Antiarrhythmics (propafenone)** are predicted to increase the anticoagulant effect of **phenindione**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- **Antifungals, azoles (miconazole)** greatly increase the anticoagulant effect of **phenindione**. [\[Severe\]](#) Theoretical
- **Axitinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Bosutinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Cabozantinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Cephalosporins (ceftriaxone)** potentially increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Anecdotal
- **Corticosteroids** are predicted to increase the effects of **phenindione**. [\[Moderate\]](#) Anecdotal
- **Crizotinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Dasatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Disulfiram** is predicted to increase the anticoagulant effect of **phenindione**. [\[Severe\]](#) Theoretical
- **Enteral feeds** (vitamin-K containing) potentially decrease the effects of **phenindione**. [\[Severe\]](#) Theoretical
- **Erlotinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Fibrates** are predicted to increase the anticoagulant effect of **phenindione**. Monitor INR and adjust dose. [\[Severe\]](#) Study
- **Gefitinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **H₂ receptor antagonists (cimetidine)** increase the exposure to **phenindione**. [\[Severe\]](#) Anecdotal
- **Imatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Lapatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Nandrolone** is predicted to increase the anticoagulant effect of **phenindione**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- **Nilotinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Oxymetholone** increases the anticoagulant effect of **phenindione**. [\[Severe\]](#) Anecdotal
- **Paracetamol** is predicted to increase the anticoagulant effect of **phenindione**. [\[Severe\]](#) Theoretical
- **Pazopanib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Penicillins** are predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Ponatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Ranibizumab** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Regorafenib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Ruxolitinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Sorafenib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Statins (rosuvastatin)** are predicted to increase the anticoagulant effect of **phenindione**. Monitor INR and adjust dose. [\[Severe\]](#) Theoretical
- **Sunitinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- **Vandetanib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical

Phenobarbital → see antiepileptics

Phenothiazines → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects), TABLE 10 p. 849 (antimuscarinics)

chlorpromazine · fluphenazine · levomepromazine · pericyazine · perphenazine · prochlorperazine · promazine · trifluoperazine

- **Chlorpromazine** dose adjustment might be necessary if smoking started or stopped during treatment.
- **Fluphenazine** dose adjustment might be necessary if smoking started or stopped during treatment.

- ▶ **Amfetamines** are predicted to decrease the effects of **chlorpromazine**. [Moderate] Study
- ▶ **Phenothiazines** are predicted to decrease the effects of **amfetamines**. [Moderate] Study
- ▶ **Antacids** decrease the absorption of **phenothiazines**. [Moderate] Anecdotal
- ▶ **Chlorpromazine** decreases the concentration of **antiepileptics (phenobarbital, primidone)** and **antiepileptics (phenobarbital, primidone)** decrease the concentration of **chlorpromazine**. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Chlorpromazine** is predicted to increase the risk of hypotatraemia when given with **desmopressin**. [Severe] Theoretical
- ▶ **Phenothiazines** are predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849 → Also see TABLE 10 p. 849
- ▶ **Eliglustat** is predicted to increase the exposure to **perphenazine**. Adjust dose. [Moderate] Theoretical
- ▶ **Phenothiazines** are predicted to decrease the antihypertensive effects of **guanethidine**. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Phenothiazines** decrease the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Study → Also see TABLE 8 p. 848
- ▶ **Phenothiazines** potentially increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 849
- ▶ **Chlorpromazine** decreases the effects of **metyrapone**. Avoid. [Moderate] Theoretical
- ▶ **Moclobemide** increases the risk of side-effects when given with **levomepromazine**. [Moderate] Study
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of neuroleptic malignant syndrome when given with **phenothiazines**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Panobinostat** is predicted to increase the exposure to **perphenazine**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **SSRIs (paroxetine)** markedly increase the exposure to **perphenazine**. [Severe] Study
- Phenoxymethylpenicillin** → see penicillins
- Phenylephrine** → see sympathomimetics, vasoconstrictor
- Phenytoin** → see antiepileptics
- Pholcodine**
- ▶ **Pholcodine** is predicted to increase the risk of CNS excitation or depression when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- Phosphodiesterase type-5 inhibitors** → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation)
- avanafil • sildenafil • tadalafil • vardenafil
- ▶ **Alpha blockers** cause significant hypotensive effects when given with **phosphodiesterase type-5 inhibitors**. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. [Severe] Study → Also see TABLE 8 p. 848
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **avanafil**. Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **sildenafil**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **tadalafil**. [Severe] Theoretical
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **vardenafil**. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (**avanafil, tadalafil**). Avoid. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (**sildenafil, vardenafil**). [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **avanafil**. Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **sildenafil**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **tadalafil**. [Severe] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **vardenafil**. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **sildenafil**. Avoid potent inhibitors of CYP3A4 or adjust **sildenafil** dose, p. 120. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **tadalafil**. Use with caution or avoid. [Severe] Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **sildenafil**. Use with caution and adjust dose. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (**avanafil, vardenafil**). Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Aprepitant** is predicted to increase the exposure to **avanafil**. Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **sildenafil**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **tadalafil**. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **vardenafil**. Adjust dose. [Severe] Theoretical
- ▶ **Bosentan** decreases the exposure to **phosphodiesterase type-5 inhibitors**. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **avanafil**. Adjust **avanafil** dose. [Moderate] Theoretical → Also see TABLE 8 p. 848
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **sildenafil**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study → Also see TABLE 8 p. 848
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **tadalafil**. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **vardenafil**. Adjust dose. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Cobicistat** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (**avanafil, vardenafil**). Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **sildenafil**. Avoid potent inhibitors of CYP3A4 or adjust **sildenafil** dose, p. 120. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **tadalafil**. Use with caution or avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **avanafil**. Adjust **avanafil** dose. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **sildenafil**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Crizotinib** is predicted to increase the exposure to **tadalafil**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **vardenafil**. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Efavirenz** is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Enzalutamide** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (**avanafil, tadalafil**). Avoid. [Severe] Study

Phosphodiesterase type-5 inhibitors (continued)

- ▶ **Enzalutamide** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (**sildenafil**, **varденаfil**). [\[Moderate\]](#) Theoretical
 - ▶ **Etravirine** moderately decreases the exposure to phosphodiesterase type-5 inhibitors. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **Grapefruit juice** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors. Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (**avanafil**, **varденаfil**). Avoid. [\[Severe\]](#) Study → Also see [TABLE 9](#) p. 849
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **sildenafil**. Avoid potent inhibitors of CYP3A4 or adjust **sildenafil** dose, p. 120. [\[Severe\]](#) Study → Also see [TABLE 9](#) p. 849
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **tadalafil**. Use with caution or avoid. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (**avanafil**, **varденаfil**). Avoid. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **sildenafil**. Avoid potent inhibitors of CYP3A4 or adjust **sildenafil** dose, p. 120. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **tadalafil**. Use with caution or avoid. [\[Severe\]](#) Study
 - ▶ **Imatinib** is predicted to increase the exposure to **avanafil**. Adjust **avanafil** dose. [\[Moderate\]](#) Theoretical
 - ▶ **Imatinib** is predicted to increase the exposure to **sildenafil**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [\[Moderate\]](#) Study
 - ▶ **Imatinib** is predicted to increase the exposure to **tadalafil**. [\[Severe\]](#) Theoretical
 - ▶ **Imatinib** is predicted to increase the exposure to **varденаfil**. Adjust dose. [\[Severe\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **sildenafil**. Avoid potent inhibitors of CYP3A4 or adjust **sildenafil** dose, p. 120. [\[Severe\]](#) Study → Also see [TABLE 9](#) p. 849
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **tadalafil**. Use with caution or avoid. [\[Severe\]](#) Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **avanafil**. Adjust **avanafil** dose. [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **sildenafil**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [\[Moderate\]](#) Study → Also see [TABLE 9](#) p. 849
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **tadalafil**. [\[Severe\]](#) Theoretical
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **varденаfil**. Adjust dose. [\[Severe\]](#) Theoretical → Also see [TABLE 9](#) p. 849
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (**avanafil**, **varденаfil**). Avoid. [\[Severe\]](#) Study → Also see [TABLE 9](#) p. 849
 - ▶ **Mitotane** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (**avanafil**, **tadalafil**). Avoid. [\[Severe\]](#) Study
 - ▶ **Mitotane** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (**sildenafil**, **varденаfil**). [\[Moderate\]](#) Theoretical
 - ▶ **Netupitant** is predicted to increase the exposure to **avanafil**. Adjust **avanafil** dose. [\[Moderate\]](#) Theoretical
 - ▶ **Netupitant** is predicted to increase the exposure to **sildenafil**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [\[Moderate\]](#) Study
 - ▶ **Netupitant** is predicted to increase the exposure to **tadalafil**. [\[Severe\]](#) Theoretical
 - ▶ **Netupitant** is predicted to increase the exposure to **varденаfil**. Adjust dose. [\[Severe\]](#) Theoretical
 - ▶ **Nevirapine** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. [\[Moderate\]](#) Theoretical
 - ▶ **Nicorandil** is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [\[Severe\]](#) Theoretical → Also see [TABLE 8](#) p. 848
 - ▶ **Nilotinib** is predicted to increase the exposure to **avanafil**. Adjust **avanafil** dose. [\[Moderate\]](#) Theoretical
 - ▶ **Nilotinib** is predicted to increase the exposure to **sildenafil**. Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 120. [\[Moderate\]](#) Study → Also see [TABLE 9](#) p. 849
 - ▶ **Nilotinib** is predicted to increase the exposure to **tadalafil**. [\[Severe\]](#) Theoretical
 - ▶ **Nilotinib** is predicted to increase the exposure to **varденаfil**. Adjust dose. [\[Severe\]](#) Theoretical → Also see [TABLE 9](#) p. 849
 - ▶ **Nitrates** potentially increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [\[Severe\]](#) Study → Also see [TABLE 8](#) p. 848
 - ▶ **Ribociclib** is predicted to increase the exposure to **sildenafil**. Avoid. [\[Moderate\]](#) Theoretical → Also see [TABLE 9](#) p. 849
 - ▶ **Rifampicin** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (**avanafil**, **tadalafil**). Avoid. [\[Severe\]](#) Study
 - ▶ **Rifampicin** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (**sildenafil**, **varденаfil**). [\[Moderate\]](#) Theoretical
 - ▶ **Riociguat** is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [\[Severe\]](#) Theoretical → Also see [TABLE 8](#) p. 848
 - ▶ **Phosphodiesterase type-5 inhibitors** are predicted to increase the risk of hypotension when given with **sapropterin**. [\[Moderate\]](#) Theoretical → Also see [TABLE 8](#) p. 848
 - ▶ **St John's Wort** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. [\[Moderate\]](#) Theoretical
- Pibrentasvir**
- ▶ **Antiarrhythmics (dronedaronе)** potentially increase the exposure to **pibrentasvir**. [\[Moderate\]](#) Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antiepileptics (eslicarbazepine, oxcarbazepine)** potentially decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole)** potentially increase the exposure to **pibrentasvir**. [\[Moderate\]](#) Theoretical
 - ▶ **Bosentan** is predicted to decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Ciclosporin** increases the exposure to **pibrentasvir**. Avoid or monitor. [\[Severe\]](#) Study
 - ▶ **Crizotinib** potentially decreases the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Pibrentasvir** (with glecaprevir) increases the exposure to **dabigatran**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Pibrentasvir** (with glecaprevir) increases the exposure to **digoxin**. [\[Moderate\]](#) Study
 - ▶ **Efavirenz** is predicted to decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Enzalutamide** is predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (atazanavir, lopinavir)** (boosted with ritonavir) increase the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (ritonavir)** potentially increase the exposure to **pibrentasvir**. [\[Severe\]](#) Theoretical
 - ▶ **Lumacaftor** potentially decreases the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Mitotane** is predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Nevirapine** is predicted to decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Rifampicin** is predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Pibrentasvir** (with glecaprevir) increases the exposure to **statins (atorvastatin, simvastatin)**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Pibrentasvir** (with glecaprevir) is predicted to increase the exposure to **statins (fluvastatin)**. [\[Moderate\]](#) Theoretical
 - ▶ **Pibrentasvir** (with glecaprevir) increases the exposure to **statins (pravastatin)**. Use with caution and adjust **pravastatin** dose. [\[Moderate\]](#) Study

- **Pibrentasvir** (with glecaprevir) increases the exposure to **statins (rosuvastatin)**. Use with caution and adjust **rosuvastatin** dose, p. 133. [\[Moderate\]](#) Study

Pilocarpine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Pimecrolimus

- **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical **pimecrolimus**. [\[Moderate\]](#) Study
- **Pimecrolimus** is predicted to decrease the efficacy of **mifamurtide**. Avoid. [\[Severe\]](#) Theoretical

Pimozide → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects), TABLE 10 p. 849 (antimuscarinics)

- **Antiarrhythmics (dronedronarone)** are predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 849

- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 849

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 849

- **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **pimozide**. Avoid. [\[Moderate\]](#) Theoretical
- **Appetitant** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 848

- **Ceritinib** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 849

- **Cobicistat** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Study

- **Crizotinib** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 849

- **Pimozide** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [\[Moderate\]](#) Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849 → Also see TABLE 10 p. 849

- **Fosaprepitant** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical

- **Grapefruit juice** increases the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical

- **HIV-protease inhibitors** are predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 849

- **Idelalisib** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Study

- **Imatinib** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical

- **Pimozide** decreases the effects of **levodopa**. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 848

- **Macrolides (clarithromycin)** are predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 849

- **Macrolides (erythromycin)** are predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 849

- **Netupitant** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical

- **Nilotinib** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 849

- **Palbociclib** is predicted to increase the exposure to **pimozide**. Adjust dose. [\[Moderate\]](#) Theoretical

- **Panobinostat** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 849

- **Pitolisant** is predicted to decrease the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical

- **Ribociclib** (high-dose) is predicted to increase the exposure to **pimozide**. Avoid. [\[Moderate\]](#) Theoretical → Also see TABLE 9 p. 849

- **Rolapitant** is predicted to increase the exposure to **pimozide**. [\[Severe\]](#) Study

Pindolol → see beta blockers, non-selective

Pioglitazone → see TABLE 14 p. 850 (antidiabetic drugs)

- **Pioglitazone** potentially decreases the exposure to **antifungals, azoles (isavuconazole)**. Use with caution or avoid. [\[Moderate\]](#) Theoretical

- **Clopidogrel** increases the exposure to **pioglitazone**. Monitor blood glucose and adjust dose. [\[Severe\]](#) Study

- **Fibrates (gemfibrozil)** increase the exposure to **pioglitazone**. Monitor blood glucose and adjust dose. [\[Severe\]](#) Study

- **Leflunomide** is predicted to increase the exposure to **pioglitazone**. [\[Moderate\]](#) Study

- **Opicapone** is predicted to increase the exposure to **pioglitazone**. Avoid. [\[Moderate\]](#) Study

- **Rifampicin** moderately decreases the exposure to **pioglitazone**. Monitor and adjust dose. [\[Moderate\]](#) Study

- **St John's Wort** slightly decreases the exposure to **pioglitazone**. [\[Mild\]](#) Study

- **Teriflunomide** is predicted to increase the exposure to **pioglitazone**. [\[Moderate\]](#) Study

Piperacillin → see penicillins

Piperaquine → see antimalarials

Pirfenidone

FOOD AND LIFESTYLE Smoking increases pirfenidone clearance; patients should be encouraged to stop smoking before and during treatment with pirfenidone.

- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **pirfenidone**. [\[Moderate\]](#) Theoretical

- **Combined hormonal contraceptives** are predicted to increase the exposure to **pirfenidone**. Use with caution and adjust dose. [\[Moderate\]](#) Study

- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **pirfenidone**. [\[Moderate\]](#) Theoretical

- **Leflunomide** is predicted to decrease the exposure to **pirfenidone**. [\[Moderate\]](#) Theoretical

- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **pirfenidone**. Use with caution and adjust dose. [\[Moderate\]](#) Study

- **Rifampicin** is predicted to decrease the exposure to **pirfenidone**. Avoid. [\[Moderate\]](#) Theoretical

- **SRRs (fluvoxamine)** are predicted to moderately increase the exposure to **pirfenidone**. Avoid. [\[Moderate\]](#) Study

- **Teriflunomide** is predicted to decrease the exposure to **pirfenidone**. [\[Moderate\]](#) Theoretical

Piroxicam → see NSAIDs

Pitolisant

- **Abiraterone** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [\[Moderate\]](#) Study

- **Antiarrhythmics (propafenone)** are predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [\[Moderate\]](#) Study

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **pitolisant**. [\[Moderate\]](#) Study

- **Antihistamines, sedating** are predicted to decrease the efficacy of **pitolisant**. [\[Unknown\]](#) Theoretical

- **Pitolisant** is predicted to decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Theoretical

- **Bupropion** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [\[Moderate\]](#) Study

- **Pitolisant** is predicted to decrease the exposure to **ciclosporin**. Avoid. [\[Severe\]](#) Theoretical

- **Cinacalcet** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [\[Moderate\]](#) Study

- **Pitolisant** is predicted to decrease the efficacy of **combined hormonal contraceptives**. Avoid. [\[Severe\]](#) Theoretical

- **Pitolisant** is predicted to decrease the exposure to **coumarins (warfarin)**. [\[Unknown\]](#) Theoretical

- **Pitolisant** is predicted to decrease the exposure to **crizotinib**. Avoid. [\[Severe\]](#) Theoretical

- **Pitolisant** is predicted to decrease the exposure to **dabigatran**. [\[Unknown\]](#) Theoretical

- **Pitolisant** is predicted to decrease the exposure to **dasatinib**. Avoid. [\[Severe\]](#) Theoretical

- **Pitolisant** is predicted to decrease the exposure to **digoxin**. [\[Unknown\]](#) Theoretical

- **Duloxetine** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [\[Moderate\]](#) Study

Pitolisant (continued)

- ▶ **Pitolisant** is predicted to decrease the exposure to **efavirenz**. [Unknown] Theoretical
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **pitolisant**. [Moderate] Study
- ▶ **Pitolisant** is predicted to decrease the exposure to **everolimus**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Pitolisant** is predicted to decrease the exposure to **irinotecan**. [Unknown] Theoretical
- ▶ **Pitolisant** is predicted to increase the exposure to **metformin**. [Unknown] Theoretical
- ▶ **Mianserin** is predicted to decrease the efficacy of **pitolisant**. [Unknown] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Mirtazapine** is predicted to decrease the efficacy of **pitolisant**. [Unknown] Theoretical
- ▶ **Mitotane** is predicted to moderately decrease the exposure to **pitolisant**. [Moderate] Study
- ▶ **Pitolisant** is predicted to decrease the exposure to **opioids (morphine)**. [Unknown] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **paracetamol**. [Unknown] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **pimozide**. Avoid. [Severe] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **repaglinide**. [Unknown] Theoretical
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to **pitolisant**. [Moderate] Study
- ▶ **Pitolisant** is predicted to decrease the exposure to **sirolimus**. Avoid. [Severe] Theoretical
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **pitolisant**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **tacrolimus**. Avoid. [Severe] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **taxanes (docetaxel)**. Avoid. [Severe] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ **Terbinafine** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Tricyclic antidepressants** are predicted to decrease the efficacy of **pitolisant**. [Mild] Theoretical
- ▶ **Pivmecillinam** → see penicillins
- ▶ **Pixantrone** → see anthracyclines
- ▶ **Pizotifen** → see antihistamines, sedating
- ▶ **Platinum compounds** → see TABLE 15 p. 850 (myelosuppression), TABLE 2 p. 847 (nephrotoxicity), TABLE 19 p. 851 (ototoxicity), TABLE 12 p. 850 (peripheral neuropathy)
- ▶ carboplatin • cisplatin • oxaliplatin
- ▶ **Cisplatin** increases the risk of pulmonary toxicity when given with **bleomycin**. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **platinum compounds**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Polymyxins** → see TABLE 2 p. 847 (nephrotoxicity), TABLE 20 p. 851 (neuromuscular blocking effects)
- ▶ **Polysaccharide-iron complex** → see iron (oral)
- ▶ **Polystyrene sulfonate**
- ▶ **Antacids** increase the risk of metabolic alkalosis when given with **polystyrene sulfonate**. [Severe] Anecdotal
- ▶ **Polystyrene sulfonate** is predicted to decrease the absorption of **thyroid hormones (levothyroxine)**. Separate administration by at least 4 hours. [Moderate] Theoretical
- ▶ **Pomalidomide** → see TABLE 15 p. 850 (myelosuppression), TABLE 5 p. 847 (thromboembolism)

- ▶ **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **pomalidomide**. Avoid. [Severe] Theoretical
- ▶ **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with **pomalidomide**. [Severe] Theoretical
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **pomalidomide**. Adjust **pomalidomide** dose. [Moderate] Theoretical
- ▶ **SSRIs (fluvoxamine)** moderately increase the exposure to **pomalidomide**. Adjust **pomalidomide** dose. [Moderate] Study
- ▶ **Ponatinib**
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- ▶ **Ponatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **ponatinib**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ponatinib**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **ponatinib**. Avoid. [Moderate] Theoretical
- ▶ **Ponatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **ponatinib**. Avoid. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **ponatinib**. Avoid. [Severe] Theoretical
- ▶ **Posaconazole** → see antifungals, azoles
- ▶ **Potassium canrenoate** → see TABLE 16 p. 851 (increased serum potassium)
- ▶ **Potassium chloride** → see TABLE 16 p. 851 (increased serum potassium)
- ▶ **Potassium citrate**
- ▶ **Potassium citrate** is predicted to decrease the efficacy of **methenamine**. Avoid. [Moderate] Theoretical
- ▶ **Potassium citrate** increases the risk of side-effects when given with **sucralfate**. Avoid. [Moderate] Theoretical
- ▶ **Potassium-sparing diuretics** → see TABLE 18 p. 851 (hyponatraemia), TABLE 16 p. 851 (increased serum potassium)
- ▶ amiloride • triamterene
- ▶ **Triamterene** potentially increases the clearance of **lithium**. [Moderate] Study
- ▶ **Pramipexole** → see dopamine receptor agonists
- ▶ **Prasugrel** → see TABLE 4 p. 847 (antiplatelet effects)
- ▶ **Pravastatin** → see statins
- ▶ **Praziquantel**
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to **praziquantel**. Avoid. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **praziquantel**. [Mild] Study
- ▶ **Antimalarials (chloroquine)** moderately decrease the exposure to **praziquantel**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **praziquantel**. [Mild] Study
- ▶ **Corticosteroids (dexamethasone)** decrease the exposure to **praziquantel**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to markedly decrease the exposure to **praziquantel**. Avoid. [Moderate] Study

- ▶ **Grapefruit juice** is predicted to increase the exposure to praziquantel. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** moderately increase the exposure to praziquantel. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to praziquantel. [Mild] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to praziquantel. [Mild] Study
- ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to praziquantel. [Mild] Study
- ▶ **Mitotane** is predicted to markedly decrease the exposure to praziquantel. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to markedly decrease the exposure to praziquantel. Avoid. [Moderate] Study

Prazosin → see alpha blockers

Prednisolone → see corticosteroids

Prednisone → see corticosteroids

Pregabalin → see antiepileptics

Prilocaine → see anaesthetics, local

Primaquine → see antimalarials

Primidone → see antiepileptics

Procarbazine → see TABLE 15 p. 850 (myelosuppression), TABLE 13 p. 850 (serotonin syndrome)

FOOD AND LIFESTYLE Procarbazine is a mild monoamine-oxidase inhibitor and might rarely interact with tyramine-rich foods (such as mature cheese, salami, pickled herring, *Bovril*®, *Oxo*®, *Marmite*® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- ▶ **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with procarbazine. [Moderate] Anecdotal
- ▶ **Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone)** are predicted to increase the risk of hypersensitivity reactions when given with procarbazine. [Severe] Anecdotal
- ▶ **Antiepileptics (fosphenytoin)** are predicted to increase the risk of hypersensitivity when given with procarbazine. [Severe] Anecdotal
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with procarbazine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Prochlorperazine → see phenothiazines

Procyclidine → see TABLE 10 p. 849 (antimuscarinics)

- ▶ **SSRIs (paroxetine)** slightly increase the exposure to procyclidine. Monitor and adjust dose. [Moderate] Study

Proguanil → see antimalarials

Promazine → see phenothiazines

Promethazine → see antihistamines, sedating

Propafenone → see antiarrhythmics

Propantheline → see TABLE 10 p. 849 (antimuscarinics)

Propiverine → see TABLE 10 p. 849 (antimuscarinics)

- ▶ **Propiverine** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Propofol → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Antiepileptics (valproate)** potentially increase the concentration of propofol. Adjust dose. [Severe] Theoretical

Propranolol → see beta blockers, non-selective

Propylthiouracil → see TABLE 15 p. 850 (myelosuppression)

- ▶ **Propylthiouracil** is predicted to decrease the effects of metyrapone. Avoid. [Moderate] Theoretical

Proton pump inhibitors

esomeprazole • lansoprazole • omeprazole • pantoprazole • rabeprazole

- ▶ **Antifungals, azoles (voriconazole)** increase the exposure to proton pump inhibitors (esomeprazole, omeprazole). Adjust dose. [Moderate] Study
- ▶ **Proton pump inhibitors** decrease the absorption of antifungals, azoles (itraconazole). Administer itraconazole capsules with an acidic beverage. [Moderate] Study

- ▶ **Proton pump inhibitors** decrease the absorption of antifungals, azoles (ketoconazole). Administer ketoconazole with an acidic beverage. [Moderate] Study

- ▶ **Proton pump inhibitors** decrease the absorption of antifungals, azoles (posaconazole) (oral suspension). Avoid. [Moderate] Study

- ▶ **Proton pump inhibitors** are predicted to decrease the absorption of bosutinib. [Moderate] Study

- ▶ **Proton pump inhibitors** are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

- ▶ **Esomeprazole** is predicted to increase the exposure to cilostazol. [Moderate] Theoretical

- ▶ **Omeprazole** is predicted to increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Study

- ▶ **Proton pump inhibitors (esomeprazole, omeprazole)** potentially increase the exposure to clobazam. Adjust dose. [Moderate] Theoretical

- ▶ **Proton pump inhibitors (esomeprazole, omeprazole)** are predicted to decrease the efficacy of clopidogrel. Avoid. [Moderate] Study

- ▶ **Proton pump inhibitors** are predicted to slightly to moderately decrease the exposure to dasatinib. Avoid. [Severe] Study

- ▶ **Proton pump inhibitors** are predicted to decrease the absorption of dipyridamole (immediate release tablets). [Moderate] Theoretical

- ▶ **Proton pump inhibitors** are predicted to slightly decrease the exposure to erlotinib. Avoid. [Moderate] Study

- ▶ **Proton pump inhibitors** are predicted to decrease the exposure to gefitinib. [Severe] Theoretical

- ▶ **HIV-protease inhibitors (tipranavir)** decrease the exposure to proton pump inhibitors. Avoid. [Severe] Study

- ▶ **Proton pump inhibitors** decrease the exposure to HIV-protease inhibitors (atazanavir). Avoid or adjust dose. [Severe] Study

- ▶ **Proton pump inhibitors** increase the exposure to HIV-protease inhibitors (saquinavir). Avoid. [Severe] Study

- ▶ **Proton pump inhibitors** are predicted to decrease the exposure to ledipasvir. Adjust dose, see ledipasvir with sofosbuvir p. 401. [Moderate] Theoretical

- ▶ **Proton pump inhibitors** decrease the clearance of methotrexate (high-dose). Use with caution or avoid. [Severe] Study

- ▶ **Proton pump inhibitors** are predicted to decrease the exposure to pazopanib. Avoid or administer concurrently without food. [Moderate] Study

- ▶ **Proton pump inhibitors** are predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Study

- ▶ **Proton pump inhibitors** potentially decrease the exposure to sofosbuvir. Adjust dose, see ledipasvir with sofosbuvir p. 401, sofosbuvir with velpatasvir, and sofosbuvir with velpatasvir and voxilaprevir. [Moderate] Study

- ▶ **Esomeprazole** is predicted to slightly to moderately increase the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. [Severe] Theoretical

- ▶ **Omeprazole** slightly to moderately increases the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. [Severe] Study

- ▶ **Proton pump inhibitors** are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir. [Moderate] Study

- ▶ **Proton pump inhibitors** are predicted to decrease the exposure to voxilaprevir. Adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. [Moderate] Study

Proxymetacaine → see anaesthetics, local

Pseudoephedrine → see sympathomimetics, vasoconstrictor

Pyrazinamide

- ▶ **Allopurinol** is predicted to increase the risk of hyperuricaemia when given with pyrazinamide. [Moderate] Theoretical

- ▶ **Pyrazinamide** is predicted to decrease the effects of sulfapyrazone. [Moderate] Theoretical

Pyridostigmine → see TABLE 6 p. 848 (bradycardia), TABLE 20 p. 851 (neuromuscular blocking effects)

- ▶ **Aminoglycosides** are predicted to decrease the effects of pyridostigmine. [Moderate] Theoretical → Also see TABLE 20 p. 851

Pyrimethamine → see antimalarials

Quetiapine → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

Quetiapine (continued)

- ▶ **Antiarrhythmics (dronedrone)** are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to quetiapine. [Moderate] Study → Also see TABLE 11 p. 849
 - ▶ **Antiepileptics (valproate)** potentially increase the risk of neutropenia when given with quetiapine. [Moderate] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
 - ▶ **Appetitant** is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
 - ▶ **Bosentan** is predicted to decrease the exposure to quetiapine. [Moderate] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study → Also see TABLE 8 p. 848
 - ▶ **Cobicistat** is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
 - ▶ **Quetiapine** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
 - ▶ **Efavirenz** is predicted to decrease the exposure to quetiapine. [Moderate] Study
 - ▶ **Enzalutamide** is predicted to decrease the exposure to quetiapine. [Moderate] Study
 - ▶ **Grapefruit juice** is predicted to increase the exposure to quetiapine. Avoid. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
 - ▶ **Quetiapine** decreases the effects of **levodopa**. [Severe] Anecdotal → Also see TABLE 8 p. 848
 - ▶ **Quetiapine** potentially increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to quetiapine. [Moderate] Study
 - ▶ **Netupitant** is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
 - ▶ **Nevirapine** is predicted to decrease the exposure to quetiapine. [Moderate] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
 - ▶ **Ribociclib** (high-dose) is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Theoretical
 - ▶ **Rifampicin** is predicted to decrease the exposure to quetiapine. [Moderate] Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to quetiapine. [Moderate] Study
- Quinagolid** → see dopamine receptor agonists
- Quinapril** → see ACE inhibitors
- Quinine** → see antimalarials
- Quinolones** → see TABLE 9 p. 849 (QT-interval prolongation)

ciprofloxacin · levofloxacin · moxifloxacin · norfloxacin · ofloxacin

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Ciprofloxacin** is predicted to increase the exposure to **agomelatine**. [Moderate] Study

- ▶ **Quinolones (ciprofloxacin, norfloxacin)** are predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **quinolones**. **Quinolones** should be taken 2 hours before or 4 hours after **antacids**. [Moderate] Study
- ▶ **Ciprofloxacin** slightly increases the exposure to **antiarrhythmics (lidocaine)**. [Mild] Study
- ▶ **Ciprofloxacin** affects the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Calcium salts (calcium carbonate)** decrease the absorption of **ciprofloxacin**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Calcium salts (calcium carbonate)** decrease the absorption of **norfloxacin**. **Norfloxacin** should be taken 2 hours before or 4 hours after **calcium carbonate**. [Moderate] Study
- ▶ **Ciprofloxacin** increases the concentration of **clozapine**. Monitor side effects and adjust dose. [Severe] Study
- ▶ **Quinolones** increase the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Didanosine** (buffered) is predicted to greatly decrease the exposure to oral **quinolones**. **Didanosine** should be taken 2 hours after **quinolones**. [Moderate] Study
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **dopamine receptor agonists (ropinirole)**. Adjust dose. [Moderate] Study
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **duloxetine**. Avoid. [Moderate] Theoretical
- ▶ **Quetiapine** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Theoretical
- ▶ **Enteral feeds** decrease the exposure to **ciprofloxacin**. [Moderate] Study
- ▶ **Ciprofloxacin** slightly increases the exposure to **erlotinib**. Monitor side effects and adjust dose. [Moderate] Study
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose. [Severe] Theoretical
- ▶ **Iron (oral)** decreases the exposure to **quinolones**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Lanthanum** moderately decreases the exposure to **quinolones**. **Quinolones** should be taken 2 hours before or 4 hours after **lanthanum**. [Moderate] Study
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **loxapine**. Avoid. [Unknown] Theoretical
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **Ciprofloxacin** potentially increases the risk of toxicity when given with **methotrexate**. Avoid. [Severe] Anecdotal
- ▶ **Ciprofloxacin** slightly increases the exposure to **monoamine-oxidase B inhibitors (rasagiline)**. [Moderate] Study
- ▶ **NSAIDs** potentially increase the risk of seizures when given with **quinolones**. [Severe] Theoretical
- ▶ **Ciprofloxacin** very slightly increases the exposure to **pentoxifylline**. [Moderate] Study
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **pirfenidone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **pomalidomide**. Adjust **pomalidomide** dose. [Moderate] Theoretical
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **roflumilast**. [Moderate] Theoretical
- ▶ **Sucralfate** decreases the exposure to **quinolones**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Norfloxacin** is predicted to increase the exposure to **theophylline**. Adjust dose. [Moderate] Anecdotal
- ▶ **Ciprofloxacin** increases the exposure to **tizanidine**. Avoid. [Moderate] Study
- ▶ **Zinc** is predicted to decrease the exposure to **quinolones**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Ciprofloxacin** is predicted to increase the exposure to **zolmitriptan**. Adjust **zolmitriptan** dose, p. 292. [Moderate] Theoretical

Rabeprazole → see proton pump inhibitors

Rabies vaccine

- ▶ **Antimalarials (chloroquine)** decrease the efficacy of rabies vaccine. Avoid. [Moderate] Study
- ▶ **Hydroxychloroquine** is predicted to decrease efficacy rabies vaccine. [Moderate] Theoretical

Raloxifene → see TABLE 5 p. 847 (thromboembolism)

Raltegravir

- ▶ **Antacids** slightly decrease the exposure to raltegravir. Avoid. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** are predicted to affect the exposure to raltegravir. [Moderate] Theoretical
- ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to affect the exposure to raltegravir. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Calcium salts (calcium carbonate)** greatly decrease the exposure to raltegravir (high-dose). Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir)** increase the exposure to raltegravir (high-dose). Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors (darunavir)** increase the risk of rash when given with raltegravir. [Moderate] Study
- ▶ **HIV-protease inhibitors (fosamprenavir)** (boosted with ritonavir) decrease the exposure to raltegravir and raltegravir decreases the exposure to HIV-protease inhibitors (**fosamprenavir**) (boosted with ritonavir). Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (tipranavir)** (boosted with ritonavir) are predicted to decrease the exposure to raltegravir (high-dose). Avoid. [Moderate] Study
- ▶ **Rifampicin** slightly decreases the exposure to raltegravir. Avoid or adjust dose—consult product literature. [Moderate] Study

Raltitrexed → see TABLE 15 p. 850 (myelosuppression)

- ▶ **Folates** are predicted to alter the effects of raltitrexed. Avoid. [Moderate] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with raltitrexed. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Ramipril → see ACE inhibitors

Ramucirumab → see monoclonal antibodies

Ranibizumab

- ▶ **Ranibizumab** is predicted to increase the risk of bleeding events when given with **argatroban**. [Severe] Theoretical
- ▶ **Ranibizumab** is predicted to increase the risk of bleeding events when given with **bivalirudin**. [Moderate] Theoretical
- ▶ **Ranibizumab** increases the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Ranibizumab** is predicted to increase the risk of bleeding events when given with **danaparoid**. [Severe] Theoretical
- ▶ **Ranibizumab** increases the risk of bleeding events when given with **heparin (unfractionated)**. [Severe] Theoretical
- ▶ **Ranibizumab** increases the risk of bleeding events when given with **low molecular-weight heparins**. [Severe] Theoretical
- ▶ **Ranibizumab** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical

Ranitidine → see H₂ receptor antagonists

Ranolazine → see TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **Ranolazine** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **alikiren**. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Aprepitant** is predicted to increase the exposure to ranolazine. [Severe] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to ranolazine. [Severe] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Ciclosporin** is predicted to increase the concentration of ranolazine and ranolazine is predicted to increase the concentration of **ciclosporin**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **colchicine**. Avoid or adjust colchicine dose. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Ranolazine** is predicted to increase the exposure to **dabigatran**. [Severe] Theoretical
- ▶ **Ranolazine** increases the concentration of **digoxin**. [Moderate] Study
- ▶ **Ranolazine** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Ranolazine** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the concentration of ranolazine. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to ranolazine. [Severe] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **lomipatide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Mitotane** is predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to ranolazine. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Ranolazine** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **panobinostat**. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Rifampicin** is predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **statins (atorvastatin)**. [Moderate] Theoretical
- ▶ **Ranolazine** slightly increases the exposure to **statins (simvastatin)**. Adjust simvastatin dose, p. 134. [Moderate] Study
- ▶ **Ranolazine** increases the concentration of **tacrolimus**. Adjust dose. [Severe] Anecdotal
- ▶ **Ranolazine** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Ranolazine** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Ranolazine** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical

Rasagiline → see monoamine-oxidase B inhibitors

Reboxetine

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to reboxetine. [Moderate] Anecdotal
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of reboxetine. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to reboxetine. [Moderate] Anecdotal
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ **Reboxetine** is predicted to increase the risk of hypokalaemia when given with **loop diuretics**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to reboxetine. [Moderate] Anecdotal
- ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **moclobemide**. Avoid. [Severe] Theoretical
- ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid. [Severe] Theoretical
- ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **monoamine-oxidase B inhibitors (rasagiline, selegiline)**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to reboxetine. [Moderate] Anecdotal
- ▶ **Reboxetine** is predicted to increase the risk of hypokalaemia when given with **thiazide diuretics**. [Moderate] Anecdotal

Regorafenib → see TABLE 15 p. 850 (myelosuppression), TABLE 4 p. 847 (antiplatelet effects)

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to regorafenib. Avoid. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study
- ▶ **Regorafenib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to regorafenib. Avoid. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study
- ▶ **Regorafenib** is predicted to increase the exposure to **methotrexate**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to regorafenib. Avoid. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Regorafenib** is predicted to increase the exposure to **NSAIDs (mefenamic acid)**. Avoid. [Moderate] Theoretical → Also see TABLE 4 p. 847
- ▶ **Regorafenib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to regorafenib. Avoid. [Moderate] Study
- ▶ **Regorafenib** is predicted to increase the exposure to **statins (atorvastatin, fluvastatin, rosuvastatin)**. [Severe] Theoretical

Remifentanyl → see opioids

Repaglinide → see TABLE 14 p. 850 (antidiabetic drugs)

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to repaglinide. [Moderate] Study
- ▶ **Ciclosporin** moderately increases the exposure to repaglinide. [Moderate] Study
- ▶ **Clopidogrel** increases the exposure to repaglinide. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to repaglinide. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study
- ▶ **Fibrates (gemfibrozil)** increase the exposure to repaglinide. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to repaglinide. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to repaglinide. [Moderate] Study
- ▶ **Iron chelators (deferasirox)** moderately increase the exposure to repaglinide. Avoid. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the exposure to repaglinide. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to repaglinide. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study
- ▶ **Opicapone** is predicted to increase the exposure to repaglinide. Avoid. [Moderate] Study
- ▶ **Pitolisant** is predicted to decrease the exposure to repaglinide. [Unknown] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study
- ▶ **Teriflunomide** is predicted to increase the exposure to repaglinide. [Moderate] Study
- ▶ **Trimethoprim** slightly increases the exposure to repaglinide. Avoid or monitor blood glucose. [Moderate] Study

Retigabine → see antiepileptics

Retinoids → see TABLE 5 p. 847 (thromboembolism)

acitretin · adapalene · alitretinoin · bexarotene · isotretinoin · tazarotene · tretinoin

- ▶ Avoid concomitant use of keratolytics in patients taking **acitretin** and **isotretinoin**.
- ▶ Since systemic absorption can follow topical application of **isotretinoin**, the possibility of interactions should be borne in mind.

- ▶ **Alcohol (beverage)** potentially increases the concentration of **acitretin**. Avoid and for 2 months after stopping **acitretin**, p. 749. [Moderate] Study
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, itraconazole, ketoconazole, miconazole, voriconazole)** are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, ketoconazole, voriconazole)** are predicted to increase the risk of tretinoin toxicity when given with **tretinoin**. [Moderate] Study
- ▶ **Clopidogrel** is predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose. [Moderate] Theoretical
- ▶ **Fibrates (gemfibrozil)** are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose. [Moderate] Theoretical
- ▶ **Fibrates (gemfibrozil)** increase the concentration of **bexarotene**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose. [Moderate] Theoretical

- **Idelalisib** is predicted to increase the exposure to **alitretinoin**. Adjust **alitretinoin** dose. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to **alitretinoin**. Adjust **alitretinoin** dose. [Moderate] Theoretical
- **Acitretin** is predicted to increase the concentration of **methotrexate**. Avoid. [Moderate] Anecdotal
- **Sulfapyrazone** is predicted to increase the exposure to **alitretinoin**. Adjust **alitretinoin** dose. [Moderate] Theoretical
- Retinoids (**acitretin**, **alitretinoin**, **isotretinoin**, **tretinoin**) increase the risk of benign intracranial hypertension when given with **tetracyclines**. Avoid. [Severe] Anecdotal
- **Bexarotene** is predicted to increase the risk of toxicity when given with **vitamin A**. Adjust dose. [Moderate] Theoretical
- Retinoids (**acitretin**, **alitretinoin**, **isotretinoin**) are predicted to increase the risk of vitamin A toxicity when given with **vitamin A**. Avoid. [Severe] Theoretical
- **Tretinoin** is predicted to increase the risk of vitamin A toxicity when given with **vitamin A**. Avoid. [Severe] Study

Ribavirin

- **Ribavirin** is predicted to increase the exposure to **didanosine**. Avoid. [Severe] Study
- **Ribavirin** increases the risk of toxicity when given with **stavudine**. Avoid. [Severe] Study
- **Ribavirin** increases the risk of anaemia and/or leucopenia when given with **zidovudine**. Avoid. [Severe] Study

Ribociclib → see TABLE 9 p. 849 (QT-interval prolongation)

FOOD AND LIFESTYLE Avoid concomitant use of pomegranate or pomegranate juice as it is predicted to increase **ribociclib** exposure.

- **Ribociclib** (high-dose) is predicted to increase the exposure to **alpha blockers (alfuzosin)**. Avoid. [Moderate] Theoretical
- **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- **Ribociclib** (high-dose) is predicted to increase the exposure to **antiarrhythmics (amiodarone)**. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 849
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- **Appetitant** is predicted to increase the exposure to **ribociclib**. [Moderate] Study
- **Bosentan** is predicted to decrease the exposure to **ribociclib**. [Moderate] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **ribociclib**. [Moderate] Study
- **Ribociclib** is predicted to increase the exposure to **ciclosporin**. Use with caution and adjust dose. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose. [Moderate] Study
- **Crizotinib** is predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- **Efavirenz** is predicted to decrease the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- **Enzalutamide** is predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- **Ribociclib** (high-dose) is predicted to increase the exposure to **ergotamine**. Avoid. [Moderate] Theoretical
- **Ribociclib** is predicted to increase the exposure to **everolimus**. Use with caution and adjust dose. [Moderate] Theoretical
- **Grapefruit juice** is predicted to increase the exposure to **ribociclib**. Avoid. [Moderate] Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- **Idelalisib** is predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose. [Moderate] Study
- **Imatinib** is predicted to increase the exposure to **ribociclib**. [Moderate] Study

- **Macrolides (clarithromycin)** are predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- **Macrolides (erythromycin)** are predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- **Ribociclib** moderately increases the exposure to **midazolam**. Avoid. [Moderate] Study
- **Mitotane** is predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- **Netupitant** is predicted to increase the exposure to **ribociclib**. [Moderate] Study
- **Nevirapine** is predicted to decrease the exposure to **ribociclib**. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 849
- **Ribociclib** is predicted to increase the exposure to **opioids (alfentanil, fentanyl)**. Use with caution and adjust dose. [Moderate] Theoretical
- **Ribociclib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 849
- **Ribociclib** (high-dose) is predicted to increase the exposure to **pimozide**. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 849
- **Ribociclib** (high-dose) is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Theoretical
- **Rifampicin** is predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- **Ribociclib** is predicted to increase the exposure to **sirolimus**. Use with caution and adjust dose. [Moderate] Theoretical
- **St John's Wort** is predicted to decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- **Ribociclib** (high-dose) is predicted to increase the exposure to **statins (simvastatin)**. Avoid. [Moderate] Theoretical
- **Ribociclib** is predicted to increase the exposure to **tacrolimus**. Use with caution and adjust dose. [Moderate] Theoretical

Rifabutin

GENERAL INFORMATION Although some manufacturers class rifabutin as a potent inducer of CYP3A4, clinical data suggests it is potentially a weak inducer, and therefore the BNf does not extrapolate the interactions of potent CYP3A4 inducers to rifabutin. For those who wish to err on the side of caution, see the interactions of rifampicin but bear in mind other mechanisms might be involved.

- **Antifungals, azoles (fluconazole)** increase the risk of uveitis when given with **rifabutin**. Adjust dose. [Severe] Study
- **Antifungals, azoles (itraconazole, posaconazole)** increase the concentration of **rifabutin** and **rifabutin** decreases the concentration of **antifungals, azoles (itraconazole, posaconazole)**. Avoid. [Severe] Study
- **Antifungals, azoles (ketoconazole)** are predicted to increase the concentration of **rifabutin** and **rifabutin** is predicted to decrease the concentration of **antifungals, azoles (ketoconazole)**. Avoid. [Severe] Theoretical
- **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **rifabutin**. Use with caution and adjust dose. [Moderate] Theoretical
- **Rifabutin** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. Avoid. [Severe] Theoretical
- **Rifabutin** decreases the concentration of **antifungals, azoles (voriconazole)** and **antifungals, azoles (voriconazole)** increase the concentration of **rifabutin**. Avoid or adjust **voriconazole** dose, p. 377. [Severe] Study
- **Rifabutin** slightly decreases the exposure to **antimalarials (atovaquone)**. Avoid. [Moderate] Study
- **Rifabutin** decreases the concentration of **cobicistat** and **cobicistat** increases the exposure to **rifabutin**. Avoid or adjust dose. [Severe] Study
- **Rifabutin** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- **Rifabutin** decreases the exposure to **dapson**. [Moderate] Study
- **Rifabutin** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical

Rifabutin (continued)

- ▶ **Efavirenz** slightly decreases the exposure to **rifabutin**. Adjust dose. [Severe] Study
- ▶ **Rifabutin** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Rifabutin** decreases the exposure to **etravirine**. [Moderate] Study
- ▶ **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir)** (boosted with ritonavir) increase the exposure to **rifabutin**. Monitor and adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** markedly increase the exposure to **rifabutin**. Avoid or adjust dose. [Severe] Study
- ▶ **Rifabutin** is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- ▶ **Rifabutin** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to **rifabutin**. Adjust dose. [Moderate] Theoretical
- ▶ **Macrolides (azithromycin)** increase the risk of neutropenia when given with **rifabutin**. [Severe] Study
- ▶ **Macrolides (clarithromycin)** increase the risk of uveitis when given with **rifabutin**. Adjust dose. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the risk of uveitis when given with **rifabutin**. Adjust dose. [Severe] Theoretical
- ▶ **Rifabutin** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Rifabutin** slightly decreases the exposure to **rilpivirine**. Adjust dose. [Severe] Study
- ▶ **Rifabutin** is predicted to decrease the exposure to **rolapitant**. Avoid. [Moderate] Theoretical
- ▶ **Rifabutin** is predicted to decrease the exposure to **simeprevir**. Avoid. [Moderate] Theoretical
- ▶ **Rifabutin** is predicted to decrease the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical
- ▶ **Rifabutin** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Rifabutin** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical

Rifampicin

- ▶ **Rifampicin** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **afatinib**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the exposure to **aliskiren**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** transiently increases the exposure to **ambrisentan**. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to anaesthetics, local (**ropivacaine**). [Moderate] Theoretical
- ▶ **Antacids** decrease the absorption of **rifampicin**. **Rifampicin** should be taken 1 hour before **antacids**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to antiarrhythmics (**disopyramide, dronedarone**). Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the efficacy of antiarrhythmics (**propafenone**). [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to anticholinesterases, centrally acting (**donepezil**). [Mild] Study
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to **rifampicin** and **rifampicin** is predicted to decrease the exposure to antiepileptics (**phenobarbital, primidone**). Use with caution and adjust dose. [Moderate] Study
- ▶ **Rifampicin** slightly decreases the exposure to antiepileptics (**brivaracetam**). Adjust dose. [Moderate] Study
- ▶ **Rifampicin** decreases the concentration of antiepileptics (**fosphenytoin, phenytoin**). Use with caution and adjust dose. [Moderate] Study
- ▶ **Rifampicin** markedly increases the clearance of antiepileptics (**lamotrigine**). Adjust **lamotrigine** dose, p. 202. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to antiepileptics (**perampanel**). Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** slightly decreases the exposure to antifungals, azoles (**fluconazole**). Adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to antifungals, azoles (**isavuconazole**). Avoid. [Severe] Study
- ▶ **Rifampicin** markedly decreases the exposure to antifungals, azoles (**itraconazole**). Avoid and for 14 days after stopping **rifampicin**. [Moderate] Study
- ▶ **Rifampicin** markedly decreases the exposure to antifungals, azoles (**ketoconazole**) and antifungals, azoles (**ketoconazole**) potentially decrease the exposure to **rifampicin**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to antifungals, azoles (**posaconazole**). Avoid. [Moderate] Anecdotal
- ▶ **Rifampicin** very markedly decreases the exposure to antifungals, azoles (**voriconazole**). Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to antihistamines, non-sedating (**bilastine**). [Moderate] Theoretical
- ▶ **Rifampicin** increases the clearance of antihistamines, non-sedating (**fexofenadine**). [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to antimalarials (**artemether**) (with lumefantrine). Avoid. [Severe] Study
- ▶ **Rifampicin** moderately decreases the exposure to antimalarials (**atovaquone**) and antimalarials (**atovaquone**) slightly increase the exposure to **rifampicin**. Avoid. [Moderate] Study
- ▶ **Rifampicin** moderately decreases the exposure to antimalarials (**mefloquine**). [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the concentration of antimalarials (**piperaquine**). Avoid. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the exposure to antimalarials (**quinine**). [Severe] Study
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to **apixaban**. Use with caution or avoid. [Severe] Study
- ▶ **Rifampicin** moderately decreases the exposure to **apremilast**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to markedly decrease the exposure to **aprepitant**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 249. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **ataluren**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **bazedoxifene**. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the exposure to **bedaquiline**. Avoid. [Severe] Study
- ▶ **Rifampicin** moderately decreases the exposure to **beta blockers, non-selective (carvedilol)**. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **beta blockers, non-selective (propranolol)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** slightly decreases the exposure to **beta blockers, selective (bisoprolol, metoprolol)**. [Mild] Study
- ▶ **Rifampicin** moderately decreases the exposure to **beta blockers, selective (celiprolol)**. [Moderate] Study
- ▶ **Rifampicin** slightly decreases the exposure to **bortezomib**. Avoid. [Severe] Study
- ▶ **Rifampicin** affects the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **bupropion**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **buspirone**. Use with caution and adjust dose. [Severe] Study

- ▶ **Rifampicin** moderately decreases the exposure to **cabozantinib**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** greatly decreases the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ **Rifampicin** moderately decreases the exposure to **calcium channel blockers (nifedipine)**. Avoid. [Severe] Study
- ▶ **Rifampicin** moderately decreases the exposure to **canagliflozin**. Adjust canagliflozin dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **cannabis extract**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** decreases the concentration of **caspofungin**. Adjust caspofungin dose, p. 372. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study
- ▶ **Rifampicin** decreases the concentration of **chloramphenicol**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **chlorthalozide**. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Rifampicin** is predicted to alter the effects of **cilostazol**. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **clozapine**. [Severe] Anecdotal
- ▶ **Rifampicin** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to corticosteroids (**budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, prednisone, triamcinolone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to corticosteroids (**fluticasone**). [Unknown] Theoretical
- ▶ **Rifampicin** decreases the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Rifampicin** is predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **dabigatran**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to **daclatasvir**. Avoid. [Severe] Study
- ▶ **Rifampicin** decreases the exposure to **dapsone**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **dasabuvir**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Rifampicin** moderately decreases the exposure to **diazepam**. Avoid. [Moderate] Study
- ▶ **Rifampicin** decreases the concentration of **digoxin**. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **edoxaban**. [Moderate] Study
- ▶ **Rifampicin** slightly decreases the exposure to **efavirenz**. Adjust dose. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to increase the exposure to **eluxadoline**. Avoid. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **erlotinib**. Avoid or adjust erlotinib dose. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- ▶ **Rifampicin** moderately decreases the exposure to **exemestane**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **fosoterodine**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **fingolimod**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **fosaprepitant**. Avoid. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **gefitinib**. Avoid. [Severe] Study
- ▶ **Rifampicin** markedly affects the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the concentration of **guanfacine**. Adjust guanfacine dose, p. 231. [Moderate] Study
- ▶ **Rifampicin** decreases the concentration of **haloperidol**. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to HIV-protease inhibitors (**atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir**). Avoid. [Severe] Study
- ▶ **Rifampicin** slightly decreases the exposure to HIV-protease inhibitors (**ritonavir**). [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to HIV-protease inhibitors (**tipranavir**). Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- ▶ **Rifampicin** is predicted to decrease the exposure to **ibrutinib**. Avoid or adjust ibrutinib dose. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **iron chelators (deferasirox)**. Monitor serum ferritin and adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **ixazomib**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical

Rifampicin (continued)

- ▶ Rifampicin is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ Rifampicin is predicted to decrease the exposure to **linagliptin**. [Moderate] Study
- ▶ Rifampicin slightly decreases the exposure to **linezolid**. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Rifampicin increases the clearance of **lorazepam**. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **lurasidone**. Avoid. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **macitentan**. Avoid. [Severe] Study
- ▶ Rifampicin decreases the concentration of **macrolides (clarithromycin)**. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
- ▶ Rifampicin is predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **midostaurin**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **modafinil**. [Moderate] Theoretical
- ▶ Rifampicin decreases the effects of **monoclonal antibodies (brentuximab vedotin)**. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **montelukast**. [Mild] Study
- ▶ Rifampicin decreases the concentration of **mycophenolate**. Monitor and adjust dose. [Severe] Study
- ▶ Rifampicin is predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ Rifampicin is predicted to slightly decrease the exposure to **natelginide**. [Mild] Study
- ▶ Rifampicin is predicted to decrease the exposure to **netupitant**. Avoid. [Severe] Study
- ▶ Rifampicin decreases the concentration of **nevirapine**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **nintedanib**. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ Rifampicin increases the clearance of **nitrazepam**. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ Rifampicin moderately decreases the exposure to **NSAIDs (celecoxib, diclofenac, etoricoxib)**. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ Rifampicin is predicted to decrease the exposure to **ombitasvir**. Avoid. [Severe] Theoretical
- ▶ Rifampicin is predicted to decrease the exposure to **ondansetron**. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **opioids (alfentanil, fentanyl)**. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **opioids (buprenorphine)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Rifampicin decreases the exposure to **opioids (codeine, morphine)**. [Moderate] Study
- ▶ Rifampicin decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **opioids (oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Rifampicin is predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **palbociclib**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **paliperidone**. Monitor and adjust dose. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **panobinostat**. Avoid. [Moderate] Theoretical
- ▶ Rifampicin decreases the exposure to **paracetamol**. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **pazopanib**. Avoid. [Severe] Theoretical
- ▶ Rifampicin is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (avanafil, tadalafil)**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (sildenafil, vardenafil)**. [Moderate] Theoretical
- ▶ Rifampicin is predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ Rifampicin moderately decreases the exposure to **pioglitazone**. Monitor and adjust dose. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **pirfenidone**. Avoid. [Moderate] Theoretical
- ▶ Rifampicin is predicted to moderately decrease the exposure to **pitolisant**. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **ponatinib**. Avoid. [Moderate] Theoretical
- ▶ Rifampicin is predicted to markedly decrease the exposure to **praziquantel**. Avoid. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **quetiapine**. [Moderate] Study
- ▶ Rifampicin slightly decreases the exposure to **raltegravir**. Avoid or adjust dose—consult product literature. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **ranolazine**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **reboxetine**. [Moderate] Anecdotal
- ▶ Rifampicin is predicted to decrease the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **repaglinide**. Monitor blood glucose and adjust dose. [Moderate] Study
- ▶ Rifampicin is predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- ▶ Rifampicin markedly decreases the exposure to **rilpivirine**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **risperidone**. Adjust dose. [Moderate] Study
- ▶ Rifampicin is predicted to moderately decrease the exposure to **rivaroxaban**. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **roflumilast**. Avoid. [Moderate] Study
- ▶ Rifampicin is predicted to markedly decrease the exposure to **rolapitant**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **roxolitinib**. Monitor and adjust dose. [Moderate] Study
- ▶ Rifampicin is predicted to moderately decrease the exposure to **saxagliptin**. [Moderate] Study
- ▶ Rifampicin moderately decreases the exposure to the active metabolite of **selezipag**. Adjust dose. [Moderate] Study
- ▶ Rifampicin is predicted to decrease the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the concentration of **sirolimus**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **sofosbuvir**. Avoid. [Severe] Study
- ▶ Rifampicin is predicted to decrease the exposure to **solifenacin**. [Moderate] Theoretical

- ▶ **Rifampicin** is predicted to decrease the exposure to **sorafenib**. [Moderate] Theoretical
- ▶ **Rifampicin** markedly decreases the exposure to **statins** (**atorvastatin**). **Atorvastatin** should be taken at the same time as **rifampicin**, p. 132, p. 364. [Moderate] Study
- ▶ **Rifampicin** moderately decreases the exposure to **statins** (**fluvastatin**). Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** very markedly decreases the exposure to **statins** (**simvastatin**). [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **sulfonylureas**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study
- ▶ **Rifampicin** decreases the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Rifampicin** markedly decreases the exposure to **tamoxifen**. [Unknown] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **taxanes** (**cabazitaxel**, **paclitaxel**). Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **taxanes** (**docetaxel**). [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical
- ▶ **Rifampicin** decreases the exposure to **terbinafine**. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **tetracyclines** (**doxycycline**). Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to markedly decrease the exposure to **ticagrelor**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **tivozanib**. [Severe] Study
- ▶ **Rifampicin** moderately decreases the exposure to **tizanidine**. [Mild] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **tofacitinib**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **tolvaptan**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **toremifene**. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** decreases the exposure to **trimethoprim**. [Moderate] Study
- ▶ **Rifampicin** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ **Rifampicin** is predicted to decrease the exposure to **vandetanib**. Avoid. [Moderate] Study
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **vinca alkaloids** (**vinblastine**, **vincristine**, **vindesine**). [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **vinca alkaloids** (**vinflunine**). Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **vinca alkaloids** (**vinorelbine**). Use with caution or avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **vismodegib**. Avoid. [Moderate] Theoretical
- ▶ **Rifampicin** potentially increases the risk of nephrotoxicity when given with **volatile halogenated anaesthetics** (**methoxyflurane**). Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Study

- ▶ **Rifampicin** markedly decreases the exposure to **zaleplon**. [Moderate] Study
 - ▶ **Rifampicin** moderately decreases the exposure to **zolidem**. [Moderate] Study
 - ▶ **Rifampicin** is predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Rifaximin**
- ▶ **Ciclosporin** very markedly increases the exposure to **rifaximin**. [Severe] Study
- Rilpivirine**
- ▶ **Antacids** are predicted to decrease the exposure to **rilpivirine**. **Antacids** should be taken 2 hours before or 4 hours after **rilpivirine**, p. 415. [Severe] Theoretical
 - ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) markedly decrease the exposure to **rilpivirine**. Avoid. [Severe] Study
 - ▶ **Antiepileptics** (**oxcarbazepine**) are predicted to decrease the concentration of **rilpivirine**. Avoid. [Severe] Theoretical
 - ▶ **Bosentan** is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical
 - ▶ **Calcium salts** (**calcium carbonate**) are predicted to slightly decrease the exposure to **rilpivirine**. **Calcium carbonate** should be taken 2 hours before or 4 hours after **rilpivirine**. [Severe] Theoretical
 - ▶ **Efavirenz** is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical
 - ▶ **Enzalutamide** markedly decreases the exposure to **rilpivirine**. Avoid. [Severe] Study
 - ▶ **Etravirine** is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical
 - ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **rilpivirine**. **H₂ receptor antagonists** should be taken 12 hours before or 4 hours after **rilpivirine**. [Severe] Study
 - ▶ **Mitotane** markedly decreases the exposure to **rilpivirine**. Avoid. [Severe] Study
 - ▶ **Nevirapine** is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical
 - ▶ **Proton pump inhibitors** are predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Study
 - ▶ **Rifabutin** slightly decreases the exposure to **rilpivirine**. Adjust dose. [Severe] Study
 - ▶ **Rifampicin** markedly decreases the exposure to **rilpivirine**. Avoid. [Severe] Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical

Riluzole

FOOD AND LIFESTYLE Charcoal-grilled foods are predicted to decrease the exposure to **riluzole**.

- ▶ **SSRIs** (**fluvoxamine**) are predicted to increase the exposure to **riluzole**. [Moderate] Theoretical
- Riociguat** → see TABLE 8 p. 848 (hypotension)
- ▶ **Antacids** slightly decrease the exposure to **riociguat**. **Antacids** should be taken 2 hours before or 1 hour after **riociguat**. [Mild] Study
 - ▶ **Antifungals**, azoles (**itraconazole**) are predicted to increase the exposure to **riociguat**. Avoid. [Moderate] Study
 - ▶ **Antifungals**, azoles (**ketoconazole**) moderately increase the exposure to **riociguat**. Avoid. [Moderate] Study
 - ▶ **Ciclosporin** is predicted to increase the exposure to **riociguat**. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** (**ritonavir**) are predicted to increase the exposure to **riociguat**. Avoid. [Moderate] Theoretical
 - ▶ **Riociguat** is predicted to increase the risk of hypotension when given with **phosphodiesterase type-5 inhibitors**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 848

Risedronate → see bisphosphonates

Risperidone → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **risperidone**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Antifungals**, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 849

Risperidone (continued)

- ▶ **Bupropion** is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- ▶ **Cinacalcet** is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- ▶ **Risperidone** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849
- ▶ **Enzalutamide** is predicted to decrease the exposure to risperidone. Adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- ▶ **Risperidone** is predicted to decrease the effects of **levodopa**. Avoid or adjust dose. [Severe] Anecdotal → Also see TABLE 8 p. 848
- ▶ **Risperidone** potentially increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 849
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Risperidone** increases the risk of dyskinesias when given with **methylphenidate**. [Severe] Anecdotal
- ▶ **Mitotane** is predicted to decrease the exposure to risperidone. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to risperidone. Adjust dose. [Moderate] Study
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- ▶ **Terbinafine** is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Ritonavir** → see HIV-protease inhibitors
- Rituximab** → see monoclonal antibodies
- Rivaroxaban** → see TABLE 3 p. 847 (anticoagulant effects)
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to rivaroxaban. Avoid. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to moderately increase the exposure to rivaroxaban. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** moderately increase the exposure to rivaroxaban. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- Rivastigmine** → see anticholinesterases, centrally acting
- Rizatriptan** → see TABLE 13 p. 850 (serotonin syndrome)
- ▶ **Beta blockers, non-selective (propranolol)** slightly to moderately increase the exposure to rizatriptan. Adjust rizatriptan dose and separate administration by at least 2 hours. [Moderate] Study
- ▶ **Rizatriptan** is predicted to increase the risk of vasoconstriction when given with **ergotamine**. Ergotamine should be taken at least 24 hours before or 6 hours after rizatriptan. [Severe] Theoretical
- ▶ **Moclobemide** moderately increases the exposure to rizatriptan. Avoid. [Moderate] Study → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to rizatriptan. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850
- Rocuronium** → see neuromuscular blocking drugs, non-depolarising

Roflumilast

- ▶ **Aminophylline** is predicted to slightly increase the exposure to roflumilast. Avoid. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Study
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to roflumilast. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to roflumilast. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Study
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to roflumilast. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Study
- ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to roflumilast. [Moderate] Study
- ▶ **Theophylline** is predicted to slightly increase the exposure to roflumilast. Avoid. [Moderate] Theoretical

Rolapitant

- ▶ **Rolapitant** is predicted to increase the exposure to **alkylating agents (bendamustine)**. Avoid or monitor. [Moderate] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **anthracyclines (doxorubicin, mitoxantrone)**. Avoid or monitor. [Moderate] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to rolapitant. Avoid. [Severe] Study
- ▶ **Rolapitant** is predicted to moderately increase the exposure to **beta blockers, selective (metoprolol)**. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to rolapitant. Avoid. [Severe] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **colchicine**. [Moderate] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **dabigatran**. [Moderate] Study
- ▶ **Rolapitant** slightly increases the exposure to **digoxin**. [Moderate] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to rolapitant. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to markedly decrease the exposure to rolapitant. Avoid. [Severe] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **irinotecan**. Avoid or monitor. [Moderate] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **methotrexate**. Avoid or monitor. [Moderate] Study
- ▶ **Mitotane** is predicted to markedly decrease the exposure to rolapitant. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to rolapitant. Avoid. [Severe] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **pimozide**. [Severe] Study
- ▶ **Rifabutin** is predicted to decrease the exposure to rolapitant. Avoid. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to markedly decrease the exposure to rolapitant. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to rolapitant. Avoid. [Severe] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **statins (rosuvastatin)**. Monitor and adjust dose. [Severe] Study
- ▶ **Rolapitant** increases the exposure to **sulfasalazine**. [Severe] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **tamoxifen**. [Severe] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **topotecan**. Avoid or monitor. [Moderate] Study
- Ropinirole** → see dopamine receptor agonists
- Ropivacaine** → see anaesthetics, local
- Rosuvastatin** → see statins
- Rotavirus vaccine** → see live vaccines
- Rotigotine** → see dopamine receptor agonists

Rufinamide → see antiepileptics

Rupatadine → see antihistamines, non-sedating

Ruxolitinib → see TABLE 15 p. 850 (myelosuppression)

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **ruxolitinib**. Adjust dose and monitor side effects. [Moderate] Study
 - ▶ **Aprepitant** is predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical
 - ▶ **Bosentan** is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical
 - ▶ **Cobicistat** is predicted to increase the exposure to **ruxolitinib**. Adjust dose and monitor side effects. [Moderate] Study
 - ▶ **Ruxolitinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
 - ▶ **Crizotinib** is predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Efavirenz** is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Grapefruit juice** is predicted to increase the exposure to **ruxolitinib**. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ruxolitinib**. Adjust dose and monitor side effects. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **ruxolitinib**. Adjust dose and monitor side effects. [Moderate] Study → Also see TABLE 15 p. 850
 - ▶ **Imatinib** is predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **ruxolitinib**. Adjust dose and monitor side effects. [Moderate] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 15 p. 850
 - ▶ **Netupitant** is predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical
 - ▶ **Nevirapine** is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Nilotinib** is predicted to increase the exposure to **ruxolitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Ruxolitinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
 - ▶ **Rifampicin** is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Study
 - ▶ **St John's Wort** is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Theoretical
- Sacubitril** → see TABLE 8 p. 848 (hypotension)
- Sacubitril** is predicted to increase the exposure to **statins**. [Severe] Study
- Safinamide** → see monoamine-oxidase B inhibitors
- Salbutamol** → see beta₂ agonists
- Salmeterol** → see beta₂ agonists
- Sapropterin** → see TABLE 8 p. 848 (hypotension)
- ▶ **Methotrexate** is predicted to decrease the efficacy of **sapropterin**. [Moderate] Theoretical
 - ▶ **Phosphodiesterase type-5 inhibitors** are predicted to increase the risk of hypotension when given with **sapropterin**. [Moderate] Theoretical → Also see TABLE 8 p. 848
 - ▶ **Trimethoprim** is predicted to decrease the efficacy of **sapropterin**. [Moderate] Theoretical
- Saquinavir** → see HIV-protease inhibitors

Sarilumab → see monoclonal antibodies

Saxagliptin → see TABLE 14 p. 850 (antidiabetic drugs)

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **saxagliptin**. [Mild] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **saxagliptin**. [Moderate] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **saxagliptin**. [Mild] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **saxagliptin**. [Moderate] Study
 - ▶ **Aprepitant** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **saxagliptin**. [Mild] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **saxagliptin**. [Moderate] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
 - ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **saxagliptin**. [Moderate] Study
 - ▶ **Grapefruit juice** is predicted to increase the exposure to **saxagliptin**. [Mild] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **saxagliptin**. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **saxagliptin**. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **saxagliptin**. [Moderate] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **saxagliptin**. [Mild] Study
 - ▶ **Mitotane** is predicted to moderately decrease the exposure to **saxagliptin**. [Moderate] Study
 - ▶ **Netupitant** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **saxagliptin**. [Mild] Study
 - ▶ **Rifampicin** is predicted to moderately decrease the exposure to **saxagliptin**. [Moderate] Study
- Secukinumab** → see monoclonal antibodies
- Selegiline** → see monoamine-oxidase B inhibitors
- Selenium**
- ▶ **Selenium** is predicted to decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **selenium**, p. 582. [Severe] Theoretical
- Selexipag**
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenytoin)** are predicted to decrease the exposure to the active metabolite of **selexipag**. Adjust dose. [Moderate] Study
 - ▶ **Antiepileptics (valproate)** are predicted to increase the exposure to **selexipag**. [Unknown] Theoretical
 - ▶ **Antifungals, azoles (fluconazole)** are predicted to increase the exposure to **selexipag**. [Unknown] Theoretical
 - ▶ **Clopidogrel** is predicted to increase the exposure to **selexipag**. Adjust dose. [Moderate] Study
 - ▶ **Fibrates (gemfibrozil)** increase the exposure to **selexipag**. Avoid. [Severe] Study
 - ▶ **Iron chelators (deferasirox)** are predicted to increase the exposure to **selexipag**. Adjust dose. [Moderate] Study
 - ▶ **Leflunomide** is predicted to increase the exposure to **selexipag**. Adjust dose. [Moderate] Theoretical
 - ▶ **Rifampicin** moderately decreases the exposure to the active metabolite of **selexipag**. Adjust dose. [Moderate] Study
 - ▶ **Teriflunomide** is predicted to increase the exposure to **selexipag**. Adjust dose. [Moderate] Theoretical
- Sertraline** → see SSRIs
- Sevoflurane** → see volatile halogenated anaesthetics
- Sildenafil** → see phosphodiesterase type-5 inhibitors
- Siltuximab** → see monoclonal antibodies

Silver sulfadiazine

PHARMACOLOGY Silver might inactivate enzymatic debriding agents—concurrent use might not be appropriate.

Simeprevir

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Simeprevir** is predicted to increase the concentration of **antiarrhythmics (amiodarone)**. Refer to specialist literature. [\[Severe\]](#) Anecdotal
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Antiepileptics (oxcarbazepine)** are predicted to decrease the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Aprepitant** is predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Cobicistat** is predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Crizotinib** is predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Etravirine** is predicted to decrease the exposure to **simeprevir**. Avoid. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Ledipasvir** moderately increases the exposure to **simeprevir** and **simeprevir** slightly increases the exposure to **ledipasvir**. Avoid. [\[Severe\]](#) Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Netupitant** is predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Nilotinib** is predicted to increase the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Rifabutin** is predicted to decrease the exposure to **simeprevir**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **simeprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Simeprevir** moderately increases the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Simeprevir** is predicted to increase the exposure to **statins (pravastatin)**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Simeprevir** moderately increases the exposure to **statins (rosuvastatin)**. Adjust **rosuvastatin** dose, p. 133. [\[Moderate\]](#) Study
- ▶ **Simeprevir** slightly increases the exposure to **statins (simvastatin)**. Monitor and adjust dose. [\[Moderate\]](#) Study

Simvastatin → see statins

Sirolimus

- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the concentration of **sirolimus**. [\[Severe\]](#) Anecdotal
- ▶ **Antiarrhythmics (dronedarone)** increase the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **sirolimus**. Avoid. [\[Severe\]](#) Study

- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** increase the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the concentration of **sirolimus**. Avoid. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Aprepitant** increases the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Bosentan** is predicted to decrease the concentration of **sirolimus** and **sirolimus** potentially increases the concentration of **bosentan**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** increase the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Ceritinib** is predicted to increase the exposure to **sirolimus**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Sirolimus** is predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Ciclosporin** moderately increases the exposure to **sirolimus**. Separate administration by 4 hours. [\[Severe\]](#) Study
- ▶ **Cobicistat** is predicted to increase the concentration of **sirolimus**. Avoid. [\[Severe\]](#) Study
- ▶ **Crizotinib** increases the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Efavirenz** is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Eliglustat** is predicted to increase the exposure to **sirolimus**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Enzalutamide** is predicted to decrease the concentration of **sirolimus**. Avoid. [\[Severe\]](#) Study
- ▶ **Grapefruit juice** increases the concentration of **sirolimus**. Avoid. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **sirolimus**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the concentration of **sirolimus**. Avoid. [\[Severe\]](#) Study
- ▶ **Imatinib** increases the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **sirolimus**. [\[Moderate\]](#) Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **sirolimus**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to **sirolimus**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the concentration of **sirolimus**. Avoid. [\[Severe\]](#) Study
- ▶ **Macrolides (erythromycin)** increase the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Sirolimus** is predicted to decrease the efficacy of **mifamurtide**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **sirolimus**. [\[Mild\]](#) Theoretical
- ▶ **Mitotane** is predicted to decrease the concentration of **sirolimus**. Avoid. [\[Severe\]](#) Study
- ▶ **Monoclonal antibodies (sarilumab)** potentially affect the exposure to **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Netupitant** increases the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Nilotinib** increases the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Palbociclib** is predicted to increase the exposure to **sirolimus**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **sirolimus**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Ribociclib** is predicted to increase the exposure to **sirolimus**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical

- ▶ **Rifampicin** is predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Severe] Theoretical
- ▶ Sirolimus is predicted to decrease the concentration of **tacrolimus** and **tacrolimus** increases the exposure to sirolimus. [Severe] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to sirolimus. [Severe] Theoretical

Sitagliptin → see TABLE 14 p. 850 (antidiabetic drugs)

Sodium aurothiomalate

- ▶ **ACE inhibitors** are predicted to increase the risk of hypersensitivity when given with sodium aurothiomalate. [Severe] Anecdotal
- ▶ Sodium aurothiomalate potentially increases the risk of side-effects when given with **penicillamine** (in those who have had previous adverse reactions to gold). Avoid. [Severe] Study

Sodium bicarbonate

- ▶ Oral sodium bicarbonate decreases the absorption of antifungals, azoles (**ketoconazole**). [Moderate] Study
- ▶ Sodium bicarbonate decreases the concentration of **lithium**. [Severe] Anecdotal
- ▶ Sodium bicarbonate is predicted to decrease the efficacy of **methenamine**. Avoid. [Moderate] Theoretical

Sodium citrate

- ▶ Sodium citrate is predicted to decrease the efficacy of **methenamine**. Avoid. [Moderate] Theoretical
- ▶ Sodium citrate is predicted to increase the risk of side-effects when given with **sucralfate**. Avoid. [Moderate] Theoretical

Sodium clodronate → see bisphosphonates

Sodium feredetate → see iron (oral)

Sodium nitroprusside → see TABLE 8 p. 848 (hypotension)

- ▶ Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics**, local (**prilocaine**). Use with caution or avoid. [Severe] Theoretical
- ▶ Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with **dapsone**. [Severe] Theoretical

Sodium oxybate → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Antiepileptics (valproate)** increase the exposure to sodium oxybate. Adjust sodium oxybate dose. [Moderate] Study

Sodium phenylbutyrate

- ▶ **Antiepileptics (valproate)** potentially decrease the effects of sodium phenylbutyrate. [Moderate] Anecdotal
- ▶ **Corticosteroids** potentially decrease the effects of sodium phenylbutyrate. [Moderate] Anecdotal
- ▶ **Haloperidol** potentially decreases the effects of sodium phenylbutyrate. [Moderate] Anecdotal

Sodium picosulfate → see TABLE 18 p. 851 (hyponatraemia)

Sodium stibogluconate

- ▶ Sodium stibogluconate increases the risk of cardiovascular side-effects when given with **amphotericin**. Separate administration by 14 days. [Severe] Study

Sofosbuvir

- ▶ Sofosbuvir is predicted to increase the risk of severe bradycardia or heart block when given with **antiarrhythmics (amiodarone)**. Refer to specialist literature. [Severe] Anecdotal
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- ▶ **Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Theoretical
- ▶ **H₂ receptor antagonists** potentially decrease the exposure to sofosbuvir. Adjust dose, see ledipasvir with sofosbuvir p. 401, sofosbuvir with velpatasvir, and sofosbuvir with velpatasvir and voxilaprevir. [Moderate] Study
- ▶ **HIV-protease inhibitors (tipranavir)** are predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Theoretical
- ▶ **Proton pump inhibitors** potentially decrease the exposure to sofosbuvir. Adjust dose, see ledipasvir with sofosbuvir p. 401, sofosbuvir with velpatasvir, and sofosbuvir with velpatasvir and voxilaprevir. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study

- ▶ **St John's Wort** is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- ▶ **Solifenacin** → see TABLE 10 p. 849 (antimuscarinics)
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to solifenacin. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to solifenacin. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study

- ▶ **Mitotane** is predicted to decrease the exposure to solifenacin. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to solifenacin. [Moderate] Theoretical

Somatropin

- ▶ **Corticosteroids** are predicted to decrease the effects of somatropin. [Moderate] Theoretical

Sorafenib → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to sorafenib. [Moderate] Theoretical
- ▶ Sorafenib increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Enzalutamide** is predicted to decrease the exposure to sorafenib. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to sorafenib. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Neomycin** moderately decreases the exposure to sorafenib. [Moderate] Study
- ▶ Sorafenib is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to sorafenib. [Moderate] Theoretical

Sotalol → see beta blockers, non-selective

Spironolactone → see aldosterone antagonists

SSRIs → see TABLE 18 p. 851 (hyponatraemia), TABLE 13 p. 850 (serotonin syndrome), TABLE 9 p. 849 (QT-interval prolongation), TABLE 4 p. 847 (antiplatelet effects)

citalopram • dapoxetine • escitalopram • fluoxetine • fluvoxamine • paroxetine • sertraline

- ▶ **Fluvoxamine** very markedly increases the exposure to **agomelatine**. Avoid. [Severe] Study
- ▶ **Fluvoxamine** moderately increases the exposure to **alprazolam**. Adjust dose. [Moderate] Study
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **amfetamines**. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Fluvoxamine** moderately to markedly increases the exposure to **aminophylline**. Avoid. [Severe] Study
- ▶ **Fluvoxamine** decreases the clearance of **anaesthetics, local (ropivacaine)**. Avoid prolonged use. [Moderate] Study
- ▶ **Fluvoxamine** is predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical → Also see TABLE 4 p. 847
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **dapoxetine**. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to SSRIs (citalopram, escitalopram, fluoxetine,

SSRIs (continued)

- fluvoxamine, paroxetine, sertraline). [Severe] Theoretical → Also see TABLE 9 p. 849
- Fluvoxamine is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study
 - SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study
 - Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of paroxetine. [Moderate] Study
 - Sertraline potentially increases the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal
 - SSRIs (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Severe] Anecdotal
 - Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
 - Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to dapoxetine. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. [Severe] Study
 - Antifungals, azoles (voriconazole) are predicted to increase the exposure to citalopram. [Severe] Theoretical → Also see TABLE 9 p. 849
 - Antihistamines, sedating (cyproheptadine) potentially decrease the effects of SSRIs. [Moderate] Anecdotal
 - Aprepitant is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
 - SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 249. [Moderate] Study
 - Fluvoxamine increases the exposure to asenapine. [Moderate] Study
 - Paroxetine moderately increases the exposure to asenapine. [Moderate] Study
 - SSRIs (fluoxetine, paroxetine) are predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study
 - Fluvoxamine moderately increases the concentration of beta blockers, non-selective (propranolol). [Moderate] Study
 - SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study
 - Bupropion is predicted to increase the exposure to dapoxetine. [Moderate] Theoretical → Also see TABLE 13 p. 850
 - Fluvoxamine markedly decreases the clearance of caffeine citrate. Monitor and adjust dose. [Severe] Study
 - Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
 - SSRIs (fluoxetine, fluvoxamine) are predicted to increase the exposure to clobazam. Adjust clobazam dose. [Moderate] Theoretical → Also see TABLE 4 p. 847
 - Cinacalcet is predicted to increase the exposure to dapoxetine. [Moderate] Theoretical
 - Fluvoxamine is predicted to increase the exposure to cinacalcet. Adjust dose. [Moderate] Theoretical
 - SSRIs (fluoxetine, fluvoxamine) potentially increase the exposure to clobazam. Adjust dose. [Moderate] Theoretical
 - SSRIs (fluoxetine, fluvoxamine) are predicted to decrease the efficacy of clopidogrel. Avoid. [Severe] Theoretical → Also see TABLE 4 p. 847
 - Fluvoxamine increases the concentration of clozapine. Monitor side effects and adjust dose. [Severe] Study
 - Cobicistat is predicted to moderately increase the exposure to dapoxetine. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. [Severe] Study
 - Crizotinib is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
 - SSRIs (fluoxetine, paroxetine) are predicted to slightly increase the exposure to darifenacin. [Mild] Study
 - Fluvoxamine moderately increases the exposure to diazepam. [Moderate] Study
 - Fluvoxamine is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. [Moderate] Study
 - Fluvoxamine markedly increases the exposure to duloxetine. Avoid. [Severe] Study → Also see TABLE 18 p. 851 → Also see TABLE 13 p. 850 → Also see TABLE 4 p. 847
 - SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study
 - Fluvoxamine is predicted to increase the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Theoretical
 - Fluvoxamine increases the concentration of frovatriptan. [Severe] Study → Also see TABLE 13 p. 850
 - Grapefruit juice moderately increases the exposure to sertraline. Avoid. [Moderate] Study
 - H₂ receptor antagonists (cimetidine) slightly increase the exposure to SSRIs (citalopram, escitalopram). Adjust dose. [Moderate] Study
 - H₂ receptor antagonists (cimetidine) slightly increase the exposure to SSRIs (paroxetine, sertraline). [Moderate] Study
 - Fluoxetine increases the concentration of haloperidol. Adjust dose. [Moderate] Anecdotal
 - Fluvoxamine increases the concentration of haloperidol. Adjust dose. [Moderate] Study
 - HIV-protease inhibitors are predicted to moderately increase the exposure to dapoxetine. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. [Severe] Study
 - Idelalisib is predicted to moderately increase the exposure to dapoxetine. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. [Severe] Study
 - Imatinib is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
 - Fluoxetine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Unknown] Theoretical
 - Fluvoxamine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
 - Fluvoxamine is predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical
 - Macrolides (clarithromycin) are predicted to moderately increase the exposure to dapoxetine. Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose. [Severe] Study
 - Macrolides (erythromycin) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
 - Fluvoxamine very markedly increases the exposure to melatonin. Avoid. [Severe] Study
 - Netupitant is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
 - SSRIs potentially increase the risk of prolonged neuromuscular blockade when given with neuromuscular blocking drugs, non-depolarising (mivacurium). [Unknown] Theoretical
 - Nilotinib is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4. [Moderate] Theoretical
 - Fluvoxamine moderately increases the exposure to olanzapine. Adjust dose. [Severe] Anecdotal
 - SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of opioids (codeine). [Moderate] Theoretical
 - SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of opioids (tramadol). [Severe] Study → Also see TABLE 13 p. 850
 - Fluvoxamine is predicted to increase the exposure to pentoxifylline. [Moderate] Theoretical
 - Paroxetine markedly increases the exposure to phenothiazines (perphenazine). [Severe] Study
 - Fluvoxamine is predicted to moderately increase the exposure to pirfenidone. Avoid. [Moderate] Study

- ▶ SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ Fluvoxamine moderately increases the exposure to **pomalidomide**. Adjust pomalidomide dose. [Moderate] Study
- ▶ Paroxetine slightly increases the exposure to **procyclidine**. Monitor and adjust dose. [Moderate] Study
- ▶ Proton pump inhibitors (esomeprazole) are predicted to slightly to moderately increase the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. [Severe] Theoretical
- ▶ Proton pump inhibitors (omeprazole) slightly to moderately increase the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. [Severe] Study
- ▶ Fluvoxamine is predicted to increase the exposure to **riluzole**. [Moderate] Theoretical
- ▶ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
- ▶ Fluvoxamine is predicted to increase the exposure to **roflumilast**. [Moderate] Study
- ▶ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to SSRIs (dapoxetine). [Moderate] Theoretical → Also see TABLE 18 p. 851 → Also see TABLE 13 p. 850 → Also see TABLE 4 p. 847
- ▶ SSRIs potentially increase the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Unknown] Theoretical
- ▶ SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of **tamoxifen**. Avoid. [Severe] Study
- ▶ Terbinafine is predicted to increase the exposure to fluoxetine. Adjust dose. [Moderate] Theoretical
- ▶ Terbinafine moderately increases the exposure to paroxetine. [Moderate] Study
- ▶ Terbinafine is predicted to increase the exposure to SSRIs (citalopram, dapoxetine, escitalopram, fluvoxamine, sertraline). [Moderate] Theoretical
- ▶ Fluvoxamine moderately to markedly increases the exposure to **theophylline**. Avoid. [Severe] Study
- ▶ Fluvoxamine very markedly increases the exposure to **tizanidine**. Avoid. [Severe] Study
- ▶ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 18 p. 851 → Also see TABLE 13 p. 850
- ▶ Fluvoxamine increases the exposure to **tricyclic antidepressants** (amitriptyline, imipramine). Adjust dose. [Severe] Study → Also see TABLE 18 p. 851 → Also see TABLE 13 p. 850
- ▶ Fluvoxamine markedly increases the exposure to **tricyclic antidepressants** (clomipramine). Adjust dose. [Severe] Study → Also see TABLE 18 p. 851 → Also see TABLE 13 p. 850
- ▶ SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 13 p. 850 → Also see TABLE 4 p. 847
- ▶ Fluvoxamine is predicted to increase the exposure to **zolmitriptan**. Adjust zolmitriptan dose, p. 292. [Severe] Theoretical → Also see TABLE 13 p. 850
- St John's Wort** → see TABLE 13 p. 850 (serotonin syndrome)
- ▶ St John's Wort is predicted to decrease the exposure to **afatinib**. [Moderate] Study
- ▶ St John's Wort is predicted to slightly decrease the exposure to aldosterone antagonists (**eplerenone**). Avoid. [Moderate] Study
- ▶ St John's Wort decreases the exposure to **aliskiren**. [Moderate] Study
- ▶ St John's Wort moderately decreases the exposure to **alprazolam**. [Moderate] Study
- ▶ St John's Wort is predicted to decrease the concentration of **aminophylline**. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to antiarrhythmics (**dronedaron**). Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to antiepileptics (**brivaracetam**). [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the concentration of antiepileptics (**carbamazepine**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the concentration of antiepileptics (**fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**). Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to antiepileptics (**perampamel**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to antiepileptics (**tiagabine**). Avoid. [Mild] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to antifungals, azoles (**isavuconazole**). Avoid. [Severe] Theoretical
- ▶ St John's Wort moderately decreases the exposure to antifungals, azoles (**voriconazole**). Avoid. [Moderate] Study
- ▶ St John's Wort is predicted to decrease the concentration of antimalarials (**piperaquine**). Avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **apixaban**. Use with caution or avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **apremilast**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **aprepitant**. Avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **axitinib**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **bedaquiline**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **bosentan**. Avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **cabozantinib**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to calcium channel blockers (**amlodipine**, **felodipine**, **lacidipine**, **lercanidipine**, **nicardipine**, **nifedipine**, **nimodipine**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to calcium channel blockers (**diltiazem**, **verapamil**). [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **certinib**. Avoid. [Severe] Theoretical
- ▶ St John's Wort decreases the concentration of **ciclosporin**. Avoid. [Moderate] Study
- ▶ St John's Wort is predicted to alter the effects of **cilostazol**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ St John's Wort decreases the efficacy of **combined hormonal contraceptives**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ St John's Wort decreases the anticoagulant effect of **coumarins**. Avoid. [Severe] Anecdotal
- ▶ St John's Wort is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **dabigatran**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **daclatasvir**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **dasabuvir**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **dasatinib**. [Severe] Study
- ▶ St John's Wort is predicted to decrease the efficacy of **desogestrel**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ St John's Wort decreases the concentration of **digoxin**. Avoid. [Severe] Anecdotal
- ▶ St John's Wort decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **edoxaban**. [Moderate] Study
- ▶ St John's Wort is predicted to decrease the concentration of **efavirenz**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to increase the exposure to **eliglustat**. Avoid. [Severe] Study

St John's Wort (continued)

- ▶ St John's Wort is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the efficacy of **etonogestrel**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **exemestane**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **fesoterodine**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **fingolimod**. Avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **fosaprepitant**. Avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **gefitinib**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **HIV-protease inhibitors**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the efficacy of **hormone replacement therapy**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **ibrutinib**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **imatinib**. [Moderate] Study
- ▶ St John's Wort slightly decreases the exposure to **irinotecan**. Avoid. [Severe] Study
- ▶ St John's Wort decreases the exposure to **ivabradine**. Avoid. [Moderate] Study
- ▶ St John's Wort is predicted to decrease the exposure to **ivacaftor**. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **ixazomib**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the efficacy of **levonorgestrel**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **macitentan**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **maraviroc**. Avoid. [Severe] Theoretical
- ▶ St John's Wort moderately decreases the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study
- ▶ St John's Wort is predicted to decrease the exposure to **midostaurin**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **naloxegol**. Avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **netupitant**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the concentration of **nevirapine**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **nintedanib**. [Moderate] Study
- ▶ St John's Wort is predicted to decrease the efficacy of **norethisterone**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- ▶ St John's Wort is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **ombitasvir**. Avoid. [Severe] Theoretical
- ▶ St John's Wort decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study → Also see TABLE 13 p. 850
- ▶ St John's Wort moderately decreases the exposure to **opioids (oxycodone)**. Adjust dose. [Moderate] Study
- ▶ St John's Wort is predicted to decrease the exposure to **osimertinib**. Avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **palbociclib**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **paliperidone**. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **panobinostat**. Avoid. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ St John's Wort slightly decreases the exposure to **pioglitazone**. [Mild] Study
- ▶ St John's Wort is predicted to decrease the exposure to **pitolisant**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **ponatinib**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **quetiapine**. [Moderate] Study
- ▶ St John's Wort is predicted to decrease the exposure to **ranolazine**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **rolapitant**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **simeprevir**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **sofosbuvir**. Avoid. [Severe] Study
- ▶ St John's Wort slightly decreases the exposure to **statins (atorvastatin)**. [Mild] Study
- ▶ St John's Wort moderately decreases the exposure to **statins (simvastatin)**. [Moderate] Study
- ▶ St John's Wort decreases the concentration of **tacrolimus**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical
- ▶ St John's Wort potentially decreases the exposure to **theophylline**. [Severe] Anecdotal
- ▶ St John's Wort is predicted to decrease the exposure to **ticagrelor**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **tivozanib**. Avoid. [Severe] Study
- ▶ St John's Wort is predicted to decrease the exposure to **tofacitinib**. [Moderate] Study
- ▶ St John's Wort is predicted to decrease the exposure to **tolvaptan**. [Moderate] Theoretical
- ▶ St John's Wort is predicted to decrease the exposure to **topotecan**. [Severe] Theoretical

- ▶ **St John's Wort** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **vismodegib**. Avoid. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical

Statins → see TABLE 1 p. 847 (hepatotoxicity)

atorvastatin · fluvastatin · pravastatin · rosuvastatin · simvastatin

- ▶ **Atorvastatin** slightly to moderately increases the exposure to **alikiren**. [Moderate] Study
- ▶ **Atorvastatin** moderately decrease the absorption of **rosuvastatin**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the risk of rhabdomyolysis when given with **atorvastatin**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to **fluvastatin**. [Severe] Theoretical
- ▶ **Antiarrhythmics (amiodarone)** increase the risk of rhabdomyolysis when given with **simvastatin**. Adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. [Severe] Study
- ▶ **Antiarrhythmics (dronedarone)** slightly increase the exposure to **rosuvastatin**. Adjust dose. [Severe] Study
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Antiepileptics (carbamazepine)** moderately decrease the exposure to **simvastatin**. Monitor and adjust dose. [Severe] Study → Also see TABLE 1 p. 847
- ▶ **Antiepileptics (carbamazepine, eslicarbazepine)** are predicted to decrease the exposure to **atorvastatin**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 847
- ▶ **Antiepileptics (eslicarbazepine)** moderately decrease the exposure to **simvastatin**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** potentially decrease the exposure to statins (**atorvastatin, simvastatin**). [Moderate] Anecdotal
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. [Severe] Study → Also see TABLE 1 p. 847
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study → Also see TABLE 1 p. 847
- ▶ **Antifungals, azoles (fluconazole, miconazole)** are predicted to increase the exposure to **fluvastatin**. [Severe] Theoretical → Also see TABLE 1 p. 847
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **atorvastatin**. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study → Also see TABLE 1 p. 847
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **simvastatin**. Avoid. [Severe] Study → Also see TABLE 1 p. 847
- ▶ **Antifungals, azoles (miconazole)** potentially increase the exposure to **atorvastatin**. [Severe] Anecdotal
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **simvastatin**. Avoid. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Bosentan** slightly decreases the exposure to **atorvastatin**. [Mild] Study
- ▶ **Bosentan** moderately decreases the exposure to **simvastatin**. [Moderate] Study
- ▶ **Calcium channel blockers (amlodipine)** slightly increase the exposure to **simvastatin**. Adjust **simvastatin** dose, p. 134. [Mild] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Cephalosporins (ceftriaxone)** are predicted to increase the concentration of **statins**. [Moderate] Theoretical
- ▶ **Ciclosporin** very markedly increases the exposure to **atorvastatin**. Avoid or adjust **atorvastatin** dose, p. 132. [Severe] Study
- ▶ **Ciclosporin** moderately increases the exposure to **fluvastatin**. [Severe] Study
- ▶ **Ciclosporin** markedly to very markedly increases the exposure to **pravastatin**. Adjust dose. [Severe] Study
- ▶ **Ciclosporin** markedly increases the exposure to statins (**rosuvastatin, simvastatin**). Avoid. [Severe] Study
- ▶ **Clopidogrel** increases the exposure to **rosuvastatin**. Adjust **rosuvastatin** dose, p. 133. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **atorvastatin**. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **simvastatin**. Avoid. [Severe] Study
- ▶ **Colchicine** increases the risk of rhabdomyolysis when given with **statins**. [Severe] Anecdotal
- ▶ **Statins (fluvastatin, rosuvastatin)** increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Danazol** is predicted to increase the risk of rhabdomyolysis when given with **atorvastatin**. [Severe] Theoretical
- ▶ **Danazol** increases the risk of rhabdomyolysis when given with **simvastatin**. Avoid. [Severe] Anecdotal
- ▶ **Statins** are predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical
- ▶ **Dasabuvir** increases the exposure to **rosuvastatin**. Adjust **rosuvastatin** dose, p. 133. [Moderate] Study
- ▶ **Dasatinib** is predicted to increase the exposure to **simvastatin**. [Moderate] Theoretical
- ▶ **Efavirenz** slightly decreases the exposure to **atorvastatin**. [Mild] Study
- ▶ **Efavirenz** moderately decreases the exposure to **simvastatin**. [Moderate] Study
- ▶ **Elbasvir** potentially increases the exposure to **atorvastatin**. Adjust **atorvastatin** dose, p. 132. [Moderate] Study
- ▶ **Elbasvir** is predicted to increase the exposure to **fluvastatin**. Adjust **fluvastatin** dose, p. 132. [Unknown] Theoretical
- ▶ **Elbasvir** increases the exposure to **rosuvastatin**. Adjust **rosuvastatin** dose, p. 133. [Moderate] Study
- ▶ **Elbasvir** is predicted to increase the exposure to **simvastatin**. Adjust **simvastatin** dose, p. 134. [Unknown] Theoretical
- ▶ **Eltrombopag** is predicted to increase the exposure to **statins**. Monitor and adjust dose. [Moderate] Study
- ▶ **Eluxadoline** is predicted to increase the exposure to **statins**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **simvastatin**. [Severe] Study
- ▶ **Ezetimibe** potentially increases the risk of rhabdomyolysis when given with **statins**. [Severe] Anecdotal
- ▶ **Fibrates (bezafibrate, ciprofibrate)** increase the risk of rhabdomyolysis when given with **pravastatin**. Avoid. [Severe] Study
- ▶ **Fibrates (bezafibrate, ciprofibrate)** increase the risk of rhabdomyolysis when given with **rosuvastatin**. Adjust **rosuvastatin** dose, p. 133. [Severe] Study
- ▶ **Fibrates (bezafibrate, ciprofibrate)** increase the risk of rhabdomyolysis when given with **simvastatin**. Adjust **simvastatin** dose, p. 134. [Severe] Study
- ▶ **Fibrates (ciprofibrate)** increase the risk of rhabdomyolysis when given with **atorvastatin**. Avoid or adjust dose. [Severe] Study

Statins (continued)

- ▶ **Fibrates (ciprofibrate)** increase the risk of rhabdomyolysis when given with **fluvastatin**. [\[Severe\]](#) Study
- ▶ **Fibrates (fenofibrate)** are predicted to increase the risk of rhabdomyolysis when given with **fluvastatin**. Adjust fenofibrate dose, p. 131. [\[Severe\]](#) Theoretical
- ▶ **Fibrates (fenofibrate)** are predicted to increase the risk of rhabdomyolysis when given with **pravastatin**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Fibrates (fenofibrate)** increase the risk of rhabdomyolysis when given with **rosuvastatin**. Adjust fenofibrate and rosuvastatin doses, p. 131, p. 133. [\[Severe\]](#) Anecdotal
- ▶ **Fibrates (gemfibrozil)** increase the risk of rhabdomyolysis when given with **statins**. Avoid. [\[Severe\]](#) Anecdotal
- ▶ **Fibrates (bezafibrate)** increase the risk of rhabdomyolysis when given with **statins (atorvastatin, fluvastatin)**. [\[Severe\]](#) Study
- ▶ **Fibrates (fenofibrate)** increase the risk of rhabdomyolysis when given with **statins (atorvastatin, simvastatin)**. Adjust fenofibrate dose, p. 131. [\[Severe\]](#) Anecdotal
- ▶ **Fusidic acid** increases the risk of rhabdomyolysis when given with **statins**. Avoid. [\[Severe\]](#) Anecdotal
- ▶ **Glecaprevir** (with pibrentasvir) is predicted to increase the exposure to **fluvastatin**. [\[Moderate\]](#) Theoretical
- ▶ **Glecaprevir** (with pibrentasvir) increases the exposure to **pravastatin**. Use with caution and adjust **pravastatin** dose, p. 133. [\[Moderate\]](#) Study
- ▶ **Glecaprevir** (with pibrentasvir) increases the exposure to **rosuvastatin**. Use with caution and adjust **rosuvastatin** dose, p. 133. [\[Moderate\]](#) Study
- ▶ **Glecaprevir** (with pibrentasvir) increases the exposure to **statins (atorvastatin, simvastatin)**. Avoid. [\[Moderate\]](#) Study
- ▶ **Grapefruit juice** increases the exposure to **atorvastatin**. [\[Mild\]](#) Study
- ▶ **Grapefruit juice** increases the exposure to **simvastatin**. Avoid. [\[Severe\]](#) Study
- ▶ **Grazoprevir** increases the exposure to **atorvastatin**. Adjust atorvastatin dose, p. 132. [\[Moderate\]](#) Study
- ▶ **Grazoprevir** is predicted to increase the exposure to **fluvastatin**. Adjust **fluvastatin** dose, p. 132. [\[Unknown\]](#) Theoretical
- ▶ **Grazoprevir** increases the exposure to **rosuvastatin**. Adjust rosuvastatin dose, p. 133. [\[Moderate\]](#) Study
- ▶ **Grazoprevir** is predicted to increase the exposure to **simvastatin**. Adjust **simvastatin** dose, p. 134. [\[Unknown\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **atorvastatin**. Avoid or adjust dose and monitor rhabdomyolysis. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** slightly to moderately increase the exposure to **rosuvastatin**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **simvastatin**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **atorvastatin**. Avoid or adjust dose and monitor rhabdomyolysis. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **simvastatin**. Avoid. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 134. [\[Severe\]](#) Study
- ▶ **Ledipasvir** is predicted to increase the exposure to **rosuvastatin**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Ledipasvir** is predicted to increase the exposure to **statins (atorvastatin, fluvastatin, pravastatin, simvastatin)**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **rosuvastatin**. Adjust dose. [\[Moderate\]](#) Study → Also see [TABLE 1](#) p. 847
- ▶ **Lomitapide** increases the exposure to **atorvastatin**. Adjust lomitapide dose or separate administration by 12 hours. [\[Mild\]](#) Study → Also see [TABLE 1](#) p. 847
- ▶ **Lomitapide** increases the exposure to **simvastatin**. Monitor and adjust **simvastatin** dose, p. 134. [\[Moderate\]](#) Study → Also see [TABLE 1](#) p. 847
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **atorvastatin**. Avoid or adjust dose and monitor rhabdomyolysis. [\[Severe\]](#) Study
- ▶ **Macrolides (clarithromycin)** moderately increase the exposure to **pravastatin**. [\[Severe\]](#) Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **simvastatin**. Avoid. [\[Severe\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **pravastatin**. [\[Severe\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 134. [\[Severe\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **simvastatin**. [\[Severe\]](#) Study
- ▶ **Monoclonal antibodies (sarilumab)** are predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. [\[Moderate\]](#) Study
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Netupitant** is predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Netupitant** is predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 134. [\[Severe\]](#) Study
- ▶ **Nevirapine** slightly decreases the exposure to **atorvastatin**. [\[Mild\]](#) Study
- ▶ **Nevirapine** moderately decreases the exposure to **simvastatin**. [\[Moderate\]](#) Study
- ▶ **Nicotinic acid** is predicted to increase the risk of rhabdomyolysis when given with **statins**. [\[Severe\]](#) Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Nilotinib** is predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 134. [\[Severe\]](#) Study
- ▶ **Osimertinib** slightly increases the exposure to **rosuvastatin**. [\[Moderate\]](#) Study
- ▶ **Paritaprevir** (with ritonavir and ombitasvir) is predicted to increase the exposure to **fluvastatin**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Paritaprevir** (with ritonavir and ombitasvir) increases the exposure to **pravastatin**. Adjust **pravastatin** dose, p. 133. [\[Moderate\]](#) Study
- ▶ **Paritaprevir** (with ritonavir and ombitasvir) increases the exposure to **rosuvastatin**. Adjust **rosuvastatin** dose, p. 133. [\[Moderate\]](#) Study
- ▶ **Rosuvastatin** is predicted to increase the anticoagulant effect of **phenindione**. Monitor INR and adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Pibrentasvir** (with glecaprevir) is predicted to increase the exposure to **fluvastatin**. [\[Moderate\]](#) Theoretical
- ▶ **Pibrentasvir** (with glecaprevir) increases the exposure to **pravastatin**. Use with caution and adjust **pravastatin** dose, p. 133. [\[Moderate\]](#) Study
- ▶ **Pibrentasvir** (with glecaprevir) increases the exposure to **rosuvastatin**. Use with caution and adjust **rosuvastatin** dose, p. 133. [\[Moderate\]](#) Study
- ▶ **Pibrentasvir** (with glecaprevir) increases the exposure to **statins (atorvastatin, simvastatin)**. Avoid. [\[Moderate\]](#) Study
- ▶ **Ranolazine** is predicted to increase the exposure to **atorvastatin**. [\[Moderate\]](#) Theoretical
- ▶ **Ranolazine** slightly increases the exposure to **simvastatin**. Adjust **simvastatin** dose, p. 134. [\[Moderate\]](#) Study
- ▶ **Regorafenib** is predicted to increase the exposure to **statins (atorvastatin, fluvastatin, rosuvastatin)**. [\[Severe\]](#) Theoretical
- ▶ **Ribociclib** (high-dose) is predicted to increase the exposure to **simvastatin**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Rifampicin** markedly decreases the exposure to **atorvastatin**. **Atorvastatin** should be taken at the same time as **rifampicin**, p. 132, p. 364. [\[Moderate\]](#) Study
- ▶ **Rifampicin** moderately decreases the exposure to **fluvastatin**. Monitor and adjust dose. [\[Moderate\]](#) Study

- ▶ **Rifampicin** very markedly decreases the exposure to **simvastatin**. [Moderate] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **rosuvastatin**. Monitor and adjust dose. [Severe] Study
- ▶ **Sacubitril** is predicted to increase the exposure to **statins**. [Severe] Study
- ▶ **Simeprevir** moderately increases the exposure to **atorvastatin**. Monitor and adjust dose. [Moderate] Study
- ▶ **Simeprevir** is predicted to increase the exposure to **pravastatin**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Simeprevir** moderately increases the exposure to **rosuvastatin**. Adjust **rosuvastatin** dose, p. 133. [Moderate] Study
- ▶ **Simeprevir** slightly increases the exposure to **simvastatin**. Monitor and adjust dose. [Moderate] Study
- ▶ **St John's Wort** slightly decreases the exposure to **atorvastatin**. [Mild] Study
- ▶ **St John's Wort** moderately decreases the exposure to **simvastatin**. [Moderate] Study
- ▶ **Sulfapyrazone** is predicted to increase the exposure to **fluvastatin**. [Severe] Theoretical
- ▶ **Fluvastatin** slightly increases the exposure to **sulfonylureas** (**glibenclamide**). [Mild] Study
- ▶ **Tedizolid** increases the exposure to **rosuvastatin**. Avoid. [Moderate] Study
- ▶ **Teriflunomide** moderately increases the exposure to **rosuvastatin**. Adjust **rosuvastatin** dose, p. 133. [Moderate] Study
- ▶ **Ticagrelor** slightly increases the exposure to **simvastatin**. Adjust **simvastatin** dose, p. 134. [Moderate] Study
- ▶ **Tivozanib** is predicted to decrease the exposure to **rosuvastatin**. [Moderate] Theoretical
- ▶ **Velpatasvir** increases the exposure to **rosuvastatin**. Adjust **rosuvastatin** dose and monitor side effects, p. 133. [Severe] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **statins** (**atorvastatin**, **simvastatin**). Monitor side effects and adjust dose. [Severe] Theoretical
- ▶ **Voxilaprevir** is predicted to increase the exposure to **pravastatin**. Monitor and adjust **pravastatin** dose, p. 133. [Severe] Study
- ▶ **Voxilaprevir** is predicted to increase the exposure to **rosuvastatin**. Avoid. [Severe] Study
- ▶ **Voxilaprevir** is predicted to increase the exposure to **statins** (**atorvastatin**, **fluvastatin**, **simvastatin**). Avoid. [Severe] Theoretical
- Stavudine** → see TABLE 12 p. 850 (peripheral neuropathy)
- ▶ **Didanosine** increases the risk of toxicity when given with **stavudine**. Avoid. [Severe] Study → Also see TABLE 12 p. 850
- ▶ **Hydroxycarbamide** increases the risk of toxicity when given with **stavudine**. Avoid. [Severe] Study
- ▶ **Isoniazid** is predicted to increase the risk of peripheral neuropathy when given with **stavudine**. [Severe] Theoretical → Also see TABLE 12 p. 850
- ▶ **Ribavirin** increases the risk of toxicity when given with **stavudine**. Avoid. [Severe] Study
- ▶ **Zidovudine** is predicted to decrease the efficacy of **stavudine**. Avoid. [Severe] Theoretical
- Stiripentol** → see antiepileptics
- Streptokinase** → see TABLE 3 p. 847 (anticoagulant effects)
- Streptomycin** → see aminoglycosides
- Sucralfate**
 - ▶ **Sucralfate** potentially decreases the effects of **coumarins** (**warfarin**). Separate administration by 2 hours. [Moderate] Anecdotal
 - ▶ **Sucralfate** decreases the absorption of **digoxin**. Separate administration by 2 hours. [Severe] Anecdotal
 - ▶ **Sucralfate** decreases the absorption of **dolutegravir**. [Moderate] Study
 - ▶ **Sucralfate** increases the risk of blocked enteral or nasogastric tubes when given with **enteral feeds**. Separate administration by 1 hour. [Moderate] Study
 - ▶ **Potassium citrate** increases the risk of side-effects when given with **sucralfate**. Avoid. [Moderate] Theoretical
 - ▶ **Sucralfate** decreases the exposure to **quinolones**. Separate administration by 2 hours. [Moderate] Study
 - ▶ **Sodium citrate** is predicted to increase the risk of side-effects when given with **sucralfate**. Avoid. [Moderate] Theoretical
- ▶ **Sucralfate** decreases the absorption of **sulpiride**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Sucralfate** potentially decreases the absorption of **theophylline**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Sucralfate** decreases the absorption of **thyroid hormones** (**levothyroxine**). Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Sucralfate** is predicted to decrease the absorption of **tricyclic antidepressants**. [Moderate] Study
- Sufentanil** → see opioids
- Sugammadex**
 - ▶ **Sugammadex** is predicted to decrease the exposure to oral **combined hormonal contraceptives**. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
 - ▶ **Sugammadex** is predicted to decrease the exposure to **desogestrel**. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
 - ▶ **Sugammadex** is predicted to decrease the efficacy of **etonogestrel**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Sugammadex** is predicted to decrease the exposure to **levonorgestrel**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Sugammadex** is predicted to decrease the exposure to **medroxyprogesterone**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Sugammadex** is predicted to decrease the exposure to **norethisterone**. Use additional contraceptive precautions. [Severe] Theoretical
- Sulfadiazine** → see sulfonamides
- Sulfadoxine** → see sulfonamides
- Sulfamethoxazole** → see sulfonamides
- Sulfasalazine** → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression)
- ▶ **Sulfasalazine** decreases the concentration of **digoxin**. [Moderate] Study
- ▶ **Sulfasalazine** is predicted to decrease the absorption of **folates**. [Moderate] Study
- ▶ **Rolapitant** increases the exposure to **sulfasalazine**. [Severe] Study
- ▶ **Tedizolid** is predicted to increase the exposure to **sulfasalazine**. Avoid. [Moderate] Theoretical
- Sulfapyrazone** → see TABLE 4 p. 847 (antiplatelet effects)
- ▶ **Sulfapyrazone** increases the concentration of **antiepileptics** (**fosphenytoin**, **phenytoin**). [Moderate] Study
- ▶ **Aspirin** decreases the effects of **sulfapyrazone**. [Moderate] Study → Also see TABLE 4 p. 847
- ▶ **Sulfapyrazone** decreases the exposure to **calcium channel blockers** (**verapamil**). [Moderate] Study
- ▶ **Sulfapyrazone** decreases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Sulfapyrazone** increases the anticoagulant effect of **coumarins**. Avoid. [Severe] Study
- ▶ **Sulfapyrazone** slightly increases the exposure to **nateglinide**. [Mild] Study
- ▶ **Pyrazinamide** is predicted to decrease the effects of **sulfapyrazone**. [Moderate] Theoretical
- ▶ **Sulfapyrazone** is predicted to increase the exposure to **retinoids** (**alitretinoin**). Adjust **alitretinoin** dose. [Moderate] Theoretical
- ▶ **Sulfapyrazone** is predicted to increase the exposure to **statins** (**fluvastatin**). [Severe] Theoretical
- ▶ **Sulfapyrazone** is predicted to increase the exposure to **sulfonylureas**. Use with caution and adjust dose. [Moderate] Study
- Sulfonamides** → see TABLE 15 p. 850 (myelosuppression)
- co-trimoxazole • sulfadiazine • sulfadoxine • sulfamethoxazole
- ▶ **Sulfonamides** potentially increase the risk of methaemoglobinaemia when given with topical **anaesthetics**, **local** (**prilocaine**). Use with caution or avoid. [Severe] Anecdotal
- ▶ **Sulfadiazine** is predicted to increase the concentration of **antiepileptics** (**fosphenytoin**). Monitor and adjust dose. [Moderate] Study
- ▶ **Sulfadiazine** increases the concentration of **antiepileptics** (**phenytoin**). Monitor and adjust dose. [Moderate] Study

Sulfonamides (continued)

- ▶ **Antimalarials (pyrimethamine)** increase the risk of side-effects when given with **sulfonamides**. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Sulfadiazine** is predicted to increase the anticoagulant effect of **coumarins**. [Severe] Theoretical
- ▶ **Sulfamethoxazole** increases the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Sulfonamides** are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
- ▶ **Sulfonamides** are predicted to increase the exposure to **methotrexate**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Sulfonamides** are predicted to increase the exposure to **sulfonyleureas**. [Moderate] Study
- ▶ **Sulfonamides** are predicted to increase the effects of **thiopental**. [Moderate] Theoretical

Sulfonyleureas → see TABLE 14 p. 850 (antidiabetic drugs)

glibenclamide · gliclazide · glimepiride · glipizide · tolbutamide

- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to **sulfonyleureas**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole, miconazole)** are predicted to increase the exposure to **sulfonyleureas**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (voriconazole)** are predicted to increase the concentration of **sulfonyleureas**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Bosentan** increases the risk of hepatotoxicity when given with **glibenclamide**. Avoid. [Severe] Study
- ▶ **Cephalosporins (ceftibiprole)** are predicted to increase the concentration of **glibenclamide**. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **glimepiride**. Adjust dose. [Moderate] Theoretical
- ▶ **Chloramphenicol** is predicted to increase the exposure to **sulfonyleureas**. [Severe] Study
- ▶ **Fibrates** are predicted to increase the risk of hypoglycaemia when given with **sulfonyleureas**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to **sulfonyleureas**. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **sulfonyleureas**. [Moderate] Study
- ▶ **Statins (fluvastatin)** slightly increase the exposure to **glibenclamide**. [Mild] Study
- ▶ **Sulfinpyrazone** is predicted to increase the exposure to **sulfonyleureas**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Sulfonamides** are predicted to increase the exposure to **sulfonyleureas**. [Moderate] Study

Sulindac → see NSAIDs

- ▶ **Sulpiride** → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Antacids** decrease the absorption of **sulpiride**. Separate administration by 2 hours. [Moderate] Study
- ▶ **Sulpiride** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849
- ▶ **Sulpiride** is predicted to decrease the effects of **levodopa**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Sulpiride** potentially increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 849
- ▶ **Sucralfate** decreases the absorption of **sulpiride**. Separate administration by 2 hours. [Moderate] Study

Sumatriptan → see TABLE 13 p. 850 (serotonin syndrome)

- ▶ **Sumatriptan** increases the risk of vasoconstriction when given with **ergotamine**. Ergotamine should be taken at least 24 hours before or 6 hours after **sumatriptan**. [Severe] Study
- ▶ **Moclobemide** moderately increases the exposure to **sumatriptan**. Avoid. [Moderate] Study → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to **sumatriptan**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 850

Sunitinib → see TABLE 15 p. 850 (myelosuppression), TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Aprepitant** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study
- ▶ **Sunitinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Elbasvir** is predicted to increase the concentration of **sunitinib**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **sunitinib**. Avoid. [Moderate] Theoretical
- ▶ **Grazoprevir** is predicted to increase the concentration of **sunitinib**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Mitotane** is predicted to decrease the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study → Also see TABLE 15 p. 850
- ▶ **Netupitant** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **sunitinib**. [Moderate] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Sunitinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose. [Moderate] Study

Suxamethonium → see TABLE 20 p. 851 (neuromuscular blocking effects)

- ▶ **Alkylating agents (cyclophosphamide)** increase the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] Study
- ▶ **Antiarrhythmics (lidocaine)** are predicted to increase the effects of **suxamethonium**. [Moderate] Study
- ▶ **Anticholinesterases, centrally acting** increase the effects of **suxamethonium**. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine)** increase the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** increase the effects of **suxamethonium**. [Moderate] Study

- ▶ **Clindamycin** increases the effects of **suxamethonium**. [Severe] Anecdotal
- ▶ **Corticosteroids** are predicted to decrease the effects of **suxamethonium**. [Severe] Anecdotal
- ▶ **Suxamethonium** is predicted to increase the risk of cardiovascular side-effects when given with **digoxin**. [Severe] Anecdotal
- ▶ **Irinotecan** is predicted to increase the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] Theoretical
- ▶ Intravenous **magnesium** is predicted to increase the effects of **suxamethonium**. [Moderate] Study
- ▶ **Metoclopramide** increases the effects of **suxamethonium**. [Moderate] Study
- ▶ Penicillins (**piperacillin**) increase the effects of **suxamethonium**. [Moderate] Study
- ▶ **SSRIs** potentially increase the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Unknown] Theoretical

Sympathomimetics, inotropic

dobutamine · dopamine

- ▶ **Sympathomimetics, inotropic** are predicted to decrease the effects of **apraclonidine**. Avoid. [Severe] Theoretical
- ▶ **Beta blockers, non-selective** increase the risk of hypertension and bradycardia when given with **dobutamine**. [Severe] Theoretical
- ▶ **Beta blockers, selective** increase the risk of hypertension and bradycardia when given with **dobutamine**. [Moderate] Theoretical
- ▶ **Entacapone** is predicted to increase the risk of cardiovascular side-effects when given with **sympathomimetics, inotropic**. [Moderate] Theoretical
- ▶ **Ergometrine** potentially increases the risk of peripheral vasoconstriction when given with **dopamine**. Avoid. [Severe] Anecdotal
- ▶ **Guanethidine** is predicted to increase the effects of **dopamine**. [Severe] Theoretical
- ▶ **Sympathomimetics, inotropic** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with **sympathomimetics, inotropic**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- ▶ **Monoamine-oxidase B inhibitors** are predicted to increase the risk of a hypertensive crisis when given with **sympathomimetics, inotropic**. Avoid. [Severe] Anecdotal
- ▶ **Opicapone** is predicted to increase the risk of cardiovascular side-effects when given with **sympathomimetics, inotropic**. [Severe] Theoretical
- ▶ **Tolcapone** is predicted to increase the risk of cardiovascular side-effects when given with **sympathomimetics, inotropic**. [Moderate] Theoretical

Sympathomimetics, vasoconstrictor

adrenaline/epinephrine · ephedrine · isometheptene · metaraminol · midodrine · noradrenaline/norepinephrine · phenylephrine · pseudoephedrine · xylometazoline

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Ephedrine** increases the risk of side-effects when given with **aminoxylamine**. Avoid in children. [Moderate] Study
- ▶ **Sympathomimetics, vasoconstrictor** are predicted to decrease the effects of **apraclonidine**. Avoid. [Severe] Theoretical
- ▶ **Atropine** increases the risk of severe hypertension when given with **phenylephrine**. [Severe] Study
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of hypertension and bradycardia when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Severe] Study
- ▶ **Beta blockers, selective** are predicted to increase the risk of hypertension and bradycardia when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Severe] Study

- ▶ **Isometheptene** potentially increases the risk of side-effects when given with **dopamine receptor agonists (bromocriptine)**. Avoid. [Severe] Anecdotal
- ▶ **Entacapone** is predicted to increase the risk of cardiovascular side-effects when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Moderate] Study
- ▶ **Ergometrine** is predicted to increase the risk of peripheral vasoconstriction when given with **noradrenaline/norepinephrine**. [Severe] Anecdotal
- ▶ **Guanethidine** increases the effects of **metaraminol**. [Severe] Anecdotal
- ▶ **Guanethidine** increases the effects of **phenylephrine**. [Severe] Study
- ▶ **Guanethidine** is predicted to increase the effects of **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Moderate] Study
- ▶ **Pseudoephedrine** increases the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Study
- ▶ **Sympathomimetics, vasoconstrictor (adrenaline/epinephrine, ephedrine, isometheptene, noradrenaline/norepinephrine, phenylephrine)** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ **Mianserin** decreases the effects of **ephedrine**. [Severe] Anecdotal
- ▶ **Moclobemide** is predicted to increase the risk of a hypertensive crisis when given with **sympathomimetics, vasoconstrictor (ephedrine, isometheptene, phenylephrine, pseudoephedrine)**. Avoid. [Severe] Study
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with **sympathomimetics, vasoconstrictor**. Avoid and for 14 days after stopping the MAOI. [Severe] Study
- ▶ **Monoamine-oxidase B inhibitors** are predicted to increase the risk of a hypertensive crisis when given with **sympathomimetics, vasoconstrictor**. Avoid. [Severe] Anecdotal
- ▶ **Opicapone** is predicted to increase the risk of cardiovascular side-effects when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Severe] Theoretical
- ▶ **Ephedrine** increases the risk of side-effects when given with **theophylline**. Avoid in children. [Moderate] Study
- ▶ **Tolcapone** is predicted to increase the effects of **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Moderate] Theoretical
- ▶ **Tricyclic antidepressants** are predicted to decrease the effects of **ephedrine**. Avoid. [Severe] Study
- ▶ **Tricyclic antidepressants** increase the effects of **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine, phenylephrine)**. Avoid. [Severe] Study

Tacalcitol → see vitamin D substances

Tacrolimus → see TABLE 2 p. 847 (nephrotoxicity), TABLE 16 p. 851 (increased serum potassium)

- ▶ Pomelo might greatly increase the concentration of tacrolimus.
- ▶ Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
- ▶ **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical **tacrolimus**. [Moderate] Study
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the concentration of **tacrolimus**. [Severe] Anecdotal
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study

Tacrolimus (continued)

- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Aprepitant** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the concentration of **tacrolimus** and **tacrolimus** potentially increases the concentration of **bosentan**. Avoid. [Severe] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Calcium channel blockers (nifedipine)** potentially increase the concentration of **tacrolimus**. Monitor concentration and adjust dose. [Severe] Anecdotal
- ▶ **Ceritinib** is predicted to increase the exposure to **tacrolimus**. Avoid. [Severe] Theoretical
- ▶ **Chloramphenicol** increases the concentration of **tacrolimus**. [Severe] Study
- ▶ **Ciclosporin** increases the concentration of **tacrolimus**. Avoid. [Severe] Study → Also see TABLE 2 p. 847 → Also see TABLE 16 p. 851
- ▶ **Cobicistat** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Danazol** potentially increases the concentration of **tacrolimus**. [Severe] Anecdotal
- ▶ **Efavirenz** is predicted to decrease the concentration of **tacrolimus**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Enzalutamide** decreases the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Grapefruit juice** increases the concentration of **tacrolimus**. Avoid. [Severe] Study
- ▶ **Grazoprevir** increases the exposure to **tacrolimus**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tacrolimus**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Tacrolimus** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to **tacrolimus**. Avoid. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Tacrolimus** is predicted to affect the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** decreases the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Monoclonal antibodies (sarilumab)** potentially affect the exposure to **tacrolimus**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **tacrolimus**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Palbociclib** is predicted to increase the exposure to **tacrolimus**. Adjust dose. [Moderate] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **tacrolimus**. Avoid. [Severe] Theoretical
- ▶ **Ranolazine** increases the concentration of **tacrolimus**. Adjust dose. [Severe] Anecdotal
- ▶ **Ribociclib** is predicted to increase the exposure to **tacrolimus**. Use with caution and adjust dose. [Moderate] Theoretical

- ▶ **Rifampicin** decreases the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
 - ▶ **Sirolimus** is predicted to decrease the concentration of **tacrolimus** and **tacrolimus** increases the exposure to **sirolimus**. [Severe] Study
 - ▶ **St John's Wort** decreases the concentration of **tacrolimus**. Avoid. [Severe] Study
 - ▶ **Tacrolimus** increases the exposure to **tofacitinib**. Avoid. [Severe] Study
 - ▶ **Tacrolimus** potentially increases the risk of serotonin syndrome when given with **venlafaxine**. [Severe] Anecdotal
 - Tadalafil** → see phosphodiesterase type-5 inhibitors
 - Tamoxifen** → see TABLE 5 p. 847 (thromboembolism)
 - ▶ **Bupropion** is predicted to decrease the efficacy of **tamoxifen**. Avoid. [Severe] Study
 - ▶ **Cinacalcet** is predicted to decrease the efficacy of **tamoxifen**. Avoid. [Severe] Study
 - ▶ **Tamoxifen** increases the anticoagulant effect of **coumarins**. [Severe] Study
 - ▶ **Rifampicin** markedly decreases the exposure to **tamoxifen**. [Unknown] Study
 - ▶ **Rolapitant** is predicted to increase the exposure to **tamoxifen**. [Severe] Study
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to decrease the efficacy of **tamoxifen**. Avoid. [Severe] Study
 - ▶ **Terbinafine** is predicted to decrease the efficacy of **tamoxifen**. Avoid. [Severe] Study
 - Tamsulosin** → see alpha blockers
 - Tapentadol** → see opioids
 - Taxanes** → see TABLE 15 p. 850 (myelosuppression), TABLE 12 p. 850 (peripheral neuropathy)
- cabazitaxel · docetaxel · paclitaxel
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **cabazitaxel**. [Moderate] Theoretical
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **paclitaxel**. [Severe] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **docetaxel**. [Severe] Theoretical → Also see TABLE 12 p. 850
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **taxanes (cabazitaxel, paclitaxel)**. Avoid. [Severe] Study → Also see TABLE 12 p. 850
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **cabazitaxel**. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **cabazitaxel**. Avoid. [Severe] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **docetaxel**. Avoid or adjust dose. [Severe] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **paclitaxel**. [Severe] Theoretical
 - ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **docetaxel**. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ **Aprepitant** is predicted to increase the exposure to **cabazitaxel**. [Moderate] Theoretical
 - ▶ **Bosentan** is predicted to decrease the exposure to **cabazitaxel**. Avoid. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **cabazitaxel**. [Moderate] Theoretical
 - ▶ **Ceritinib** is predicted to increase the exposure to **paclitaxel**. [Moderate] Theoretical → Also see TABLE 15 p. 850
 - ▶ **Clopidogrel** is predicted to increase the concentration of **paclitaxel**. [Severe] Anecdotal
 - ▶ **Cobicistat** is predicted to increase the exposure to **cabazitaxel**. Avoid. [Severe] Study
 - ▶ **Cobicistat** is predicted to moderately increase the exposure to **docetaxel**. Avoid or adjust dose. [Severe] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **paclitaxel**. [Severe] Theoretical

- **Crizotinib** is predicted to increase the exposure to **cabazitaxel**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- **Efavirenz** is predicted to decrease the exposure to **cabazitaxel**. Avoid. [Severe] Study
- **Eliglustat** is predicted to increase the exposure to **paclitaxel**. Adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to **docetaxel**. [Severe] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to taxanes (**cabazitaxel**, **paclitaxel**). Avoid. [Severe] Study
- **Fibrates (gemfibrozil)** are predicted to increase the concentration of **paclitaxel**. [Severe] Anecdotal
- **HIV-protease inhibitors** are predicted to increase the exposure to **cabazitaxel**. Avoid. [Severe] Study
- **HIV-protease inhibitors** are predicted to moderately increase the exposure to **docetaxel**. Avoid or adjust dose. [Severe] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to **paclitaxel**. [Severe] Theoretical
- **Idelalisib** is predicted to increase the exposure to **cabazitaxel**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- **Idelalisib** is predicted to moderately increase the exposure to **docetaxel**. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 850
- **Idelalisib** is predicted to increase the exposure to **paclitaxel**. [Severe] Theoretical → Also see TABLE 15 p. 850
- **Imatinib** is predicted to increase the exposure to **cabazitaxel**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- **Lapatinib** slightly increases the exposure to **paclitaxel**. [Severe] Study
- **Leflunomide** is predicted to increase the concentration of **paclitaxel**. [Severe] Anecdotal → Also see TABLE 15 p. 850
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with taxanes (**docetaxel**, **paclitaxel**). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to **cabazitaxel**. Avoid. [Severe] Study
- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **docetaxel**. Avoid or adjust dose. [Severe] Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to **paclitaxel**. [Severe] Theoretical
- **Macrolides (erythromycin)** are predicted to increase the exposure to **cabazitaxel**. [Moderate] Theoretical
- **Mirabegron** is predicted to increase the exposure to **paclitaxel**. [Mild] Theoretical
- **Mitotane** is predicted to decrease the exposure to **docetaxel**. [Severe] Theoretical → Also see TABLE 15 p. 850
- **Mitotane** is predicted to decrease the exposure to taxanes (**cabazitaxel**, **paclitaxel**). Avoid. [Severe] Study → Also see TABLE 15 p. 850
- **Netupitant** is predicted to increase the exposure to **cabazitaxel**. [Moderate] Theoretical
- **Nevirapine** is predicted to decrease the exposure to **cabazitaxel**. Avoid. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to **cabazitaxel**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- **Pitolisant** is predicted to decrease the exposure to **docetaxel**. Avoid. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **docetaxel**. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to taxanes (**cabazitaxel**, **paclitaxel**). Avoid. [Severe] Study
- **St John's Wort** is predicted to decrease the exposure to **cabazitaxel**. Avoid. [Severe] Study
- **Teriflunomide** is predicted to increase the concentration of **paclitaxel**. [Severe] Anecdotal
- **Velpatasvir** is predicted to increase the exposure to **paclitaxel**. [Severe] Theoretical

Tazarotene → see retinoids

Tedizolid

- **Tedizolid** is predicted to increase the exposure to **imatinib**. Avoid. [Moderate] Theoretical
- **Tedizolid** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Theoretical

- **Tedizolid** is predicted to increase the exposure to **methotrexate**. Avoid. [Moderate] Theoretical
- **Tedizolid** increases the exposure to **statins (rosuvastatin)**. Avoid. [Moderate] Study
- **Tedizolid** is predicted to increase the exposure to **sulfasalazine**. Avoid. [Moderate] Theoretical
- **Tedizolid** is predicted to increase the exposure to **topotecan**. Avoid. [Moderate] Theoretical

Tegafur

- **Tegafur** potentially increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Severe] Anecdotal
- **Tegafur** increases the anticoagulant effect of **coumarins**. [Moderate] Theoretical
- **Folates** are predicted to increase the risk of toxicity when given with **tegafur**. [Severe] Theoretical
- **H₂ receptor antagonists (cimetidine)** are predicted to increase the risk of toxicity when given with **tegafur**. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tegafur**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Methotrexate** is predicted to increase the risk of toxicity when given with **tegafur**. [Severe] Theoretical

Telcicoplanin

GENERAL INFORMATION If other nephrotoxic or neurotoxic drugs are given, monitor renal and auditory function on prolonged administration.

Telavancin → see TABLE 2 p. 847 (nephrotoxicity), TABLE 19 p. 851 (ototoxicity), TABLE 9 p. 849 (QT-interval prolongation)

Telbivudine

- **Interferons (interferon alfa)** are predicted to increase the risk of peripheral neuropathy when given with **telbivudine**. Avoid. [Severe] Theoretical
- **Interferons (peginterferon alfa)** increase the risk of peripheral neuropathy when given with **telbivudine**. Avoid. [Severe] Study

Telmisartan → see angiotensin-II receptor antagonists

Telotristat ethyl

- **Telotristat ethyl** decreases the exposure to **midazolam**. [Moderate] Study
- **Octreotide** (short-acting) decreases the exposure to **telotristat ethyl**. **Telotristat ethyl** should be taken at least 30 minutes before **octreotide**, p. 467. [Moderate] Study

Temazepam → see TABLE 11 p. 849 (CNS depressant effects)

Temocillin → see penicillins

Temozolomide → see alkylating agents

Temozolomide → see TABLE 15 p. 850 (myelosuppression)

- **Antiarrhythmics (dronedarone)** are predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- **Aprepitant** is predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical
- **Bosentan** is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- **Crizotinib** is predicted to increase the concentration of **temsirolimus**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- **Efavirenz** is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- **Enzalutamide** is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Study
- **Grapefruit juice** is predicted to increase the concentration of **temsirolimus**. Use with caution or avoid. [Moderate] Theoretical

Tamsulosin (continued)

- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **tamsulosin**. Avoid. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the concentration of **tamsulosin**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the concentration of **tamsulosin**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tamsulosin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to **tamsulosin**. Avoid. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the concentration of **tamsulosin**. Avoid. [Severe] Theoretical
- ▶ **Macrolides (erythromycin)** are predicted to increase the concentration of **tamsulosin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the concentration of **tamsulosin**. Avoid. [Severe] Study → Also see TABLE 15 p. 850
- ▶ **Netupitant** is predicted to increase the concentration of **tamsulosin**. [Moderate] Theoretical
- ▶ **Nevirapine** is predicted to decrease the concentration of **tamsulosin**. Avoid. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of **tamsulosin**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Pitolisant** is predicted to decrease the exposure to **tamsulosin**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the concentration of **tamsulosin**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the concentration of **tamsulosin**. Avoid. [Severe] Theoretical

Tenecteplase → see TABLE 3 p. 847 (anticoagulant effects)

Tenofovir alafenamide

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (atazanavir, darunavir)** increase the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors (tipranavir)** are predicted to affect the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical
- ▶ **Rifabutin** is predicted to decrease the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical

Tenofovir disoproxil → see TABLE 2 p. 847 (nephrotoxicity)

- ▶ **Tenofovir disoproxil** increases the risk of toxicity when given with **didanosine**. Avoid. [Severe] Study
- ▶ **Ledipasvir** (with sofosbuvir) slightly increases the exposure to **tenofovir disoproxil**. [Moderate] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **tenofovir disoproxil**. [Severe] Study
- ▶ **Voxilaprevir** is predicted to increase the exposure to **tenofovir disoproxil**. [Severe] Study

Tenoxicam → see NSAIDs

Terazosin → see alpha blockers

Terbinafine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Terbinafine** is predicted to increase the exposure to anticholinesterases, centrally acting (**galantamine**). Monitor and adjust dose. [Moderate] Study
- ▶ **Terbinafine** is predicted to moderately increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 249. [Moderate] Study
- ▶ **Terbinafine** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
- ▶ **Terbinafine** is predicted to increase the exposure to **beta blockers, selective (metoprolol, nebivolol)**. [Moderate] Study
- ▶ **Terbinafine** is predicted to slightly increase the exposure to **darifenacin**. [Mild] Study
- ▶ **Terbinafine** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study

- ▶ **Terbinafine** is predicted to decrease the efficacy of **opioids (codeine)**. [Moderate] Theoretical
- ▶ **Terbinafine** is predicted to decrease the efficacy of **opioids (tramadol)**. [Severe] Study
- ▶ **Terbinafine** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **terbinafine**. Adjust dose. [Moderate] Study
- ▶ **Terbinafine** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
- ▶ **Terbinafine** is predicted to increase the exposure to **SSRIs (citalopram, dapoxetine, escitalopram, fluvoxamine, sertraline)**. [Moderate] Theoretical
- ▶ **Terbinafine** is predicted to increase the exposure to **SSRIs (fluoxetine)**. Adjust dose. [Moderate] Theoretical
- ▶ **Terbinafine** moderately increases the exposure to **SSRIs (paroxetine)**. [Moderate] Study
- ▶ **Terbinafine** is predicted to decrease the efficacy of **tamoxifen**. Avoid. [Severe] Study
- ▶ **Terbinafine** is predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [Severe] Study
- ▶ **Terbinafine** is predicted to increase the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study

Terbutaline → see beta₂ agonists

Teriflunomide

- ▶ **Teriflunomide** is predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Teriflunomide** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Teriflunomide** is predicted to decrease the exposure to **anaesthetics, local (ropivacaine)**. [Moderate] Theoretical
- ▶ **Teriflunomide** potentially increases the exposure to **baricitinib**. [Moderate] Theoretical
- ▶ **Teriflunomide** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- ▶ **Teriflunomide** is predicted to decrease the exposure to **clozapine**. [Moderate] Theoretical
- ▶ **Teriflunomide** affects the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Teriflunomide** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **teriflunomide**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Teriflunomide** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **Teriflunomide** is predicted to increase the exposure to **montelukast**. [Moderate] Theoretical
- ▶ **Teriflunomide** is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Teriflunomide** is predicted to increase the exposure to **pioglitazone**. [Moderate] Study
- ▶ **Teriflunomide** is predicted to decrease the exposure to **pirfenidone**. [Moderate] Theoretical
- ▶ **Teriflunomide** is predicted to increase the exposure to **repaglinide**. [Moderate] Study
- ▶ **Teriflunomide** is predicted to increase the exposure to **selexipag**. Adjust dose. [Moderate] Theoretical
- ▶ **Teriflunomide** moderately increases the exposure to **statins (rosuvastatin)**. Adjust **rosuvastatin** dose, p. 133. [Moderate] Study
- ▶ **Teriflunomide** is predicted to increase the concentration of **taxanes (paclitaxel)**. [Severe] Anecdotal
- ▶ **Teriflunomide** is predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study
- ▶ **Teriflunomide** moderately decreases the exposure to **tizanidine**. [Mild] Study

Tetrabenazine → see TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **Tetrabenazine** is predicted to decrease the effects of **levodopa**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Tetrabenazine** is predicted to increase the risk of CNS toxicity when given with **monoamine-oxidase A and B inhibitors**,

irreversible. Avoid and for 14 days after stopping the MAOI.

[Severe] Theoretical

Tetracaine → see anaesthetics, local

Tetracycline → see tetracyclines

Tetracyclines → see TABLE 1 p. 847 (hepatotoxicity)

demeclocycline • doxycycline • lymecycline • minocycline • oxytetracycline • tetracycline • tigecycline

- ▶ **ACE inhibitors (quinapril)** (tablet) decrease the absorption of oral tetracycline. Avoid. [Moderate] Study
- ▶ **Antacids** decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the exposure to doxycycline. Monitor and adjust dose. [Moderate] Study → Also see TABLE 1 p. 847
- ▶ **Tetracycline** decreases the concentration of antimalarials (atovaquone). [Moderate] Study
- ▶ **Calcium salts (calcium carbonate)** are predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- ▶ **Tetracyclines** increase the risk of bleeding events when given with coumarins. [Moderate] Anecdotal
- ▶ **Dairy products** decrease the exposure to tetracyclines (demeclocycline, oxytetracycline, tetracycline). Avoid. [Moderate] Study
- ▶ **Enzalutamide** decreases the exposure to doxycycline. Monitor and adjust dose. [Moderate] Study
- ▶ **Iron (oral)** decreases the absorption of tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron (oral). [Moderate] Study
- ▶ **Kaolin** is predicted to decrease the absorption of tetracyclines. [Moderate] Theoretical
- ▶ **Lanthanum** is predicted to decrease the absorption of tetracyclines. Separate administration by 2 hours. [Moderate] Theoretical
- ▶ **Mitotane** decreases the exposure to doxycycline. Monitor and adjust dose. [Moderate] Study
- ▶ **Retinoids (acitretin, alitretinoin, isotretinoin, tretinoin)** increase the risk of benign intracranial hypertension when given with tetracyclines. Avoid. [Severe] Anecdotal
- ▶ **Rifampicin** decreases the exposure to doxycycline. Monitor and adjust dose. [Moderate] Study
- ▶ **Oral zinc** is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Theoretical

Thalidomide → see TABLE 6 p. 848 (bradycardia), TABLE 15 p. 850 (myelosuppression), TABLE 12 p. 850 (peripheral neuropathy), TABLE 5 p. 847 (thromboembolism), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with thalidomide. Avoid. [Severe] Study
- ▶ **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with thalidomide. [Severe] Theoretical

Theophylline → see TABLE 17 p. 851 (reduced serum potassium)

FOOD AND LIFESTYLE Smoking can increase theophylline clearance and increased doses of theophylline are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.

- ▶ **Aciclovir** is predicted to increase the exposure to theophylline. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Theophylline** decreases the efficacy of **antiarrhythmics (adenosine)**. Separate administration by 24 hours. [Mild] Study
- ▶ **Antiepileptics (carbamazepine)** potentially increase the clearance of theophylline and theophylline decreases the exposure to antiepileptics (carbamazepine). Adjust dose. [Moderate] Anecdotal
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to increase the clearance of theophylline. Adjust dose. [Moderate] Theoretical

- ▶ **Antiepileptics (stiripentol)** are predicted to increase the exposure to theophylline. Avoid. [Moderate] Theoretical
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. [Severe] Theoretical
- ▶ **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. [Severe] Theoretical
- ▶ **Caffeine citrate** decreases the clearance of theophylline. [Moderate] Study
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Theophylline** increases the risk of agitation when given with **doxapram**. [Moderate] Study
- ▶ **Enteral feeds** decrease the exposure to theophylline. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of theophylline. Adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- ▶ **Interferons** slightly increase the exposure to theophylline. Adjust dose. [Moderate] Study
- ▶ **Iron chelators (deferasirox)** increase the exposure to theophylline. Avoid. [Moderate] Study
- ▶ **Isoniazid** is predicted to affect the clearance of theophylline. [Severe] Anecdotal
- ▶ **Leflunomide** is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- ▶ **Theophylline** is predicted to decrease the concentration of **lithium**. Monitor concentration and adjust dose. [Moderate] Anecdotal
- ▶ **Macrolides (azithromycin, clarithromycin)** are predicted to increase the exposure to theophylline. Adjust dose. [Moderate] Anecdotal
- ▶ **Macrolides (erythromycin)** decrease the clearance of theophylline and theophylline potentially decreases the clearance of macrolides (erythromycin). Adjust dose. [Severe] Study
- ▶ **Methotrexate** decreases the clearance of theophylline. [Moderate] Study
- ▶ **Monoclonal antibodies (blinatumomab)** are predicted to transiently increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (sarilumab)** potentially affect the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Obeticholic acid** is predicted to increase the exposure to theophylline. [Severe] Theoretical
- ▶ **Pentoxifylline** increases the concentration of theophylline. Monitor and adjust dose. [Severe] Study
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Quinolones (norfloxacin)** are predicted to increase the exposure to theophylline. Adjust dose. [Moderate] Anecdotal
- ▶ **Rifampicin** is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- ▶ **Theophylline** is predicted to slightly increase the exposure to **roflumilast**. Avoid. [Moderate] Theoretical
- ▶ **SSRIs (fluvoxamine)** moderately to markedly increase the exposure to theophylline. Avoid. [Severe] Study
- ▶ **St John's Wort** potentially decreases the exposure to theophylline. [Severe] Anecdotal
- ▶ **Sucralfate** potentially decreases the absorption of theophylline. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Sympathomimetics, vasoconstrictor (ephedrine)** increase the risk of side-effects when given with theophylline. Avoid in children. [Moderate] Study
- ▶ **Teriflunomide** is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study

Theophylline (continued)

- **Valaciclovir** is predicted to increase the exposure to theophylline. [Severe] Theoretical

Thiazide diuretics → see TABLE 18 p. 851 (hyponatraemia), TABLE 8 p. 848 (hypotension), TABLE 17 p. 851 (reduced serum potassium)

bendroflumethiazide • chlortalidone • clopamide • cyclopenthiazide • hydrochlorothiazide • hydroflumethiazide • indapamide • metolazone • xipamide

- **Thiazide diuretics** are predicted to increase the risk of hypersensitivity reactions when given with **allopurinol**. [Severe] Theoretical
- **Aspirin** (high-dose) increases the risk of acute renal failure when given with **thiazide diuretics**. [Severe] Theoretical
- **Thiazide diuretics** increase the risk of hypercalcaemia when given with **calcium salts**. [Severe] Anecdotal
- **Thiazide diuretics** increase the concentration of **lithium**. Avoid or adjust dose and monitor concentration. [Severe] Study
- **NSAIDs** increase the risk of acute renal failure when given with **thiazide diuretics**. [Severe] Theoretical → Also see TABLE 18 p. 851
- **Reboxetine** is predicted to increase the risk of hypokalaemia when given with **thiazide diuretics**. [Moderate] Anecdotal
- **Thiazide diuretics** are predicted to increase the risk of hypercalcaemia when given with **toremifene**. [Severe] Theoretical
- **Thiazide diuretics** increase the risk of hypercalcaemia when given with **vitamin D substances**. [Moderate] Theoretical

Thiopental → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)

- **Sulfonamides** are predicted to increase the effects of thiopental. [Moderate] Theoretical
- **Tricyclic antidepressants** increase the risk of cardiac arrhythmias and hypotension when given with thiopental. [Moderate] Study → Also see TABLE 8 p. 848

Thiotepa → see alkylating agents

Thyroid hormones

levothyroxine • liothyronine

- **Antacids** are predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Anecdotal
- **Antiarrhythmics (amiodarone)** are predicted to increase the risk of thyroid dysfunction when given with thyroid hormones. Avoid. [Moderate] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenytoin)** are predicted to increase the risk of hypothyroidism when given with thyroid hormones. [Moderate] Study
- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the effects of thyroid hormones. [Moderate] Theoretical
- **Oral calcium salts** are predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Anecdotal
- **Thyroid hormones** are predicted to affect the concentration of **digoxin**. Monitor and adjust dose. [Moderate] Theoretical
- **Oral hormone replacement therapy** is predicted to decrease the effects of thyroid hormones. [Moderate] Theoretical
- **Iron (oral)** decreases the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Study
- **Lanthanum** decreases the absorption of thyroid hormones. Separate administration by 2 hours. [Moderate] Study
- **Polystyrene sulfonate** is predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Theoretical
- **Sucralfate** decreases the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Study

Tiagabine → see antiepileptics

Tiaprofenic acid → see NSAIDs

Tibolone → see TABLE 5 p. 847 (thromboembolism)

Ticagrelor → see TABLE 4 p. 847 (antiplatelet effects)

- **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

- **Bosentan** is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical
- **Ciclosporin** is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- **Cobicistat** is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- **Ticagrelor** increases the concentration of **digoxin**. [Moderate] Study
- **Efavirenz** is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical
- **Enzalutamide** is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- **Ticagrelor** is predicted to increase the exposure to **ergotamine**. Avoid. [Severe] Theoretical
- **Grapefruit juice** moderately increases the exposure to ticagrelor. [Moderate] Study
- **HIV-protease inhibitors** are predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- **Idelalisib** is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- **Ticagrelor** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- **Macrolides (azithromycin)** are predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- **Mitotane** is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- **Nevirapine** is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical
- **Ranolazine** is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- **Rifampicin** is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- **St John's Wort** is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical
- **Ticagrelor** slightly increases the exposure to **statins (simvastatin)**. Adjust simvastatin dose, p. 134. [Moderate] Study
- **Vemurafenib** is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study

Ticarcillin → see penicillins

Tigecycline → see tetracyclines

Timolol → see beta blockers, non-selective

Tinidazole

- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with tinidazole. Avoid for 72 hours stopping treatment. [Moderate] Theoretical
- **Tinidazole** is predicted to increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Theoretical

Tinzaparin → see low molecular-weight heparins

Tioguanine → see TABLE 15 p. 850 (myelosuppression)

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tioguanine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Tiotropium → see TABLE 10 p. 849 (antimuscarinics)

Tipranavir → see HIV-protease inhibitors

Tirofiban → see TABLE 4 p. 847 (antiplatelet effects)

Tivozanib

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to tivozanib. [Severe] Study
- **Enzalutamide** is predicted to decrease the exposure to tivozanib. [Severe] Study
- **Mitotane** is predicted to decrease the exposure to tivozanib. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to tivozanib. [Severe] Study
- **St John's Wort** is predicted to decrease the exposure to tivozanib. Avoid. [Severe] Study
- **Tivozanib** is predicted to decrease the exposure to **statins (rosuvastatin)**. [Moderate] Theoretical

Tizanidine → see TABLE 6 p. 848 (bradycardia), TABLE 8 p. 848

(hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects)

- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) moderately decrease the exposure to **tizanidine**. [Mild] Study
- ▶ **Combined hormonal contraceptives** increase the exposure to **tizanidine**. Avoid. [Moderate] Study
- ▶ HIV-protease inhibitors (**ritonavir**) moderately decrease the exposure to **tizanidine**. [Mild] Study
- ▶ **Iron chelators** (**deferasirox**) are predicted to increase the exposure to **tizanidine**. Avoid. [Moderate] Theoretical
- ▶ **Leflunomide** moderately decreases the exposure to **tizanidine**. [Mild] Study
- ▶ **Obeticholic acid** is predicted to increase the exposure to **tizanidine**. [Severe] Theoretical
- ▶ **Quinolones** (**ciprofloxacin**) increase the exposure to **tizanidine**. Avoid. [Moderate] Study
- ▶ **Rifampicin** moderately decreases the exposure to **tizanidine**. [Mild] Study
- ▶ **SSRIs** (**fluvoxamine**) very markedly increase the exposure to **tizanidine**. Avoid. [Severe] Study
- ▶ **Teriflunomide** moderately decreases the exposure to **tizanidine**. [Mild] Study

Tobramycin → see aminoglycosides

Tocilizumab → see monoclonal antibodies

Tofacitinib

- ▶ Antiarrhythmics (**dronedarone**) are predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **tofacitinib**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose. [Moderate] Study
- ▶ Antifungals, azoles (**isavuconazole**) are predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ Antifungals, azoles (**posaconazole**) are predicted to increase the exposure to **tofacitinib**. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **tofacitinib**. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem**, **verapamil**) are predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Ciclosporin** increases the exposure to **tofacitinib**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **tofacitinib**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Live vaccines** potentially increase the risk of generalised infection (possibly life-threatening) when given with **tofacitinib**. Avoid. [Severe] Theoretical
- ▶ **Macrolides** (**clarithromycin**) are predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose. [Moderate] Study
- ▶ **Macrolides** (**erythromycin**) are predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **tofacitinib**. Avoid. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **tofacitinib**. Avoid. [Severe] Study

- ▶ **St John's Wort** is predicted to decrease the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Tacrolimus** increases the exposure to **tofacitinib**. Avoid. [Severe] Study
- Tolbutamide** → see sulfonylureas
- Tolcapone**
 - ▶ Tolcapone increases the exposure to **levodopa**. Monitor and adjust dose. [Moderate] Study
 - ▶ Tolcapone is predicted to increase the effects of **monoamine-oxidase A and B inhibitors**, **irreversible**. Avoid. [Severe] Theoretical
 - ▶ Tolcapone is predicted to increase the risk of cardiovascular side-effects when given with **sympathomimetics**, **inotropic**. [Moderate] Theoretical
 - ▶ Tolcapone is predicted to increase the effects of **sympathomimetics**, vasoconstrictor (**adrenaline/epinephrine**, **noradrenaline/norepinephrine**). [Moderate] Theoretical

Tolfenamic acid → see NSAIDs

Tolterodine → see TABLE 9 p. 849 (QT-interval prolongation), TABLE 10 p. 849 (antimuscarinics)

- ▶ Antiarrhythmics (**dronedarone**) are predicted to increase the exposure to **tolterodine**. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **tolterodine**. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Aprepitant** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical
- ▶ Calcium channel blockers (**diltiazem**, **verapamil**) are predicted to increase the exposure to **tolterodine**. [Mild] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ **Eliglustat** is predicted to increase the exposure to **tolterodine**. Adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical
- ▶ **Macrolides** (**clarithromycin**) are predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study → Also see TABLE 9 p. 849
- ▶ **Macrolides** (**erythromycin**) are predicted to increase the exposure to **tolterodine**. [Mild] Theoretical → Also see TABLE 9 p. 849
- ▶ **Netupitant** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **tolterodine**. [Mild] Theoretical → Also see TABLE 9 p. 849

Tolvaptan → see TABLE 16 p. 851 (increased serum potassium)

GENERAL INFORMATION Avoid concurrent use of drugs that increase serum-sodium concentrations.

- ▶ Antiarrhythmics (**dronedarone**) are predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **tolvaptan**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **tolvaptan**. [Moderate] Theoretical
- ▶ Calcium channel blockers (**diltiazem**, **verapamil**) are predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study

Tolvaptan (continued)

- ▶ **Crizotinib** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Tolvaptan** increases the concentration of **digoxin**. [Mild] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **tolvaptan**. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **tolvaptan**. Avoid. [Severe] Study
- ▶ **Grapefruit juice** increases the exposure to **tolvaptan**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Tolvaptan** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **tolvaptan**. Avoid. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **tolvaptan**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **tolvaptan**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **tolvaptan**. [Moderate] Theoretical
- Topiramate** → see antiepileptics
- Topotecan** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Antiarhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** increase the clearance of **topotecan**. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Calcium channel blockers (verapamil)** are predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Ceritinib** is predicted to increase the exposure to **topotecan**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Ciclosporin** is predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **topotecan**. Adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Lapatinib** is predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **topotecan**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Macrolides** are predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **topotecan**. [Mild] Theoretical
- ▶ **Ranolazine** is predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Rolapitant** is predicted to increase the exposure to **topotecan**. Avoid or monitor. [Moderate] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **topotecan**. [Severe] Theoretical
- ▶ **Tedizolid** is predicted to increase the exposure to **topotecan**. Avoid. [Moderate] Theoretical
- ▶ **Velpatasvir** is predicted to increase the exposure to **topotecan**. [Severe] Theoretical
- ▶ **Vemurafenib** is predicted to increase the exposure to **topotecan**. [Severe] Study
- Torsemide** → see loop diuretics

Toremifene → see TABLE 5 p. 847 (thromboembolism), TABLE 9 p. 849 (QT-interval prolongation)

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **torsemifene**. Adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **torsemifene**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Cobicistat** is predicted to increase the exposure to **torsemifene**. [Moderate] Theoretical
- ▶ **Toremifene** is predicted to increase the anticoagulant effect of **coumarins**. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **torsemifene**. Adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **torsemifene**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to increase the exposure to **torsemifene**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **torsemifene**. [Moderate] Theoretical → Also see TABLE 9 p. 849
- ▶ **Mitotane** is predicted to decrease the exposure to **torsemifene**. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **torsemifene**. Adjust dose. [Moderate] Study
- ▶ **Thiazide diuretics** are predicted to increase the risk of hypercalcaemia when given with **torsemifene**. [Severe] Theoretical
- Trabectedin** → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression)
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical → Also see TABLE 1 p. 847
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 1 p. 847
- ▶ **Cobicistat** is predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **trabectedin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Rifampicin** is predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical

Tramadol → see opioids

Trametinib

- ▶ **Antiarhythmics (amiodarone, dronedarone)** are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Calcium channel blockers (verapamil)** are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Ciclosporin** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Lapatinib** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Macrolides** are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Ranolazine** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Vemurafenib** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical

Trandolapril → see ACE inhibitors

Tranexamic acid → see TABLE 5 p. 847 (thromboembolism)

Tranylcypromine → see monoamine-oxidase A and B inhibitors, irreversible

Trastuzumab → see monoclonal antibodies

Trastuzumab emtansine → see monoclonal antibodies

Trazodone → see TABLE 13 p. 850 (serotonin syndrome), TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine)** decrease the concentration of **trazodone**. Adjust dose. [Moderate] Anecdotal
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical

Tree pollen extract

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

Treosulfan → see alkylating agents

Tretinoin → see retinoids

Triamcinolone → see corticosteroids

Triamterene → see potassium-sparing diuretics

Tricyclic antidepressants → see TABLE 18 p. 851 (hyponatraemia), TABLE 8 p. 848 (hypotension), TABLE 13 p. 850 (serotonin syndrome), TABLE 9 p. 849 (QT-interval prolongation), TABLE 10 p. 849 (antimuscarinics)

amitriptyline · clomipramine · dosulepin · doxepin · imipramine · lofepramine · nortriptyline · trimipramine

- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **tricyclic antidepressants**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiarrhythmics (propafenone)** are predicted to increase the concentration of **tricyclic antidepressants**. [Moderate] Theoretical → Also see TABLE 10 p. 849
- ▶ **Antiepileptics (carbamazepine)** decrease the exposure to **tricyclic antidepressants**. Adjust dose. [Moderate] Study → Also see TABLE 18 p. 851
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to **tricyclic antidepressants**. [Moderate] Study
- ▶ **Tricyclic antidepressants (clomipramine, imipramine)** potentially increase the risk of overheating and dehydration when given with **antiepileptics (zonisamide)**. Avoid in children. [Severe] Theoretical

- ▶ **Bupropion** is predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 13 p. 850
 - ▶ **Cinacalcet** is predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [Severe] Study
 - ▶ **Tricyclic antidepressants** decrease the antihypertensive effects of **clonidine**. Monitor and adjust dose. [Moderate] Anecdotal → Also see TABLE 8 p. 848
 - ▶ **Cobicistat** is predicted to slightly increase the exposure to **tricyclic antidepressants**. [Mild] Study
 - ▶ **Darifenacin** is predicted to increase the exposure to **tricyclic antidepressants**. [Moderate] Theoretical → Also see TABLE 10 p. 849
 - ▶ **Eliglustat** is predicted to increase the exposure to **nortriptyline**. Adjust dose. [Moderate] Theoretical
 - ▶ **Tricyclic antidepressants** are predicted to decrease the antihypertensive effects of **guanethidine**. [Moderate] Study → Also see TABLE 8 p. 848
 - ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **tricyclic antidepressants**. [Moderate] Study
 - ▶ **HIV-protease inhibitors (ritonavir, tipranavir)** are predicted to increase the exposure to **tricyclic antidepressants**. [Moderate] Theoretical
 - ▶ **Tricyclic antidepressants** potentially increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 13 p. 850 → Also see TABLE 9 p. 849
 - ▶ **Amitriptyline** decreases the effects of **metyrapone**. Avoid. [Moderate] Theoretical
 - ▶ **Tricyclic antidepressants** are predicted to increase the risk of severe toxic reaction when given with **moclobemide**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 850
 - ▶ **Tricyclic antidepressants** are predicted to increase the risk of severe toxic reaction when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 13 p. 850
 - ▶ **Tricyclic antidepressants** are predicted to decrease the effects of **moxonidine**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848
 - ▶ **Tricyclic antidepressants** are predicted to decrease the efficacy of **pitolisant**. [Mild] Theoretical
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 18 p. 851 → Also see TABLE 13 p. 850
 - ▶ **SSRIs (fluvoxamine)** markedly increase the exposure to **clomipramine**. Adjust dose. [Severe] Study → Also see TABLE 18 p. 851 → Also see TABLE 13 p. 850
 - ▶ **SSRIs (fluvoxamine)** increase the exposure to **tricyclic antidepressants (amitriptyline, imipramine)**. Adjust dose. [Severe] Study → Also see TABLE 18 p. 851 → Also see TABLE 13 p. 850
 - ▶ **Sucralfate** is predicted to decrease the absorption of **tricyclic antidepressants**. [Moderate] Study
 - ▶ **Tricyclic antidepressants** increase the effects of **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine, phenylephrine)**. Avoid. [Severe] Study
 - ▶ **Tricyclic antidepressants** are predicted to decrease the effects of **sympathomimetics, vasoconstrictor (ephedrine)**. Avoid. [Severe] Study
 - ▶ **Terbinafine** is predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [Severe] Study
 - ▶ **Tricyclic antidepressants** increase the risk of cardiac arrhythmias and hypotension when given with **thiopental**. [Moderate] Study → Also see TABLE 8 p. 848
- Trientine**
- ▶ **Trientine** potentially decreases the absorption of **iron (oral)**. [Moderate] Theoretical
 - ▶ **Trientine** potentially decreases the absorption of **zinc**. [Moderate] Theoretical
- Trifluoperazine** → see phenothiazines
- Trihexyphenidyl** → see TABLE 10 p. 849 (antimuscarinics)
- Trimethoprim** → see TABLE 18 p. 851 (hyponatraemia), TABLE 2 p. 847 (nephrotoxicity), TABLE 16 p. 851 (increased serum potassium)

Trimethoprim (continued)

- ▶ **Trimethoprim** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. [Moderate] Study
- ▶ **Antimalarials (pyrimethamine)** increase the risk of side-effects when given with **trimethoprim**. [Severe] Study
- ▶ **Trimethoprim** is predicted to increase the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Dapstone** increases the exposure to **trimethoprim** and **trimethoprim** increases the exposure to **dapstone**. [Severe] Study
- ▶ **Trimethoprim** increases the concentration of **digoxin**. [Moderate] Study
- ▶ **Trimethoprim** slightly increases the exposure to **lamivudine**. [Moderate] Study
- ▶ **Trimethoprim** is predicted to increase the risk of side-effects when given with **methotrexate**. Avoid. [Severe] Theoretical → Also see TABLE 2 p. 847
- ▶ **Trimethoprim** slightly increases the exposure to **repaglinide**. Avoid or monitor blood glucose. [Moderate] Study
- ▶ **Rifampicin** decreases the exposure to **trimethoprim**. [Moderate] Study
- ▶ **Trimethoprim** is predicted to decrease the efficacy of **sapropterin**. [Moderate] Theoretical

Trimipramine → see tricyclic antidepressants

Tropicamide → see TABLE 10 p. 849 (antimuscarinics)

Trospium → see TABLE 10 p. 849 (antimuscarinics)

Tryptophan → see TABLE 13 p. 850 (serotonin syndrome)

▶ **Tryptophan** greatly decreases the concentration of **levodopa**. [Moderate] Study

▶ **Tryptophan** increases the risk of side-effects when given with **monoamine-oxidase A and B inhibitors, irreversible**. [Severe] Anecdotal → Also see TABLE 13 p. 850

Typhoid vaccine, oral → see live vaccines

Ulipristal

▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study

▶ **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** decrease the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal

▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study

▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study

▶ **Aprepitant** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal

▶ **Bosentan** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal

▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study

▶ **Cobicistat** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study

▶ **Ulipristal** is predicted to decrease the efficacy of **combined hormonal contraceptives**. Avoid. [Severe] Theoretical

▶ **Crizotinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study

▶ **Ulipristal** is predicted to decrease the efficacy of **desogestrel**. Avoid. [Severe] Theoretical

▶ **Efavirenz** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal

▶ **Enzalutamide** is predicted to markedly decrease the exposure to **ulipristal**. Avoid and for 4 weeks after stopping **ulipristal**, p. 507. [Severe] Theoretical

▶ **Ulipristal** is predicted to decrease the efficacy of **etonogestrel**. Avoid. [Severe] Theoretical

▶ **Fosaprepitant** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal

- ▶ **Grapefruit juice** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Theoretical
 - ▶ **Griseofulvin** potentially decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
 - ▶ **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir)** are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
 - ▶ **HIV-protease inhibitors (ritonavir)** decrease the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
 - ▶ **Idelalisib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
 - ▶ **Ulipristal** is predicted to decrease the efficacy of **levonorgestrel**. Avoid. [Severe] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the efficacy of **ulipristal**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
 - ▶ **Modafinil** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
 - ▶ **Netupitant** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
 - ▶ **Nevirapine** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
 - ▶ **Nilotinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
 - ▶ **Ulipristal** is predicted to decrease the efficacy of **norethisterone**. Avoid. [Severe] Theoretical
 - ▶ **Rifabutin** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
 - ▶ **Rifampicin** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 497. [Severe] Anecdotal
- Umeclidinium** → see TABLE 10 p. 849 (antimuscarinics)
- Urokinase** → see TABLE 3 p. 847 (anticoagulant effects)
- Ursodeoxycholic acid**
- ▶ **Antacids** are predicted to decrease the absorption of **ursodeoxycholic acid**. Separate administration by 2 hours. [Moderate] Theoretical
 - ▶ **Ursodeoxycholic acid** affects the concentration of **ciclosporin**. Use with caution and adjust dose. [Severe] Anecdotal
 - ▶ **Fibrates** are predicted to decrease the efficacy of **ursodeoxycholic acid**. Avoid. [Severe] Theoretical
- Ustekinumab** → see monoclonal antibodies
- Valaciclovir** → see TABLE 2 p. 847 (nephrotoxicity)
- ▶ **Valaciclovir** is predicted to increase the exposure to **aminophylline**. [Severe] Anecdotal
 - ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **valaciclovir**. [Moderate] Theoretical
 - ▶ **Valaciclovir** is predicted to increase the exposure to **theophylline**. [Severe] Theoretical
- Valganciclovir** → see TABLE 15 p. 850 (myelosuppression), TABLE 2 p. 847 (nephrotoxicity)
- ▶ **Valganciclovir** is predicted to increase the risk of seizures when given with **carbapenems (imipenem)**. Avoid. [Severe] Anecdotal
 - ▶ **Valganciclovir** is predicted to increase the exposure to **didanosine**. [Moderate] Study
 - ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **valganciclovir**. [Moderate] Theoretical → Also see TABLE 15 p. 850
- Valproate** → see antiepileptics
- Valsartan** → see angiotensin-II receptor antagonists

Vancomycin → see TABLE 2 p. 847 (nephrotoxicity), TABLE 19 p. 851 (ototoxicity)

Vanedanib → see TABLE 9 p. 849 (QT-interval prolongation)

- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **vanedanib**. Avoid. [Moderate] Study
- ▶ **Vanedanib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Vanedanib** slightly increases the exposure to **digoxin**. Monitor ECG and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **vanedanib**. Avoid. [Moderate] Study
- ▶ **Vanedanib** slightly increases the exposure to **metformin**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **vanedanib**. Avoid. [Moderate] Study
- ▶ **Vanedanib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **vanedanib**. Avoid. [Moderate] Study

Vardenafil → see phosphodiesterase type-5 inhibitors

Varicella-zoster vaccine → see live vaccines

Vecuronium → see neuromuscular blocking drugs, non-depolarising

Vedolizumab → see monoclonal antibodies

Velpatasvir

- ▶ **Velpatasvir** is predicted to increase the exposure to **aliskiren**. [Severe] Theoretical
- ▶ **Antacids** are predicted to decrease the concentration of **velpatasvir**. Separate administration by 4 hours. [Moderate] Theoretical
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the concentration of **velpatasvir**. Avoid or monitor. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
- ▶ Antiepileptics (**oxcarbazepine**) are predicted to decrease the exposure to **velpatasvir**. Avoid. [Severe] Theoretical
- ▶ **Velpatasvir** is predicted to increase the exposure to antihistamines, non-sedating (**fexofenadine**). [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Moderate] Theoretical
- ▶ **Calcium salts (calcium carbonate)** are predicted to decrease the concentration of **velpatasvir**. Separate administration by 4 hours. [Moderate] Anecdotal
- ▶ **Velpatasvir** is predicted to increase the exposure to **colchicine**. [Severe] Theoretical
- ▶ **Velpatasvir** is predicted to increase the exposure to **dabigatran**. [Severe] Theoretical
- ▶ **Velpatasvir** is predicted to increase the exposure to **digoxin**. [Severe] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **Efavirenz** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **everolimus**. [Severe] Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the concentration of **velpatasvir**. Adjust dose, see sofosbuvir with **velpatasvir**. [Moderate] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **loperamide**. [Severe] Theoretical
- ▶ **Mitotane** is predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Moderate] Theoretical
- ▶ **Proton pump inhibitors** are predicted to decrease the concentration of **velpatasvir**. Adjust dose, see sofosbuvir with **velpatasvir**. [Moderate] Study
- ▶ **Rifampicin** is predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **sirolimus**. [Severe] Theoretical

- ▶ **St John's Wort** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Moderate] Theoretical
 - ▶ **Velpatasvir** is predicted to increase the exposure to **statins (atorvastatin, simvastatin)**. Monitor side effects and adjust dose. [Severe] Theoretical
 - ▶ **Velpatasvir** increases the exposure to **statins (rosuvastatin)**. Adjust **rosuvastatin** dose and monitor side effects, p. 133. [Severe] Study
 - ▶ **Velpatasvir** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Severe] Theoretical
 - ▶ **Velpatasvir** is predicted to increase the exposure to **tenofovir disoproxil**. [Severe] Study
 - ▶ **Velpatasvir** is predicted to increase the exposure to **topotecan**. [Severe] Theoretical
- Vemurafenib** → see TABLE 9 p. 849 (QT-interval prolongation)
- ▶ **Vemurafenib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
 - ▶ **Vemurafenib** is predicted to increase the exposure to **aliskiren**. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **vemurafenib**. Avoid. [Severe] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical → Also see TABLE 9 p. 849
 - ▶ **Vemurafenib** is predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **colchicine**. Avoid or adjust **colchicine** dose. [Severe] Theoretical
 - ▶ **Vemurafenib** increases the exposure to **dabigatran**. Use with caution and adjust dose. [Severe] Theoretical
 - ▶ **Vemurafenib** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **vemurafenib**. Avoid. [Severe] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical → Also see TABLE 9 p. 849
 - ▶ **Idelalisib** is predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical → Also see TABLE 9 p. 849
 - ▶ **Mitotane** is predicted to decrease the exposure to **vemurafenib**. Avoid. [Severe] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Vemurafenib** is predicted to increase the exposure to **panobinostat**. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 849
 - ▶ **Rifampicin** is predicted to decrease the exposure to **vemurafenib**. Avoid. [Severe] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study
 - ▶ **Vemurafenib** is predicted to increase the exposure to **topotecan**. [Severe] Study
 - ▶ **Vemurafenib** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical

Venetoclax

FOOD AND LIFESTYLE Avoid Seville (bitter orange) and star fruit as they might increase the exposure to **venetoclax**.

- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study

Venetoclax (continued)

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **venetoclax**. Avoid potent inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Aprepitant** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **venetoclax**. Avoid potent inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Venetoclax** slightly increases the exposure to **coumarins (warfarin)**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **venetoclax**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **venetoclax**. Avoid potent inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **venetoclax**. Avoid potent inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Lapatinib** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
- ▶ **Venetoclax** potentially decreases the efficacy of **live vaccines**. Avoid. [Severe] Theoretical
- ▶ **Macrolides (azithromycin)** decrease the exposure to **venetoclax**. [Mild] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **venetoclax**. Avoid potent inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **Netupitant** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **venetoclax**. Avoid moderate inhibitors of CYP3A4 or adjust **venetoclax** dose. [Severe] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **Vemurafenib** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical

- ▶ **Venlafaxine** → see TABLE 13 p. 850 (serotonin syndrome), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects), TABLE 4 p. 847 (antiplatelet effects)
- ▶ **Abiraterone** potentially increases the exposure to **venlafaxine**. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **venlafaxine**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Cobicistat** is predicted to increase the exposure to **venlafaxine**. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **venlafaxine**. [Mild] Study
- ▶ **Venlafaxine** slightly increases the exposure to **haloperidol**. [Severe] Study → Also see TABLE 9 p. 849 → Also see TABLE 11 p. 849
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **venlafaxine**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to increase the exposure to **venlafaxine**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **venlafaxine**. [Moderate] Study → Also see TABLE 9 p. 849
- ▶ **Tacrolimus** potentially increases the risk of serotonin syndrome when given with **venlafaxine**. [Severe] Anecdotal

Verapamil → see calcium channel blockers

Verteporfin

GENERAL INFORMATION Caution on concurrent use with other photosensitising drugs.

Vigabatrin → see antiepileptics

Vilanterol → see beta₂ agonists

Vildagliptin → see TABLE 14 p. 850 (antidiabetic drugs)

Vinblastine → see vinca alkaloids

Vinca alkaloids → see TABLE 1 p. 847 (hepatotoxicity), TABLE 15 p. 850 (myelosuppression), TABLE 19 p. 851 (ototoxicity), TABLE 12 p. 850 (peripheral neuropathy), TABLE 5 p. 847 (thromboembolism), TABLE 9 p. 849 (QT-interval prolongation)

vinblastine · vincristine · vindesine · vinflunine · vinorelbine

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **vinflunine**. Avoid. [Severe] Theoretical → Also see TABLE 12 p. 850
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **vinorelbine**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 12 p. 850
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **vinca alkaloids (vinblastine, vincristine, vindesine)**. [Severe] Theoretical → Also see TABLE 1 p. 847 → Also see TABLE 12 p. 850
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 1 p. 847 → Also see TABLE 9 p. 849
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **vinca alkaloids**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Aprepitant** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- ▶ **Asparaginase** potentially increases the risk of neurotoxicity when given with **vincristine**. Vincristine should be taken 3 to 24 hours before **asparaginase**. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- ▶ **Crisantaspase** potentially increases the risk of neurotoxicity when given with **vincristine**. Vincristine should be taken 3 to 24 hours before **crisantaspase**. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Crizotinib** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849

- ▶ **Enzalutamide** is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to vinflunine. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Idelalisib** is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Imatinib** is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with vinca alkaloids. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 9 p. 849
- ▶ **Mitotane** is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to vinflunine. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Mitotane** is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Netupitant** is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 15 p. 850 → Also see TABLE 9 p. 849
- ▶ **Pegaspargase** potentially increases the risk of neurotoxicity when given with vincristine. Vincristine should be taken 3 to 24 hours before pegaspargase. [Severe] Anecdotal → Also see TABLE 1 p. 847 → Also see TABLE 15 p. 850
- ▶ **Rifampicin** is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to vinflunine. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. [Severe] Theoretical
- Vincristine** → see vinca alkaloids
- Vindesine** → see vinca alkaloids
- Vinflunine** → see vinca alkaloids
- Vinorelbine** → see vinca alkaloids
- Vismodegib** → see TABLE 15 p. 850 (myelosuppression)
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 850
- ▶ **Rifampicin** is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- ▶ **St John's Wort** is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- Vitamin A**
- ▶ **Retinoids (acitretin, alitretinoin, isotretinoin)** are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Theoretical
- ▶ **Retinoids (bexarotene)** are predicted to increase the risk of toxicity when given with vitamin A. Adjust dose. [Moderate] Theoretical
- ▶ **Retinoids (tretinoin)** are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Study
- Vitamin D substances**
- alfacalcidol · calcipotriol · calcitriol · colecalciferol · dihydrotychsterol · ergocalciferol · paricalcitol · tacalcitol
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the effects of vitamin D substances. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of vitamin D substances. [Moderate] Study

- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the effects of vitamin D substances. [Moderate] Theoretical
- ▶ **Antifungals, azoles (clotrimazole, ketoconazole)** are predicted to decrease the exposure to colecalciferol. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to paricalcitol. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to paricalcitol. [Moderate] Study
- ▶ **Vitamin D substances** are predicted to increase the risk of toxicity when given with digoxin. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to paricalcitol. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to paricalcitol. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to paricalcitol. [Moderate] Study
- ▶ **Thiazide diuretics** increase the risk of hypercalcaemia when given with vitamin D substances. [Moderate] Theoretical
- Vitamin E substances**
- alpha tocopherol · alpha tocopheryl acetate
- ▶ **Vitamin E substances** affect the exposure to ciclosporin. [Moderate] Study
- Volatile halogenated anaesthetics** → see TABLE 8 p. 848 (hypotension), TABLE 11 p. 849 (CNS depressant effects)
- desflurane · isoflurane · methoxyflurane · sevoflurane

- ▶ **Antiepileptics (phenobarbital, primidone)** potentially increase the risk of nephrotoxicity when given with methoxyflurane. Avoid. [Severe] Theoretical → Also see TABLE 11 p. 849
- ▶ **Isoniazid** potentially increases the risk of nephrotoxicity when given with methoxyflurane. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** potentially increases the risk of nephrotoxicity when given with methoxyflurane. Avoid. [Severe] Theoretical
- Voriconazole** → see antifungals, azoles
- Vortioxetine** → see TABLE 13 p. 850 (serotonin syndrome), TABLE 4 p. 847 (antiparkinsonian effects)
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- ▶ **Bupropion** is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study → Also see TABLE 13 p. 850
- ▶ **Cinacalcet** is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study → Also see TABLE 13 p. 850 → Also see TABLE 4 p. 847
- ▶ **Terbinafine** is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study

Voxelaprevir

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of voxelaprevir. Avoid. [Severe] Study
- ▶ **Antiepileptics (oxcarbazepine)** are predicted to decrease the concentration of voxelaprevir. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the concentration of voxelaprevir. Avoid. [Severe] Theoretical
- ▶ **Ciclosporin** increases the concentration of voxelaprevir. Avoid. [Severe] Study
- ▶ **Voxelaprevir** is predicted to increase the concentration of dabigatran. Avoid. [Severe] Study
- ▶ **Voxelaprevir** is predicted to increase the concentration of edoxaban. Avoid. [Severe] Theoretical
- ▶ **Efavirenz** is predicted to decrease the concentration of voxelaprevir. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the concentration of voxelaprevir. Avoid. [Severe] Study

Voxilaprevir (continued)

- ▶ **HIV-protease inhibitors (atazanavir)** (boosted with ritonavir) increase the concentration of **voxilaprevir**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (lopinavir)** are predicted to increase the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Study
- ▶ **Modafinil** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- ▶ **Proton pump inhibitors** are predicted to decrease the exposure to **voxilaprevir**. Adjust dose, see sofosbuvir with velpatasvir and voxilaprevir. [Moderate] Study
- ▶ **Rifabutin** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- ▶ **Rifampicin** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Study
- ▶ **St John's Wort** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- ▶ **Voxilaprevir** is predicted to increase the exposure to **statins (atorvastatin, fluvastatin, simvastatin)**. Avoid. [Severe] Theoretical
- ▶ **Voxilaprevir** is predicted to increase the exposure to **statins (pravastatin)**. Monitor and adjust **pravastatin** dose. [Severe] Study
- ▶ **Voxilaprevir** is predicted to increase the exposure to **statins (rosuvastatin)**. Avoid. [Severe] Study
- ▶ **Voxilaprevir** is predicted to increase the exposure to **tenofovir disoproxil**. [Severe] Study

Warfarin → see coumarins

Wasp venom extract

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

Xipamide → see thiazide diuretics

Xylometazoline → see sympathomimetics, vasoconstrictor

Yellow fever vaccine, live → see live vaccines

Zaleplon → see TABLE 11 p. 849 (CNS depressant effects)

- ▶ **Rifampicin** markedly decreases the exposure to **zaleplon**. [Moderate] Study

Zidovudine → see TABLE 15 p. 850 (myelosuppression), TABLE 2 p. 847 (nephrotoxicity)

- ▶ **Antiepileptics (valproate)** slightly increase the exposure to **zidovudine**. [Moderate] Study
- ▶ **Antimalarials (pyrimethamine)** are predicted to increase the risk of side-effects when given with **zidovudine**. [Severe] Theoretical → Also see TABLE 15 p. 850
- ▶ **Zidovudine** increases the risk of haematological toxicity when given with **aspirin** (high-dose). [Severe] Study
- ▶ **HIV-protease inhibitors (tipranavir)** slightly decrease the exposure to **zidovudine**. Avoid. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** decrease the absorption of **zidovudine**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **zidovudine**. Refer to specialist literature. [Severe] Theoretical
- ▶ **Zidovudine** increases the risk of haematological toxicity when given with **NSAIDs**. [Severe] Study → Also see TABLE 2 p. 847
- ▶ **Ribavirin** increases the risk of anaemia and/or leucopenia when given with **zidovudine**. Avoid. [Severe] Study
- ▶ **Zidovudine** is predicted to decrease the efficacy of **stavudine**. Avoid. [Severe] Theoretical

Zinc

- ▶ Oral **zinc** decreases the absorption of oral **bisphosphonates (alendronic acid)**. **Zinc** should be taken at least 30 minutes before **alendronic acid**. [Moderate] Study
- ▶ Oral **zinc** is predicted to decrease the absorption of oral **bisphosphonates (ibandronic acid)**. Avoid **zinc** for at least 6 hours before or 1 hour after **ibandronic acid**. [Moderate] Theoretical
- ▶ Oral **zinc** decreases the absorption of oral **bisphosphonates (risedronate)**. Separate administration by at least 2 hours. [Moderate] Study

- ▶ Oral **zinc** decreases the absorption of oral **bisphosphonates (sodium clodronate)**. Avoid **zinc** for 2 hours before or 1 hour after **sodium clodronate**. [Moderate] Study
- ▶ Oral **calcium salts** decrease the absorption of **zinc**. [Moderate] Study
- ▶ **Zinc** is predicted to decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **zinc**. [Severe] Theoretical
- ▶ **Zinc** is predicted to decrease the efficacy of **iron (oral)** and **iron (oral)** is predicted to decrease the efficacy of **zinc**. [Moderate] Study
- ▶ **Zinc** is predicted to decrease the absorption of **penicillamine**. [Mild] Theoretical
- ▶ **Zinc** is predicted to decrease the exposure to **quinolones**. Separate administration by 2 hours. [Moderate] Study
- ▶ Oral **zinc** is predicted to decrease the absorption of **tetracyclines**. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- ▶ **Trientine** potentially decreases the absorption of **zinc**. [Moderate] Theoretical

Zoledronic acid → see bisphosphonates

Zolmitriptan → see TABLE 13 p. 850 (serotonin syndrome)

- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **zolmitriptan**. Adjust **zolmitriptan** dose, p. 292. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **zolmitriptan**. Adjust **zolmitriptan** dose, p. 292. [Mild] Study
- ▶ **Moclobemide** slightly increases the exposure to **zolmitriptan**. Adjust **zolmitriptan** dose, p. 292. [Moderate] Study → Also see TABLE 13 p. 850
- ▶ **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to **zolmitriptan**. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **zolmitriptan**. Adjust **zolmitriptan** dose, p. 292. [Moderate] Theoretical
- ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **zolmitriptan**. Adjust **zolmitriptan** dose, p. 292. [Severe] Theoretical → Also see TABLE 13 p. 850
- ▶ **Zolpidem** → see TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Antiepileptics (carbamazepine)** moderately decrease the exposure to **zolpidem**. [Moderate] Study
- ▶ **Rifampicin** moderately decreases the exposure to **zolpidem**. [Moderate] Study
- ▶ **Zonisamide** → see antiepileptics
- ▶ **Zopiclone** → see TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Antiarrhythmics (dronedronate)** are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 849
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- ▶ **Antiepileptics (diltiazem, verapamil)** are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study

- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- ▶ **Rifampicin** is predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Zuclopenthixol** → see TABLE 8 p. 848 (hypotension), TABLE 9 p. 849 (QT-interval prolongation), TABLE 11 p. 849 (CNS depressant effects)
- ▶ **Zuclopenthixol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 848 → Also see TABLE 9 p. 849
- ▶ **Zuclopenthixol** is predicted to decrease the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 848
- ▶ **Zuclopenthixol** potentially increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 849

Appendix 2

Borderline substances

CONTENTS

Enteral feeds (non-disease specific)	page 1014
Enteral feeds (non-disease specific): less than 5 g protein/100 mL	1014
Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL	1016
Enteral feeds (non-disease specific): Child under 12 years	1018
Nutritional supplements (non-disease specific)	1022
Nutritional supplements: less than 5 g protein/100 mL	1022
Nutritional supplements: 5 g (or more) protein/100 mL	1023
Specialised formulas	1027
Specialised formulas: Infant and child	1027
Specialised formulas for specific clinical conditions	1032
Feed supplements	1034
High-energy supplements	1034
Fibre, vitamin, and mineral supplements	1038
Feed additives	1039
Special additives for conditions of intolerance	1039

Feed thickeners and pre-thickened drinks	page 1039
Flavouring preparations	1040
Foods for special diets	1040
Gluten-free foods	1040
Low-protein foods	1043
Nutritional supplements for metabolic diseases	1046
Glutaric aciduria (type 1)	1046
Glycogen storage disease	1046
Homocystinuria or hypermethioninaemia	1046
Hyperlysinaemia	1047
Isovaleric acidemia	1047
Maple syrup urine disease	1047
Methylmalonic or propionic acidemia	1048
Other inborn errors of metabolism	1048
Phenylketonuria	1049
Tyrosinaemia	1051

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee's advice and endorsed 'ACBS' will normally not be investigated.

Information

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)

All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements

For most enteral feeds and nutritional supplements, the main source of **carbohydrate** is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as 'clinically lactose-free' or 'lactose-free' by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of **protein** or **amino acids** are included with each product entry. The **fat** or **oil** content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table,

below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of **vitamins, minerals, and trace elements**—the manufacturer's product literature should be consulted for more detailed information. Feeds containing vitamin K may affect the INR in patients receiving warfarin; see **Interactions**: Appendix 1: enteral feeds.

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Nutritional values

Nutritional values of products vary with flavour and pack size—consult product literature.

Paediatric ACBS indications: Disease-related malnutrition, intractable malabsorption, growth failure, pre-operative preparation of malnourished patients, dysphagia, short-bowel syndrome, bowel fistula

Standard ACBS indications: Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

Other conditions for which ACBS products can be prescribed

This is a list of clinical conditions for which the ACBS has approved toilet preparations. For details of preparations see Chapter 13.

Dermatitis, eczema and pruritus

Aveeno[®] Bath Oil; *Aveeno*[®] Cream; *Aveeno*[®] Lotion; *E45*[®] Emollient Bath Oil; *E45*[®] Emollient Wash Cream; *E45*[®] Lotion

Dermatitis herpetiformis

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)

Covermark® classic foundation and finishing powder;
Dermablend® Ultra corrective foundation; *Dermacolor*®
 Camouflage cream and fixing powder; *Keromask*® masking
 cream and finishing powder; *Veil*® Cover cream and
 Finishing Powder. (Cleansing Creams, Cleansing Milks,
 and Cleansing Lotions are excluded).

Disinfectants (antiseptics)

May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygienic purposes.

Dry mouth (xerostomia)

For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.
AS Saliva Orthana®; *Biotène Oralbalance*®; *Glandosane*®;
Saliveze®

Photodermatoses (skin protection in)

Anthelios® XL SPF 50+ Melt-in cream; *Sunsense*® Ultra;
Uvistat® Lipscreen SPF 50, *Uvistat*® Suncream SPF 30 and 50

Prices quoted in Appendix 2 are basic NHS net prices; for further information see Prices in BNFC.

Table 1 Enteral feeds (non-disease specific)

Less than 5 g protein/100 mL

Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® 1500 Complete (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	3.8 g cows' milk soya	13 g (sugars 0.9 g)	3.4 g	1.5 g	Gluten-free Residual lactose Contains fish oil	Borderline substances standard ACBS indications p. 1012 except bowel fistula and pre-operative preparation of malnourished patients. Not suitable for child under 2 years	Fresubin 1500 Complete liquid: 1.5 litre = £14.05
Fresubin® Original (Fresenius Kabi Ltd)	Liquid (sip or tube feed) per 100 mL	420 kJ (100 kcal)	3.8 g cows' milk soya	13.8 g (sugars 3.5 g)	3.4 g	Nil	Gluten-free Residual lactose Contains fish gelatin Feed in flexible pack contains fish oil and fish gelatin	Borderline substances standard ACBS indications p. 1012	Fresubin Original drink: blackcurrant, chocolate, nut, peach, vanilla 200 ml = £2.28; Fresubin Original tube feed liquid: 1000 ml = £8.74; 1500 ml = £13.10; 500 ml = £4.41
Fresubin® Original Fibre (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	3.8 g cows' milk soya	13 g (sugars 0.9 g)	3.4 g	1.5 g	Gluten-free Residual lactose Contains fish oil	Borderline substances standard ACBS indications p. 1012 except bowel fistula and pre-operative preparation of malnourished patients. Not suitable for child under 2 years	Fresubin Original Fibre liquid: 500 ml = £4.99; 1000 ml = £9.96
Jevity® (Abbott Laboratories Ltd)	Liquid (tube feed) per 100 mL	449 kJ (107 kcal)	4 g caseinates	14.1 g (sugars 470 mg)	3.47 g	1.76 g	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012 except bowel fistula. Not suitable for child under 2 years	Jevity liquid: 1000 ml = £10.59; 1500 ml = £15.85; 500 ml = £5.62
Nutrison® (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4 g cows' milk	12.3 g (sugars 1 g)	3.9 g	Nil	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012	Nutrison liquid: 500 ml = £5.20; 500 ml = £4.68; 1000 ml = £9.12; 1500 ml = £13.68
Nutrison® Multi Fibre (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4 g cows' milk	12.3 g (sugars 1 g)	3.9 g	1.5 g	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012 except bowel fistula	Nutrison Multi Fibre liquid: 1500 ml = £15.83; 500 ml = £5.62; 500 ml = £5.27; 1000 ml = £10.57
Osmolite® (Abbott Laboratories Ltd)	Liquid (tube feed) per 100 mL	424 kJ (100 kcal)	4 g caseinates soy isolate	13.6 g (sugars 630 mg)	3.4 g	Nil	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012	Osmolite liquid: 500 ml = £5.21; 1000 ml = £9.14; 1500 ml = £13.71

SOYA PROTEIN FORMULA									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® Soya Fibre (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	3.8 g soya protein	13.3 g (sugars 4.1 g)	3.6 g	2 g	Gluten-free Lactose-free Contains fish oil	Borderline substances standard ACBS indications p. 1012; also cows' milk protein intolerance, lactose intolerance	Fresubin Soya Fibre liquid: 500 ml = £5.16
Nutrison® Soya (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4 g soy isolate	12.3 g (sugars 1 g)	3.9 g	Nil	Gluten-free Residual lactose Milk protein-free	Borderline substances standard ACBS indications p. 1012; also cows' milk protein and lactose intolerance	Nutrison Soya liquid: 500 ml = £5.61; 1000 ml = £11.23
Nutrison® Soya Multi Fibre (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4 g soy isolate	12.3 g (sugars 700 mg)	3.9 g	1.5 g	Gluten-free Residual lactose Milk protein-free	Borderline substances standard ACBS indications p. 1012 except bowel fistula; also cows' milk protein and lactose intolerance	Nutrison Soya Multi Fibre liquid: 1.5 litre = £18.68
PEPTIDE-BASED FORMULA									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Nutrison Peptisorb® (Nutricia Ltd)	Liquid (tube feed) per 100 mL	425 kJ (100 kcal)	4 g whey protein hydrolysate	17.6 g (sugars 1.7 g)	1.7 g (MCT 47 %)	Nil	Gluten-free Residual lactose	Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Nutrison Peptisorb liquid: 500 ml = £7.44; 1000 ml = £14.74; 500 ml = £8.18
Peptamen® (Nestle Health Science)	Liquid (sip or tube feed) per 100 mL	420 kJ (100 kcal)	4 g whey peptides	12.7 g (sugars 480 mg)	3.7 g (MCT 70 %)	Nil	Gluten-free Residual lactose	Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Peptamen liquid: vanilla 800 ml = £12.56; unflavoured 500 ml = £7.06; 1000 ml = £13.25
Survimed® OPD (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	4.5 g whey protein hydrolysate	14.3 g (sugars 1.1 g)	2.8 g (MCT 51 %)	0.1 g	Gluten-free Residual lactose Contains fish oil	Borderline substances standard ACBS indications p. 1012; also growth failure	Survimed OPD: liquid 500 ml = £7.36; 800 ml = £13.60; 1000 ml = £14.72; HN liquid 500 ml = £7.09
Enteral feeds: Less than 1 kcal/mL and less than 5 g protein/100 mL									
AMINO ACID FORMULA (ESSENTIAL AND NON-ESSENTIAL AMINO ACIDS)									
Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Elemental 028® Extra (Nutricia Ltd)	Liquid (sip feed) per 100 mL	360 kJ (86 kcal)	2.5 g (protein equivalent)	11 g (sugars 4.7 g)	3.5 g (MCT 35 %)	Nil		Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula	Elemental 028 Extra liquid: orange & pineapple, grapefruit, summer fruits 250 ml = £3.86
	Standard dilution (20 %) of powder (sip or tube feed) per 100 mL	374 kJ (89 kcal)	2.5 g (protein equivalent)	11.8 g (sugars 1.8 g)	3.5 g (MCT 35 %)	Nil		Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula.	Elemental 028 Extra powder: plain, orange, banana 100 gram = £7.49
Powder provides protein equivalent 12.5 g, carbohydrate 59 g, fat 17.45 g, energy 1871 kJ (443 kcal)/100 g.									

Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL

Enteral feeds: 1.5 kcal/mL and 5 g (or more) protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® 2250 Complete (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	630 kJ (150 kcal)	5.6 g cows' milk	18.8 g (sugars 1.5 g)	5.8 g	2 g	Gluten-free Residual lactose Contains fish oil and fish gelatin	Borderline substances standard ACBS indications p. 1012	Fresubin 2250 Complete liquid: 1.5 litre = £15.68
Fresubin® Energy (Fresenius Kabi Ltd)	Liquid (sip feed) per 100 mL	630 kJ (150 kcal)	5.6 g cows' milk	18.8 g (sugars)	5.8 g	Nil	Gluten-free Residual lactose Contains fish gelatin Strawberry flavour may contain traces of wheat starch and egg.	Borderline substances standard ACBS indications p. 1012	Fresubin Energy liquid: banana, blackcurrant, cappuccino, chocolate, lemon, strawberry, tropical fruits, vanilla 200 ml = £1.40; unflavoured 200 ml = £1.40; 500 ml = £5.40
	Liquid (tube feed) per 100 mL	630 kJ (150 kcal)	5.6 g cows' milk	18.8 g (sugars 1.4 g)	5.8 g	Nil	Gluten-free Residual lactose Contains fish oil and fish gelatin	Borderline substances standard ACBS indications p. 1012	Fresubin Energy liquid: 1000 ml = £10.61; 1500 ml = £14.23
Fresubin® Energy Fibre (Fresenius Kabi Ltd)	Liquid (sip feed) per 100 mL	630 kJ (150 kcal)	5.6 g cows' milk	18.8 g (sugars)	5.8 g	2 g	Gluten-free Residual lactose Contains fish gelatin	Borderline substances standard ACBS indications p. 1012	Fresubin Energy Fibre liquid: banana, caramel, cherry, chocolate, strawberry 200 ml = £2.17
	Liquid (tube feed) per 100 mL	630 kJ (150 kcal)	5.6 g cows' milk	18.8 g (sugars 1.5 g)	5.8 g	2 g	Gluten-free Residual lactose Contains fish oil and fish gelatin	Borderline substances standard ACBS indications p. 1012	Fresubin Energy Fibre liquid unflavoured: 500 ml = £5.92; 1000 ml = £11.30
Fresubin® HP Energy (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	630 kJ (150 kcal)	7.5 g cows' milk	17 g (sugars 1 g)	5.8 g (MCT 57 %)	Nil	Gluten-free Residual lactose Contains fish oil and fish gelatin	Borderline substances standard ACBS indications p. 1012; also CAPD and haemodialysis	Fresubin HP Energy liquid: 500 ml = £5.50; 1000 ml = £11.00
Jevity® 1.5 kcal (Abbott Laboratories Ltd)	Liquid (tube feed) per 100 mL	649 kJ (154 kcal)	6.38 g caseinates and soy isolate	20.1 g (sugars 1.47 g)	4.9 g	2.2 g	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012 Not suitable for child under 2 years; not recommended for child 2-10 years	Jevity 1.5kcal liquid: 1500 ml = £19.55; 500 ml = £6.73; 1000 ml = £12.67
Nutrison® Energy (Nutricia Ltd)	Liquid (tube feed) per 100 mL	630 kJ (150 kcal)	6 g cows' milk	18.5 g (sugars 1.5 g)	5.8 g	Nil	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012	Nutrison Energy liquid: 1000 ml = £11.39; 500 ml = £6.05; 1500 ml = £17.03; 500 ml = £5.66 (bottle)
Nutrison® Energy Multi Fibre (Nutricia Ltd)	Liquid (tube feed) per 100 mL	630 kJ (150 kcal)	6 g cows' milk	18.5 g (sugars 1.5 g)	5.8 g	1.5 g	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012	Nutrison Energy Multi Fibre liquid: 500 ml = £6.33 (bottle); 1000 ml = £12.64; 500 ml = £6.72; 1500 ml = £19.51
Osmolite® 1.5 kcal (Abbott Laboratories Ltd)	Liquid (tube feed) per 100 mL	632 kJ (150 kcal)	6.25 g cows' milk soya protein isolate	20 g (sugars 4.9 g)	5 g	Nil	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012	Osmolite 1.5kcal tube feed liquid: 1000 ml = £11.41; 500 ml = £6.06; 1500 ml = £17.07
Resource® Energy (Nestle Health Science)	Liquid (sip feed) per 100 mL	630 kJ (150 kcal)	5.6 g cows' milk	21 g (sugars 5.2 g)	5 g	less than 0.5 g	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012 Not suitable for use in child under 3 years	Resource Energy liquid: apricot, banana, chocolate, coffee, strawberry & raspberry, vanilla 800 ml = £7.93

Enteral feeds: Less than 1.5 kcal/mL and 5 g (or more) protein/100 mL Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® 1000 Complete (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	5.5 g cows' milk	12.5 g (sugars 1.1 g)	3.1 g	2 g	Gluten-free Residual lactose Contains fish oil	Borderline substances standard ACBS indications p. 1012	Fresubin 1000 Complete liquid: 1 litre = £11.30
Fresubin® 1200 Complete (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	500 kJ (120 kcal)	6 g cows' milk	15 g (sugars 1.22 g)	4.1 g	2 g	Gluten-free Residual lactose Contains fish oil	Borderline substances standard ACBS indications p. 1012	Fresubin 1200 Complete liquid: 1 litre = £14.38

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years

Enteral feeds: More than 1.5 kcal/mL and 5 g (or more) protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years

Enteral feeds (non-disease specific): Child under 12 years

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Nutrini® Low Energy Multi Fibre (Nutricia Ltd)	Liquid (tube feed) per 100 mL	315 kJ (75 kcal)	2.1 g whey protein and caseinate	9.3 g (sugars 600 mg)	3.3 g	800 mg	Gluten-free Residual lactose Contains fish oil	Borderline substances paediatric ACBS indications p. 1012 except bowel fistula, in child 1-6 years, body-weight 8-20 kg	Nutrini Low Energy Multifibre liquid: 200 ml = £2.79; 500 ml = £7.08
Nutriprem® 1 (Cow & Gate Ltd)	Liquid (sip feed) per 100 mL	335 kJ (80 kcal)	2.5 g whey protein and casein	7.6 g (lactose 6.3 g)	4.4 g	800 mg	Contains soya, fish oil and egg lipid	Low birth-weight formula	Nutriprem 1 liquid: 70 ml = Hospital supply only
Nutriprem® 2 (Cow & Gate Ltd)	Liquid (sip feed) per 100 mL	310 kJ (75 kcal)	2 g whey protein and casein	7.4 g (lactose 5.8 g)	4 g	600 mg	Contains soya, fish oil and egg lipid	Catch-up growth in pre-term infants (less than 35 weeks at birth) and small for gestational-age infants up to 6 months corrected age.	Nutriprem 2 liquid: 200 ml = £1.74

	Standard dilution (15.3%) of powder (sip feed) per 100 mL	315 kJ (75 kcal)	2 g whey protein and casein	7.4 g (lactose 5.9 g)	4 g (including MCT oil)	600 mg			Nutriprem 2 powder: 800 gram = £10.37
Powder provides: protein 13 g, carbohydrate 48.3 g, fat 26.7 g, fibre 5.2 g, energy 2030 kJ (485 kcal)/100 g.									
AMINO ACID FORMULA (ESSENTIAL AND NON-ESSENTIAL AMINO ACIDS)									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Emsogen® (Nutricia Ltd)	Standard dilution (20%) of powder (sip or tube feed) per 100 mL	368 kJ (88 kcal)	2.5 g protein equivalent (essential and non-essential amino acids)	12 g (sugars 1.6 g)	3.3 g (MCT 83%)	Nil	Lactose-free	Short-bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula Not suitable for child under 1 year or as sole source of nutrition in child 1-5 years	Emsogen powder unflavoured: 100 gram = £7.71
Powder provides: protein equivalent 12.5 g, carbohydrate 60 g, fat 16.4 g, energy 1839 kJ (438 kcal)/100 g. Additional source of alpha linolenic acid needed if used as sole source of nutrition.									
Enteral feeds, Child: 1 kcal/mL and less than 4 g protein/100 mL Not suitable for use in child under 1 year unless otherwise stated									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fortini® 1.0 Multi Fibre (Nutricia Ltd)	Liquid (sip feed) per 100 mL	420 kJ (100 kcal)	2.4 g cows' milk	11.8 g (sugars 4.7 g)	4.5 g	1.5 g	Gluten-free Residual lactose	Disease-related malnutrition and growth failure in child 1-6 years, body-weight 8-20 kg	Fortini 1.0 Multi Fibre liquid: banana, chocolate, strawberry, vanilla 200 ml = £2.67
Frebini® Original (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	2.5 g cows' milk	12.5 g (sugars 700 mg)	4.4 g	Nil	Gluten-free Residual lactose Contains fish oils and fish gelatin	Borderline substances standard ACBS indications p. 1012 and growth failure in child 1-10 years, body-weight 8-30 kg	Frebini Original liquid: 500 ml = £6.52
Frebini® Original Fibre (Fresenius Kabi Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	2.5 g cows' milk	12.5 g (sugars 700 mg)	4.4 g	750 mg	Gluten-free Residual lactose Contains fish oils and fish gelatin	Borderline substances standard ACBS indications p. 1012 and growth failure in child 1-10 years, body-weight 8-30 kg	Frebini Original Fibre liquid: 500 ml = £7.25
Infatrin® (Nutricia Ltd)	Liquid (sip or tube feed) per 100 mL	415 kJ (100 kcal)	2.6 g cows' milk	10.3 g (lactose 5.2 g)	5.4 g	800 mg	Gluten-free Contains fish oil	Failure to thrive, disease-related malnutrition and malabsorption, in child from birth up to body-weight 8 kg	Infatrin liquid: 200 ml = £2.40; 500 ml = £6.52; 125 ml = £1.51
Nutrini® (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	2.8 g cows' milk	12.3 g (sugars 1 g)	4.4 g	Nil	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012 and growth failure in child 1-6 years, body-weight 8-20 kg	Nutrini liquid: 200 ml = £2.91; 500 ml = £7.22
Nutrini® Multi Fibre (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	2.8 g whey protein and caseinate	12.3 g (sugars 800 mg)	4.4 g	800 mg	Gluten-free Residual lactose Contains fish oil	Borderline substances standard ACBS indications p. 1012 and growth failure in child 1-6 years, body-weight 8-20 kg	Nutrini Multifibre liquid: 200 ml = £3.22; 500 ml = £8.01

Enteral feeds, Child: 1 kcal/mL and less than 4 g protein/100 mL (product list continued)									
Not suitable for use in child under 1 year unless otherwise stated									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Paediasure® (Abbott Laboratories Ltd)	Liquid (sip or tube feed) per 100 mL	422 kJ (100 kcal)	2.8 g cows' milk	11.2 g (sugars 3.92 g)	4.98 g	Nil	Gluten-free Residual lactose	Borderline substances paediatric ACBS indications p. 1012 in child 1–10 years, body-weight 8–30 kg	PaediaSure liquid: banana, chocolate, strawberry 200 ml = £2.62; vanilla 200 ml = £2.62; 500 ml = £7.24. Nutritional values may vary with flavour—consult product literature
Paediasure® Fibre (Abbott Laboratories Ltd)	Liquid (sip or tube feed) per 100 mL	424 kJ (101 kcal)	2.8 g caseinates and whey protein	10.9 g (sugars 3.84 g)	4.98 g	730 mg	Gluten-free Residual lactose	Borderline substances paediatric ACBS indications p. 1012 in child 1–10 years, body-weight 8–30 kg	PaediaSure fibre liquid: banana, strawberry 200 ml = £2.77; vanilla 200 ml = £8.03. Nutritional values may vary with flavour—consult product literature
Paediasure® Peptide (Abbott Laboratories Ltd)	Liquid (sip or tube feed) per 100 mL	420 kJ (100 kcal)	3 g whey protein and caseinate	13 g (sugars 2.98 g)	4 (MCT 50%) g	Nil	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012 and growth failure in child 1–10 years, body-weight 8–30 kg	PaediaSure Peptide liquid: 500 ml = £11.29; 200 ml = £4.07
Similac® High Energy (Abbott Laboratories Ltd)	Liquid (sip or tube feed) per 100 mL	419 kJ (100 kcal)	2.6 g cows' milk and whey protein	10.1 g (sugars 5.6 g)	5.2 g	400 mg	Gluten-free Contains lactose and soy oil	Increased energy requirements, faltering growth, and/or need for fluid restriction, in child body-weight up to 8 kg	Similac High Energy liquid: 60 ml = £0.71; 200 ml = £2.38
Tentrini® (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	3.3 g whey protein and caseinate	12.3 g (sugars 800 mg)	4.2 g	Nil	Gluten-free Residual lactose Contains fish oil	Borderline substances standard ACBS indications p. 1012 and growth failure in child 7–12 years, body-weight 21–45 kg	Tentrini liquid: 500 ml = £6.36
Tentrini® Multi Fibre (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	3.3 g whey protein and caseinate	12.3 g (sugars 800 mg)	4.2 g	1.1 g	Gluten-free Residual lactose Contains fish oil	Borderline substances standard ACBS indications p. 1012 except bowel fistula, and growth failure in child 7–12 years body-weight 21–45 kg	Tentrini Multifibre liquid: 500 ml = £7.00
HYDROLYSATE FORMULA									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Nutrini® Peptisorb (Nutricia Ltd)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	2.8 g whey protein hydrolysate	13.7 g (sugars 800 mg)	3.9 g (MCT 46%)	Nil	Gluten-free Residual lactose	Borderline substances standard ACBS indications p. 1012 and growth failure in child 1–6 years, body-weight 8–20 kg	Nutrini Peptisorb liquid: 500 ml = £11.27
Peptamen® Junior (Nestlé Health Science)	Liquid (tube feed) per 100 mL	420 kJ (100 kcal)	3 g whey protein hydrolysate	13.2 g	4 g (MCT 60%)	Nil	Gluten-free Residual lactose Hydrolysed with pork trypsin	Short bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistula, in child 1–10 years	Peptamen Junior gluten free liquid: 500 ml = £7.05
	Standard dilution (22%) of powder (sip or tube feed) per 100 mL	420 kJ (100 kcal)	3 g whey protein hydrolysate	13.8 g	3.85 g (MCT 60%)	Nil	Gluten-free Residual lactose Hydrolysed with bacterial trypsin		Peptamen Junior powder: 400 gram = £18.49
Powder provides: protein 13.7 g, carbohydrate 62.9 g, fat 17.5 g, energy 1910 kJ (457 kcal)/100 g.									

Enteral feeds, Child: More than 1 kcal/mL and less than 4 g protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated

Resource Fibre 2.0 liquid: apricot, coffee, neutral, strawberry, summer fruit, vanilla 200 ml = £1.95

Table 3 Specialised formulas

Specialised formulas: Infant and child

Specialised formulas: Infant and child: Amino acid-based formula

Specialised formulas are suitable for infants from birth unless otherwise indicated.

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Alfamino® (Nestle Health Science)	Standard dilution (13.8%) of powder per 100 mL	291 kJ (69 kcal)	1.8 g protein equivalent (essential and non- essential amino acids)	7.9 g (sugars 2.2 g)	3.4 g	Nil		Severe cows' milk allergy and or multiple food allergies	SMA Alfamino powder: 400 gram = £23.81
Powder provides protein equivalent 13.3 g, carbohydrate 57 g, fat 24.6 g, energy 2105 kJ (503 kcal)/100 g.									
Neocate® Active (Nutricia Ltd)	Standard dilution (21%) of powder per 300 mL serving (63-g sachet made up to 300 mL with water)	1255 kJ (300 kcal)	8.3 g protein equivalent (essential and non- essential amino acids)	34 g (sugars 3.1 g)	14.5 g	Nil	Milk protein-free	Proven whole protein intolerance, short bowel syndrome, intractable malabsorption, or other gastro- intestinal disorders where an elemental diet is indicated. Nutritional supplement only. Not suitable for child under 1 year.	Neocate Active powder: blackcurrant, unflavoured 945 gram = £69.75
Powder provides: protein equivalent 13.1 g, carbohydrate 54 g, fat 23 g, energy 1992 kJ (475 kcal)/100 g.									
Neocate® Advance (Nutricia Ltd)	Standard dilution (25%) of powder per 100 mL	420 kJ (100 kcal)	2.5 g protein equivalent (essential and non- essential amino acids)	14.6 g (sugars 1.3 g)	3.5 g (MCT 35%)	Nil	Milk protein-free	Proven whole protein intolerance, short bowel syndrome, intractable malabsorption, or other gastro- intestinal disorders where an elemental diet is indicated. Not suitable for child under 1 year	Neocate Advance powder: banana & vanilla 750 gram = £48.60; unflavoured 1000 gram = £61.40
Powder provides: protein equivalent 10 g, carbohydrate 58.5 g, fat 14 g, energy 1683 kJ (400 kcal)/100 g.									
Neocate® LCP (Nutricia Ltd)	Standard dilution (13.8%) of powder per 100 mL	279 kJ (67 kcal)	1.8 g protein equivalent (essential and non- essential amino acids)	7.2 g (sugars 650 mg)	3.4 g	Nil	Milk protein-free	Cows' milk allergy, multiple food protein intolerance, and conditions requiring an elemental diet	Neocate LCP powder: 400 gram = £29.56
Powder provides: protein equivalent 13 g, carbohydrate 52.5 g, fat 24.5 g, energy 2020 kJ (483 kcal)/100 g.									

Specialised formulas: Infant and child: Amino acid-based formula (product list continued)

Specialised formulas are suitable for infants from birth unless otherwise indicated.

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Neocate [®] Spoon (Nutricia Ltd)	Standard dilution (38%) of powder per 97 g serving (37-g sachet diluted with 60 mL water)	733 kJ (175 kcal)	3 g protein equivalent (essential and non- essential amino acids)	24.9 g (sugars 4.6 g)	7 g	Nil	Milk protein-free	Cows' milk allergy, multiple food protein intolerance, and conditions requiring an elemental diet. Not suitable for child under 6 months.	Neocate Spoon powder: 555 gram = £41.25
Powder provides protein equivalent 8.2 g, carbohydrate 67.4 g, fat 18.8 g, energy 1981 kJ (472 kcal)/100 g.									
Nutramigen [®] Puramino (Mead Johnson Nutrition (UK) Ltd)	Standard dilution (13.6%) of powder per 100 mL	290 kJ (68 kcal)	1.89 g essential and non-essential amino acids	7.2 g 7.3 g (sugars 4 g)	3.6 g	Nil	Gluten-free Lactose-free	For use in the management of severe protein intolerance, multiple food intolerance and other gastro-intestinal disorders where an amino acid based diet is specifically indicated for infants and young children.	Nutramigen PurAmino powder: 400 gram = £27.63
Powder provides: protein 13.9 g, carbohydrate 53 g, fat 26 g, energy 2100 kJ (500 kcal)/100 g.									
Specialised formulas: Infant and child: Hydrolysate formula									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
SMA Althéra [®] (Nestle Health Science)	Standard dilution (13.2%) of powder per 100 mL	280 kJ (67 kcal)	1.7 g whey hydrolysed	7.3 g (sugars 4 g)	3.4 g	Nil	Contains lactose	Complete nutritional support from birth to 3 years or supplementary feeding from 6 months to 3 years, in cow's milk protein allergy or multiple food protein allergies	SMA Althera powder: 450 gram = £10.68
Powder provides: protein 12.5 g, carbohydrate 55.5 g, fat 26 g, energy 2119 kJ (506 kcal)/100 g.									
Aptamil Pepti [®] 1 (Allergy) (Milupa Ltd)	Standard dilution (13.6%) of powder per 100 mL	280 kJ (67 kcal)	1.6 g whey hydrolysed	7.1 g (sugars 3.5 g)	3.5 g	600 mg	Contains lactose and fish oil	Established cows' milk protein intolerance, with or without secondary lactose intolerance	Aptamil Pepti 1 (Allergy) powder: 800 gram = £19.73; 400 gram = £9.87
Powder provides: protein 11.6 g, carbohydrate 52 g, fat 25.6 g, energy 2025 kJ (484 kcal)/100 g.									
Aptamil Pepti [®] 2 (Allergy) (Milupa Ltd)	Standard dilution (14.3%) of powder per 100 mL	285 kJ (68 kcal)	1.6 g whey hydrolysed	8 g (sugars 3.6 g)	3.1 g	600 mg	Contains lactose and fish oil	Established cows' milk protein allergy or intolerance. Not suitable for child under 6 months.	Aptamil Pepti 2 (Allergy) powder: 400 gram = £9.41; 800 gram = £18.82
Powder provides: protein 11.2 g, carbohydrate 56.1 g, fat 21.8 g, energy 1985 kJ (473 kcal)/100 g.									
Aptamil Pepti-Junior [®] (Nutricia Early Life Nutrition Ltd)	Standard dilution (12.8%) of powder per 100 mL	275 kJ (66 kcal)	1.8 g whey hydrolysed	6.8 g (sugars 1.1 g)	3.5 g	Nil	Residual lactose Contains fish oil	Disaccharide and/or whole protein intolerance, or where amino acids and peptides are indicated in conjunction with medium chain triglycerides.	Aptamil Pepti-Junior powder: 450 gram = £13.36
Powder provides: protein 14 g, carbohydrate 53.4 g, fat 27.3 g, energy 2155 kJ (515 kcal)/100 g.									

Infatrini® Peptisorb (Nutricia Ltd)	Liquid (sip or tube feed) per 100 mL	420 kJ (100 kcal)	2.6 g whey protein hydrolysate	10.3 g (sugars 2.7 g)	5.4 g (MCT 50%)	Nil	Gluten-free Residual lactose Contains fish oil	Disease-related malnutrition, intractable malabsorption, proven inflammatory bowel disease, short bowel syndrome, bowel fistula, and intolerance to whole protein feeds in child from birth to 18 months or body-weight up to 9 kg	Infatrini Peptisorb liquid: 200 ml = £3.67
Nutramigen® 1 with LGG (Mead Johnson Nutrition (UK) Ltd)	Standard dilution (13.5 %) of powder per 100 mL	280 kJ (68 kcal)	1.9 g casein hydrolysed	7.5 g	3.4 g	Nil	Gluten-free Lactose-free	For the dietary management of cow's milk allergy with/or without lactose intolerance.	Nutramigen 1 with LGG powder: 400 gram = £11.21
Powder provides: protein 14 g, carbohydrate 55 g, fat 25 g, energy 2100 kJ (500 kcal)/100 g.									
Nutramigen® 2 with LGG (Mead Johnson Nutrition (UK) Ltd)	Standard dilution (14.6 %) of powder per 100 mL	285 kJ (68 kcal)	1.7 g casein hydrolysed	8.6 g	2.9 g	Nil	Gluten-free Lactose-free	For the dietary management of cow's milk allergy with/or without lactose intolerance. Not suitable for child under 6 months.	Nutramigen 2 with LGG powder: 400 gram = £11.21
Powder provides: protein 12 g, carbohydrate 62 g, fat 20 g, energy 2000 kJ (480 kcal)/100 g.									
Pepdite® (Nutricia Ltd)	Standard dilution (15 %) of powder per 100 mL	297 kJ (71 kcal)	2.1 g protein equivalent (non-milk hydrolysate)	7.8 g (sugars 700 mg)	3.5 g	Nil	Lactose-free Contains meat (pork) and soya derivatives	Disaccharide and/or whole protein intolerance	Pepdite powder: 400 gram = £19.69
Powder provides: protein equivalent 13.8 g, carbohydrate 52 g, fat 23.2 g, energy 1977 kJ (472 kcal)/100 g.									
Pepdite® 1+ (Nutricia Ltd)	Standard dilution (22.8 %) of powder per 100 mL	423 kJ (100 kcal)	3.1 g protein equivalent (non-milk hydrolysate, essential amino acids)	13 g (sugars 1.2 g)	3.9 g (MCT 35 %)	Nil	Lactose-free Contains meat (pork) and soya derivatives	Disaccharide and/or whole protein intolerance, or where amino acids or peptides are indicated in conjunction with medium chain triglycerides. Not suitable for child under 1 year.	Pepdite 1+ powder: 400 gram = £20.67
Powder provides: protein equivalent 13.8 g, carbohydrate 57 g, fat 17.3 g, energy 1844 kJ (439 kcal)/100 g.									
Pregestimil® Lipil (Mead Johnson Nutrition (UK) Ltd)	Standard dilution (13.5 %) of powder per 100 mL	280 kJ (68 kcal)	1.89 g casein hydrolysed	6.9 g	3.8 g (MCT 54 %)	Nil	Gluten-free Lactose-free	Disaccharide and/or whole protein intolerance, or where amino acids or peptides are indicated in conjunction with medium chain triglycerides.	Pregestimil LIPIL powder: 400 gram = £12.43
Powder provides: protein 14 g, carbohydrate 51 g, fat 28 g, energy 2100 kJ (500 kcal)/100 g.									
Similac® Alimentum (Abbott Laboratories Ltd)	Standard dilution (14%) of powder per 100 mL	283 kJ (67.6 kcal)	1.86 g casein hydrolysed	6.62 g (sugars 1.5 g)	3.75 g (MCT 33%)	Nil	Gluten-free Lactose-free Contains meat derivatives	Cows' milk protein allergy and other conditions where an extensively hydrolysed formula is indicated.	Similac Alimentum powder: 400 gram = £9.10
Powder provides: protein equivalent 14.4 g, carbohydrate 51.4 g, fat 29.1 g, energy 2196 kJ (525 kcal)/100 g.									

Specialised formulas: Infant and child: Residual lactose formula									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Enfamil® O-Lac (Mead Johnson Nutrition (UK) Ltd)	Standard dilution (13%) of powder per 100 mL	280 kJ (68 kcal)	1.42 g cows' milk	7.2 g	3.7 g	Nil	Gluten-free Residual lactose	Proven lactose intolerance	Enfamil O-Lac powder: 400 gram = £5.28
Powder provides: protein 10.9 g, carbohydrate 55 g, fat 28 g, energy 2200 kJ (524 kcal)/100 g.									
Galactomin 17® (Nutricia Ltd)	Standard dilution (13.6%) of powder per 100 mL	295 kJ (70 kcal)	1.7 g protein equivalent (cows' milk)	7.5 g (sugars 1.4 g)	3.7 g	Nil	Residual lactose	Proven lactose intolerance in pre-school children, galactosaemia, and galactokinase deficiency.	Galactomin 17 powder: 400 gram = £17.62
Powder provides: protein equivalent 12.3 g, carbohydrate 55.3 g, fat 27.2 g, energy 2155 kJ (515 kcal)/100 g.									
SMA® LF (SMA Nutrition)	Standard dilution (13%) of powder per 100 mL	281 kJ (67 kcal)	1.5 g casein, whey	7.2 g (sugars 2.6 g)	3.6 g	Nil	Residual lactose	Proven lactose intolerance	SMA LF powder: 430 gram = £5.34
Powder provides: protein 12 g, carbohydrate 55.6 g, fat 28 g, energy 2185 kJ (522 kcal)/100 g.									
Specialised formulas: Infant and child: MCT-enhanced formula									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Lipistart® (Vitaflo International Ltd)	Standard dilution (15%) of powder per 100 mL	282 kJ (68 kcal)	2.1 g protein equivalent (whey, soya)	8.3 g (sugars 700 mg)	3.1 g (MCT 81%)	Nil	Residual lactose	Dietary management of fat malabsorption, long-chain fatty acid oxidation disorders, and other disorders requiring a high MCT, low LCT formula.	Lipistart powder: 400 gram = £20.51
Powder provides: protein equivalent 13.7 g, carbohydrate 55.3 g, fat 20.6 g, energy 1883 kJ (450 kcal)/100 g.									
MCT Peptide® (Nutricia Ltd)	Standard dilution (15%) of powder per 100 mL	286 kJ (68 kcal)	2 g protein equivalent (non-milk peptides, essential amino acids)	8.8 g (sugars 1.2 g)	2.7 g (MCT 75%)	Nil	Gluten-free Lactose-free Contains meat (pork) and soya derivatives	Disorders in which a high intake of MCT is beneficial	MCT Peptide powder: 400 gram = £21.42
Powder provides: protein equivalent 13.8 g, carbohydrate 59 g, fat 18 g, energy 1903 kJ (453 kcal)/100 g.									
MCT Peptide® +1 (Nutricia Ltd)	Standard dilution (20%) of powder per 100 mL	381 kJ (91 kcal)	2.8 g protein equivalent (non-milk peptides, essential amino acids)	11.8 g (sugars 1.6 g)	3.6 g (MCT 75%)	Nil	Gluten-free Lactose-free Contains meat (pork) and soya derivatives	Disorders in which a high intake of MCT is beneficial Not suitable for child under 1 year.	MCT Peptide 1+ powder: 400 gram = £21.42
Powder provides: protein equivalent 13.8 g, carbohydrate 59 g, fat 18 g, energy 1903 kJ (453 kcal)/100 g.									

Monogen [®] (Nutricia Ltd)	Standard dilution (17.5%) of powder per 100 mL	310 kJ (74 kcal)	2.2 g protein equivalent (whey)	12 g (sugars 1.2 g)	1.9 g (MCT 80 %)	Nil	Residual lactose Supplementation with essential fatty acids may be needed	Long-chain acyl-CoA dehydrogenase deficiency (LCAD), carnitine palmitoyl transferase deficiency (CPTD), primary and secondary lipoprotein lipase deficiency, chylothorax, and lymphangiectasia	Monogen powder: 400 gram = £21.29
Powder provides: protein equivalent 12.5 g, carbohydrate 68 g, fat 11 g, energy 1769 kJ (420 kcal)/100 g.									
Specialised formulas: Infant and child: Soya-based formula									
Wysoy [®] (SMA Nutrition)	Standard dilution (13.2%) of powder per 100 mL	280 kJ (67 kcal)	1.8 g soya protein isolate	6.9 g (sugars 2.5 g)	3.6 g	Nil	Lactose-free	Proven lactose and associated sucrose intolerance in pre-school children, galactokinase deficiency, galactosaemia, and proven whole cows' milk sensitivity.	SMA Wysoy powder: 860 gram = £10.54
Powder provides: protein 14 g, carbohydrate 54 g, fat 27 g, energy 2155 kJ (515 kcal)/100 g.									
Specialised formulas: Infant and child: Low calcium formula									
Locasol [®] (Nutricia Ltd)	Standard dilution (13.1%) of powder per 100 mL	278 kJ (66 kcal)	1.9 g cows' milk	7 g (sugars 6.9 g)	3.4 g	Nil	Contains lactose Calcium less than 7 mg/100 mL No added vitamin D	Conditions of calcium intolerance requiring restriction of calcium and vitamin D intake	Locasol powder: 400 gram = £24.50
Powder provides: protein 14.6 g, carbohydrate 53.7 g, fat 26.1 g, energy 2125 kJ (508 kcal)/100 g.									
Specialised formulas: Infant and child: Fructose-based formula									
Galactomin 19 [®] (Nutricia Ltd)	Standard dilution (12.9%) of powder per 100 mL	288 kJ (69 kcal)	1.9 g protein equivalent (cows' milk)	6.4 g (fructose 6.3 g)	4 g	Nil	Residual lactose, galactose and glucose	Conditions of glucose plus galactose intolerance	Galactomin 19 powder: 400 gram = £46.37
Powder provides: protein equivalent 14.6 g, carbohydrate 49.7 g, fat 30.8 g, energy 2233 kJ (534 kcal)/100 g.									
Specialised formulas: Infant and child: Pre-thickened infant feeds									
Not to be used for a period of more than 6 months; not to be used in conjunction with any other feed thickener or antacid products.									
Enfamil [®] AR (Mead Johnson Nutrition (UK) Ltd)	Standard dilution (13.5%) of powder per 100 mL	285 kJ (68 kcal)	1.7 g cows' milk	7.6 g (lactose 4.6 g)	3.5 g	Nil	Contains lactose, pregelatinised rice starch	Significant gastro-oesophageal reflux	Enfamil AR powder: 400 gram = £3.95
Powder provides: protein 12.5 g, carbohydrate 56 g, fat 26 g, energy 2093 kJ (500 kcal)/100 g.									

Specialised formulas for specific clinical conditions

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Alicalm® (Nutricia Ltd)	Standard dilution (30%) of powder per 100 mL	567 kJ (135 kcal)	4.5 g caseinate whey	17.4 g (sugars 3.2 g)	5.3 g	Nil	Residual lactose	Crohn's disease Not suitable for child under 1 year; use as nutritional supplement only in children 1–6 years.	Alicalm oral powder: 400 gram = £22.53
Powder provides: protein 15 g, carbohydrate 58 g, fat 17.5 g, energy 1889 kJ (450 kcal)/100 g.									
Forticare® (Nutricia Ltd)	Liquid (sip feed) per 100 mL	675 kJ (160 kcal)	9 g cows' milk	19.1 g (sugars 13.6 g)	5.3 g	2.1 g	Gluten-free Residual lactose Contains fish oil	Nutritional supplement in patients with lung cancer undergoing chemotherapy, or with pancreatic cancer Not suitable in child under 3 years	Forticare liquid: cappuccino, orange & lemon, peach & ginger 500 ml = £9.40
Heparon® Junior (Nutricia Ltd)	Standard dilution (18%) of powder per 100 mL	363 kJ (86 kcal)	2 g cows' milk	11.6 g (sugars 2.9 g)	3.6 g	Nil	Contains lactose Electrolytes/100 mL: Na ⁺ 0.56 mmol K ⁺ 1.9 mmol Ca ²⁺ 2.3 mmol P ⁺ 1.6 mmol	Enteral feed or nutritional supplement for children with acute or chronic liver failure	Heparon Junior powder: 400 gram = £22.70
Powder provides: protein 11.1 g, carbohydrate 64.2 g, fat 19.9 g, energy 2016 kJ (480 kcal)/100 g.									
KetoCal® (Nutricia Ltd)	Standard dilution (20%) of powder per 100 mL	602 kJ (146 kcal)	3.1 g cows' milk with additional amino acids	600 mg (sugars 120 mg)	14.6 g (LCT 100 %)	Nil	Electrolytes/100 mL: Na ⁺ 4.3 mmol K ⁺ 4.1 mmol Ca ²⁺ 2.15 mmol P ⁺ 2.77 mmol	Enteral feed or nutritional supplement as part of ketogenic diet in management of epilepsy resistant to drug therapy, in children over 1 year, only on the advice of secondary care physician with experience of ketogenic diet.	KetoCal 4:1 powder: unflavoured, vanilla 300 gram = £31.96
Powder provides: protein 15.25 g, carbohydrate 3 g, fat 73 g, energy 3011 kJ (730 kcal)/100 g.									
KetoCal® 3:1 (Nutricia Ltd)	Standard dilution (9.5%) of powder per 100 mL	276 kJ (66 kcal)	1.5 g	680 mg (sugars 570 mg)	6.4 g	Nil	Electrolytes/100 mL: Na ⁺ 1.3 mmol K ⁺ 2.4 mmol Ca ²⁺ 2 mmol P ⁺ 1.7 mmol	Enteral feed or nutritional supplement as part of ketogenic diet in management of drug resistant epilepsy or other conditions for which a ketogenic diet is indicated in children from birth to 6 years; as a nutritional supplement in children over 6 years.	KetoCal 3:1 powder: 300 gram = £30.93
Powder provides: protein 15.3 g, carbohydrate 7.2 g, fat 67.7 g, energy 2927 kJ (699 kcal)/100 g.									
KetoCal® 4:1 LQ (Nutricia Ltd)	Liquid (sip or tube feed) per 100 mL	620 kJ (150 kcal)	3.09 g casein and whey with additional amino acids	610 mg (sugars 230 mg)	14.8 g (LCT 100 %)	1.12 g	Residual lactose Electrolytes/100 mL: Na ⁺ 4.9 mmol K ⁺ 4.7 mmol Ca ²⁺ 2.4 mmol P ⁺ 3.1 mmol	Enteral feed or nutritional supplement as part of ketogenic diet in management of drug resistant epilepsy or other conditions for which a ketogenic diet is indicated in children 1–10 years; as a nutritional supplement in children over 10 years.	KetoCal 4:1LQ liquid: unflavoured, vanilla 200 ml = £4.56

Kindergen® (Nutricia Ltd)	Standard dilution (20%) of powder per 100 mL	421 kJ (101 kcal)	1.5 g whey protein	11.8 g (sugars 1.2 g)	5.3 g (LCT 93 %)	Nil	Electrolytes/100 mL: Na ⁺ 2 mmol K ⁺ 0.6 mmol Ca ²⁺ 2.8 mmol P ⁻ 3 mmol Low Vitamin A	Enteral feed or nutritional supplement for children with chronic renal failure receiving peritoneal rapid overnight dialysis.	Kindergen powder: 400 gram = £30.47
Powder provides: protein 7.5 g, carbohydrate 59 g, fat 26.3 g, energy 2104 kJ (504 kcal)/100 g.									
Modulen IBD® (Nestle Health Science)	Standard dilution (20%) of powder (sip or tube feed) per 100 mL	420 kJ (100 kcal)	3.6 g casein	11 g (sugars 3.98 g)	4.7 g	Nil	Gluten-free Residual lactose	Crohn's disease active phase, and in remission if malnourished	Modulen IBD powder: 400 gram = £15.59
Powder provides: protein 18 g, carbohydrate 54 g, fat 23 g, energy 2070 kJ (500 kcal)/100 g.									
ProSure® (Abbott Laboratories Ltd)	Liquid (sip or tube feed) per 100 mL	536 kJ (127 kcal)	6.65 g cows' milk	18.3 g (sugars 2.95 g)	2.56 g	2.07 g	Gluten-free Residual lactose Contains fish oil	Nutritional supplement for patients with pancreatic cancer. Not suitable for child under 1 year; use with caution in child 1-4 years.	ProSure liquid: 220 mL = £3.47
Renamil® (Stanningley Pharma Ltd)	Powder (sip or tube feed when reconstituted) per 100 g	2003 kJ (477 kcal)	4.6 g cows' milk	70.8 g	19.3 g	Nil	Contains lactose Gluten-free Electrolytes/100 g: Na ⁺ 1.04 mmol K ⁺ 0.13 mmol Ca ²⁺ 10.22 mmol P ⁻ 1.06 mmol Contains no vitamin A or vitamin D	Enteral feed or nutritional supplement for adults and children over 1 year with chronic renal failure.	Renamil powder: 1000 gram = £25.40
Renapro® (Stanningley Pharma Ltd)	Powder per 100 g	1580 kJ (372 kcal)	90 g whey protein	800 mg	1 g	Nil	Gluten-free Residual lactose Electrolytes/100 g: Na ⁺ 23 mmol K ⁺ 2 mmol Ca ²⁺ 4.99 mmol P ⁻ 4.84 mmol	Nutritional supplement for biochemically proven hypoproteinaemia and patients undergoing dialysis. Not suitable for child under 1 year.	Renapro powder: 600 gram = £69.60
Powder provides: protein 18 g, energy 316 kJ (74 kcal)/20-g sachet.									
Renastart® (Vitafo International Ltd)	Standard dilution (20%) of powder per 100 mL	414 kJ (99 kcal)	1.5 g cows' milk soya	12.5 g (sugars 1.3 g)	4.8 g	Nil	Contains lactose Electrolytes/100 mL: Na ⁺ 2.1 mmol K ⁺ 0.6 mmol Ca ²⁺ 0.6 mmol P ⁻ 0.6 mmol	Dietary management of renal failure in child from birth to 10 years.	Renastart powder: 400 gram = £27.92
Powder provides: protein 7.5 g, carbohydrate 62.5 g, fat 23.8 g, energy 2071 kJ (494 kcal)/100 g.									

Table 4 Feed supplements**High-energy supplements****High-energy supplements: carbohydrate**

Flavoured carbohydrate supplements are not suitable for child under 1 year; liquid supplements should be diluted before use in child under 5 years.

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Maxijul® Super Soluble (Nutricia Ltd)	Powder per 100 g	1615 kJ (380 kcal)	Nil	95 g Glucose polymer (sugars 8.6 g)	Nil	Nil	Gluten-free Lactose-free	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement.	Maxijul Super Soluble powder: 528 gram = £6.80; 25000 gram = £163.10; 200 gram = £2.73
Polycal® (Nutricia Ltd)	Powder per 100 g	1630 kJ (384 kcal)	Nil	96 g Maltodextrin (sugars 6 g)	Nil	Nil	Gluten-free Lactose-free	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement.	Polycal powder: 400 gram = £4.53
	Liquid per 100 mL	1050 kJ (247 kcal)	Nil	61.9 g Maltodextrin (sugars 12.2 g)	Nil	Nil		Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement. Not suitable for child under 3 years.	Polycal liquid: neutral, orange 200 ml = £1.81
S.O.S.® (Vitaflor International Ltd)	Powder per 100 g	1590 kJ (380 kcal)	Nil	95 g (sugars 9 g)	Nil	Nil		For use as an emergency regimen in the dietary management of inborn errors of metabolism in adults and children from birth.	S.O.S. 10 oral powder 21g sachets 30 sachet = £7.74; S.O.S. 20 oral powder 42g sachets 30 sachet = £15.48; S.O.S. 25 oral powder 52g sachets 30 sachet = £19.15; S.O.S. 15 oral powder 31g sachets 30 sachet = £11.43
Contents of each sachet should be reconstituted with water to a total volume of 200 ml									
Vitajoule® (Vitaflor International Ltd)	Powder per 100 g	1590 kJ (380 kcal)	Nil	95 g Dried glucose syrup (sugars 9 g)	Nil	Nil	Gluten-free Lactose-free	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement. Flavoured carbohydrate supplements are not suitable for child under 1 year; liquid supplements should be diluted before use in child under 5 years.	Vitajoule powder: 500 gram = £4.63

High-energy supplements: fat

Liquid supplements should be diluted before use in child under 5 years

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Calogen® (Nutricia Ltd)	Liquid (emulsion) per 100 mL	1850 kJ (450 kcal)	Nil	100 mg	50 g (LCT 100 %)	Nil	Gluten-free Lactose-free	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat (or fat and carbohydrate) supplement. Liquid supplements should be diluted before use in child under 5 years.	Calogen emulsion: banana 500 ml = £11.33; neutral 200 ml = £4.61; 500 ml = £11.33; strawberry 200 ml = £4.61; 500 ml = £11.33
Fresubin® 5 kcal Shot (Fresenius Kabi Ltd)	Liquid (emulsion) per 100 mL	2100 kJ (500 kcal)	Nil	4.0 g (sucrose)	53.8 g	400 mg	Gluten-free Lactose-free	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat (or fat and carbohydrate) supplement. Liquid supplements should be diluted before use in child under 5 years. Not suitable for child under 3 years.	Fresubin 5kcal shot drink: lemon, neutral 480 ml = £11.84
Liquigen® (Nutricia Ltd)	Liquid (emulsion) per 100 mL	1850 kJ (450 kcal)	Nil	Nil	50 g (MCT 97 %) Fractionated coconut oil	Nil	Gluten-free Lactose-free	Steatorrhoea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease, liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in epilepsy, and in type 1 lipoproteinaemia Not suitable for child under 1 year	Liquigen emulsion: 250 ml = £9.71
Medium-chain Triglyceride (MCT) Oil (Nutricia Ltd)	Liquid per 100 mL	3515 kJ (855 kcal)	Nil	Nil	MCT 100 %	Nil		Nutritional supplement for steatorrhoea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease and liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in management of epilepsy, type 1 hyperlipoproteinaemia	MCT oil: 500 ml = £15.40
FAT AND CARBOHYDRATE									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Duocal® Super Soluble (Nutricia Ltd)	Powder per 100 g	2061 kJ (492 kcal)	Nil	72.7 g (sugars 6.5 g)	22.3 g (MCT 35 %)	Nil	Gluten-free Lactose-free	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat (or fat and carbohydrate) supplement.	Duocal Super Soluble powder: 400 gram = £18.96
Energivit® (Nutricia Ltd)	Standard dilution (15%) of powder per 100 mL	309 kJ (74 kcal)	Nil	10 g (sugars 900 mg)	3.75 g	Nil	Lactose-free With vitamins, minerals, and trace elements	For children requiring additional energy, vitamins, minerals, and trace elements following a protein-restricted diet	Energivit powder: 400 gram = £23.06
Powder provides: carbohydrate 66.7 g, fat 25 g, energy 2059 kJ (492 kcal)/100 g.									

High-energy supplements: protein									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
ProSource [®] Jelly (Nutrinovo Ltd)	Semi-solid per 100 mL	315 kJ (75 kcal)	16.9 g collagen protein hydrolysate whey protein isolate	Less than 1 g	Nil	Less than 1 g	Gluten-free Lactose-free Contains porcine derivatives	Hypoproteinaemia Not recommended for child under 3 years	ProSource jelly: fruit punch, orange 118 ml = £1.87
Protifar [®] (Nutricia Ltd)	Powder per 100 g	1580 kJ (373 kcal)	88.5 g cows' milk	less than 1.5 g	1.6 g	Nil	Gluten-free Residual lactose Electrolytes/100 mL: Na ⁺ 1.3 mmol K ⁺ 1.28 mmol Ca ²⁺ 33.75 mmol P ⁻ 22.58 mmol	Nutritional supplement for use in biochemically proven hypoproteinaemia.	Protifar powder: 225 gram = £9.20
Powder provides: protein 2.2 g per 2.5 g scoopful.									
PROTEIN AND CARBOHYDRATE									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Dialamine [®] (Nutricia Ltd)	Standard dilution (20%) of powder per 100 mL	264 kJ (62 kcal)	4.3 g protein equivalent (essential and non-essential amino acids)	11.2 g (sugars 10.2 g)	Nil	Nil	Contains vitamin C	Hypoproteinaemia, chronic renal failure, wound fistula leakage with excessive protein loss, conditions requiring a controlled nitrogen intake, and haemodialysis. Not suitable for child under 6 months.	Dialamine powder: 400 gram = £77.02
Powder provides: protein equivalent 25 g, carbohydrate 65 g, vitamin C 125 mg, energy 1530 kJ (360 kcal)/100 g.									
ProSource [®] Liquid (Nutrinovo Ltd)	Liquid per 30 mL	420 kJ (100 kcal)	10 g collagen protein whey protein isolate	15 g (sugars 8 g)	Nil	Nil	Gluten-free Lactose-free May contain porcine derivatives	Biochemically proven hypoproteinaemia Not recommended for child under 3 years.	ProSource liquid 30ml sachets: citrus berry, lemon, orange creme, neutral 100 sachet = £101.16
ProSource [®] Plus (Nutrinovo Ltd)	Liquid per 30 mL	420 kJ (100 kcal)	15 g collagen protein whey protein isolate	11 g (sugars 10 g)	Nil	Nil	Gluten-free Lactose-free May contain porcine derivatives	Hypoproteinaemia Not recommended for child under 3 years	ProSource Plus liquid 30ml sachets neutral: 100 sachet = £143.90

PROTEIN, FAT, AND CARBOHYDRATE									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Calogen [®] Extra (Nutricia Ltd)	Liquid per 100 mL	1650 kJ (400 kcal)	5 g cows' milk	4.5 g (sugars 3.5 g)	40.3 g	Nil	Gluten-free Residual lactose Contains vitamins and minerals	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement. Not suitable for child under 3 years; use with caution in child 3-6 years. May require dilution for child 3-5 years.	Calogen Extra emulsion: neutral, strawberry 200 ml = £4.98
Calogen [®] Extra Shots (Nutricia Ltd)	Liquid per 100 mL	1650 kJ (400 kcal)	5 g cows' milk	4.5 g (sugars 3.5 g)	40.3 g	Nil	Gluten-free Residual lactose With vitamins and minerals	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement. Not suitable for child under 3 years; use with caution in child 3-6 years. May require dilution for child 3-5 years.	Calogen Extra Shots emulsion: neutral, strawberry 240 ml = £5.75
Calshake [®] (Fresenius Kabi Ltd)	Powder per 87 g	1841 kJ (439 kcal)	4.1 g cows' milk	56.4 g (sugars 20 g)	22 g	Nil	Contains lactose Gluten-free	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement. Not suitable for child under 1 year.	Calshake powder: banana, neutral, strawberry, vanilla 609 gram = £17.71; chocolate 630 gram = £17.71
Powder: one sachet reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 12 g.									
Enshake [®] (Abbott Laboratories Ltd)	Powder per 100 g	1893 kJ (450 kcal)	8.4 g cows' milk, soy protein isolate	69 g (sugars 14.5 g)	15.6 g	Nil	Residual lactose Contains vitamins and minerals	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement. Not suitable for child under 1 year; use with caution in child 1-6 years.	Enshake oral powder 96.5g sachets: banana, chocolate, strawberry, vanilla 6 sachet = £14.68
Powder: 96.5 g reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 16 g.									
MCT Procal [®] (Vitaflor International Ltd)	Powder per 100 g	2742 kJ (657 kcal)	12.5 g cows' milk	20.6 g (sugars 3.1 g)	63.1 g (MCT 99%)	Nil	Contains lactose	Dietary management of disorders of long-chain fatty acid oxidation, fat malabsorption, and other disorders requiring a low LCT, high MCT supplement. Not suitable for child under 1 year.	MCT procal oral powder 16g sachets: 30 sachet = £25.15
Powder 16 g provides: protein 2 g, carbohydrate 3.3 g, fat 10.1 g, energy 439 kJ (105 kcal).									

High-energy supplements: protein (product list continued)									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Pro-Cal® (Vitafo International Ltd)	Powder per 100 g	2787 kJ (667 kcal)	13.6 g cows' milk	28.2 g (sugars 16 g)	55.5 g	Nil	Contains lactose Gluten-free	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement. Not suitable for child under 1 year; use with caution in child 1-5 years.	Pro-Cal powder: 12500 gram = £224.84; 375 gram = £16.76; 510 gram = £15.53; 1500 gram = £31.64; 3000 gram = £74.68
Powder 15 g provides: protein 2 g, carbohydrate 4.2 g, fat 8.3 g, energy 418 kJ (100 kcal).									
Pro-Cal® Shot (Vitafo International Ltd)	Liquid per 100 mL	1385 kJ (334 kcal)	6.7 g cows' milk	13.4 g (sugars 13.3 g)	28.2 g	Nil	Contains lactose Gluten-free Contains soya	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement. Not suitable for child under 3 years.	Pro-Cal: shot starter pack 360 ml = £7.37; shot banana, shot neutral, shot strawberry 720 ml = £14.71
Scandishake® Mix (Nutricia Ltd)	Powder per 100 g	2099 kJ (500 kcal)	4.7 g cows' milk	65 g (sugars 14.3 g)	24.7 g	Nil	Gluten-free Contains lactose	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement. Not suitable for child under 3 years.	Scandishake Mix oral powder 85g sachets: banana, caramel, chocolate, strawberry, unflavoured, vanilla 6 sachet = £15.54
Powder: 85 g reconstituted with 240 mL whole milk provides: protein 11.7 g, carbohydrate 66.8 g, fat 30.4 g, energy 2457 kJ (588 kcal).									
Vitasavoury® (Vitafo International Ltd)	Powder per 100 g	2562 kJ (619 kcal)	12 g cows' milk	22.5 g (sugars 1.4 g)	52 g	6.4 g	Contains lactose Contains soya (chicken flavour)	Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement. Not suitable for child under 3 years.	Vitasavoury powder: chicken, golden vegetable, leek & potato, mushroom 500 g = £20.08
Fibre, vitamin, and mineral supplements									
High-fibre supplements									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Resource® Optifibre® (Nestle Health Science)	Powder per 100 g	323 kJ (76 kcal)	Nil	19 g guar gum, partially hydrolysed	Nil	78 g	Gluten-free Lactose-free	Borderline substances standard ACBS indications p. 1012 except dysphagia Not suitable for child under 5 years	Resource Optifibre powder: 80 gram = £4.33; 250 gram = £10.64
Vitamin and Mineral supplements									
Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
FruitiVits® (Vitafo International Ltd)	Powder per 100 g	133 kJ (33 kcal)	Nil	8.3 g (sugars 400 mg)	Less than 100 mg	3.3 g		Vitamin, mineral, and trace element supplement in children 3-10 years with restrictive therapeutic diets	FruitiVits oral powder 6g sachets: 30 sachet = £68.00
Paediatric Seravit® (Nutricia Ltd)	Powder per 100 g	1275 kJ (300 kcal)	Nil	75 g (sugars 6.75 g)	Nil	Nil	Pineapple flavour not suitable for child under 6 months	Vitamin, mineral, and trace element supplement in infants and children with restrictive therapeutic diets.	Seravit Paediatric powder: unflavoured 200 gram = £18.78; pineapple 200 gram = £20.01

Feed additives

Special additives for conditions of intolerance

Colief®

- ▶ For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature.

LIQUID, lactase 50 000 units/g

Colief 50,000units/g infant drops (Forum Health Products Ltd)
7 ml (ACBS) • NHS indicative price = £8.40

Fructose

- ▶ (Laevulose) For proven glucose/galactose intolerance

Glucose

- ▶ (Dextrose monohydrate) For use as an energy supplement in sucrose-isomaltase deficiency

VSL#3®

- ▶ Nutritional supplement for use under the supervision of a physician, for the maintenance of remission of ileoanal pouchitis induced by antibacterials in adults. For dosage and administration details, consult product literature.
- POWDER, containing 8 strains of live, freeze-dried, lactic acid bacteria. Contains traces of soya, gluten, and lactose.

VSL#3 Probiotic Food Supplement oral powder 4.4g sachets (Ferring Pharmaceuticals Ltd)

30 sachet (ACBS) • NHS indicative price = £34.36

Feed thickeners and pre-thickened drinks

Carobel, Instant®

- ▶ For thickening feeds in the treatment of vomiting.

POWDER, carob seed flour.

Instant Carobel powder (Cow & Gate Ltd)

135 gram (ACBS) • NHS indicative price = £2.91

Multi-thick®

- ▶ For thickening of liquids and foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive.

POWDER, modified maize starch, gluten- and lactose-free.

Multi-thick powder (Abbott Laboratories Ltd)

250 gram (ACBS) • NHS indicative price = £4.83

Nutilis® Clear

- ▶ For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years.

POWDER, maltodextrin, xanthan gum, guar gum, gluten- and lactose-free.

Nutilis Clear powder (Nutricia Ltd)

72 gram (ACBS) • NHS indicative price = £11.04 | 175 gram

(ACBS) • NHS indicative price = £8.46

Nutilis® Powder

- ▶ For thickening of foods in dysphagia. Not suitable for child under 3 years.

POWDER, carbohydrate 86 g, energy 1520 kJ (358 kcal)/100 g, modified maize starch, gluten- and lactose-free.

Nutilis powder (Nutricia Ltd)

240 gram (ACBS) • NHS indicative price = £7.00 | 300 gram

(ACBS) • NHS indicative price = £5.30

Resource® Thickened Drink

- ▶ For dysphagia. Not suitable for children under 1 year.

LIQUID, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 376 kJ (89 kcal)/100 mL. Gluten- and lactose-free.

Resource Thickened Drink custard apple (Nestle Health Science)

114 ml (ACBS) • NHS indicative price = £0.75

Resource Thickened Drink custard orange (Nestle Health Science)

114 ml (ACBS) • NHS indicative price = £0.75

Resource Thickened Drink syrup apple (Nestle Health Science)

114 ml (ACBS) • NHS indicative price = £0.75

Resource Thickened Drink syrup orange (Nestle Health Science)

114 ml (ACBS) • NHS indicative price = £0.75

Resource® ThickUp®

- ▶ For thickening of foods in dysphagia. Not suitable for children under 1 year.

POWDER, modified maize starch. Gluten- and lactose-free.

Resource ThickUp powder (Nestle Health Science)

227 gram (ACBS) • NHS indicative price = £4.66 | 337.5 gram

(ACBS) • NHS indicative price = £18.49

Resource® ThickUp Clear

- ▶ For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years.

POWDER, maltodextrin, xanthum gum, gluten- and lactose-free.

Resource ThickUp Clear powder (Nestle Health Science)

28.8 gram (ACBS) • NHS indicative price = £5.28 | 127 gram

(ACBS) • NHS indicative price = £8.46

SLO Drinks®

Nutritional supplements for metabolic diseases

Glutaric aciduria (type 1)

GA1 Anamix® Infant

- ▶ Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

GA1 Anamix Infant powder (Nutricia Ltd)

400 gram (ACBS) • NHS indicative price = £40.79

GA Gel®

- ▶ Nutritional supplement for dietary management of type 1 glutaric aciduria in children 6 months–10 years.
GEL, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 10 g, carbohydrate 10.3 g, fat trace, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1040.

GA gel oral powder 24g sachets (Vitaflor International Ltd)

30 sachet (ACBS) • NHS indicative price = £224.92

GA1 Maxamaid®

- ▶ Nutritional supplement for the dietary management of type 1 glutaric aciduria.
POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements.
Maxamaid products are generally intended for use in children 1–8 years.

GA1 Maxamaid powder (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £103.00

XLVS, TRY Glutaridon®

- ▶ Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements.
POWDER, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g.

XLVS TRY Glutaridon powder (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £195.11

Glycogen storage disease

Corn flour and corn starch

- ▶ For glycogen storage disease

Glycosade®

- ▶ A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years.
POWDER, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g.

Glycosade oral powder 60g sachets (Vitaflor International Ltd)

30 sachet (ACBS) • NHS indicative price = £118.21

Homocystinuria or hypermethioninaemia

HCU Anamix® Infant

- ▶ Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years.

POWDER, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

HCU Anamix Infant powder (Nutricia Ltd)

400 gram (ACBS) • NHS indicative price = £40.79

HCU cooler® 15

- ▶ A methionine-free protein substitute for use as a nutritional supplement in children over 3 years with homocystinuria.
LIQUID, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements.

HCU orange cooler 15 liquid (Vitaflor International Ltd)

130 mL (ACBS) • NHS indicative price = £11.87

HCU Express® 15

- ▶ A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria.
POWDER, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 50 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1040.

HCU express 15 oral powder 25g sachets (Vitaflor International Ltd)

30 sachet (ACBS) • NHS indicative price = £349.27

HCU Express® 20

- ▶ A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria.
POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/34 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1040

HCU express 20 oral powder 34g sachets (Vitaflor International Ltd)

30 sachet (ACBS) • NHS indicative price = £451.25

HCU gel®

- ▶ A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria.
POWDER, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.3 g, fat 20 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1040.

HCU gel oral powder 24g sachets (Vitaflor International Ltd)

30 sachet (ACBS) • NHS indicative price = £224.86

HCU Lophlex® LQ 20

- ▶ Nutritional supplement for the dietary management of homocystinuria in children over 3 years.
LIQUID, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 8.8 g, fat 440 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

HCU Lophlex LQ 20 liquid (Nutricia Ltd)

125 mL (ACBS) • NHS indicative price = £16.82

HCU LV®

- ▶ Nutritional supplement for the dietary management of hypermethioninaemia or vitamin B6 non-responsive homocystinuria in children over 8 years.
POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8 g sachet, with vitamins, minerals, and trace elements.

HCU-LV oral powder 27.8g sachets tropical (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £165.09

Methylmalonic or propionic acidemia**MMA/PA Anamix® Infant**

- ▶ Nutritional supplement for the dietary management of proven methylmalonic acidemia or propionic acidemia in children from birth to 3 years.

POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

MMA / PA Anamix Infant powder (Nutricia Ltd)

400 gram (ACBS) • NHS indicative price = £40.79

XMTVI Asadon®

- ▶ Nutritional supplement for the dietary management of methylmalonic acidemia or propionic acidemia in children and adults.

POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

XMTVI Asadon powder (Nutricia Ltd)

200 gram (ACBS) • NHS indicative price = £78.04

MMA/PA Maxamum®

- ▶ Nutritional supplement for the dietary management of methylmalonic acidemia or propionic acidemia.

POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamum products are generally intended for use in children over 8 years.

MMA/PA Maxamum powder (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £165.09

Other inborn errors of metabolism**Cystine500®**

- ▶ Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, cystine 500 mg, carbohydrate 3.3 g, fat nil, energy 63 kJ (15 kcal)/4 g

Cystine500 oral powder sachets (Vitafo International Ltd)

30 sachet (ACBS) • NHS indicative price = £57.14

DocOmega®

- ▶ Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth.
- POWDER, protein (cows' milk, soya) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals

DocOmega oral powder 4g sachets (Vitafo International Ltd)

30 sachet (ACBS) • NHS indicative price = £41.35

EAA® Supplement

- ▶ Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders in children over 3 years.

POWDER, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements.

EAA Supplement oral powder 12.5g sachets (Vitafo International Ltd)

50 sachet (ACBS) • NHS indicative price = £215.60

Isoleucine50®

- ▶ Nutritional supplement for use in the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, isoleucine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Isoleucine50 oral powder 4g sachets (Vitafo International Ltd)

30 sachet (ACBS) • NHS indicative price = £57.14

KeyOmega®

- ▶ Nutritional supplement for the dietary management of inborn errors of metabolism.

POWDER, protein (cows' milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g.

KeyOmega oral powder 4g sachets (Vitafo International Ltd)

30 sachet (ACBS) • NHS indicative price = £42.29

Leucine100®

- ▶ Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g

Leucine100 oral powder sachets (Vitafo International Ltd)

30 sachet (ACBS) • NHS indicative price = £57.14

Low protein drink

- ▶ Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year.

POWDER, protein (cows' milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose.

Termed *Milupa® lp-drink* by manufacturer.

Milupa LP drink (Nutricia Ltd)

400 gram (ACBS) • NHS indicative price = £9.68

Phenylalanine50®

- ▶ Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth.

POWDER, phenylalanine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Phenylalanine50 oral powder sachets (Vitafo International Ltd)

30 sachet (ACBS) • NHS indicative price = £55.48

ProZero®

- ▶ A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults.

Liquid, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose.

ProZero liquid (Vitafo International Ltd)

250 mL (ACBS) • NHS indicative price = £1.52 | 1000 mL (ACBS) • NHS indicative price = £6.09

Tyrosine1000®

- ▶ Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/4 g sachet.

Tyrosine1000 oral powder 4g sachets (Vitalfo International Ltd)

30 sachet (ACBS) • NHS indicative price = £5.23

Valine50®

- ▶ Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Valine50 oral powder 4g sachets (Vitalfo International Ltd)

30 sachet (ACBS) • NHS indicative price = £57.14

Phenylketonuria**Add-Ins®**

- ▶ Nutritional supplement for the dietary management of proven phenylketonuria in children over 4 years.

POWDER, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2 g sachet, with vitamins, minerals, and trace elements.

Add Ins oral powder 18.2g sachets (Nutricia Ltd)

60 sachet (ACBS) • NHS indicative price = £394.20

Easiphen®

- ▶ Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years.

LIQUID, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements.

Easiphen liquid (Nutricia Ltd)

250 ml (ACBS) • NHS indicative price = £10.12

L-Tyrosine

- ▶ Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations.

POWDER, L-tyrosine 20 g, carbohydrate 76.8 g, fat nil, energy 1612 kJ (379 kcal)/100 g.

L-Tyrosine powder (Nutricia Ltd)

100 gram (ACBS) • NHS indicative price = £22.98

Lophlex®

- ▶ Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 385 kJ (91 kcal)/27.8 g sachet, with vitamins, minerals, and trace elements.

Lophlex powder 27.8g sachets berry (Nutricia Ltd)

30 sachet (ACBS) • NHS indicative price = £303.90

Lophlex powder 27.8g sachets orange (Nutricia Ltd)

30 sachet (ACBS) • NHS indicative price = £303.90

Lophlex powder 27.8g sachets unflavoured (Nutricia Ltd)

30 sachet (ACBS) • NHS indicative price = £303.90

Loprofin® PKU Drink

- ▶ Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults.

LIQUID, protein (cows' milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL.

Loprofin PKU drink (Nutricia Ltd)

200 ml (ACBS) • NHS indicative price = £0.79

Loprofin® Sno-Pro

- ▶ Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure and other inborn errors of amino acid metabolism.

LIQUID, protein (cows' milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL. Contains lactose.

Loprofin SNO-PRO drink (Nutricia Ltd)

200 ml (ACBS) • NHS indicative price = £1.31

Phlexy-10® Exchange System

- ▶ Nutritional supplement for the dietary management of phenylketonuria.

CAPSULES, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule.

Phlexy-10 500mg capsules (Nutricia Ltd)

200 capsule (ACBS) • NHS indicative price = £45.49

TABLETS, protein equivalent (essential and non-essential amino acids except phenylalanine) 833 mg tablet.

Phlexy-10 tablets (Nutricia Ltd)

75 tablet (ACBS) • NHS indicative price = £29.25

DRINK MIX, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 8.8 g/20 g sachet.

Phlexy-10 drink mix apple & blackcurrant (Nutricia Ltd)

600 gram (ACBS) • NHS indicative price = £134.70

Phlexy-10 drink mix citrus burst (Nutricia Ltd)

600 gram (ACBS) • NHS indicative price = £134.70

600 gram (ACBS) • NHS indicative price = £134.70

Phlexy-Vits®

- ▶ For use as a vitamin and mineral component of restricted therapeutic diets in children over 11 years and adults with phenylketonuria and similar amino acid abnormalities.

POWDER, vitamins, minerals, and trace elements

Phlexy-Vits powder (Nutricia Ltd)

210 gram (ACBS) • NHS indicative price = £74.70

TABLETS, vitamins, minerals, and trace elements

Phlexy-Vits tablets (Nutricia Ltd)

180 tablet (ACBS) • NHS indicative price = £85.60

PK Aid 4®

- ▶ Nutritional supplement for the dietary management of phenylketonuria in children and adults.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g.

PK Aid 4 powder (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £149.97

PKU Anamix® First Spoon

- ▶ Nutritional supplement for the dietary management of proven phenylketonuria in children from 6 months to 5 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 5 g, carbohydrate 4.8 g, fat 150 mg, fibre nil, energy 168 kJ (41 kcal)/12.5 g sachet, with vitamins, minerals, and trace elements

PKU Anamix First Spoon oral powder 12.5g sachets (Nutricia Ltd)

30 sachet (ACBS) • NHS indicative price = £96.30

PKU Anamix® Infant

- ▶ Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

PKU Anamix Infant powder (Nutricia Ltd)

400 gram (ACBS) • NHS indicative price = £37.08

PKU Anamix® Junior

- ▶ Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g,

energy 455 kJ (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements

PKU Anamix Junior powder chocolate (Nutricia Ltd)
1080 gram (ACBS) • NHS indicative price = £132.60

PKU Anamix Junior powder neutral (Nutricia Ltd)
1080 gram (ACBS) • NHS indicative price = £132.60

PKU Anamix® Junior LQ

- ▶ Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 510 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

PKU Anamix Junior LQ liquid berry (Nutricia Ltd)
125 mL (ACBS) • NHS indicative price = £5.88

PKU Anamix Junior LQ liquid orange (Nutricia Ltd)
125 mL (ACBS) • NHS indicative price = £5.88

PKU cooler10®

- ▶ Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements.

PKU orange cooler 10 liquid (Vitaflor International Ltd)
87 mL (ACBS) • NHS indicative price = £4.83

87 ml (ACBS) • NHS indicative price = £7.60

TYR red cooler 15 liquid (Vitaflor International Ltd)
130 ml (ACBS) • NHS indicative price = £11.87

TYR red cooler 20 liquid (Vitaflor International Ltd)
174 ml (ACBS) • NHS indicative price = £15.89

TYR express15®

- ▶ Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults. POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.4 g, fat less than 100 mg, energy 310 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1040.

TYR express 15 oral powder 25g sachets (Vitaflor International Ltd)
30 sachet (ACBS) • NHS indicative price = £349.27

TYR express20®

- ▶ Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years. POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1040.

TYR express 20 oral powder 34g sachets (Vitaflor International Ltd)
30 sachet (ACBS) • NHS indicative price = £451.25

TYR Gel®

- ▶ Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years. GEL, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals and trace elements. To flavour unflavoured products, see FlavourPac p. 1040.

TYR gel oral powder 24g sachets (Vitaflor International Ltd)
30 sachet (ACBS) • NHS indicative price = £224.86

TYR Lophlex® LQ 20

- ▶ Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

TYR Lophlex LQ 20 liquid (Nutricia Ltd)
125 ml (ACBS) • NHS indicative price = £16.82

XPHEN TYR Tyrosidon®

- Nutritional supplement for the management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

XPHEN TYR Tyrosidon Free AA Mix powder (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £195.11

XPTM Tyrosidon®

- Nutritional supplement for the dietary management of tyrosinaemia type I in children and adults where plasma-methionine concentrations are above normal.

POWDER, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

XPTM Tyrosidon powder (Nutricia Ltd)

500 gram • NHS indicative price = £91.31

Appendix 3

Cautionary and advisory labels for dispensed medicines

Guidance for cautionary and advisory labels

Medicinal forms within BNF publications include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients and carers when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks (e.g. driving or work), any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discolouration of urine or stools by a medicine should also be mentioned.

For some medicines there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

Original packs

Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. The advice in patient information leaflets may be less appropriate when the medicine is for a child, particularly for unlicensed medicines or indications. Pharmacists should explain discrepancies to carers, if necessary. The patient information leaflet should only be withheld in exceptional circumstances because it contains other information that should be provided. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels

In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed 'NCL' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as 'Discard.... days after opening' and 'Do not use after....', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the *BNF for Children* these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid

preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the *BNF for Children* apply to medicines dispensed against a prescription. Children and carers should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the *BNF for Children* does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The *BNF for Children* will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

For *BNF for Children* 2011–2012, a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the *BNF for Children* and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

Welsh labels

Comprehensive Welsh translations are available for each cautionary and advisory label.

Labels

1 Warning: This medicine may make you sleepy

Rhybudd: Gall y feddyginiath hon eich gwneud yn gysglyd

To be used on *preparations for children* containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol

Rhybudd: Gall y feddyginiath hon eich gwneud yn gysglyd. Peidiwch â gyrnu, defnyddio offer llaw neu beirannau os ydychyn yn digwydd. Peidiwch ag yfed alcohol

To be used on *preparations for adults that can cause drowsiness*, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. *It is an offence to drive while under the influence of drink or drugs.*

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.

- 14** This medicine may colour your urine. This is harmless
 Gall y feddyginiaeth hon lliwio eich dŵr. Nid yw hyn yn arwydd o ddrwg
 To be used on *preparations that may cause the patient's urine to turn an unusual colour*. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).
- 15** Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
 Rhybudd: Fflamadwy. Ar ôl rhoi'r feddyginiaeth ymlaen, cadwch yn glir o dân neu fflamau
 To be used on *preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame*.
- 16** Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
 Rhochwch y dabled i doddî dan eich tafod - peidiwch â'i lyncu. Cadwch y tabledi yn y botel yma gyda'r caead wedi'i gau yn dynn. Gofynnwch am dabledi newydd 8 wythnos ar ôl ei hagog
 To be used on *glyceryl trinitrate tablets* to remind the patient not to transfer the tablets to plastic or less suitable containers.
- 17** Do not take more than... in 24 hours
 Peidiwch â chymryd mwy na... mewn 24 awr
 To be used on *preparations for the treatment of acute migraine* except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.
 It may also be used on preparations for which no dose has been specified by the prescriber.
- 18** Do not take more than... in 24 hours. Also, do not take more than... in any one week
 Peidiwch â chymryd mwy na... mewn 24 awr. Hefyd, peidiwch â chymryd mwy na... mewn wythnos
 To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.
- 19** Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
 Rhybudd: Bydd y feddyginiaeth hon yn eich gwneud yn gysglyd. Os ydych yn dal i deimlo'n gysglyd drannoeth, peidiwch â gyrru, defnyddio offer llaw neu beiriannau. Peidiwch ag yfed alcohol
 To be used on *preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night*. On the rare occasions when hypnotics are prescribed for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an *alternative to the label 2 wording* (the choice being at the discretion of the pharmacist) for *anxiolytics prescribed to be taken at night*.
 It is hoped that this wording will convey adequately the problem of residual morning sedation after taking 'sleeping tablets'.
- 21** Take with or just after food, or a meal
 Cymerwch gyda neu ar ôl bwyd
 To be used on *preparations that are liable to cause gastric irritation, or those that are better absorbed with food*.
 Patients should be advised that a *small amount of food is sufficient*.
- 22** Take 30 to 60 minutes before food
 Cymerwch 30 i 60 munud cyn bwyd
 To be used on some preparations *whose absorption is thereby improved*.
 Most oral antibacterials require label 23 instead (see below).
- 23** Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
 Cymerwch y feddyginiaeth hon ar stumog wag. Mae hyn yn golygu awr cyn, neu 2 awr ar ôl bwyd
 To be used on *oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach*.
- 24** Suck or chew this medicine
 Bydd angen cnoi neu sugno'r feddyginiaeth hon
 To be used on *preparations that should be sucked or chewed*.
 The pharmacist should use discretion as to which of these words is appropriate.
- 25** Swallow this medicine whole. Do not chew or crush
 Llyncwch yn gyfan. Peidiwch â chnoi neu falu'n fân
 To be used on *preparations that are enteric-coated or designed for modified-release*.
 Also to be used on *preparations that taste very unpleasant or may damage the mouth if not swallowed whole*.
 Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.
- 26** Dissolve this medicine under your tongue
 Gadewch i'r feddyginiaeth hon doddî o dan y tafod
 To be used on *preparations designed for sublingual use*.
 Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.
- 27** Take with a full glass of water
 Cymerwch gyda llond gwyrdr o ddŵr
 To be used on *preparations that should be well diluted* (e.g. chloral hydrate), *where a high fluid intake is required* (e.g. sulfonamides), *or where water is required to aid the action* (e.g. methylcellulose). The patient should be advised that 'a full glass' means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.
- 28** Spread thinly on the affected skin only
 Taenwch yn denau ar y croen sydd wedi'i effeithio yn unig
 To be used on *external preparations* that should be applied sparingly (e.g. corticosteroids, dithranol).
- 29** Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
 Peidiwch â chymryd mwy na 2 ar unrhyw un adeg. Peidiwch â chymryd mwy nag 8 mewn 24 awr
 To be used on containers of dispensed *solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an 'as required' basis*. The dose form should be specified, e.g. tablets or capsules.
 This label has been introduced because of the serious consequences of overdosage with paracetamol.
- 30** Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
 Yn cynnwys paracetamol. Peidiwch â chymryd unrhyw beth arall sy'n cynnwys paracetamol tra'n cymryd y feddyginiaeth hon. Siaradwch gyda'ch meddyg ar unwaith os ydych yn cymryd gormod, hyd yn oed os ydych yn teimlo'n iawn
 To be used on all containers of dispensed *preparations containing paracetamol*.
- 32** Contains aspirin. Do not take anything else containing aspirin while taking this medicine
 Yn cynnwys aspirin. Peidiwch â chymryd unrhyw beth arall sy'n cynnwys aspirin tra'n cymryd y feddyginiaeth hon
 To be used on containers of dispensed *preparations containing aspirin when the name on the label does not include the word 'aspirin'*.

Dental Practitioners' Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Licensed **sugar-free** versions, where available, are preferred.

Licensed **alcohol-free** mouthwashes, where available, are preferred.

Aciclovir Cream, BP
 Aciclovir Oral Suspension, BP, 200 mg/5 mL
 Aciclovir Tablets, BP, 200 mg
 Aciclovir Tablets, BP, 800 mg
 Amoxicillin Capsules, BP
 Amoxicillin Oral Powder, DPF
 Amoxicillin Oral Suspension, BP
 Artificial Saliva Gel, DPF
 Artificial Saliva Oral Spray, DPF
 Artificial Saliva Pastilles, DPF
 Artificial Saliva Protective Spray, DPF
 Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS (patients suffering from dry mouth as a result of having or, having undergone, radiotherapy or sicca syndrome):
BioXtra® Gel Mouthspray
BioXtra® Moisturising Gel
Glandosane®
Saliveze®
 Artificial Saliva Substitute Spray, DPF
 Aspirin Tablets, Dispersible, BP
 Azithromycin Capsules, 250 mg, DPF
 Azithromycin Oral Suspension, 200 mg/5 mL, DPF
 Azithromycin Tablets, 250 mg, DPF
 Azithromycin Tablets, 500 mg, DPF
 Beclometasone Pressurised Inhalation, BP,
 50 micrograms/metered inhalation, CFC-free, as:
Clenil Modulate®
 Benzydamine Mouthwash, BP 0.15%
 Benzydamine Oromucosal Spray, BP 0.15%
 Betamethasone Soluble Tablets, 500 micrograms, DPF
 Carbamazepine Tablets, BP
 Cefalexin Capsules, BP
 Cefalexin Oral Suspension, BP
 Cefalexin Tablets, BP
 Cefradine Capsules, BP
 Cetirizine Oral Solution, BP, 5 mg/5 mL
 Cetirizine Tablets, BP, 10 mg
 Chlorhexidine Gluconate Gel, BP
 Chlorhexidine Mouthwash, BP
 Chlorhexidine Oral Spray, DPF
 Chlorphenamine Oral Solution, BP
 Chlorphenamine Tablets, BP
 Choline Salicylate Dental Gel, BP
 Clarithromycin Oral Suspension, 125 mg/5 mL, DPF
 Clarithromycin Oral Suspension, 250 mg/5 mL, DPF
 Clarithromycin Tablets, BP
 Clindamycin Capsules, BP
 Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
 Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
 Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL
 Diazepam Oral Solution, BP, 2 mg/5 mL

Diazepam Tablets, BP
 Diclofenac Sodium Tablets, Gastro-resistant, BP
 Dihydrocodeine Tablets, BP, 30 mg
 Doxycycline Tablets, Dispersible, BP
 Doxycycline Capsules, BP, 100 mg
 Doxycycline Tablets, 20 mg, DPF
 Ephedrine Nasal Drops, BP
 Erythromycin Ethyl Succinate Oral Suspension, BP
 Erythromycin Ethyl Succinate Tablets, BP
 Erythromycin Stearate Tablets, BP
 Erythromycin Tablets, Gastro-resistant, BP
 Fluconazole Capsules, 50 mg, DPF
 Fluconazole Oral Suspension, 50 mg/5 mL, DPF
 Hydrocortisone Cream, BP, 1%
 Hydrocortisone Oromucosal Tablets, BP
 Hydrogen Peroxide Mouthwash, BP, 6%
 Ibuprofen Oral Suspension, BP, sugar-free
 Ibuprofen Tablets, BP
 Lansoprazole Capsules, Gastro-resistant, BP
 Lidocaine Ointment, BP, 5%
 Lidocaine Spray 10%, DPF
 Loratadine Syrup, 5 mg/5 mL, DPF
 Loratadine Tablets, BP, 10 mg
 Menthol and Eucalyptus Inhalation, BP 1980
 Metronidazole Oral Suspension, BP
 Metronidazole Tablets, BP
 Miconazole Cream, BP
 Miconazole Oromucosal Gel, BP
 Miconazole and Hydrocortisone Cream, BP
 Miconazole and Hydrocortisone Ointment, BP
 Nystatin Oral Suspension, BP
 Omeprazole Capsules, Gastro-resistant, BP
 Oxytetracycline Tablets, BP
 Paracetamol Oral Suspension, BP
 Paracetamol Tablets, BP
 Paracetamol Tablets, Soluble, BP
 Phenoxymethylpenicillin Oral Solution, BP
 Phenoxymethylpenicillin Tablets, BP
 Promethazine Hydrochloride Tablets, BP
 Promethazine Oral Solution, BP
 Saliva Stimulating Tablets, DPF
 Sodium Chloride Mouthwash, Compound, BP
 Sodium Fluoride Mouthwash, BP
 Sodium Fluoride Oral Drops, BP
 Sodium Fluoride Tablets, BP
 Sodium Fluoride Toothpaste 0.619%, DPF
 Sodium Fluoride Toothpaste 1.1%, DPF
 Sodium Fusidate Ointment, BP
 Temazepam Oral Solution, BP
 Temazepam Tablets, BP
 Tetracycline Tablets, BP

Nurse Prescribers' Formulary

Nurse Prescribers' Formulary for Community Practitioners

List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers' list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described under Details of NPF preparations.

Almond Oil Ear Drops, BP
 Arachis Oil Enema, NPF
 Aspirin Tablets, Dispersible, 300 mg, BP (max. 96 tablets; max. pack size 32 tablets)
 Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
 Bisacodyl Tablets, BP
 Catheter Maintenance Solution, Sodium Chloride, NPF
 Catheter Maintenance Solution, 'Solution G', NPF
 Catheter Maintenance Solution, 'Solution R', NPF
 Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
 Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
 Choline Salicylate Dental Gel, BP
 Clotrimazole Cream 1%, BP
 Co-danthramer Capsules, NPF
 Co-danthramer Capsules, Strong, NPF
 Co-danthramer Oral Suspension, NPF
 Co-danthramer Oral Suspension, Strong, NPF
 Co-danthrusate Capsules, BP
 Co-danthrusate Oral Suspension, NPF
 Crotamiton Cream, BP
 Crotamiton Lotion, BP
 Dimeticone barrier creams containing at least 10%
 Dimeticone Lotion, NPF
 Docusate Capsules, BP
 Docusate Enema, NPF
 Docusate Oral Solution, BP
 Docusate Oral Solution, Paediatric, BP
 Econazole Cream 1%, BP
 Emollients as listed below:
 Aquadrate® 10% w/w Cream
 Arachis Oil, BP
 Balneum® Plus Cream
 Cetaben® Emollient Cream
 Dermamist®
 Diprobace® Cream
 Diprobace® Ointment
 Doublebase®
 Doublebase® Dayleve Gel
 E45® Cream
 E45® Itch Relief Cream
 Emulsifying Ointment, BP
 Eucerin® Intensive 10% w/w Urea Treatment Cream
 Eucerin® Intensive 10% w/w Urea Treatment Lotion
 Hydromol® Cream

Hydromol® Intensive
 Hydrous Ointment, BP
 Lipobase®
 Liquid and White Soft Paraffin Ointment, NPF
 Neutrogena® Norwegian Formula Dermatological Cream
 Nutraplus® Cream
 Oilatum® Cream
 Oilatum® Junior Cream
 Paraffin, White Soft, BP
 Paraffin, Yellow Soft, BP
 Ultrabase®
 Unguentum M®
 Emollient Bath and Shower Preparations as listed below:
 Aqueous Cream, BP
 Balneum® (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIa of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
 Balneum Plus® Bath Oil (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIa of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
 Cetaben® Emollient Bath Additive
 Dermalo® Bath Emollient
 Doublebase® Emollient Bath Additive
 Doublebase® Emollient Shower Gel
 Doublebase® Emollient Wash Gel
 Hydromol® Bath and Shower Emollient
 Oilatum® Emollient
 Oilatum® Gel
 Oilatum® Junior Bath Additive
 Zerolatum® Emollient Medicinal Bath Oil
 Folic Acid Tablets 400 micrograms, BP
 Glycerol Suppositories, BP
 Ibuprofen Oral Suspension, BP (except for indications and doses that are prescription-only)
 Ibuprofen Tablets, BP (except for indications and doses that are prescription-only)
 Ispaghula Husk Granules, BP
 Ispaghula Husk Granules, Effervescent, BP
 Ispaghula Husk Oral Powder, BP
 Lactulose Solution, BP
 Lidocaine Ointment, BP
 Lidocaine and Chlorhexidine Gel, BP
 Macrogol Oral Liquid, Compound, NPF
 Macrogol Oral Powder, Compound, NPF
 Macrogol Oral Powder, Compound, Half-strength, NPF
 Magnesium Hydroxide Mixture, BP
 Magnesium Sulfate Paste, BP
 Malathion aqueous lotions containing at least 0.5%
 Mebendazole Oral Suspension, NPF
 Mebendazole Tablets, NPF
 Methylcellulose Tablets, BP
 Miconazole Cream 2%, BP
 Miconazole Oromucosal Gel, BP
 Mouthwash Solution-tablets, NPF
 Nicotine Inhalation Cartridge for Oromucosal Use, NPF
 Nicotine Lozenge, NPF
 Nicotine Medicated Chewing Gum, NPF
 Nicotine Nasal Spray, NPF
 Nicotine Oral Spray, NPF
 Nicotine Sublingual Tablets, NPF
 Nicotine Transdermal Patches, NPF
 Nystatin Oral Suspension, BP
 Olive Oil Ear Drops, BP
 Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)

Paracetamol Tablets, BP (max. 96 tablets; max. pack size 32 tablets)
 Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets; max. 96 tablets; max. pack size 32 tablets)
 Permethrin Cream, NPF
 Phosphates Enema, BP
 Povidone–Iodine Solution, BP
 Senna Oral Solution, NPF
 Senna Tablets, BP
 Senna and Ispaghula Granules, NPF
 Sodium Chloride Solution, Sterile, BP
 Sodium Citrate Compound Enema, NPF
 Sodium Picosulfate Capsules, NPF
 Sodium Picosulfate Elixir, NPF
 Spermicidal contraceptives as listed below:
 Gygel® Contraceptive Jelly
 Sterculia Granules, NPF
 Sterculia and Frangula Granules, NPF
 Titanium Ointment, BP
 Water for Injections, BP
 Zinc and Castor Oil Ointment, BP
 Zinc Oxide and Dimeticone Spray, NPF
 Zinc Oxide Impregnated Medicated Bandage, NPF
 Zinc Oxide Impregnated Medicated Stocking, NPF
 Zinc Paste Bandage, BP 1993
 Zinc Paste and Ichthammol Bandage, BP 1993

Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may **not** be prescribed by Nurses are annotated Nx.

Appliances (including Contraceptive Devices) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff). (Where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic.)

Incontinence Appliances as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff).

Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff).

Chemical Reagents as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff).

The Drug Tariffs can be accessed online at:
 National Health Service Drug Tariff for England and Wales:
www.ppa.org.uk/ppa/edt_intro.htm
 Health and Personal Social Services for Northern Ireland
 Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
 Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Details of NPF preparations

Preparations on the Nurse Prescribers' Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers' Formulary. Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

Arachis Oil Enema

arachis oil 100%

Catheter Maintenance Solution, Sodium Chloride

(proprietary products: *OptiFlo S*; *Uro-Tainer Sodium Chloride*; *Urilflex-S*), sodium chloride 0.9%

Catheter Maintenance Solution, 'Solution G'

(proprietary products: *OptiFlo G*; *Uro-Tainer Suby G*; *Urilflex G*), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

Catheter Maintenance Solution, 'Solution R'

(proprietary products: *OptiFlo R*; *Uro-Tainer Solution R*; *Urilflex R*), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions

(proprietary products: *ChloraPrep*; *Hydrex Solution*; *Hydrex spray*), chlorhexidine gluconate in alcoholic solution

Chlorhexidine gluconate aqueous solutions

(proprietary product: *Unisept*), chlorhexidine gluconate in aqueous solution

Co-danthramer Capsules [PoM]

co-danthramer 25/200 (dantron 25 mg, poloxamer '188' 200 mg)

Co-danthramer Capsules, Strong [PoM]

co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer '188' 500 mg)

Co-danthramer Oral Suspension [PoM]

(proprietary product: *Codalax*), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer '188' 200 mg/5 mL)

Co-danthramer Oral Suspension, Strong [PoM]

(proprietary product: *Codalax Forte*), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer '188' 1 g/5 mL)

Co-danthrusate Oral Suspension [PoM]

(proprietary product: *Normax*), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

Dimeticone barrier creams

(proprietary products *Conotrane Cream*, dimeticone '350' 22%; *Siopel Barrier Cream*, dimeticone '1000' 10%), dimeticone 10–22%

Dimeticone Lotion

(proprietary product: *Hedrin*), dimeticone 4%

Docusate Enema

(proprietary product: *Norgalax Micro-enema*), docusate sodium 120 mg in 10 g

Liquid and White Soft Paraffin Ointment

liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Liquid, Compound

(proprietary product: *Movicol Liquid*), macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

Macrogol Oral Powder, Compound

(proprietary products: *Laxido Orange*, *Molaxole*, *Movicol*), macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet; (amount of potassium chloride varies according to flavour of *Movicol*® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K⁺ 5.4 mmol/litre)

Macrogol Oral Powder, Compound, Half-strength

(proprietary product: *Movicol-Half*), macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Malathion aqueous lotions

(proprietary products: *Derbac-M Liquid*), malathion 0.5% in an aqueous basis

Mebendazole Oral Suspension [PoM]

(proprietary product: *Vermox*), mebendazole 100 mg/5 mL

Mebendazole Tablets [PoM]

(proprietary products: *Ovex*, *Vermox*), mebendazole 100 mg (can be supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg)

Mouthwash Solution-tablets

consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

Nicotine Inhalation Cartridge for Oromucosal Use

(proprietary products: *NicAssist Inhalator*, *Nicorette Inhalator*), nicotine 15 mg (for use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device))

Nicotine Lozenge

nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: *Nicorette Mint Lozenge*, *Nicotinell Mint Lozenge*), or nicotine (as resinate) 1.5 mg, 2 mg, or 4 mg (proprietary product: *NiQuitin Lozenges*, *NiQuitin Minis*, *NiQuitin Pre-quit*)

Nicotine Medicated Chewing Gum

(proprietary products: *NicAssist Gum*, *Nicorette Gum*, *Nicotinell Gum*, *NiQuitin Gum*), nicotine 2 mg or 4 mg

Nicotine Nasal Spray

(proprietary product: *NicAssist Nasal Spray*, *Nicorette Nasal Spray*), nicotine 500 micrograms/metered spray

Nicotine Oral Spray

(proprietary product: *Nicorette Quickmist*), nicotine 1 mg/metered spray

Nicotine Sublingual Tablets

(proprietary product: *NicAssist Microtab*, *Nicorette Microtab*), nicotine (as a cyclodextrin complex) 2 mg (to be prescribed as either a starter pack (2 × 15-tablet discs with dispenser) or refill pack (7 × 15-tablet discs))

Nicotine Transdermal Patches

releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary products: *Boots NicAssist Patch*, *Nicorette Patch*), or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (proprietary products: *NicAssist Translucent Patch*, *Nicorette Invisi Patch*), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: *Nicopatch*, *Nicotinell TTS*, *NiQuitin*, *NiQuitin Clear*) (prescriber should specify the brand to be dispensed)

Permethrin Cream

(proprietary product: *Lyclear Dermal Cream*), permethrin 5%

Senna Oral Solution

(proprietary product: *Senokot Syrup*), sennosides 7.5 mg/5 mL

Senna and Ispaghula Granules

(proprietary product: *Manevac Granules*), senna fruit 12.4%, ispaghula 54.2%

Sodium Citrate Compound Enema

(proprietary products: *Micolette Micro-enema*; *Micalax Micro-enema*; *Relaxit Micro-enema*), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

Sodium Picosulfate Capsules

(proprietary products: *Dulcolax Perles*), sodium picosulfate 2.5 mg

Sodium Picosulfate Elixir

(proprietary product: *Dulcolax Liquid*), sodium picosulfate 5 mg/5 mL

Sterculia Granules

(proprietary product: *Normacol Granules*), sterculia 62%

Sterculia and Frangula Granules

(proprietary product: *Normacol Plus Granules*), sterculia 62%, frangula (standardised) 8%

Zinc Oxide and Dimeticone Spray

(proprietary product: *Sprilon*), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit

Zinc Oxide Impregnated Medicated Bandage

(proprietary product: *Steripaste*), sterile cotton bandage impregnated with paste containing zinc oxide 15%

Zinc Oxide Impregnated Medicated Stocking

(proprietary product: *Zipzoc*), sterile rayon stocking impregnated with ointment containing zinc oxide 20%

Non-medical prescribing

Overview

A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient's agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/health/2012/04/prescribing-change.

For information on the mixing of medicines by Independent and Supplementary Prescribers, see *Mixing of medicines prior to administration in clinical practice: medical and non-medical prescribing*, National Prescribing Centre, May 2010 (available at www.gov.uk/government/uploads/system/uploads/attachment_data/file/213885/dh_116360.pdf).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions see Guidance on prescribing p. 1.

In order to protect patient safety, the initial prescribing and supply of medicines prescribed should normally remain separate functions performed by separate healthcare professionals.

Nurses

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition. Unlicensed medicines are excluded from the Nurse Prescribing Formulary in Scotland.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine hydrochloride p. 277, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

The Nurse Prescribers' Formulary p. 1057 for Community Practitioners provides information on prescribing.

Pharmacists

Pharmacist Independent Prescribers can prescribe any medicine for any medical condition. This includes unlicensed medicines, subject to accepted clinical good practice.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine hydrochloride p. 277, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Physiotherapists

Physiotherapist Independent Prescribers can prescribe any medicine for any medical condition. This includes "off-label" medicines subject to accepted clinical good practice. They are also allowed to prescribe the following Controlled Drugs: oral or injectable morphine p. 282, transdermal fentanyl p. 279 and oral diazepam p. 220, dihydrocodeine tartrate p. 278, lorazepam p. 222, oxycodone hydrochloride p. 284 or temazepam p. 821.

Physiotherapist Independent Prescribers must work within their own level of professional competence and expertise.

Therapeutic radiographers

Therapeutic Radiographer Independent Prescribers can prescribe any medicine for any medical condition. This includes "off-label" medicines subject to accepted clinical good practice. Therapeutic Radiographer Independent Prescribers must work within their own level of professional competence and expertise.

Optometrists

Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

Podiatrists

Podiatrist Independent Prescribers can prescribe any medicine for any medical condition. This includes "off-label" medicines subject to accepted clinical good practice. They are also allowed to prescribe the following Controlled Drugs for oral administration: diazepam p. 220, dihydrocodeine tartrate p. 278, lorazepam p. 222 and temazepam p. 821.

Podiatrist Independent Prescribers must work within their own level of professional competence and expertise.

Further Information

For further details about the different types of prescribers, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

Index of proprietary manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on 'special-order' manufacturers and specialist importing companies see 'Special-order manufacturers'.

Special-order manufacturers

Unlicensed medicines are available from 'special-order' manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at tinyurl.com/cdslike.

Licensed **hospital manufacturing units** also manufacture 'special-order' products as unlicensed medicines, the principal NHS units are listed below. A database (*Pro-File*; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

YellowCard

COMMISSION ON HUMAN MEDICINES (CHM)

It's easy to report online at:
www.mhra.gov.uk/yellowcard

**REPORT OF SUSPECTED ADVERSE DRUG REACTIONS**

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See 'Adverse reactions to drugs' section in BNFC or www.mhra.gov.uk/yellowcard for guidance. Do not be put off reporting because some details are not known.

PATIENT DETAILS Patient Initials: _____ Sex: M / F Is the patient pregnant? Y / N Ethnicity: _____
 Age (at time of reaction): _____ Weight (kg): _____ Identification number (e.g. Practice or Hospital Ref): _____

SUSPECTED DRUG(S)/VACCINE(S)

Drug/Vaccine (Brand if known)	Batch	Route	Dosage	Date started	Date stopped	Prescribed for
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____

SUSPECTED REACTION(S) Please describe the reaction(s) and any treatment given. (Please attach additional pages if necessary):**Outcome**

Recovered ☐
 Recovering ☐
 Continuing ☐
 Other ☐

Date reaction(s) started: _____ Date reaction(s) stopped: _____

Do you consider the reactions to be serious? Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

<input type="checkbox"/> Patient died due to reaction	<input type="checkbox"/> Involved or prolonged inpatient hospitalisation
<input type="checkbox"/> Life threatening	<input type="checkbox"/> Involved persistent or significant disability or incapacity
<input type="checkbox"/> Congenital abnormality	Medically significant; please give details: _____

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

☐ Mild ☐ Unpleasant, but did not affect everyday activities ☐ Bad enough to affect everyday activities

It's easy to report online: www.mhra.gov.uk/yellowcard

OTHER DRUG(S) (including self-medication and complementary remedies)

Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No

If yes, please give the following information if known:

Drug/Vaccine (Brand if known)	Batch	Route	Dosage	Date started	Date stopped	Prescribed for
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____

Additional relevant information e.g. medical history, test results, known allergies, rechallenge (if performed). For reactions relating to use of a medicine during pregnancy please state all other drugs taken during pregnancy, the last menstrual period, information on previous pregnancies, ultrasound scans, any delivery complications, birth defects or developmental concerns.

Please list any medicines obtained from the internet:

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

☐ Mild ☐ Unpleasant, but did not affect everyday activities ☐ Bad enough to affect everyday activities

It's easy to report online: www.mhra.gov.uk/yellowcard

OTHER DRUG(S) (including self-medication and complementary remedies)

Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No

If yes, please give the following information if known:

Drug/Vaccine (Brand if known)	Batch	Route	Dosage	Date started	Date stopped	Prescribed for
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____	_____

Additional relevant information e.g. medical history, test results, known allergies, rechallenge (if performed). For reactions relating to use of a medicine during pregnancy please state all other drugs taken during pregnancy, the last menstrual period, information on previous pregnancies, ultrasound scans, any delivery complications, birth defects or developmental concerns.

Please list any medicines obtained from the internet:

Newborn Life Support

Resuscitation Council (UK)

Newborn Life Support

Paediatric Basic Life Support

(Healthcare professionals with a duty to respond)

Resuscitation Council (UK)

Paediatric Basic Life Support

(Healthcare professionals with a duty to respond)

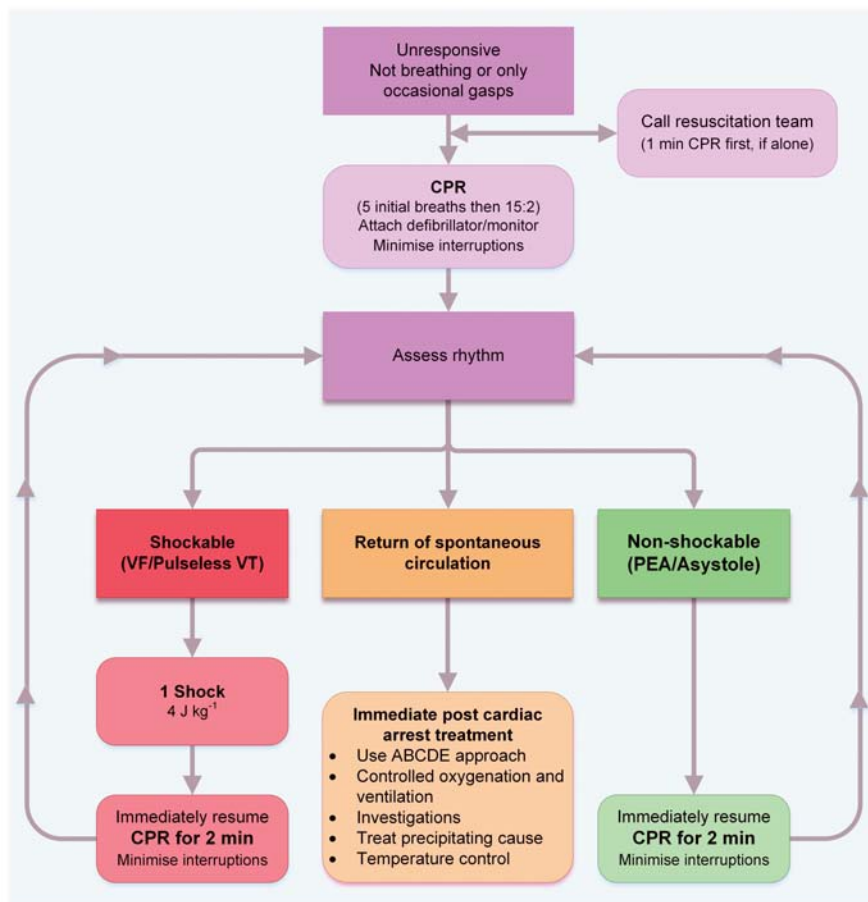

Paediatric Advanced Life Support

Resuscitation Council (UK)

Paediatric Advanced Life Support

During CPR

- Ensure high-quality CPR: rate, depth, recoil
- Plan actions before interrupting CPR
- Give oxygen
- Vascular access (intravenous, intraosseous)
- Give adrenaline every 3-5 min
- Consider advanced airway and capnography
- Continuous chest compressions when advanced airway in place
- Correct reversible causes
- Consider amiodarone after 3 and 5 shocks

Reversible Causes

- Hypoxia
- Hypovolaemia
- Hyper/hypokalaemia, metabolic
- Hypothermia
- Thrombosis (coronary or pulmonary)
- Tension pneumothorax
- Tamponade (cardiac)
- Toxic/therapeutic disturbances

Body Surface Area in Children

Medical emergencies in the community

Overview

Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the child's condition requires investigation and further treatment, the child should be transferred to hospital promptly.

Airways disease, obstructive

▶ **ASTHMA: ACUTE**

Regard each emergency consultation as being for **severe acute asthma** until shown otherwise; failure to respond adequately **at any time** requires immediate transfer to hospital

▶ **EITHER Salbutamol aerosol inhaler p. 156**

(100 micrograms/metered inhalation)

BY AEROSOL INHALATION VIA LARGE-VOLUME SPACER (AND A CLOSE-FITTING FACE MASK IF CHILD UNDER 3 YEARS)

- ▶ Child: 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary

▶ **OR Salbutamol nebuliser solution (1 mg/mL, 2 mg/mL)**

BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)

▶ Child 4 years and below: 2.5 mg every 20–30 minutes or as necessary

▶ Child 5–11 years: 2.5–5 mg every 20–30 minutes or as necessary

▶ Child 12–17 years: 5 mg every 20–30 minutes or as necessary

▶ **OR Terbutaline sulfate nebuliser solution p. 158 (2.5 mg/mL)**

BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)

▶ Child 4 years and below: 5 mg every 20–30 minutes or as necessary

▶ Child 5–11 years: 5–10 mg every 20–30 minutes or as necessary

▶ Child 12–17 years: 10 mg every 20–30 minutes or as necessary

▶ **PLUS (in all cases)**

▶ **EITHER Prednisolone tablets p. 442 (or prednisolone soluble tablets) (5 mg)**

BY MOUTH

- ▶ Child 11 years and below: 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
- ▶ Child 12–17 years: 40–50 mg once daily for at least 5 days

▶ **OR Hydrocortisone p. 440 (preferably as sodium succinate)**

BY INTRAVENOUS INJECTION

- ▶ Child 17 years and below: 4 mg/kg (max. 100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable:

▶ Child 1 year and below: 25 mg

▶ Child 2–4 years: 50 mg

▶ Child 5–17 years: 100 mg

High-flow **oxygen** should be given if available (via face mask in children)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat **nebulised beta₂ agonist** (as above) and give with

Ipratropium bromide nebuliser solution p. 153

(250 micrograms/mL)

BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)

- ▶ Child 11 years and below: 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
- ▶ Child 12–17 years: 500 micrograms every 4–6 hours as necessary

▶ **CROUP**

Dexamethasone oral solution p. 439 (2 mg/5 mL)

BY MOUTH

- ▶ Child 1 month–2 years: 150 micrograms/kg as a single dose

Anaphylaxis

▶ **ANAPHYLAXIS**

Adrenaline/epinephrine injection p. 136 (1 mg/mL (1 in 1000))

BY INTRAMUSCULAR INJECTION

- ▶ Child 5 years and below: 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
- ▶ Child 6–11 years: 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
- ▶ Child 12–17 years: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) should be given if child is small or prepubertal

High-flow **oxygen** and **intravenous fluids** should be given as soon as available.

Chlorphenamine maleate injection p. 178

BY INTRAMUSCULAR OR INTRAVENOUS INJECTION

May help counter histamine-mediated vasodilation and bronchoconstriction.

Hydrocortisone (preferably as sodium succinate)

BY INTRAVENOUS INJECTION

Has delayed action but should be given to severely affected patients to prevent further deterioration.

Bacterial disease

▶ **MENINGOCOCCAL DISEASE**

Benzylicillin sodium injection p. 338 (600 mg, 1.2 g)

BY INTRAVENOUS INJECTION (OR BY INTRAMUSCULAR INJECTION IF VENOUS ACCESS NOT AVAILABLE)

- ▶ Neonate: 300 mg
- ▶ Child 1 month–11 months: 300 mg
- ▶ Child 1–9 years: 600 mg
- ▶ Child 10–17 years: 1.2 g

NOTE A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer.

▶ **OR if history of allergy to penicillin**

Cefotaxime injection p. 320 (1 g)

BY INTRAVENOUS INJECTION (OR BY INTRAMUSCULAR INJECTION IF VENOUS ACCESS NOT AVAILABLE)

- ▶ Neonate: 50 mg/kg
- ▶ Child 1 month–11 years: 50 mg/kg (max. 1 g)
- ▶ Child 12–17 years: 1 g

NOTE A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.

- ▶ **OR if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins**

Chloramphenicol injection p. 354 (1 g)

BY INTRAVENOUS INJECTION

- ▶ Child 1 month-17 years: 12.5–25 mg/kg

NOTE A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.

See also Central nervous system infections, antibacterial therapy p. 305.

Hypoglycaemia

▶ **DIABETIC HYPOGLYCAEMIA**

Glucose or sucrose

BY MOUTH

- ▶ Child over 2 years: approx. 10–20 g (110–220 mL *Lucozade® Energy Original* or 100–200 mL *Coca-Cola®*—both non-diet versions or 2–4 teaspoonfuls of sugar or 3–6 sugar lumps) repeated after 10–15 minutes if necessary

- ▶ **OR if hypoglycaemia unresponsive or if oral route cannot be used**

Glucagon injection p. 465 (1 mg/mL)

BY SUBCUTANEOUS OR INTRAMUSCULAR INJECTION

- ▶ Child body-weight up to 25 kg: 500 micrograms (0.5 mL)
- ▶ Child body-weight 25 kg and over: 1 mg (1 mL)

- ▶ **OR if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes**

Glucose intravenous infusion p. 590 (10%)

BY INTRAVENOUS INJECTION INTO LARGE VEIN

- ▶ Child 1 month-17 years: 5 mL/kg (glucose 500 mg/kg)

Seizures

▶ **CONVULSIVE (INCLUDING FEBRILE) SEIZURES LASTING LONGER THAN 5 MINUTES**

- ▶ **EITHER Diazepam rectal solution p. 220** (2 mg/mL, 4 mg/mL)

BY RECTUM

- ▶ Neonate: 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
- ▶ Child 1 month-1 year: 5 mg, repeated once after 10–15 minutes if necessary
- ▶ Child 2-11 years: 5–10 mg, repeated once after 10–15 minutes if necessary
- ▶ Child 12-17 years: 10–20 mg, repeated once after 10–15 minutes if necessary

- ▶ **OR Midazolam oromucosal solution p. 223**

BY BUCCAL ADMINISTRATION, REPEATED ONCE AFTER 10 MINUTES IF NECESSARY

- ▶ Neonate: 300 micrograms/kg [unlicensed]
- ▶ Child 1-2 months: 300 micrograms/kg (max. 2.5 mg) [unlicensed]
- ▶ Child 3 months-11 months: 2.5 mg
- ▶ Child 1-4 years: 5 mg
- ▶ Child 5-9 years: 7.5 mg
- ▶ Child 10-17 years: 10 mg

Approximate Conversions and Units

Conversion of pounds to kilograms

lb	kg
1	0.45
2	0.91
3	1.36
4	1.81
5	2.27
6	2.72
7	3.18
8	3.63
9	4.08
10	4.54
11	4.99
12	5.44
13	5.90
14	6.35

Conversion of stones to kilograms

stones	kg
1	6.35
2	12.70
3	19.05
4	25.40
5	31.75
6	38.10
7	44.45
8	50.80
9	57.15
10	63.50
11	69.85
12	76.20
13	82.55
14	88.90
15	95.25

Conversion from millilitres to fluid ounces

mL	fl oz
50	1.8
100	3.5
150	5.3
200	7.0
500	17.6
1000	35.2

Length

1 metre (m) = 1000 millimetres (mm)
 1 centimetre (cm) = 10 mm
 1 inch (in) = 25.4 mm
 1 foot (ft) = 12 inches
 12 inches = 304.8 mm

Mass

1 kilogram (kg) = 1000 grams (g)
 1 gram (g) = 1000 milligrams (mg)
 1 milligram (mg) = 1000 micrograms
 1 microgram = 1000 nanograms
 1 nanogram = 1000 picograms

Volume

1 litre = 1000 millilitres (mL)
 1 millilitre (1 mL) = 1000 microlitres
 1 pint ≈ 568 mL

Other units

1 kilocalorie (kcal) = 4186.8 joules (J)
 1000 kilocalories (kcal) = 4.1868 megajoules (MJ)
 1 megajoule (MJ) = 238.8 kilocalories (kcal)
 1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)
 1 kilopascal (kPa) = 7.5 mmHg (pressure)

Plasma-drug concentrations

Plasma-drug concentrations in BNF publications are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

Prescribing for children: weight, height, and gender

The table below shows the **mean values** for weight, height and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of actual measurements. However, the child's actual weight and height might vary considerably from the values in the table and it is important to see the child to ensure that the value chosen is appropriate. In most cases the child's actual measurement should be obtained as soon as possible and the dose recalculated.

Age	Weight (kg)	Height (cm)
Full-term neonate	3.5	51
1 month	4.3	55
2 months	5.4	58
3 months	6.1	61
4 months	6.7	63
6 months	7.6	67
1 year	9	75
3 years	14	96
5 years	18	109
7 years	23	122
10 years	32	138
12 years	39	149
14 year old boy	49	163
14 year old girl	50	159
Adult male	68	176
Adult female	58	164

Recommended wording of cautionary and advisory labels

For details including Welsh language translation, please see Appendix 3

- 1 Warning: This medicine may make you sleepy
- 2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
- 3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
- 4 Warning: Do not drink alcohol
- 5 Do not take indigestion remedies 2 hours before or after you take this medicine
- 6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
- 7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
- 8 Warning: Do not stop taking this medicine unless your doctor tells you to stop
- 9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
- 10 Warning: Read the additional information given with this medicine
- 11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
- 12 Do not take anything containing aspirin while taking this medicine
- 13 Dissolve or mix with water before taking
- 14 This medicine may colour your urine. This is harmless
- 15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
- 16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
- 17 Do not take more than... in 24 hours
- 18 Do not take more than... in 24 hours. Also, do not take more than... in any one week
- 19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
- 21 Take with or just after food, or a meal
- 22 Take 30 to 60 minutes before food
- 23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
- 24 Suck or chew this medicine
- 25 Swallow this medicine whole. Do not chew or crush
- 26 Dissolve this medicine under your tongue
- 27 Take with a full glass of water
- 28 Spread thinly on the affected skin only
- 29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
- 30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
- 32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine

Abbreviations and Symbols

Internationally recognised units and symbols are used in the BNF publications where possible.

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing. The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c.	= ante cibum (before food)
b. d.	= bis die (twice daily)
o. d.	= omni die (every day)
o. m.	= omni mane (every morning)
o. n.	= omni nocte (every night)
p. c.	= post cibum (after food)
p. r. n.	= pro re nata (when required)
q. d. s.	= quater die sumendum (to be taken four times daily)
q. q. h.	= quarta quaque hora (every four hours)
stat	= immediately
t. d. s.	= ter die sumendum (to be taken three times daily)
t. i. d.	= ter in die (three times daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102	Tartrazine
E211	Sodium Benzoate
E104	Quinoline Yellow
E223	Sodium Metabisulfite
E110	Sunset Yellow FCF
E320	Butylated Hydroxyanisole
E123	Amaranth
E321	Butylated Hydroxytoluene
E124	Ponceau 4R
E322	Lecithins
E127	Erythrosine BS
