- ▶ Child 9–11 years (body-weight 50 kg and above): 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

- ▶ Child 12–17 years: 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

Disseminated Lyme borreliosis (early [Stage II] and late [Stage III])

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate 15 days to 28 days: 50–80 mg/kg once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration.

- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration; maximum 4 g per day

- ▶ Child 9–11 years (body-weight 50 kg and above): 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

- ▶ Child 12–17 years: 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 9–11 years (body-weight 50 kg and above): 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

- ▶ Child 12–17 years: 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration; maximum 4 g per day

- ▶ Child 9–11 years (body-weight 50 kg and above): 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

- ▶ Child 12–17 years: 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

Congenital gonococcal conjunctivitis

▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate: 25–50 mg/kg (max. per dose 125 mg) for 1 dose, intravenous infusion to be administered over 60 minutes.

Prevention of secondary case of meningococcal meningitis

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1 month–11 years: 125 mg for 1 dose
- ▶ Child 12–17 years: 250 mg for 1 dose

continued →

Prevention of secondary case of *Haemophilus influenzae* type b disease

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years: 50 mg/kg daily (max. per dose 1 g) for 2 days
- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child 12–17 years: 1 g daily for 2 days

Acute otitis media

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50 mg/kg (max. per dose 2 g) for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed
- ▶ Child 9–11 years (body-weight 50 kg and above): 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed
- ▶ Child 12–17 years: 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed

- **UNLICENSED USE** [EvGr] Not licensed for prophylaxis of *Haemophilus influenzae* type b disease. (E) Not licensed for prophylaxis of meningococcal meningitis. [EvGr] Not licensed for congenital gonococcal conjunctivitis. Not licensed for use in children under 12 years of age for uncomplicated gonorrhoea. Not licensed for use in children for pelvic inflammatory disease. (E)
- **CONTRA-INDICATIONS** Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in premature and full-term neonates—risk of precipitation in urine and lungs (fatal reactions) · full-term neonates with jaundice, hypoalbuminaemia, acidosis, unconjugated hyperbilirubinaemia, or impaired bilirubin binding—risk of developing bilirubin encephalopathy · premature neonates less than 41 weeks corrected gestational age
- **CAUTIONS** History of hypercalcaemia · history of kidney stones · use with caution in neonates
- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Anaemia · coagulation disorder · granulocytopenia
 - ▶ **Rare or very rare** Bronchospasm · glycosuria · haematuria · oedema
 - ▶ **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · cholelithiasis · hypersensitivity · kernicterus (in neonates) · nephrolithiasis · oral disorders · pancreatitis · seizure · vertigo
- SIDE-EFFECTS, FURTHER INFORMATION** Precipitates of calcium ceftriaxone can occur in the gall bladder and urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic.
- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be harmful in animal studies. [EvGr] Specialist sources indicate suitable for use in pregnancy. (D)
- **BREAST FEEDING** [EvGr] Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant. (D)
- **RENAL IMPAIRMENT**
 - Dose adjustments** Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available.
 - Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² max. 50 mg/kg daily or max. 2 g daily).

- **MONITORING REQUIREMENTS** Manufacturer advises to monitor full blood count regularly during prolonged treatment.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.
 - ▶ With intravenous use For intravenous infusion (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates—may displace bilirubin from serum albumin). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if infusion lines at different sites are used, or if the infusion lines are replaced or thoroughly flushed between infusions with Sodium Chloride 0.9% to avoid precipitation—consult product literature.
 - Displacement value may be significant, consult local guidelines. For intravenous injection, give over 5 minutes.
 - ▶ With intramuscular use For intramuscular injection, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular injection should only be considered when the intravenous route is not possible or less appropriate. If administered by intramuscular injection, the lower end of the dose range should be used for the shortest time possible; volume depends on the age and size of the child, but doses over 1 g must be divided between more than one site.
 - Displacement value may be significant, consult local guidelines. The maximum single intramuscular dose is 2 g, doses greater than 2 g must be given in divided doses or by intravenous administration (see above).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Powder for solution for injection

ELECTROLYTES: May contain Sodium

• Ceftriaxone (Non-proprietary)

Ceftriaxone (as Ceftriaxone sodium) 250 mg Ceftriaxone 250mg powder for solution for injection vials | 1 vial [PoM] £2.30 DT = £2.40

Ceftriaxone (as Ceftriaxone sodium) 1 gram Ceftriaxone 1g powder for solution for injection vials | 1 vial [PoM] £9.58 DT = £9.58 | 10 vial [PoM] £91.50–£95.80

Ceftriaxone (as Ceftriaxone sodium) 2 gram Ceftriaxone 2g powder for solution for injection vials | 1 vial [PoM] £18.30 DT = £19.18 | 10 vial [PoM] £191.80

Ceftriaxone 2g powder for solution for infusion vials | 1 vial [PoM] £19.18 DT = £19.18

▶ Rocephin (Roche Products Ltd)

Ceftriaxone (as Ceftriaxone sodium) 250 mg Rocephin 250mg powder for solution for injection vials | 1 vial [PoM] £2.40 DT = £2.40

Ceftriaxone (as Ceftriaxone sodium) 1 gram Rocephin 1g powder for solution for injection vials | 1 vial [PoM] £9.58 DT = £9.58

Ceftriaxone (as Ceftriaxone sodium) 2 gram Rocephin 2g powder for solution for injection vials | 1 vial [PoM] £19.18 DT = £19.18

ANTIBACTERIALS > GLYCOPEPTIDE

Teicoplanin

27-Nov-2017

- **DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

● **INDICATIONS AND DOSE****Clostridium difficile infection**

▶ BY MOUTH

- ▶ Child 12–17 years: 100–200 mg twice daily for 7–14 days

Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft-tissue infections, pneumonia, complicated urinary tract infections)

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 12–17 years: Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Streptococcal or enterococcal endocarditis (in combination with another antibacterial) | Bone and joint infections

▶ INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Child 12–17 years: 12 mg/kg every 12 hours for 3–5 doses, then (by intravenous injection or by intravenous infusion or by intramuscular injection) 12 mg/kg once daily

Surgical prophylaxis

▶ BY INTRAVENOUS INJECTION

- ▶ Child: (consult local protocol)

Serious infections caused by Gram-positive bacteria (including endocarditis, complicated skin and soft-tissue infections, pneumonia, complicated urinary tract infections, bone and joint infections)

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate: Initially 16 mg/kg for 1 dose, followed by 8 mg/kg once daily, subsequent dose to be administered 24 hours after initial dose, doses to be given by intravenous infusion.

- ▶ Child 1 month: Initially 16 mg/kg for 1 dose, followed by 8 mg/kg once daily, subsequent dose to be administered 24 hours after initial dose, doses to be given by intravenous infusion

- ▶ Child 2 months–11 years: Initially 10 mg/kg every 12 hours for 3 doses, then 6–10 mg/kg once daily

Peritonitis associated with peritoneal dialysis (added to dialysis fluid)

▶ BY INTRAPERITONEAL INFUSION

- ▶ Child 12–17 years: (consult local protocol)

PHARMACOKINETICS

- ▶ Teicoplanin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Not licensed for surgical prophylaxis.

- **INTERACTIONS** → Appendix 1: teicoplanin

● **SIDE-EFFECTS**

- ▶ Common or very common Fever · pain · skin reactions

- ▶ Uncommon Bronchospasm · diarrhoea · dizziness ·

- eosinophilia · headache · hearing impairment · hypersensitivity · leucopenia · nausea · thrombocytopenia · vomiting

- ▶ Rare or very rare Abscess · red man syndrome

- ▶ **Frequency not known** Agranulocytosis · angioedema · chills · neutropenia · overgrowth of nonsusceptible organisms · renal impairment · seizure · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.

- **ALLERGY AND CROSS-SENSITIVITY** Caution if history of vancomycin sensitivity.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** No information available.

● **RENAL IMPAIRMENT**

Dose adjustments Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Monitoring Monitor renal and auditory function during prolonged treatment in renal impairment.

● **MONITORING REQUIREMENTS**

- ▶ With intramuscular use or intravenous use Manufacturer advises monitor serum-teicoplanin trough concentration at steady state after completion of loading dose and during maintenance treatment—consult product literature.
- ▶ Blood counts and liver and kidney function tests required.
- ▶ Manufacturer advises monitoring for adverse reactions when doses of 12 mg/kg twice daily are administered.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For intermittent intravenous infusion, dilute reconstituted solution further in sodium chloride 0.9% or glucose 5%; give over 30 minutes.
- ▶ With oral use Injection can be used to prepare solution for oral administration.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

▶ **Targocid** (Sanofi) ▼

Teicoplanin 200 mg Targocid 200mg powder and solvent for solution for injection vials | 1 vial [PoM] £3.93

Teicoplanin 400 mg Targocid 400mg powder and solvent for solution for injection vials | 1 vial [PoM] £7.32

Vancomycin

11-May-2018

- **DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.

● **INDICATIONS AND DOSE****Clostridium difficile infection**

▶ BY MOUTH

- ▶ Neonate: 10 mg/kg every 6 hours for 10 days, treatment duration may need to be tailored to the clinical course of individual patients.

- ▶ Child 1 month–11 years: 10 mg/kg every 6 hours for 10 days, treatment duration may need to be tailored to the clinical course of individual patients; maximum 2 g per day

continued →

***Clostridium difficile* infection [first episode]**

- BY MOUTH
- Child 12–17 years: 125 mg every 6 hours for 10 days; increased if necessary to 500 mg every 6 hours for 10 days, increased dose if severe or complicated infection

***Clostridium difficile* infection [multiple recurrences]**

- BY MOUTH
- Child 12–17 years: 125 mg every 6 hours for 10 days, followed by, either tapering the dose (gradually reducing until 125 mg daily) or a pulse regimen (125–500 mg every 2–3 days for at least 3 weeks)

Complicated skin and soft tissue infections | Bone infections | Joint infections | Community-acquired pneumonia | Hospital-acquired pneumonia [including ventilator-associated pneumonia] | Infective endocarditis | Acute bacterial meningitis | Bacteraemia [occurring in association with or suspected to be associated with the licensed indications]

- BY INTRAVENOUS INFUSION

- Neonate up to 29 weeks corrected gestational age (administered on expert advice): 15 mg/kg every 24 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information.

- Neonate 29 weeks to 35 weeks corrected gestational age (administered on expert advice): 15 mg/kg every 12 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information.

- Neonate 35 weeks corrected gestational age and above (administered on expert advice): 15 mg/kg every 8 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information.

- Child 1 month–11 years: 10–15 mg/kg every 6 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information, doses higher than 60 mg/kg/day cannot be generally recommended as the safety of increased dosing has not been fully assessed
- Child 12–17 years: 15–20 mg/kg every 8–12 hours (max. per dose 2 g) adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information, in seriously ill patients, a loading dose of 25–30 mg/kg (usual max. 2 g) can be used to facilitate rapid attainment of the target trough serum-vancomycin concentration

Perioperative prophylaxis of bacterial endocarditis [in patients at high risk of developing bacterial endocarditis when undergoing major surgical procedures]

- BY INTRAVENOUS INFUSION

- Neonate: 15 mg/kg, to be given prior to induction of anaesthesia, a second dose may be required depending on duration of surgery.

- Child: 15 mg/kg, to be given prior to induction of anaesthesia, a second dose may be required depending on duration of surgery

Surgical prophylaxis (when high risk of MRSA)

- BY INTRAVENOUS INFUSION

- Child: (consult local protocol)

CNS infection e.g. ventriculitis (administered on expert advice)

- BY INTRAVENTRICULAR ADMINISTRATION

- Neonate: 10 mg every 24 hours.

- Child: 10 mg every 24 hours, for all children reduce to 5 mg daily if ventricular size reduced or increase to 15–20 mg once daily if ventricular size increased, adjust dose according to CSF concentration after 3–4 days; aim for pre-dose ("trough") concentration less than 10 mg/litre. If CSF not draining free reduce dose frequency to once every 2–3 days

Peritonitis associated with peritoneal dialysis

- BY INTRAPERITONEAL ADMINISTRATION

- Child: Add to each bag of dialysis fluid to achieve a concentration of 20–25 mg/litre

Eradication of methicillin-resistant *Staphylococcus aureus* from the respiratory tract in cystic fibrosis

- BY INHALATION OF NEBULISED SOLUTION

- Child: 4 mg/kg twice daily (max. per dose 250 mg) for 5 days, alternatively 4 mg/kg 4 times a day (max. per dose 250 mg) for 5 days

PHARMACOKINETICS

- Vancomycin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route. Not licensed for intraventricular use or inhalation. Not licensed for use by the *intrathecal* route for the treatment of meningitis.

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

For intraventricular administration, seek specialist advice.

- **CONTRA-INDICATIONS**
- With intravenous use Previous hearing loss
- **CAUTIONS**
- With intravenous use Premature neonates (monitor serum-concentration carefully) · young infants (monitor serum-concentration carefully)
- With oral use Systemic absorption may be enhanced in patients with inflammatory disorders of the intestinal mucosa or with *Clostridium difficile*-induced pseudomembranous colitis (increased risk of adverse reactions)

- **INTERACTIONS** → Appendix 1: vancomycin

SIDE-EFFECTS

GENERAL SIDE-EFFECTS Agranulocytosis · dizziness · drug fever · eosinophilia · hypersensitivity · nausea · nephritis tubulointerstitial · neutropenia (more common after 1 week or cumulative dose of 25g) · renal failure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus (discontinue) · vasculitis · vertigo

SPECIFIC SIDE-EFFECTS

- With intravenous use Back pain · bradycardia · cardiac arrest (on rapid intravenous injection) · cardiogenic shock (on rapid intravenous injection) · chest pain · dyspnoea · hearing loss · hypotension · muscle complaints ·

pseudomembranous enterocolitis · red man syndrome · wheezing

SIDE-EFFECTS, FURTHER INFORMATION Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

- **ALLERGY AND CROSS-SENSITIVITY** Caution if teicoplanin sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
Monitoring Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.
- **BREAST FEEDING** Present in milk—significant absorption following oral administration unlikely.
- **RENAL IMPAIRMENT** Manufacturer advises serial monitoring of renal function.
- ▶ With intravenous use Manufacturer advises use with caution—increased risk of toxic effects with prolonged high blood concentration.
Dose adjustments ▶ With oral use Manufacturer advises dose adjustment is unlikely to be required unless substantial oral absorption occurs in inflammatory disorders of the intestinal mucosa or with *Clostridium difficile*-induced pseudomembranous colitis, see *Monitoring*.
 - ▶ With intravenous use Manufacturer advises initial dose must not be reduced—consult product literature.
- **MONITORING REQUIREMENTS**
 - ▶ With intravenous use Manufacturer advises initial doses should be based on body-weight; subsequent dose adjustments should be based on serum-vancomycin concentrations to achieve targeted therapeutic concentrations. All patients require serum-vancomycin measurement (on the second day of treatment, immediately before the next dose if renal function normal, earlier if renal impairment—consult product literature). Frequency of monitoring depends on the clinical situation and response to treatment; regular monitoring indicated in high-dose therapy and longer-term use, particularly in patients with impaired renal function, impaired hearing, or concurrent use of nephrotoxic or ototoxic drugs. Manufacturer advises pre-dose ('trough') concentration should normally be 10–20 mg/litre depending on the site of infection and the susceptibility of the pathogen; trough concentration of 15–20 mg/litre is usually recommended to cover susceptible pathogens with MIC greater than or equal to 1 mg/litre—consult product literature.
 - ▶ Manufacturer advises periodic testing of auditory function. Manufacturer advises monitor blood counts, urinalysis, hepatic and renal function periodically in all patients; monitor leucocyte count regularly in patients receiving long-term vancomycin or if given concurrently with other drugs that may cause neutropenia or agranulocytosis.
 - ▶ With oral use Manufacturer advises monitoring serum-vancomycin concentration in inflammatory intestinal disorders.
 - ▶ With intraventricular use Aim for pre-dose ('trough') concentration less than 10 mg/litre.
 - ▶ When used by inhalation Measure lung function before and after initial dose of vancomycin and monitor for bronchospasm.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites. Displacement value may be significant, consult product literature and local guidelines. For intermittent intravenous infusion, the reconstituted preparation should be further diluted in sodium chloride 0.9% or glucose 5% to a concentration of up to 5 mg/mL; give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if

intermittent not available (limited evidence); 10 mg/mL can be used if infused via a central venous line over at least 1 hour.

- ▶ With oral use Injection can be used to prepare solution for oral administration—consult product literature.
- ▶ When used by inhalation For nebulisation administer required dose in 4 mL of sodium chloride 0.9% (or water for injections). Administer inhaled bronchodilator before vancomycin.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, infusion

Powder for solution for infusion

▶ **Vancomycin (Non-proprietary)**

Vancomycin (as Vancomycin hydrochloride) 500 mg Vancomycin 500mg powder for solution for infusion vials | 1 vial [PoM] £7.25 | 10 vial [PoM] £62.50

Vancomycin (as Vancomycin hydrochloride) 500 mg Vancocin 500mg powder for solution for infusion vials | 1 vial [PoM] £6.25

Vancomycin (as Vancomycin hydrochloride) 1 gram Vancocin 1g powder for solution for infusion vials | 1 vial [PoM] £12.50

Capsule

CAUTIONARY AND ADVISORY LABELS 9

▶ **Vancomycin (Non-proprietary)**

Vancomycin (as Vancomycin hydrochloride) 125 mg Vancomycin 125mg capsules | 28 capsule [PoM] £132.47 DT = £132.47

Vancomycin (as Vancomycin hydrochloride) 250 mg Vancomycin 250mg capsules | 28 capsule [PoM] £140.08 DT = £140.08

▶ **Vancomycin Matrigel** (Flynn Pharma Ltd)

Vancomycin (as Vancomycin hydrochloride) 125 mg Vancocin Matrigel 125mg capsules | 28 capsule [PoM] £88.31 DT = £132.47

ANTIBACTERIALS > LINCOSAMIDES

Clindamycin

- **DRUG ACTION** Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

● INDICATIONS AND DOSE

Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections | Erysipelas or cellulitis in penicillin-allergic patients (alternative to macrolides)

▶ BY MOUTH

▶ Neonate up to 14 days: 3–6 mg/kg 3 times a day.

▶ Neonate 14 days to 28 days: 3–6 mg/kg 4 times a day.

▶ Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)

▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

▶ Child: 3.75–6.25 mg/kg 4 times a day; increased if necessary up to 10 mg/kg 4 times a day (max. per dose 1.2 g), increased dose used for severe infections, total daily dose may alternatively be given in 3 divided doses, single doses above 600 mg to be continued →

administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

Staphylococcal lung infection in cystic fibrosis

- BY MOUTH
- Child: 5–7 mg/kg 4 times a day (max. per dose 600 mg)

Treatment of falciparum malaria (to be given with or following quinine)

- BY MOUTH
- Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days

- **UNLICENSED USE** Not licensed for treatment of falciparum malaria.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · diarrhoeal states

- **CAUTIONS** Avoid in Acute porphyrias p. 603

- **INTERACTIONS** → Appendix 1: clindamycin

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Abdominal pain · antibiotic associated colitis · diarrhoea (discontinue) · skin reactions
- **Uncommon** Nausea · vomiting
- **Frequency not known** Agranulocytosis · angioedema · eosinophilia · jaundice · leucopenia · neutropenia · severe cutaneous adverse reactions (SCARs) · taste altered · thrombocytopenia · vulvovaginal infection

SPECIFIC SIDE-EFFECTS

- **Frequency not known**
- With oral use Gastrointestinal disorders
- With parenteral use Cardiac arrest · hypotension

SIDE-EFFECTS, FURTHER INFORMATION Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. If *C. difficile* infection is suspected or confirmed, discontinue the antibiotic if appropriate. Seek specialist advice if the antibiotic cannot be stopped and the diarrhoea is severe.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant.

- **MONITORING REQUIREMENTS** Monitor liver and renal function if treatment exceeds 10 days. Monitor liver and renal function in neonates and infants.

- **DIRECTIONS FOR ADMINISTRATION** Avoid rapid intravenous administration. For *intravenous infusion*, dilute to a concentration of not more than 18 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 10–60 minutes at a max. rate of 20 mg/kg/hour.

- **PATIENT AND CARER ADVICE** Capsules should be swallowed with a glass of water. Patients and their carers should be advised to discontinue immediately and contact doctor if diarrhoea develops.

ANTIBACTERIALS > MACROLIDES

Macrolides

Overview

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 331 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose or the total dose in 4 divided doses, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin p. 329 is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, typhoid [unlicensed indication], and trachoma [unlicensed indication].

Clarithromycin p. 330 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication.

Erythromycin, azithromycin, and clarithromycin have a role in the treatment of Lyme disease p. 360.

Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

Macrolides

- **CAUTIONS** Electrolyte disturbances (predisposition to QT interval prolongation) · may aggravate myasthenia gravis · predisposition to QT interval prolongation

● SIDE-EFFECTS

- **Common or very common** Appetite decreased · arthralgia · diarrhoea · dizziness · eye discomfort · gastrointestinal

discomfort · gastrointestinal disorders · headache · hearing impairment · nausea · pancreatitis · sensation abnormal · skin reactions · sleep disorders · taste altered · vasodilation · vision disorders · vomiting

- **Uncommon** Angioedema · anxiety · arrhythmias · burping · candida infection · cardiac arrest · chest pain · constipation · drowsiness · dry mouth · eosinophilia · eye allergy · haemorrhage · hepatic disorders · leucopenia · loss of consciousness · movement disorders · muscle complaints · neutropenia · oedema · oral disorders · palpitations · photosensitivity reaction · pulmonary embolism · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · thrombocytosis · tremor · vertigo
- **Rare or very rare** Antibiotic associated colitis · hearing loss (can occur after large doses) · myasthenia gravis · nephritis tubulointerstitial
- **Frequency not known** Aggression · agranulocytosis · atrioventricular block · cerebral impairment · depersonalisation · depression · haemolytic anaemia · hallucination · hypotension · mania · myopathy · psychotic disorder · renal impairment · seizure · smell altered · syncope · thrombocytopenia · urine discolouration

F 328

Azithromycin

● INDICATIONS AND DOSE

Prevention of secondary cause of invasive group A streptococcal infection in patients who are allergic to penicillin

► BY MOUTH

- Child 6 months–11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
- Child 12–17 years: 500 mg once daily for 5 days

Respiratory-tract infections, otitis media, skin and soft-tissue infections

► BY MOUTH

- Child 6 months–17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
- Child 6 months–17 years (body-weight 15–25 kg): 200 mg once daily for 3 days
- Child 6 months–17 years (body-weight 26–35 kg): 300 mg once daily for 3 days
- Child 6 months–17 years (body-weight 36–45 kg): 400 mg once daily for 3 days
- Child 6 months–17 years (body-weight 46 kg and above): 500 mg once daily for 3 days

Infection in cystic fibrosis

► BY MOUTH

- Child 6 months–17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days, repeated after 1 week to complete course, treatment may be repeated as necessary

Chronic *Pseudomonas aeruginosa* infection in cystic fibrosis

► BY MOUTH

- Child 6–17 years (body-weight 25–40 kg): 250 mg 3 times a week
- Child 6–17 years (body-weight 41 kg and above): 500 mg 3 times a week

Uncomplicated genital chlamydial infections | Non-gonococcal urethritis

► BY MOUTH

- Child 12–17 years: 1 g for 1 dose

Lyme disease (under expert supervision)

► BY MOUTH

- Child 6 months–17 years: 10 mg/kg once daily (max. per dose 500 mg) for 7–10 days

Mild to moderate typhoid due to multiple-antibacterial resistant organisms

► BY MOUTH

- Child 6 months–17 years: 10 mg/kg once daily (max. per dose 500 mg) for 7 days

- **UNLICENSED USE** Not licensed for typhoid fever, Lyme disease, chronic *Pseudomonas aeruginosa* infection in cystic fibrosis, or prophylaxis of group A streptococcal infection.
- **INTERACTIONS** → Appendix 1: macrolides
- **PREGNANCY** Manufacturers advise use only if adequate alternatives not available.
- **BREAST FEEDING** Present in milk; use only if no suitable alternatives.
- **HEPATIC IMPAIRMENT** Manufacturers advise avoid in severe liver disease—no information available.
- **RENAL IMPAIRMENT** Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry or banana.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Azithromycin for bacterial infections www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0
- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 5, 9

► Azithromycin (Non-proprietary)

Azithromycin 250 mg Azithromycin 250mg tablets | 4 tablet [PoM]

£10.11 DT = £11.12 | 6 tablet [PoM] £2.04–£14.46

Azithromycin 500 mg Azithromycin 500mg tablets | 3 tablet [PoM]

Azithromycin (as Azithromycin dihydrate) 250 mg Azithromycin 250mg capsules | 4 capsule [PoM] £3.59–£10.10 | 6 capsule [PoM] £15.15 DT = £5.39

► **Zithromax** (Pfizer Ltd)

Azithromycin (as Azithromycin dihydrate) 250 mg Zithromax 250mg capsules | 4 capsule [PoM] £7.16 | 6 capsule [PoM] £10.74 DT = £5.39

F 328

Clarithromycin

● INDICATIONS AND DOSE

Respiratory-tract infections | Mild to moderate skin and soft-tissue infections | Otitis media

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Neonate: 7.5 mg/kg twice daily.

- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
- Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily
- Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily
- Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily
- Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily
- Child 12–17 years: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)
- BY INTRAVENOUS INFUSION
- Child 1 month–11 years: 7.5 mg/kg every 12 hours (max. per dose 500 mg every 12 hours) maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein
- Child 12–17 years: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

Lyme disease

► BY MOUTH

- Child 1 month–11 years: 7.5 mg/kg twice daily (max. per dose 500 mg) for 14–21 days
- Child 12–17 years: 500 mg twice daily for 14–21 days

Prevention of pertussis

► BY MOUTH

► Neonate: 7.5 mg/kg twice daily for 7 days.

- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
- Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7 days
- Child 12–17 years: 500 mg twice daily for 7 days

Helicobacter pylori eradication in combination with omeprazole, and amoxicillin or metronidazole

► BY MOUTH

- Child 1–5 years: 7.5 mg/kg twice daily (max. per dose 500 mg)
- Child 6–11 years: 7.5 mg/kg twice daily (max. per dose 500 mg)
- Child 12–17 years: 500 mg twice daily

Acute sinusitis

► BY MOUTH

- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days

- Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5 days
- Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5 days
- Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5 days
- Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days
- Child 12–17 years: 250 mg twice daily for 5 days, alternatively 500 mg twice daily for 5 days

● **UNLICENSED USE** [EvGr] Duration of treatment and child age ranges for acute sinusitis differ from product literature and adhere to national guidelines. (A) See Sinusitis (acute) p. 697 for further information. Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months. Intravenous infusion not licensed for use in children under 12 years.

● **INTERACTIONS** → Appendix 1: macrolides

● **PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk.

● **HEPATIC IMPAIRMENT** Avoid in severe impairment if renal impairment also present.

● **RENAL IMPAIRMENT** Avoid if severe hepatic impairment also present.

► With oral use Avoid *Klaricid XL*® or clarithromycin m/r preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Dose adjustments Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², max. duration 14 days.

● **DIRECTIONS FOR ADMINISTRATION** For intermittent intravenous infusion dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of 2 mg/mL; give into large proximal vein over 60 minutes.

Erythromycin**● INDICATIONS AND DOSE****Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)**

► BY MOUTH

► Neonate: 12.5 mg/kg every 6 hours.

► Child 1 month–1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections

► Child 2–7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections

► Child 8–17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections

► BY INTRAVENOUS INFUSION

► Neonate: 10–12.5 mg/kg every 6 hours.

► Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

Lyme disease (under expert supervision)

► BY MOUTH

► Child: 12.5 mg/kg 4 times a day (max. per dose 500 mg) for 14–21 days

Chlamydial ophthalmia

► BY MOUTH

► Neonate: 12.5 mg/kg every 6 hours.

► Child 1 month–1 year: 125 mg 4 times a day, increased to 250 mg every 6 hours, dose increase for severe infections, total daily dose may alternatively be given in two divided doses

► Child 2–7 years: 250 mg 4 times a day, increased to 500 mg every 6 hours, dose increase for severe infections, total daily dose may alternatively be given in two divided doses

► Child 8–17 years: 250–500 mg 4 times a day, increased to 500–1000 mg every 6 hours, dose increase for severe infections, total daily dose may alternatively be given in two divided doses

► BY INTRAVENOUS INFUSION

► Neonate: 10–12.5 mg/kg every 6 hours.

► Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

Early syphilis

► BY MOUTH

► Child 12–17 years: 500 mg 4 times a day for 14 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

► BY MOUTH

► Child 1 month–1 year: 12.5 mg/kg 4 times a day for 14 days

► Child 2–11 years: 250 mg twice daily for 14 days

► Child 12–17 years: 500 mg twice daily for 14 days

Pelvic inflammatory disease

► BY MOUTH

► Child 1 month–1 year: 12.5 mg/kg 4 times a day for 14 days

► Child 2–11 years: 250 mg twice daily for 14 days

► Child 12–17 years: 500 mg twice daily for 14 days

Prevention and treatment of pertussis

► BY MOUTH

► Neonate: 12.5 mg/kg every 6 hours.

► Child 1 month–1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections

► Child 2–7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections

► Child 8–17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections

► BY INTRAVENOUS INFUSION

► Neonate: 10–12.5 mg/kg every 6 hours.

► Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

Prevention of secondary case of diphtheria in non-immune patient

► BY MOUTH

► Child 1 month–1 year: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

► Child 2–7 years: 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

► Child 8–17 years: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients

► BY MOUTH

► Child 1 month–1 year: 125 mg every 6 hours for 10 days

► Child 2–7 years: 250 mg every 6 hours for 10 days

► Child 8–17 years: 250–500 mg every 6 hours for 10 days

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)

► BY MOUTH

► Child 1 month–1 year: 125 mg twice daily, antibiotic prophylaxis is not fully reliable

► Child 2–7 years: 250 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

► Child 8–17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection continued →

Prevention of recurrence of rheumatic fever

► BY MOUTH

- Child 1 month–1 year: 125 mg twice daily
- Child 2–17 years: 250 mg twice daily

Acne

► BY MOUTH

- Child 1–23 months: 250 mg once daily, alternatively 125 mg twice daily
- Child 12–17 years: 500 mg twice daily

Gastro-intestinal stasis

► BY MOUTH

- Neonate: 3 mg/kg 4 times a day.
- Child: 3 mg/kg 4 times a day
- BY INTRAVENOUS INFUSION
- Neonate: 3 mg/kg 4 times a day.
- Child 1–11 months: 3 mg/kg 4 times a day

- **UNLICENSED USE** Not licensed for use in gastro-intestinal stasis.

- **CAUTIONS** Avoid in Acute porphyrias p. 603 • neonate under 2 weeks (risk of hypertrophic pyloric stenosis)

- **INTERACTIONS** → Appendix 1: macrolides

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Only small amounts in milk—not known to be harmful.

- **HEPATIC IMPAIRMENT** May cause idiosyncratic hepatotoxicity.

RENAL IMPAIRMENT

- **Dose adjustments** Reduce dose in severe renal impairment (ototoxicity).

DIRECTIONS FOR ADMINISTRATION

- With intravenous use Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.

PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Erythromycin for bacterial infections www.medicinesforchildren.org.uk/erythromycin-for-bacterial-infections

PROFESSION SPECIFIC INFORMATION**Dental practitioners' formulary**

Erythromycin tablets e/c may be prescribed. Erythromycin ethyl succinate oral suspension may be prescribed. Erythromycin stearate tablets may be prescribed. Erythromycin ethyl succinate tablets may be prescribed.

ANTIBACTERIALS > MONOBACTAMS**Aztreonam**

- **DRUG ACTION** Aztreonam is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

● INDICATIONS AND DOSE

Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Neonate up to 7 days: 30 mg/kg every 12 hours.

- Neonate 7 days to 28 days: 30 mg/kg every 6–8 hours.

- Child 1 month–11 years: 30 mg/kg every 6–8 hours
- Child 12–17 years: 1 g every 8 hours, alternatively 2 g every 12 hours

Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis

► BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

- Child 2–11 years: 50 mg/kg every 6–8 hours (max. per dose 2 g 4 times a day)

- ▶ Child 12–17 years: 2 g every 6–8 hours

Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ Child 6–17 years: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

- **UNLICENSED USE** Injection not licensed for use in children under 7 days.

● CAUTIONS

- ▶ When used by inhalation Haemoptysis—risk of further haemorrhage

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Dyspnoea · respiratory disorders

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ When used by inhalation Cough · haemoptysis · joint disorders · laryngeal pain · nasal complaints · rash

- ▶ **Rare or very rare**

- ▶ With parenteral use Anaemia · asthenia · breast tenderness · chest pain · confusion · diplopia · dizziness · eosinophilia · haemorrhage · headache · hepatic disorders · hypotension · insomnia · leucocytosis · myalgia · nasal congestion · neutropenia · oral disorders · pancytopenia · paraesthesia · pseudomembranous enterocolitis · seizure · thrombocytopenia · thrombocytosis · tinnitus · vertigo · vulvovaginal candidiasis

- ▶ **Frequency not known**

- ▶ With parenteral use Abdominal pain · angioedema · diarrhoea · nausea · skin reactions · taste altered · toxic epidermal necrolysis · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in aztreonam hypersensitivity.

Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

● PREGNANCY

- ▶ With intravenous use No information available; manufacturer of injection advises avoid.
- ▶ When used by inhalation No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

- **BREAST FEEDING** Amount in milk probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Use injection with caution.

Monitoring ▶ With intravenous use Monitor liver function.

● RENAL IMPAIRMENT

Dose adjustments ▶ With intravenous use If estimated glomerular filtration rate 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If estimated glomerular filtration rate less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.

● MONITORING REQUIREMENTS

- ▶ When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For intravenous injection, give over 3–5 minutes. Displacement value of injection may be significant, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.

- ▶ When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that aztreonam powder for nebuliser solution (Cayston[®]) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as ≥2% decline in forced expiratory volume in 1 second).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for nebuliser solution

- ▶ **Cayston** (Gilead Sciences International Ltd)

Aztreonam (as Aztreonam lysine) 75 mg Cayston 75mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset | 84 vial [PoM] £2,181.53

Powder for solution for injection

- ▶ **Azactam** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Aztreonam 1 gram Azactam 1g powder for solution for injection vials | 1 vial [PoM] £9.40 (Hospital only)

Aztreonam 2 gram Azactam 2g powder for solution for injection vials | 1 vial [PoM] £18.82 (Hospital only)

ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

● INDICATIONS AND DOSE

Anaerobic infections

- ▶ BY MOUTH

- ▶ Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)

- ▶ Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)

- ▶ Child 12–17 years: 400 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)

- ▶ BY RECTUM

- ▶ Child 1–11 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days

- ▶ Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days

- ▶ Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days

- ▶ Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days

- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 26 weeks corrected gestational age: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 24 hours, then 7.5 mg/kg daily usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection).

- ▶ Neonate 26 weeks to 34 weeks corrected gestational age: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 12 hours, then 7.5 mg/kg every 12 hours usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection).

continued →

- ▶ Neonate 34 weeks corrected gestational age and above: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 8 hours, then 7.5 mg/kg every 8 hours usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection).

- ▶ Child 1 month: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 8 hours, then 7.5 mg/kg every 8 hours usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection)
- ▶ Child 2 months–17 years: 7.5 mg/kg every 8 hours (max. per dose 500 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)

***Helicobacter pylori* eradication; in combination with clarithromycin and omeprazole**

▶ BY MOUTH

- ▶ Child 1–5 years: 100 mg twice daily
- ▶ Child 6–11 years: 200 mg twice daily
- ▶ Child 12–17 years: 400 mg twice daily

***Helicobacter pylori* eradication; in combination with amoxicillin and omeprazole**

▶ BY MOUTH

- ▶ Child 1–5 years: 100 mg 3 times a day
- ▶ Child 6–11 years: 200 mg 3 times a day
- ▶ Child 12–17 years: 400 mg 3 times a day

Fistulating Crohn's disease

▶ BY MOUTH

- ▶ Child: 7.5 mg/kg 3 times a day usually given for 1 month but should not be used for longer than 3 months because of concerns about peripheral neuropathy

Pelvic inflammatory disease

▶ BY MOUTH

- ▶ Child 12–17 years: 400 mg twice daily for 14 days

Acute ulcerative gingivitis

▶ BY MOUTH

- ▶ Child 1–2 years: 50 mg every 8 hours for 3 days
- ▶ Child 3–6 years: 100 mg every 12 hours for 3 days
- ▶ Child 7–9 years: 100 mg every 8 hours for 3 days
- ▶ Child 10–17 years: 200–250 mg every 8 hours for 3 days

Acute oral infections

▶ BY MOUTH

- ▶ Child 1–2 years: 50 mg every 8 hours for 3–7 days
- ▶ Child 3–6 years: 100 mg every 12 hours for 3–7 days
- ▶ Child 7–9 years: 100 mg every 8 hours for 3–7 days
- ▶ Child 10–17 years: 200–250 mg every 8 hours for 3–7 days

Surgical prophylaxis

▶ BY MOUTH

- ▶ Child 1 month–11 years: 30 mg/kg (max. per dose 500 mg), to be administered 2 hours before surgery
- ▶ Child 12–17 years: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

▶ BY RECTUM

- ▶ Child 5–9 years: 500 mg, to be administered 2 hours before surgery, then 500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)
- ▶ Child 10–17 years: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 40 weeks corrected gestational age: 10 mg/kg, to be administered up to 30 minutes before the procedure.

- ▶ Neonate 40 weeks corrected gestational age and above: 20–30 mg/kg, to be administered up to 30 minutes before the procedure.

- ▶ Child 1 month–11 years: 30 mg/kg (max. per dose 500 mg), to be administered up to 30 minutes before the procedure
- ▶ Child 12–17 years: 500 mg, to be administered up to 30 minutes before the procedure, then 500 mg every 8 hours if required for up to 3 further doses (in high-risk procedures)

Invasive intestinal amoebiasis | Extra-intestinal amoebiasis (including liver abscess)

▶ BY MOUTH

- ▶ Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

Urogenital trichomoniasis

▶ BY MOUTH

- ▶ Child 1–2 years: 50 mg 3 times a day for 7 days
- ▶ Child 3–6 years: 100 mg twice daily for 7 days
- ▶ Child 7–9 years: 100 mg 3 times a day for 7 days
- ▶ Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

Giardiasis

▶ BY MOUTH

- ▶ Child 1–2 years: 500 mg once daily for 3 days
- ▶ Child 3–6 years: 600–800 mg once daily for 3 days
- ▶ Child 7–9 years: 1 g once daily for 3 days
- ▶ Child 10–17 years: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

Established case of tetanus

▶ BY INTRAVENOUS INFUSION

- ▶ Child: (consult product literature)

● **INTERACTIONS** → Appendix 1: metronidazole

● **SIDE-EFFECTS**

- ▶ **Common or very common** Dry mouth · myalgia · nausea · oral disorders · taste altered · vomiting
- ▶ **Uncommon** Asthenia · headache · leucopenia (with long term or intensive therapy)
- ▶ **Rare or very rare** Agranulocytosis · angioedema · appetite decreased · ataxia · confusion · diarrhoea · dizziness · drowsiness · encephalopathy · epigastric pain · epileptiform seizure (with long term or intensive therapy) · hallucination · hepatic disorders · meningitis aseptic · mucositis · neutropenia · optic neuropathy · pancreatitis · pancytopenia · peripheral neuropathy (with long term or intensive therapy) · psychotic disorder · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · urine dark · vision disorders
- ▶ **Frequency not known** Depressed mood · hearing impairment
- **PREGNANCY** Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.
- **HEPATIC IMPAIRMENT** Use with caution in hepatic encephalopathy.
- Dose adjustments** In severe liver disease reduce total daily dose to one-third, and give once daily.
- **MONITORING REQUIREMENTS** Clinical and laboratory monitoring advised if treatment exceeds 10 days.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give over 20–30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION**
Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Metronidazole for bacterial infections www.medicinesforchildren.org.uk/metronidazole-bacterial-infections
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Metronidazole Tablets may be prescribed. Metronidazole Oral Suspension may be prescribed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Tablet

CAUTIONARY AND ADVISORY LABELS 4, 9, 21, 25, 27

Metronidazole (Non-proprietary)

Metronidazole 200 mg Metronidazole 200mg tablets | 21 tablet [PoM] £4.99 DT = £4.03 | 250 tablet [PoM] £20.00

Metronidazole 400 mg Metronidazole 400mg tablets | 21 tablet [PoM] £7.95 DT = £4.30

Metronidazole 500 mg Metronidazole 500mg tablets | 21 tablet [PoM] £37.82 DT = £37.82

Flagyl (Zentiva)

Metronidazole 200 mg Flagyl 200mg tablets | 21 tablet [PoM] £4.49 DT = £4.03

Metronidazole 400 mg Flagyl 400mg tablets | 14 tablet [PoM] £6.34

Suppository

CAUTIONARY AND ADVISORY LABELS 4, 9

Flagyl (Zentiva)

Metronidazole 500 mg Flagyl 500mg suppositories | 10 suppository [PoM] £15.18

Metronidazole 1 gram Flagyl 1g suppositories | 10 suppository [PoM] £23.06

Oral suspension

CAUTIONARY AND ADVISORY LABELS 4, 9

Metronidazole (Non-proprietary)

Metronidazole (as Metronidazole benzoate) 40 mg per 1 ml Metronidazole 200mg/5ml oral suspension | 100 ml [PoM] £32.93 DT = £32.93

Infusion

ELECTROLYTES: May contain Sodium

Metronidazole (Non-proprietary)

Metronidazole 5 mg per 1 ml Metronidazole 500mg/100ml infusion 100ml Macoflex bags | 1 bag [PoM] £5
Metronidazole 500mg/100ml infusion 100ml bags | 20 bag [PoM] £63.86

Tinidazole

- **DRUG ACTION** Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

INDICATIONS AND DOSE

Intestinal amoebiasis

BY MOUTH

- ▶ Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
- ▶ Child 12–17 years: 2 g once daily for 2–3 days

Amoebic involvement of liver

BY MOUTH

- ▶ Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
- ▶ Child 12–17 years: 1.5–2 g once daily for 3–6 days

Urogenital trichomoniasis | Giardiasis

BY MOUTH

- ▶ Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
- ▶ Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary

INTERACTIONS → Appendix 1: tinidazole

SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · appetite decreased · diarrhoea · headache · nausea · skin reactions · vertigo · vomiting
- ▶ **Frequency not known** Angioedema · ataxia · dizziness · fatigue · flushing · leucopenia · oral disorders · peripheral neuropathy · seizure · sensation abnormal · taste altered · urine discolouration

- **PREGNANCY** Manufacturer advises avoid in first trimester.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.

- **MONITORING REQUIREMENTS** Clinical and laboratory monitoring advised if treatment exceeds 10 days.

ANTIBACTERIALS > PENICILLINS

Penicillins

Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin sodium p. 338 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease in children. It is also used in combination with gentamicin p. 312 for the empirical treatment of sepsis in neonates less than 48 hours old. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium **is no longer the drug of first choice for pneumococcal meningitis**. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 333 is preferred. Benzylpenicillin sodium is inactivated by gastric acid and absorption from the gastro-intestinal tract is low; therefore it must be given by injection.

Benzathine benzylpenicillin or procaine benzylpenicillin

are used in the treatment of syphilis.

Phenoxymethylpenicillin p. 339 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle cell disease.

Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin sodium because they produce penicillinases. Flucloxacillin p. 345, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the main indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Broad-spectrum penicillins

Ampicillin p. 341 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Ampicillin is also active against *Listeria* spp. and enterococci. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the 'blind' treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin can be given by mouth, but less than half the dose is absorbed and absorption is further decreased by the presence of food in the gut. Ampicillin is well excreted in the bile and urine.

Amoxicillin p. 339 is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach.

Amoxicillin or ampicillin are principally indicated for the treatment of community-acquired pneumonia and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections. They are also used in the treatment of endocarditis and listerial meningitis. Amoxicillin may also be used for the treatment of Lyme disease [not licensed].

Maculopapular rashes occur commonly with ampicillin (and amoxicillin) but are not usually related to true penicillin allergy. They often occur in children with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. The risk of rash is also increased in children with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Co-amoxiclav p. 343 consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampicil p. 342) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

Antipseudomonal penicillins

Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam.

Ticarcillin, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam p. 337 has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 337 and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicæmia, hospital-acquired pneumonia,

and complicated infections involving the urinary-tract, skin and soft tissue, or intra-abdomen. They may be used for the empirical treatment of septicæmia in immunocompromised children but otherwise should generally be reserved for serious infections resistant to other antibacterials. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin) since they have a synergistic effect.

Piperacillin with tazobactam is used in cystic fibrosis for the treatment of *Ps. aeruginosa* colonisation when ciprofloxacin p. 348 and nebulised colistimethate sodium p. 346 have been ineffective; it can also be used in infective exacerbations, when it is combined with an aminoglycoside.

Mecillinams

Pivmecillinam hydrochloride p. 344 has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci.

Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

Penicillins

● **DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

● **CAUTIONS** History of allergy

● **SIDE-EFFECTS**

- **Common or very common** Diarrhoea · hypersensitivity · nausea · skin reactions · thrombocytopenia · vomiting
- **Uncommon** Antibiotic associated colitis · leucopenia
- **Rare or very rare** Agranulocytosis · angioedema · haemolytic anaemia · hepatic disorders · nephritis · tubulointerstitial · neutropenia · seizure · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can cause antibiotic-associated colitis.

● **ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin

then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

ANTIBACTERIALS > PENICILLINS, ANTIPSEUDOMONAL WITH BETA- LACTAMASE INHIBITOR

F 336

Piperacillin with tazobactam

● INDICATIONS AND DOSE

Hospital-acquired pneumonia | Septicaemia | Complicated infections involving the urinary tract | Complicated infections involving the skin | Complicated infections involving the soft-tissues

► BY INTRAVENOUS INFUSION

► Neonate: 90 mg/kg every 8 hours.

- Child 1 month–11 years: 90 mg/kg every 6–8 hours (max. per dose 4.5 g every 6 hours)
- Child 12–17 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

Complicated intra-abdominal infections

► BY INTRAVENOUS INFUSION

- Child 2–11 years: 112.5 mg/kg every 8 hours (max. per dose 4.5 g)
- Child 12–17 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

Infections in neutropenic patients

► BY INTRAVENOUS INFUSION

- Child: 90 mg/kg every 6 hours (max. per dose 4.5 g)

● **UNLICENSED USE** Not licensed for use in children under 12 years (except for children 2–12 years with neutropenia and complicated intra-abdominal infections).

● **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)

● **INTERACTIONS** → Appendix 1: penicillins

● SIDE-EFFECTS

► **Common or very common** Anaemia · candida infection · constipation · gastrointestinal discomfort · headache · insomnia

► **Uncommon** Arthralgia · flushing · hypokalaemia · hypotension · myalgia

► **Rare or very rare** Epistaxis · stomatitis

► **Frequency not known** Eosinophilia · pancytopenia · pneumonia eosinophilic · renal failure · thrombocytosis

● **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.

● **BREAST FEEDING** Trace amount in milk, but appropriate to use.

● RENAL IMPAIRMENT

Dose adjustments Child under 12 years 78.75 mg/kg (max. 4.5 g) every 8 hours if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

Child 12–18 years max. 4.5 g every 8 hours if estimated glomerular filtration rate 20–40 mL/minute/1.73 m²; max. 4.5 g every 12 hours if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

● **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

● **DIRECTIONS FOR ADMINISTRATION** Displacement value may be significant when reconstituting injection, consult local guidelines. For intravenous infusion, dilute reconstituted solution to a concentration of 15–90 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Powder for solution for injection

ELECTROLYTES: May contain Sodium

► **Piperacillin with tazobactam (Non-proprietary)**

Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram Piperacillin 2g / Tazobactam 250mg powder for solution for injection vials | 1 vial [PoM] £9.55 DT = £7.65 (Hospital only)

Piperacillin 2g / Tazobactam 250mg powder for solution for infusion vials | 1 vial [PoM] £7.85 DT = £7.65

► **Tazocin** (Pfizer Ltd)

Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram Tazocin 2.25g powder for solution for injection vials | 1 vial [PoM] £7.65 DT = £7.65

F 336

Ticarcillin with clavulanic acid

● INDICATIONS AND DOSE

Infections due to *Pseudomonas* and *Proteus* spp.

► BY INTRAVENOUS INFUSION

► Preterm neonate (body-weight up to 2 kg): 80 mg/kg every 12 hours.

► Preterm neonate (body-weight 2 kg and above): 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections.

► Neonate: 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections.

► Child (body-weight up to 40 kg): 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections

► Child (body-weight 40 kg and above): 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

● **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)

CAUTIONS, FURTHER INFORMATION

► **Cholestatic jaundice** Cholestatic jaundice is possibly associated with clavulanic acid. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav (amoxicillin, clavulanic acid) than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

● **INTERACTIONS** → Appendix 1: clavulanic acid · penicillins

● **SIDE-EFFECTS** Bullous dermatitis · eosinophilia · haemorrhage · hypokalaemia

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

● **RENAL IMPAIRMENT** Accumulation of electrolytes contained in preparation can occur in patients with renal failure.

Dose adjustments ▶ In neonates Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

- ▶ In children Use normal dose every 8 hours if estimated glomerular filtration rate 30–60 mL/minute/1.73 m²; use half normal dose every 8 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use half normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

- **DIRECTIONS FOR ADMINISTRATION** Displacement value may be important, consult local guidelines. For intermittent infusion, dilute reconstituted solution further to a concentration of 16–32 mg/mL with glucose 5%; infuse over 30–40 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Dose is expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Potassium, sodium

▶ **Timentin** (GlaxoSmithKline UK Ltd)

Clavulanic acid (as Potassium clavulanate) 200 mg, Ticarcillin (as Ticarcillin sodium) 3 gram Timentin 3.2g powder for solution for infusion vials | 4 vial **[PoM]** £21.32

ANTIBACTERIALS > PENICILLINS, BETA-LACTAMASE SENSITIVE

F 336

Benzylpenicillin sodium (Penicillin G)

● INDICATIONS AND DOSE

Mild to moderate susceptible infections | Throat infections | Otitis media | Cellulitis | Pneumonia

▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 25 mg/kg every 12 hours; increased if necessary to 25 mg/kg every 8 hours, intravenous route recommended in neonates.

- ▶ Neonate 7 days to 28 days: 25 mg/kg every 8 hours; increased if necessary to 50 mg/kg every 8 hours in severe infection, intravenous route recommended in neonates.

- ▶ Child: 25 mg/kg every 6 hours; increased if necessary to 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours) in severe infection, intravenous route recommended in infants

Endocarditis (in combination with other antibacterial if necessary)

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Child: 25 mg/kg every 4 hours; increased if necessary to 50 mg/kg every 4 hours (max. per dose 2.4 g every 4 hours)

Meningitis | Meningococcal disease

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 50 mg/kg every 12 hours.

- ▶ Neonate 7 days to 28 days: 50 mg/kg every 8 hours.

- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital

▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1–11 months: 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Child 1–9 years: 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently

▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1–11 months: 300 mg, administer as single dose prior to transfer to hospital
- ▶ Child 1–9 years: 600 mg, administer as single dose prior to transfer to hospital
- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to transfer to hospital

Neonatal sepsis

▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 25 mg/kg every 12 hours; increased if necessary to 25 mg/kg every 8 hours, intravenous route recommended in neonates.

- ▶ Neonate 7 days to 28 days: 25 mg/kg every 8 hours; increased if necessary to 50 mg/kg every 8 hours in severe infection, intravenous route recommended in neonates.

IMPORTANT SAFETY INFORMATION

Intrathecal injection of benzylpenicillin is **not** recommended.

- **CAUTIONS** Accumulation of sodium from injection can occur with high doses
 - **INTERACTIONS** → Appendix 1: penicillins
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Fever · Jarisch-Herxheimer reaction
 - ▶ **Rare or very rare** Neurotoxicity
 - ▶ **Frequency not known** Coma
 - **PREGNANCY** Not known to be harmful.
 - **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
 - **RENAL IMPAIRMENT** Accumulation of sodium from injection can occur in renal failure. High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma.
- Dose adjustments** Estimated glomerular filtration rate 10–50 mL/minute/1.73 m², use normal dose every 8–12 hours.
- Estimated glomerular filtration rate less than 10 mL/minute/1.73 m² use normal dose every 12 hours.
 - **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
 - **DIRECTIONS FOR ADMINISTRATION** Intravenous route recommended in neonates and infants. For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.

Phenoxymethylpenicillin

(Penicillin V)

● INDICATIONS AND DOSE

Oral infections | Tonsillitis | Otitis media | Erysipelas |

Cellulitis

▶ BY MOUTH

- ▶ Child 1–11 months: 62.5 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 1–5 years: 125 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 6–11 years: 250 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 12–17 years: 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day

Prevention of recurrence of rheumatic fever

▶ BY MOUTH

- ▶ Child 1 month–5 years: 125 mg twice daily
- ▶ Child 6–17 years: 250 mg twice daily

Prevention of secondary case of invasive group A streptococcal infection

▶ BY MOUTH

- ▶ Neonate: 12.5 mg/kg every 6 hours (max. per dose 62.5 mg) for 10 days.

- ▶ Child 1–11 months: 62.5 mg every 6 hours for 10 days
- ▶ Child 1–5 years: 125 mg every 6 hours for 10 days
- ▶ Child 6–11 years: 250 mg every 6 hours for 10 days
- ▶ Child 12–17 years: 250–500 mg every 6 hours for 10 days

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease

▶ BY MOUTH

- ▶ Child 1–11 months: 62.5 mg twice daily
- ▶ Child 1–4 years: 125 mg twice daily
- ▶ Child 5–17 years: 250 mg twice daily

Acute sinusitis

▶ BY MOUTH

- ▶ Child 1–11 months: 62.5 mg 4 times a day for 5 days
- ▶ Child 1–5 years: 125 mg 4 times a day for 5 days
- ▶ Child 6–11 years: 250 mg 4 times a day for 5 days
- ▶ Child 12–17 years: 500 mg 4 times a day for 5 days

- **UNLICENSED USE** [EvGr] Duration of treatment for acute sinusitis adheres to national guidelines. ⚠ See Sinusitis (acute) p. 697 for further information.

- **INTERACTIONS** → Appendix 1: penicillins

- **SIDE-EFFECTS** Arthralgia · circulatory collapse · coagulation disorder · eosinophilia · exfoliative dermatitis · faeces soft · fever · increased risk of infection · neurotoxicity · oral disorders · paraesthesia

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

F 336

Amoxicillin

(Amoxycillin)

● INDICATIONS AND DOSE

Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)

▶ BY MOUTH

- ▶ Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).

- ▶ Child 1–11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
- ▶ Child 1–4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
- ▶ Child 5–11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
- ▶ Child 12–17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

- ▶ Neonate 7 days to 28 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

continued →

- ▶ Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

Cystic fibrosis (treatment of asymptomatic *Haemophilus influenzae* carriage or mild exacerbation)

- ▶ BY MOUTH

- ▶ Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).

- ▶ Child 1–11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
- ▶ Child 1–4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
- ▶ Child 5–11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
- ▶ Child 12–17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection.

- ▶ Neonate 7 days to 28 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection.

- ▶ Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

Lyme disease (under expert supervision)

- ▶ BY MOUTH

- ▶ Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg 3 times a day) usual duration 2–4 weeks.

- ▶ Child 1–11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day usual duration 2–4 weeks
- ▶ Child 1–4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day usual duration 2–4 weeks
- ▶ Child 5–17 years: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)

Anthrax (treatment and post-exposure prophylaxis)

- ▶ BY MOUTH

- ▶ Child (body-weight up to 20 kg): 80 mg/kg daily in 3 divided doses
- ▶ Child (body-weight 20 kg and above): 500 mg 3 times a day

Listerial meningitis (in combination with another antibiotic)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 50–100 mg/kg every 12 hours.

- ▶ Neonate 7 days to 28 days: 50–100 mg/kg every 8 hours.

- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

Group B streptococcal infection | Enterococcal endocarditis (in combination with another antibiotic)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 50 mg/kg every 12 hours.

- ▶ Neonate 7 days to 28 days: 50 mg/kg every 8 hours.

- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease—if cover also needed for *Haemophilus influenzae*

- ▶ BY MOUTH

- ▶ Child 1 month–4 years: 125 mg twice daily
- ▶ Child 5–11 years: 250 mg twice daily
- ▶ Child 12–17 years: 500 mg twice daily

***Helicobacter pylori* eradication in combination with clarithromycin and omeprazole**

- ▶ BY MOUTH

- ▶ Child 1–5 years: 250 mg twice daily
- ▶ Child 6–11 years: 500 mg twice daily
- ▶ Child 12–17 years: 1 g twice daily

***Helicobacter pylori* eradication in combination with metronidazole and omeprazole**

- ▶ BY MOUTH

- ▶ Child 1–5 years: 125 mg 3 times a day
- ▶ Child 6–11 years: 250 mg 3 times a day
- ▶ Child 12–17 years: 500 mg 3 times a day

- **UNLICENSED USE** Amoxicillin doses in BNF Publications may differ from those in product literature.

● **CAUTIONS**

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of sodium can occur with high parenteral doses

- **INTERACTIONS** → Appendix 1: penicillins

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Rare or very rare** Acute generalised exanthematous pustulosis (AGEP) · colitis haemorrhagic · crystalluria · dizziness · hyperkinesia · hypersensitivity vasculitis · mucocutaneous candidiasis

- ▶ **Frequency not known** Jarisch-Herxheimer reaction

SPECIFIC SIDE-EFFECTS

- ▶ **Rare or very rare**
- ▶ With oral use Black hairy tongue
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy).
- ▶ With intravenous use Accumulation of sodium from injection can occur in patients with renal failure.
Dose adjustments Reduce dose in severe impairment; rashes more common.
- **DIRECTIONS FOR ADMINISTRATION** Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50 mg/mL (100 mg/mL for neonates). May be further diluted with Glucose 5% or Glucose 10% or Sodium chloride 0.9% or 0.45% for intravenous infusion. Give intravenous infusion over 30 minutes when using doses over 30 mg/kg.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations and sachets may include peach, strawberry, or lemon.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for Amoxicillin (Amoxil®) paediatric suspension (use of pipette).

● INDICATIONS AND DOSE

Susceptible infections (including bronchitis, urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)

► BY MOUTH

► Neonate 7 days to 20 days: 30 mg/kg 3 times a day (max. per dose 125 mg).

► Neonate 21 days to 28 days: 30 mg/kg 4 times a day (max. per dose 125 mg).

► Child 1–11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

► Child 1–4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

► Child 5–11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)

► Child 12–17 years: 500 mg 4 times a day; increased if necessary to 1 g 4 times a day, use increased dose in severe infection

► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

► Neonate 7 days to 20 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

► Neonate 21 days to 28 days: 30 mg/kg every 6 hours, increased if necessary to 60 mg/kg every 6 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

► Child: 25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours), increased if necessary to 50 mg/kg every 6 hours (max. per dose 1 g every 6 hours), increased dose used in severe infection

Group B streptococcal infection | Enterococcal endocarditis (in combination with another antibacterial)

► BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 50 mg/kg every 12 hours.

► Neonate 7 days to 20 days: 50 mg/kg every 8 hours.

► Neonate 21 days to 28 days: 50 mg/kg every 6 hours.

► Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

Listerial meningitis

► BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 100 mg/kg every 12 hours.

► Neonate 7 days to 20 days: 100 mg/kg every 8 hours.

► Neonate 21 days to 28 days: 100 mg/kg every 6 hours.

► Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

● CAUTIONS

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) • chronic lymphocytic leukaemia (increased risk of erythematous rashes) • cytomegalovirus infection (increased risk of

erythematous rashes) · glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS** Colitis haemorrhagic · purpura
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **RENAL IMPAIRMENT**
 - ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.
- Dose adjustments** If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use Administer at least 30 minutes before food.
 - ▶ With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50–100 mg/mL. May be further diluted with glucose 5% or 10% or sodium chloride 0.9% or 0.45% for infusion. Give over 30 minutes when using doses of greater than 50 mg/kg to avoid CNS toxicity including convulsions.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Ampicillin for bacterial infection www.medicinesforchildren.org.uk/ampicillin-bacterial-infection

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 23

Ampicillin 250 mg Ampicillin 250mg capsules | 28 capsule [PoM] £20.50 DT = £20.50

Ampicillin 500 mg Ampicillin 500mg capsules | 28 capsule [PoM] £40.30 DT = £40.30

Powder for solution for injection

▶ Ampicillin (Non-proprietary)

Ampicillin (as Ampicillin sodium) 500 mg Ampicillin 500mg powder for solution for injection vials | 10 vial [PoM] £78.30 DT = £78.30

£ 336

Co-fluampicil

● INDICATIONS AND DOSE

Mixed infections involving beta-lactamase-producing staphylococci

- ▶ BY MOUTH
 - ▶ Child 1 month–9 years: 125/125 mg every 6 hours
 - ▶ Child 10–17 years: 250/250 mg every 6 hours
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - ▶ Child 1 month–1 year: 62.5/62.5 mg every 6 hours
 - ▶ Child 2–9 years: 125/125 mg every 6 hours
 - ▶ Child 10–17 years: 250/250 mg every 6 hours

Severe mixed infections involving beta-lactamase-producing staphylococci

- ▶ BY MOUTH
 - ▶ Child 1 month–9 years: 250/250 mg every 6 hours
 - ▶ Child 10–17 years: 500/500 mg every 6 hours
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - ▶ Child 1 month–1 year: 125/125 mg every 6 hours
 - ▶ Child 2–9 years: 250/250 mg every 6 hours
 - ▶ Child 10–17 years: 500/500 mg every 6 hours

IMPORTANT SAFETY INFORMATION

HEPATIC DISORDERS

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

● CAUTIONS

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses · risk of kernicterus in jaundiced neonates when high doses given parenterally
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS** Arthralgia · bronchospasm · coma · dyspnoea · electrolyte imbalance · eosinophilia · erythema nodosum · gastrointestinal disorder · hallucination · Jarisch-Herxheimer reaction · myalgia · purpura non-thrombocytopenic · vasculitis
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT**
 - ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.
- Dose adjustments** Reduce dose or frequency if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; rashes more common.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.

Capsule

CAUTIONARY AND ADVISORY LABELS 9, 22

► **Co-fluampicil (Non-proprietary)**

Ampicillin (as Ampicillin trihydrate) 250 mg, Flucloxacillin (as Flucloxacillin sodium) 250 mg Co-fluampicil 250mg/250mg capsules | 28 capsule [PoM](#) £2.27 DT = £1.97 | 100 capsule [PoM](#) £8.11

ANTIBACTERIALS > PENICILLINS, BROAD-SPECTRUM WITH BETA- LACTAMASE INHIBITOR

F 336

Co-amoxiclav**● INDICATIONS AND DOSE**

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites

► **BY MOUTH USING TABLETS**

- Child 12-17 years: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection

► **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Neonate: 30 mg/kg every 12 hours.

- Child 1-2 months: 30 mg/kg every 12 hours
- Child 3 months-17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 125/31 suspension)

► **BY MOUTH USING ORAL SUSPENSION**

- Neonate: 0.25 mL/kilogram 3 times a day.

- Child 1-11 months: 0.25 mL/kilogram 3 times a day, dose doubled in severe infection
- Child 1-5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 250/62 suspension)

► **BY MOUTH USING ORAL SUSPENSION**

- Child 6-11 years: 0.15 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 400/57 suspension)

► **BY MOUTH USING ORAL SUSPENSION**

- Child 2 months-1 year: 0.15 mL/kilogram twice daily, doubled in severe infection
- Child 2-6 years (body-weight 13-21 kg): 2.5 mL twice daily, doubled in severe infection
- Child 7-12 years (body-weight 22-40 kg): 5 mL twice daily, doubled in severe infection

- Child 12-17 years (body-weight 41 kg and above): 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection

Severe dental infection with spreading cellulitis | Dental infection not responding to first-line antibacterial

► **BY MOUTH USING TABLETS**

- Child 12-17 years: 250/125 mg every 8 hours for 5 days

Acute sinusitis (doses for 125/31 suspension)► **BY MOUTH USING ORAL SUSPENSION**

- Child 1-11 months: 0.25 mL/kilogram 3 times a day for 5 days
- Child 1-5 years: 5 mL 3 times a day for 5 days, alternatively 0.25 mL/kilogram 3 times a day for 5 days

Acute sinusitis (doses for 250/62 suspension)► **BY MOUTH USING ORAL SUSPENSION**

- Child 6-11 years: 5 mL 3 times a day for 5 days, alternatively 0.15 mL/kilogram 3 times a day for 5 days

Acute sinusitis► **BY MOUTH**

- Child 12-17 years: 250/125 mg 3 times a day for 5 days, alternatively 500/125 mg 3 times a day for 5 days

DOSE EQUIVALENCE AND CONVERSION

- Doses are expressed as co-amoxiclav.
- A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- **UNLICENSED USE** [Evg](#) Doses and duration of treatment for acute sinusitis in BNF Publications differ from product literature and adhere to national guidelines. (A) See Sinusitis (acute) p. 697 for further information.

- **CONTRA-INDICATIONS** History of co-amoxiclav-associated jaundice or hepatic dysfunction · history of penicillin-associated jaundice or hepatic dysfunction

● CAUTIONS

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parental therapy)

SPECIFIC CAUTIONS

- With intravenous use accumulation of electrolytes contained in parenteral preparations can occur with high doses

CAUTIONS, FURTHER INFORMATION

- Cholestatic jaundice Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

- **INTERACTIONS** → Appendix 1: clavulanic acid · penicillins

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- **Common or very common** Increased risk of infection
- **Uncommon** Dizziness · dyspepsia · headache
- **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · colitis haemorrhagic · crystalluria · hypersensitivity vasculitis · meningitis aseptic

SPECIFIC SIDE-EFFECTS

- **Frequency not known**
- With oral use Akathisia · black hairy tongue

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT**
Monitoring Monitor liver function in liver disease.
- **RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy). Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.
Dose adjustments ▶ With oral use *Co-amoxiclav* 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
Co-amoxiclav 400/57 suspension: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
▶ With intravenous use *Co-amoxiclav injection*: use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. For *intravenous injection*, administer over 3–4 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.
▶ With oral use Flavours of oral liquid formulations may include raspberry and orange.

ANTIBACTERIALS > PENICILLINS, MEICILLINAM-TYPE

F 336

Pivmecillinam hydrochloride

• INDICATIONS AND DOSE

Acute uncomplicated cystitis

▶ BY MOUTH

- ▶ Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days

Chronic or recurrent bacteriuria

▶ BY MOUTH

- ▶ Child (body-weight 40 kg and above): 400 mg every 6–8 hours

Urinary-tract infections

▶ BY MOUTH

- ▶ Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses

- **UNLICENSED USE** Not licensed for use in children under 3 months.
- **CONTRA-INDICATIONS** Carnitine deficiency · gastro-intestinal obstruction · infants under 3 months · oesophageal strictures
- **CAUTIONS** Avoid in Acute porphyrias p. 603

- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
 - **Common or very common** Vulvovaginal fungal infection
 - **Uncommon** Dizziness · fatigue · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatic function abnormal · oral ulceration · vertigo
- **PREGNANCY** Not known to be harmful, but manufacturer advises avoid.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **MONITORING REQUIREMENTS** Liver and renal function tests required in long-term use.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.
- **PATIENT AND CARER ADVICE** Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).

Flucloxacillin

● INDICATIONS AND DOSE

Infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia | Adjunct in impetigo | Adjunct in cellulitis

► BY MOUTH

► Neonate up to 7 days: 25 mg/kg twice daily.

► Neonate 7 days to 20 days: 25 mg/kg 3 times a day.

► Neonate 21 days to 28 days: 25 mg/kg 4 times a day.

► Child 1 month–1 year: 62.5–125 mg 4 times a day

► Child 2–9 years: 125–250 mg 4 times a day

► Child 10–17 years: 250–500 mg 4 times a day

► BY INTRAMUSCULAR INJECTION

► Child: 12.5–25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours)

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 25 mg/kg every 12 hours.

► Neonate 7 days to 20 days: 25 mg/kg every 8 hours.

► Neonate 21 days to 28 days: 25 mg/kg every 6 hours.

► Child: 12.5–25 mg/kg every 6 hours (max. per dose 1 g every 6 hours)

Severe infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia (severe infection) | Adjunct in impetigo (severe infection) | Adjunct in cellulitis (severe infection)

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 50 mg/kg every 12 hours.

► Neonate 7 days to 20 days: 50 mg/kg every 8 hours.

► Neonate 21 days to 28 days: 50 mg/kg every 6 hours.

► Child: 25–50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Endocarditis (in combination with other antibacterial if necessary)

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Osteomyelitis

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 50–100 mg/kg every 12 hours.

► Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.

► Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.

► Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Cerebral abscess | Staphylococcal meningitis

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 50–100 mg/kg every 12 hours.

► Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.

► Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.

► Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Staphylococcal lung infection in cystic fibrosis

► BY MOUTH

► Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—primary prevention

► BY MOUTH

► Neonate: 125 mg twice daily.

► Child 1 month–3 years: 125 mg twice daily

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—secondary prevention

► BY MOUTH

► Child: 50 mg/kg twice daily (max. per dose 1 g twice daily)

IMPORTANT SAFETY INFORMATION

HEPATIC DISORDERS

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin
- flucloxacillin should be used with caution in patients with hepatic impairment
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials

• CAUTIONS

Combinations available: *Co-fluampicil*, p. 342

ANTIBACTERIALS > POLYMYXINS

Colistimethate sodium

18-Dec-2016

(Colistin sulfomethate sodium)

- **DRUG ACTION** The polymyxin antibiotic, colistimethate sodium (colistin sulfomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

• INDICATIONS AND DOSE

Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii* and *Klebsiella pneumoniae*

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Child (body-weight up to 60 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection
- ▶ Child (body-weight 60 kg and above): 1–2 million units 3 times a day, to be administered into a totally implantable venous access device when giving via slow intravenous injection; maximum 6 million units per day

Adjunct to standard antibacterial therapy for

***Pseudomonas aeruginosa* infection in cystic fibrosis**

▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ Child 1 month–1 year: 0.5–1 million units twice daily, adjusted according to response, increased to 1 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*
- ▶ Child 2–17 years: 1–2 million units twice daily, adjusted according to response, increased to 2 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*
- ▶ BY INHALATION OF POWDER
- ▶ Child 6–17 years: 1.66 million units twice daily

PROMIXIN® INJECTION

Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, *Klebsiella pneumoniae*

- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child (body-weight up to 40 kg): 75 000–150 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection
- Child (body-weight 40 kg and above): 9 million units daily in 2–3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection

PROMIXIN® NEBULISER SOLUTION

Management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis

- BY INHALATION OF NEBULISED SOLUTION
- Child 1 month–1 year: 0.5–1 million units twice daily, for specific advice on administration using nebulisers—consult product literature; maximum 2 million units per day
- Child 2–17 years: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day

- **CONTRA-INDICATIONS** Myasthenia gravis

- **CAUTIONS**

- When used by inhalation Severe haemoptysis—risk of further haemorrhage

- **INTERACTIONS** → Appendix 1: colistimethate

- **SIDE-EFFECTS**

- **Common or very common**

- When used by inhalation Arthralgia · asthenia · asthma · balance impaired · chest discomfort · cough · dysphonia · dyspnoea · fever · haemorrhage · headache · lower respiratory tract infection · nausea · respiratory disorders · taste altered · throat complaints · tinnitus · vomiting

- **Uncommon**

- When used by inhalation Anxiety · appetite decreased · diarrhoea · drowsiness · ear congestion · flatulence · oral disorders · proteinuria · seizure · sputum purulent · thirst · weight change

- **Rare or very rare**

- With parenteral use Confusion · nephrotoxicity · presyncope · psychosis · speech slurred · visual impairment

- **Frequency not known**

- With parenteral use Apnoea · neurological effects · neurotoxicity · renal disorder · sensory disorder

SIDE-EFFECTS, FURTHER INFORMATION Neurotoxicity and nephrotoxicity are dose-related.

- **PREGNANCY**

- When used by inhalation Clinical use suggests probably safe.
- With intravenous use Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

- **RENAL IMPAIRMENT**

Dose adjustments ► With intravenous use Reduce dose.
Monitoring ► With intravenous use In renal impairment, monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended 'peak' plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre; pre-dose ('trough') concentration 2–6 mg/litre.

- **MONITORING REQUIREMENTS**

- With intravenous use Monitor renal function.
- When used by inhalation Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

- **DIRECTIONS FOR ADMINISTRATION**

- When used by inhalation Other inhaled drugs should be administered before colistimethate sodium. For *nebulisation* administer required dose in 2–4 mL of sodium chloride 0.9% (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.
- With intravenous use For *intravenous infusion*, dilute to a concentration of 40 000 units/mL with Sodium Chloride 0.9%; give over 30 minutes. For *slow intravenous injection* into a totally implantable venous access device, dilute to a concentration of 90 000 units/mL with Sodium Chloride 0.9% for child under 12 years (200 000 units/mL for child over 12 years).

COLOMYCIN® Colomycin® Injection may be used for nebulisation; administer required dose in 2–4 mL of sodium chloride 0.9%, (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.

- **PRESCRIBING AND DISPENSING INFORMATION**

Colistimethate sodium is included in some preparations for topical application.

- **PATIENT AND CARER ADVICE**

- When used by inhalation Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, confusion and visual disturbances.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Colistimethate sodium by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)**
NICE TA276

Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA276

ANTIBACTERIALS > QUINOLONES

Quinolones

31-Oct-2017

Overview

Ciprofloxacin below is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including *Salmonella*, *Shigella*, *Campylobacter*, *Neisseria*, and *Pseudomonas*. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against *Chlamydia* and some mycobacteria. Most anaerobic organisms are not susceptible.

Nalidixic acid is licensed for urinary tract infections or gastro-intestinal infections caused by Gram-negative organisms, other than *Pseudomonas* species, sensitive to nalidixic acid.

Many *Staphylococci* are resistant to quinolones and their use should be avoided in MRSA infections.

Olofloxacin eye drops p. 677 are used in ophthalmic infections.

There is much less experience of the other quinolones in children; expert advice should be sought.

photosensitivity occurs) · G6PD deficiency · history of epilepsy · myasthenia gravis (risk of exacerbation)

CAUTIONS, FURTHER INFORMATION Quinolones cause arthropathy in the weight-bearing joints of immature animals and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of ciprofloxacin may be justified in children.

● SIDE-EFFECTS

- **Common or very common** Appetite decreased · arthralgia · asthenia · constipation · diarrhoea · dizziness · dyspnoea · eye discomfort · eye disorders · fever · gastrointestinal discomfort · headache · hearing impairment · hepatic disorders · myalgia · nausea · QT interval prolongation · rhabdomyolysis · skin reactions · sleep disorders · taste altered · vision disorders · vomiting
- **Uncommon** Anaemia · anxiety · arrhythmias · chest pain · confusion · depression · drowsiness · dry eye · eosinophilia · eye inflammation · flatulence · hallucination · hyperhidrosis · hypersensitivity · hypotension · leucopenia · neutropenia · pain · paraesthesia · renal failure · seizure · smell altered · tendon disorders · thrombocytopenia · tremor · vertigo
- **Rare or very rare** Agranulocytosis · angioedema · arthritis · coordination abnormal · haemolytic anaemia · hyperglycaemia · hypoglycaemia · muscle weakness · myasthenia gravis aggravated · nephritis tubulointerstitial · pancreatitis · photosensitivity reaction · polyneuropathy · pseudomembranous enterocolitis · psychotic disorder · severe cutaneous adverse reactions (SCARs) · stomatitis · suicidal tendencies · syncope · vasculitis
- **Frequency not known** Peripheral neuropathy (sometimes irreversible)

SIDE-EFFECTS, FURTHER INFORMATION The drug should be discontinued if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

- **ALLERGY AND CROSS-SENSITIVITY** Use of quinolones contra-indicated in quinolone hypersensitivity.
- **PREGNANCY** Avoid in pregnancy—shown to cause arthropathy in animal studies; safer alternatives are available.

Quinolones

IMPORTANT SAFETY INFORMATION

The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

TENDON DAMAGE

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

- **CONTRA-INDICATIONS** History of tendon disorders related to quinolone use

- **CAUTIONS** Can prolong the QT interval · children or adolescents (arthropathy has developed in weight-bearing joints in young animals) · conditions that predispose to seizures · diabetes (may affect blood glucose) · exposure to excessive sunlight should be avoided (discontinue if

Ciprofloxacin

26-Apr-2018

● INDICATIONS AND DOSE

Fistulating Crohn's disease

- BY MOUTH
- Child: 5 mg/kg twice daily

Severe respiratory-tract infections, gastro-intestinal infection

- BY MOUTH
- Neonate: 15 mg/kg twice daily.

- Child: 20 mg/kg twice daily (max. per dose 750 mg)
- BY INTRAVENOUS INFUSION

- Neonate: 10 mg/kg every 12 hours, to be given over 60 minutes.

- Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes

Pseudomonal lower respiratory-tract infection in cystic fibrosis

- BY MOUTH
- Child: 20 mg/kg twice daily (max. per dose 750 mg)
- BY INTRAVENOUS INFUSION
- Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes

Complicated urinary-tract infections

► BY MOUTH

- Neonate: 10 mg/kg twice daily.

- Child: 10 mg/kg twice daily, dose to be doubled in severe infection (max. 750 mg twice daily)

► BY INTRAVENOUS INFUSION

- Neonate: 6 mg/kg every 12 hours, to be given over 60 minutes.

- Child: 6 mg/kg every 8 hours; increased to 10 mg/kg every 8 hours (max. per dose 400 mg), in severe infection

Gonorrhoea

► BY MOUTH

- Child 12–17 years: 500 mg for 1 dose

Anthrax (treatment and post-exposure prophylaxis)

► BY MOUTH

- Child: 15 mg/kg twice daily (max. per dose 500 mg)

► BY INTRAVENOUS INFUSION

- Child: 10 mg/kg every 12 hours (max. per dose 400 mg)

Prevention of secondary case of meningococcal meningitis

► BY MOUTH

- Neonate: 30 mg/kg (max. per dose 125 mg) for 1 dose.

- Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
- Child 5–11 years: 250 mg for 1 dose
- Child 12–17 years: 500 mg for 1 dose

- **UNLICENSED USE** Not licensed for use in children under 1 year of age. Licensed for use in children over 1 year for complicated urinary-tract infections, for pseudomonal lower respiratory-tract infections in cystic fibrosis, for prophylaxis and treatment of inhalational anthrax. Licensed for use in children over 1 year for other infections where the benefit is considered to outweigh the potential risks. Not licensed for use in children for gastro-intestinal anthrax. Not licensed for use in children for prophylaxis of meningococcal meningitis.

- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · avoid excessive alkalinity of urine (risk of crystalluria) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · ensure adequate fluid intake (risk of crystalluria) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)

- **INTERACTIONS** → Appendix 1: quinolones

● **SIDE-EFFECTS**

- Common or very common Arthropathy

- Uncommon Akathisia · fungal superinfection · musculoskeletal pain · oedema · renal impairment · sensation abnormal · thrombocytosis · vasodilation

- Rare or very rare Antibiotic associated colitis · asthma · bone marrow disorders · crystalluria · erythema nodosum · gait abnormal · haematuria · intracranial pressure increased · leucocytosis · migraine · muscle cramps · muscle tone increased · olfactory nerve disorder · petechiae · status epilepticus

- Frequency not known Mood altered · severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.

- **BREAST FEEDING** Amount too small to be harmful but manufacturer advises avoid.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—consult product literature.

● **PRESCRIBING AND DISPENSING INFORMATION**

- With oral use Flavours of oral liquid formulations may include strawberry.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infections-0

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

10 bag [PoM] £200.00 (Hospital only)

ANTIBACTERIALS > SULFONAMIDES

Co-trimoxazole

- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

● INDICATIONS AND DOSE

Treatment of susceptible infections

► BY MOUTH

- Child 6 weeks–5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily
- Child 6 months–5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
- Child 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
- Child 12–17 years: 960 mg twice daily
- BY INTRAVENOUS INFUSION
- Child 6 weeks–17 years: 18 mg/kg every 12 hours; increased to 27 mg/kg every 12 hours (max. per dose 1.44 g), increased dose used in severe infection

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections

► BY MOUTH

- Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines

DOSE EQUIVALENCE AND CONVERSION

- 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

- **UNLICENSED USE** Not licensed for *Burkholderia cepacia* infections in cystic fibrosis. Not licensed for *Stenotrophomonas maltophilia* infections. Not licensed for use in children under 6 weeks.

IMPORTANT SAFETY INFORMATION**RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE**

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiosis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

- **CONTRA-INDICATIONS** Acute porphyrias p. 603
- **CAUTIONS** Asthma • avoid in blood disorders (unless under specialist supervision) • avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus • G6PD deficiency (risk of haemolytic anaemia) • maintain adequate fluid intake • predisposition to folate deficiency

- **INTERACTIONS** → Appendix 1: sulfonamides • trimethoprim

● **SIDE-EFFECTS**

- **Common or very common** Diarrhoea • electrolyte imbalance • fungal overgrowth • headache • nausea • skin reactions
- **Uncommon** Vomiting
- **Rare or very rare** Agranulocytosis • angioedema • aplastic anaemia • appetite decreased • arthralgia • ataxia • cough • depression • dizziness • dyspnoea • eosinophilia • fever • haemolysis • haemolytic anaemia • hallucination • hepatic disorders • hypoglycaemia • leucopenia • lung infiltration • megaloblastic anaemia • meningitis aseptic • metabolic acidosis • methaemoglobinaemia • myalgia • myocarditis allergic • nephritis tubulointerstitial • neutropenia • oral disorders • pancreatitis • peripheral neuritis • photosensitivity reaction • pseudomembranous enterocolitis • renal impairment • renal tubular acidosis • seizure • serum sickness • severe cutaneous adverse reactions (SCARs) • systemic lupus erythematosus (SLE) • thrombocytopenia • tinnitus • uveitis • vasculitis • vertigo
- SIDE-EFFECTS, FURTHER INFORMATION** Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis) develop.

- **PREGNANCY** Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.

Dose adjustments Use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m².

Monitoring Plasma concentration monitoring may be required in patients with moderate to severe renal impairment; seek expert advice.

● **MONITORING REQUIREMENTS**

- Plasma concentration monitoring may be required with high doses; seek expert advice.
- Monitor blood counts on prolonged treatment.

- **DIRECTIONS FOR ADMINISTRATION** For intermittent intravenous infusion, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.

● **PRESCRIBING AND DISPENSING INFORMATION**

Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.

Flavours of oral liquid formulations may include banana, or vanilla.

Sulfadiazine

07-Feb-2018

(Sulphadiazine)

- **DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulphonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

INDICATIONS AND DOSE

Toxoplasmosis in pregnancy (in combination with pyrimethamine and folinic acid)

► BY MOUTH

► Child 12-17 years: 1 g 3 times a day until delivery

Congenital toxoplasmosis (in combination with pyrimethamine and folinic acid)

► BY MOUTH

► Neonate: 50 mg/kg twice daily for 12 months.

- **UNLICENSED USE** Not licensed for use in toxoplasmosis.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Sulfadiazine has been confused with sulfasalazine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Acute porphyrias p. 603
- **CAUTIONS** Asthma • avoid in blood disorders (unless under specialist supervision) • avoid in infants under 6 weeks (except for treatment or prophylaxis of *pneumocystis pneumonia*) because of the risk of kernicterus • G6PD deficiency (risk of haemolytic anaemia) • maintain adequate fluid intake • predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1: sulfonamides
- **SIDE-EFFECTS**
- Rare or very rare Haemolytic anaemia
- Frequency not known Agranulocytosis • aplastic anaemia • appetite decreased • ataxia • back pain • blood disorders •

cough • crystalluria • cyanosis • depression • diarrhoea • dizziness • drowsiness • dyspnoea • eosinophilia • erythema nodosum • fatigue • fever • haematuria • hallucination • headache • hepatic disorders • hypoglycaemia • hypoprothrombinaemia • hypothyroidism • idiopathic intracranial hypertension • insomnia • kernicterus (in neonates) • leucopenia • meningitis aseptic • myocarditis • nausea • nephritis tubulointerstitial • nephrotoxicity • nerve disorders • neurological effects • neutropenia • oral disorders • pancreatitis • photosensitivity reaction • pseudomembranous enterocolitis • psychosis • renal impairment • renal tubular necrosis • respiratory disorders • seizure • serum sickness-like reaction • severe cutaneous adverse reactions (SCARs) • skin reactions • systemic lupus erythematosus (SLE) • thrombocytopenia • tinnitus • vasculitis • vertigo • vomiting

SIDE-EFFECTS, FURTHER INFORMATION Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis) develop.

- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 27

Sulfadiazine 500 mg Sulfadiazine 500mg tablets | 56 tablet [PoM]
£190.74 DT = £152.95

ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

Tetracyclines

Overview

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. In children over 12 years of age they are useful for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 352 with either streptomycin p. 313 or rifampicin p. 364), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic respiratory diseases (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 331).

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 353 which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of

lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines have a role in the management of meticillin-resistant *Staphylococcus aureus* (MRSA) infections.

Tetracyclines

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) • systemic lupus erythematosus (may be exacerbated)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Angioedema • diarrhoea • headache • Henoch-Schönlein purpura • hypersensitivity • nausea • pericarditis • photosensitivity reaction • skin reactions • systemic lupus erythematosus exacerbated • vomiting
 - ▶ **Rare or very rare** Appetite decreased • discolouration of thyroid gland • dysphagia • eosinophilia • fontanelle bulging (in infants) • gastrointestinal disorders • haemolytic anaemia • hepatic disorders • idiopathic intracranial hypertension • increased risk of infection • neutropenia • oral disorders • pancreatitis • pseudomembranous enterocolitis • severe cutaneous adverse reactions (SCARs) • thrombocytopenia
- ▶ **Frequency not known** Dizziness

SIDE-EFFECTS, FURTHER INFORMATION Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment if raised intracranial pressure develops).

- **PREGNANCY** Should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Should **not** be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **HEPATIC IMPAIRMENT** Should be avoided or used with caution in patients with hepatic impairment.

above

Demeclocycline hydrochloride

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- ▶ **BY MOUTH**
- ▶ Child 12–17 years: 150 mg 4 times a day, alternatively 300 mg twice daily

- **CAUTIONS** Photosensitivity more common than with other tetracyclines
- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Agranulocytosis • aplastic anaemia • hearing impairment • nephritis • severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Intracranial pressure increased • muscle weakness • nephrogenic diabetes insipidus • vision disorders
- **HEPATIC IMPAIRMENT** Dose adjustments Max. 1 g daily in divided doses.
- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

- **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight or sun lamps.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Tablet

Doxycycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily

Acute sinusitis

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 4 days

Severe infections (including refractory urinary-tract infections)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: 200 mg daily

Acne

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: 100 mg once daily

Early syphilis

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: 100 mg twice daily for 14 days

Late latent syphilis

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: 100 mg twice daily for 28 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: 100 mg twice daily for 7 days

Pelvic inflammatory disease

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: 100 mg twice daily for 14 days

Lyme disease (under expert supervision)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)

Anthrax (treatment or post-exposure prophylaxis)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 1 month–11 years: 2.5 mg/kg twice daily (max. per dose 100 mg twice daily), only to be used in children under 12 years if alternative antibacterial cannot be given
- ▶ Child 12–17 years: 100 mg twice daily

Prophylaxis of malaria

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

Adjunct to quinine in treatment of *Plasmodium falciparum* malaria

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12–17 years: 200 mg daily for 7 days

Periodontitis (as an adjunct to gingival scaling and root planing)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 20 mg twice daily for 3 months

- **UNLICENSED USE** Doxycycline doses in BNF Publications may differ from those in product literature. Not licensed for severe recurrent aphthous ulceration. Not licensed for malaria prophylaxis during pregnancy. Not licensed for treatment or post-exposure prophylaxis of anthrax. [EvGr](#) Duration of treatment for acute sinusitis adheres to national guidelines. ⚠ See Sinusitis (acute) p. 697 for further information.

Not licensed for use in children under 12 years.

- **CAUTIONS** Alcohol dependence
- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS**
 - **Common or very common** Dyspnoea · hypotension · peripheral oedema · serum sickness · tachycardia
 - **Uncommon** Gastritis · gastrointestinal discomfort
 - **Rare or very rare** Antibiotic associated colitis · arthralgia · flushing · hepatic function abnormal · myalgia · photoonycholysis · severe cutaneous adverse reactions (SCARs) · tinnitus · vision disorders
- **PREGNANCY** When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation.
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.
- **DIRECTIONS FOR ADMINISTRATION** Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.
- **PATIENT AND CARER ADVICE** Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

● MEDICINAL FORMS

Minocycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg twice daily

Acne

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: 100 mg once daily, alternatively 50 mg twice daily
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 100 mg daily

- **CAUTIONS** Systemic lupus erythematosus

- **INTERACTIONS** → Appendix 1: tetracyclines

● SIDE-EFFECTS

- **Rare or very rare** Acute kidney injury · hearing impairment · respiratory disorders
- **Frequency not known** Alopecia · antibiotic associated colitis · arthralgia · ataxia · breast secretion · conjunctival discoloration · drug reaction with eosinophilia and systemic symptoms (DRESS) · dyspepsia · hyperbilirubinaemia · hyperhidrosis · polyarteritis nodosa · sensation abnormal · tear discoloration · vertigo

- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).

- **MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

- **DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.

- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture).

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

ANTIBACTERIALS > OTHER

Chloramphenicol

- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

● INDICATIONS AND DOSE

Life threatening infections particularly those caused by *Haemophilus influenzae*! Typhoid fever

► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child: 12.5 mg/kg every 6 hours, dose may be doubled in severe infections such as septicaemia, meningitis and epiglottitis providing plasma-chloramphenicol concentrations are measured and high doses reduced as soon as indicated

► BY INTRAVENOUS INJECTION

- Neonate up to 14 days: 12.5 mg/kg twice daily, doses should be checked carefully as overdosage can be fatal.
- Neonate 14 days to 28 days: 12.5 mg/kg 2–4 times a day, doses should be checked carefully as overdosage can be fatal.

Cystic fibrosis for the treatment of respiratory *Burkholderia cepacia* infection resistant to other antibacterials

- BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Child: (consult product literature)

● **CONTRA-INDICATIONS** Acute porphyrias p. 603● **CAUTIONS** Avoid repeated courses and prolonged treatment● **INTERACTIONS** → Appendix 1: chloramphenicol● **SIDE-EFFECTS**► **Rare or very rare**

- With parenteral use Aplastic anaemia (reversible or irreversible, with reports of resulting leukaemia)
- Frequency not known
- With oral use Bone marrow disorders · circulatory collapse · diarrhoea · enterocolitis · nausea · optic neuritis · oral disorders · ototoxicity · vomiting
- With parenteral use Agranulocytosis · bone marrow disorders · depression · diarrhoea · dry mouth · fungal superinfection · headache · nausea · nerve disorders · thrombocytopenic purpura · urticaria · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

Grey syndrome Grey baby syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism.

● **PREGNANCY** Manufacturer advises avoid; neonatal 'grey-baby syndrome' if used in third trimester.● **BREAST FEEDING** Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause 'grey syndrome'.● **HEPATIC IMPAIRMENT** Avoid if possible—increased risk of bone-marrow depression.

Dose adjustments Reduce dose.

Monitoring Monitor plasma-chloramphenicol concentration in hepatic impairment.

● **RENAL IMPAIRMENT** Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.● **MONITORING REQUIREMENTS**

- Plasma concentration monitoring preferred in those under 4 years of age.
- Plasma concentration monitoring required in neonates. Grey baby syndrome may follow excessive doses in neonates with immature hepatic metabolism.
- Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre.
- Blood counts required before and periodically during treatment.

● **DIRECTIONS FOR ADMINISTRATION** Displacement value may be significant for injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%.● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Daptomycin

25-Apr-2018

- **DRUG ACTION** Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

● **INDICATIONS AND DOSE****Complicated skin and soft-tissue infections caused by Gram-positive bacteria**

► BY INTRAVENOUS INFUSION

- Child 12–23 months: 10 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients
- Child 2–6 years: 9 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients
- Child 7–11 years: 7 mg/kg once daily for up to 14 days, alternatively 9 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients
- Child 12–17 years: 5 mg/kg once daily for up to 14 days, alternatively 7 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients

● **CAUTIONS** Obesity (limited information on safety and efficacy)● **INTERACTIONS** → Appendix 1: daptomycin● **SIDE-EFFECTS**

- **Common or very common** Anaemia · anxiety · asthenia · constipation · diarrhoea · dizziness · fever · flatulence · gastrointestinal discomfort · headache · hypertension · hypotension · increased risk of infection · insomnia · nausea · pain · skin reactions · vomiting
- **Uncommon** Appetite decreased · arrhythmias · arthralgia · electrolyte imbalance · eosinophilia · flushing · glossitis · hyperglycaemia · muscle weakness · myalgia · myopathy · paraesthesia · renal impairment · taste altered · thrombocytosis · tremor · vertigo
- **Rare or very rare** Jaundice
- **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · antibiotic associated colitis · chills · cough · infusion related reaction · peripheral neuropathy · respiratory disorders · syncope

SIDE-EFFECTS, FURTHER INFORMATION If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Present in milk in small amounts, but absorption from gastrointestinal tract negligible.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises the dosage regimen has not been established—use with caution and monitor renal function regularly.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor plasma creatine phosphokinase (CPK) before treatment and then at least weekly during treatment; monitor CPK more frequently in patients at higher risk of developing myopathy, including those with renal impairment, taking other drugs associated with myopathy, or if CPK elevated more than 5 times upper limit of normal before treatment.
 - ▶ Manufacturer advises monitor renal function regularly during concomitant administration of potentially nephrotoxic drugs.
- **EFFECT ON LABORATORY TESTS** Interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, manufacturer advises give intermittently in Sodium Chloride 0.9%; reconstitute with Sodium Chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 60 minutes for children aged 1–6 years and over 30 minutes for children aged 7–17 years.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage after reconstitution and dilution.

• MEDICINAL FORMS

Fosfomycin

22-Mar-2017

- **DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and Enterobacteriaceae.

• INDICATIONS AND DOSE

Acute uncomplicated lower urinary-tract infections (in females)

- ▶ BY MOUTH USING GRANULES
- ▶ Child 12–17 years (female): 3 g for 1 dose.

Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- ▶ Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.
- ▶ Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- ▶ Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- ▶ Child 12–17 years (body-weight 40 kg and above): 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- ▶ Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.
- ▶ Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- ▶ Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- ▶ Child 12–17 years (body-weight 40 kg and above): 12–16 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Bacterial meningitis when first-line treatment ineffective or inappropriate

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- ▶ Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.
- ▶ Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- ▶ Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- ▶ Child 12–17 years (body-weight 40 kg and above): 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the

high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

● CAUTIONS

- With intravenous use Cardiac insufficiency · hyperaldosteronism · hyponatraemia · hypertension · pulmonary oedema

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common** Abdominal pain · antibiotic associated colitis · diarrhoea · headache · nausea · vomiting
- Uncommon** Skin reactions

SPECIFIC SIDE-EFFECTS

- Common or very common**
 - With oral use Dizziness · vulvovaginal infection
- Uncommon**
 - With parenteral use Appetite decreased · dyspnoea · electrolyte imbalance · fatigue · oedema · taste altered · vertigo
- Rare or very rare**
 - With parenteral use Bone marrow disorders · eosinophilia · hepatic disorders · visual impairment
- Frequency not known**
 - With parenteral use Agranulocytosis · asthmatic attack · confusion · leucopenia · neutropenia · pseudomembranous enterocolitis · tachycardia · thrombocytopenia
- PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.

● RENAL IMPAIRMENT

- With oral use Avoid oral treatment if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- With intravenous use Age under 12 years (body-weight under 40 kg)—no information available. Age 12–18 years (body-weight over 40 kg)—use with caution if estimated glomerular filtration rate 40–80 mL/minute/1.73 m², and consult product literature for dose if estimated glomerular filtration rate less than 40 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- With intravenous use Monitor electrolytes and fluid balance.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. Reconstitute each 2-g vial with 50 mL Glucose 5% or Glucose 10% or Water for Injections; do not exceed infusion rate of 133 mg/minute.
- With oral use Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.

- PRESCRIBING AND DISPENSING INFORMATION** Doses expressed as fosfomycin base.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2015) that fosfomycin (*Fomicyt*®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

The *Scottish Medicines Consortium* has advised (September 2016) that fosfomycin trometamol (*Monuril*®) is accepted for use within NHS Scotland for the treatment of acute lower uncomplicated urinary tract infections, caused by pathogens sensitive to fosfomycin in adult and adolescent females and for prophylaxis in diagnostic and surgical transurethral procedures.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- Fomicyt** (Nordic Pharma Ltd)

Fosfomycin (as Fosfomycin sodium) 2 gram Fomicyt 2g powder for solution for infusion vials | 10 vial [PoM] £150.00

Fosfomycin (as Fosfomycin sodium) 4 gram Fomicyt 4g powder for solution for infusion vials | 10 vial [PoM] £300.00

Granules

CAUTIONARY AND ADVISORY LABELS 9, 13, 23

EXCIPIENTS: May contain Sucrose

- Fosfomycin (Non-proprietary)**

Fosfomycin (as Fosfomycin trometamol) 3 gram Fosfomycin 3g granules sachets | 1 sachet [PoM] £75.45 DT = £4.86

- Monuril** (Zambon S.p.A.)

Fosfomycin (as Fosfomycin trometamol) 3 gram Monuril 3g granules sachets | 1 sachet [PoM] £4.86 DT = £4.86

Fusidic acid

16-Jun-2017

- DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

● INDICATIONS AND DOSE

Staphylococcal skin infection

- BY MOUTH USING TABLETS

- Child 12–17 years: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate

- TO THE SKIN

- Child: Apply 3–4 times a day usually for 7 days

Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials

- BY MOUTH USING ORAL SUSPENSION

- Neonate: 15 mg/kg 3 times a day.

- Child 1–11 months: 15 mg/kg 3 times a day

- Child 1–4 years: 250 mg 3 times a day

- Child 5–11 years: 500 mg 3 times a day

- Child 12–17 years: 750 mg 3 times a day

- BY MOUTH USING TABLETS

- Child 12–17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections, dose expressed as sodium fusidate

Staphylococcal infections due to susceptible organisms

- BY INTRAVENOUS INFUSION

- Child (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate

- Child (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

DOSE EQUIVALENCE AND CONVERSION

- Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

● CAUTIONS

- With systemic use Impaired transport and metabolism of bilirubin
- With topical use Avoid contact of cream or ointment with eyes

CAUTIONS, FURTHER INFORMATION

- Avoiding resistance To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

- INTERACTIONS** → Appendix 1: fusidic acid

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common** Dizziness · drowsiness · hepatic disorders · hyperbilirubinaemia

- ▶ **Uncommon** Appetite decreased · asthenia · headache · malaise · skin reactions
- ▶ **Frequency not known** Agranulocytosis · anaemia · leucopenia · neutropenia · pancytopenia · renal failure · rhabdomyolysis · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Vascular pain (reduced if given via central vein)
- ▶ With oral use Diarrhoea · gastrointestinal discomfort · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Elevated liver enzymes, hyperbilirubinaemia and jaundice can occur with systemic use—these effects are usually reversible following withdrawal of therapy.

- **PREGNANCY**
- ▶ With systemic use Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING**
- ▶ With systemic use Present in milk—manufacturer advises caution.
- **HEPATIC IMPAIRMENT**
- ▶ With systemic use Manufacturer advises caution—monitor liver function periodically during treatment.
- **MONITORING REQUIREMENTS**
- ▶ With systemic use Manufacturer advises monitor liver function with high doses or on prolonged therapy; monitoring also advised for patients with biliary tract obstruction, those taking potentially hepatotoxic medication, or those taking concurrent medication with a similar excretion pathway.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intravenous infusion, give intermittently in Sodium chloride 0.9% or Glucose 5%; reconstitute each vial with 10 mL buffer solution, then add contents of vial to 500 mL infusion fluid to give a solution containing approximately 1 mg/mL. Give requisite dose via a central line over 2 hours (give over at least 6 hours if administered via a large peripheral vein).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and orange.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
May be prescribed as Sodium Fusidate ointment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 21

- ▶ **Fucidin** (LEO Pharma)

Fusidic acid 50 mg per 1 mL Fusidin 250mg/5ml oral suspension | 50 mL [PoM] £6.73 DT = £6.73

Powder and solution for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Fusidic acid (Non-proprietary)**

Sodium fusidate 500 mg Sodium fusidate 500mg powder and solvent for solution for infusion vials | 1 vial [PoM] £38.00

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Fusidic acid (Non-proprietary)**

Fusidic acid 20 mg per 1 gram Fusidic acid 2% cream | 15 gram [PoM] £1.92 DT = £1.46 | 30 gram [PoM] £5.00 DT = £2.92

- ▶ **Fucidin** (LEO Pharma)

Fusidic acid 20 mg per 1 gram Fusidin 20mg/g cream | 15 gram [PoM] £1.92 DT = £1.46 | 30 gram [PoM] £3.59 DT = £2.92

Ointment

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), woolfat and related substances (including lanolin)

- ▶ **Fucidin** (LEO Pharma)

Sodium fusidate 20 mg per 1 gram Fusidin 20mg/g ointment | 15 gram [PoM] £2.68 DT = £2.68 | 30 gram [PoM] £4.55 DT = £4.55

Linezolid

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

INDICATIONS AND DOSE

Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 10 mg/kg every 12 hours, increased if necessary to 10 mg/kg every 8 hours, increased dose can be used if poor response.

▶ Neonate 7 days to 28 days: 10 mg/kg every 8 hours.

- ▶ Child 1 month–11 years: 10 mg/kg every 8 hours (max. per dose 600 mg)
- ▶ Child 12–17 years: 600 mg every 12 hours

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION**CHM ADVICE (OPTIC NEUROPATHY)**

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

BLOOD DISORDERS

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

- **CAUTIONS** Acute confusional states · bipolar depression · carcinoid tumour · phaeochromocytoma · schizophrenia · thyrotoxicosis · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- ▶ Close observation Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma,

carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

● **INTERACTIONS** → Appendix 1: linezolid

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · constipation · diarrhoea · dizziness · gastrointestinal discomfort · headache · hypertension · increased risk of infection · insomnia · localised pain · nausea · skin reactions · taste altered · vomiting
- ▶ **Uncommon** Arrhythmia · chills · dry mouth · eosinophilia · fatigue · gastritis · hyperhidrosis · hyponatraemia · leucopenia · neutropenia · oral disorders · pancreatitis · polyuria · renal failure · seizure · sensation abnormal · thirst · thrombocytopenia · thrombophlebitis · tinnitus · transient ischaemic attack · vision disorders · vulvovaginal disorder
- ▶ **Rare or very rare** Antibiotic associated colitis · bone marrow disorders
- ▶ **Frequency not known** Alopecia · angioedema · lactic acidosis · nerve disorders · serotonin syndrome · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** No dose adjustment necessary but in severe hepatic impairment use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** No dose adjustment necessary but metabolites may accumulate if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.
- **DIRECTIONS FOR ADMINISTRATION** Infusion to be administered over 30–120 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
There is limited information on use in children and expert advice should be sought.
- **PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Infusion

EXCIPIENTS: May contain Glucose

ELECTROLYTES: May contain Sodium

▶ **Linezolid (Non-proprietary)**

Linezolid 2 mg per 1 mL Linezolid 600mg/300ml infusion bags | 10 bag [PoM] £445.00 (Hospital only)

▶ **Zyvox (Pfizer Ltd)**

Linezolid 2 mg per 1 mL Zyvox 600mg/300ml infusion bags | 10 bag [PoM] £445.00

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 10

EXCIPIENTS: May contain Aspartame

▶ **Zyvox (Pfizer Ltd)**

Linezolid 20 mg per 5 mL Zyvox 100mg/5ml granules for oral suspension | 150 mL [PoM] £222.50

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 10

▶ **Linezolid (Non-proprietary)**

Linezolid 600 mg Linezolid 600mg tablets | 10 tablet [PoM] £82.12-£445.00 DT = £335.35

▶ **Zyvox (Pfizer Ltd)**

Linezolid 600 mg Zyvox 600mg tablets | 10 tablet [PoM] £445.00 DT = £335.35

Trimethoprim

● **INDICATIONS AND DOSE**

Urinary-tract infections | Respiratory tract infections

▶ **BY MOUTH**

▶ **Neonate:** Initially 3 mg/kg for 1 dose, then 1–2 mg/kg twice daily.

- ▶ Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
- ▶ Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
- ▶ Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
- ▶ Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
- ▶ Child 12–17 years: 200 mg twice daily

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

▶ **BY MOUTH**

▶ **Neonate:** 2 mg/kg once daily, dose to be taken at night.

- ▶ Child 4–5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night
- ▶ Child 6 weeks–5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night
- ▶ Child 6 months–5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night
- ▶ Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
- ▶ Child 12–17 years: 100 mg once daily, dose to be taken at night

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)

▶ **BY MOUTH**

▶ Child: 5 mg/kg every 6–8 hours

Shigellosis | Invasive salmonella infection

▶ **BY MOUTH**

▶ Child: (consult product literature)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis pneumonia. Not licensed for use in children under 6 weeks.
- **CONTRA-INDICATIONS** Blood dyscrasias
- **CAUTIONS** Acute porphyrias p. 603 · neonates (specialist supervision required) · predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1: trimethoprim
- **SIDE-EFFECTS**
- ▶ **Common or very common** Diarrhoea · electrolyte imbalance · fungal overgrowth · headache · nausea · skin reactions · vomiting
- ▶ **Rare or very rare** Agranulocytosis · angioedema · anxiety · appetite decreased · arthralgia · behaviour abnormal · bone marrow disorders · confusion · constipation · cough · depression · dizziness · dyspnoea · eosinophilia · erythema nodosum · fever · haemolysis · haemolytic anaemia · haemorrhage · hallucination · hepatic disorders · hypoglycaemia · lethargy · leucopenia · meningitis aseptic · movement disorders · myalgia · neutropenia · oral disorders · pancreatitis · paraesthesia · peripheral neuritis · photosensitivity reaction · pseudomembranous enterocolitis · renal impairment · seizure · severe cutaneous adverse reactions (SCARs) · sleep disorders · syncope · systemic lupus erythematosus (SLE) ·

thrombocytopenia • tinnitus • tremor • uveitis • vasculitis • vertigo • wheezing

- **Frequency not known** Gastrointestinal disorder • megaloblastic anaemia • methaemoglobinemia
- **PREGNANCY** Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.
- **BREAST FEEDING** Present in milk—short-term use not known to be harmful.

● **RENAL IMPAIRMENT**

Dose adjustments Use half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m².

Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m².

Monitoring Monitor plasma-trimethoprim concentration if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).
- **PATIENT AND CARER ADVICE**
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.
Medicines for Children leaflet: Trimethoprim for bacterial infections www.medicinesforchildren.org.uk/trimethoprim-for-bacterial-infections

● **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

► **Trimethoprim (Non-proprietary)**

Trimethoprim 10 mg per 1 mL Trimethoprim 50mg/5mL oral suspension sugar free sugar-free | 100 mL [PoM] £5.24 DT = £2.30

► **Monotrim** (Chemidex Pharma Ltd)

Trimethoprim 10 mg per 1 mL Monotrim 50mg/5mL oral suspension sugar-free | 100 mL [PoM] £1.77 DT = £2.30

Tablet

CAUTIONARY AND ADVISORY LABELS 9

► **Trimethoprim (Non-proprietary)**

Trimethoprim 100 mg Trimethoprim 100mg tablets | 28 tablet [PoM] £9.99 DT = £0.86

Trimethoprim 200 mg Trimethoprim 200mg tablets | 6 tablet [PoM] £2.15 DT = £0.31 | 14 tablet [PoM] £9.99 DT = £0.73

Combinations available: **Co-trimoxazole**, p. 350

2.1 Anthrax

Anthrax

Treatment and post-exposure prophylaxis

Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin p. 348 or, in patients over 12 years, doxycycline p. 352 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 339, benzylpenicillin sodium p. 338, chloramphenicol p. 354, clarithromycin p. 330, clindamycin p. 327, imipenem with cilastatin p. 315, rifampicin p. 364 [unlicensed indication], and vancomycin p. 325). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline

[unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

2.2 Lyme disease

Lyme disease

Treatment

Amoxicillin p. 339 [unlicensed indication], cefuroxime p. 319 (as cefuroxime axetil) or doxycycline p. 352 are the antibacterials of choice for *early Lyme disease* or *Lyme arthritis* but doxycycline should only be used in children over 12 years of age. If these antibacterials are contra-indicated, a **macrolide** (e.g. clarithromycin p. 330) can be used for early Lyme disease. Intravenous administration of ceftriaxone p. 322, cefotaxime p. 320, or benzylpenicillin sodium p. 338 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

2.3 Methicillin-resistant staphylococcus aureus

MRSA

Management

Infection from *Staphylococcus aureus* strains resistant to met icillin [now discontinued] (met icillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 345 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 364 or fusidic acid p. 357 should **not** be used alone because resistance may develop rapidly. Clindamycin p. 327 alone or a combination of rifampicin and fusidic acid can be used for *skin and soft-tissue infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** (e.g. vancomycin p. 325) can be used for severe skin and soft-tissue infections associated with MRSA. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial. Linezolid p. 358 should be reserved for skin and soft-tissue infections that have not responded to other antibacterials or for children who cannot tolerate other antibacterials.

A **glycopeptide** can be used for *pneumonia* associated with MRSA. Linezolid should be reserved for hospital-acquired pneumonia that has not responded to other antibacterials or for children who cannot tolerate other antibacterials.

Trimethoprim p. 359 or nitrofurantoin p. 369 can be used for *urinary-tract infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for septicaemia associated with MRSA.

See the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 325 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

It is important that hospitals have infection control guidelines to minimise MRSA transmission, including policies on isolation and treatment of MRSA carriers and on hand hygiene. See eradication of nasal carriage of MRSA in Nose p. 694.

2.4 Tuberculosis

Tuberculosis

16-Mar-2017

Treatment phases, overview

Active tuberculosis is treated in two phases—an *initial phase* using four drugs and a *continuation phase* using two drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should **not** be used concurrently. Compliance with therapy is a major determinant of its success. Treatment needs to be carefully monitored in families in whom concordance may be problematic.

Initial phase

The concurrent use of four drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as fixed dose combination preparations unless the child is unable to swallow the tablets or one of the components cannot be given because of resistance, intolerance or an inappropriate dose combination. The treatment of choice for the initial phase is the daily use of rifampicin p. 364, ethambutol hydrochloride p. 367, pyrazinamide p. 368 and isoniazid p. 367 (with pyridoxine hydrochloride p. 627 for prophylaxis of isoniazid-induced neuropathy); modified according to drug susceptibility testing. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for two months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after two months, treatment with rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride) should be continued until full susceptibility is confirmed, even if this is for longer than two months.

Streptomycin p. 313 is rarely used in the UK although it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced and ethambutol hydrochloride is contra-indicated, or when patients cannot tolerate standard treatment.

Continuation phase

After the initial phase, daily treatment is continued for a further 4 months with rifampicin and isoniazid (preferably given as a combination preparation) with pyridoxine hydrochloride. Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment

The unsupervised treatment regimen should be used for children who are likely to take antituberculosis drugs reliably **without supervision** by a healthcare worker. Children and families who are unable or unlikely to comply with daily administration of therapy should be treated with the regimen described under Supervised Treatment.

Pregnancy and breast-feeding

The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

Neonates

Congenital tuberculosis is acquired from maternal extrapulmonary sites at birth, particularly the genital tract; if infection is suspected, the baby will require treatment with rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride). This regimen is used for 2 months during the initial phase of treatment. After the initial phase, rifampicin and isoniazid with pyridoxine hydrochloride is continued for a further 4 months.

Supervised treatment

Drug administration should be **fully supervised** by a healthcare worker (directly observed therapy, DOT) in children or families who cannot comply reliably with the treatment regimen. If daily directly observed therapy is not possible, a supervised dosing schedule of three times a week should be considered. Regimens with a dosing schedule of fewer than three times a week should not be used.

Directly observed therapy should be offered to children or to children whose carers:

- have a history of non-adherence;
- have previously been treated for tuberculosis;
- are in denial of the tuberculosis diagnosis;
- have multidrug-resistant tuberculosis;
- have a major psychiatric or cognitive disorder;
- have a history of homelessness, drug or alcohol misuse;
- are in prison, or have been in the past 5 years;
- are too ill to self-administer treatment;
- request directly observed therapy.

Advice and support should be offered to these children and their carers to assist with treatment completion.

Immunocompromised patients

Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised children. The organism should always be cultured to confirm its type and drug sensitivity.

Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard six month regimen; after completing treatment, children should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a child who is HIV-positive (see also *Latent tuberculosis* below); care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first two months of antituberculosis treatment increases the risk of

Recommended dosage for standard unsupervised 6-month treatment

Isoniazid	Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
Rifampicin	Child: ► body-weight up to 50 kg: 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day; ► body-weight 50 kg and above: 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day
Pyrazinamide	Child: ► body-weight up to 50 kg: 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day; ► body-weight 50 kg and above: 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
Ethambutol hydrochloride	Child: 20 mg/kg once daily for 2 months (initial phase)

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (*Rifater*[®], *Rifinah*[®]) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

Recommended dosage for intermittent supervised 6-month treatment

Isoniazid	Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
Rifampicin	Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
Pyrazinamide	Child: ► body-weight up to 50 kg: 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase); ► body-weight 50 kg and above: 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
Ethambutol hydrochloride	Child: 30 mg/kg 3 times a week for 2 months (initial phase)

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (*Rifater*[®], *Rifinah*[®]) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

immune reconstitution syndrome. Treatment for tuberculosis should not routinely exceed 6 months in children who are HIV-positive, unless the tuberculosis has central nervous system involvement, in which case treatment should not routinely extend beyond 12 months.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex, in which case specialist advice on management is needed.

Extrapulmonary tuberculosis**Central nervous system tuberculosis**

Children with central nervous system tuberculosis should be offered rifampicin, ethambutol hydrochloride, pyrazinamide and isoniazid (with pyridoxine hydrochloride) for two months. After completion of the initial treatment phase, rifampicin and isoniazid (with pyridoxine hydrochloride) should be continued for a further 10 months. Treatment for tuberculosis meningitis should be offered if clinical signs and laboratory findings are consistent with the diagnosis, even if a rapid diagnostic test is negative.

An initial high dose dexamethasone p. 439 or prednisolone p. 442 should be started at the same time as antituberculosis therapy and then slowly withdrawn over 4–8 weeks.

Referral for surgery should be considered only in children who have raised intracranial pressure.

Pericardial tuberculosis

An initial high dose of oral prednisolone should be offered to children with active pericardial tuberculosis at the same time as initiation of antituberculosis therapy; it should then be slowly withdrawn over 2–3 weeks.

Latent tuberculosis

Clinicians should be aware that some groups of children with latent tuberculosis are at increased risk of developing active tuberculosis (such as children who are HIV-positive, diabetic or receiving treatment with a tumour necrosis factor alpha

inhibitor). These children and their carers should be advised of the risks and symptoms of active tuberculosis.

Close contacts

All children who are a close contact (prolonged, frequent or intense contact, e.g. household contacts or relations) of a person with confirmed pulmonary or laryngeal tuberculosis should be tested for latent tuberculosis. Children under 2 years should be assessed by a specialist.

Immunocompromised

Children in whom latent tuberculosis is suspected and who are anticipated to be, or who are currently immunocompromised (for example, if they are from a high incidence country or have been in close contact with people with suspected infectious or confirmed pulmonary or laryngeal tuberculosis), should be referred to a tuberculosis specialist.

Chemoprophylaxis for latent tuberculosis

Neonates who have been in close contact with a person with tuberculosis which has not yet been treated for at least two weeks, should be treated with isoniazid p. 367 (with pyridoxine hydrochloride p. 627) followed by a Mantoux test after six weeks of treatment. If the test is positive (and active tuberculosis is not present) treatment should be continued for six months; if negative (and confirmed by a negative interferon-gamma release assay), the treatment should be stopped and a BCG vaccination given.

Children aged 4 weeks to 2 years who have been in close contact with a person with tuberculosis which has not been treated for at least two weeks, should be treated with either isoniazid (with pyridoxine hydrochloride) alone for six months (preferred regimen if interactions with rifamycins are a concern) or rifampicin p. 364 and isoniazid (with pyridoxine hydrochloride) for three months (recommended when hepatotoxicity is a concern); and then have a Mantoux test. If the test is positive (and active tuberculosis is not present), the treatment course should be completed. If the test is negative, treatment should be continued and re-

assessed after 6 weeks. If the results are then negative (and confirmed by a negative interferon-gamma release assay), the treatment should be stopped and a BCG vaccination given (if the child has not already had one). If the result is positive (and active tuberculosis is not present), the course of treatment should be continued.

Children aged over 2 years should be offered a Mantoux test, and if positive (and active tuberculosis is not present), then treated as above for children aged 4 weeks to 2 years. If the test is negative, reassess after 6 weeks.

Testing for hepatitis B and hepatitis C should be considered before starting treatment for tuberculosis as this may affect the choice of therapy. Children with severe liver disease should be treated under the care of a specialist team; careful monitoring of liver function is necessary in children with non-severe liver disease, abnormal liver function, or who misuse alcohol or drugs.

See advice on immunisation against tuberculosis and tuberculin testing under Vaccines p. 777.

Treatment failure

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the child or their carer. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be specialised by a specialist paediatrician.

Treatment interruptions

A break in antituberculosis treatment of at least two weeks (during the initial phase), or missing more than 20 % of prescribed doses is classified as treatment interruption. Re-establishing treatment appropriately following interruptions is key to ensuring treatment success without relapse, drug resistance or further adverse events. If an adverse reaction recurs upon re-introducing a particular drug, do not give that drug in future regimens and consider extending the total regimen accordingly.

Treatment interruptions due to drug-induced hepatotoxicity

Following treatment interruption due to drug-induced hepatotoxicity, all potential causes of hepatotoxicity should be investigated. Once hepatic function has recovered, antituberculosis therapy should be sequentially re-introduced at previous full doses over a period of no more than ten days, initially with ethambutol hydrochloride p. 367 and either isoniazid (with pyridoxine hydrochloride) or rifampicin.

In children with severe or highly infectious tuberculosis who need to interrupt the standard regimen, consider continuing treatment with at least two drugs with low risk of hepatotoxicity, such as ethambutol hydrochloride and streptomycin p. 313 (with or without a quinolone, such as levofloxacin or moxifloxacin), and with ongoing monitoring by a liver specialist.

Treatment interruptions due to cutaneous reactions

If a child with severe or highly infectious tuberculosis has a cutaneous reaction, consider continuing treatment with a combination of at least two drugs with a low risk of causing cutaneous reactions, such as ethambutol hydrochloride and streptomycin with monitoring by a dermatologist.

Antituberculosis drugs

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculosis regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculosis regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does

not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20–30% of patients.

Rifabutin p. 364 is licensed in adults for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis. There is limited experience in children.

Pyrazinamide p. 368 is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*.

Ethambutol hydrochloride is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms.

Drug-resistant tuberculosis

Drug-resistant tuberculosis should be treated by a specialist paediatrician with experience in such cases, and where appropriate facilities for infection-control exist. Multidrug-resistant tuberculosis (*resistance to isoniazid and rifampicin, with or without any other resistance*) requires treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive. Testing for resistance to second-line drugs is recommended and treatment should be modified according to susceptibility. The risk of resistance is minimised by ensuring therapy is administered in the correct dose and combination for the prescribed duration.

Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin p. 311, capreomycin, cycloserine p. 366, newer macrolides (e.g. azithromycin p. 329 and clarithromycin p. 330), moxifloxacin p. 677 and prothionamide (prothionamide; no longer on UK market). Availability of suitable formulations may limit choice in children.

Single drug-resistant tuberculosis

For single drug-resistance the following treatment regimen is recommended:

Resistance to isoniazid p. 367:

- First two months (initial phase): rifampicin p. 364, pyrazinamide p. 368 and ethambutol hydrochloride p. 367
- Continue with (continuation phase): rifampicin and ethambutol hydrochloride for seven months (up to ten months for extensive disease)

Resistance to pyrazinamide:

- First two months (initial phase): rifampicin, ethambutol hydrochloride and isoniazid (with pyridoxine hydrochloride p. 627)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for seven months

Resistance to ethambutol hydrochloride:

- First two months (initial phase): rifampicin, pyrazinamide and isoniazid (with pyridoxine hydrochloride)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for four months

Resistance to rifampicin:

- Offer treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive.

ANTIMYCOBACTERIALS > RIFAMYCINS

Rifabutin

● INDICATIONS AND DOSE

Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count

- BY MOUTH
- Child 1 month–11 years: 5 mg/kg once daily (max. per dose 300 mg), also consult product literature
- Child 12–17 years: 300 mg once daily, also consult product literature

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs

- BY MOUTH
- Child 1 month–11 years: 5 mg/kg once daily for up to 6 months after cultures negative
- Child 12–17 years: 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs

- BY MOUTH
- Child 12–17 years: 150–450 mg once daily for at least 6 months

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Acute porphyrias p. 603 · discolours soft contact lenses
- **INTERACTIONS** → Appendix 1: rifabutin
- **SIDE-EFFECTS** Agranulocytosis · anaemia · arthralgia · bronchospasm · chest pain · corneal deposits · decreased leucocytes · dyspnoea · eosinophilia · fever · haemolysis · hepatic disorders · influenza like illness · myalgia · nausea · neutropenia · pancytopenia · skin reactions · thrombocytopenia · urine discolouration · uveitis (more common following high doses or concomitant use with drugs that increase plasma concentration) · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose in severe impairment.
Monitoring In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.
- **RENAL IMPAIRMENT**
Dose adjustments Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - Renal function should be checked before treatment.
 - Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.
 - Blood counts should be monitored on prolonged therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

● PATIENT AND CARER ADVICE

Soft contact lenses Patients or their carers should be advised that rifabutin discolours soft contact lenses.
Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

Rifampicin

● INDICATIONS AND DOSE

Brucellosis in combination with other antibacterials | Legionnaires disease in combination with other antibacterials | Serious staphylococcal infections in combination with other antibacterials

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Neonate: 5–10 mg/kg twice daily.

- Child 1–11 months: 5–10 mg/kg twice daily
- Child 1–17 years: 10 mg/kg twice daily (max. per dose 600 mg)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

► BY MOUTH

- Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

► BY MOUTH

- Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
- Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day

Congenital tuberculosis

► BY MOUTH

- Neonate: 15 mg/kg once daily for 6 months (initial and continuation phases).

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid

► BY MOUTH

- Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
- Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
- Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 3 months
- Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

► BY MOUTH

- Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
- Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
- Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 6 months
- Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of *Haemophilus influenzae* type b disease

► BY MOUTH

- Child 1–2 months: 10 mg/kg once daily for 4 days
- Child 3 months–11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
- Child 12–17 years: 600 mg once daily for 4 days

Prevention of secondary case of meningococcal meningitis

► BY MOUTH

- Neonate: 5 mg/kg every 12 hours for 2 days.
- Child 1–11 months: 5 mg/kg every 12 hours for 2 days
- Child 1–11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
- Child 12–17 years: 600 mg every 12 hours for 2 days

Pruritis due to cholestasis

► BY MOUTH

- Child: 5–10 mg/kg once daily (max. per dose 600 mg)

- **UNLICENSED USE** Not licensed for use in children for pruritis due to cholestasis.
- **CONTRA-INDICATIONS** Acute porphyrias p. 603 · jaundice
- **CAUTIONS** Discolours soft contact lenses
- **INTERACTIONS** → Appendix 1: rifampicin
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Nausea · thrombocytopenia · vomiting
- **Uncommon** Diarrhoea · leucopenia
- **Frequency not known** Abdominal discomfort · acute kidney injury · adrenal insufficiency · agranulocytosis · appetite decreased · disseminated intravascular coagulation · dyspnoea · eosinophilia · flushing · haemolytic anaemia · hepatitis · hypersensitivity · influenza · intracranial haemorrhage · menstrual disorder · muscle weakness · myopathy · oedema · pseudomembranous enterocolitis · severe cutaneous adverse reactions (SCARs) · shock · skin reactions · sputum discolouration · sweat discolouration · tear discolouration · urine discolouration · vasculitis · wheezing

SPECIFIC SIDE-EFFECTS

- With intravenous use Bone pain · gastrointestinal disorder · hyperbilirubinaemia · psychotic disorder
- With oral use Psychosis

SIDE-EFFECTS, FURTHER INFORMATION Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, and acute renal failure. Discontinue if serious side-effects develop.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.

● CONCEPTION AND CONTRACEPTION

Important Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

● PREGNANCY Manufacturers advise very high doses

teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

● BREAST FEEDING Amount too small to be harmful.**● HEPATIC IMPAIRMENT** Impaired elimination.

Dose adjustments Avoid or do not exceed 8 mg/kg daily.

Monitoring In patients with pre-existing liver disease or hepatic impairment, monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

● RENAL IMPAIRMENT Use with caution if doses above 10 mg/kg daily.**● MONITORING REQUIREMENTS**

- **Renal function** should be checked before treatment.
- **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
- Blood counts should be monitored in patients on prolonged therapy.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

● PRESCRIBING AND DISPENSING INFORMATION If treatment interruption occurs, re-introduce with low dosage and increase gradually.

- With oral use In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children. Flavours of syrup may include raspberry.

● PATIENT AND CARER ADVICE

Soft contact lenses Patients or their carers should be advised that rifampicin discolours soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

- CNS toxicity** Discontinue or reduce dose if symptoms of CNS toxicity occur.
- Rashes or allergic dermatitis** Discontinue or reduce dose if rashes or allergic dermatitis develop.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Present in milk—amount too small to be harmful.
- **RENAL IMPAIRMENT**
Dose adjustments Increase interval between doses if creatinine clearance less than 50 mL/minute/1.73 m².
Monitoring Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Blood concentration should not exceed a peak concentration of 30 mg/litre (measured 3–4 hours after the dose).
 - ▶ Monitor haematological, renal, and hepatic function.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 2, 8

► Cycloserine (Non-proprietary)

Cycloserine 250 mg Cycloserine 250mg capsules | 100 capsule [PoM] £442.89 DT = £442.89

Ethambutol hydrochloride

19-Mar-2018

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

► BY MOUTH

► Child: 20 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

► BY MOUTH

► Child: 30 mg/kg 3 times a week for 2 months (initial phase)

Congenital tuberculosis, in combination with other drugs

► BY MOUTH

► Neonate: 20 mg/kg once daily for 2 months (initial phase).

● **CONTRA-INDICATIONS** Optic neuritis · poor vision

● **CAUTIONS** Young children

CAUTIONS, FURTHER INFORMATION

► Understanding warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

● **INTERACTIONS** → Appendix 1: ethambutol

● SIDE-EFFECTS

► **Common or very common** Hyperuricaemia · nerve disorders · visual impairment

► **Rare or very rare** Nephritis tubulointerstitial

► **Frequency not known** Alveolitis allergic · appetite decreased · asthenia · confusion · dizziness · eosinophilia · fever · flatulence · gastrointestinal discomfort · gout · hallucination · headache · jaundice · leucopenia · nausea · nephrotoxicity · neutropenia · photosensitive lichenoid eruption · sensation abnormal · severe cutaneous adverse reactions (SCARs) · skin reactions · taste metallic · thrombocytopenia · tremor · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Ocular toxicity is more common where excessive dosage is used or if the patient's renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Amount too small to be harmful.

● **RENAL IMPAIRMENT** Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment.

Dose adjustments If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week.

Monitoring If creatinine clearance less than 30 mL/minute/1.73 m², monitor plasma-ethambutol concentration.

● MONITORING REQUIREMENTS

► 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).

► Renal function should be checked before treatment.
► Visual acuity should be tested by Snellen chart before treatment with ethambutol.
► In young children, routine ophthalmological monitoring recommended.

● **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of ethambutol is required, the following strength is used: 400 mg/5 mL.

● PATIENT AND CARER ADVICE

Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

Isoniazid

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Congenital tuberculosis, in combination with other drugs

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Neonate: 10 mg/kg daily for 6 months (initial and continuation phases).

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

► INITIALLY BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Neonate: 10 mg/kg daily for 6 months.

► Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively (by mouth) 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
► Child 12–17 years: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin

● **CONTRA-INDICATIONS** Drug-induced liver disease

● **CAUTIONS** Acute porphyrias p. 603 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)

CAUTIONS, FURTHER INFORMATION

- ▶ **Peripheral neuropathy** Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 627 should be given prophylactically from the start of treatment.

● **INTERACTIONS** → Appendix 1: isoniazid

● **SIDE-EFFECTS**

- ▶ **Uncommon** Hepatic disorders
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Agranulocytosis · alopecia · anaemia · aplastic anaemia · eosinophilia · fever · gynaecomastia · haemolytic anaemia · hyperglycaemia · lupus-like syndrome · nerve disorders · optic atrophy · pancreatitis · pellagra · psychosis · seizure · skin reactions · thrombocytopenia · vasculitis

● **PREGNANCY** Not known to be harmful; prophylactic pyridoxine recommended.

● **BREAST FEEDING** Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. **Monitoring** In breast-feeding, monitor infant for possible toxicity.

● **HEPATIC IMPAIRMENT** Use with caution.

Monitoring In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

● **RENAL IMPAIRMENT** Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 627 recommended.

● **MONITORING REQUIREMENTS**

- ▶ **Renal function** should be checked before treatment.
- ▶ **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Doses may need to be recalculated to allow for weight gain in younger children.
- ▶ **With oral use** In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The RCPCH and NPPG recommend that, when a liquid special of isoniazid is required, the following strength is used: 50 mg/5 mL.

● **PATIENT AND CARER ADVICE**

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

2.5 Urinary tract infections

Urinary-tract infections

Description of condition

Urinary-tract infections are common bacterial infections usually caused by *Escherichia coli*, *Proteus mirabilis*, or *Staphylococcus saprophyticus*. Occasionally, urinary-tract infections can also be caused by *Citrobacter* species, *Serratia marcescens*, *Pseudomonas* species, *Klebsiella aerogenes*, or *Staphylococcus epidermidis*.

The most common urinary-tract infection symptoms in children younger than 3 months are fever, vomiting, lethargy, and irritability. Children older than 3 months usually present with fever with urinary frequency or dysuria.

Lower urinary-tract infections are associated with inflammation of the bladder (cystitis) and urethra (urethritis), whereas upper urinary-tract infections are associated with inflammation of the renal pelvis and the kidneys (pyelonephritis). Urinary-tract infections are considered recurrent after at least two episodes of acute pyelonephritis, three episodes of cystitis or one episode of acute pyelonephritis plus one or more episodes of cystitis.

Urinary-tract infections are more common in girls than boys. The risk of contracting a urinary-tract infection is greater in children with functional and structural abnormalities that may cause urinary retention (e.g. vesicoureteric reflux, genital malformation, dysfunctional elimination syndrome, or constipation). Acute pyelonephritis, especially in children with vesicoureteric reflux, may lead to renal scarring and hypertension.

Aims of treatment

The aim of treatment is to relieve symptoms, prevent systemic infection, and to reduce the risk of complications.

Treatment

Urinary-tract infections require prompt antibacterial treatment to minimise the risk of complications including renal scarring, hypertension and renal failure.

[EvGr] Initial treatment for symptomatic bacteriuria should not be delayed while waiting for urine culture results and the

antibacterial used should reflect local bacterial sensitivity. Urine culture results will determine the subsequent choice of antibacterial therapy.

Children under 3 months of age with a suspected urinary-tract infection and all children with a high risk of serious illness should be referred urgently to paediatric specialist care.

Parenteral antibacterials should be used to treat urinary-tract infections in children under 1 month old who present with a fever or, children 1–3 months old who appear unwell or present with abnormal white blood cell counts. A third-generation cephalosporin (such as cefotaxime p. 320 or ceftriaxone p. 322) should be given in combination with an antibacterial active against listeria (such as ampicillin p. 341 or amoxicillin p. 339).

Children over 3 months of age with cystitis should receive a 3-day course of oral antibacterial in line with the local formulary which may include trimethoprim p. 359, nitrofurantoin below, a cephalosporin or amoxicillin as options. Children should be reassessed if they are still feeling unwell 24–48 hours after starting treatment.

Children over 3 months of age with acute pyelonephritis should be treated with an oral antibacterial with low resistance patterns such as a cephalosporin or co-amoxiclav p. 343 for 7–10 days and referral to a paediatric specialist should be considered. Alternatively, a broad-spectrum antibacterial such as cefotaxime or ceftriaxone can be administered intravenously for the first 2–4 days followed by an oral antibacterial for a total duration of 10 days. Once-daily dosing is recommended when intravenous aminoglycosides (e.g. gentamicin p. 312, amikacin p. 311) are used in children with urinary-tract infections. If intravenous treatment is indicated but not possible, intramuscular treatment should be considered. **[A]**

Prevention of recurrence

[EvGr] Children who have had a urinary-tract infection should be encouraged to drink plenty of fluids. Dysfunctional elimination syndromes and constipation should also be addressed. Antibacterial prophylaxis may be considered in children with recurrent symptomatic urinary-tract infections (see *Prevention of urinary-tract infection* in Antibacterials, use for prophylaxis p. 302).

When children develop a urinary-tract infection whilst taking antibacterial prophylaxis, a different antibacterial should be chosen to treat the infection rather than increasing the dose of the antibacterial used for prophylaxis. **[A]**

ANTIBACTERIALS > OTHER

Nitrofurantoin

● INDICATIONS AND DOSE

Acute uncomplicated urinary-tract infections

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days

► Child 12–17 years: 50 mg 4 times a day for 3–7 days

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

► Child 12–17 years: 100 mg twice daily, dose to be taken with food

Severe chronic recurrent urinary-tract infections

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Child 12–17 years: 100 mg 4 times a day for 3–7 days

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night continued →

- ▶ Child 12–17 years: 50–100 mg once daily, dose to be taken at night

Genito-urinary surgical prophylaxis

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily on day of procedure and for 3 days after

- **CONTRA-INDICATIONS** Acute porphyrias p. 603 • G6PD deficiency • infants less than 3 months old
- **CAUTIONS** Anaemia • diabetes mellitus • electrolyte imbalance • folate deficiency • pulmonary disease • susceptibility to peripheral neuropathy • urine may be coloured yellow or brown • vitamin B deficiency
- **INTERACTIONS** → Appendix 1: nitrofurantoin
- **SIDE-EFFECTS** Agranulocytosis • alopecia • anaemia • angioedema • aplastic anaemia • appetite decreased • arthralgia • asthenia • chest pain • chills • circulatory collapse • confusion • cough • cyanosis • depression • diarrhoea • dizziness • drowsiness • dyspnoea • eosinophilia • euphoric mood • fever • granulocytopenia • haemolytic anaemia • headache • hepatic disorders • idiopathic intracranial hypertension • increased risk of infection • leucopenia • lupus-like syndrome • nausea • nerve disorders • nystagmus • pancreatitis • psychotic disorder • pulmonary hypersensitivity • pulmonary reaction (possible association with lupus erythematosus-like syndrome) • respiratory disorders • skin reactions • Stevens-Johnson syndrome • thrombocytopenia • urine discolouration • vertigo • vomiting
- **PREGNANCY** Avoid at term—may produce neonatal haemolysis.
- **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution; cholestatic jaundice and chronic active hepatitis reported.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract. Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
- **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms (discontinue if deterioration in lung function).
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Nitrofurantoin for urinary tract infections www.medicinesforchildren.org.uk/nitrofurantoin-for-urinary-tract-infections

3 Fungal infection

Antifungals, systemic use

Fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 377 is the treatment of choice for aspergillosis; liposomal amphotericin p. 373 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 372 or itraconazole p. 375 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis

Many superficial candidal infections, including infections of the skin, are treated locally. Systemic antifungal treatment is required in widespread or intractable infection. Vaginal candidiasis can be treated with locally acting antifungals; alternatively, fluconazole p. 374 can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy. Fluconazole is given by mouth for unresponsive infections; it is reliably absorbed and is effective. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, either amphotericin by intravenous infusion or an **echinocandin** can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable children who have not received an azole antifungal recently. Amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in children intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 378 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients,

can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis).

Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 726 are used more frequently than griseofulvin p. 379 because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain. Fluconazole or itraconazole are alternatives in the treatment of tinea capitis caused by *T. tonsurans* or *Microsporum* spp. [both unlicensed indications].

Pityriasis versicolor may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; they should be used under specialist advice in children. Although terbinafine is not licensed for use in children, it is considered to be the drug of choice for onychomycosis. Itraconazole can be administered as intermittent 'pulse' therapy. Topical antifungals also have a role in the treatment of onychomycosis.

Immunocompromised children

Immunocompromised children are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Micafungin p. 372 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole or itraconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections in immunocompromised children; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. There is limited information available on use in children. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Voriconazole is a broad-spectrum antifungal drug which is licensed in adults for use in life-threatening infections.

Imidazole antifungals

The imidazole antifungals include clotrimazole p. 515, econazole nitrate p. 515, ketoconazole p. 444, and tioconazole p. 726. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 516 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

Polyene antifungals

The polyene antifungals include amphotericin and nystatin p. 710; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin p. 373 by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*® and *AmBisome*®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include caspofungin p. 372 and micafungin p. 372. They are only active against *Aspergillus* spp. and *Candida* spp.; however, micafungin is not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. Echinocandin antifungals have a role in the prevention and systemic treatment of fungal infections.

Other antifungals

Flucytosine p. 378 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 379 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. Griseofulvin is used in the treatment of tinea capitis. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 726 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

Caspofungin

● INDICATIONS AND DOSE

Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

► BY INTRAVENOUS INFUSION

► Neonate: 25 mg/m² once daily.

- Child 1–2 months: 25 mg/m² once daily
- Child 3–11 months: 50 mg/m² once daily
- Child 1–17 years: 70 mg/m² once daily (max. per dose 70 mg) for 1 day, then 50 mg/m² once daily (max. per dose 70 mg); increased to 70 mg/m² once daily (max. per dose 70 mg), dose may be increased if lower dose tolerated but inadequate response

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises increase dose to 70 mg/m² daily (max. 70 mg daily) with concurrent use of some enzyme inducers (such as carbamazepine, dexamethasone, phenytoin, and rifampicin).

● **INTERACTIONS** → Appendix 1: caspofungin

● SIDE-EFFECTS

- **Common or very common** Arthralgia · diarrhoea · dyspnoea · electrolyte imbalance · fever · headache · hyperhidrosis · nausea · skin reactions · vomiting
- **Uncommon** Anaemia · anxiety · appetite decreased · arrhythmias · ascites · chest discomfort · coagulation disorder · congestive heart failure · constipation · cough · disorientation · dizziness · drowsiness · dry mouth · dysphagia · excessive tearing · eyelid oedema · fatigue · flatulence · fluid overload · flushing · gastrointestinal discomfort · haematuria · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · hypoxia · insomnia · laryngeal pain · leucopenia · malaise · metabolic acidosis · muscle weakness · myalgia · nasal congestion · oedema · pain · palpitations · renal impairment · respiratory disorders · sensation abnormal · taste altered · thrombocytopenia · tremor · vision blurred
- **Frequency not known** Severe cutaneous adverse reactions (SCARs)

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** No information available for severe impairment.

Dose adjustments Usual initial dose, then use 70% of normal maintenance dose in moderate impairment.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Candidas[®]), allow vial to reach room temperature; initially reconstitute 50 mg with 10.5 mL Water for Injections to produce a 5.2 mg/mL solution, or reconstitute 70 mg with 10.5 mL Water for Injections to produce a 7.2 mg/mL solution; mix gently to dissolve; dilute requisite dose to a final concentration not exceeding

500 micrograms/mL with Sodium Chloride 0.9%; give over 60 minutes; incompatible with glucose solutions.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Caspofungin (Non-proprietary)

Caspofungin (as Caspofungin acetate) 50 mg Caspofungin 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £81.92–£327.67

Caspofungin (as Caspofungin acetate) 70 mg Caspofungin 70mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £104.20–£416.78

► Candidas (Merck Sharp & Dohme Ltd)

Caspofungin (as Caspofungin acetate) 50 mg Candidas 50mg powder for solution for infusion vials | 1 vial [PoM] £327.67

Caspofungin (as Caspofungin acetate) 70 mg Candidas 70mg powder for solution for infusion vials | 1 vial [PoM] £416.78

Micafungin

● INDICATIONS AND DOSE

Invasive candidiasis

► BY INTRAVENOUS INFUSION

► Neonate (administered on expert advice): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate.

- Child (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
- Child (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

Oesophageal candidiasis

► BY INTRAVENOUS INFUSION

- Child 16–17 years (body-weight up to 40 kg): 3 mg/kg once daily
- Child 16–17 years (body-weight 40 kg and above): 150 mg once daily

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days

► BY INTRAVENOUS INFUSION

- Neonate: 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range.
- Child (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
- Child (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

● **INTERACTIONS** → Appendix 1: micafungin

● **SIDE-EFFECTS** Anaemia · anxiety · appetite decreased · arrhythmias · confusion · constipation · diarrhoea · disseminated intravascular coagulation · dizziness · drowsiness · dyspnoea · electrolyte imbalance · eosinophilia · flushing · gastrointestinal discomfort · haemolysis · haemolytic anaemia · headache · hepatic disorders · hepatic failure (potentially life-threatening) · hyperbilirubinaemia · hyperhidrosis · hypersensitivity · hypertension · hypoalbuminaemia · hypotension · insomnia · leucopenia · nausea · neutropenia · palpitations · pancytopenia · peripheral oedema · renal impairment · severe cutaneous adverse reactions (SCARs) · shock · skin reactions · taste altered · thrombocytopenia · tremor · vomiting

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution; renal function may deteriorate.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor renal function.
 - ▶ Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* reconstitute each vial with 5 mL Glucose 5% or Sodium Chloride 0.9%; gently rotate vial, without shaking, to dissolve; dilute requisite dose to a concentration of 0.5–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; protect infusion from light; give over 60 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Mycamine** (Astellas Pharma Ltd)
Micafungin (as Micafungin sodium) 50 mg Mycamine 50mg powder for solution for infusion vials | 1 vial [PoM](#) £196.08
- Micafungin (as Micafungin sodium) 100 mg Mycamine 100mg powder for solution for infusion vials | 1 vial [PoM](#) £341.00

ANTIFUNGALS > POLYENE ANTIFUNGALS

Amphotericin

(Amphotericin B)

● INDICATIONS AND DOSE

ABELCET®

Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Test dose 100 micrograms/kg (max. per dose 1 mg), then 5 mg/kg once daily

AMBISOME®

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate: 1 mg/kg once daily, increased if necessary to 3 mg/kg once daily; maximum 5 mg/kg per day.

- ▶ Child: Test dose 100 micrograms/kg (max. per dose 1 mg), to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Visceral leishmaniasis (unresponsive to the antimonial alone)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

FUNGIZONE®

Systemic fungal infections

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 1 mg/kg once daily, increased if necessary to 1.5 mg/kg daily for 7 days, then reduced to 1–1.5 mg/kg once daily on alternate days if required.
- ▶ Child: Test dose 100 micrograms/kg (max. per dose 1 mg), included as part of first dose of 250 micrograms/kg daily, then increased if tolerated to 1 mg/kg daily, dose is gradually increased over 2–4 days; in severe infection max. 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

● UNLICENSED USE

AMBISOME® *Ambisome®* not licensed for use in children under 1 month.

FUNGIZONE® Intravenous conventional formulation amphotericin (*Fungizone®*) is licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Avoid rapid infusion (risk of arrhythmias) - when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

CAUTIONS, FURTHER INFORMATION

- ▶ **Anaphylaxis** Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion in children over 1 month of age; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

- **INTERACTIONS** → Appendix 1: amphotericin

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · appetite decreased · azotaemia · chills · diarrhoea · dyspnoea · electrolyte imbalance · fever · headache · hepatic function abnormal (discontinue) · hyposthenuria · hypotension · nausea · nephrocalcinosis · renal impairment · renal tubular acidosis · skin reactions · vomiting
- ▶ **Uncommon** Agranulocytosis · arrhythmias · flushing · gastrointestinal discomfort · hepatic disorders · leucopenia · myalgia · peripheral neuropathy · respiratory disorders · thrombocytopenia
- ▶ **Rare or very rare** Arthralgia · cardiac arrest · coagulation disorder · encephalopathy · eosinophilia · haemorrhage · hearing impairment · heart failure · hypersensitivity · hypertension · malaise · nephrogenic diabetes insipidus · pain · pulmonary oedema non-cardiogenic · seizure · severe cutaneous adverse reactions (SCARs) · shock · vertigo · vision disorders · weight decreased

- **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

● DIRECTIONS FOR ADMINISTRATION

ABELCET® Amphotericin (lipid complex)

For *intravenous infusion*, allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe

with a 5-micron filter needle provided (fresh needle for each syringe) and dilute in Glucose 5% to a concentration of 2 mg/mL; preferably give *via* an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions—flush existing intravenous line with Glucose 5% or use separate line.

AMBIOME® Amphotericin (liposomal)

For intravenous infusion, reconstitute each vial with 12 mL Water for Injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into Glucose 5% or 10% through the 5-micron filter provided, to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose given over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions—flush existing intravenous line with Glucose 5% or 10%, or use separate line.

FUNGIZONE® Amphotericin (as sodium deoxycholate complex)

For intravenous infusion, reconstitute each vial with 10 mL Water for Injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in Glucose 5% to a concentration of 100 micrograms/mL (in fluid-restricted children, up to 400 micrograms/mL given *via* a central line); pH of glucose solution must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 4–6 hours, or if tolerated over a minimum of 2 hours (initial test dose given over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with Sodium Chloride solutions—flush existing intravenous line with Glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

- **PRESCRIBING AND DISPENSING INFORMATION** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Suspension for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Abelcet** (Teva UK Ltd)

Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 mL Abelcet 100mg/20mL concentrate for suspension for infusion vials | 10 vial [PoM] £775.04 (Hospital only)

Powder for solution for infusion

EXCIPIENTS: May contain Sucrose

ELECTROLYTES: May contain Sodium

- ▶ **Ambisome** (Gilead Sciences International Ltd)

Amphotericin B liposomal 50 mg Ambisome 50mg powder for solution for infusion vials | 10 vial [PoM] £821.87

- ▶ **Fungizone** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Amphotericin B 50 mg Fungizone Intravenous 50mg powder for solution for infusion vials | 1 vial [PoM] £3.88

ANTIFUNGALS > TRIAZOLE ANTIFUNGALS

Fluconazole

● **INDICATIONS AND DOSE**

Candidal balanitis

- ▶ BY MOUTH
- ▶ Child 16–17 years: 150 mg for 1 dose

Vaginal candidiasis

- ▶ BY MOUTH
- ▶ Child 1 month–15 years: 150 mg for 1 dose, for use in patients who are post-puberty
- ▶ Child 16–17 years: 150 mg for 1 dose

Vulvovaginal candidiasis (recurrent)

- ▶ BY MOUTH
- ▶ Child: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months, for use in patients who are post-puberty

Mucosal candidiasis (except genital)

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 14 days: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 72 hours.

- ▶ Neonate 14 days to 28 days: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 48 hours.

- ▶ Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)
- ▶ Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

Tinea capitis

- ▶ BY MOUTH
- ▶ Child 1–17 years: 6 mg/kg daily (max. per dose 300 mg) for 2–4 weeks

Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis

- ▶ BY MOUTH
- ▶ Child: 3 mg/kg daily (max. per dose 50 mg) for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 14 days: 6–12 mg/kg every 72 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).

- ▶ Neonate 14 days to 28 days: 6–12 mg/kg every 48 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).

- ▶ Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)

Prevention of fungal infections in immunocompromised patients

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 14 days: 3–12 mg/kg every 72 hours, dose given according to extent and duration of neutropenia.

- ▶ Neonate 14 days to 28 days: 3–12 mg/kg every 48 hours, dose given according to extent and duration of neutropenia.

- ▶ Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of

neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia

Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 6 mg/kg daily (max. per dose 200 mg)

- **UNLICENSED USE** Not licensed for tinea infections in children, or for vaginal candidiasis in girls under 16 years, or for prevention of relapse of cryptococcal meningitis after completion of primary therapy in children with AIDS.

- **CONTRA-INDICATIONS** Acute porphyrias p. 603

- **CAUTIONS** Susceptibility to QT interval prolongation

- **INTERACTIONS** → Appendix 1: antifungals, azoles

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Diarrhoea · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- **Uncommon** Dizziness · flatulence · hepatic disorders · seizure · taste altered
- **Rare or very rare** Agranulocytosis · alopecia · dyslipidaemia · hypokalaemia · leucopenia · neutropenia · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · torsade de pointes

SPECIFIC SIDE-EFFECTS

► **Uncommon**

- With parenteral use Anaemia · appetite decreased · asthenia · constipation · drowsiness · dry mouth · fever · hyperhidrosis · insomnia · malaise · myalgia · paraesthesia · vertigo

► **Rare or very rare**

- With parenteral use Angioedema · face oedema · tremor
- **Frequency not known**
- With oral use Cardio-respiratory distress · oedema

SIDE-EFFECTS, FURTHER INFORMATION If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

- **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.

- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Toxicity with related drugs.

● **RENAL IMPAIRMENT**

Dose adjustments Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Fluconazole Capsules 50 mg may be prescribed.

Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Itraconazole

● **INDICATIONS AND DOSE**

Oropharyngeal candidiasis

► **BY MOUTH**

- Child 1 month–11 years: 3–5 mg/kg once daily for 15 days; maximum 100 mg per day

- Child 12–17 years: 100 mg once daily for 15 days

Oropharyngeal candidiasis in patients with AIDS or neutropenia

► **BY MOUTH**

- Child 1 month–11 years: 3–5 mg/kg once daily for 15 days; maximum 200 mg per day

- Child 12–17 years: 200 mg once daily for 15 days

continued →

Systemic candidiasis where other antifungal drugs inappropriate or ineffective

- BY MOUTH
 - Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)
- BY INTRAVENOUS INFUSION
 - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

Pityriasis versicolor

- BY MOUTH
 - Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 7 days
 - Child 12–17 years: 200 mg once daily for 7 days

Tinea pedis | Tinea manuum

- BY MOUTH
 - Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 30 days
 - Child 12–17 years: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

Tinea corporis | Tinea cruris

- BY MOUTH
 - Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 15 days
 - Child 12–17 years: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

Tinea capitis

- BY MOUTH
 - Child 1–17 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 2–6 weeks

Onychomycosis

- BY MOUTH
 - Child 1–11 years: 5 mg/kg daily (max. per dose 200 mg) for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses
 - Child 12–17 years: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

Systemic aspergillosis where other antifungal drugs inappropriate or ineffective

- BY INTRAVENOUS INFUSION
 - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days
- BY MOUTH
 - Child: 5 mg/kg once daily (max. per dose 200 mg), increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis

Histoplasmosis

- BY MOUTH
 - Child: 5 mg/kg 1–2 times a day (max. per dose 200 mg)

Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective

- BY MOUTH
 - Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)
- BY INTRAVENOUS INFUSION
 - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate

- BY MOUTH
 - Child: 5 mg/kg once daily (max. per dose 200 mg), then increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased only if low plasma-itraconazole concentration

Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic

- BY MOUTH USING ORAL SOLUTION
 - Child: 2.5 mg/kg twice daily, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established

- **UNLICENSED USE** Not licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION**HEART FAILURE**

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older adults and those with cardiac disease;
- patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

- **CONTRA-INDICATIONS** Acute porphyrias p. 603
- **CAUTIONS** Active liver disease · history of hepatotoxicity with other drugs · susceptibility to congestive heart failure
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Alopecia · constipation · diarrhoea · dyspnoea · gastrointestinal discomfort · headache · heart failure · hepatic disorders · hyperbilirubinaemia · hypotension · nausea · oedema · pulmonary oedema · skin reactions · vision disorders · vomiting
- **Uncommon** Taste altered
- **Rare or very rare** Angioedema · hypersensitivity vasculitis · hypertriglyceridaemia · pancreatitis · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)
- **Frequency not known** Peripheral neuropathy (discontinue)

SPECIFIC SIDE-EFFECTS

- **Common or very common**
 - With intravenous use Chest pain · confusion · cough · dizziness · drowsiness · electrolyte imbalance · fatigue · gastrointestinal disorder · granulocytopenia · heart failure · hyperglycaemia · hyperhidrosis · hypersensitivity · hypertension · myalgia · pain · renal impairment · tachycardia · tremor · urinary incontinence
- **Uncommon**
 - With intravenous use Dysphonia · hearing loss · numbness · thrombocytopenia
 - With oral use Flatulence · menstrual disorder

► **Rare or very rare**

- With oral use Erectile dysfunction · hearing impairment · leucopenia · sensation abnormal · serum sickness · urinary frequency increased

SIDE-EFFECTS, FURTHER INFORMATION Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

- **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies).

- **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Use only if potential benefit outweighs risk of hepatotoxicity.

Dose adjustments Dose reduction may be necessary.

- **RENAL IMPAIRMENT** Risk of congestive heart failure.

- With oral use Bioavailability of oral formulations possibly reduced.

- With intravenous use Use intravenous infusion with caution if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² (monitor renal function); avoid intravenous infusion if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS**

- Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
- Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion, dilute 250 mg with 50 mL Sodium Chloride 0.9% and give requisite dose through an in-line filter (0.2 micron) over 60 minutes.
- With oral use For oral liquid, do not take with food; swish around mouth and swallow, do not rinse afterwards.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.

- With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for infusion

EXCIPIENTS: May contain Propylene glycol

- **Sporanox** (Janssen-Cilag Ltd)

Voriconazole

● **INDICATIONS AND DOSE**

Invasive aspergillosis | Serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

- **BY MOUTH**

- Child 2–11 years: Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required

- Child 12–14 years (body-weight up to 50 kg): Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required

- Child 12–14 years (body-weight 50 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

- Child 15–17 years (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours

- Child 15–17 years (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

- **BY INTRAVENOUS INFUSION**

- Child 2–11 years: Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months

- Child 12–14 years (body-weight up to 50 kg): Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months

- Child 12–14 years (body-weight 50 kg and above): Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

- Child 15–17 years: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises increasing the maintenance dose with concurrent use of fosphenytoin, phenytoin, or rifabutin—no specific recommendations made for children.

- **CONTRA-INDICATIONS** Acute porphyrias p. 603

- **CAUTIONS** Avoid exposure to sunlight · bradycardia · cardiomyopathy · electrolyte disturbances · history of QT interval prolongation · patients at risk of pancreatitis · symptomatic arrhythmias

- **INTERACTIONS** → Appendix 1: antifungals, azoles

● SIDE-EFFECTS

- ▶ **Common or very common** Acute kidney injury · agranulocytosis · alopecia · anaemia · anxiety · arrhythmias · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · hallucination · headache · hepatic disorders · hypoglycaemia · hypotension · increased risk of infection · insomnia · leucopenia · muscle tone increased · nausea · neutropenia · oedema · oral disorders · pain · pulmonary oedema · respiratory disorders · seizure · sensation abnormal · skin reactions · syncope · tetany · thrombocytopenia · tremor · vision disorders · vomiting
- ▶ **Uncommon** Adrenal insufficiency · arthritis · brain oedema · duodenitis · encephalopathy · eosinophilia · gallbladder disorders · hearing impairment · hypothyroidism · influenza like illness · lymphadenopathy · lymphangitis · movement disorders · nephritis · nerve disorders · pancreatitis · parkinsonism · phototoxicity · proteinuria · pseudomembranous enterocolitis · QT interval prolongation · renal tubular necrosis · severe cutaneous adverse reactions (SCARs) · taste altered · thrombophlebitis · vertigo
- ▶ **Rare or very rare** Angioedema · cardiac conduction disorders · disseminated intravascular coagulation · hyperthyroidism
- ▶ **Frequency not known** Cutaneous lupus erythematosus · infusion related reaction · perioritis (more common in transplant patients) · squamous cell carcinoma (more common in presence of phototoxicity)

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Hepatitis, cholestasis, and acute hepatic failure have been reported; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.

Phototoxicity Phototoxicity occurs uncommonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in *animal studies*—manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT**
Dose adjustments ▶ Child 12–17 years In mild to moderate hepatic cirrhosis use usual initial dose then halve subsequent doses. No information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT**
 ▶ Child 2–12 years No information available.
 ▶ Child 12–17 years Intravenous vehicle may accumulate if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).
- **MONITORING REQUIREMENTS**
 ▶ Monitor renal function.
 ▶ Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL

solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.
 Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.
 Patients and their carers should be advised to keep the alert card with them at all times.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 11, 23

EXCIPIENTS: May contain Sulfbutylether beta cyclodextrin sodium
 ELECTROLYTES: May contain Sodium

▶ VFEND (Pfizer Ltd)

Voriconazole 200 mg VFEND 200mg powder and solvent for solution for infusion vials | 1 vial [PoM] £77.14 (Hospital only)

ANTIFUNGALS > OTHER

Flucytosine

● INDICATIONS AND DOSE

Systemic yeast and fungal infections | Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

▶ BY INTRAVENOUS INFUSION, OR BY MOUTH

▶ Neonate: 50 mg/kg every 12 hours.

▶ Child: Usual dose 50 mg/kg every 6 hours usually for not more than 7 days, alternatively 25–37.5 mg/kg every 6 hours usually for not more than 7 days, lower dose may be sufficient for sensitive organisms

Cryptococcal meningitis (adjunct to amphotericin)

► BY INTRAVENOUS INFUSION, OR BY MOUTH

- Neonate: 50 mg/kg every 12 hours.
- Child: 25 mg/kg every 6 hours for 2 weeks

- **UNLICENSED USE** Tablets not licensed.
- **CAUTIONS** Blood disorders
- **INTERACTIONS** → Appendix 1: flucytosine
- **SIDE-EFFECTS** Agranulocytosis · aplastic anaemia · blood disorder · cardiotoxicity · confusion · diarrhoea · hallucination · headache · hepatic disorders · leucopenia · nausea · rash · sedation · seizure · thrombocytopenia · toxic epidermal necrolysis · ventricular dysfunction · vertigo · vomiting
- **PREGNANCY** Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid.
- **RENAL IMPAIRMENT**
Dose adjustments Use normal dose every 12 hours if creatinine clearance 20–40 mL/minute; use normal dose every 24 hours if creatinine clearance 10–20 mL/minute; use initial normal dose if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration.
Monitoring In renal impairment liver- and kidney-function tests and blood counts required weekly.
- **MONITORING REQUIREMENTS**
 - For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).
 - Liver- and kidney-function tests and blood counts required (weekly in blood disorders).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 20–40 minutes.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

3.1 Pneumocystis pneumonia**Pneumocystis pneumonia****Overview**

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

The recommended duration of treatment is generally 14–21 days.

Mild to moderate disease

Co-trimoxazole p. 350 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone below or a combination of dapsone below with trimethoprim p. 359 is given by mouth for the treatment of mild to moderate disease [unlicensed indication] in children who cannot tolerate co-trimoxazole.

A combination of clindamycin p. 327 and primaquine p. 396 may be used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 381 given by intravenous infusion is an alternative for children who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion. If there is clinical improvement after 7–10 days of intravenous therapy with pentamidine isetionate, patients can be switched to oral treatment (e.g. atovaquone) to complete 21 days treatment.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy

In moderate to severe pneumocystis infections associated with HIV infection, prednisolone p. 442 is given by mouth for 5 days (alternatively, hydrocortisone p. 440 may be given parenterally); the dose is then reduced over the next 16 days and then stopped. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all children with a history of this infection, and to all HIV-infected infants aged 1 month–1 year. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised children. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the child has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Prophylaxis should also be given to infants aged 1 month–1 year who are suspected to be HIV-positive, or whose mothers had a viral load greater than 1000 HIV RNA copies/mL between 36 weeks' gestation and delivery; prophylaxis should be continued until HIV infection is excluded or until immunity recovers.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. Co-trimoxazole may be used in infants born to mothers with a high risk of transmission of infection.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in children unable to tolerate co-trimoxazole. It is effective but children may be prone to extrapulmonary infection. Alternatively, dapsone can be used.

ANTIPROTOZOALS**Atovaquone****• INDICATIONS AND DOSE**

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

► BY MOUTH

- Child 1–2 months: 15–20 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
- Child 3 months–1 year: 22.5 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
- Child 2–17 years: 15–20 mg/kg twice daily (max. per dose 750 mg) for 14–21 days, dose to be taken with food, particularly high fat food

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Other causes of pulmonary disease should be sought and treated · initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy)

- **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

- **Common or very common** Anaemia · angioedema · bronchospasm · diarrhoea · headache · hypersensitivity · hyponatraemia · insomnia · nausea · neutropenia · skin reactions · throat tightness · vomiting
- **Frequency not known** Stevens-Johnson syndrome

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Monitoring** Monitor more closely in hepatic impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution. **Monitoring** Monitor more closely in renal impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

► **Wellvone** (GlaxoSmithKline UK Ltd)

Atovaquone 150 mg per 1 ml Wellvone 750mg/5ml oral suspension sugar-free | 226 ml (PoM) £486.37

Dapsone**• INDICATIONS AND DOSE**

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)

► BY MOUTH

- Child 1 month–11 years: 2 mg/kg once daily (max. per dose 100 mg)
- Child 12–17 years: 100 mg once daily

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia

► BY MOUTH

- Child: 2 mg/kg once daily (max. per dose 100 mg)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia. Monotherapy not licensed for children for prophylaxis of *P. jirovecii* pneumonia.

- **CAUTIONS** Anaemia (treat severe anaemia before starting)
 - avoid in Acute porphyrias p. 603 • cardiac disease • G6PD deficiency • pulmonary disease • susceptibility to haemolysis

- **INTERACTIONS** → Appendix 1: dapsone

- **SIDE-EFFECTS** Agranulocytosis • appetite decreased • haemolysis • haemolytic anaemia • headache • hepatic disorders • hyposalbuminaemia • insomnia • lepra reaction • methaemoglobinaemia • motor loss • nausea • peripheral neuropathy • photosensitivity reaction • psychosis • severe cutaneous adverse reactions (SCARs) • skin reactions • tachycardia • vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects are dose-related.

If dapsone syndrome occurs (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hyposalbuminaemia, psychosis and death).

- **PREGNANCY** Folic acid p. 574 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinaemia reported in third trimester.
- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.
- **PATIENT AND CARER ADVICE** Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 8

Dapsone 50 mg Dapsone 50mg tablets | 28 tablet **[PoM]** £38.04 DT = £38.04

Dapsone 100 mg Dapsone 100mg tablets | 28 tablet **[PoM]** £97.39 DT = £95.15

Pentamidine isetionate

● INDICATIONS AND DOSE

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Child: 4 mg/kg once daily for at least 7–10 days

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ Child 5–17 years: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

Visceral leishmaniasis (specialist use only)

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child 1–17 years: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

Cutaneous leishmaniasis (specialist use only)

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child 1–17 years: 3–4 mg/kg 1–2 times a week until condition resolves

Trypanosomiasis (specialist use only)

▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Child 1–17 years: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for prevention of pneumocystis pneumonia in children.

- **CAUTIONS** Anaemia • bradycardia • coronary heart disease • history of ventricular arrhythmias • hyperglycaemia • hypertension • hypoglycaemia • hypokalaemia • hypomagnesaemia • hypotension • leucopenia • risk of severe hypotension following administration • thrombocytopenia

- **INTERACTIONS** → Appendix 1: pentamidine

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Dizziness • hypoglycaemia (can be severe and sometimes fatal) • hypotension (can be severe and sometimes fatal) • local reaction • nausea • rash • taste altered
- ▶ **Rare or very rare** QT interval prolongation
- ▶ **Frequency not known** Pancreatitis acute (can be severe and sometimes fatal)

SPECIFIC SIDE-EFFECTS

▶ Common or very common

- ▶ When used by inhalation Cough • dyspnoea • respiratory disorders
- ▶ With parenteral use Acute kidney injury • anaemia • azotaemia • electrolyte imbalance • flushing • haematuria • hyperglycaemia • leucopenia • localised pain • myopathy • syncope • thrombocytopenia • vomiting

▶ Rare or very rare

- ▶ With parenteral use Arrhythmia (can be severe and sometimes fatal) • pancreatitis (can be severe and sometimes fatal)

▶ Frequency not known

- ▶ When used by inhalation Angioedema • appetite decreased • bradycardia • fatigue • renal failure
- ▶ With parenteral use Arrhythmias • perioral hypoaesthesia • sensation abnormal • Stevens-Johnson syndrome

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● RENAL IMPAIRMENT

Dose adjustments Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses.

● MONITORING REQUIREMENTS

- ▶ Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
- ▶ Carry out laboratory monitoring according to product literature.

- **DIRECTIONS FOR ADMINISTRATION** Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion*, reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.

Powder for injection (dissolved in water for injection) may be used for nebulisation.

- **HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ **Pentacarinat** (Sanofi)

Pentamidine isetionate 300 mg Pentacarinat 300mg powder for solution for injection vials | 5 vial **[PoM]** £158.86

4 Helminth infection

Helminth infections

Specialist centres

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

Birmingham	(0121) 424 0357
Scotland	Contact local Infectious Diseases Unit
Liverpool	(0151) 705 3100
London	0845 155 5000 (treatment)

Threadworms

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 384 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Ascaricides (common roundworm infections)

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 383 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

Tapeworm infections

Taeniacides

Niclosamide [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 384 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole p. 383 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

Hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative. Levamisole is also is also effective in children.

Schistosomicides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (*Cysticide*®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Filaricides

Diethylcarbamazine [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin p. 383 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

Cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or **tiabendazole** (tiabendazole) by mouth [all unlicensed] (available from

'special-order' manufacturers or specialist importing companies).

Strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from 'special order' manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

ANTHELMINTICS

Albendazole

● INDICATIONS AND DOSE

Chronic *Strongyloides* infection

- ▶ BY MOUTH
- ▶ Child 2–17 years: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases

- ▶ BY MOUTH
- ▶ Child 2–17 years: 7.5 mg/kg twice daily (max. per dose 400 mg twice daily) for 28 days followed by 14-day break, repeated for up to 2–3 cycles

Hookworm infections

- ▶ BY MOUTH
- ▶ Child 2–17 years: 400 mg for 1 dose

● **UNLICENSED USE** Albendazole is an unlicensed drug.

● **INTERACTIONS** → Appendix 1: albendazole

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Eskazole (Imported (France))**
Albendazole 400 mg Eskazole 400mg tablets | 60 tablet [PoM] 

Chewable tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Zentel (Imported)**
Albendazole 200 mg Zentel 200mg chewable tablets | 6 tablet [PoM] 
- Albendazole 400 mg Zentel 400mg chewable tablets | 1 tablet [PoM] 

Diethylcarbamazine

● INDICATIONS AND DOSE

Wuchereria bancrofti infections | *Brugia malayi* infections

- ▶ BY MOUTH
- ▶ Child 1 month–9 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 3 mg/kg daily in divided doses, dose to be increased gradually over 3 days
- ▶ Child 10–17 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

Loa loa infections

- ▶ BY MOUTH
- ▶ Child 1 month–9 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 3 mg/kg daily

in divided doses, dose to be increased gradually over 3 days

- ▶ Child 10–17 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

● **UNLICENSED USE** Diethylcarbamazine is an unlicensed drug.

● MEDICINAL FORMS

No licensed medicines listed.

Ivermectin

17-May-2017

● INDICATIONS AND DOSE

Chronic *Strongyloides* infection

- ▶ BY MOUTH
- ▶ Child 5–17 years: 200 micrograms/kg daily for 2 days

Onchocerciasis

- ▶ BY MOUTH
- ▶ Child 5–17 years: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months, depending on symptoms, must be given until adult worms die out

Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone

- ▶ BY MOUTH
- ▶ Child: (consult product literature)

● **UNLICENSED USE** Ivermectin is unlicensed.

● **INTERACTIONS** → Appendix 1: ivermectin

● SIDE-EFFECTS

▶ **Common or very common** Skin reactions

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

- ▶ **Stromectol (Imported (France))**
Ivermectin 3 mg Stromectol 3mg tablets | 4 tablet [PoM] 

Levamisole

● INDICATIONS AND DOSE

Roundworm infections

- ▶ BY MOUTH
- ▶ Child: 2.5–3 mg/kg (max. per dose 150 mg) for 1 dose

Hookworm infections

- ▶ BY MOUTH
- ▶ Child: 2.5 mg/kg (max. per dose 150 mg) for 1 dose, dose to be repeated after 7 days if severe

Nephrotic syndrome (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Child: 2.5 mg/kg once daily on alternate days (max. per dose 150 mg)

● **UNLICENSED USE** Not licensed.

● **CONTRA-INDICATIONS** Blood disorders

● **CAUTIONS** Epilepsy · juvenile idiopathic arthritis · Sjögren's syndrome

● **INTERACTIONS** → Appendix 1: levamisole

● **SIDE-EFFECTS** Arthralgia (long term use) · blood disorder (long term use) · diarrhoea · dizziness · headache · influenza like illness (long term use) · insomnia (long term use) · myalgia (long term use) · nausea · rash (long term use) · seizure (long term use) · taste altered (long term use) · vasculitis (long term use) · vomiting

- **PREGNANCY** Embryotoxic in *animal* studies, avoid if possible.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT**
Dose adjustments Use with caution—dose adjustment may be necessary.
- **PATIENT AND CARER ADVICE**

COUNTAINARY AND ADVISORY LABELS 4

► Ergamisol (Imported (Belgium))

Levamisole (as Levamisole hydrochloride) 50 mg Ergamisol 50mg tablets | 20 tablet [PoM] 

Mebendazole

● INDICATIONS AND DOSE

Threadworm infections

► BY MOUTH

- Child 6 months–17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

Whipworm infections | Hookworm infections

► BY MOUTH

- Child 1–17 years: 100 mg twice daily for 3 days

Roundworm infections

► BY MOUTH

- Child 1 year: 100 mg twice daily for 3 days
- Child 2–17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

- **UNLICENSED USE** Not licensed for use as a single dose of 500 mg in roundworm infections. Not licensed for use in children under 2 years.
- **INTERACTIONS** → Appendix 1: mebendazole
- **SIDE-EFFECTS**
 - Common or very common Gastrointestinal discomfort
 - Uncommon Diarrhoea · flatulence
 - Rare or very rare Alopecia · dizziness · hepatitis · neutropenia · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Amount present in milk too small to be harmful but manufacturer advises avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Mebendazole for worm infections www.medicinesforchildren.org.uk/mebendazole-for-worm-infections
- **EXCEPTIONS TO LEGAL CATEGORY** Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

► Ovox (McNeil Products Ltd)

Mebendazole 20 mg per 1 ml Ovox 100mg/5ml oral suspension | 30 ml [P] £6.74 DT = £1.55

Mebendazole 100 mg Vermox 100mg chewable tablets sugar-free | 6 tablet [PoM] £1.34 DT = £1.34

Praziquantel

● INDICATIONS AND DOSE

Tapeworm infections (*Taenia solium*)

► BY MOUTH

- Child 4–17 years: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

Tapeworm infections (*Hymenolepis nana*)

► BY MOUTH

- Child 4–17 years: 25 mg/kg for 1 dose, to be taken after a light breakfast

Schistosoma haematobium worm infections | *Schistosoma mansoni* worm infections

► BY MOUTH

- Child 4–17 years: 20 mg/kg, followed by 20 mg/kg after 4–6 hours

Schistosoma japonicum worm infections

► BY MOUTH

- Child 4–17 years: 20 mg/kg 3 times a day for 1 day

- **UNLICENSED USE** Praziquantel is an unlicensed drug.

- **INTERACTIONS** → Appendix 1: praziquantel

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

► Cesol (Imported (Germany))

Praziquantel 150 mg Cesol 150mg tablets | 6 tablet [PoM] 

► Biltricid (Imported (Germany))

Praziquantel 600 mg Biltricid 600mg tablets | 6 tablet [PoM] 

► Cysticide (Imported (Germany))

Praziquantel 500 mg Cysticide 500mg tablets | 90 tablet [PoM] 

5 Protozoal infection

Antiprotozoal drugs

Amoebicides

Metronidazole p. 333 is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers. Tinidazole p. 335 is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate p. 300.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of

10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with large volumes of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Tinidazole may be used as an alternative to metronidazole.

Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Skin lesions can also be treated with sodium stibogluconate.

Amphotericin p. 373 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*®). *Abelcet*®, a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isetionate p. 381 (pentamidine isethionate) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 399 and sulfadiazine p. 351, given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 327 or clarithromycin p. 330 or azithromycin p. 329. Long-term secondary prophylaxis is required after treatment of

toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus. When there is evidence of placental or fetal infection, pyrimethamine may be given with sulfadiazine and folinic acid p. 555 after the first trimester.

In neonates without signs of toxoplasmosis, but born to mothers known to have become infected, spiramycin is given while awaiting laboratory results. If toxoplasmosis is confirmed in the infant, pyrimethamine and sulfadiazine are given for 12 months, together with folinic acid.

5.1 Leishmaniasis

Other drugs used for Leishmaniasis Amphotericin, p. 373 · Pentamidine isetionate, p. 381

ANTIPROTOZOALS

Sodium stibogluconate

● INDICATIONS AND DOSE

Visceral leishmaniasis (specialist use only)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 20 mg/kg daily for at least 20 days

● UNLICENSED USE

- ▶ With intravenous use Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) · mucocutaneous disease · predisposition to QT interval prolongation · treat intercurrent infection (e.g. pneumonia)

CAUTIONS, FURTHER INFORMATION

- ▶ Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.

- **INTERACTIONS** → Appendix 1: sodium stibogluconate

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · appetite decreased · arthralgia · diarrhoea · headache · lethargy · malaise · myalgia · nausea · vomiting
- ▶ **Rare or very rare** Chest pain · chills · fever · flushing · haemorrhage · hyperhidrosis · jaundice · skin reactions · vertigo
- ▶ **Frequency not known** Arrhythmias · cough · pain · pancreatitis · pneumonia · QT interval prolongation · thrombosis

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** Avoid in significant impairment.

- **MONITORING REQUIREMENTS** Monitor ECG before and during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain

occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Pentostam** (GlaxoSmithKline UK Ltd)

Antimony pentavalent (as Sodium stibogluconate) 100 mg per 1 ml Pentostam 10g/100ml solution for injection vials | 1 vial [PoM]
£66.43

5.2 Malaria

Antimalarials

23-Jan-2018

Artemether with lumefantrine

Artemether with lumefantrine p. 393 is licensed for the *treatment of acute non-complicated falciparum malaria*.

Chloroquine

Chloroquine p. 395 is used for the *prophylaxis of malaria* in areas of the world where the *risk of chloroquine-resistant falciparum malaria is still low*. It is also used with proguanil hydrochloride p. 397 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (for details, see Recommended regimens for prophylaxis against malaria p. 387).

Guidelines for malaria prevention in travellers from the United Kingdom (2017) published by Public Health England state that patients already taking hydroxychloroquine sulfate p. 639 for another indication, and for whom chloroquine would be an appropriate antimalarial, can remain on hydroxychloroquine sulfate.

Chloroquine is **no longer recommended** for the *treatment of falciparum malaria* owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine p. 397, *Malarone*®, or *Riamet*®. It is still recommended for the *treatment of non-falciparum malaria*.

Mefloquine

Mefloquine p. 396 is used for the *prophylaxis of malaria* in areas of the world where there is a *high risk of chloroquine resistant falciparum malaria* (for details, see Recommended regimens for prophylaxis against malaria p. 387).

Mefloquine is now rarely used for the *treatment of falciparum malaria* because of increased resistance. It is rarely used for the *treatment of non-falciparum malaria* because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

Piperaquine with arteminimol

Arteminimol with piperaquine phosphate p. 393 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

Primaquine

Primaquine p. 396 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

Proguanil

Proguanil hydrochloride is used (usually with *chloroquine*, but occasionally *alone*) for the *prophylaxis of malaria*, (for details, see Recommended regimens for prophylaxis against malaria p. 387).

Proguanil hydrochloride used alone is not suitable for the *treatment of malaria*; however, *Malarone*® (a combination of atovaquone with proguanil hydrochloride p. 394) is licensed for the treatment of acute uncomplicated falciparum malaria. *Malarone*® is also used for the *prophylaxis of falciparum malaria* in areas of *widespread mefloquine or chloroquine resistance*. *Malarone*® is also used as an alternative to mefloquine or doxycycline p. 352. *Malarone*® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine

Pyrimethamine p. 399 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the *prophylaxis of malaria*, but can be used in the *treatment of falciparum malaria with (or following) quinine*.

Quinine

Quinine is not suitable for the *prophylaxis of malaria*.

Quinine is used for the *treatment of falciparum malaria* or if the infective species is *not known* or if the infection is *mixed* (for details see Malaria, treatment p. 392).

Tetracyclines

Doxycycline is used in adults and children over 12 years for the *prophylaxis of malaria* in areas of *widespread mefloquine or chloroquine resistance*. Doxycycline is also used as an alternative to mefloquine or *Malarone*® (for details, see Recommended regimens for prophylaxis against malaria p. 387).

Malaria, prophylaxis

23-Jan-2018

Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists, published in the Public Health England Guidelines for malaria prevention in travellers from the United Kingdom, 2017. The advice is aimed at residents of the UK who travel to endemic areas.

For specialist centres offering advice on specific malaria-related problems see Malaria, treatment p. 392. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

For more information on choice of drug, see also Antimalarials above. Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. **Weight is a better guide than age**. If in doubt obtain advice from specialist centre (see under Malaria, treatment p. 392).

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important and is recommended even in malaria-free areas as a preventive measure against other insect vector-borne diseases. Mosquito nets impregnated with permethrin p. 729 provide the most effective barrier protection against insects (infants should sleep with a mosquito net stretched over the cot or baby carrier); mats and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% (available as sprays, and modified-release polymer formulations) is safe and effective when applied to the skin of adults and children over

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
-	No risk
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine

Specific recommendations

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Low risk below 2000 m from May–November	1
	Very low risk below 2000 m from December–April	1
Algeria	Very low risk in remote focus in Illizi department only	1
Andaman and Nicobar Islands (India)	Low risk	1
Angola	High risk	4
Argentina	Very low risk in low altitude areas of Salta provinces bordering Bolivia and in Chaco, Corrientes, and Misiones provinces close to border with Paraguay and Brazil	1
	No risk in Iguazú Falls and areas other than those above	-
Armenia	No risk	1
Azerbaijan	Very low risk	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Very low risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	1
	No risk in Belize district (including Belize city and islands)	-
Benin	High risk	4
Bhutan	Low risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	1
	No risk in areas other than those above	-
Bolivia	Low risk in Amazon basin	1
	Low risk in rural areas below 2500 m (other than above)	1
	No risk above 2500 m	-
Botswana	High risk from November–June in northern half, including Okavango Delta area	4
	Low risk from July–October in northern half	1
	Very low risk in southern half	1
Brazil	Low risk in Amazon basin, including city of Manaus	1
	Very low risk in areas other than those above	1
	No risk in Iguazú Falls	-
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4
Cambodia	Low risk. Mefloquine resistance widespread in western provinces bordering Thailand	1
	Very low risk in Angkor Wat and Lake Tonle Sap, including Siem Reap	1
	No risk in Phnom Penh	-
Cameroon	High risk	4
Cape Verde	Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4
China	Low risk in Yunnan and Hainan provinces	1

2 months of age. It can also be used during pregnancy and breast-feeding. However, ingestion should be avoided, therefore breast-feeding mothers should wash their hands and breast tissue before handling infants. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis

In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 396) before travel into an endemic area; *Malarone*® or doxycycline p. 352 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for *Malarone*® prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine p. 395 and proguanil hydrochloride p. 397 may be used. However there is considerable concern over the protective efficacy of the combination of chloroquine and proguanil hydrochloride in certain areas where it was previously useful. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. *Malarone*® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or *Malarone*® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region

It is important to be aware that **any illness** that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be **warned** of this and told that if they develop any illness **particularly within 3 months** of their return they should go **immediately** to a doctor and specifically mention their exposure to malaria.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without *chloroquine resistance* proguanil alone is

recommended; in areas with *chloroquine resistance*, doxycycline or *Malarone*® may be considered.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 574 (in doses greater than standard pregnancy prophylaxis) should be given for at least the first trimester. The centres listed (see Malaria, treatment p. 392) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. *Malarone*® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding

Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin sodium p. 97 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment

Children and their carers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are

likely to be more than 24 hours away from medical care. Self-medication should be **avoided** if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with **written instructions** that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Malaria prophylaxis, specific recommendations

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See also *Recommended regimens for prophylaxis against malaria* (p. 387).

Important

Settled immigrants (or long-term visitors) to the UK may be unaware that **any immunity they may have acquired while living in malarious areas is lost rapidly** after migration to the UK, or that any non-malarious areas where they lived previously **may now be malarious**.

Treatment

Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists. Choice will depend on the age of the child.

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for *falciparum malaria* with quinine p. 397, *Malarone*® (atovaquone with proguanil hydrochloride p. 394), or *Riamet*® (artemether with lumefantrine p. 393). *Falciparum malaria* can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine p. 395 which should not therefore be given for treatment. Quinine, *Malarone*® (atovaquone with proguanil hydrochloride), or *Riamet*® (artemether with lumefantrine) can be given by mouth if the child can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the child is seriously ill or unable to take tablets. Mefloquine p. 396 is now rarely used for treatment because of concerns about resistance.

Oral quinine is well tolerated by children although the salts are bitter. Quinine is given by mouth together with or followed by clindamycin p. 327 [unlicensed indication] or, in children over 12 doxycycline p. 352.

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, *Malarone*®, or *Riamet*® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*® or *Riamet*® treatment.

If the child is seriously ill or unable to swallow tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by *intravenous infusion* [unlicensed] (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline in children over 12 years, or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous *artesunate* may be available for 'named-patient' use.

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The treatment doses of oral and intravenous quinine (including the loading dose) can safely be given in pregnancy. Clindamycin [unlicensed indication] should be given for 7 days with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development in fetus); pyrimethamine with sulfadoxine, *Malarone*®, and *Riamet*® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous *artesunate* may be available for 'named patient' use.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region. Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, *Malarone*® [unlicensed indication], quinine, or *Riamet*® [unlicensed indication] can be used; as with chloroquine, primaquine p. 396 should be given for radical cure.

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a *radical cure* (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine.

For a radical cure, primaquine [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age.

Parenteral

If the child is unable to take oral therapy, quinine can be given by intravenous infusion, changed to oral chloroquine as soon as the patient's condition permits.

Pregnancy

Treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be **postponed** until the pregnancy is over; instead chloroquine should be continued, given weekly, during the pregnancy.

ANTIPROTOZOALS > ANTIMALARIALS

Artemether with lumefantrine

● INDICATIONS AND DOSE

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

► BY MOUTH

- Child (body-weight 5–14 kg): Initially 1 tablet, followed by 1 tablet for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours)
- Child (body-weight 15–24 kg): Initially 2 tablets, followed by 2 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours)
- Child (body-weight 25–34 kg): Initially 3 tablets, followed by 3 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)
- Child 12–17 years (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)

- **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.
- **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction
- **CAUTIONS** Avoid in Acute porphyrias p. 603 · electrolyte disturbances
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · appetite decreased · arthralgia · asthenia · cough · diarrhoea · dizziness · headache · myalgia · nausea · palpitations · QT interval prolongation · skin reactions · sleep disorders · vomiting
 - **Uncommon** Clonus · drowsiness
 - **Frequency not known** Angioedema
- **PREGNANCY** Toxicity in *animal* studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
Monitoring In severe renal impairment monitor ECG and plasma potassium concentration.
- **MONITORING REQUIREMENTS** Monitor patients unable to take food (greater risk of recrudescence).

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed just before administration.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Artemimol with piperazine phosphate

(Piperazine tetraphosphate with dihydroartemisinin)

● INDICATIONS AND DOSE

Treatment of uncomplicated falciparum malaria

► BY MOUTH

- Child 6 months–17 years (body-weight 7–12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months–17 years (body-weight 13–23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months–17 years (body-weight 24–35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months–17 years (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months–17 years (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

- **CONTRA-INDICATIONS** Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anaemia · appetite decreased · asthenia · conjunctivitis · cough · diarrhoea · eosinophilia · fever · increased risk of infection · leucocytosis · leucopenia · neutropenia · QT interval prolongation · skin reactions · thrombocytopenia · vomiting
 - **Uncommon** Arthralgia · cardiac conduction disorder · epistaxis · headache · hepatic disorders · hypochromia · lymphadenopathy · nausea · rhinorrhoea · seizure · splenomegaly · stomatitis · thrombocytosis
- **PREGNANCY** Teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** No information available in moderate to severe impairment.
Monitoring Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** No information available in moderate to severe impairment.

Monitoring Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.

● MONITORING REQUIREMENTS

- Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QT_c interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
- Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperquine concentration, in children who are vomiting or in females.
- DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.
- PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperquine phosphate with arteminol.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Chloroquine

● INDICATIONS AND DOSE

Prophylaxis of malaria

► INITIALLY BY MOUTH USING SYRUP

- Child 4–5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 1–2 years (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 3–4 years (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 5–7 years (body-weight 16.5–24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 8–13 years (body-weight 25–44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

► INITIALLY BY MOUTH USING TABLETS

- Child 14–17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Treatment of non-falciparum malaria

► BY MOUTH

- Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days

P. vivax or P. ovale infection during pregnancy while radical cure is postponed

► BY MOUTH

- Child: 10 mg/kg once weekly (max. per dose 310 mg)

DOSE EQUIVALENCE AND CONVERSION

- Doses expressed as chloroquine base.
- Each tablet contains 155 mg of chloroquine base (equivalent to 250 mg of chloroquine phosphate).
- Syrup contains 50 mg/5 mL of chloroquine base (equivalent to 80 mg/5 mL of chloroquine phosphate).

- **UNLICENSED USE** Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

- **CAUTIONS** Acute porphyrias p. 603 · diabetes (may lower blood glucose) · G6PD deficiency · long-term therapy (regular ophthalmic examination recommended by manufacturers) · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (avoid for prophylaxis of malaria if history of epilepsy) · severe gastro-intestinal disorders

- **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

- **Rare or very rare** Cardiomyopathy · hallucination · hepatitis
- **Frequency not known** Abdominal pain · agranulocytosis · alopecia · anxiety · atrioventricular block · bone marrow disorders · confusion · corneal deposits · depression · diarrhoea · eye disorders · gastrointestinal disorder · headache · hearing impairment · hypoglycaemia · hypotension · insomnia · interstitial lung disease · movement disorders · myopathy · nausea · neuromyopathy · neutropenia · personality change · photosensitivity

reaction · psychotic disorder · QT interval prolongation · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tongue protrusion · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects which occur at doses used in the prophylaxis or treatment of malaria are generally not serious.

Overdose Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.
- **BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment.
- **RENAL IMPAIRMENT** Manufacturers advise caution. **Dose adjustments** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment.
For rheumatoid arthritis and lupus erythematosus, reduce dose.
- **MONITORING REQUIREMENTS** Ophthalmic examination with long-term therapy.
- **PATIENT AND CARER ADVICE** Warn travellers going to malarious areas about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS** **NHS restrictions** Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

● MEDICINAL FORMS

Paludrine/Avoclor tablets anti-malarial travel pack | 112 tablet **P**
£13.50

Mefloquine

● INDICATIONS AND DOSE

Treatment of malaria

- **BY MOUTH**
- Child: (consult product literature)

Prophylaxis of malaria

- **BY MOUTH**
- Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

- **UNLICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature. Not licensed for use in children under 5 kg body-weight and under 3 months.
- **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions • avoid for standby treatment if history of convulsions • history of blackwater fever
- **CAUTIONS** Cardiac conduction disorders • epilepsy (avoid for prophylaxis) • not recommended in infants under 3 months (5 kg) • traumatic brain injury

CAUTIONS, FURTHER INFORMATION

- Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the *Guide for Healthcare Professionals* provided by the manufacturer.

- **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

- **Common or very common** Anxiety • depression • diarrhoea • dizziness • gastrointestinal discomfort • headache • nausea • skin reactions • sleep disorders • vision disorders • vomiting
- **Frequency not known** Acute kidney injury • agranulocytosis • alopecia • aplastic anaemia • appetite decreased • arrhythmias • arthralgia • asthenia • behaviour abnormal • cardiac conduction disorders • cataract • chest pain • chills • concentration impaired • confusion • cranial nerve

paralysis • delusional disorder • depersonalisation • drowsiness • dyspnoea • encephalopathy • eye disorder • fever • flushing • gait abnormal • hallucination • hearing impairment • hepatic disorders • hyperacusia • hyperhidrosis • hypertension • hypotension • leucocytosis • leucopenia • malaise • memory loss • mood altered • movement disorders • muscle complaints • muscle weakness • nephritis • nerve disorders • oedema • palpitations • pancreatitis • paraesthesia • pneumonia • pneumonitis • psychosis • seizure • self-endangering behaviour • speech disorder • Stevens-Johnson syndrome • suicidal tendencies • syncope • thrombocytopenia • tremor • vertigo

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal* studies).
- **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.
- **BREAST FEEDING** Present in milk but risk to infant minimal.
- **HEPATIC IMPAIRMENT** Elimination may be prolonged; avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.
- **PATIENT AND CARER ADVICE** A patient alert card should be provided. Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and especially within 3 months of return. **Driving and skilled tasks** Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 10, 21, 27

● INDICATIONS AND DOSE

Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection

- **BY MOUTH**
- Child 6 months–17 years: 500 micrograms/kg daily (max. per dose 30 mg) for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P. ovale* infection

► BY MOUTH

- Child 6 months–17 years: 250 micrograms/kg daily (max. per dose 15 mg) for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection in patients with mild G6PD deficiency (administered on expert advice) [Adjunct in the treatment of non-falciparum malaria caused by *P. ovale* infection in patients with mild G6PD deficiency (administered on expert advice)]

► BY MOUTH

- Child: 750 micrograms/kg once weekly for 8 weeks; maximum 45 mg per week

Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)

► BY MOUTH

- Child: This combination is associated with considerable toxicity (consult product literature)

- **UNLICENSED USE** Not licensed.
- **CAUTIONS** G6PD deficiency · systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · appetite decreased · nausea · vomiting
 - **Uncommon** Haemolytic anaemia (more common in G6PD deficiency) · leucopenia · methaemoglobinemia
- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester.
- **BREAST FEEDING** No information available; theoretical risk of haemolysis in G6PD-deficient infants.
- **PRE-TREATMENT SCREENING** Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.

04-Dec-2017

● INDICATIONS AND DOSE**Non-falciparum malaria**

► BY INTRAVENOUS INFUSION

- Child: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Change to oral chloroquine as soon as the patient's condition permits, reduce dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

continued →

Falciparum malaria

► BY MOUTH

- Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin

► BY INTRAVENOUS INFUSION

- Neonate: Loading dose 20 mg/kg, infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours until patient can swallow oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours.

- Child: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

Falciparum malaria (in intensive care unit)

► BY INTRAVENOUS INFUSION

- Neonate: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours until patient can swallow oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours.
- Child: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

DOSE EQUIVALENCE AND CONVERSION

- When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine.
- Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

- **UNLICENSED USE** Injection not licensed.

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE: REMINDER OF DOSE-DEPENDENT QT-PROLONGING EFFECTS (NOVEMBER 2017)**

Quinine has been associated with dose-dependent QT-interval-prolonging effects and should be used with caution in patients with risk factors for QT prolongation or in those with atrioventricular block—see Cautions for further information.

- **CONTRA-INDICATIONS** Haemoglobinuria · myasthenia gravis · optic neuritis · tinnitus
- **CAUTIONS** Atrial fibrillation (monitor ECG during parenteral treatment) · cardiac disease (monitor ECG during parenteral treatment) · conduction defects (monitor ECG during parenteral treatment) · electrolyte disturbance · G6PD deficiency · heart block (monitor ECG during parenteral treatment)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS** Abdominal pain · agitation · agranulocytosis · angioedema · asthma · atrioventricular conduction changes · bronchospasm · cardiotoxicity · cerebral impairment · coagulation disorders · coma · confusion · death · diarrhoea · dyspnoea · fever · flushing · gastrointestinal disorder · haemoglobinuria · haemolysis · haemolytic uraemic syndrome · headache · hearing impairment · hypersensitivity · loss of consciousness · muscle weakness · myasthenia gravis aggravated · nausea · ocular toxicity · oedema · pancytopenia · photosensitivity reaction · QT interval prolongation · renal impairment · skin reactions · thrombocytopenia · vertigo · vision disorders · vomiting

Overdose Quinine is very toxic in overdosage; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 832.

- **PREGNANCY** High doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT**
Dose adjustments ► With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **RENAL IMPAIRMENT**
Dose adjustments ► With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **MONITORING REQUIREMENTS** Monitor blood glucose and electrolyte concentration during parenteral treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute to a concentration of 2 mg/mL (max. 30 mg/mL in fluid restriction) with Glucose 5% or Sodium Chloride 0.9% and give over 4 hours.
- **PRESCRIBING AND DISPENSING INFORMATION** Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

- Pyrimethamine 25 mg Daraprim 25mg tablets | 30 tablet [PoM] £13.00

6 Viral infection

6.1 Hepatitis

Hepatitis

Overview

Treatment for viral hepatitis should be initiated by a specialist in hepatology or infectious diseases. The management of uncomplicated acute viral hepatitis is largely symptomatic. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Chronic hepatitis B

Interferon alfa p. 557, **peginterferon alfa-2a**, lamivudine p. 420, adefovir dipivoxil, entecavir, and tenofovir disoproxil p. 421 have a role in the treatment of chronic hepatitis B in adults, but their role in children has not been well established. Specialist supervision is required for the management of chronic hepatitis B.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either entecavir p. 418 or lamivudine, may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' in children who require treatment for both HIV and chronic hepatitis B. If children infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV. Management of these children should be co-ordinated between HIV and hepatology specialists.

Chronic hepatitis C

Treatment should be considered for children with moderate or severe liver disease. Specialist supervision is required and the regimen is chosen according to the genotype of the infecting virus and the viral load. A combination of ribavirin p. 400 with either interferon alfa or **peginterferon alfa-2b** is licensed for use in children over 3 years with chronic hepatitis C. A combination of peginterferon alfa p. 402 and ribavirin is preferred.

6.2 Hepatitis infections

6.2a Chronic hepatitis B

Other drugs used for Chronic hepatitis B Interferon alfa, p. 557 • Lamivudine, p. 420 • Tenofovir disoproxil, p. 421

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

415

Tenofovir alafenamide

26-Feb-2018

● INDICATIONS AND DOSE

Chronic hepatitis B (initiated by a specialist)

- BY MOUTH
- Child 12–17 years (body-weight 35 kg and above): 25 mg once daily (for duration of treatment consult product literature)

- **CAUTIONS** Decompensated liver disease • HIV co-infection

- **INTERACTIONS** → Appendix 1: tenofovir alafenamide

● SIDE-EFFECTS

- Common or very common Abdominal distension
- Frequency not known Hepatitis aggravated (during or following treatment)

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises monitor hepatic and renal function in decompensated liver disease—risk of adverse effects may be increased (no information available).

- **PRE-TREATMENT SCREENING** Manufacturer advises HIV antibody testing should be offered to those with unknown HIV-1 status before initiation of treatment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function tests at repeated intervals during treatment and for at least 6 months after last dose—recurrent hepatitis may occur on discontinuation.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

6.2b Chronic hepatitis C

Other drugs used for Chronic hepatitis C Interferon alfa, p. 557 • Peginterferon alfa, p. 402

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ribavirin

(Tribavirin)

● INDICATIONS AND DOSE

Bronchiolitis

- BY INHALATION OF AEROSOL, OR BY INHALATION OF NEBULISED SOLUTION
- Child 1–23 months: Inhale a solution containing 20 mg/mL for 12–18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator

Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (administered on expert advice)

- BY INTRAVENOUS INFUSION
- Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

REBETOL® CAPSULES

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation

- BY MOUTH
- Child 3–17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
- Child 3–17 years (body-weight 47–49 kg): 200 mg, dose to be given in the morning and 400 mg, dose to be given in the evening
- Child 3–17 years (body-weight 50–64 kg): 400 mg twice daily
- Child 3–17 years (body-weight 65–80 kg): 400 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
- Child 3–17 years (body-weight 81–104 kg): 600 mg twice daily
- Child 3–17 years (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

REBETOL® ORAL SOLUTION

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation

- BY MOUTH
- Child 3–17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
- Child 3–17 years (body-weight 47–49 kg): 200 mg daily, dose to be given in the morning and 400 mg daily, dose to be given in the evening
- Child 3–17 years (body-weight 50–64 kg): 400 mg twice daily
- Child 3–17 years (body-weight 65–80 kg): 400 mg daily, dose to be given in the morning and 600 mg daily, dose to be given in the evening
- Child 3–17 years (body-weight 81–104 kg): 600 mg twice daily
- Child 3–17 years (body-weight 105 kg and above): 600 mg daily, dose to be given in the morning and 800 mg daily, dose to be given in the evening

- **UNLICENSED USE** Inhalation licensed for use in children (age range not specified by manufacturer). Intravenous preparation not licensed.

● CONTRA-INDICATIONS

- With systemic use Active severe psychiatric condition • autoimmune disease • autoimmune hepatitis • consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products • haemoglobinopathies • history of severe

psychiatric condition · severe debilitating medical conditions · severe, uncontrolled cardiac disease in children with chronic hepatitis C

• CAUTIONS

- ▶ When used by inhalation Maintain standard supportive respiratory and fluid management therapy
- ▶ With systemic use Cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) · consult product literature for specific cautions when ribavirin used in combination with other medicinal products · patients with a transplant—risk of rejection · risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

• INTERACTIONS → Appendix 1: ribavirin

• SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · arthritis · asthenia · behaviour abnormal · chest pain · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hearing impairment · hyperthyroidism · hypotension · hypothyroidism · increased risk of infection · influenza like illness · lymphadenopathy · malaise · memory loss · mood altered · muscle complaints · muscle weakness · nasal congestion · nausea · neutropenia · oral disorders · pain · palpitations · peripheral oedema · photosensitivity reaction · respiratory disorders · sensation abnormal · sexual dysfunction · skin reactions · sleep disorders · sweat changes · syncope · taste altered · thirst · throat pain · thrombocytopenia · tremor · vasodilation · vertigo · vision disorders · vomiting · weight decreased
 - ▶ **Uncommon** Dehydration · diabetes mellitus · hallucination · hepatic disorders · hypertension · nerve disorders · sarcoidosis · suicidal tendencies · thyroiditis
 - ▶ **Rare or very rare** Angina pectoris · angioedema · bone marrow disorders · cardiac inflammation · cerebral ischaemia · cholangitis · coma · congestive heart failure · facial paralysis · hypersensitivity · intracranial haemorrhage · myocardial infarction · myopathy · pancreatitis · psychotic disorder · pulmonary embolism · retinopathy · seizure · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · vasculitis
 - ▶ **Frequency not known** Haemolytic anaemia · homicidal ideation · nephrotic syndrome · pure red cell aplasia · renal failure · solid organ transplant rejection · ulcerative colitis
- SIDE-EFFECTS, FURTHER INFORMATION** Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

• CONCEPTION AND CONTRACEPTION

- ▶ With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
- ▶ When used by inhalation Women planning pregnancy should avoid exposure to aerosol.

• PREGNANCY Avoid; teratogenicity in animal studies.

- ▶ When used by inhalation Pregnant women should avoid exposure to aerosol.

• BREAST FEEDING Avoid—no information available.

- ▶ **HEPATIC IMPAIRMENT** Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.

Dose adjustments No dosage adjustment required.

- **RENAL IMPAIRMENT** Plasma-ribavirin concentration increased. Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.

Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

• MONITORING REQUIREMENTS

- ▶ When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
- ▶ With systemic use Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature). Test thyroid function before treatment and then every 3 months.
- ▶ With oral use Eye examination recommended before treatment. Eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Peginterferon alfa and ribavirin for chronic hepatitis C (November 2013)** NICE TA300
Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children.
www.nice.org.uk/TA300

- **LESS SUITABLE FOR PRESCRIBING** Ribavirin inhalation is less suitable for prescribing.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ANTIVIRALS > NUCLEOTIDE ANALOGUES

Ledipasvir with sofosbuvir

09-Nov-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 402.

- **DRUG ACTION** Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

• INDICATIONS AND DOSE

Chronic hepatitis C infection (initiated by a specialist)

- ▶ **BY MOUTH**
- ▶ Child 12–17 years: 90/400 mg once daily, for duration of treatment consult product literature continued →

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose of concurrent H₂-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.
- ▶ Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take at the same time as sofosbuvir with ledipasvir.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg ledipasvir/sofosbuvir.

- **CAUTIONS** Retreatment following treatment failure—efficacy not established
- **INTERACTIONS** → Appendix 1: ledipasvir · sofosbuvir
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Fatigue · headache · rash
 - ▶ **Frequency not known** Angioedema · arrhythmia
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**

Vomiting If vomiting occurs within 5 hours of administration, an additional dose should be taken.

Missed doses If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION Manufacturer advises in chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin dual therapy in those with

intolerance or contra-indications to peginterferon alfa who require urgent treatment.

- **INTERACTIONS** → Appendix 1: sofosbuvir

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · chest pain · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · dry mouth · dyspnoea · fever · gastrointestinal discomfort · gastroesophageal reflux disease · headaches · influenza like illness · insomnia · irritability · memory loss · muscle complaints · nasopharyngitis · nausea · neutropenia · pain · skin reactions · vision blurred · vomiting · weight decreased
- ▶ **Frequency not known** Arrhythmia

SIDE-EFFECTS, FURTHER INFORMATION Side-effects listed are reported when sofosbuvir is used in combination with ribavirin or with ribavirin and peginterferon alfa.

- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT** Safety and efficacy not established if eGFR less than 30 mL/minute/1.73 m²—accumulation may occur.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

6.3 Herpesvirus infections

Herpesvirus infections

Herpes simplex and varicella-zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella-zoster virus.

Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. After completing parenteral treatment of neonatal herpes simplex encephalitis, oral suppression therapy with aciclovir p. 404 for 6 months can be considered on specialist advice. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with *chickenpox* should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

In pregnancy severe chickenpox may cause complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Neonates and children who have been exposed to chickenpox and are at special risk of complications may

require prophylaxis with varicella-zoster immunoglobulin (see under Disease-specific Immunoglobulins). Prophylactic intravenous aciclovir should be considered for neonates whose mothers develop chickenpox 4 days before to 2 days after delivery.

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice

Aciclovir is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed in adults for use in herpes zoster and genital herpes; there is limited information available on use in children.

Valaciclovir p. 406 is an ester of aciclovir, licensed in adults for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed in children over 12 years for preventing cytomegalovirus disease following solid organ transplantation. Valaciclovir may be used for the treatment of mild herpes zoster in immunocompromised children over 12 years; treatment should be initiated under specialist supervision.

Cytomegalovirus infection

Ganciclovir p. 407 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed under specialist supervision and only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. The use of ganciclovir may also be considered for symptomatic congenital CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 422; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for use in children over 12 years for prevention of cytomegalovirus disease following renal transplantation.

Foscarnet sodium p. 408 is also active against cytomegalovirus; it is toxic and can cause renal impairment. It is deposited in teeth, bone and cartilage, and *animal* studies have shown that deposition is greater in young animals. Its effect on skeletal development in children is not known. Foscarnet sodium should be prescribed under specialist supervision.

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Aciclovir

(Acyclovir)

• INDICATIONS AND DOSE

Herpes simplex, suppression

► BY MOUTH

- Child 12–17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, prophylaxis in the immunocompromised

► BY MOUTH

- Child 1–23 months: 100–200 mg 4 times a day
- Child 2–17 years: 200–400 mg 4 times a day

Herpes simplex, treatment

► BY MOUTH

- Child 1–23 months: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- Child 2–17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

► BY INTRAVENOUS INFUSION

- Neonate: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment).
- Child 1–2 months: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)
- Child 3 months–11 years: 250 mg/m² every 8 hours usually for 5 days
- Child 12–17 years: 5 mg/kg every 8 hours usually for 5 days

Herpes simplex, treatment, in immunocompromised or if absorption impaired

► BY MOUTH

- Child 1–23 months: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- Child 2–17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment, in immunocompromised or in simple encephalitis

► BY INTRAVENOUS INFUSION

- Child 3 months–11 years: 500 mg/m² every 8 hours usually for 5 days (given for at least 21 days in encephalitis—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)
- Child 12–17 years: 10 mg/kg every 8 hours usually for 5 days (given for at least 14 days in encephalitis and for at least 21 days if also immunocompromised—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment

► BY MOUTH

- Child 1–23 months: 200 mg 4 times a day for 5 days
- Child 2–5 years: 400 mg 4 times a day for 5 days
- Child 6–11 years: 800 mg 4 times a day for 5 days
- Child 12–17 years: 800 mg 5 times a day for 7 days

► BY INTRAVENOUS INFUSION

- Neonate: 10–20 mg/kg every 8 hours for at least 7 days.

- Child 1–2 months: 10–20 mg/kg every 8 hours for at least 7 days
- Child 3 months–11 years: 250 mg/m² every 8 hours usually for 5 days
- Child 12–17 years: 5 mg/kg every 8 hours usually for 5 days

Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised

► BY INTRAVENOUS INFUSION

- Child 3 months–11 years: 500 mg/m² every 8 hours usually for 5 days
- Child 12–17 years: 10 mg/kg every 8 hours usually for 5 days

Herpes zoster (shingles), treatment in immunocompromised

► BY MOUTH

- Child 1–23 months: 200 mg 4 times a day continued for 2 days after crusting of lesions
- Child 2–5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions
- Child 6–11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
- Child 12–17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions

Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis

► BY INTRAVENOUS INFUSION

- Neonate: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised.
- Child 1–2 months: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised
- Child 3 months–11 years: 500 mg/m² every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised
- Child 12–17 years: 10 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised

Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated

► BY MOUTH

- Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

Varicella zoster (chickenpox), prophylaxis after delivery

► BY INTRAVENOUS INFUSION

- Neonate: 10 mg/kg every 8 hours continued until serological tests confirm absence of virus.

DOSES AT EXTREMES OF BODY-WEIGHT

- With intravenous use To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

● UNLICENSED USE

- With oral use Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer).

Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.

- With intravenous use Intravenous infusion not licensed for herpes zoster in children under 18 years.

- **CAUTIONS** Maintain adequate hydration (especially with infusion or high doses)

- **INTERACTIONS** → Appendix 1: aciclovir

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · diarrhoea · dizziness · fatigue · fever · headache · nausea · photosensitivity reaction · skin reactions · vomiting
- **Uncommon** Anaemia · leucopenia · thrombocytopenia
- **Rare or very rare** Acute kidney injury · agitation · alopecia · angioedema · ataxia · coma · confusion · drowsiness · dysarthria · dyspnoea · encephalopathy · hallucination · hepatic disorders · inflammation localised · psychosis · renal impairment · renal pain · seizure · tremor
- **Frequency not known** Crystalluria

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

- **RENAL IMPAIRMENT** Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

Dose adjustments ► With intravenous use Use *normal intravenous dose* every 12 hours if estimated glomerular filtration rate 25–50 mL/minute/1.73 m² (every 24 hours if estimated glomerular filtration rate

10–25 mL/minute/1.73 m². Consult product literature for intravenous dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

► With oral use For *herpes zoster*, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². For *herpes simplex*, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute to 25 mg/mL with Water for Injections or Sodium Chloride 0.9% then dilute to concentration of 5 mg/mL with Sodium Chloride 0.9% or Sodium Chloride and Glucose and give over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and central venous access and given over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid preparations may include banana, or orange.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Aciclovir (oral) for viral infections www.medicinesforchildren.org.uk/aciclovir-for-viral-infections

● PROFESSION SPECIFIC INFORMATION**Dental practitioners' formulary**

Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet**CAUTIONARY AND ADVISORY LABELS 9**► **Aciclovir (Non-proprietary)**

Valaciclovir**• INDICATIONS AND DOSE****Herpes zoster infection, treatment in immunocompromised patients**► **BY MOUTH**

- Child 12–17 years: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

Herpes simplex, treatment of first infective episode► **BY MOUTH**

- Child 12–17 years: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients► **BY MOUTH**

- Child 12–17 years: 1 g twice daily for 10 days

Herpes simplex, treatment of recurrent infections► **BY MOUTH**

- Child 12–17 years: 500 mg twice daily for 3–5 days

Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients► **BY MOUTH**

- Child 12–17 years: 1 g twice daily for 5–10 days

Herpes labialis treatment► **BY MOUTH**

- Child 12–17 years: Initially 2 g, then 2 g after 12 hours

Herpes simplex, suppression of infections► **BY MOUTH**

- Child 12–17 years: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to

reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients► **BY MOUTH**

- Child 12–17 years: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used► **BY MOUTH**

- Child 12–17 years: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

- **UNLICENSED USE** Not licensed for treatment of herpes zoster in children. Not licensed for treatment or suppression of herpes simplex infection in immunocompromised or HIV-positive children.
- **CAUTIONS** Maintain adequate hydration (especially with high doses)
- **INTERACTIONS** → Appendix 1: valaciclovir
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · dizziness · headache · nausea · photosensitivity reaction · skin reactions · vomiting
 - **Uncommon** Abdominal discomfort · agitation · confusion · dyspnoea · haematuria · hallucination · leucopenia · level of consciousness decreased · renal pain · thrombocytopenia · tremor
 - **Rare or very rare** Angioedema · ataxia · coma · delirium · dysarthria · encephalopathy · nephrolithiasis · psychosis · renal impairment · seizure
 - **Frequency not known** Microangiopathic haemolytic anaemia

SIDE-EFFECTS, FURTHER INFORMATION Neurological reactions more frequent with higher doses.

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution with high doses used for preventing cytomegalovirus disease—no information available in children.
- **RENAL IMPAIRMENT** Maintain adequate hydration.

Dose adjustments For *herpes zoster*, 1 g every 12 hours if estimated glomerular filtration rate 30–50 mL/minute/1.73 m² (1 g every 24 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²).

For *treatment of herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

For *treatment of herpes labialis*, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose).

For *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Reduce dose according to estimated glomerular filtration rate for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).

- **PRESCRIBING AND DISPENSING INFORMATION** Valaciclovir is a pro-drug of aciclovir.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

6.3a Cytomegalovirus infections

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ganciclovir

31-May-2018

● INDICATIONS AND DOSE

Prevention of cytomegalovirus disease [pre-emptive therapy in patients with drug-induced immunosuppression]

▶ BY INTRAVENOUS INFUSION

- ▶ Child 12-17 years: Initially 5 mg/kg every 12 hours for 7–14 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily

Prevention of cytomegalovirus disease [universal prophylaxis in patients with drug-induced immunosuppression]

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: (consult product literature).

- ▶ Child 1 month-16 years: (consult product literature)

- ▶ Child 17 years: 6 mg/kg once daily, on 5 days of the week, alternatively 5 mg/kg once daily

Treatment of cytomegalovirus disease [in immunocompromised patients]

▶ BY INTRAVENOUS INFUSION

- ▶ Child: Initially 5 mg/kg every 12 hours for 14–21 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily, maintenance only for patients at risk of relapse; if disease progresses initial induction treatment may be repeated

Congenital cytomegalovirus infection of the CNS

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 6 mg/kg every 12 hours for 6 weeks.

- **UNLICENSED USE** Not licensed for use in children under 12 years for the treatment of cytomegalovirus disease in immunocompromised patients. Not licensed for congenital cytomegalovirus infection of the CNS.
- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)

- **CAUTIONS** History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy
- **INTERACTIONS** → Appendix 1: ganciclovir
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · cough · depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · fever · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints · nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased
 - ▶ **Uncommon** Alopecia · arrhythmia · deafness · haematuria · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment
 - ▶ **Rare or very rare** Agranulocytosis · hallucination
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. Ganciclovir may cause temporary or permanent inhibition of spermatogenesis—impaired fertility observed in *animal* studies.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises reduce dose for patients receiving mg/kg dosing if creatinine clearance less than 70 mL/minute—consult product literature.
- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises, for *intravenous infusion*, give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute with Water for Injections (500 mg/10 mL) then dilute requisite dose to a concentration of not more than 10 mg/mL with infusion fluid; give over 1 hour into a vein with adequate flow, preferably using a plastic cannula.
- **HANDLING AND STORAGE**

Caution in handling Ganciclovir is a potential teratogen and carcinogen. Manufacturer advises avoid inhalation of the powder or direct contact of the powder or reconstituted solution with the skin or mucous membranes; if contact occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

6.4 HIV infection

HIV infection

Overview

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals.

The natural progression of HIV disease is different in children compared to adults; drug treatment should only be undertaken by specialists within a formal paediatric HIV clinical network. Guidelines and dose regimens are under constant review and for this reason some dose recommendations have not been included in *BNF for Children*.

Further information on the management of children with HIV can be obtained from the Children's HIV Association (CHIVA) www.chiva.org.uk; and further information on antiretroviral use and toxicity can be obtained from the Paediatric European Network for Treatment of AIDS (PENTA) website penta-id.org/.

Aims of treatment

Treatment is aimed at suppressing viral replication for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and the child's tolerance of treatment. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Initiation of treatment

Treatment is started in all HIV infected children under 1 year of age regardless of clinical and immunological parameters. In children over 1 year of age, treatment is based on the

child's age, CD4 cell count, viral load, and symptoms. The choice of antiviral treatment for children should take into account the method and frequency of administration, risk of side-effects, compatibility of drugs with food, palatability, and the appropriateness of the formulation. Initiating treatment with a combination of drugs ('highly active antiretroviral therapy' which includes 2 nucleoside reverse transcriptase inhibitors with either a non-nucleoside reverse transcriptase inhibitor or a boosted protease inhibitor) is recommended. Abacavir p. 416 and lamivudine p. 420 are the nucleoside reverse transcriptase inhibitors of choice for initial therapy; however, zidovudine p. 422 and lamivudine are used in children who are positive for the HLA-B*5701 allele. Nevirapine p. 414 is the preferred non-nucleoside reverse transcriptase inhibitor in children under 3 years of age, but efavirenz p. 413 is preferred in older children. Lopinavir with ritonavir p. 425 is the preferred boosted protease inhibitor for initial therapy. The metabolism of many antiretrovirals varies in young children; it may therefore be necessary to adjust the dose according to the plasma-drug concentration. Children who require treatment for both HIV and chronic hepatitis B should receive antivirals that are active against both diseases.

HIV infection, switching therapy

Deterioration of the condition (including clinical, virological changes, and CD4 cell changes) may require a complete change of therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance, and the possibility of cross-resistance.

HIV infection and pregnancy

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. **All treatment options require careful assessment by a specialist.** Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Local protocols and national guidelines (www.bhiva.org) should be consulted for recommendations on treatment during pregnancy and the perinatal period. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

HIV infection and breast-feeding

Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

HIV infection, post-exposure prophylaxis

Children exposed to HIV infection through needlestick injury or by another route should be sent immediately to an accident and emergency department for post-exposure prophylaxis [unlicensed indication]. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Recommendations have been developed by the Children's HIV Association, www.chiva.org.uk.

Drug treatment

Zidovudine, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 417, emtricitabine p. 418, lamivudine, stavudine p. 421, and tenofovir disoproxil p. 421. There are concerns about renal toxicity and effects on bone mineralisation when tenofovir disoproxil is used in prepubertal children.

The protease inhibitors include atazanavir p. 423, darunavir p. 423, fosamprenavir p. 425 (a pro-drug of amprenavir), lopinavir (available as lopinavir with ritonavir), ritonavir p. 426, and tipranavir p. 426. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, lopinavir (available as lopinavir with ritonavir), and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 413, nevirapine and rilpivirine p. 415 are active against the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and rarely fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide below, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs. Enfuvirtide should be combined with other potentially active antiretroviral drugs; it is given by subcutaneous injection.

Maraviroc p. 427 is an antagonist of the CCR5 chemokine receptor. It is used in patients exclusively infected with CCR5-tropic HIV.

Dolutegravir p. 411 and raltegravir p. 411 are inhibitors of HIV integrase. They are used for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

Immune reconstitution syndrome

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves' disease) have also been reported many months after initiation of treatment.

Osteonecrosis

Osteonecrosis has been reported in children with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

HIV infection in neonates

In order to prevent transmission of infection, neonates born to HIV-positive mothers should be given post-exposure prophylaxis as soon as possible after birth, but starting no later than 72 hours after birth. Zidovudine p. 422 alone should be given to neonates whose mothers had a viral load less than 50 HIV RNA copies/mL between 36 weeks' gestation and delivery, or whose mothers underwent caesarean section while taking zidovudine monotherapy. Combination antiretroviral therapy should be given to neonates whose mothers had a viral load over 50 HIV RNA copies/mL at delivery or whose mothers are found to be HIV positive after delivery. Prophylaxis is continued for 4 weeks.

ANTIVIRALS > HIV-FUSION INHIBITORS

Enfuvirtide

- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

- BY SUBCUTANEOUS INJECTION
- Child 6–15 years: 2 mg/kg twice daily (max. per dose 90 mg)
- Child 16–17 years: 90 mg twice daily

● SIDE-EFFECTS

- **Common or very common** Anxiety · appetite decreased · asthenia · concentration impaired · conjunctivitis · diabetes mellitus · gastroesophageal reflux disease · haematuria · hypertriglyceridaemia · increased risk of infection · influenza like illness · irritability · lymphadenopathy · myalgia · nasal congestion · nephrolithiasis · nightmare · numbness · pancreatitis · peripheral neuropathy · skin papilloma · skin reactions · tremor · vertigo · weight decreased
- **Frequency not known** Diarrhoea · hypersensitivity · immune reconstitution inflammatory syndrome · nausea · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous injection*, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do **not** shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

- **Fuzeon** (Roche Products Ltd)

Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial [Pom] £1,081.57

ANTIVIRALS > HIV-INTEGRASE INHIBITORS

Dolutegravir

05-Jun-2018

- **DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

● **INDICATIONS AND DOSE**

HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

► BY MOUTH

- Child 12–17 years (body-weight 40 kg and above): 50 mg once daily

HIV infection in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)

► BY MOUTH

- Child 12–17 years (body-weight 40 kg and above): 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: *TIVICAY*® (DOLUTEGRAVIR), *TRIUMEQ*® (DOLUTEGRAVIR, ABACAVIR, LAMIVUDINE), *JULUCA*® (DOLUTEGRAVIR, RILPIVIRINE): NEURAL TUBE DEFECTS REPORTED IN INFANTS BORN TO WOMEN EXPOSED TO DOLUTEGRAVIR AT THE TIME OF CONCEPTION (MAY 2018)

In an ongoing birth outcome surveillance study conducted in Botswana, 4 cases of neural tube defects have been reported in 426 infants born to women who took dolutegravir as part of combined antiretroviral therapy at the time of conception. The manufacturer, in agreement with the European Medicines Agency, has recommended the following measures while this safety signal is being evaluated:

- Pregnancy testing should be performed and pregnancy excluded before initiation of treatment in females of childbearing potential; effective contraception should be used throughout treatment;
- Use of dolutegravir should be avoided in pregnancy; if pregnancy occurs and is confirmed in the first trimester, it is recommended to switch to an alternative treatment unless there is no suitable alternative.

- **INTERACTIONS** → Appendix 1: dolutegravir

● **SIDE-EFFECTS**

- **Common or very common** Depression · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting
- **Uncommon** Arthralgia · hepatitis · hypersensitivity · immune reconstitution inflammatory syndrome · myalgia · suicidal tendencies

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** Manufacturer advises avoid, see *Important Safety Information*.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dolutegravir tablets.
Missed doses If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (May 2014) that dolutegravir (*Tivicay*®) is accepted for use within NHS Scotland when used in combination with other anti-retroviral medicines for the treatment of HIV infected adolescents above 12 years. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (July 2017) that dolutegravir (*Tivicay*®) is accepted for use within NHS Scotland when used in combination with other anti-retroviral medicines for the treatment of HIV infected children aged 6 to 12 years of age. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that dolutegravir (*Tivicay*®) is recommended as an option for use within NHS Wales in combination with other anti-retroviral medicinal products for the treatment of HIV infected patients above 6 years of age. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

| 30 tablet [PoM] £249.38

Dolutegravir (as Dolutegravir sodium) 50 mg Tivicay 50mg tablets
| 30 tablet [PoM] £498.75

Combinations available: *Abacavir with dolutegravir and lamivudine*, p. 416

Raltegravir

10-May-2018

- **DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

● **INDICATIONS AND DOSE****HIV-1 infection (initiated by a specialist)**

► BY MOUTH USING TABLETS

- Child (body-weight 25 kg and above): 400 mg twice daily
- Child (body-weight 40 kg and above): 1200 mg once daily, once daily dosing for use in patients who are treatment naive or virologically suppressed on an initial regimen of 400 mg twice daily—use 600 mg tablets only

► BY MOUTH USING CHEWABLE TABLETS

- Child (body-weight 11–13 kg): 75 mg twice daily
- Child (body-weight 14–19 kg): 100 mg twice daily
- Child (body-weight 20–27 kg): 150 mg twice daily
- Child (body-weight 28–39 kg): 200 mg twice daily
- Child (body-weight 40 kg and above): 300 mg twice daily

► BY MOUTH USING ORAL SUSPENSION

- Neonate up to 7 days (body-weight 2 kg): 4 mg once daily.

- Neonate up to 7 days (body-weight 3 kg): 5 mg once daily.

continued →

- ▶ Neonate up to 7 days (body-weight 4 kg): 7 mg once daily.
- ▶ Neonate 7 days to 28 days (body-weight 2 kg): 8 mg twice daily.
- ▶ Neonate 7 days to 28 days (body-weight 3 kg): 10 mg twice daily.
- ▶ Neonate 7 days to 28 days (body-weight 4 kg): 15 mg twice daily.

- ▶ Child (body-weight 3 kg): 25 mg twice daily
- ▶ Child (body-weight 4–5 kg): 30 mg twice daily
- ▶ Child (body-weight 6–7 kg): 40 mg twice daily
- ▶ Child (body-weight 8–10 kg): 60 mg twice daily
- ▶ Child (body-weight 11–13 kg): 80 mg twice daily
- ▶ Child (body-weight 14–19 kg): 100 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Raltegravir granules for oral suspension and chewable tablets are **not** bioequivalent or interchangeable with the 400 mg and 600 mg *standard* tablets.

- **CONTRA-INDICATIONS** Pre-term neonates—no information available
- **CAUTIONS** Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis
- **INTERACTIONS** → Appendix 1: raltegravir
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Akathisia · appetite abnormal · asthenia · behaviour abnormal · depression · diarrhoea · dizziness · fever · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · skin reactions · sleep disorders · vertigo · vomiting
 - ▶ **Uncommon** Alopecia · anaemia · anxiety · arrhythmias · arthralgia · arthritis · body fat disorder · burping · cachexia · chest discomfort · chills · cognitive disorder · concentration impaired · confusion · constipation · diabetes mellitus · drowsiness · dry mouth · dyslipidaemia · dysphonia · erectile dysfunction · feeling jittery · glossitis · gynaecomastia · haemorrhage · hepatic disorders · hot flush · hyperglycaemia · hypersensitivity · hypertension · immune reconstitution inflammatory syndrome · increased risk of infection · lipodystrophy · lymph node abscess · lymphatic abnormalities · malaise · memory loss · menopausal symptoms · mood altered · myalgia · myopathy · nasal congestion · nephritis · nephrolithiasis · nerve disorders · neutropenia · nocturia · odynophagia · oedema · osteopenia · pain · palpitations · pancreatitis acute · polydipsia · psychiatric disorder · renal cyst · renal impairment · sensation abnormal · severe cutaneous adverse reactions (SCARs) · skin papilloma · submandibular mass · suicidal tendencies · sweat changes · taste altered · tendinitis · thrombocytopenia · tinnitus · tremor · visual impairment · weight increased
- ▶ **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

For further information regarding **lipodystrophy** and **osteonecrosis** see HIV infection p. 409.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *chewable tablets*, the 100 mg strength can be divided into equal 50 mg doses.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).

● NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (September 2013) that raltegravir (*Isentress*®) is accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adolescents and children aged 2 to 17 years when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance; raltegravir should be prescribed under the supervision of specialists in paediatric HIV.

The *Scottish Medicines Consortium* has advised (November 2015) that raltegravir granules for oral suspension (*Isentress*®) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adults, adolescents, children, toddlers and infants from the age of 4 weeks when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance; raltegravir granules should be prescribed under the supervision of specialists in paediatric HIV.

The *Scottish Medicines Consortium* has advised (November 2015) that raltegravir chewable tablets (*Isentress*®) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in children from the age of 4 weeks to <2 years when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance; raltegravir chewable tablets should be prescribed under the supervision of specialists in paediatric HIV.

The *Scottish Medicines Consortium* has advised (November 2017) that raltegravir 600 mg film-coated tablets (*Isentress*®) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adults and paediatric patients weighing at least 40 kg when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

- Child 3 months–17 years (body-weight 15–19 kg): 250 mg once daily
- Child 3 months–17 years (body-weight 20–24 kg): 300 mg once daily
- Child 3 months–17 years (body-weight 25–32.4 kg): 350 mg once daily
- Child 3 months–17 years (body-weight 32.5–39 kg): 400 mg once daily
- Child 3 months–17 years (body-weight 40 kg and above): 600 mg once daily

► BY MOUTH USING TABLETS

- Child (body-weight 40 kg and above): 600 mg once daily

► BY MOUTH USING ORAL SOLUTION

- Child 3–4 years (body-weight 13–14 kg): 360 mg once daily
- Child 3–4 years (body-weight 15–19 kg): 390 mg once daily
- Child 3–4 years (body-weight 20–24 kg): 450 mg once daily
- Child 3–4 years (body-weight 25–32.5 kg): 510 mg once daily
- Child 5–17 years (body-weight 13–14 kg): 270 mg once daily
- Child 5–17 years (body-weight 15–19 kg): 300 mg once daily
- Child 5–17 years (body-weight 20–24 kg): 360 mg once daily
- Child 5–17 years (body-weight 25–32.4 kg): 450 mg once daily
- Child 5–17 years (body-weight 32.5–39 kg): 510 mg once daily
- Child 5–17 years (body-weight 40 kg and above): 720 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- The bioavailability of *Sustiva*[®] oral solution is lower than that of the capsules and tablets; the oral solution is **not** interchangeable with either capsules or tablets on a milligram-for-milligram basis.

- **UNLICENSED USE** Opening capsules and adding contents to food is an unlicensed method of administration.
- **CAUTIONS** Acute porphyrias p. 603 · history of psychiatric disorders · history of seizures
- **INTERACTIONS** → Appendix 1: efavirenz
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anxiety · concentration impaired · depression · diarrhoea · dizziness · drowsiness · dyslipidaemia · fatigue · headache · movement disorders · nausea · skin reactions · sleep disorders · vomiting
 - **Uncommon** Behaviour abnormal · confusion · flushing · gynaecomastia · hallucination · hepatic disorders · memory loss · mood altered · pancreatitis · psychosis · seizure · Stevens-Johnson syndrome · suicidal tendencies · thinking abnormal · tinnitus · tremor · vertigo · vision blurred
 - **Rare or very rare** Delusions · photosensitivity reaction
 - **Frequency not known** Immune reconstitution inflammatory syndrome · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION For further information regarding **osteonecrosis**, **immune reconstitution syndrome** and **lipodystrophy**, see HIV infection p. 409.

Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

CNS effects Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

- **PREGNANCY** Reports of neural tube defects when used in first trimester.
- **HEPATIC IMPAIRMENT** Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in severe impairment.
- **Monitoring** In mild to moderate liver disease, monitor for dose-related side-effects (e.g. CNS effects) and liver function.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal failure—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function if receiving other hepatotoxic drugs.
- **DIRECTIONS FOR ADMINISTRATION** Capsules may be opened and contents added to food (contents have a peppery taste).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry and mint.
- **PATIENT AND CARER ADVICE** Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

Etravirine

● INDICATIONS AND DOSE

HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)

► BY MOUTH

- Child 6–17 years (body-weight 16–19 kg): 100 mg twice daily
- Child 6–17 years (body-weight 20–24 kg): 125 mg twice daily
- Child 6–17 years (body-weight 25–29 kg): 150 mg twice daily
- Child 6–17 years (body-weight 30 kg and above): 200 mg twice daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 603

- **INTERACTIONS** → Appendix 1: etravirine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diabetes mellitus · diarrhoea · headache · hyperglycaemia · myocardial infarction · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Angioedema · bronchospasm · dry mouth · dyslipidaemia · gynaecomastia · haematemesis · hepatic disorders · hyperhidrosis · hypersensitivity · hypersomnia · numbness · pancreatitis · sluggishness · vision blurred
 - ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Haemorrhagic stroke · osteonecrosis · weight increased

SIDE-EFFECTS, FURTHER INFORMATION For further information regarding **osteonecrosis**, **immune reconstitution syndrome** and **lipodystrophy**, see HIV infection p. 409.

Hypersensitivity reactions Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.
- **DIRECTIONS FOR ADMINISTRATION** Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.
Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Nevirapine

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (initial dose)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ **Child:** Initially 150–200 mg/m² once daily (max. per dose 200 mg) for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart

using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ **Child 1 month–2 years:** 150–200 mg/m² twice daily (max. per dose 200 mg), alternatively 300–400 mg/m² once daily (max. per dose 400 mg)
- ▶ **Child 3–17 years:** 150–200 mg/m² twice daily (max. per dose 200 mg)

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ **Child 3–17 years** (body surface area 0.58–0.83 m²): 200 mg once daily
- ▶ **Child 3–17 years** (body surface area 0.84–1.17 m²): 300 mg once daily
- ▶ **Child 3–17 years** (body surface area 1.18 m² and above): 400 mg once daily
- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ **Child 3–17 years** (body surface area 0.58–0.83 m²): 200 mg once daily
- ▶ **Child 3–17 years** (body surface area 0.84–1.17 m²): 300 mg once daily
- ▶ **Child 3–17 years** (body surface area 1.18 m² and above): 400 mg once daily

- **UNLICENSED USE** 'Immediate-release' tablets not licensed for use in children weighing less than 50 kg or with body surface area less than 1.25 m²; 'immediate-release' tablets and suspension not licensed for once daily dose after the initial dose titration.
- **CONTRA-INDICATIONS** Acute porphyrias p. 603 · post-exposure prophylaxis
- **CAUTIONS** Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)
- **INTERACTIONS** → Appendix 1: nevirapine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · angioedema · diarrhoea · fatigue · fever · headache · hepatic disorders · hypersensitivity · hypertransaminasaemia · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Anaemia · arthralgia · myalgia · severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Eosinophilia · osteonecrosis · weight increased

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic effects Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days). Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available; use 'immediate-release' preparation with caution in moderate impairment and avoid in severe impairment. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).
- **RENAL IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Hepatic disease Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
 - ▶ Rash Monitor closely for skin reactions during first 18 weeks.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than or equal to 100 000 copies/mL

- ▶ BY MOUTH
- ▶ Child 12–17 years: 25 mg once daily

- **CAUTIONS** Acute porphyrias p. 603
- **INTERACTIONS** → Appendix 1: rilpivirine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · depression · dizziness · drowsiness · dry mouth · fatigue · gastrointestinal discomfort · headache · nausea · rash · sleep disorders · vomiting
 - ▶ **Uncommon** Immune reconstitution inflammatory syndrome

SIDE-EFFECTS, FURTHER INFORMATION For further information regarding lipodystrophy, see HIV infection p. 409.

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer rilpivirine tablets.
Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (October 2016) that Rilpivirine (Edurant[®]) is recommended as an option for use within NHS Wales in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in antiretroviral treatment-naïve patients from 12 years old to < 18 years old with a viral load ≤ 100,000 HIV-1 RNA copies/ml.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Edurant** (Janssen-Cilag Ltd)
Rilpivirine (as Rilpivirine hydrochloride) 25 mg Edurant 25mg tablets | 30 tablet [PoM] £200.27

Combinations available: **Emtricitabine with rilpivirine and tenofovir alafenamide**, p. 419

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Nucleoside reverse transcriptase inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anaemia (may require transfusion) · appetite decreased · asthenia · diarrhoea · dizziness · headache · myalgia · nausea · skin reactions · vomiting
- ▶ **Uncommon** Hepatic steatosis · lactic acidosis · pancreatitis · thrombocytopenia
- ▶ **Frequency not known** Immune reconstitution inflammatory syndrome · osteonecrosis · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

● PREGNANCY

Monitoring Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

- **HEPATIC IMPAIRMENT** Use with caution in children with hepatic impairment (greater risk of hepatic side effects). However, some nucleoside reverse transcriptase inhibitors are used in children who also have chronic hepatitis B.

Abacavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

► BY MOUTH

- Child 3 months–11 years: 8 mg/kg twice daily (max. per dose 300 mg), alternatively 16 mg/kg once daily (max. per dose 600 mg)
- Child 3 months–11 years (body-weight 14–20 kg): 150 mg twice daily, alternatively 300 mg once daily
- Child 3 months–11 years (body-weight 21–29 kg): 150 mg, taken in the morning and 300 mg, taken in the evening, alternatively 450 mg once daily
- Child 3 months–11 years (body-weight 30 kg and above): 300 mg twice daily, alternatively 600 mg once daily
- Child 12–17 years: 300 mg twice daily, alternatively 600 mg once daily

● INTERACTIONS → Appendix 1: abacavir

● SIDE-EFFECTS

- **Common or very common** Fever · lethargy
- **Rare or very rare** Erythema multiforme · severe cutaneous adverse reactions (SCARs)
- **Frequency not known** Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION Life-threatening hypersensitivity reactions have been reported, characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis. Laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time. Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction).

- **ALLERGY AND CROSS-SENSITIVITY** Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.
- **HEPATIC IMPAIRMENT** Monitor closely in mild impairment (combination preparations not recommended as reduced abacavir dose may be required). Avoid in moderate impairment unless essential—close monitoring recommended. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.
- **PRE-TREATMENT SCREENING** Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.
- **MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.
- **PATIENT AND CARER ADVICE** Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment. Patients should be provided with an alert card and advised to keep it with them at all times.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol

► **Ziagen** (ViiV Healthcare UK Ltd)

Abacavir (as Abacavir sulfate) 20 mg per 1 ml Ziagen 20mg/ml oral solution sugar-free | 240 ml [PoM] £55.72

Tablet

► **Ziagen** (ViiV Healthcare UK Ltd)

Abacavir (as Abacavir sulfate) 300 mg Ziagen 300mg tablets | 60 tablet [PoM] £208.95

Abacavir with dolutegravir and lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir above, lamivudine p. 420, dolutegravir p. 411.

● INDICATIONS AND DOSE

HIV infection

► BY MOUTH

- Child 12–17 years (body-weight 40 kg and above): 1 tablet once daily

● INTERACTIONS → Appendix 1: abacavir · dolutegravir · lamivudine

- **RENAL IMPAIRMENT** Avoid *Triumeq*® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

● PATIENT AND CARER ADVICE

Missed doses If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Triumeq** (ViiV Healthcare UK Ltd) ▼

Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg Triumeq 50mg/600mg/300mg tablets | 30 tablet [PoM] £798.16

Abacavir with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir above, lamivudine p. 420.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretrovirals

► BY MOUTH

- Child 12–17 years (body-weight 40 kg and above): 1 tablet once daily

● INTERACTIONS → Appendix 1: abacavir · lamivudine

- **RENAL IMPAIRMENT** Avoid *Kivexa*® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Abacavir with lamivudine (Non-proprietary)**

Lamivudine 300 mg, Abacavir 600 mg Abacavir 600mg / Lamivudine 300mg tablets | 30 tablet [PoM] £150.83–£299.41 | 30 tablet [PoM] £224.56 (Hospital only)

► **Kivexa** (ViiV Healthcare UK Ltd)

Lamivudine 300 mg, Abacavir 600 mg Kivexa 600mg/300mg tablets | 30 tablet [PoM] £352.25

Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 416, lamivudine p. 420, zidovudine p. 422.

● INDICATIONS AND DOSE

HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)

- BY MOUTH
- Child (body-weight 30 kg and above): 1 tablet twice daily

● **UNLICENSED USE** Trizivir® not licensed for use in children.

● **INTERACTIONS** → Appendix 1: abacavir · lamivudine · zidovudine

● **RENAL IMPAIRMENT** Avoid Trizivir® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Trizivir (ViiV Healthcare UK Ltd)
Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg Trizivir tablets | 60 tablet (PoM) £509.06

F 415

01-Sep-2016

Didanosine

(ddi; DDI)

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- BY MOUTH
- Child 1–7 months: 50–100 mg/m² twice daily
- Child 8 months–17 years: 180–240 mg/m² once daily; usual dose 200 mg/m² once daily; maximum 400 mg per day

● **UNLICENSED USE** Tablets not licensed for use in children under 3 months. EC capsules not licensed for use in children under 6 years.

● **CAUTIONS** History of pancreatitis (preferably avoid, otherwise extreme caution) · hyperuricaemia · lactic acidosis · peripheral neuropathy

CAUTIONS, FURTHER INFORMATION

► Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with didanosine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

● **INTERACTIONS** → Appendix 1: didanosine

● SIDE-EFFECTS

► **Common or very common** Arthralgia · chills · dry mouth · fever · flatulence · gynaecomastia · hepatic disorders · pain · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops)

► **Uncommon** Acute kidney injury · alopecia · diabetes mellitus · dry eye · haemodialysis · hyperglycaemia · hypoglycaemia · leucopenia · myopathy · optic neuritis · retinal discolouration · sialadenitis

► **Rare or very rare** Parotid gland enlargement

► **Frequency not known** Lipotrophy

SIDE-EFFECTS, FURTHER INFORMATION

● **Pancreatitis** Suspend treatment if serum lipase raised or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity; monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

● **Lipodystrophy syndrome** Metabolic effects may occur with didanosine: these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. Manufacturer advises monitoring of plasma lipids and blood-glucose.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● HEPATIC IMPAIRMENT

Monitoring In hepatic impairment, monitor for toxicity.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²; consult product literature.

● MONITORING REQUIREMENTS

Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.

● **DIRECTIONS FOR ADMINISTRATION** Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.

With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets (child under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 25

► **Videx EC** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Didanosine 125 mg Videx EC 125mg capsules | 30 capsule (PoM) £48.18 (Hospital only)

Didanosine 200 mg Videx EC 200mg capsules | 30 capsule (PoM) £77.09 (Hospital only)

Didanosine 250 mg Videx EC 250mg capsules | 30 capsule (PoM) £96.37 (Hospital only)

Didanosine 400 mg Videx EC 400mg capsules | 30 capsule (PoM) £154.19 (Hospital only)

Didanosine 25 mg Videx 25mg chewable dispersible tablets sugar-free | 60 tablet (PoM) £25.06 (Hospital only)

Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide

03-May-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine below, elvitegravir, cobicistat, tenofovir alafenamide p. 400.

• INDICATIONS AND DOSE

HIV-1 infection (specialist use only)

► BY MOUTH

- Child 6–11 years (body-weight 25 kg and above): 1 tablet once daily
- Child 12–17 years (body-weight 35 kg and above): 1 tablet once daily

• INTERACTIONS → Appendix 1: cobicistat · elvitegravir · tenofovir alafenamide

• SIDE-EFFECTS

- **Common or very common** Abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- **Uncommon** Anaemia · angioedema · depression
- **Frequency not known** Nephrotoxicity · osteonecrosis · weight increased

• CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must contain drospirenone or norgestimate as the progestogen and at least 30 micrograms ethinylestradiol.

• HEPATIC IMPAIRMENT

Manufacturer advises use with caution in mild-to-moderate impairment (greater risk of hepatic side-effects); avoid in severe impairment—no information available.

• RENAL IMPAIRMENT

Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available. Manufacturer advises caution in children under 12 years with renal impairment—no information available.

• PRESCRIBING AND DISPENSING INFORMATION

Dispense in original container—contains desiccant.

• PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (*Genvoya*®) is accepted for use within NHS Scotland for the treatment of adults and adolescents (aged 12 years and older with body weight at least 35 kg) infected with human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (July 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (*Genvoya*®) is recommended as an option for use within NHS Wales for the treatment of adults and adolescents (aged 12 years and older with body weight at least 35 kg) infected with human immunodeficiency virus type 1 (HIV-1), without known

mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- Child 3 months–11 years (body-weight 14–20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
- Child 3 months–11 years (body-weight 21–29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg daily, dose to be taken in the morning and 150 mg daily, dose to be taken in the evening, alternatively 225 mg once daily
- Child 3 months–11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily
- Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily

ZEFFIX[®]

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

► BY MOUTH

- Child 2–11 years: 3 mg/kg once daily (max. per dose 100 mg), children receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection
- Child 12–17 years: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

● UNLICENSED USE

EPIVIR[®] ORAL SOLUTION Not licensed for use in children under 3 months.

EPIVIR[®] TABLETS Not licensed for use in children under 3 months.

ZEFFIX[®] Not licensed for use in children.

- **CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

- **INTERACTIONS** → Appendix 1: lamivudine

● SIDE-EFFECTS

- **Common or very common** Hepatitis aggravated · muscle cramps · myopathy
- **Rare or very rare** Angioedema
- **Frequency not known** Abdominal discomfort · malaise · respiratory tract infection · throat complaints

- **BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature.
- **MONITORING REQUIREMENTS** When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and strawberry.

MEDICINAL FORMS

DT = £73.81

F 415

01-Sep-2016

Stavudine (d4T)

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

► BY MOUTH

- Child (body-weight up to 30 kg): 1 mg/kg twice daily, to be taken preferably at least 1 hour before food
- Child (body-weight 30–59 kg): 30 mg twice daily, to be taken preferably at least 1 hour before food
- Child (body-weight 60 kg and above): 40 mg twice daily, to be taken preferably at least 1 hour before food

- **UNLICENSED USE** Capsules not licensed for use in children under 3 months.

- **CAUTIONS** Excessive alcohol intake · history of pancreatitis · history of peripheral neuropathy · lactic acidosis (especially when used in combination with didanosine)—use only if alternative regimens are not suitable

CAUTIONS, FURTHER INFORMATION

- Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with stavudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: stavudine

SIDE-EFFECTS

- Common or very common Depression · drowsiness · dyspepsia · hyperlactataemia · lipotrophy · nerve

disorders · paraesthesia · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · sleep disorders · thinking abnormal

- **Uncommon** Anxiety · arthralgia · emotional lability · gynaecomastia · hepatic disorders · urticaria
- **Rare or very rare** Diabetes mellitus · hyperglycaemia · muscle weakness · neutropenia

SIDE-EFFECTS, FURTHER INFORMATION Metabolic effects may occur with stavudine; plasma lipids and blood glucose concentrations should be measured routinely.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy.
Dose adjustments Reduce dose to 50% if estimated glomerular filtration rate 25–50 mL/minute/1.73 m²; reduce dose to 25% if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.
- **LESS SUITABLE FOR PRESCRIBING** Stavudine (especially in combination with didanosine) is associated with a higher risk of lipotrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

F 415

Tenofovir disoproxil

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs when first-line nucleoside reverse transcriptase inhibitors cannot be used because of resistance or contra-indications

► BY MOUTH

- Child 2–17 years: 6.5 mg/kg once daily (max. per dose 245 mg)
- Child 6–17 years (body-weight 17–21 kg): 123 mg once daily
- Child 6–17 years (body-weight 22–27 kg): 163 mg once daily
- Child 6–17 years (body-weight 28–34 kg): 204 mg once daily
- Child 6–17 years (body-weight 35 kg and above): 245 mg once daily

Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histology of active liver inflammation or fibrosis)

► BY MOUTH

- Child 12–17 years (body-weight 35 kg and above): 245 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

- **INTERACTIONS** → Appendix 1: tenofovir disoproxil

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal distension · flatulence
- ▶ **Uncommon** Proximal renal tubulopathy
- ▶ **Rare or very rare** Acute tubular necrosis · angioedema · hepatitis · nephritis · nephrogenic diabetes insipidus · renal impairment

- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.

• MONITORING REQUIREMENTS

- ▶ Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
- ▶ When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **DIRECTIONS FOR ADMINISTRATION** *Granules*: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do **not** mix granules with liquids.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tenofovir granules. **Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Zidovudine

01-Sep-2016

(Azidothymidine; AZT)

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ▶ **BY MOUTH**

- ▶ Child: 180 mg/m² twice daily (max. per dose 300 mg)
- ▶ Child (body-weight 8–13 kg): 100 mg twice daily
- ▶ Child (body-weight 14–20 kg): 100 mg, to be taken in the morning and 200 mg, to be taken in the evening
- ▶ Child (body-weight 21–27 kg): 200 mg twice daily
- ▶ Child (body-weight 28–29 kg): 200–250 mg twice daily
- ▶ Child (body-weight 30 kg and above): 250–300 mg twice daily

HIV infection in combination with other antiretroviral drugs (dose expressed in mg/kg)

- ▶ **BY MOUTH**

- ▶ Child (body-weight 4–8 kg): 12 mg/kg twice daily

- ▶ Child (body-weight 9–29 kg): 9 mg/kg twice daily

Prevention of maternal-fetal HIV transmission

- ▶ **BY MOUTH, OR BY INTRAVENOUS INFUSION**

- ▶ Child: Seek specialist advice (combination therapy preferred) (consult local protocol)

HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ Child 3 months–11 years: 60–80 mg/m² every 6 hours usually for not more than 2 weeks, dose approximating to 9–12 mg/kg twice daily by mouth
- ▶ Child 12–17 years: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

- **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) · abnormally low neutrophil counts (consult product literature) · neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature)

- **CAUTIONS** Lactic acidosis · risk of haematological toxicity particularly with high dose and advanced disease · vitamin B₁₂ deficiency (increased risk of neutropenia)

CAUTIONS, FURTHER INFORMATION

- ▶ Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: zidovudine

• SIDE-EFFECTS

- ▶ **Common or very common** Leucopenia · malaise · neutropenia
- ▶ **Uncommon** Bone marrow disorders · dyspnoea · fever · flatulence · generalised pain · myopathy
- ▶ **Rare or very rare** Alertness decreased · anxiety · cardiomyopathy · chest pain · chills · cough · depression · drowsiness · dyspepsia · gynaecomastia · hepatic disorders · hyperhidrosis · influenza like illness · insomnia · nail discolouration · oral discolouration · paraesthesia · pure red cell aplasia · seizure · skin reactions · taste altered · urinary frequency increased
- ▶ **Frequency not known** Lipotrophy

SIDE-EFFECTS, FURTHER INFORMATION

Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

Lipodystrophy syndrome Metabolic effects may occur with zidovudine; plasma lipids and blood glucose concentrations should be measured routinely.

- **HEPATIC IMPAIRMENT** Accumulation may occur.

- **RENAL IMPAIRMENT**

Dose adjustments Reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²—consult product literature.

- **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment, then every 3 months.

- **DIRECTIONS FOR ADMINISTRATION** For *intermittent intravenous infusion*, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

● MEDICINAL FORMS

Lamivudine 150 mg, Zidovudine 300 mg Combivir 150mg/300mg tablets | 60 tablet [PoM] £300.12

ANTIVIRALS > PROTEASE INHIBITORS, HIV

Protease inhibitors

- **CONTRA-INDICATIONS** Acute porphyrias p. 603

- **CAUTIONS** Haemophilia (increased risk of bleeding)

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · angioedema · anxiety · appetite abnormal · arthralgia · asthenia · diabetes mellitus · diarrhoea · dizziness · dry mouth · dyslipidaemia · dyspnoea · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatic disorders · hypersensitivity · hypertension · malaise · muscle complaints · nausea · neutropenia · oral ulceration · pancreatitis · peripheral neuropathy · seizure · skin reactions · sleep disorders · taste altered · vomiting

- ▶ **Uncommon** Drowsiness · immune reconstitution inflammatory syndrome · osteonecrosis · Stevens-Johnson syndrome · weight increased

- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

above

Atazanavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

- ▶ BY MOUTH
- ▶ Child 6–17 years (body-weight 15–19 kg): 150 mg once daily
- ▶ Child 6–17 years (body-weight 20–39 kg): 200 mg once daily
- ▶ Child 6–17 years (body-weight 40 kg and above): 300 mg once daily

- **CAUTIONS** Cardiac conduction disorders · electrolyte disturbances · predisposition to QT interval prolongation

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Hepatic disorders
- ▶ **Uncommon** Abnormal dreams · chest pain · depression · disorientation · drug reaction with eosinophilia and systemic symptoms (DRESS) · gallbladder disorders · gastritis · gynaecomastia · haematuria · memory loss · myopathy · nephritis tubulointerstitial · nephrolithiasis · proteinuria · syncope · torsade de pointes · urinary frequency increased

- ▶ **Rare or very rare** Gait abnormal · oedema · palpitations · QT interval prolongation · renal pain · vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.

- **PREGNANCY** Theoretical risk of hyperbilirubinaemia in neonate if used at term.

Monitoring In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 5, 21

- ▶ **Reyataz** (Bristol-Myers Squibb Pharmaceuticals Ltd)

- Atazanavir (as Atazanavir sulfate) 300 mg** Reyataz 300mg capsules | 30 capsule [PoM] £303.38 (Hospital only)

above

Darunavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir

- ▶ BY MOUTH
- ▶ Child 3–17 years (body-weight 15–29 kg): 375 mg twice daily
- ▶ Child 3–17 years (body-weight 30–39 kg): 450 mg twice daily

continued →

- ▶ Child 3–17 years (body-weight 40 kg and above): 600 mg twice daily
- ▶ Child 12–17 years: 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells $\times 10^6$ /litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

- ▶ BY MOUTH
- ▶ Child 12–17 years (body-weight 40 kg and above): 800 mg once daily

● **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● **SIDE-EFFECTS**

- ▶ **Common or very common** Hyperlipidaemia · skin reactions · sleep disorders
- ▶ **Uncommon** Abdominal discomfort · angina pectoris · arrhythmias · burping · chest pain · concentration impaired · confusion · constipation · cough · depression · dry eye · eye erythema · feeling hot · flushing · gastritis · gout · gynaecomastia · haemorrhage · hepatic disorders · herpes simplex · hyperglycaemia · hypothyroidism · lethargy · leucopenia · memory loss · mood altered · muscle weakness · myocardial infarction · nail discolouration · nephrolithiasis · oral disorders · osteoporosis · pain · peripheral oedema · polydipsia · QT interval prolongation · renal impairment · sensation abnormal · sexual dysfunction · sweat changes · throat irritation · thrombocytopenia · urinary disorders · urine abnormalities · vertigo

- ▶ **Rare or very rare** Arthritis · chills · feeling abnormal · joint stiffness · musculoskeletal stiffness · palpitations · restlessness · rhinorrhoea · severe cutaneous adverse reactions (SCARs) · syncope · taste loss · visual impairment
- SIDE-EFFECTS, FURTHER INFORMATION** Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if this develops.

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with sulfonamide sensitivity.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

● **PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Darunavir with cobicistat, emtricitabine and tenofovir alafenamide

06-Feb-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, darunavir p. 423, cobicistat, emtricitabine p. 418, tenofovir alafenamide p. 400.

● **INDICATIONS AND DOSE**

HIV infection (initiated by a specialist)

- ▶ BY MOUTH

- ▶ Child 12–17 years (body-weight 40 kg and above): 1 tablet once daily

- **INTERACTIONS** → Appendix 1: cobicistat · HIV-protease inhibitors · tenofovir alafenamide

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—no information available.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1290/18

The *Scottish Medicines Consortium* has advised (January 2018) that darunavir with cobicistat, emtricitabine and tenofovir alafenamide (*Symtuza*®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg).

All Wales Medicines Strategy Group (AWMSG) Decisions

AWMSG No. 2418

The *All Wales Medicines Strategy Group* has advised (March 2018) that darunavir with cobicistat, emtricitabine and tenofovir alafenamide (*Symtuza*®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Fosamprenavir

F 423

- **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

► BY MOUTH

- Child 6–17 years (body-weight 25–39 kg): 18 mg/kg twice daily (max. per dose 700 mg)
- Child 6–17 years (body-weight 40 kg and above): 700 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- 700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- **Common or very common** Oral paraesthesia
- **Frequency not known** Rash erythematous

SIDE-EFFECTS, FURTHER INFORMATION Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves and may respond to antihistamines.

- **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment.

Dose adjustments Reduce dose in moderate to severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** In children, oral suspension should be taken with food.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

● MEDICINAL FORMS

Lopinavir with ritonavir

19-Mar-2018

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

► BY MOUTH USING TABLETS

- Child 2–17 years (body-weight up to 40 kg and body surface area 0.5–0.7 m²): 200/50 mg twice daily
- Child 2–17 years (body-weight up to 40 kg and body surface area 0.8–1.1 m²): 300/75 mg twice daily
- Child 2–17 years (body-weight 40 kg and above and body surface area 1.2 m² and above): 400/100 mg twice daily

► BY MOUTH USING ORAL SOLUTION

- Child 14 days–5 months: 3.75 mL/m² twice daily
- Child 6 months–17 years: 2.9 mL/m² twice daily (max. per dose 5 mL)

DOSE EQUIVALENCE AND CONVERSION

- Oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL (or 80 mg lopinavir, 20 mg ritonavir/mL).

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- **Common or very common** Gastrointestinal discomfort · gastrointestinal disorders · increased risk of infection · leucopenia · lymphadenopathy · menstrual cycle irregularities · migraine · muscle weakness · myopathy · night sweats · pain · sexual dysfunction · skin reactions
- **Uncommon** Abnormal dreams · atherosclerosis · atrioventricular block · cholangitis · constipation · deep vein thrombosis · haemorrhage · hepatic disorders · hyperbilirubinaemia · hypogonadism · myocardial infarction · nephritis · stomatitis · stroke · taste loss · tinnitus · tremor · tricuspid valve incompetence · vasculitis · vertigo · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

- **PREGNANCY** Avoid oral solution due to high alcohol and propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in *animal* studies).

- **HEPATIC IMPAIRMENT** Avoid oral solution due to propylene glycol content; manufacturer advises avoid tablets in severe impairment.

- **RENAL IMPAIRMENT** Avoid oral solution due to high propylene glycol content.

● MONITORING REQUIREMENTS

- Monitor liver function before and during treatment.
- With oral solution, monitor for signs of alcohol and propylene glycol toxicity (particularly in infants).

- **PRESCRIBING AND DISPENSING INFORMATION** With oral solution, manufacturer advises high alcohol (42 % v/v) and propylene glycol content—consider total amounts from all medicines that are to be given to infants in order to avoid toxicity; caution in patients for which consumption may be harmful.

- **PATIENT AND CARER ADVICE** Oral solution tastes bitter.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1302/18

The *Scottish Medicines Consortium* has advised (February 2018) that lopinavir with ritonavir oral solution (*Kaletra*®) is accepted for use within NHS Scotland in combination with other antiretrovirals for the treatment of HIV-1 infected children aged from 14 days up to 2 years.

SMC No. 326/06

The *Scottish Medicines Consortium* has advised (November 2006) that lopinavir with ritonavir tablet (*Kaletra*®) is accepted for use within NHS Scotland in combination with other antiretrovirals for the treatment of HIV-1 infected adults and children above the age of 2 years.

All Wales Medicines Strategy Group (AWMSG) Decisions

AWMSG No. 3557

The *All Wales Medicines Strategy Group* has advised (March 2018) that lopinavir with ritonavir oral solution (*Kaletra*®) is recommended as an option for use within NHS Wales in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus (HIV-1) infected children aged from 14 days to less than 2 years old.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

EXCIPIENTS: May contain Alcohol, propylene glycol

► **Kaletra** (AbbVie Ltd)

Ritonavir 20 mg per 1 ml, Lopinavir 80 mg per 1 ml
80mg/20mg/1ml oral solution | 120 ml [PoM] £122.96 |
300 ml [PoM] £307.39

Tablet

Ritonavir 25 mg, Lopinavir 100 mg Kaletra 100mg/25mg tablets |
60 tablet [PoM] £76.85
Ritonavir 50 mg, Lopinavir 200 mg Kaletra 200mg/50mg tablets |
120 tablet [PoM] £285.41

F 423

Ritonavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

► BY MOUTH

► Child 2-17 years: Initially 250 mg/m² twice daily, increased in steps of 50 mg/m² every 2–3 days; increased to 350 mg/m² twice daily (max. per dose 600 mg twice daily), tolerability of this regimen is poor

Low-dose ritonavir to increase the effect of atazanavir

► BY MOUTH

► Child 6-17 years (body-weight 15-19 kg): 80–100 mg once daily
► Child 6-17 years (body-weight 20 kg and above): 100 mg once daily

Low-dose ritonavir to increase the effect of darunavir

► BY MOUTH

► Child 3-17 years (body-weight 15-29 kg): 50 mg twice daily
► Child 3-17 years (body-weight 30-39 kg): 60 mg twice daily
► Child 3-17 years (body-weight 40 kg and above): 100 mg twice daily
► Child 12-17 years (body-weight 40 kg and above): 100 mg once daily for use in patients taking darunavir once daily

Low-dose ritonavir to increase the effect of fosamprenavir

► BY MOUTH

► Child 6-17 years (body-weight 25-32 kg): 3 mg/kg twice daily
► Child 6-17 years (body-weight 33 kg and above): 100 mg twice daily

Low-dose ritonavir to increase the effect of tipranavir

► BY MOUTH

► Child 2-11 years: 150 mg/m² twice daily (max. per dose 200 mg)
► Child 12-17 years: 200 mg twice daily

● **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease

● **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

► **Common or very common** Back pain · concentration impaired · confusion · cough · dehydration · feeling hot · flushing · gastrointestinal discomfort · gastrointestinal haemorrhage · gout · hypotension · menorrhagia · myopathy · oedema · oral paraesthesia · oropharyngeal pain · paraesthesia · peripheral coldness · pharyngitis · renal impairment · skin reactions · syncope · thrombocytopenia · urinary frequency increased · vision blurred
► **Uncommon** Myocardial infarction

► **Rare or very rare** Hyperglycaemia · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

● PREGNANCY

Dose adjustments Only use low-dose booster to increase the effect of other protease inhibitors.

● **HEPATIC IMPAIRMENT** Avoid in decompensated liver disease; in severe impairment without decompensation, use 'booster' doses with caution (avoid treatment doses).

● **DIRECTIONS FOR ADMINISTRATION** Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ritonavir oral solution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

► **Norvir** (AbbVie Ltd)

Ritonavir 100 mg Norvir 100mg tablets | 30 tablet [PoM] £19.44

F 423

Tipranavir

● INDICATIONS AND DOSE

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir

► BY MOUTH USING CAPSULES

► Child 12-17 years: 500 mg twice daily

► BY MOUTH USING ORAL SOLUTION

► Child 2-11 years: 375 mg/m² twice daily (max. per dose 500 mg)

DOSE EQUIVALENCE AND CONVERSION

► The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

● **CAUTIONS** Patients at risk of increased bleeding from trauma, surgery or other pathological conditions

● **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

► **Common or very common** Hyperlipidaemia
► **Uncommon** Exanthema · hepatic disorders · hyperamylasaemia · hyperglycaemia · influenza like illness · renal failure · thrombocytopenia
► **Rare or very rare** Dehydration · hyperbilirubinaemia · intracranial haemorrhage
► **Frequency not known** Bleeding tendency

SIDE-EFFECTS, FURTHER INFORMATION Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available.

● **MONITORING REQUIREMENTS** Monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include toffee and mint.

- **PATIENT AND CARER ADVICE** Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > OTHER

Maraviroc

- **DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.

● INDICATIONS AND DOSE

CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

► BY MOUTH

► Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Cardiovascular disease
- **INTERACTIONS** → Appendix 1: maraviroc
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anaemia · appetite decreased · asthenia · depression · diarrhoea · flatulence · headache · insomnia · nausea · rash
 - **Uncommon** Hyperbilirubinaemia · increased risk of infection · myopathy · postural hypotension · proteinuria · renal failure · seizure
 - **Rare or very rare** Angina pectoris · granulocytopenia · hepatic disorders · metastases · neoplasms · pancytopenia · severe cutaneous adverse reactions (SCARs)
 - **Frequency not known** Fever · hypersensitivity · immune reconstitution inflammatory syndrome · organ dysfunction · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment, including patients with chronic hepatitis B or C.
- **RENAL IMPAIRMENT** If estimated glomerular filtration rate less than 80 mL/minute/1.73 m², consult product literature.

Maraviroc 300 mg Celsentri 300mg tablets | 60 tablet [PoM] £519.14

6.5 Influenza

Influenza

Management

Oseltamivir p. 428 and zanamivir p. 429 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; oseltamivir is licensed for use within 48 hours of the first symptoms while zanamivir is licensed for use within 36 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in children with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised children.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Amantadine hydrochloride is licensed for prophylaxis and treatment of influenza A in children over 10 years of age, but it is no longer recommended.

ANTIVIRALS > NEURAMINIDASE INHIBITORS

Oseltamivir

20-Jul-2017

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

● **INDICATIONS AND DOSE**

Prevention of influenza

► BY MOUTH

- Neonate: 3 mg/kg once daily for 10 days for post-exposure prophylaxis.
- Child 1–11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis
- Child 1–12 years (body-weight 10–15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 15–23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 23–40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 13–17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Treatment of influenza

► BY MOUTH

- Neonate: 3 mg/kg twice daily for 5 days.
- Child 1–11 months: 3 mg/kg twice daily for 5 days
- Child 1–12 years (body-weight 10–15 kg): 30 mg twice daily for 5 days
- Child 1–12 years (body-weight 15–23 kg): 45 mg twice daily for 5 days
- Child 1–12 years (body-weight 23–40 kg): 60 mg twice daily for 5 days
- Child 1–12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
- Child 13–17 years: 75 mg twice daily for 5 days

- **UNLICENSED USE** Not licensed for use in premature infants.
- **SIDE-EFFECTS**
 - **Common or very common** Dyspepsia
 - **Uncommon** Skin reactions
- **PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).
- **BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).
- **RENAL IMPAIRMENT** Avoid for treatment and prevention if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
Dose adjustments For treatment, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).
 For prevention, use 40% of normal dose once daily if estimated glomerular filtration rate

30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).

- **DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.
 - **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.
 - **PATIENT AND CARER ADVICE**
 Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-for-influenza
 - **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
 - **Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008)** NICE TA158
 Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
 - Oseltamivir is **not** recommended for seasonal prophylaxis against influenza.
 - When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
 - During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.
- At risk patients include those aged 65 years or older or those who have one or more of the following conditions:
- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
 - chronic heart disease;
 - chronic renal disease;
 - chronic liver disease;
 - chronic neurological disease;
 - immunosuppression;
 - diabetes mellitus.
- The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.
- This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.
- www.nice.org.uk/guidance/ta158
- **Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009)** NICE TA168
 Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
 - When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be

used to indicate when influenza is circulating in the community.)

- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

Zanamivir

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

• INDICATIONS AND DOSE

Post-exposure prophylaxis of influenza

▶ BY INHALATION OF POWDER

- ▶ Child 5–17 years: 10 mg once daily for 10 days

Prevention of influenza during an epidemic

▶ BY INHALATION OF POWDER

- ▶ Child 5–17 years: 10 mg once daily for up to 28 days

Treatment of influenza

▶ BY INHALATION OF POWDER

- ▶ Child 5–17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

- **UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

- **CAUTIONS** Asthma · chronic pulmonary disease · uncontrolled chronic illness

CAUTIONS, FURTHER INFORMATION

- ▶ **Asthma and chronic pulmonary disease** Risk of bronchospasm—short-acting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Skin reactions
 - ▶ **Uncommon** Bronchospasm · dehydration · dyspnoea · oropharyngeal oedema · presyncope · severe cutaneous adverse reactions (SCARs) · throat tightness
 - ▶ **Rare or very rare** Face oedema
 - ▶ **Frequency not known** Behaviour abnormal · delirium · hallucination · level of consciousness decreased · psychiatric disorder · seizure

- **PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

- **DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

- **PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008)** NICE TA158

Inhalation powder

▶ **Relenza** (GlaxoSmithKline UK Ltd)

Zanamivir 5 mg Relenza 5mg inhalation powder blisters with Diskhaler | 20 blister (PoM) £16.36

bronchiolitis. Ribavirin is effective in Lassa fever and has also been used parenterally in the treatment of life-threatening RSV, parainfluenza virus, and adenovirus infections in immunocompromised children [unlicensed indications].

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at www.gov.uk/dh.

DRUGS FOR RESPIRATORY DISEASES > MONOCLONAL ANTIBODIES

Palivizumab

• INDICATIONS AND DOSE

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)

▶ BY INTRAMUSCULAR INJECTION

▶ Neonate: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk.

▶ Child 1–23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)

▶ BY INTRAMUSCULAR INJECTION

▶ Child 1–23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

- **UNLICENSED USE** Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

6.6 Respiratory syncytial virus

Respiratory syncytial virus

Management

Ribavirin p. 400 inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV

- **CAUTIONS** Moderate to severe acute infection • moderate to severe febrile illness • serum-palivizumab concentration may be reduced after cardiac surgery • thrombocytopenia

- **SIDE-EFFECTS**

- ▶ **Common or very common** Apnoea
- ▶ **Uncommon** Seizure • thrombocytopenia • urticaria
- ▶ **Frequency not known** Hypersensitivity

- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to humanised monoclonal antibodies.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Synagis** (AbbVie Ltd)

Palivizumab 100 mg per 1 ml Synagis 100mg/1ml solution for injection vials | 1 vial [PoM] £563.64

Synagis 50mg/0.5ml solution for injection vials | 1 vial [PoM] £306.34

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus

Diabetes insipidus is caused by either a deficiency of anti-diuretic hormone (ADH, vasopressin) secretion (cranial, neurogenic, or pituitary diabetes insipidus) or by failure of the renal tubules to react to secreted antidiuretic hormone (nephrogenic diabetes insipidus).

Vasopressin (antidiuretic hormone, ADH) p. 67 is used in the treatment of *pituitary diabetes insipidus* as is its analogue desmopressin below. Dosage is tailored to produce a regular diuresis every 24 hours to avoid water intoxication. Treatment may be required permanently or for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus; following an intramuscular or intranasal dose, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of pituitary diabetes insipidus. Failure to respond suggests nephrogenic diabetes insipidus. Fluid input must be managed carefully to avoid hyponatraemia; this test is not usually recommended in young children.

In *neurogenic and partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's

disease; it is also used to test fibrinolytic response.

Desmopressin also has a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, before introducing more definitive treatment. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, and octreotide are used similarly but experience in children is limited.

1.1 Diabetes insipidus

Other drugs used for Diabetes insipidus Chlorothiazide, p. 111

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES

Desmopressin

09-Jun-2017

- **DRUG ACTION** Desmopressin is an analogue of vasopressin.

● INDICATIONS AND DOSE

Diabetes insipidus, treatment

► BY MOUTH

- Neonate: Initially 1–4 micrograms 2–3 times a day, adjusted according to response.
- Child 1–23 months: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
- Child 2–11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
- Child 12–17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily

- BY SUBLINGUAL ADMINISTRATION
- Child 2–17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- BY INTRANASAL ADMINISTRATION

► Neonate: Initially 100–500 nanograms, adjusted according to response; usual dose 1.25–10 micrograms daily in 1–2 divided doses.

- Child 1–23 months: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
- Child 2–11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
- Child 12–17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
- BY INTRAMUSCULAR INJECTION

► Neonate: Initially 100 nanograms once daily, adjusted according to response.

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Child 1 month–11 years: Initially 400 nanograms once daily, adjusted according to response
- Child 12–17 years: Initially 1–4 micrograms once daily, adjusted according to response

Primary nocturnal enuresis

- BY MOUTH
- Child 5–17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- BY SUBLINGUAL ADMINISTRATION
- Child 5–17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

Diabetes insipidus, diagnosis (water deprivation test)

- BY INTRANASAL ADMINISTRATION
- Neonate: Not recommended, use trial of treatment.
- Child 1–23 months: 5–10 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended
- Child 2–11 years: 10–20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia
- Child 12–17 years: 20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia
- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Neonate: Not recommended, use trial of treatment.
- Child 1–23 months: 400 nanograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended
- Child 2–11 years: 0.5–1 microgram for 1 dose, manage fluid input carefully to avoid hyponatraemia
- Child 12–17 years: 1–2 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia

Renal function testing

- BY INTRANASAL ADMINISTRATION
- Child 1–11 months: 10 micrograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload
- Child 1–14 years: 20 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

- Child 15–17 years: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Child 1–11 months: 400 nanograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload
- Child 1–17 years: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

Mild to moderate haemophilia and von Willebrand's disease

- BY INTRANASAL ADMINISTRATION
- Child 1–17 years: 4 micrograms/kg for 1 dose, for pre-operative use give 2 hours before procedure
- BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- Child: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

Fibrinolytic response testing

- BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- Child 2–17 years: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

Assessment of antidiuretic hormone secretion (congenital deficiency suspected) (specialist use only)

- BY INTRANASAL ADMINISTRATION
- Child 1–23 months: Initially 100–500 nanograms for 1 dose

Assessment of antidiuretic hormone secretion (congenital deficiency not suspected) (specialist use only)

- BY INTRANASAL ADMINISTRATION
- Child 1–23 months: 1–5 micrograms for 1 dose

● **UNLICENSED USE** Consult product literature for individual preparations. Not licensed for assessment of antidiuretic hormone secretion. Oral use of *DDAVP* intravenous injection is not licensed.

● **CONTRA-INDICATIONS** Cardiac insufficiency · conditions treated with diuretics · history of hyponatraemia · polydipsia in alcohol dependence · psychogenic polydipsia

CAUTIONS

GENERAL CAUTIONS Asthma · avoid fluid overload · cardiovascular disease (not indicated for nocturnal enuresis or nocturia) · conditions which might be aggravated by water retention · cystic fibrosis · epilepsy · heart failure · hypertension (not indicated for nocturnal enuresis or nocturia) · migraine · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

SPECIFIC CAUTIONS

- With intranasal use should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

● **INTERACTIONS** → Appendix 1: desmopressin

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Hyponatraemia (on administration without restricting fluid intake) · nausea
- **Frequency not known** Abdominal pain · aggression · allergic dermatitis · emotional disorder · fluid retention · headache · hyponatraemic seizure · vomiting · weight increased

SPECIFIC SIDE-EFFECTS

- With intranasal use Epistaxis · nasal congestion · rhinitis
- SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises avoiding concomitant use of drugs which increase

secretion of vasopressin (e.g. tricyclic antidepressants)—increases risk of hyponatraemia.

- **PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.
- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.
- **MONITORING REQUIREMENTS** In *nocturia*, periodic blood pressure and weight checks are needed to monitor for fluid overload.
- **DIRECTIONS FOR ADMINISTRATION** DDAVP® and Desmotabs® tablets may be crushed.
DDAVP® intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.
DDAVP® injection may be administered orally.
Desmopressin oral lyophilisates are for sublingual administration.
- ▶ With intravenous use Higher doses of DDAVP® by *intravenous infusion*, used in mild to moderate haemophilia and von Willebrand's disease, may be diluted with 30–50 mL Sodium Chloride 0.9% intravenous infusion.
For *intravenous infusion* (Octim®), dilute with 50 mL of Sodium Chloride 0.9% and give over 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.
Children requiring an intranasal dose of less than 10 micrograms should be given DDAVP® intranasal solution.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Desmopressin for bedwetting www.medicinesforchildren.org.uk/desmopressin-bedwetting-0
Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, spray, nasal drops

Tablet

- ▶ **Desmopressin (Non-proprietary)**
Desmopressin acetate 100 microgram Desmopressin 100microgram tablets | 90 tablet [PoM] £76.62 DT = £63.08
Desmopressin acetate 200 microgram Desmopressin 200microgram tablets | 30 tablet [PoM] £35.23 DT = £9.09
- ▶ **DDAVP** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 100 microgram DDAVP 0.1mg tablets | 90 tablet [PoM] £44.12 DT = £63.08
Desmopressin acetate 200 microgram DDAVP 0.2mg tablets | 90 tablet [PoM] £88.23
- ▶ **Desmotabs** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 200 microgram Desmotabs 0.2mg tablets | 30 tablet [PoM] £29.43 DT = £9.09

Solution for injection

- ▶ **DDAVP** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 4 microgram per 1 ml DDAVP 4micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £13.16
- ▶ **Octim** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 15 microgram per 1 ml Octim 15micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £192.20

Spray

- ▶ **Desmopressin (Non-proprietary)**
Desmopressin acetate 10 microgram per 1 dose Desmopressin 10micrograms/dose nasal spray | 60 dose [PoM] £31.50 DT = £28.06

- ▶ **Desmospray** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 2.5 microgram per 1 dose Desmospray 2.5micrograms/dose nasal spray | 50 dose [PoM] £25.02 DT = £28.06
 - ▶ **Octim** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 150 microgram per 1 dose Octim 150micrograms/dose nasal spray | 25 dose [PoM] £576.60
- #### Oral lyophilisate
- CAUTIONARY AND ADVISORY LABELS 26
- ▶ **DDAVP Melt** (Ferring Pharmaceuticals Ltd)
Desmopressin (as Desmopressin acetate) 60 microgram DDAVP Melt 60microgram oral lyophilisates sugar-free | 100 tablet [PoM] £50.53 DT = £50.53
Desmopressin (as Desmopressin acetate) 120 microgram DDAVP Melt 120microgram oral lyophilisates sugar-free | 100 tablet [PoM] £101.07 DT = £101.07
Desmopressin (as Desmopressin acetate) 240 microgram DDAVP Melt 240microgram oral lyophilisates sugar-free | 100 tablet [PoM] £202.14
 - ▶ **DesmoMelt** (Ferring Pharmaceuticals Ltd)
Desmopressin (as Desmopressin acetate) 120 microgram DesmoMelt 120microgram oral lyophilisates sugar-free | 30 tablet [PoM] £30.34 DT = £30.34
Desmopressin (as Desmopressin acetate) 240 microgram DesmoMelt 240microgram oral lyophilisates sugar-free | 30 tablet [PoM] £60.68 DT = £60.68
 - ▶ **Noqdirna** (Ferring Pharmaceuticals Ltd)
Desmopressin (as Desmopressin acetate) 25 microgram Noqdirna 25microgram oral lyophilisates sugar-free | 30 tablet [PoM] £15.16 DT = £15.16
Desmopressin (as Desmopressin acetate) 50 microgram Noqdirna 50microgram oral lyophilisates sugar-free | 30 tablet [PoM] £15.16 DT = £15.16

Nasal drops

- ▶ **DDAVP** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 100 microgram per 1 ml DDAVP 100micrograms/ml intranasal solution | 2.5 ml [PoM] £9.72 DT = £9.72

2 Corticosteroid responsive conditions

CORTICOSTEROIDS

Corticosteroids, general use

Overview

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 440 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, low-dose

hydrocortisone p. 440 can be used in septic shock that is resistant to volume expansion and catecholamines, and is accompanied by suspected or proven adrenal insufficiency.

The suppressive action of glucocorticoids on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most adults a single dose of dexamethasone p. 439 at night is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone p. 438 and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 20); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should **not** be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 136. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

In the management of asthma, corticosteroids are preferably used by inhalation but systemic therapy along with bronchodilators is required for the emergency treatment of severe acute asthma.

Betamethasone is used in women at risk of preterm delivery to reduce the incidence of neonatal respiratory distress syndrome [unlicensed use].

Dexamethasone should not be used routinely for the prophylaxis and treatment of chronic lung disease in neonates because of an association with adverse neurological effects.

Corticosteroids may be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis, and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia and thrombocytopenic purpura.

High doses of a corticosteroid (usually prednisolone p. 442) are used in the treatment of *glomerular kidney disease*, including *nephrotic syndrome*. The condition frequently recurs; a corticosteroid given in high doses and for prolonged periods may delay relapse but the higher incidence of adverse effects limits the overall benefit. Those who suffer frequent relapses may be treated with prednisolone given in a low dose (daily or on alternate days) for 3–6 months; the dose should be adjusted to minimise effects on growth and development. Other drugs used in the treatment of glomerular kidney disease include levamisole p. 383, cyclophosphamide p. 535, chlorambucil p. 534, and ciclosporin p. 519. *Congenital nephrotic syndrome* may be resistant to corticosteroids and immunosuppressants; indometacin and an ACE inhibitor such as captopril p. 112 have been used.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa, allergic rhinitis, and aphthous ulcers.

Side-effects

MHRA/CHM advice: Corticosteroids: rare risk of central serous chorioretinopathy with local as well as systemic administration (August 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and pericocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side effects

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone acetate, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side effects

- diabetes
- osteoporosis
- in addition high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.
- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

Managing side-effects

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 15 years; they are also useful in older children and adults, particularly if high doses

are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

Corticosteroids, replacement therapy

Overview

The adrenal cortex normally secretes hydrocortisone (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone p. 440 and the mineralocorticoid fludrocortisone acetate p. 440; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2–3 divided doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In *acute adrenocortical insufficiency*, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

In *hypopituitarism*, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 485 and sex hormones should be given as indicated by the pattern of hormone deficiency.

In *congenital adrenal hyperplasia*, the pituitary gland increases production of corticotropin to compensate for reduced formation of cortisol; this results in excessive adrenal androgen production. Treatment is aimed at suppressing corticotropin using hydrocortisone. Careful and continual dose titration is required to avoid growth retardation and toxicity; for this reason potent, synthetic glucocorticoids such as dexamethasone are usually reserved for use in adolescents. The dose is adjusted according to clinical response and measurement of adrenal androgens and 17-hydroxyprogesterone. Salt-losing forms of congenital adrenal hyperplasia (where there is a lack of aldosterone production) also require mineralocorticoid replacement and salt supplementation (particularly in early life). The dose of mineralocorticoid is adjusted according to electrolyte concentration and plasma-renin activity.

Glucocorticoid therapy

Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 440 is so high that its anti-inflammatory activity is of no clinical relevance.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 1 mg	≡	Betamethasone 150 micrograms
	≡	Deflazacort 1.2 mg
	≡	Dexamethasone 150 micrograms
	≡	Hydrocortisone 4 mg
	≡	Methylprednisolone 800 micrograms
	≡	Triamcinolone 800 micrograms

The relatively high mineralocorticoid activity of hydrocortisone p. 440, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 442 has predominantly glucocorticoid activity and is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 438 and dexamethasone p. 439 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion.

Some esters of betamethasone and of beclomethasone dipropionate p. 160 (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 438 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periorcular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) · systemic infection (unless specific therapy given)

CONTRA-INDICATIONS, FURTHER INFORMATION

For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **CAUTIONS** Congestive heart failure · diabetes mellitus (including a family history of) · diverticulitis · epilepsy · glaucoma (including a family history of or susceptibility to) · history of steroid myopathy · history of tuberculosis or X-ray changes (frequent monitoring required) · hypertension · hypothyroidism · infection (particularly untreated) · myasthenia gravis · ocular herpes simplex (risk of corneal perforation) · osteoporosis · peptic ulcer · psychiatric reactions · recent intestinal anastomoses · recent myocardial infarction (rupture reported) · severe affective disorders (particularly if history of steroid-induced psychosis) · should not be used long-term · thromboembolic disorders · ulcerative colitis

CAUTIONS, FURTHER INFORMATION For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Adrenal suppression · anxiety · appetite increased · behaviour abnormal · cataract subcapsular · cognitive impairment · Cushing's syndrome · diabetic control impaired · electrolyte imbalance · fluid retention · gastrointestinal discomfort · glaucoma · headache · healing impaired · hirsutism · hypertension · increased risk of infection · leucocytosis · menstrual cycle irregularities · mood altered · myocardial rupture (following recent myocardial infarction) · nausea · osteoporosis · peptic ulcer · psychotic disorder · skin reactions · sleep disorders · telangiectasia · weight increased
- ▶ **Uncommon** Alkalosis hypokalaemic · bone fractures · haemorrhage · heart failure · hyperhidrosis · myopathy · oedema · osteonecrosis · pancreatitis · papilloedema · seizure · thromboembolism · tuberculosis reactivation · vertigo · vision blurred
- ▶ **Rare or very rare** Bruising · tendon rupture
- ▶ **Frequency not known** Chorioretinopathy · eye disorders · growth retardation · intracranial pressure increased with papilloedema (usually after withdrawal)

SIDE-EFFECTS, FURTHER INFORMATION

Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death. To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

Infections Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

Chickenpox Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox. Manifestations of fulminant illness include pneumonia, hepatitis and disseminated

intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella-zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

Measles Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

Psychiatric reactions Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment. Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

- **PREGNANCY** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.
- **Monitoring** Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
- **HEPATIC IMPAIRMENT** The plasma-drug concentration may be increased (particularly on systemic use). Oral and parenteral use should be undertaken with caution.
- **RENAL IMPAIRMENT** Use by oral and injectable routes should be undertaken with caution.
- **MONITORING REQUIREMENTS** The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
- **EFFECT ON LABORATORY TESTS** Suppression of skin test reactions.
- **TREATMENT CESSATION** The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week *or* 2 mg/kg daily for 1 week *or* 1 mg/kg daily for 1 month;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

● PATIENT AND CARER ADVICE

Advice for patients Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:

- Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur.

Steroid treatment cards Steroid treatment cards should be issued where appropriate. Consider giving a 'steroid card' to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk.

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal.

In **Scotland**, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dppas@apsgroup.co.uk or by fax on 0131 629 9967.

Betamethasone

● INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child 1–11 months: Initially 1 mg, repeated up to 4 times in 24 hours according to response
- Child 1–5 years: Initially 2 mg, repeated up to 4 times in 24 hours according to response
- Child 6–11 years: Initially 4 mg, repeated up to 4 times in 24 hours according to response
- Child 12–17 years: 4–20 mg, repeated up to 4 times in 24 hours according to response

● **INTERACTIONS** → Appendix 1: corticosteroids

● **SIDE-EFFECTS** Hiccups · malaise · Stevens-Johnson syndrome

● **PREGNANCY** Readily crosses the placenta. Transient effect on fetal movements and heart rate.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

► **Betamethasone (Non-proprietary)**

Betamethasone (as Betamethasone sodium phosphate) 4 mg per 1 ml Betamethasone 4mg/1ml solution for injection ampoules | 5 ampoule (PoM) £18.81 DT = £17.25

Deflazacort

● INDICATIONS AND DOSE

Inflammatory and allergic disorders

► BY MOUTH

- Child 1-month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
- Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

Nephrotic syndrome

► BY MOUTH

- Child: Initially 1.5 mg/kg once daily (max. per dose 120 mg), reduced to the lowest effective dose for maintenance

● **INTERACTIONS** → Appendix 1: corticosteroids

● **SIDE-EFFECTS** Hypotension

● **PATIENT AND CARER ADVICE** Patient counselling is advised for deflazacort tablets (steroid card).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Dexamethasone

● INDICATIONS AND DOSE

Physiological replacement

- BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION
- Child: 250–500 micrograms/m² every 12 hours, adjusted according to response

Suppression of inflammatory and allergic disorders

- BY MOUTH
- Child: 10–100 micrograms/kg daily in 1–2 divided doses, adjusted according to response; up to 300 micrograms/kg daily may be required in emergency situations
- BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child 1 month–11 years: 83–333 micrograms/kg daily in 1–2 divided doses; maximum 20 mg per day
- Child 12–17 years: Initially 0.4–20 mg daily

Mild croup

- BY MOUTH
- Child: 150 micrograms/kg for 1 dose

Severe croup (or mild croup that might cause complications)

- INITIALLY BY MOUTH
- Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

Adjunctive treatment of bacterial meningitis (starting before or with first dose of antibacterial)

- BY SLOW INTRAVENOUS INJECTION
- Child 3 months–17 years: 150 micrograms/kg every 6 hours (max. per dose 10 mg) for 4 days

Life-threatening cerebral oedema

- BY INTRAVENOUS INJECTION
- Child (body-weight up to 35 kg): Initially 16.7 mg, then 3.3 mg every 3 hours for 3 days, then 3.3 mg every 6 hours for 1 day, then 1.7 mg every 6 hours for 4 days, then reduced in steps of 0.8 mg daily
- Child (body-weight 35 kg and above): Initially 20.8 mg, then 3.3 mg every 2 hours for 3 days, then 3.3 mg every 4 hours for 1 day, then 3.3 mg every 6 hours for 4 days, then reduced in steps of 1.7 mg daily

● UNLICENSED USE

- With intravenous use Consult product literature; not licensed for use in bacterial meningitis.

● INTERACTIONS → Appendix 1: corticosteroids

● SIDE-EFFECTS

- With intravenous use Hypotension · perineal irritation (may occur following the intravenous injection of large doses of the phosphate ester)
- With oral use Exophthalmos · hiccups · hyperglycaemia · hypotension · malaise · protein catabolism

● PREGNANCY Dexamethasone readily crosses the placenta.

● DIRECTIONS FOR ADMINISTRATION

- With oral use For administration by *mouth* tablets may be dispersed in water or injection solution given by mouth.
- With intravenous use For *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.

● PRESCRIBING AND DISPENSING INFORMATION

Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for dexamethasone tablet, oral solution and injection (steroid card).

Fludrocortisone acetate

21-Dec-2017

● INDICATIONS AND DOSE

Mineralocorticoid replacement in adrenocortical insufficiency

▶ BY MOUTH

- ▶ Neonate: Initially 50 micrograms once daily, adjusted according to response; usual dose 50–200 micrograms once daily, higher doses may be required, dose adjustment may be required if salt supplements are administered.
- ▶ Child: Initially 50–100 micrograms once daily; maintenance 50–300 micrograms once daily, adjusted according to response, dose adjustment may be required if salt supplements are administered

● INTERACTIONS → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Conjunctivitis · exophthalmos · fatigue · idiopathic intracranial hypertension · muscle atrophy · muscle weakness · petechiae

● HEPATIC IMPAIRMENT

Monitoring Monitor patient closely in hepatic impairment.

● PATIENT AND CARER ADVICE

Hydrocortisone

21-Dec-2017

● INDICATIONS AND DOSE

Acute adrenocortical insufficiency (Addisonian crisis)

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

- ▶ Neonate: Initially 10 mg, then (by continuous intravenous infusion) 100 mg/m² daily, alternatively (by intravenous infusion) 100 mg/m² daily in divided doses, to be given every 6–8 hours; adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose.

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Child 1 month–11 years: Initially 2–4 mg/kg, then 2–4 mg/kg every 6 hours, adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose
- ▶ Child 12–17 years: 100 mg every 6–8 hours

Congenital adrenal hyperplasia

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Neonate: 9–15 mg/m² in 3 divided doses, adjusted according to response.
- ▶ Child: 9–15 mg/m² in 3 divided doses, adjusted according to response

Adrenal hypoplasia | Addison's disease, chronic maintenance or replacement therapy

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Neonate: 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed.

- ▶ Child: 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed

Inflammatory bowel disease—induction of remission

▶ BY INTRAVENOUS INJECTION

- ▶ Child 2–17 years: 2.5 mg/kg every 6 hours (max. per dose 100 mg)

▶ BY CONTINUOUS INTRAVENOUS INFUSION

- ▶ Child 2–17 years: 10 mg/kg daily; maximum 400 mg per day

Ulcerative colitis | Proctitis | Proctosigmoiditis

▶ BY RECTUM USING RECTAL FOAM

- ▶ Child 2–17 years: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

Acute hypersensitivity reactions | Angioedema

▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response
- ▶ Child 6 months–5 years: Initially 50 mg 3 times a day, adjusted according to response
- ▶ Child 6–11 years: Initially 100 mg 3 times a day, adjusted according to response
- ▶ Child 12–17 years: Initially 200 mg 3 times a day, adjusted according to response

Hypotension resistant to inotropic treatment and volume replacement (limited evidence)

▶ BY INTRAVENOUS INJECTION

- ▶ Neonate: Initially 2.5 mg/kg, then 2.5 mg/kg after 4 hours if required, followed by 2.5 mg/kg every 6 hours for 48 hours or until blood pressure recovers, dose to then be reduced gradually over at least 48 hours.

- ▶ Child: 1 mg/kg every 6 hours (max. per dose 100 mg)

Severe acute asthma | Life-threatening acute asthma

▶ BY INTRAVENOUS INJECTION

- ▶ Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 5–11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 12–17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

- **UNLICENSED USE** Use of injection by mouth is unlicensed.

● CONTRA-INDICATIONS

- ▶ With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● CAUTIONS

- ▶ With rectal use Systemic absorption may occur

- **INTERACTIONS** → Appendix 1: corticosteroids

• SIDE-EFFECTS**► Uncommon**

- With rectal use Skin discolouration
- Frequency not known
- With oral use Dyslipidaemia · fatigue · hypotension · malaise
- With parenteral use Exophthalmos · hiccups · Kaposi's sarcoma · lipomatosis · malaise

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.
- With oral use For administration by mouth, injection solution may be swallowed [unlicensed use] but consider phosphate content.

- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of hydrocortisone is required, the following strength is used: 5 mg/5 mL.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for hydrocortisone tablets and injections (steroid card).

• LESS SUITABLE FOR PRESCRIBING

- With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

• EXCEPTIONS TO LEGAL CATEGORY

- With intramuscular use or intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

- BY DEEP INTRAMUSCULAR INJECTION
- Child: Seek specialist advice, to be injected into the gluteal muscle

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: METHYLPREDNISOLONE INJECTABLE MEDICINE CONTAINING LACTOSE (SOLU-MEDRONE® 40 MG): DO NOT USE IN PATIENTS WITH COWS' MILK ALLERGY (OCTOBER 2017)

An EU-wide review has concluded that *Solu-Medrone®* 40 mg may contain trace amounts of milk proteins and should not be used in patients with a known or suspected allergy to cows' milk. Serious allergic reactions, including bronchospasm and anaphylaxis, have been reported in patients allergic to cows' milk proteins. If a patient's symptoms worsen or new allergic symptoms occur, administration should be stopped and the patient treated accordingly.

Prednisolone

21-Dec-2017

• INDICATIONS AND DOSE

Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)

► BY MOUTH

► Child: 1–2 mg/kg

Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)

► BY MOUTH

► Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

Mild to moderate acute asthma | Severe or life-threatening acute asthma

► BY MOUTH

► Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary

► Child 12–17 years: 40–50 mg daily for at least 5 days

Autoimmune inflammatory disorders (including juvenile idiopathic arthritis, connective tissue disorders and systemic lupus erythematosus)

► BY MOUTH

► Child: Initially 1–2 mg/kg once daily, to be reduced after a few days if appropriate; maximum 60 mg per day

Autoimmune hepatitis

► BY MOUTH

► Child: Initially 2 mg/kg once daily, to then be reduced to minimum effective dose; maximum 40 mg per day

Corticosteroid replacement therapy

► BY MOUTH

► Child 12–17 years: 2–2.5 mg/m² daily in 1–2 divided doses, adjusted according to response

Infantile spasms

► BY MOUTH

► Child 1 month–1 year: Initially 10 mg 4 times a day for 14 days; increased to 20 mg 3 times a day for 7 days if

seizures not controlled after initial 7 days, reduce dose gradually over 15 days until stopped

Infantile spasms (dose reduction in patient taking 40 mg daily)

► BY MOUTH

► Child 1 month–1 year: Reduced in steps of 10 mg every 5 days, then stop

Infantile spasms (dose reduction in patient taking 60 mg daily)

► BY MOUTH

► Child 1 month–1 year: Reduced to 40 mg daily for 5 days, then reduced to 20 mg daily for 5 days, then reduced to 10 mg daily for 5 days and then stop

Idiopathic thrombocytopenic purpura

► BY MOUTH

► Child 1–9 years: 1–2 mg/kg daily for maximum of 14 days, alternatively 4 mg/kg daily for a maximum of 4 days

Nephrotic syndrome

► BY MOUTH

► Child: Initially 60 mg/m² once daily for 4–6 weeks until proteinuria ceases, then reduced to 40 mg/m² once daily on alternate days for 4–6 weeks, then withdraw by reducing dose gradually; maximum 80 mg per day

Nephrotic syndrome (prevention of relapse)

► BY MOUTH

► Child: 0.5–1 mg/kg once daily or on alternate days for 3–6 months

Ulcerative colitis | Crohn's disease

► BY MOUTH

► Child 2–17 years: 2 mg/kg once daily (max. per dose 60 mg) until remission occurs, followed by reducing doses

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection

► BY MOUTH

► Child: 2 mg/kg daily for 5 days, the dose is then reduced over the next 16 days and then stopped, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards, the corticosteroid should be withdrawn before anti-pneumocystis treatment is complete; maximum 80 mg per day

Proctitis

► BY RECTUM USING RECTAL FOAM

► Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

► BY RECTUM USING SUPPOSITORIES

► Child 2–17 years: 5 mg twice daily, to be inserted into the rectum morning and night, after a bowel movement

Distal ulcerative colitis

► BY RECTUM USING RECTAL FOAM

► Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn's disease

► BY RECTUM USING SUPPOSITORIES

► Child 2–17 years: 5 mg twice daily, to be inserted into the rectum morning and night, after a bowel movement

- **UNLICENSED USE** Prednisolone rectal foam not licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Prednisolone has been confused with propranolol; care must be taken to ensure the correct drug is prescribed and dispensed.

● CONTRA-INDICATIONS

- ▶ With rectal use Bowel perforation • extensive fistulas • intestinal obstruction • recent intestinal anastomoses

● CAUTIONS

- ▶ With rectal use systemic absorption may occur with rectal preparations
- ▶ With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

● INTERACTIONS → Appendix 1: corticosteroids

● SIDE-EFFECTS

- ▶ With oral use Diarrhoea • dizziness • dyslipidaemia • exophthalmos • fatigue • lipomatosis • malaise • protein catabolism

● PREGNANCY

As it crosses the placenta 88% of prednisolone is inactivated.

Monitoring ▶ With systemic use Pregnant women with fluid retention should be monitored closely.

● BREAST FEEDING

Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

Monitoring ▶ With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

● PATIENT AND CARER ADVICE

Patient counselling is advised for prednisolone tablets (steroid card).
Medicines for Children leaflet: Prednisolone (oral) for nephrotic syndrome www.medicinesforchildren.org.uk/prednisolone-oral-nephrotic-syndrome

Medicines for Children leaflet: Prednisolone for asthma www.medicinesforchildren.org.uk/prednisolone-asthma

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, enema

- Prednisolone sodium phosphate 200 microgram per 1 ml Predsol 20mg/100ml retention enema | 7 enema [PoM] £7.50 DT = £7.50

2.1 Cushing's syndrome and disease

Cushing's Syndrome

Management

Most types of *Cushing's syndrome* are treated surgically. Metyrapone p. 444 may be useful to control the symptoms of the disease or to prepare the child for surgery. The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole p. 444 may have a direct effect on corticotropic tumour cells in patients with Cushing's disease. It is used under specialist supervision in children over 12 years for treatment of endogenous Cushing's syndrome.

ENZYME INHIBITORS

Ketoconazole

20-Jul-2017

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17α -hydroxylase, 11α -hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease.

● INDICATIONS AND DOSE

Endogenous Cushing's syndrome (specialist use only)

► BY MOUTH

- Child 12-17 years: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

- **CONTRA-INDICATIONS** Acquired QTc prolongation · Acute porphyrias p. 603 · avoid concomitant use of hepatotoxic drugs · congenital QTc prolongation

- **CAUTIONS** Risk of adrenal insufficiency

- **INTERACTIONS** → Appendix 1: antifungals, azoles

● SIDE-EFFECTS

- **Common or very common** Adrenal insufficiency · diarrhoea · gastrointestinal discomfort · nausea · skin reactions · vomiting
- **Uncommon** Allergic conditions · alopecia · angioedema · asthenia · dizziness · drowsiness · headache · thrombocytopenia
- **Rare or very rare** Fever · hepatic disorders · taste altered
- **Frequency not known** Alcohol intolerance · appetite abnormal · arthralgia · azoospermia · dry mouth · epistaxis · flatulence · fontanelle bulging · gynecomastia · hot flush · insomnia · intracranial pressure increased · malaise · menstrual disorder · myalgia · nervousness · papilloedema · paraesthesia · peripheral oedema · photophobia · photosensitivity reaction · tongue discoloration

SIDE-EFFECTS, FURTHER INFORMATION Potentially life-threatening hepatotoxicity reported rarely with oral use.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.

- **HEPATIC IMPAIRMENT** Avoid in acute or chronic impairment. Do not initiate treatment if liver enzymes greater than 2 times the normal upper limit.

● MONITORING REQUIREMENTS

- Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
- Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed

thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.

- **Hepatotoxicity** Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.

- **PATIENT AND CARER ADVICE** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop.

Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

Driving and skilled tasks Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

► Ketoconazole (non-proprietary) ▼

Ketoconazole 200 mg Ketoconazole 200mg tablets | 60 tablet [PoM] £480.00

Metyrapone

- **DRUG ACTION** Metyrapone is a competitive inhibitor of 11β -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

● INDICATIONS AND DOSE

Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)

► BY MOUTH

- Child: 15 mg/kg every 4 hours for 6 doses, alternatively 300 mg/m² every 4 hours for 6 doses; usual dose 250–750 mg every 4 hours

Management of Cushing's syndrome (specialist supervision in hospital)

► BY MOUTH

- Child: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

- **CONTRA-INDICATIONS** Adrenocortical insufficiency

- **CAUTIONS** Avoid in Acute porphyrias p. 603 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)

- **INTERACTIONS** → Appendix 1: metyrapone

● SIDE-EFFECTS

- **Common or very common** Dizziness · headache · hypotension · nausea · sedation · vomiting
- **Rare or very rare** Abdominal pain · adrenal insufficiency · allergic dermatitis · hirsutism
- **Frequency not known** Alopecia · bone marrow failure · hypertension

- **PREGNANCY** Avoid (may impair biosynthesis of fetal-placental steroids).

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution in hepatic impairment (delayed response).
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

3 Diabetes mellitus and hypoglycaemia

3.1 Diabetes mellitus

Diabetes

05-Jun-2017

Description of condition

Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads to the abnormalities of carbohydrate, fat and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes mellitus below and Type 2 diabetes mellitus p. 448 are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrine disease). Treatment with endocrine, antiviral or antipsychotic drugs may also cause secondary diabetes. In children, conditions such as cystic fibrosis can lead to diabetes; monogenic diabetes (previously known as maturity onset diabetes in the young) can also occur due to a single gene defect.

Driving

Information on the requirements for driving vehicles by young people receiving treatment for diabetes is available in the BNF or from the DVLA at www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive.

Alcohol

Adolescents and their carers should be made aware that alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; (note: specialist sources recommend that **adult** patients with diabetes should drink alcohol only in moderation, and when accompanied by food).

Oral glucose tolerance tests

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is **not** recommended or necessary for routine diagnostic use of diabetes when severe symptoms of hyperglycaemia are present. In children who have less severe symptoms and blood-glucose levels that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It may be useful for diagnosis of monogenic diabetes or cystic fibrosis related diabetes, and is used to establish the presence of gestational diabetes.

An oral glucose tolerance test involves measuring the blood-glucose concentration after fasting, and then 2 hours after drinking a standard anhydrous glucose drink. Anhydrous glucose may alternatively be given as the

appropriate amount of *Polycal*® or as *Rapilose*® OGTT oral solution.

HbA1c measurement

Glycated haemoglobin (HbA1c) forms when red blood cells are exposed to glucose in the plasma. The HbA1c test reflects average plasma glucose over the previous 2 to 3 months and provides a good indicator of glycaemic control. Unlike the oral glucose tolerance test, an HbA1c test can be performed at any time of the day and does not require any special preparation such as fasting.

HbA1c values are expressed in *mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol)*, a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values	
IFCC-HbA1c (mmol/mol)	DCCT-HbA1c (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
69	8.5
75	9.0

The HbA1c test is used for monitoring glycaemic control in both Type 1 diabetes and Type 2 diabetes in children, and for diagnosis of Type 2 diabetes in adults. [EvGr] HbA1c should not be used to diagnose diabetes in children. ⚠

HbA1c is also a reliable predictor of microvascular and macrovascular complications and mortality. Lower HbA1c is associated with a lower risk of long term vascular complications, and children and their carers should be supported to aim for an individualised HbA1c target (see Type 1 diabetes below and Type 2 diabetes p. 448). [EvGr] HbA1c should usually be measured in children with type 1 and type 2 diabetes every 3 months; and more frequently in children with type 1 diabetes if blood-glucose is poorly controlled. ⚠

HbA1c monitoring is invalid in children with disturbed erythrocyte turnover or in children with a lack of, or abnormal haemoglobin (for example, any anaemia, a recent blood transfusion, or an altered red cell lifespan). In these cases, quality-controlled plasma glucose profiles, total glycated haemoglobin estimation (if there is abnormal haemoglobin), or fructosamine estimation can be used.

Laboratory measurement of fructosamine concentration measures the glycated fraction of all plasma proteins over the previous 14 to 21 days but is a less accurate measure of glycaemic control than HbA1c.

Type 1 diabetes

05-Jun-2017

Description of condition

Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood.

Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the

resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, premature cardiovascular disease, and peripheral artery disease.

Typical features in children presenting with type 1 diabetes are hyperglycaemia, polyuria, polydipsia, weight loss, and excessive tiredness.

Aims of treatment

Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications. Disability from complications can often be prevented by early detection and active management of the disease (Diabetic complications p. 449).

EvGr The target for glycaemic control should be individualised for each child, considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, and history of hypoglycaemia. Tighter control of blood-glucose is now recommended for children with type 1 diabetes and treatment should attempt to reach near normal HbA1c and blood-glucose concentration. A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is recommended in children to minimise the risk of long-term complications. The optimal plasma glucose targets for children are:

- fasting blood-glucose concentration of 4–7 mmol/litre on waking;
- a blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- a blood-glucose concentration of 5–9 mmol/litre after meals;
- a blood-glucose concentration of at least 5 mmol/litre in young people when driving. **⚠**

Overview

EvGr Type 1 diabetes requires insulin replacement, supported when necessary by active management of other associated cardiovascular risk factors such as hypertension. Tight glycaemic control may be achieved by intensive insulin management (multiple daily injections or insulin pump therapy) from diagnosis, accompanied by carbohydrate counting.

The effectiveness of metformin in combination with insulin is not yet known in children, and so should not be used; other oral antidiabetic drugs should not be used in combination with insulin as their use may increase the risk of hypoglycaemia.

Dietary control is important in both type 1 and type 2 diabetes and children (with their families) should be encouraged to develop good knowledge of nutrition and how it affects their diabetes and insulin requirements. Healthy eating, regular exercise, and control of body-weight can reduce cardiovascular risk and help improve glycaemic control.

Children with type 1 diabetes over the age of 6 months should receive immunisation against influenza and pneumococcal infection (in children treated with antidiabetic drugs)—see Vaccines p. 777. **⚠**

Management of type 1 diabetes with insulin

EvGr All children with type 1 diabetes require insulin therapy (see also Insulin p. 447). Treatment should be initiated and managed by clinicians with relevant expertise; there are three basic types of insulin regimen, although each regimen should be individualised.

Children should also be offered carbohydrate-counting training as part of a structured education programme. **⚠**

Multiple daily injection basal-bolus insulin regimens

One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside multiple bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

Mixed (biphasic) regimen

One, two, or three insulin injections per day of short-acting insulin mixed with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

Continuous subcutaneous insulin infusion (insulin pump)

A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

Recommended insulin regimens

EvGr Children should be offered multiple daily injection basal-bolus regimens initiated at diagnosis, considering personal and family circumstances, and personal preferences. Children and their carers should be encouraged to adjust the insulin dose as appropriate after each blood-glucose measurement, and to inject rapid-acting insulin analogues before eating (rather than after eating); this reduces blood-glucose concentrations after meals and helps to optimise blood-glucose control.

If a multiple daily injection basal-bolus insulin regimen is unsuitable, or the child does not have optimal blood-glucose control, it may be necessary to offer an alternative insulin regimen (either continuous subcutaneous insulin infusion or once-, twice- or three-times daily mixed injections) as well as additional support (such as increased contact with their specialist diabetes team).

Continuous subcutaneous insulin infusion (or insulin pump) therapy may be considered under the care of a specialist team. It should only be offered to children over 12 years who suffer disabling hypoglycaemia, or, who have high HbA1c concentrations (69 mmol/mol [8.5%] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Children under 12 years may be offered insulin pump therapy if a multiple daily injection regimen is impractical or inappropriate, but they should undergo a trial of a multiple dose injection regimen between the ages of 12 and 18 years.

If the chosen regimen is a twice daily injection regimen, the insulin dose should be adjusted according to the general trend in pre-meal, bedtime and occasional night-time blood-glucose concentration. **⚠**

Insulin requirements

EvGr The dosage of insulin must be determined individually for each child and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations.

Prescribers and patients should be aware that initiation of insulin may be followed by a **temporary** partial remission phase or 'honeymoon period' when lower doses of insulin are required than are subsequently necessary to maintain glycaemic control with an HbA1c concentration of less than 48 mmol/mol (6.5%). **⚠**

EvGr Insulin doses should be reviewed after puberty (around 1 year after menarche or after the growth spurt in boys) as insulin resistance falls after puberty, and maintenance of pubertal doses may increase the risk for excessive weight gain. **⚠**

EvGr Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet and exercise), psychological issues, and organic causes such as

renal disease, thyroid disorders, coeliac disease, Addison's disease or gastroparesis. A review of the child's injection sites should be offered at each clinic visit. **⚠**

Infection, stress, accidental or surgical trauma, and puberty may all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, and in certain endocrine disorders, such as anterior pituitary or adrenocortical insufficiency and hypothyroidism.

EvGr Rapid-acting insulin analogues should be supplied for use during intercurrent illness and episodes of hyperglycaemia. **⚠**

Risks of hypoglycaemia with insulin

EvGr Hypoglycaemia is an inevitable adverse effect of insulin treatment, and children and their carers should be advised of the warning signs and actions to take (for guidance on management, see Hypoglycaemia p. 465). **⚠**

Impaired awareness of hypoglycaemia can occur, when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present. **EvGr** Awareness of hypoglycaemia should be discussed and assessed with the child and their carer approximately every 3 months. **⚠**

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the child. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor.

Loss of warning of hypoglycaemia among insulin-treated children can be a serious hazard, especially for adolescents who are drivers, cyclists, or in dangerous occupations. Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see *Driving*, under Diabetes p. 445).

EvGr To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous glucose monitoring should be considered. **⚠**

EvGr Children and their carers should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. If recurrent severe episodes of hypoglycaemia continue despite appropriate interventions, the child should be referred to a specialist centre. **⚠**

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

Hypodermic equipment

EvGr Children and their carers should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers. Arrangements should be made for the suitable disposal of these containers. **⚠**

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/Services/2034.htm
- Scottish Drug Tariff:

Insulin

05-Jun-2017

Overview

For recommended insulin regimens see Type 1 diabetes p. 445 and Type 2 diabetes p. 448.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins.

Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs).

Absorption from a limb site can vary considerably (by as much as 20–40%) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood flow around the injection site due to exercise can also increase insulin absorption.

EvGr Lipohypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered. Lipohypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipohypertrophy before administration. **⚠**

Insulin preparations

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Short-acting insulins

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble Insulin p. 447 (human and, bovine or porcine—both rarely used), and the rapid-acting insulin analogues (insulin aspart p. 455, insulin glulisine p. 456 and insulin lispro p. 456).

Soluble insulin

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimens, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours.

When injected intravenously, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. Diabetic ketoacidosis p. 449 and peri-operatively.

Rapid-acting insulin

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection.

[EvGr] For maintenance regimens, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA1c, and reduction in the incidence of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of *post-meal* injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial-glucose concentration, and subsequent hypoglycaemia. **[A]**

Intermediate-acting insulin

Intermediate-acting insulins (isophane insulin p. 457) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of approximately 1–2 hours, a maximal effect at 3–12 hours, and a duration of action of 11–24 hours.

Isophane insulin is a suspension of insulin with protamine; it may be given as one or more daily injections alongside separate meal-time short-acting insulin injections, or mixed with a short-acting (soluble or rapid-acting) insulin in the same syringe—for recommended insulin regimens see Type 1 diabetes p. 445 and Type 2 diabetes below. Isophane insulin may be mixed with a short-acting insulin by the patient, or a pre-mixed biphasic insulin can be supplied (biphasic isophane insulin p. 457, biphasic insulin aspart p. 458 and biphasic insulin lispro p. 458).

Biphasic insulins (biphasic isophane insulin, biphasic insulin aspart, biphasic insulin lispro) are pre-mixed insulin preparations containing various combinations of short-acting insulin (soluble insulin or rapid-acting analogue insulin) and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 15% to 50%. These preparations should be administered by subcutaneous injection immediately before a meal.

Long-acting insulin

Like intermediate-acting insulins, the long-acting insulins (protamine zinc insulin p. 460, insulin zinc suspension p. 459, insulin detemir p. 459, insulin glargine p. 459, insulin degludec p. 458) mimic endogenous basal insulin secretion, but their duration of action may last up to 36 hours. They achieve a steady-state level after 2–4 days to produce a constant level of insulin.

Insulin glargine and insulin degludec are given once daily and insulin detemir is given once or twice daily according to individual requirements. The older long-acting insulins, (insulin zinc suspension and protamine zinc insulin) are now rarely prescribed.

Type 2 diabetes

05-Jun-2017

Description of condition

Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic insulin production also occurs progressively over time, resulting in hyperglycaemia.

Type 2 diabetes in children is associated with increased body-weight, increased risk of renal complications, hypertension, and dyslipidaemia; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

Aims of treatment

Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effective blood-glucose control and maintenance of HbA1c at or below the target value set for each individual child.

Overview

[EvGr] Lifestyle modifications (including weight loss, smoking cessation and regular exercise) can help to reduce hyperglycaemia and reduce cardiovascular risk and should be encouraged where appropriate. Children and their carers should also receive advice from a paediatric dietitian to help optimise body-weight and blood-glucose control.

Lifestyle modifications alone are often unsuccessful at achieving glycaemic control in children, therefore antidiabetic drugs should be offered and initiated alongside lifestyle interventions such as diet and exercise, from the time of diagnosis.

Children with type 2 diabetes should receive immunisation against influenza (over the age of 6 months) and pneumococcal infection—see Vaccines p. 777. **[A]**

Antidiabetic drugs

In children, type 2 diabetes does not usually occur until adolescence and information on the use of oral antidiabetic drugs in children is limited. For recommended treatment regimens and the place in therapy of each drug, see *Treatment of type 2 diabetes*.

[EvGr] Treatment with antidiabetic drugs should be initiated under specialist supervision **only**. **[E]**

Metformin hydrochloride p. 452 is the only oral antidiabetic drug licensed for use in children. It has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. Metformin hydrochloride does not stimulate insulin secretion and therefore, when given alone, does not cause hypoglycaemia.

[EvGr] The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastrointestinal side-effects. **⚠**

There is little experience of the use of other non-insulin antidiabetic drugs in children, with most evidence extrapolated from adult studies.

Several **sulfonylureas** (such as gliclazide p. 453, glibenclamide p. 453 and tolbutamide p. 453) are available but experience in children is limited; they are not the recommended choice of treatment in children; therefore treatment should be initiated by a specialist. The sulfonylureas may cause hypoglycaemia which may be more common in children than in adults. Hypoglycaemia is more likely with long-acting sulfonylureas such as glibenclamide, which has been associated with severe, prolonged and sometimes fatal cases—for this reason sulfonylureas are usually avoided in children.

Treatment of type 2 diabetes

[EvGr] A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is ideal to minimise the risk of long-term complications, however an individualised lowest achievable target should be agreed with each child and their carers taking into account factors such as daily activities, individual life goals, complications, and comorbidities. HbA1c concentrations should be monitored every 3 months.

Note: Consider relaxing the target HbA1c level on a case-by-case basis, with particular consideration for children where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

Standard-release metformin hydrochloride is the first-line choice for initial treatment in children and should be offered from diagnosis, alongside nutrition and lifestyle advice.

If the combination of lifestyle changes and metformin hydrochloride fails to reduce HbA1c to the agreed target within 3 to 4 months of therapy, addition of a long-acting insulin or once-daily human isophane insulin p. 457 should be considered (see also, Insulin p. 447). **⚠**

[EvGr] Initiation of insulin should be under specialist care. **⚠**

[EvGr] Metformin hydrochloride should be continued alongside insulin, to improve insulin sensitivity. The combination of metformin hydrochloride and once-daily insulin is usually an effective treatment for maintaining glycaemic control in the majority of children for extended periods of time.

If the combination of basal insulin and metformin does not achieve the HbA1c target (and postprandial hyperglycaemia persists) addition of prandial rapid- or short-acting insulin should be initiated and titrated until the target HbA1c is met. **⚠** Weight gain may occur and can be particularly problematic in children with type 2 diabetes when insulin therapy is initiated, unless there is careful attention and adherence to dietary measures. **[EvGr]** The importance of diet and exercise should be emphasised. **⚠**

Useful Resources

Diabetes (type and type 2) in children and young people: diagnosis and management. National Institute for Health and Care Excellence. Clinical guideline NG18. August 2015 www.nice.org.uk/guidance/ng18.

Diabetic complications

See also

Diabetes p. 445

Type 1 diabetes p. 445

Type 2 diabetes p. 448

Diabetes and cardiovascular disease

Diabetes is a strong risk factor for cardiovascular disease later in life. Other risk factors for cardiovascular disease (smoking, hypertension, obesity and hyperlipidaemia) should be addressed. The use of an ACE inhibitor and of a lipid-regulating drug can be beneficial in children with diabetes and a high cardiovascular disease risk. (ACE inhibitors may also have a role in the management of diabetic nephropathy).

Diabetic nephropathy

Regular review of diabetic children over 12 years of age should include an annual test for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Micral-Test II*[®] or *Microalbumintest*[™]) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Microalbuminuria can occur transiently during puberty; if it persists (at least 3 positive tests) treatment with an ACE inhibitor or an angiotensin-II receptor antagonist under specialist guidance should be considered; to minimise the risk of renal deterioration, blood pressure should be carefully controlled.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in children with renal impairment.

See also treatment of hypertension in diabetes.

Diabetic neuropathy

Clinical neuropathy is rare in children whose diabetes is well controlled.

Diabetic ketoacidosis

Management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis, published by the British Society of Paediatric Endocrinology and Diabetes, (available at www.bspegd.org.uk) should be followed. Clinically well children with mild ketoacidosis who are dehydrated up to 5% usually respond to oral rehydration and subcutaneous insulin. For those who do not respond, or are clinically unwell, or are dehydrated by more than 5%, insulin and replacement fluids are best given by intravenous infusion.

- To restore circulating volume for children in *shock*, give 10 mL/kg **sodium chloride 0.9%** as a rapid infusion, repeat as necessary up to a maximum of 30 mL/kg.
- Further fluid should be given by intravenous infusion at a rate that replaces deficit and provides maintenance over 48 hours; initially use **sodium chloride 0.9%**, changing to **sodium chloride 0.45%** and **glucose 5%** after 12 hours if response is adequate and plasma-sodium concentration is stable.
- Include **potassium chloride** in the fluids unless anuria is suspected, adjust according to plasma-potassium concentration.
- Insulin infusion is necessary to switch off ketogenesis and reverse acidosis; it should not be started until at least 1 hour after the start of intravenous rehydration fluids.
- **Soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL and infused at a rate of 0.1 units/kg/hour.
- **Sodium bicarbonate** infusion (1.26% or 2.74%) is rarely necessary and is used only in cases of extreme acidosis (blood pH less than 6.9) and shock, since the acid-base disturbance is normally corrected by treatment with insulin.

- Once blood glucose falls to 14 mmol/litre, **glucose intravenous infusion 5% or 10%** should be added to the fluids.
- The insulin infusion rate can be reduced to no less than 0.05 units/kg/hour when blood-glucose concentration has fallen to 14 mmol/litre and blood pH is greater than 7.3 and a glucose infusion has been started; it is continued until the child is ready to take food by mouth. Subcutaneous insulin can then be started.
- The insulin infusion should not be stopped until 1 hour after starting subcutaneous soluble or long acting insulin, or 10 minutes after starting subcutaneous insulin aspart p. 455, or insulin glulisine p. 456, or insulin lispro p. 456.

Hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma occurs rarely in children. Treatment is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion and slower rehydration may be required.

Diabetes, surgery and medical illness

05-Jun-2017

Management of diabetes during surgery

[EvGr] Children with diabetes should undergo surgery in centres with facilities and expertise for the care of children with diabetes. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these children. All surgery requiring general anaesthesia in children with type 1 and type 2 diabetes requires hospital admission. **[A]**

Note: The following recommendations provide general guidance for the management of diabetes during surgery.

Local protocols and guidelines should be referred to where they exist.

Use of insulin during surgery

Elective surgery—minor procedures

[EvGr] **Minor procedures** (procedures of less than 2 hours requiring either general anaesthesia or heavy sedation) in children who have type 1 or type 2 diabetes should not have a major impact on glycaemic control, and a slight modification of the usual regimen may be all that is necessary—adjustments should be made following local protocol; taking into consideration the type of insulin or antidiabetic drugs the child usually takes, whether fasting is required, the time of day of the operation, and requirement for intravenous fluids and glucose. All children who are usually prescribed insulin require intravenous insulin during surgery, to avoid ketoacidosis. **[A]**

Elective surgery—major procedures

[EvGr] **Major procedures** (procedures requiring general anaesthesia for more than 2 hours) in children who have type 1 or type 2 diabetes, should ideally be performed when diabetes is under optimal control. If glycaemic control is poor, the procedure should be delayed if possible; otherwise it is advisable to admit the child well in advance of surgery for stabilisation of glycaemic control.

Blood-glucose concentration should be maintained within the usual target range of 5–10 mmol/litre throughout the peri-operative period for all surgical procedures.

Children usually prescribed insulin for type 1 or type 2 diabetes require an intravenous insulin infusion p. 454 during surgery (even if fasting) to avoid ketoacidosis. Detailed local protocols should be consulted. In general, the following steps should be followed:

- on the *evening before surgery*, the usual insulin regimen should be given as normal; the usual bedtime snack should be given and hourly capillary blood-glucose monitoring should be initiated to detect hypoglycaemia or hyperglycaemia before the procedure. Ketones should also

be checked if blood-glucose is above 14 mmol/litre, and an appropriate dose of short-acting insulin should be administered to restore blood-glucose to the target range;

- on the *morning of surgery* the **usual** insulin dose should be omitted;
- at least 2 hours *before the procedure*, a maintenance fluid infusion of sodium chloride 0.45 % and glucose 5 % (sodium chloride with glucose) intravenous infusion should be started. A switch to sodium chloride 0.9 % infusion may be required if sodium concentration falls and there is risk of hyponatraemia. After surgery, potassium chloride p. 601 should be added to the intravenous fluid, according to the child's body weight and fluid requirements. Electrolytes must be measured frequently throughout, and adjustments to the infusion made as necessary;
- soluble human insulin 1 unit/mL in sodium chloride 0.9 % intravenous infusion should be started with the maintenance fluids at an infusion rate appropriate to the blood-glucose concentration, to maintain a concentration between 5 and 10 mmol/litre, adjusted according to hourly blood-glucose monitoring;
- if the blood-glucose concentration falls below 6 mmol/litre the insulin infusion should **not** be stopped as this will cause rebound hyperglycaemia; instead the rate should be reduced; however, if blood-glucose concentration drops below 4 mmol/litre the insulin infusion can be stopped temporarily for 10–15 minutes. **[A]**

[EvGr] After surgery, continue the glucose infusion, and the intravenous insulin infusion or additional short-acting insulin as necessary, until the child can eat and drink normally and their usual treatment regimen can resume. A short-acting insulin can also be given if required to reduce hyperglycaemia. **[A]**

Emergency surgery

[EvGr] Children with diabetes (type 1 and 2) requiring emergency surgery, should always have their blood-glucose, blood or urinary ketone concentration, and serum electrolytes checked before surgery. If ketones are high, blood gases should also be checked. If ketoacidosis is present, recommendations for Diabetic ketoacidosis p. 449 should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for *major elective surgery* (above). **[A]**

Use of antidiabetic drugs during surgery

[EvGr] If elective *minor surgical procedures* only require a short-fasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue.

Children who usually take **sulfonylureas** should have their medication stopped on the day of surgery. **[A]**

[EvGr] **Sulfonylureas** are associated with hypoglycaemia in the fasted state and therefore should not be recommenced until the child is eating and drinking normally. **[E]**

[EvGr] Children undergoing *minor procedures* require hourly blood-glucose monitoring and, if blood-glucose concentration rises above 10 mmol/litre, should be treated with subcutaneous rapid-acting insulin no more frequently than every 3 hours.

Children undergoing a *major surgical* procedure expected to last at least 2 hours should be managed on an intravenous insulin infusion following the recommendations for *Elective surgery* (above). **[A]**

[EvGr] Insulin is almost always required in medical and surgical emergencies. **[E]**

[EvGr] **Metformin hydrochloride p. 452** is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. In children undergoing *major surgery* lasting more than 2 hours, metformin hydrochloride

should be discontinued 24 hours before the procedure. Children having minor surgery lasting less than 2 hours may stop their metformin on the day of surgery. Metformin hydrochloride should not be restarted until at least 48 hours after surgery or after the child is eating again, and only once normal renal function has been established. \blacktriangle

The manufacturer advises that metformin should also be omitted if contrast medium is administered during surgery to reduce the risk of contrast-induced nephropathy. It should be stopped prior to, or at the time of the test, and not to be restarted until 48 hours afterwards, and only once normal renal function has been established.

Use of antidiabetic drugs during medical illness

Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during intercurrent illness when the drug is unlikely to control hyperglycaemia (such as coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Diabetes, pregnancy and breast-feeding

01-Aug-2017

Description of condition

Diabetes in pregnancy is associated with increased risks to the young woman (such as pre-eclampsia and rapidly worsening retinopathy), and to the developing fetus, compared with pregnancy in non-diabetic young women. Effective blood-glucose control before conception and throughout pregnancy reduces (but does not eliminate) the risk of adverse outcomes such as miscarriage, congenital malformation, stillbirth, and neonatal death.

Management of pre-existing diabetes

[EvGr] Young women with pre-existing diabetes who are planning on becoming pregnant should aim to keep their HbA1c level below 48 mmol/mol (6.5%) if possible without causing problematic hypoglycaemia. Any reduction towards this target is likely to reduce the risk of congenital malformations in the newborn.

Young women with pre-existing diabetes who are planning to become pregnant should be advised to take folic acid at the dose for young women who are at high-risk of conceiving a child with a neural tube defect, see folic acid p. 574. \blacktriangle

Overview

Oral antidiabetic drugs

[EvGr] All oral antidiabetic drugs, except metformin hydrochloride p. 452, should be discontinued before pregnancy (or as soon as an unplanned pregnancy is identified) and substituted with insulin therapy. Young women with diabetes may be treated with metformin hydrochloride [unlicensed in pregnancy] as an adjunct or alternative to insulin in the preconception period and during pregnancy, when the likely benefits from improved blood-glucose control outweigh the potential for harm. Metformin hydrochloride can be continued immediately after birth and during breast-feeding for those with pre-existing Type 2 diabetes. All other antidiabetic drugs should be avoided while breast-feeding. \blacktriangle

Insulin

Limited evidence suggests that the rapid-acting insulin analogues (insulin aspart p. 455 and insulin lispro p. 456) can be associated with fewer episodes of hypoglycaemia, a reduction in postprandial glucose excursions and an improvement in overall glycaemic control compared with regular human insulin.

[EvGr] Isophane insulin p. 457 is the first-choice for long-acting insulin during pregnancy, however in young women who have good blood-glucose control before pregnancy with the long-acting insulin analogues (insulin detemir p. 459 or insulin glargine p. 459), it may be appropriate to continue their use throughout pregnancy.

Continuous subcutaneous insulin infusion p. 454 (insulin pump therapy) may be appropriate for young women who have difficulty achieving glycaemic control with multiple daily injections of insulin without significant disabling hypoglycaemia.

All young women treated with insulin during pregnancy should be aware of the risks of hypoglycaemia, particularly in the first trimester, and should be advised to always carry a fast-acting form of glucose, such as dextrose tablets or a glucose-containing drink. Pregnant young women with Type 1 diabetes should also be prescribed glucagon p. 465 for use if needed.

Young women with pre-existing diabetes treated with insulin during pregnancy are at increased risk of hypoglycaemia in the postnatal period and should reduce their insulin immediately after birth. Blood-glucose levels should be monitored carefully to establish the appropriate dose. \blacktriangle

Medication for diabetic complications

[EvGr] Angiotensin-converting enzyme inhibitors and angiotensin-II receptor antagonists should be discontinued and replaced with an alternative antihypertensive suitable for use in pregnancy before conception or as soon as pregnancy is confirmed. Statins should not be prescribed during pregnancy and should be discontinued before a planned pregnancy. \blacktriangle

Gestational diabetes

[EvGr] Young women with gestational diabetes who have a fasting plasma glucose below 7 mmol/litre at diagnosis, should first attempt a change in diet and exercise alone in order to reduce blood-glucose. If blood-glucose targets are not met within 1 to 2 weeks, metformin hydrochloride p. 452 may be prescribed [unlicensed use]. Insulin p. 454 may be prescribed if metformin is contra-indicated or not acceptable, and may also be added to treatment if metformin is not effective alone.

Young women who have a fasting plasma glucose above 7 mmol/litre at diagnosis should be treated with insulin immediately with or without metformin hydrochloride, in addition to a change in diet and exercise.

Young women who have a fasting plasma glucose between 6 and 6.9 mmol/litre alongside complications, such as macrosomia or hydramnios, should be considered for immediate insulin treatment, with or without metformin hydrochloride.

Young women with gestational diabetes should discontinue hypoglycaemic treatment immediately after giving birth. \blacktriangle

BLOOD GLUCOSE LOWERING DRUGS > BIGUANIDES

Metformin hydrochloride

06-Jun-2017

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus [monotherapy or in combination with other antidiabetic drugs (including insulin)]

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 8–9 years (specialist use only): Initially 200 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
- Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day

- **UNLICENSED USE** Not licensed for use in children under 10 years.

- **CONTRA-INDICATIONS** Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)

- **CAUTIONS** Risk factors for lactic acidosis

CAUTIONS, FURTHER INFORMATION

- Risk factors for lactic acidosis Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.

- **INTERACTIONS** → Appendix 1: metformin

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · appetite decreased · diarrhoea (usually transient) · gastrointestinal disorder · nausea · taste altered · vomiting
- **Rare or very rare** Hepatitis · lactic acidosis (discontinue) · skin reactions · vitamin B12 absorption decreased
- SIDE-EFFECTS, FURTHER INFORMATION** Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

- **PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

- **BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.

- **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².
Dose adjustments Manufacturer advises consider dose reduction in moderate impairment.

- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be informed of the risk of lactic acidosis and told to seek immediate medical attention if symptoms such as dyspnoea, muscle cramps, abdominal pain, hypothermia, or asthenia occur.
Medicines for Children leaflet: Metformin for diabetes
www.medicinesforchildren.org.uk/metformin-diabetes

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

BLOOD GLUCOSE LOWERING DRUGS > SULFONYLUREAS

Sulfonylureas

- **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

- **CONTRA-INDICATIONS** Presence of ketoacidosis

- **CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) · G6PD deficiency

● SIDE-EFFECTS

- **Common or very common** Diarrhoea · gastrointestinal discomfort · hypoglycaemia · nausea

- **Uncommon** Hepatic disorders · vomiting

- **Rare or very rare** Agranulocytosis · erythropenia · granulocytopenia · haemolytic anaemia · leucopenia · pancytopenia · thrombocytopenia

- **Frequency not known** Allergic dermatitis (usually in the first 6–8 weeks of therapy) · constipation · visual impairment

- **HEPATIC IMPAIRMENT** Jaundice may occur.

- Dose adjustments** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia.

- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.

● PATIENT AND CARER ADVICE

- Driving and skilled tasks** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

Glibenclamide

● INDICATIONS AND DOSE

Type 2 diabetes mellitus

► BY MOUTH

- Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

Maturity-onset diabetes of the young (specialist use only)

► BY MOUTH

- Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **UNLICENSED USE** Not licensed for use in breast feeding women with pre-existing diabetes. Not licensed for use in gestational diabetes.

Not licensed for use in children.

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 603

- **INTERACTIONS** → Appendix 1: sulfonylureas

- **SIDE-EFFECTS** Appetite decreased · SIADH · taste metallic

- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.

- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Glibenclamide (Non-proprietary)

- Glibenclamide 2.5 mg Glibenclamide 2.5mg tablets | 28 tablet [PoM] £11.78 DT = £10.49
- Glibenclamide 5 mg Glibenclamide 5mg tablets | 28 tablet [PoM] £14.72 DT = £3.16

F 452

Gliclazide

● INDICATIONS AND DOSE

Type 2 diabetes mellitus

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

Maturity-onset diabetes of the young (specialist use only)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12–17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 603

- **INTERACTIONS** → Appendix 1: sulfonylureas

- **SIDE-EFFECTS** Anaemia · angioedema · dyspepsia · hypersensitivity vasculitis · hyponatraemia · severe cutaneous adverse reactions (SCARs) · skin reactions

- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.

- **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

► Gliclazide (Non-proprietary)

- Gliclazide 40 mg Gliclazide 40mg tablets | 28 tablet [PoM] £3.19 DT = £3.04
- Gliclazide 80 mg Gliclazide 80mg tablets | 28 tablet [PoM] £7.22 DT = £0.92 | 60 tablet [PoM] £0.81–£9.32
- **Diamicron** (Servier Laboratories Ltd)
Gliclazide 80 mg Diamicron 80mg tablets | 60 tablet [PoM] £4.38
- **Zicron** (Bristol Laboratories Ltd)
Gliclazide 40 mg Zicron 40mg tablets | 28 tablet [PoM] £3.36 DT = £3.04

F 452

Tolbutamide

● INDICATIONS AND DOSE

Type 2 diabetes mellitus

► BY MOUTH

- Child 12–17 years (specialist use only): 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 603

- **INTERACTIONS** → Appendix 1: sulfonylureas

● SIDE-EFFECTS

- **Rare or very rare** Aplastic anaemia · blood disorder
- **Frequency not known** Alcohol intolerance · appetite abnormal · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · headache · hypersensitivity (usually in the first 6–8 weeks of therapy) · paraesthesia · photosensitivity reaction · tinnitus · weight increased
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

► Tolbutamide (Non-proprietary)

- Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet [PoM] £34.88 DT = £4.56 | 112 tablet [PoM] £17.60–£18.24

INSULINS

Insulins

IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)

Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

● SIDE-EFFECTS

- Common or very common Oedema
- Uncommon Lipodystrophy · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION

Overdose Overdose causes hypoglycaemia.

● PREGNANCY

Dose adjustments During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

● BREAST FEEDING

Dose adjustments During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

● HEPATIC IMPAIRMENT

Dose adjustments Insulin requirements may be decreased in patients with hepatic impairment.

● RENAL IMPAIRMENT The compensatory response to hypoglycaemia is impaired in renal impairment.

Dose adjustments Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary.

● MONITORING REQUIREMENTS

- Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).
- While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.
- DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not

available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

- **PRESCRIBING AND DISPENSING INFORMATION** Show container to patient or carer and confirm the expected version is dispensed.

Units The word 'unit' should **not** be abbreviated.

● PATIENT AND CARER ADVICE

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks. Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.

Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

INSULINS > RAPID-ACTING

▢ above

Insulin

(Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child: According to requirements

Hyperglycaemia during illness

- BY INTRAVENOUS INFUSION

- Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

- Child: 0.025–0.1 unit/kg/hour, dose to be adjusted according to blood-glucose concentration

Neonatal hyperglycaemia | Neonatal diabetes

- BY INTRAVENOUS INFUSION

- Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

Diabetic ketoacidosis | Diabetes during surgery

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **INTERACTIONS** → Appendix 1: insulins

● SIDE-EFFECTS

- Rare or very rare Refraction disorder

- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked

morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

- ▶ With intravenous use For *intravenous infusion*, dilute to a concentration of 1 unit/mL with Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin. For *intravenous infusion in neonatal intensive care*, dilute 5 units to a final volume of 50 mL with Sodium Chloride 0.9% and mix thoroughly; an intravenous infusion rate of 0.1 mL/kg/hour provides a dose of 0.01 units/kg/hour.

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151** Continuous subcutaneous insulin infusion is recommended as an option in children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, **or**
- whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

Insulin lispro

21-Feb-2018

(Recombinant human insulin analogue—short acting)

INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1 month-1 year: Administer shortly before meals or when necessary shortly after meals, according to requirements
- ▶ Child 2-17 years: Administer shortly before meals or when necessary shortly after meals, according to requirements
- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month-1 year: According to requirements
- ▶ Child 2-17 years: According to requirements

- **UNLICENSED USE** Not licensed for use in children under 2 years.

- **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)

- **INTERACTIONS** → Appendix 1: insulins

- **PREGNANCY** Not known to be harmful—may be used during pregnancy.

- **BREAST FEEDING** Not known to be harmful—may be used during lactation.

- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

- ▶ With intravenous use For *intravenous infusion*, dilute to a concentration of 0.1–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin lispro is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151** Continuous subcutaneous insulin infusion is recommended as an option in children over 12 years with type 1 diabetes:

Insuman Comb 25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50
- ▶ **Insuman Comb 50** (Sanofi)
Insulin human (as Insulin isophane human) 50 unit per 1 ml, Insulin human (as Insulin soluble human) 50 unit per 1 ml Insuman Comb 50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50

F 454

Isophane insulin

(Isophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane Insulin (NPH)—intermediate acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements

- **INTERACTIONS** → Appendix 1: insulins

- **PREGNANCY** Recommended where longer-acting insulins are needed.

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humulin I** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68
Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT = £19.08

- ▶ **Humulin I KwikPen** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £21.70 DT = £21.70
- ▶ **Hypurin Bovine Isophane** (Wockhardt UK Ltd)
Insulin bovine (as Insulin isophane bovine) 100 unit per 1 ml Hypurin Bovine Isophane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72
- ▶ **Hypurin Porcine Isophane** (Wockhardt UK Ltd)
Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml Hypurin Porcine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £46.95
Hypurin Porcine Isophane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £31.30
- ▶ **Insulatard** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £7.48
- ▶ **Insulatard InnoLet** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard InnoLet 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £20.40 DT = £21.70
- ▶ **Insulatard Penfill** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £22.90 DT = £19.08
- ▶ **Insuman Basal** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61
Insuman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT = £19.08
- ▶ **Insuman Basal SoloStar** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £19.80 DT = £21.70

INSULINS > INTERMEDIATE-ACTING COMBINED WITH RAPID-ACTING

F 454

Biphasic insulin aspart (Intermediate-acting insulin)

• INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer up to 10 minutes before or soon after a meal, according to requirements

- **INTERACTIONS** → Appendix 1: insulins

- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **NovoMix 30 FlexPen** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £29.89 DT = £29.89
- ▶ **NovoMix 30 Penfill** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £28.79 DT = £28.79

Biphasic insulin lispro (Intermediate-acting insulin)

• INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer up to 15 minutes before or soon after a meal, according to requirements

- **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)

- **INTERACTIONS** → Appendix 1: insulins

- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humalog Mix25** (Eli Lilly and Company Ltd)
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £16.61
Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46 DT = £29.46
- ▶ **Humalog Mix25 KwikPen** (Eli Lilly and Company Ltd)
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £30.98 DT = £30.98
- ▶ **Humalog Mix50** (Eli Lilly and Company Ltd)
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46 DT = £29.46
- ▶ **Humalog Mix50 KwikPen** (Eli Lilly and Company Ltd)
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £30.98 DT = £30.98

INSULINS > LONG-ACTING

14-Mar-2017

Insulin degludec

(Recombinant human insulin analogue—long acting)

• INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1–17 years: Dose to be given according to requirements

- **INTERACTIONS** → Appendix 1: insulins

- **SIDE-EFFECTS**

- ▶ Uncommon Peripheral oedema

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin degludec (*Tresiba*®) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.

● NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (October 2016) that insulin degludec (*Tresiba*®) is not recommended for use within NHS Wales for the treatment of diabetes mellitus in adolescents and children from the age of 1 year.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Tresiba FlexTouch (Novo Nordisk Ltd)

Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba FlexTouch 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £46.60 DT = £46.60

Insulin human (as Insulin degludec) 200 unit per 1 ml Tresiba FlexTouch 200units/ml solution for injection 3ml pre-filled pen | 3 pre-filled disposable injection [PoM] £55.92 DT = £55.92

► Tresiba Penfill (Novo Nordisk Ltd)

Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £46.60 DT = £46.60

F 454

Insulin detemir

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

► BY SUBCUTANEOUS INJECTION

► Child 2–17 years: According to requirements

● INTERACTIONS → Appendix 1: insulins

● SIDE-EFFECTS

► Uncommon Refraction disorder

● **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 457 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Levemir FlexPen (Novo Nordisk Ltd)

Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £42.00 DT = £42.00

► Levemir InnoLet (Novo Nordisk Ltd)

Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir InnoLet 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £44.85 DT = £42.00

► Levemir Penfill (Novo Nordisk Ltd)

Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £42.00 DT = £42.00

F 454

Insulin glargine

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

► BY SUBCUTANEOUS INJECTION

► Child 2–17 years: According to requirements

● INTERACTIONS → Appendix 1: insulins

● SIDE-EFFECTS

► Rare or very rare Myalgia · sodium retention · taste altered

● **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

● **PRESCRIBING AND DISPENSING INFORMATION** Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised that *Lantus*® preparations (April 2013) and *Toujeo*® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin

It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Abasaglar (Eli Lilly and Company Ltd) ▼

Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £35.28 DT = £37.77

► Abasaglar KwikPen (Eli Lilly and Company Ltd) ▼

Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar KwikPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £35.28 DT = £37.77

► Lantus (Sanofi)

Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £37.77 DT = £37.77

Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £37.77 DT = £37.77

Lantus 100units/ml solution for injection 10ml vials | 1 vial [PoM] £27.92 DT = £27.92

► Toujeo (Sanofi)

Insulin human (as Insulin glargine) 300 unit per 1 ml Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pen | 3 pre-filled disposable injection [PoM] £33.13 DT = £33.13

F 454

Insulin zinc suspension

(Insulin zinc suspension (mixed)—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

► BY SUBCUTANEOUS INJECTION

► Child: According to requirements

● INTERACTIONS → Appendix 1: insulins

● **SIDE-EFFECTS** Hypokalaemia · weight increased

● **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 457 is recommended where longer-acting insulins are needed; insulin detemir above may also be considered.

● **PRESCRIBING AND DISPENSING INFORMATION** A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral

crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

► **Hypurin Bovine Lente** (Wockhard UK Ltd)

Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml Hypurin Bovine Lente 100units/ml suspension for injection 10ml vials | 1 vial (PoM) £27.72

F 454

Protamine zinc insulin

(Protamine zinc insulin injection—long acting)

• INDICATIONS AND DOSE

Diabetes mellitus

► BY SUBCUTANEOUS INJECTION

► Child: According to requirements

• **INTERACTIONS** → Appendix 1: insulins

• **SIDE-EFFECTS** Hypokalaemia

• **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 457 is recommended where longer-acting insulins are needed; insulin detemir p. 459 may also be considered.

• **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

► **Hypurin Bovine Protamine Zinc** (Wockhard UK Ltd)

Insulin bovine (as Insulin protamine zinc bovine) 100 unit per 1 ml Hypurin Bovine Protamine Zinc 100units/ml suspension for injection 10ml vials | 1 vial (PoM) £27.72

3.1a Diabetes, diagnosis and monitoring

Diabetes mellitus, diagnostic and monitoring devices

Urinalysis: urinary glucose

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with *Micral-Test II*® but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood glucose monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Carers and children should be properly trained in the use of blood glucose monitoring systems and the appropriate action to take on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Children using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens,

the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the blood glucose level is high or if the child is unwell, blood **ketones** should be measured according to local guidelines in order to detect diabetic ketoacidosis. Children and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Other drugs used for Diabetes, diagnosis and monitoring

Hypodermic insulin injection pens

• HYPODERMIC INSULIN INJECTION PENS

AUTOPEN® 24

Autopen® 24 (for use with Sanofi- Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).

Autopen 24 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-21 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.71 • Drug Tariff (Part IXa)

Autopen 24 hypodermic insulin injection pen reusable for 3mL cartridge 2 unit dial up / range 2-42 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.71 • Drug Tariff (Part IXa)

AUTOPEN® CLASSIC

Autopen® Classic (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).

Autopen Classic hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-21 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.96 • Drug Tariff (Part IXa)

Autopen Classic hypodermic insulin injection pen reusable for 3mL cartridge 2 unit dial up / range 2-42 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.96 • Drug Tariff (Part IXa)

1 device • NHS indicative price = £16.96 • Drug Tariff (Part IXa)

CLIKSTAR®

For use with **Lantus®**, **Apidra®**, and **Insuman®** 3-mL insulin cartridges; allowing 1-unit dose adjustment, max. 80 units.

HUMAPEN® LUXURA HD

For use with **Humulin®** and **Humalog®** 3-mL cartridges; allowing 0.5-unit dosage adjustment, max. 30 units.

HumaPen Luxura HD hypodermic insulin injection pen reusable for 3mL cartridge 0.5 unit dial up / range 1-30 units (Eli Lilly and Company Ltd) 1 device • NHS indicative price = £27.01 • Drug Tariff (Part IXa)

1 device • NHS indicative price = £27.01 • Drug Tariff (Part IXa)

NOVOPEN® 4

For use with **Penfill®** 3-mL insulin cartridges; allowing 1-unit dosage adjustment, max. 60 units.

NovoPen 4 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-60 units (Novo Nordisk Ltd) 1 device • NHS indicative price = £26.86 • Drug Tariff (Part IXa)

NovoPen 4 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-60 units (Novo Nordisk Ltd) 1 device • NHS indicative price = £26.86 • Drug Tariff (Part IXa)

Needle free insulin delivery systems

• NEEDLE FREE INSULIN DELIVERY SYSTEMS

INSUJET®

For use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max 40 units. Available as **starter set** (**Insulet®** device, nozzle cap, nozzle and piston, 1 × 10-mL adaptor, 1 × 3-mL adaptor, 1 cartridge cap removal key), **nozzle pack** (15 nozzles), **cartridge adaptor pack** (15 adaptors), or **vial adaptor pack** (15 adaptors).

Insulet starter set (Spirit Healthcare Ltd)

1 pack • NHS indicative price = £90.00 • Drug Tariff (Part IXa)

3.2 Hypoglycaemia

Hypoglycaemia

02-Jun-2017

Treatment of hypoglycaemia

Prompt treatment of hypoglycaemia in children from any cause is essential as severe hypoglycaemia may cause subsequent neurological damage. Hyperinsulinism, fatty acid oxidation disorders and glycogen storage disease are less common causes of acute hypoglycaemia in children.

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. If necessary this may be repeated after 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal (if it is due) can prevent blood-glucose concentration from falling again.

Proprietary products of quick-acting carbohydrate (e.g. *GlucoGel*®, *DextroGel*®, *GSF-Syrup*®, *Rapilose*® gel) are available on prescription for patients to keep on hand in case of hypoglycaemia.

Alternatively, approximately 10 g of glucose is available from 2 teaspoons of sugar, or from 3 sugar lumps, and also from non-diet versions of the following soft drinks: 110 mL of *Lucozade*®, *Energy Original* (also, see note below), 100 mL of *Coca-Cola*®, 19 mL of *Ribena*® *Blackcurrant* (to be diluted).

Note: the carbohydrate content of commercially available glucose-containing drinks is currently subject to change—individual product labels should be checked. Patients should be aware that for a time, both old and new bottles and cans may be available—individual product labels should be checked.

Hypoglycaemia which causes unconsciousness or seizures is an emergency. Glucagon below, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases blood-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon can be issued to parents or carers of insulin-treated children for emergency use in hypoglycaemic attacks. It is often advisable to prescribe it on an 'if necessary' basis for hospitalised insulin-treated children, so that it can be given rapidly by the nurses during a hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 10% p. 590 can be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 50% is **not** recommended, as it is very viscous and hypertonic. Close monitoring is necessary, particularly in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Children whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs can persist for many hours.

Glucagon is not effective in the treatment of hypoglycaemia due to fatty acid oxidation or glycogen storage disorders.

Chronic hypoglycaemia

Diazoxide p. 466 is useful in the management of chronic hypoglycaemia due to excessive insulin secretion, either from a tumour involving the islets of Langerhans or from persisting hyperinsulinaemic hypoglycaemia of infancy (nesidioblastosis). Diazoxide has no place in the

management of acute hypoglycaemia. Chlorothiazide p. 111 reduces diazoxide-induced sodium and water retention and has the added benefit of potentiating the glycaemic effect of diazoxide.

If diazoxide and chlorothiazide fail to suppress excessive glucose requirements in chronic hypoglycaemia then octreotide p. 467 or nifedipine p. 109 can be added. Octreotide suppresses secretion of growth hormone, but growth is unlikely to be affected in the long term.

Neonatal hypoglycaemia

Neonatal hypoglycaemia at birth is treated with glucose **intravenous infusion 10%**. Mild asymptomatic persistent hypoglycaemia may respond to a single dose of glucagon. Glucagon has also been used in the short-term management of endogenous hyperinsulinism.

GLYCOGENOLYTIC HORMONES

Glucagon

• INDICATIONS AND DOSE

Insulin-induced hypoglycaemia

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

► Neonate: 20 micrograms/kg.

- Child 1 month-1 year: 500 micrograms
- Child 2-17 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
- Child 2-17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given

Endogenous hyperinsulinism

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Neonate: 200 micrograms/kg (max. per dose 1 mg) for 1 dose.

► Child 1 month-1 year: 1 mg for 1 dose

► BY CONTINUOUS INTRAVENOUS INFUSION

► Neonate: 1–18 micrograms/kg/hour (max. per dose 50 micrograms/kg/hour), adjusted according to response.

► Child 1 month-1 year: 1–10 micrograms/kg/hour, dose to be adjusted as necessary

Diagnosis of growth hormone secretion (specialist use only)

► BY INTRAMUSCULAR INJECTION

► Child: 100 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may vary, consult local guidelines

Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

► INITIALLY BY INTRAVENOUS INJECTION

► Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

DOSE EQUIVALENCE AND CONVERSION

► 1 unit of glucagon = 1 mg of glucagon.

- **UNLICENSED USE** Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

Unlicensed for growth hormone test and hyperinsulinism.

- **CONTRA-INDICATIONS** Pheochromocytoma

- **CAUTIONS** Glucagonoma · ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency ·

insulinoma • when used in the diagnosis of growth hormone secretion, delayed hypoglycaemia may result—deaths reported (ensure a meal is eaten before discharge)

- **INTERACTIONS** → Appendix 1: glucagon

- **SIDE-EFFECTS**

- ▶ **Common or very common** Nausea
- ▶ **Uncommon** Vomiting
- ▶ **Rare or very rare** Abdominal pain • hypertension • hypotension • tachycardia

- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use When administered by *continuous intravenous infusion*, do not add to infusion fluids containing calcium—precipitation may occur.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Glucagon for hypoglycaemia www.medicinesforchildren.org.uk/glucagon-for-hypoglycaemia

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription-only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **GlucaGen Hypokit** (Novo Nordisk Ltd)
Glucagon hydrochloride 1 mg GlucaGen Hypokit 1mg powder and solvent for solution for injection | 1 vial [PoM] £11.52 DT = £11.52

3.2a Chronic hypoglycaemia

Other drugs used for Chronic hypoglycaemia
Chlorothiazide, p. 111

GLYCOGENOLYTIC HORMONES

Diazoxide

- **INDICATIONS AND DOSE**

Resistant hypertension

- ▶ **BY MOUTH**
- ▶ **Neonate:** Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day.
- ▶ **Child:** Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day

Chronic intractable hypoglycaemia

- ▶ **BY MOUTH**
- ▶ **Neonate:** Initially 5 mg/kg twice daily, adjusted according to response, initial dose used to establish response; maintenance 1.5–3 mg/kg 2–3 times a day; increased if necessary up to 7 mg/kg 3 times a day, higher doses are unlikely to be beneficial, but may be required in some cases.
- ▶ **Child:** Initially 1.7 mg/kg 3 times a day, adjusted according to response; maintenance 1.5–3 mg/kg 2–3 times a day, increased if necessary up to 5 mg/kg 3 times a day, doses up to 5 mg/kg may be required in some cases, but higher doses are unlikely to be beneficial

- **UNLICENSED USE** Not licensed for resistant hypertension.

- **CAUTIONS** Aortic coarctation • aortic stenosis • arteriovenous shunt • heart failure • hyperuricaemia • impaired cardiac circulation • impaired cerebral circulation

- **INTERACTIONS** → Appendix 1: diazoxide

- **SIDE-EFFECTS** Abdominal pain • albuminuria • appetite decreased (long term use) • arrhythmia • azotaemia •

cardiomegaly • cataract • constipation • diabetic hyperosmolar coma • diarrhoea • dizziness • dyspnoea • eosinophilia • extrapyramidal symptoms • face abnormal • fever • fluid retention • galactorrhoea • haemorrhage • headache • heart failure • hirsutism • hyperglycaemia • hyperuricaemia (long term use) • hypogammaglobulinaemia • hypotension • ileus • ketoacidosis • leucopenia • libido decreased • musculoskeletal pain • nausea • nephritic syndrome • oculogyric crisis • pancreatitis • parkinsonism • pulmonary hypertension • skin reactions • sodium retention • taste altered • thrombocytopenia • tinnitus • vision disorders • voice alteration (long term use) • vomiting

- **PREGNANCY** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT**
Dose adjustments Dose reduction may be required.

- **MONITORING REQUIREMENTS**

- ▶ Monitor blood pressure.
- ▶ Monitor white cell and platelet count during prolonged use.
- ▶ Regularly assess growth, bone, and psychological development during prolonged use.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution
Tablet

- ▶ **Eudemine** (RPH Pharmaceuticals AB)
Diazoxide 50 mg Eudemine 50mg tablets | 100 tablet [PoM] £46.45

Capsule

- ▶ **Diazoxide (Non-proprietary)**
Diazoxide 25 mg Progylcem 25 capsules | 100 capsule [PoM] £

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOSTATIN ANALOGUES

Somatostatin analogues

- **CAUTIONS** Diabetes mellitus (antidiabetic requirements may be reduced) • insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses)

- **SIDE-EFFECTS**

- ▶ **Common or very common** Adrenal insufficiency • alopecia • appetite decreased • arrhythmias • arthralgia • asthenia • biliary dilatation • cholelithiasis (following long term use) • constipation • diabetes mellitus • diarrhoea • dizziness • dyspnoea • gallbladder disorders • gastrointestinal discomfort • gastrointestinal disorders • glucose tolerance impaired (following long term use) • headache • hepatic disorders • hyperbilirubinaemia • hyperglycaemia (long term use) • hypoglycaemia • hypotension • hypothyroidism • lethargy • musculoskeletal pain • myalgia • nausea • QT interval prolongation • skin reactions • thyroid disorder • vomiting • weight decreased
- ▶ **Uncommon** Anaemia • dehydration • hot flush • insomnia
- ▶ **Frequency not known** Pancreatitis • pancreatitis acute (after administration)

- **DIRECTIONS FOR ADMINISTRATION** Injection sites should be rotated.

F 466

17-Oct-2016

Octreotide

● INDICATIONS AND DOSE

Persistent hyperinsulinaemic hypoglycaemia unresponsive to diazoxide and glucose

► BY SUBCUTANEOUS INJECTION

- **Neonate:** Initially 2–5 micrograms/kg every 6–8 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required.

- **Child:** Initially 1–2 micrograms/kg every 4–6 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required

Bleeding from oesophageal or gastric varices

► BY CONTINUOUS INTRAVENOUS INFUSION

- **Child:** 1 microgram/kg/hour, higher doses may be required initially, when no active bleeding reduce dose over 24 hours; Usual maximum 50 micrograms/hour

- **UNLICENSED USE** Not licensed in children.

- **INTERACTIONS** → Appendix 1: octreotide

● SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION Administering non-depot injections of octreotide between meals and at bedtime may reduce gastrointestinal side-effects.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● MONITORING REQUIREMENTS

- Monitor thyroid function on long-term therapy.
- Monitor liver function.

- **TREATMENT CESSATION** Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection or intravenous infusion, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Octreotide (Non-proprietary)

Octreotide (as Octreotide acetate) 50 microgram per

1 ml Octreotide 50micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £18.85 DT = £18.85
Octreotide 50micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £14.85–£18.60

4 Disorders of bone metabolism

Bone metabolism

Disorders of bone metabolism

The two main disorders of bone metabolism that occur in children are rickets and osteoporosis. The two most common forms of rickets are Vitamin D deficiency rickets and hypophosphataemic rickets. See also calcium.

Osteoporosis

Osteoporosis in children may be primary (e.g. *osteogenesis imperfecta* and *idiopathic juvenile osteoporosis*), or secondary (e.g. due to inflammatory disorders, immobilisation, or corticosteroids); specialist management is required.

Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible.

Calcitonin

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon) p. 471 (synthetic or recombinant salmon calcitonin) is used by specialists to lower the plasma-calcium concentration in children with hypercalcaemia associated with malignancy.

Bisphosphonates

A bisphosphonate such as pamidronate disodium p. 469 is used in the management of severe forms of *osteogenesis imperfecta* and other causes of osteoporosis in children to reduce the number of fractures; the long-term effects of bisphosphonates in children has not been established. Single doses of bisphosphonates are also used to manage hypercalcaemia. Treatment should be initiated under specialist advice only.

Other drugs used for Disorders of bone metabolism

Calcitriol, p. 631

BISPHOSPHONATES

Bisphosphonates

- **DRUG ACTION** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE JAW (NOVEMBER 2009) AND INTRAVENOUS BISPHOSPHONATES: OSTEONECROSIS OF THE JAW – FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

Guidance for dentists in primary care is included in *Oral Health Management of Patients Prescribed Bisphosphonates: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at www.sdcep.org.uk).

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving

bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

● SIDE-EFFECTS

- **Common or very common** Alopecia • anaemia • arthralgia • asthenia • constipation • diarrhoea • dizziness • dysphagia • electrolyte imbalance • eye inflammation • fever • gastritis • gastrointestinal discomfort • headache • influenza like illness • malaise • myalgia • nausea • oesophageal ulcer (discontinue) • oesophagitis (discontinue) • pain • peripheral oedema • renal impairment • skin reactions • taste altered • vomiting
- **Uncommon** Anaphylactic reaction • angioedema • bronchospasm • oesophageal stenosis (discontinue) • osteonecrosis
- **Rare or very rare** Atypical femur fracture • Stevens-Johnson syndrome

● PATIENT AND CARER ADVICE

Atypical femoral fractures Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Osteonecrosis of the jaw During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms. **Osteonecrosis of the external auditory canal** Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

14-Sep-2017

Alendronic acid (Alendronate)

● INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta and other causes) (initiated under specialist supervision)
Hypercalcaemia (initiated under specialist supervision)

- BY MOUTH
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Abnormalities of oesophagus • hypocalcaemia • other factors which delay emptying (e.g. stricture or achalasia)

- **CAUTIONS** Active gastro-intestinal bleeding • atypical femoral fractures • duodenitis • dysphagia • exclude other causes of osteoporosis • gastritis • history (within 1 year) of ulcers • surgery of the upper gastro-intestinal tract • symptomatic oesophageal disease • ulcers • upper gastro-intestinal disorders

- **INTERACTIONS** → Appendix 1: bisphosphonates

● SIDE-EFFECTS

- **Common or very common** Abdominal distension • gastrointestinal disorders • joint swelling • vertigo
- **Uncommon** Erythema • eye inflammation • haemorrhage
- **Rare or very rare** Femoral stress fracture • oropharyngeal ulceration • photosensitivity reaction • severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or

worsening heartburn, pain on swallowing or retrosternal pain.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 35 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.
- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution. Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

- **Alendronic acid (Non-proprietary)**
Alendronic acid 700 microgram per 1 mL Alendronic acid 70mg/100mL oral solution unit dose sugar free sugar-free | 4 unit dose [PoM] £28.56 DT = £28.56

Effervescent tablet

- **Binosto** (Internis Pharmaceuticals Ltd)
Alendronic acid (as Alendronate sodium) 70 mg Binosto 70mg effervescent tablets sugar-free | 4 tablet [PoM] £22.80 DT = £22.80

Tablet

- **Alendronic acid (Non-proprietary)**
Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet [PoM] £3.25 DT = £1.38
Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet [PoM] £22.80 DT = £0.41
- **Fosamax Once Weekly** (Merck Sharp & Dohme Ltd)
Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet [PoM] £22.80 DT = £0.41

F 468

Pamidronate disodium

(Formerly called
aminohydroxypropylenediphosphonate
disodium (APD))

● INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) | Hypercalcaemia (specialist use only)

- BY INTRAVENOUS INFUSION
- Child: (consult product literature)

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Atypical femoral fractures · cardiac disease · ensure adequate hydration · previous thyroid surgery (risk of hypocalcaemia)
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
- Common or very common Appetite decreased · chills · decreased leucocytes · drowsiness · electrolyte imbalance ·

flushing · hypertension · insomnia · paraesthesia · tetany · thrombocytopenia

- **Uncommon** Agitation · dyspnoea · eye inflammation · hypotension · muscle cramps · osteonecrosis · seizure
- **Rare or very rare** Confusion · glomerulonephritis · haematuria · heart failure · nephritis tubulointerstitial · nephrotic syndrome · oedema · pulmonary oedema · reactivation of infections · renal disorder exacerbated · renal tubular disorder · respiratory disorders · visual hallucinations · xanthopsia
- **Frequency not known** Atrial fibrillation
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—no information available.
- **RENAL IMPAIRMENT**
Monitoring Monitor renal function in renal disease or predisposition to renal impairment (e.g. in tumour-induced hypercalcaemia).
- **DIRECTIONS FOR ADMINISTRATION** For slow intravenous infusion (Aredia®; Pamidronate disodium, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For Aredia®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For Pamidronate disodium (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.
- **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw). **Driving and skilled tasks** Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

➤ Pamidronate disodium (Non-proprietary)

- Pamidronate disodium 3 mg per 1 mL Pamidronate disodium 15mg/5mL solution for infusion vials | 1 vial [PoM] £27.50 (Hospital only) | 5 vial [PoM] £149.15 (Hospital only)
- Pamidronate disodium 30mg/10mL solution for infusion vials | 1 vial [PoM] £55.00-£59.66 (Hospital only)
- Pamidronate disodium 60mg/20mL solution for infusion vials | 1 vial [PoM] £110.00 (Hospital only)
- Pamidronate disodium 90mg/30mL solution for infusion vials | 1 vial [PoM] £165.00 (Hospital only)
- Pamidronate disodium 9 mg per 1 mL Pamidronate disodium 90mg/10mL solution for infusion vials | 1 vial [PoM] £170.45 (Hospital only)
- Pamidronate disodium 15 mg per 1 mL Pamidronate disodium 60mg/4mL solution for infusion ampoules | 1 ampoule [PoM] £119.32
- Pamidronate disodium 15mg/1mL solution for infusion ampoules | 4 ampoule [PoM] £119.32
- Pamidronate disodium 90mg/6mL solution for infusion ampoules | 1 ampoule [PoM] £170.46
- Pamidronate disodium 30mg/2mL solution for infusion ampoules | 2 ampoule [PoM] £119.32

F 468

Risedronate sodium

28-Sep-2017

● INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) | Hypercalcaemia (specialist use only)

- BY MOUTH
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Atypical femoral fractures · oesophageal abnormalities · other factors which delay transit or emptying (e.g. stricture or achalasia)
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
 - **Uncommon** Gastrointestinal disorders · iritis
 - **Rare or very rare** Glossitis
 - **Frequency not known** Amblyopia · apnoea · chest pain · corneal lesion · dry eye · hypersensitivity · hypersensitivity vasculitis · increased risk of infection · leg cramps · liver disorder · muscle weakness · neoplasms · nocturia · pain · skin reactions · tinnitus · toxic epidermal necrolysis · weight decreased
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - Correct hypocalcaemia before starting.
 - Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.
- **DIRECTIONS FOR ADMINISTRATION** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day **or**, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risedronate sodium tablets.
Medicines for Children leaflet: Risedronate for brittle bones www.medicinesforchildren.org.uk/risedronate-for-brittle-bones
Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Calcitonin (salmon)

(Salcatonin)

● INDICATIONS AND DOSE

Hypercalcaemia (limited experience in children) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 2.5–5 units/kg every 12 hours (max. per dose 400 units every 6–8 hours), adjusted according to response, no additional benefit with doses over 8 units/kg every 6 hours
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 5–10 units/kg, to be administered by slow intravenous infusion over at least 6 hours

Osteoporosis (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: Refer for specialist advice, experience very limited

- **UNLICENSED USE** Not licensed in children.
- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Heart failure • history of allergy (skin test advised) • risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)
- **INTERACTIONS** → Appendix 1: calcitonin (salmon)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain • arthralgia • diarrhoea • dizziness • fatigue • flushing • headache • musculoskeletal pain • nausea • secondary malignancy (long term use) • taste altered • vomiting
 - ▶ **Uncommon** Hypersensitivity • hypertension • influenza like illness • oedema • polyuria • skin reactions • visual impairment
 - ▶ **Rare or very rare** Bronchospasm • throat swelling • tongue swelling
 - ▶ **Frequency not known** Hypocalcaemia • tremor
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Avoid; inhibits lactation in *animals*.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Monitor bone growth.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion*, dilute injection solution (e.g. 400 units in 500 mL) with Sodium Chloride 0.9% and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration—use diluted solution without delay.

● MEDICINAL FORMS

5 Gonadotrophin responsive conditions

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPIN-RELEASING HORMONES

Goserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

ZOLADEX LA®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

ZOLADEX®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 3.6 mg every 28 days, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **CAUTIONS** Depression • patients with metabolic bone disease (decrease in bone mineral density can occur)
- **SIDE-EFFECTS** Asthma • body hair changes • breast abnormalities • depression • headache • hypersensitivity • mood altered • ovarian cyst (may require withdrawal) • paraesthesia • skin reactions • vaginal haemorrhage • visual impairment • weight change • withdrawal bleed
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Triptorelin

27-Apr-2017

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

DECAPEPTYL[®] SR 11.25MG

Gonadotrophin-dependent precocious puberty

- BY INTRAMUSCULAR INJECTION
- Child: 11.25 mg every 3 months, discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys

GONAPEPTYL DEPOT[®]

Gonadotrophin-dependent precocious puberty

- BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Child (body-weight up to 20 kg): Initially 1.875 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 1.875 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
- Child (body-weight 20–30 kg): Initially 2.5 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 2.5 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
- Child (body-weight 31 kg and above): Initially 3.75 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 3.75 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **SIDE-EFFECTS**
 - Common or very common Depression · mood altered
 - Uncommon Anaphylactic reaction · haemorrhage · nausea · vaginal discharge · vomiting
 - Frequency not known Alopecia · angioedema · epiphysiolysis · gastrointestinal discomfort · headache · hot flush · malaise · myalgia · nervousness · pain · skin reactions · vision disorders · weight increased
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.
- **PRESCRIBING AND DISPENSING INFORMATION**
DECAPEPTYL[®] SR 11.25MG Each vial includes an overage to allow accurate administration of an 11.25 mg dose.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- **Decapeptyl SR** (Ipsen Ltd)
Triptorelin 11.25 mg Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial (PoM) £207.00 DT = £207.00
- **Gonaepetyl Depot** (Ferring Pharmaceuticals Ltd)
Triptorelin (as Triptorelin acetate) 3.75 mg Gonaepetyl Depot 3.75mg powder and solvent for suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection (PoM) £81.69

6 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Corticotrophins

Tetracosactide below (tetracosactrin), an analogue of corticotropin (adrenocorticotrophic hormone, ACTH), is used to test adrenocortical function; failure of plasma-cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency. A low-dose test is considered by some clinicians to be more sensitive when used to confirm established, partial adrenal suppression.

Tetracosactide should be given only if no other ACTH preparations have been given previously. Tetracosactide depot injection (*Synacthen Depot*®) is also used in the treatment of infantile spasms but it is contra-indicated in neonates because of the presence of benzyl alcohol in the injection. Corticotropin-releasing factor, corticorelin p. 474, (also known as corticotropin-releasing hormone, CRH) is used to test anterior pituitary function and secretion of corticotropin.

Gonadotrophins

Gonadotrophins are occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin p. 474 is used in the investigation of testicular function in suspected primary hypogonadism and incomplete masculinisation. It has also been used in delayed puberty in boys to stimulate endogenous testosterone production, but it has little advantage over testosterone.

Growth hormone

Growth hormone is used to treat proven deficiency of the hormone, Prader-Willi syndrome, Turner's syndrome, growth disturbance in children born small for corrected gestational age, chronic renal insufficiency, and short stature homeobox-containing gene (SHOX) deficiency. Growth hormone is also used in Noonan syndrome and idiopathic short stature [unlicensed indications] under specialist management. Treatment should be initiated and monitored by a paediatrician with expertise in managing growth-hormone disorders; treatment can be continued under a shared-care protocol by a general practitioner.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatotropin p. 475, produced using recombinant DNA technology.

Mecasermin p. 477, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 474 when injected intravenously in post-pubertal girls leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. It is used in the assessment of delayed or precocious puberty.

Other growth hormone stimulation tests involve the use of insulin, glucagon p. 465, arginine p. 613, and clonidine

hydrochloride p. 102 [all unlicensed uses]. The tests should be carried out in specialist centres.

6.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

Tetracosactide

(Tetracosactrin)

● INDICATIONS AND DOSE

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), standard-dose test

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child: 145 micrograms/m² (max. per dose 250 micrograms) for 1 dose

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), low-dose test

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child: 0.3 microgram/m² for 1 dose

Infantile spasm

- ▶ BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION
- ▶ Child 1-23 months: Initially 500 micrograms once daily on alternate days, adjusted according to response

- **UNLICENSED USE** Not licensed for low-dose test for adrenocortical insufficiency. Not licensed for treatment of infantile spasms.
- **CONTRA-INDICATIONS** Acute psychosis · adrenogenital syndrome · allergic disorders · asthma · avoid injections containing benzyl alcohol in neonates · Cushing's syndrome · infectious diseases · peptic ulcer · primary adrenocortical insufficiency · refractory heart failure
- **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) · active systemic diseases (should not be used unless adequate disease-specific therapy is being given) · diabetes mellitus · diverticulitis · history of asthma · history of atopic allergy · history of eczema · history of hayfever · history of hypersensitivity · hypertension · latent amoebiasis (may become activated) · latent tuberculosis (may become activated) · myasthenia gravis · ocular herpes simplex · osteoporosis · predisposition to thromboembolic · psychological disturbances may be triggered · recent intestinal anastomosis · reduced immune response (should not be used unless adequate disease-specific therapy is being given) · ulcerative colitis
- CAUTIONS, FURTHER INFORMATION**
 - ▶ Risk of anaphylaxis Should only be administered under medical supervision. Consult product literature.
 - ▶ Hypertension Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
 - ▶ Diabetes mellitus Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.
- **SIDE-EFFECTS** Abdominal distension · abscess · adrenocortical unresponsiveness · angioedema · appetite increased · bone fractures · congestive heart failure · Cushing's syndrome · diabetes mellitus exacerbated · dizziness · dyspnoea · electrolyte imbalance · exophthalmos · fluid retention · flushing · gastrointestinal disorders · glaucoma · growth retardation · haemorrhage · headache · healing impaired · hirsutism · hyperglycaemia ·

hyperhidrosis · hypersensitivity (may be more severe in patients susceptible to allergies, especially asthma) · hypertension · idiopathic intracranial hypertension exacerbated · increased risk of infection · leucocytosis · malaise · menstruation irregular · muscle weakness · myopathy · nausea · osteonecrosis · osteoporosis · pancreatitis · papilloedema · pituitary unresponsiveness · posterior subcapsular cataract · protein catabolism · psychiatric disorder · seizure · skin reactions · tendon rupture · thromboembolism · vasculitis necrotising · ventricular hypertrophy · vertigo · vomiting · weight increased

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** An enhanced effect of tetracosactide therapy may occur in patients with cirrhosis of the liver. Use with caution in hepatic impairment.
Monitoring Monitor hepatic function closely during treatment.
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.
Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.
- **DIRECTIONS FOR ADMINISTRATION** For intramuscular or intravenous injection, may be diluted in sodium chloride 0.9% to 250 nanograms/mL.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Synacthen** (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd) Tetracosactide acetate 250 microgram per 1 ml Synacthen 250micrograms/1ml solution for injection ampoules | 1 ampoule [PoM] £38.00

Suspension for injection

EXCIPIENTS: May contain Benzyl alcohol

- **Synacthen Depot** (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd) Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 1 ampoule [PoM] £346.28

6.2 Assessment of pituitary function

DIAGNOSTIC AGENTS

Corticotropin

(Corticotrophin-releasing hormone; CRH)

● INDICATIONS AND DOSE

Test of anterior pituitary function

- BY INTRAVENOUS INJECTION
- Child: 1 microgram/kg (max. per dose 100 micrograms) for 1 dose, to be administered over 30 seconds

- **UNLICENSED USE** Not licensed.

- **SIDE-EFFECTS** Altered smell sensation · flushing · hypotension · taste altered
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- **Acthrel (Imported (United States))**

Corticotropin ovine triflutate 100 microgram Acthrel powder for solution for injection vials | 1 vial [PoM] £

Gonadorelin

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

● INDICATIONS AND DOSE

Assessment of anterior pituitary function | Assessment of delayed puberty

- BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Child 1-17 years: 2.5 micrograms/kg (max. per dose 100 micrograms) for 1 dose

- **CAUTIONS** Pituitary adenoma

● SIDE-EFFECTS

- **Uncommon** Pain · skin reactions · swelling
- **Rare or very rare** Abdominal discomfort · bronchospasm · dizziness · eye erythema · flushing · headache · nausea · tachycardia
- **Frequency not known** Menorrhagia · sepsis

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- **Gonadorelin (Non-proprietary)**

Gonadorelin (as Gonadorelin hydrochloride)

100 microgram Gonadorelin 100microgram powder and solvent for solution for injection vials | 1 vial [PoM] £75.00 (Hospital only)

6.3 Gonadotrophin replacement therapy

GONADOTROPHINS

Chorionic gonadotrophin

(Human chorionic gonadotrophin; HCG)

- **DRUG ACTION** A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

● INDICATIONS AND DOSE

Delayed puberty in the male to stimulate endogenous testosterone production

- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Child: (consult product literature)

Test of testicular function, short stimulation test

- BY INTRAMUSCULAR INJECTION
- Child: 1500–2000 units once daily for 3 days

Test of testicular function, prolonged stimulation test

► BY INTRAMUSCULAR INJECTION

► Child: 1500–2000 units twice weekly for 3 weeks

Hypogonadotrophic hypogonadism

► BY INTRAMUSCULAR INJECTION

► Child: 1000–2000 units twice weekly, adjusted according to response

Undescended testes

► BY INTRAMUSCULAR INJECTION

► Child 7–16 years: Initially 500 units 3 times a week, adjusted according to response to up to 4000 units 3 times a week continue for 1–2 months after testicular descent

► Child 17 years: Initially 1000 units twice weekly, adjusted according to response to up to 4000 units 3 times a week continue for 1–2 months after testicular descent

- **UNLICENSED USE** Unlicensed in children for test of testicular function.
- **CONTRA-INDICATIONS** Androgen-dependent tumours
- **CAUTIONS** Asthma · cardiac impairment · epilepsy · migraine · prepubertal boys (risk of premature epiphyseal closure or precocious puberty)
- **SIDE-EFFECTS** Fatigue · fever · fluid retention · gynaecomastia · headache · hypersensitivity · mood altered · oedema · ovarian hyperstimulation syndrome · skin reactions · sodium retention
- **RENAL IMPAIRMENT** Use with caution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► **Pregnyl** (Merck Sharp & Dohme Ltd)

Chorionic gonadotrophin human 1500 unit Pregnyl 1,500unit powder and solvent for solution for injection ampoules | 1 ampoule [PoM] £2.12 [CD4-2]

Chorionic gonadotrophin human 5000 unit Pregnyl 5,000unit powder and solvent for solution for injection ampoules | 1 ampoule [PoM] £3.15 [CD4-2]

6.4 Growth hormone disorders

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES

Somatotropin

(Recombinant Human Growth Hormone)

INDICATIONS AND DOSE**Gonadal dysgenesis (Turner syndrome)**

► BY SUBCUTANEOUS INJECTION

► Child: 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily

Deficiency of growth hormone

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

► Child: 23–39 micrograms/kg daily, alternatively 0.7–1 mg/m² daily

Growth disturbance in children born small for gestational age whose growth has not caught up by 4 years or later | Noonan syndrome

► BY SUBCUTANEOUS INJECTION

► Child 4–17 years: 35 micrograms/kg daily, alternatively 1 mg/m² daily

Prader-Willi syndrome, in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet

► BY SUBCUTANEOUS INJECTION

► Child: 1 mg/m² daily, alternatively 35 micrograms/kg daily; maximum 2.7 mg per day

Chronic renal insufficiency (renal function decreased to less than 50%)

► BY SUBCUTANEOUS INJECTION

► Child: 45–50 micrograms/kg daily, alternatively 1.4 mg/m² daily, higher doses may be needed, adjust if necessary after 6 months

SHOX deficiency

► BY SUBCUTANEOUS INJECTION

► Child: 45–50 micrograms/kg daily

DOSE EQUIVALENCE AND CONVERSION

► Dose formerly expressed in units; somatropin 1 mg ≡ 3 units.

- **UNLICENSED USE** Not licensed for use in Noonan syndrome.
- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) · not to be used after renal transplantation · not to be used for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome) · severe obesity in Prader-Willi syndrome · severe respiratory impairment in Prader-Willi syndrome
- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · disorders of the epiphysis of the hip (monitor for limping) · history of malignant disease · hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value · initiation of treatment close to puberty not recommended in child born small for corrected gestational age · papilloedema · relative deficiencies of other pituitary hormones · resolved intracranial hypertension (monitor closely) · Silver-Russell syndrome
- **INTERACTIONS** → Appendix 1: somatropin
- **SIDE-EFFECTS**
 - **Common or very common** Headache · lipatrophy
 - **Uncommon** Arthralgia · carpal tunnel syndrome · fluid retention · gynaecomastia · idiopathic intracranial hypertension · myalgia · paraesthesia
 - **Rare or very rare** Hyperglycaemia · hyperinsulinism · hypothyroidism · osteonecrosis of femur · pancreatitis · slipped capital femoral epiphysis
 - **Frequency not known** Leukaemia · musculoskeletal stiffness · oedema

SIDE-EFFECTS, FURTHER INFORMATION Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- **PREGNANCY** Discontinue if pregnancy occurs—no information available.
- **BREAST FEEDING** No information available. Absorption from milk unlikely.
- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipatrophy.
- **GENOTROPIN[®], NORDITROPIN[®], NUTROPINAQ[®], OMNITROPE[®], SAIZEN[®], ZOMACTON[®]** For use by subcutaneous injection.
- **HUMATROPE[®]** Cartridges for use by subcutaneous injection. Powder for reconstitution for use by subcutaneous or intramuscular injection.
- **PRESCRIBING AND DISPENSING INFORMATION** Somatropin is a biological medicine. Biological medicines must be

prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

GENOTROPIN® PREPARATIONS Cartridges are for use with *Genotropin®* Pen device (non-NHS but available free of charge from clinics).

NORDITROPIN® PREPARATIONS Cartridges are for use with appropriate *NordiPen®* device (non-NHS but available free of charge from clinics).

Multidose disposable prefilled pens for use with *NovoFine®* or *NovoTwist®* needles.

NUTROPINAQ® For use with *NutropinAq®* Pen device (non-NHS but available free of charge from clinics).

OMNITROPE® For use with *Omnitrope Pen 5®* and *Omnitrope Pen 10®* devices (non-NHS but available free of charge from clinics).

SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION For use with *one.click®* autoinjector device or *cool.click®* needle-free autoinjector device or *easypod®* autoinjector device (non-NHS but available free of charge from clinics).

SAIZEN® SOLUTION FOR INJECTION For use with *cool.click®* needle-free autoinjector device or *easypod®* autoinjector device (non-NHS but available free of charge from clinics).

ZOMACTON® 4 mg vial for use with *ZomaJet 2® Vision* needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

10 mg vial for use with *ZomaJet Vision X®* needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Somatropin for the treatment of growth failure in children (May 2010) NICE TA188**

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency
- have Turner syndrome
- have Prader-Willi syndrome
- have chronic renal insufficiency
- are born small for gestational age with subsequent growth failure at 4 years of age or later
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA188

6.4a Insulin-like growth factor-I deficiency

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOMEDINS

Mecasermin

(Recombinant human insulin-like growth factor-I; rhIGF-I)

- **DRUG ACTION** Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotrophic effects of human growth hormone.

● INDICATIONS AND DOSE

Treatment of growth failure in children with severe primary insulin-like growth factor-I deficiency

► **BY SUBCUTANEOUS INJECTION**

- **Child 2–17 years:** Initially 40 micrograms/kg twice daily for 1 week, increased, if tolerated, in steps of 40 micrograms/kg (max. per dose 120 micrograms/kg twice daily), discontinue if no response within 1 year, reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

- **CONTRA-INDICATIONS** Evidence of tumour activity (discontinue treatment)

- **CAUTIONS** Correct hypothyroidism before initiating treatment · diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · papilloedema

● SIDE-EFFECTS

- **Common or very common** Adenoidal hypertrophy · arthralgia · dizziness · ear discomfort · gastrointestinal discomfort · gynaecomastia · hair texture abnormal · headache · hearing impairment · hyperglycaemia · hypoglycaemia · injection site reaction (rotate site) · melanocytic naevus · myalgia · otitis media · pain in extremity · papilloedema · scoliosis · seizures · skin hypertrophy · sleep apnoea · snoring · tachycardia · thymus enlargement · tonsillar hypertrophy · tremor · vomiting
- **Uncommon** Cardiac hypertrophy · cardiac valve disorders · depression · idiopathic intracranial hypertension · lipohypertrophy · nervousness · weight increased
- **Frequency not known** Alopecia

SIDE-EFFECTS, FURTHER INFORMATION Funduscopy for papilloedema recommended regularly during treatment and if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension.

- **CONCEPTION AND CONTRACEPTION** Contraception advised in women of child-bearing potential.

- **PREGNANCY** Avoid unless essential.

- **BREAST FEEDING** Avoid.

● MONITORING REQUIREMENTS

- Monitor ECG before and on termination of treatment (and during treatment if ECG abnormal).
- Monitor for disorders of the epiphysis of the hip (monitor for limping).
- Monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions).
- **DIRECTIONS FOR ADMINISTRATION** Dose should be administered just before or after food.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer mecasermin injection. **Missed doses** Patients or carers should be advised not to increase dose if a dose is missed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

7 Sex hormone responsive conditions

Sex hormones

Hormone replacement therapy

Sex hormone replacement therapy is indicated in children for the treatment of gonadotrophin deficiency, gonadal disorders, or delayed puberty that interferes with quality of life. Indications include constitutional delay in puberty, congenital or acquired hypogonadotrophic hypogonadism, hypergonadotrophic hypogonadism (Turner's syndrome, Klinefelter's syndrome), endocrine disorders (Cushing's syndrome or hyperprolactinaemia), and chronic illnesses, such as cystic fibrosis or sickle-cell disease, that may affect the onset of puberty.

Replacement therapy is generally started at the appropriate age for the development of puberty and should be managed by a paediatric endocrinologist. Patients with constitutional delay, chronic illness, or eating disorders may need only small doses of hormone supplements for 4 to 6 months to induce puberty and endogenous sex hormone production, which is then sustained. Patients with organic causes of hormone deficiency will require life-long replacement, adjusted to allow normal development.

Inadequate treatment may lead to poor bone mineralisation, resulting in fractures and osteoporosis.

Female sex hormones

Oestrogens

Oestrogens are necessary for the development of female secondary sexual characteristics. If onset of puberty is delayed because of organic pathology, puberty can be induced with ethinylestradiol p. 478 in increasing doses, guided by breast staging and uterine scans. Cyclical progestogen replacement is added after 12–18 months of oestrogen treatment. Once the adult dosage of oestrogen has been reached, it may be more convenient to provide replacement either as a low-dose oestrogen containing oral contraceptive formulation [unlicensed indication] or as a combined oestrogen and progestogen hormone replacement therapy preparation [unlicensed indication]. There is limited experience in the use of transdermal patches or gels in

children; compliance and skin irritation are sometimes a problem.

Ethinylestradiol is occasionally used, under **specialist supervision**, for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited), for the prevention of tall stature, and in tests of growth hormone secretion.

Topical oestrogen creams are used in the treatment of labial adhesions.

Progestogens

There are two main groups of progestogen, *progesterone* and *its analogues* (dydrogesterone and medroxyprogesterone acetate) and *testosterone analogues* (norethisterone p. 479 and norgestrel). The newer progestogens (desogestrel, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel is the active isomer of norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

In delayed puberty cyclical progestogen is added after 12–18 months of oestrogen therapy to establish a menstrual cycle.

Norethisterone is also used to postpone menstruation during a cycle; treatment is started 3 days before the expected onset of menstruation.

7.1 Female sex hormone responsive conditions

OESTROGENS

Ethinylestradiol (Ethinylestradiol)

● INDICATIONS AND DOSE

Induction of sexual maturation in girls

► BY MOUTH

- Child (female): Initially 2 micrograms daily for 6 months, then increased to 5 micrograms daily for 6 months, then increased to 10 micrograms daily for 6 months, then increased to 20 micrograms daily, after 12–18 months of treatment give progestogen for 7 days of each 28-day cycle.

Maintenance of sexual maturation in girls

► BY MOUTH

- Child (female): 20 micrograms daily, to be given with cyclical progestogen for 7 days of each 28-day cycle.

Prevention of tall stature in girls

► BY MOUTH

- Child 2–11 years (female): 20–50 micrograms daily.

Pituitary priming before growth hormone secretion test in girls with bone age over 10 years

► BY MOUTH

- Child (female): 100 micrograms daily for 3 days before test.

- **UNLICENSED USE** Unlicensed for use in children.

- **CONTRA-INDICATIONS** Acute porphyrias p. 603 · cardiovascular disease (sodium retention with oedema) · family history of thromboembolism · gallstones · heart disease associated with pulmonary hypertension · heart disease associated with risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer · history of haemolytic uraemic syndrome · migraine with aura · sclerosing treatment for varicose veins · severe or multiple risk

factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding · venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment)

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · Crohn's disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression (especially if induced by hormonal contraceptive) · hyperprolactinaemia (seek specialist advice) · inflammatory bowel disease · migraine (migraine-like headaches) · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial disease · risk factors for migraine · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from treatment.
- Risk of venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:
 - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
 - obesity—body mass index $\geq 30 \text{ kg/m}^2$ (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
 - history of superficial thrombophlebitis;
 - smoking.
- Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:
 - family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
 - diabetes mellitus (avoid if diabetes complications present);
 - hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (In adolescents, avoid if blood pressure very high);
 - smoking (avoid if smoking 40 or more cigarettes daily);
 - obesity (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

- **INTERACTIONS** → Appendix 1: hormone replacement therapy
- **SIDE-EFFECTS** Breast abnormalities · cervical mucus increased · cholelithiasis · contact lens intolerance · depression · electrolyte imbalance · embolism and thrombosis · erythema nodosum · feminisation · fluid retention · headaches · hypertension · jaundice · cholestatic · metrorrhagia · mood altered · myocardial infarction · nausea · neoplasms · skin reactions · stroke · uterine disorders · vomiting · weight change
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and jaundice.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

► Ethinylestradiol (Non-proprietary)

Ethinylestradiol 2 microgram Ethinylestradiol 2microgram tablets | 100 tablet [PoM] £200.00

Ethinylestradiol 10 microgram Ethinylestradiol 10microgram tablets | 21 tablet [PoM] £200.00 DT = £200.00

Ethinylestradiol 50 microgram Ethinylestradiol 50microgram tablets | 21 tablet [PoM] £200.00 DT = £200.00

Ethinylestradiol 1 mg Ethinylestradiol 1mg tablets | 28 tablet [PoM] £200.00 DT = £200.00

PROGESTOGENS

Norethisterone

● INDICATIONS AND DOSE

Postponement of menstruation

► BY MOUTH

- Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

Induction and maintenance of sexual maturation in females (combined with an oestrogen after 12–18 months oestrogen therapy)

► BY MOUTH

- Child: 5 mg once daily for the last 7 days of 28-day cycle

Short-term contraception

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

Contraception

► BY MOUTH

- Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

● UNLICENSED USE

- When used for Induction and maintenance of sexual maturation in females or Postponement of menstruation Not licensed for use in children.
- When used for Contraception Consult product literature for the licensing status of individual preparations.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Avoid in patients with a history of liver tumours · breast cancer (unless

progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications) · when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

SPECIFIC CONTRA-INDICATIONS

- With oral use Acute porphyrias p. 603 · severe arterial disease · undiagnosed vaginal bleeding

● CAUTIONS

GENERAL CAUTIONS Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

SPECIFIC CAUTIONS

- When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies
- With intramuscular use for contraception Disturbances of lipid metabolism · history during pregnancy of deterioration of atherosclerosis · history during pregnancy of pruritus · possible risk of breast cancer

CAUTIONS, FURTHER INFORMATION

- Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

● INTERACTIONS → Appendix 1: norethisterone

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Menstrual cycle irregularities
- Uncommon Breast tenderness · depression
- Frequency not known Hepatic cancer · skin reactions · thromboembolism · weight change

SPECIFIC SIDE-EFFECTS

- Common or very common
- With intramuscular use Dizziness · haemorrhage · headache · hypersensitivity · nausea
- Uncommon
- With intramuscular use Abdominal distension
- Frequency not known
- With oral use Appetite change · fatigue · gastrointestinal disorder · headaches · hypertension · libido disorder · nervousness

- **PREGNANCY** Not known to be harmful in contraceptive doses. Avoid in other indications.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

- ▶ With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.
- **HEPATIC IMPAIRMENT** When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Caution when used for sexual maturation and to postpone menstruation; avoid if severe.

- **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.

● **PATIENT AND CARER ADVICE**

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery. Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Contraceptives by injection Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

Missed oral contraceptive pill The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

7.2 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

Androgens

Androgens cause masculinisation; they are used as replacement therapy in androgen deficiency, in delayed puberty, and in those who are hypogonadal due to either pituitary or testicular disease.

When given to patients with hypopituitarism androgens can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which stimulates spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate or propionate or alternatively *Sustanon*®, which consists of a mixture of testosterone esters and has a longer duration of action, can be used. For induction of puberty, depot testosterone injections are given monthly and the doses increased every 6 to 12 months according to response. Single ester testosterone injections may need to be given more frequently.

Oral **testosterone undecanoate** is used for induction of puberty. An alternative approach that promotes growth rather than sexual maturation uses oral oxandrolone p. 481.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

Testosterone topical gel is also available but experience of use in children under 15 years is limited. Topical testosterone is applied to the penis in the treatment of micropallus; an extemporaneously prepared cream should be used because the alcohol in proprietary gel formulations causes irritation.

Anti-androgens and precocious puberty

The gonadorelin stimulation test is used to distinguish between *gonadotrophin-dependent (central) precocious puberty* and *gonadotrophin-independent precocious puberty*. Treatment requires specialist management.

Gonadorelin analogues, used in the management of gonadotrophin-dependent precocious puberty, delay development of secondary sexual characteristics and growth velocity.

Testolactone p. 482 and cyproterone acetate p. 482 are used in the management of gonadotrophin-independent precocious puberty, resulting from McCune-Albright syndrome, familial male precocious puberty (testotoxicosis), hormone-secreting tumours, and ovarian and testicular disorders. Testolactone inhibits the aromatisation of testosterone, the rate limiting step in oestrogen synthesis. Cyproterone acetate is a progestogen with anti-androgen properties.

Spironolactone is sometimes used in combination with testosterone because it has some androgen receptor blocking properties.

High blood concentration of sex hormones may activate release of gonadotrophin releasing hormone, leading to development of secondary, central gonadotrophin-dependent precocious puberty. This may require the addition of gonadorelin analogues to prevent progression of pubertal development and skeletal maturation.

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in girls. They are used in the treatment of some *aplastic anaemias*.

Oxandrolone is used to stimulate late pre-pubertal growth prior to induction of sexual maturation in boys with short stature and in girls with Turner's syndrome; specialist management is required.

ANABOLIC STEROIDS > ANDROSTAN DERIVATIVES

Oxandrolone

● INDICATIONS AND DOSE

Stimulation of late pre-pubertal growth in boys (of appropriate age) with short stature

► BY MOUTH

- Child 10–17 years (male): 1.25–2.5 mg daily for 3–6 months.

Stimulation of late pre-pubertal growth in girls with Turner's syndrome

► BY MOUTH

- Child (female): 0.625–2.5 mg daily, to be taken in combination with growth hormone.

- **CONTRA-INDICATIONS** History of primary liver tumours · hypercalcaemia · nephrosis

- **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · skeletal metastases (risk of hypercalcaemia)

● SIDE-EFFECTS

- **Common or very common** Androgenetic alopecia · androgenic effects · anxiety · asthenia · bone formation increased · depression · electrolyte imbalance · epiphyses premature fusion (in pre-pubertal males) · gastrointestinal haemorrhage · gynaecomastia · headache · hirsutism · hypertension · jaundice · cholestatic · nausea · oedema · paraesthesia · polycythaemia · precocious puberty (in pre-pubertal males) · seborrhoea · sexual dysfunction · skin reactions · spermatogenesis reduced · virilism · weight increased

- **Rare or very rare** Hepatic neoplasm

- **Frequency not known** Sleep apnoea

- **PREGNANCY** Avoid—causes masculinisation of female fetus.

- **BREAST FEEDING** Avoid; may cause masculinisation in the female infant or precocious development in the male infant. High doses suppress lactation.

- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.

- **RENAL IMPAIRMENT** Use with caution—potential for fluid retention.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

- **Oxandrin (Imported (Australia))**

Oxandrolone 2.5 mg Oxandrin 2.5mg tablets | 100 tablet [PoM] [X] [CD4-2]

ANDROGENS

Androgens

- **CONTRA-INDICATIONS** Breast cancer in males · history of liver tumours · hypercalcaemia · prostate cancer

- **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored · skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) · sleep apnoea · stop treatment or reduce dose if severe polycythaemia occurs · tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)

● SIDE-EFFECTS

- **Common or very common** Headache · skin reactions

- **Uncommon** Alopecia · gynaecomastia · nausea

- **Frequency not known** Fluid retention · jaundice · polycythaemia · sexual dysfunction

SIDE-EFFECTS, FURTHER INFORMATION Stop treatment or reduce dose if severe polycythaemia occurs.

- **PREGNANCY** Avoid—causes masculinisation of female fetus.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.

- **RENAL IMPAIRMENT** Caution—potential for fluid retention.

- **MONITORING REQUIREMENTS** Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.

► above

Testosterone enantate

● INDICATIONS AND DOSE

Induction and maintenance of sexual maturation in males (specialist use only)

► BY DEEP INTRAMUSCULAR INJECTION

- Child 12–17 years: 25–50 mg/m² every month, increase dose every 6–12 months according to response

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Thrombophilia—increased risk of thrombosis

- **SIDE-EFFECTS** Androgenetic alopecia · anxiety · asthenia · bone disorders · circulatory system disorder · depression · gastrointestinal disorder · gastrointestinal haemorrhage · hepatomegaly · hypercalcaemia · libido increased · neoplasms · oedema · paraesthesia · precocious puberty · prostate disorder · spermatogenesis abnormal · urticaria

● MEDICINAL FORMS

7.2a Precocious puberty

Other drugs used for Precocious puberty Goserelin, p. 471

· Leuporelin acetate, p. 472 · Triptorelin, p. 472

ANTI-ANDROGENS

Cyproterone acetate

● INDICATIONS AND DOSE

Gonadotrophin-independent precocious puberty (specialist use only)

- BY MOUTH
- Child: Initially 25 mg twice daily, adjusted according to response

- **UNLICENSED USE** Unlicensed for use in children.

- **CONTRA-INDICATIONS** Dubin-Johnson syndrome · history of thromboembolic disorders · liver-disease · malignant diseases · meningioma or history of meningioma · previous

or existing liver tumours · Rotor syndrome · severe depression · severe diabetes (with vascular changes) · sickle-cell anaemia · wasting diseases · youths under 18 years (may arrest bone maturation and testicular development)

- **CAUTIONS** Diabetes mellitus · in prostate cancer, severe depression · in prostate cancer, sickle-cell anaemia

● SIDE-EFFECTS

- **Common or very common** Depressed mood · dyspnoea · fatigue · gynaecomastia · hepatic disorders · hot flush · hyperhidrosis · nipple pain · restlessness · weight change
- **Uncommon** Skin reactions
- **Rare or very rare** Galactorrhoea · neoplasms
- **Frequency not known** Adrenocortical suppression · anaemia · azoospermia · hair changes · hypotrichosis · osteoporosis · sebaceous gland underactivity (may clear acne) · thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).

- **HEPATIC IMPAIRMENT** Avoid—dose-related toxicity.

● MONITORING REQUIREMENTS

- Monitor blood counts initially and throughout treatment.
- Monitor adrenocortical function regularly.
- Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

8 Thyroid disorders

8.1 Hyperthyroidism

Antithyroid drugs

Overview

Antithyroid drugs are used for hyperthyroidism either to prepare children for thyroidectomy or for long-term management. In the UK carbimazole below is the most commonly used drug. Propylthiouracil p. 484 should be reserved for children who are intolerant of, or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Treatment in children should be undertaken by a specialist.

Carbimazole or propylthiouracil are initially given in large doses to block thyroid function. This dose is continued until the child becomes euthyroid, usually after 4 to 8 weeks, and is then gradually reduced to a maintenance dose of 30–60% of the initial dose. Alternatively high-dose treatment is continued in combination with levothyroxine sodium replacement (*blocking-replacement regimen*) p. 485; this is particularly useful when dose adjustment proves difficult. Treatment is usually continued for 12 to 24 months. The blocking-replacement regimen is **not** suitable during pregnancy. Hypothyroidism should be avoided particularly during pregnancy as it can cause fetal goitre.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (^{131}I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 104 is useful for rapid relief of thyrotoxic symptoms and can be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but atenolol is also used.

Thyrotoxic crisis ('thyroid storm') requires emergency treatment with intravenous administration of fluids,

propranolol hydrochloride and hydrocortisone p. 440 as sodium succinate, as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Antithyroid drugs in pregnancy

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

Antithyroid drugs in neonates

Neonatal hyperthyroidism is treated with carbimazole or propylthiouracil, usually for 8 to 12 weeks. In severe symptomatic disease iodine may be needed to block the thyroid and propranolol required to treat peripheral symptoms.

ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

Carbimazole

● **INDICATIONS AND DOSE**

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

- ▶ **BY MOUTH**
- ▶ Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

Hyperthyroidism (including Graves' disease)

- ▶ **BY MOUTH**
- ▶ Neonate: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses (up to 1 mg/kg daily) are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses.
- ▶ Child 1 month–11 years: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses; maximum 30 mg per day
- ▶ Child 12–17 years: Initially 30 mg daily until euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses

DOSE EQUIVALENCE AND CONVERSION

- ▶ When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

IMPORTANT SAFETY INFORMATION

NEUTROPENIA AND AGRANULOCYTOSIS

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and

the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

● INTERACTIONS → Appendix 1: carbimazole

● SIDE-EFFECTS

- **Rare or very rare** Bone marrow disorders · haemolytic anaemia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
- **Frequency not known** Agranulocytosis · alopecia · angioedema · dyspepsia · eosinophilia · fever · gastrointestinal disorder · generalised lymphadenopathy · haemorrhage · headache · hepatic disorders · insulin autoimmune syndrome · leucopenia · malaise · myopathy · nausea · nerve disorders · neutropenia · salivary gland enlargement · skin reactions · taste loss

- **PREGNANCY** Carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate. Carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

- **PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

► Carbimazole (Non-proprietary)

Carbimazole 5 mg Carbimazole 5mg tablets | 100 tablet [PoM]

£84.80 DT = £43.74

Carbimazole 10 mg Carbimazole 10mg tablets | 100 tablet [PoM]

£81.32

Carbimazole 15 mg Carbimazole 15mg tablets | 100 tablet [PoM]

£115.98

Carbimazole 20 mg Carbimazole 20mg tablets | 100 tablet [PoM]

£208.17 DT = £144.47

ANTITHYROID DRUGS > THIOURACILS

Propylthiouracil

● INDICATIONS AND DOSE

Hyperthyroidism (including Graves' disease)

► BY MOUTH

- **Neonate:** Initially 2.5–5 mg/kg twice daily until euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.

- **Child 1–11 months:** Initially 2.5 mg/kg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial

dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis

- **Child 1–4 years:** Initially 25 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis
- **Child 5–11 years:** Initially 50 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis
- **Child 12–17 years:** Initially 100 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis

DOSE EQUIVALENCE AND CONVERSION

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

- **UNLICENSED USE** Not licensed for use in children under 6 years of age.

- **INTERACTIONS** → Appendix 1: propylthiouracil

● SIDE-EFFECTS

- **Rare or very rare** Agranulocytosis · bone marrow disorders · glomerulonephritis acute · hearing impairment · leucopenia · thrombocytopenia · vomiting

- **Frequency not known** Alopecia · arthralgia · arthritis · encephalopathy · fever · gastrointestinal disorder · haemorrhage · headache · hepatic disorders · hypoproteinaemia · interstitial pneumonitis · lupus-like syndrome · lymphadenopathy · myopathy · nausea · nephritis · skin reactions · taste altered · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

- **PREGNANCY** Propylthiouracil can be given but the blocking-replacement regimen is **not** suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function.

Monitoring Monitor infant's thyroid status.

- **HEPATIC IMPAIRMENT**

Dose adjustments Reduce dose.

- **RENAL IMPAIRMENT**

Dose adjustments Use 75% of normal dose if estimated glomerular filtration rate 10–50 mL/minute/1.73 m².

Use 50% of normal dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor for hepatotoxicity.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

● MEDICINAL FORMS

Tablet

► Propylthiouracil (Non-proprietary)

Propylthiouracil 50 mg Propylthiouracil 50mg tablets | 56 tablet [PoM] £57.58 DT = £55.21 | 100 tablet [PoM] £98.59-£115.98

VITAMINS AND TRACE ELEMENTS

Iodide with iodine

● INDICATIONS AND DOSE

Thyrotoxicosis (pre-operative)

► BY MOUTH USING ORAL SOLUTION

► Neonate: 0.1–0.3 mL 3 times a day.

► Child: 0.1–0.3 mL 3 times a day

Neonatal thyrotoxicosis

► BY MOUTH USING ORAL SOLUTION

► Neonate: 0.05–0.1 mL 3 times a day.

Thyrotoxic crisis

► BY MOUTH USING ORAL SOLUTION

► Child 1 month–1 year: 0.2–0.3 mL 3 times a day

● **CAUTIONS** Children · not for long-term treatment

● **SIDE-EFFECTS** Conjunctivitis · depression (long term use) · erectile dysfunction (long term use) · excessive tearing · headache · hypersensitivity · increased risk of infection · influenza-like illness · insomnia (long term use) · rash · salivary gland pain

● **PREGNANCY** Neonatal goitre and hypothyroidism.

● **BREAST FEEDING** Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.

● **DIRECTIONS FOR ADMINISTRATION** For oral solution, dilute well with milk or water.

● MEDICINAL FORMS

No licensed medicines listed.

8.2 Hypothyroidism

Thyroid hormones

Overview

Thyroid hormones are used in hypothyroidism (juvenile myxoedema), and also in diffuse non-toxic goitre, congenital or neonatal hypothyroidism, and Hashimoto's thyroiditis (lymphadenoid goitre). Neonatal hypothyroidism requires prompt treatment to facilitate normal development.

Levothyroxine sodium (thyroxine sodium) below is the treatment of choice for *maintenance* therapy.

Doses for congenital hypothyroidism and juvenile myxoedema should be titrated according to clinical response, growth assessment, and measurement of plasma thyroxine and thyroid-stimulating hormone concentrations. In congenital hypothyroidism higher initial doses may normalise metabolism more quickly, with associated beneficial effects on mental development.

Liothyronine sodium p. 486 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 440, and treatment of infection; assisted ventilation is often required.

THYROID HORMONES

Levothyroxine sodium

(Thyroxine sodium)

● INDICATIONS AND DOSE

Hypothyroidism

► BY MOUTH

► Neonate: Initially 10–15 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 5 micrograms/kg every 2 weeks, alternatively adjusted in steps of 5 micrograms/kg as required; maintenance 20–50 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.

► Child 1 month–1 year: Initially 5 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 10–25 micrograms every 2–4 weeks until metabolism normalised; maintenance 25–75 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

► Child 2–11 years: Initially 50 micrograms once daily; adjusted in steps of 25 micrograms every 2–4 weeks until metabolism normalised; maintenance 75–100 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

► Child 12–17 years: Initially 50 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks until metabolism normalised; maintenance 100–200 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

Hypert thyroidism (blocking-replacement regimen) in combination with carbimazole

► BY MOUTH

► Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

● **CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · long-standing hypothyroidism · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

● **INTERACTIONS** → Appendix 1: thyroid hormones

● **SIDE-EFFECTS** Alopecia · angina pectoris · anxiety · arrhythmias · arthralgia · diarrhoea · dyspnoea · epiphyses premature fusion · fever · flushing · headache · heat intolerance · hyperhidrosis · idiopathic intracranial hypertension · insomnia · malaise · menstruation irregular · muscle spasms · muscle weakness · oedema · palpitations · skin reactions · thyrotoxic crisis · tremor · vomiting · weight decreased

- **PREGNANCY** Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Dose adjustments Levothyroxine requirement may increase during pregnancy.

Monitoring Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.
- **PRESCRIBING AND DISPENSING INFORMATION** Levothyroxine equivalent to 100 micrograms/m²/day can be used as a guide to the requirements in children.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Levothyroxine for hypothyroidism www.medicinesforchildren.org.uk/levothyroxine-for-hypothyroidism

MEDICINAL FORMS

Levothyroxine sodium anhydrous 100 microgram Eltroxin 100microgram tablets | 28 tablet [PoM] £1.78 DT = £0.96

Oral solution

- ▶ **Levothyroxine sodium (Non-proprietary)**
Levothyroxine sodium anhydrous 5 microgram per 1 ml Levothyroxine sodium 25micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £118.63 DT = £94.94
Levothyroxine sodium anhydrous 10 microgram per 1 ml Levothyroxine sodium 50micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £91.22 DT = £89.66
Levothyroxine sodium anhydrous 20 microgram per 1 ml Levothyroxine sodium 100micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £165.00 DT = £164.88

Liothyronine sodium (L-Tri-iodothyronine sodium)

INDICATIONS AND DOSE

Hypothyroidism

- ▶ **BY MOUTH**
- ▶ Child 12–17 years: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses

Hypothyroid coma

- ▶ **BY SLOW INTRAVENOUS INJECTION**
- ▶ Child 12–17 years: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

Hypothyroidism (replacement for oral levothyroxine)

- ▶ **BY SLOW INTRAVENOUS INJECTION**
- ▶ Child: Convert daily levothyroxine dose to liothyronine and give in 2–3 divided doses, adjusted according to response
- ▶ **DOSE EQUIVALENCE AND CONVERSION**
- ▶ 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- ▶ Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

- **CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · prolonged hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency) · severe hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency)

- **INTERACTIONS** → Appendix 1: thyroid hormones

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Rare or very rare** Alopecia · angina pectoris (more common at excessive dosage) · arrhythmia (more common at excessive dosage) · diarrhoea (more common at excessive dosage) · heat intolerance · muscle cramps · muscle weakness · palpitations (more common at excessive dosage) · tachycardia (more common at excessive dosage) · vomiting (more common at excessive dosage)
- ▶ **Frequency not known** Agitation · fever · flushing · headache · hyperhidrosis · insomnia (more common at excessive dosage) · oedema · restlessness (more common at excessive dosage) · skin reactions · tremor (more common at excessive dosage) · weight decreased

SPECIFIC SIDE-EFFECTS

- ▶ **Rare or very rare**
- ▶ With intravenous use Epiphyses premature fusion · idiopathic intracranial hypertension · menstruation irregular
- **PREGNANCY** Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.
Dose adjustments Liothyronine requirement may increase during pregnancy.
Monitoring Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).
- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.
- **PRESCRIBING AND DISPENSING INFORMATION** Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

● MEDICINAL FORMS

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary incontinence

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity; oxybutynin hydrochloride p. 489 also has a direct relaxant effect on urinary smooth muscle. Oxybutynin hydrochloride can be considered first for children under 12 years. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose and then slowly titrating upwards; alternatively oxybutynin hydrochloride can be given by intravesicular instillation. Tolterodine tartrate p. 490 is also effective for urinary incontinence; it can be considered for children over 12 years, or for younger children who have failed to respond to oxybutynin hydrochloride. Modified-release preparations of oxybutynin hydrochloride and tolterodine tartrate are available; they may have fewer side-effects. Antimuscarinic treatment should be reviewed soon after it is commenced, and then at regular intervals; a response generally occurs within 6 months but occasionally may take longer. Children with nocturnal enuresis may require specific additional measures if night-time symptoms also need to be controlled.

See also Nocturnal enuresis in children below.

Nocturnal enuresis in children

23-May-2017

Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

Treatment

Children under 5 years

[EvGr] For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families. **[A]**

Non Drug Treatment

[EvGr] Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in children under 7 years should be considered depending on the child's maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 432, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable. **[A]**

Drug Treatment

[EvGr] Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn **gradually** at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 489 or tolterodine tartrate p. 490 [unlicensed indication]). Treatment should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 240 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually.

ANTIMUSCARINICS

Antimuscarinics (systemic)

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention
- **CAUTIONS** Arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia) · cardiac surgery (due to association with tachycardia) · children (increased risk of side-effects) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · gastro-oesophageal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to angle-closure glaucoma · pyrexia · ulcerative colitis
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Confusion · constipation · dizziness · drowsiness · dry mouth · dyspepsia · flushing · headache · nausea · palpitations · skin reactions · tachycardia · urinary disorders · vision disorders · vomiting
 - ▶ **Uncommon** Angioedema
- **PATIENT AND CARER ADVICE**
 - ▶ **Driving and skilled tasks** Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

 above

Oxybutynin hydrochloride

● INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
 - ▶ Child 2–4 years: 1.25–2.5 mg 2–3 times a day
 - ▶ Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
 - ▶ Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- ▶ **BY INTRAVESICAL INSTILLATION**
 - ▶ Child 2–17 years: 5 mg 2–3 times a day
- ▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**
 - ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

Nocturnal enuresis associated with overactive bladder

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
 - ▶ Child 5–17 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime

▶ BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*® XL

- **UNLICENSED USE** Not licensed for use in children under 5 years. Intravesical instillation not licensed for use in children.

- **CAUTIONS** Acute porphyrias p. 603

- **INTERACTIONS** → Appendix 1: oxybutynin

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · dry eye
- ▶ **Uncommon** Abdominal discomfort · appetite decreased · dysphagia · urticaria

SPECIFIC SIDE-EFFECTS

- ▶ **Frequency not known**

Anxiety · arrhythmia · cognitive disorder · depressive symptom · disorientation · drug dependence · gastrointestinal disorders · glaucoma · hallucination · heat stroke · hypohidrosis · mydriasis · nightmare · paranoia · photosensitivity reaction · seizure · urinary tract infection

- **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in *animal studies*.

- **BREAST FEEDING** Manufacturers advise avoid—present in milk in *animal studies*.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

- **PRESCRIBING AND DISPENSING INFORMATION** The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

Intravesical instillation may be available from ‘special-order’ manufacturers or specialist importing companies.

1.2 Urinary retention

Urinary retention

31-May-2017

Description of condition

Urinary retention is the inability to voluntarily urinate. Causes in children can include severe voiding dysfunction, urethral blockage, drug treatment (such as opioids and antimuscarinic drugs), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, and neurogenic causes.

Acute urinary retention is a medical emergency characterised by the abrupt (over a period of hours) development of the inability to pass urine, associated with increasing pain and the presence of a distended bladder, which can be palpated on examination.

Chronic urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by difficulties with initiating and maintaining urinary stream, urinary overflow, no sensation for needing to void and a post-void residual.

Treatment

[EvGr] Treatment of urinary retention depends on the underlying condition. Catheterisation is used as an effective initial management strategy, which should be followed by diagnostic evaluation and appropriate treatment of the underlying cause. Clean intermittent catheterisation on a long-term basis is effective for children with idiopathic or neurogenic bladder dysfunction.

The selective alpha-adrenoceptor blockers, doxazosin below and tamsulosin hydrochloride p. 492, have been shown to be of use in primary bladder neck dysfunction and dysfunctional voiding; they reduce urethral sphincteric pressure, thereby improving bladder emptying in children. Treatment should be under specialist advice only. 

ALPHA-ADRENOCEPTOR BLOCKERS

Doxazosin

● INDICATIONS AND DOSE

Hypertension

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ **Child 6–11 years:** Initially 500 micrograms once daily, then increased to 2–4 mg once daily, dose should be increased at intervals of 1 week
- ▶ **Child 12–17 years:** Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily, rarely doses of up to 16 mg daily may be required

Dysfunctional voiding (initiated under specialist supervision)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ **Child 4–11 years:** Initially 0.5 mg daily, adjusted according to response, dose should be increased at monthly intervals; maximum 2 mg per day
- ▶ **Child 12–17 years:** Initially 1 mg daily, adjusted according to response, dose may be doubled at intervals of 1 month; usual maintenance 2–4 mg daily; maximum 8 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** History of postural hypotension
- **CAUTIONS** Care with initial dose (postural hypotension) · cataract surgery (risk of intra-operative floppy iris syndrome) · heart failure · pulmonary oedema due to aortic or mitral stenosis
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS**
- ▶ **Common or very common** Arrhythmias · asthenia · chest pain · cough · cystitis · dizziness · drowsiness · dry mouth · dyspnoea · gastrointestinal discomfort · headache · hypotension · increased risk of infection · influenza like illness · muscle complaints · nausea · oedema · pain · palpitations · skin reactions · urinary disorders · vertigo
- ▶ **Uncommon** Angina pectoris · anxiety · appetite abnormal · arthralgia · constipation · depression · diarrhoea · gastrointestinal disorders · gout · haemorrhage · insomnia · myocardial infarction · sensation abnormal · sexual dysfunction · stroke · syncope · tinnitus · tremor · vomiting · weight increased
- ▶ **Rare or very rare** Alopecia · bronchospasm · flushing · gynaecomastia · hepatic disorders · leucopenia · malaise · muscle weakness · thrombocytopenia · vision blurred
- ▶ **Frequency not known** Floppy iris syndrome
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Accumulates in milk in *animal studies*—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution. Manufacturer advises avoid in severe impairment—no information available.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for doxazosin tablets (initial dose).
- Driving and skilled tasks** May affect performance of skilled tasks e.g. driving.

1.3 Urological pain

Urological pain

Treatment

Lidocaine hydrochloride gel is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

Alkalinisation of urine

Alkalinisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of cystitis caused by lower urinary tract infections.

ALKALISING DRUGS

Citric acid with potassium citrate

● INDICATIONS AND DOSE

Relief of discomfort in mild urinary-tract infections |

Alkalinisation of urine

► BY MOUTH USING ORAL SOLUTION

- Child 1–5 years: 5 mL 3 times a day, diluted well with water
- Child 6–17 years: 10 mL 3 times a day, diluted well with water

- **CAUTIONS** Cardiac disease
- **INTERACTIONS** → Appendix 1: potassium citrate
- **SIDE-EFFECTS** Hyperkalaemia • nausea • vomiting
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- Monitoring** Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL.
- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 27

2 Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine p. 703 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas spp.* Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% (physiological saline) p. 589 is usually adequate and is preferred as a mechanical irrigant.

Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

Catheter maintenance solutions

● CATHETER MAINTENANCE SOLUTIONS

OptiFlo R citric acid 6% catheter maintenance solution (Bard Ltd)

Sodium chloride 9 mg per 1 ml 50 ml • NHS indicative price = £3.54 • Drug Tariff (Part IXa)

100 ml • NHS indicative price = £3.54 • Drug Tariff (Part IXa)

3 Contraception

Contraceptives, hormonal

Overview

The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg16) should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom*®) is also available; it is pre-lubricated but does not contain a spermicide.

Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen ('combined oral contraceptives') are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'phasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Choice

The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- *Low strength preparations* (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- *Standard strength preparations* (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased*

preparations) are appropriate for standard use. Phased preparations are generally reserved for women who *either* do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 500, ethinylestradiol with drospirenone p. 501, and ethinylestradiol with gestodene p. 502 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Denogest with estradiol valerate p. 500 is in the combined oral contraceptive *Qlaira*®. Nomegestrol is the progestogen contained in the combined oral contraceptive *Zoely*®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evra*®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*®).

Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate p. 512 (*Depo-Provera*®, *SAYANA PRESS*®) is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (*Noristerat*®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems *Mirena*®, *Jaydess*® and *Levosert*® release levonorgestrel p. 508 directly into the uterine cavity. *Mirena*® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. *Jaydess*® and *Levosert*® are licensed for contraception, and *Levosert*® is additionally

licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Contraceptives, non-hormonal

Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' p. 513 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for young women irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

A frameless, copper-bearing intra-uterine device (*Gyne Fix*®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

Caution with oil-based lubricants

Products such as petroleum jelly (*Vaseline*®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from

latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Emergency contraception

01-Sep-2017

Overview

[EvGr] Emergency contraception is intended for occasional use, to reduce the risk of pregnancy after unprotected sexual intercourse. It does not replace effective regular contraception.

Women who do not wish to conceive should be offered emergency contraception after unprotected sexual intercourse that has taken place on any day of a natural menstrual cycle. Emergency contraception should also be offered after unprotected intercourse from day 21 after childbirth (unless the criteria for lactational amenorrhoea are met), and from day 5 after abortion, miscarriage, ectopic pregnancy or uterine evacuation for gestational trophoblastic disease.

Emergency contraception should also be offered to women if their regular contraception has been compromised or has been used incorrectly. ⚠

Emergency contraceptive methods

Copper intra-uterine devices

[EvGr] Insertion of a copper intra-uterine device (see intra-uterine contraceptive devices (copper) p. 505) is the most effective form of emergency contraception and should be offered (if appropriate) to all women who have had unprotected sexual intercourse and do not want to conceive. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse or up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle. Antibacterial cover should be considered for copper intra-uterine contraceptive device insertion if there is a significant risk of sexually transmitted infection that could be associated with ascending pelvic infection.

A copper intra-uterine device is not known to be affected by body mass index (BMI) or body-weight or by other drugs. ⚠

Hormonal methods

[EvGr] Hormonal emergency contraceptives (includes levonorgestrel p. 508 and ulipristal acetate p. 507) should be offered as soon as possible after unprotected intercourse if a copper intra-uterine device is not appropriate or is not acceptable to the patient; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy. Hormonal emergency contraception administered after ovulation is ineffective.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate is effective if taken within 120 hours (5 days) of unprotected intercourse. Ulipristal acetate has been demonstrated to be more effective than levonorgestrel for emergency contraception.

It is possible that a higher body-weight or BMI could reduce the effectiveness of oral emergency contraception, particularly levonorgestrel; if BMI is greater than 26 kg/m² or body-weight is greater than 70 kg, it is recommended that either ulipristal acetate or a double dose of levonorgestrel [unlicensed indication] (see *Emergency contraception* under levonorgestrel) is given. It is unknown which is more effective.

Ulipristal acetate should be considered as the first-line hormonal emergency contraceptive for a woman who has

had unprotected intercourse 96–120 hours ago (even if she has also had unprotected intercourse within the last 96 hours). It should also be considered first line for a woman who has had unprotected sexual intercourse within the last 5 days if it is likely to have taken place during the 5 days before the estimated day of ovulation. **⚠**

Hormonal emergency contraception interactions

See Contraceptives, interactions below.

Starting hormonal contraception after emergency hormonal contraception

Emergency hormonal contraception methods do **not** provide ongoing contraception. **EvGr** After taking levonorgestrel, women should start suitable hormonal contraception immediately. They must use condoms reliably or abstain from intercourse until contraception becomes effective.

Women should wait 5 days after taking ulipristal acetate before starting suitable hormonal contraception. Women must use condoms reliably or abstain from intercourse during the 5 day waiting period and also until their contraceptive method is effective. **⚠**

The copper intra-uterine device immediately provides effective ongoing contraception.

Contraceptives, interactions

06-Jun-2017

Overview

The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 196, eslicarbazepine acetate, nevirapine p. 414, oxcarbazepine p. 204, phenytoin p. 205, phenobarbital p. 216, primidone p. 217, ritonavir p. 426, St John's Wort, topiramate p. 212 and, above all, rifabutin p. 364 and rifampicin p. 364) and possibly also griseofulvin p. 379. **EvGr** A condom together with a long-acting method (such as an injectable contraceptive) may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists. **⚠**

Combined hormonal contraceptives interactions

EvGr Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progestogen-only contraceptives (medroxyprogesterone acetate p. 512 and norethisterone p. 479) or intra-uterine devices (levonorgestrel p. 508; see also Contraceptives, non-hormonal p. 496). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed: **⚠**

Short course (2 months or less) of an enzyme-inducing drug

EvGr Continuing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug. **⚠**

Long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin) or a course of griseofulvin

EvGr Use a monophasic combined oral contraceptive at a dose of ethinylestradiol 50 micrograms or more daily [unlicensed use] and use either an extended or a 'tricycling' regimen (i.e. taking three packets of monophasic tablets without a break followed by a shortened tablet-free interval of four days [unlicensed use]); continue for the duration of treatment with the interacting drug and for four weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use] on specialist advice, or to use additional precautions, or to change to a method unaffected by the interacting drugs.

Use of contraceptive patches and vaginal rings (including concurrent use of two patches or two vaginal rings) is not recommended for women taking enzyme-inducing drugs over a long period. **⚠**

Long-term course (over 2 months) of rifampicin or rifabutin

An alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for four weeks after stopping the enzyme-inducing drug.

Antibacterials that do not induce liver enzymes

EvGr It is recommended that no additional contraceptive precautions are required when *combined* oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman. **⚠**

There had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 341, doxycycline p. 352) reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. **EvGr** The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug. **⚠**

Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. **EvGr** The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

Effectiveness of the etonogestrel-releasing implant p. 511 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug. **⚠**

Hormonal emergency contraception interactions

The effectiveness of levonorgestrel and ulipristal acetate p. 507 is reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). [EvGr] A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See *Dose adjustments due to interactions* under levonorgestrel). There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers. **A**

The effectiveness of ulipristal acetate for emergency contraception in women using drugs that increase gastric pH has not been studied. [EvGr] Levonorgestrel or a copper intra-uterine device should be considered as alternatives.

Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception—the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended.

Ulipristal acetate can be used as emergency hormonal contraception more than once in the same cycle. **A** Conversely, manufacturer advises that use of levonorgestrel as emergency contraception more than once in the same cycle is not advisable due to increased risk of side-effects (such as menstrual irregularities).

[EvGr] Levonorgestrel should not be used (as emergency hormonal contraception) within 5 days of administration of ulipristal acetate (as emergency hormonal contraception), as the contraceptive effect of ulipristal acetate may be reduced by progestogens.

Ulipristal acetate is not recommend for use in women who have severe asthma treated by oral corticosteroids, due to the antiglucocorticoid effect of ulipristal acetate. **A**

Useful Resources

Drug interactions with hormonal contraception. The Faculty of Sexual and Reproductive Healthcare. Clinical guidance. January 2018.

www.fsrh.org/standards-and-guidance/current-clinical-guidance/drug-interactions

3.1 Contraception, combined**OESTROGENS COMBINED WITH PROGESTOGENS****Combined hormonal contraceptives**

- **CONTRA-INDICATIONS** Acute porphyrias p. 603 • gallstones • heart disease associated with pulmonary hypertension or risk of embolus • history during pregnancy of cholestatic jaundice • history during pregnancy of chorea • history during pregnancy of pemphigoid gestationis • history during pregnancy of pruritus • history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) • history of haemolytic uraemic syndrome • migraine with aura • personal history of venous or arterial thrombosis • sclerosing treatment for varicose veins • severe or multiple risk factors for arterial disease • severe or multiple risk factors for venous thromboembolism • systemic lupus erythematosus • transient cerebral ischaemic attacks without headaches • undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • Crohn's disease • gene mutations associated with breast cancer (e.g. BRCA 1) • history of severe depression especially if induced by

hormonal contraceptive • hyperprolactinaemia (seek specialist advice) • inflammatory bowel disease • migraine • personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) • risk factors for arterial disease • risk factors for venous thromboembolism • sickle-cell disease • undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

- ▶ Risk factors for venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:
 - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
 - obesity; body mass index $\geq 30 \text{ kg/m}^2$ (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
 - history of superficial thrombophlebitis;
 - age over 35 years (avoid if over 50 years);
 - smoking.

Combined Hormonal Contraception and Risk of Venous Thromboembolism

Progestogen in Combined Hormonal Contraceptive	Estimated incidence per 10 000 women per year of use
Non-pregnant, not using combined hormonal contraception	2
Levonorgestrel ¹	5–7
Norgestimate ¹	5–7
Norethisterone ¹	5–7
Etonogestrel ¹	6–12
Norelgestromin ¹	6–12
Gestodene ¹	9–12
Desogestrel ¹	9–12
Drospirenone ¹	9–12
Dienogest ²	Not known—insufficient data
Nomegestrol ²	Not known—insufficient data

¹ Combined with ethinylestradiol ² Combined with estradiol

- **Risk factors for arterial disease** Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- **family history of arterial disease** in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- **diabetes mellitus** (avoid if diabetes complications present);
- **hypertension**; blood pressure above **systolic 140 mmHg** or **diastolic 90 mmHg** (avoid if blood pressure above **systolic 160 mmHg** or **diastolic 95 mmHg**); (in adolescents, avoid if blood pressure very high);
- **smoking** (avoid if smoking 40 or more cigarettes daily);
- **age** over 35 years (avoid if over 50 years);
- **obesity** (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- **migraine without aura** (avoid if **migraine with aura** (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

- **Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

• SIDE-EFFECTS

- **Common or very common** Acne · fluid retention · headaches · menstrual cycle irregularities · nausea · weight increased
- **Uncommon** Alopecia · hypertension
- **Rare or very rare** Venous thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.

• DIRECTIONS FOR ADMINISTRATION

- **With oral use** Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection

may be lost. **21-day combined preparations**, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. **Every day (ED) combined preparations**, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations.

Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days.

Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*®).

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®). **After abortion or miscarriage** Start same day.

• PATIENT AND CARER ADVICE

Travel Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

Missed doses The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets).

Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the

first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

F 498

Dienogest with estradiol valerate

● INDICATIONS AND DOSE

Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations

► BY MOUTH

- Females of childbearing potential: 1 active tablet once daily for 26 days, followed by 1 inactive tablet daily for 2 days, withdrawal bleeding may occur during the 2-day interval of *inactive* tablets, tablets should be taken at approximately the same time each day

- **UNLICENSED USE** Consult product literature for the licensing status.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

● SIDE-EFFECTS

- **Common or very common** Breast abnormalities · gastrointestinal discomfort · headaches · increased risk of infection
- **Uncommon** Appetite increased · cervical abnormalities · crying · depression · diarrhoea · dizziness · fatigue · haemorrhage · hot flush · hyperhidrosis · mood altered · muscle spasms · neoplasms · oedema · ovarian and fallopian tube disorders · painful sexual intercourse · pelvic disorders · sexual dysfunction · skin reactions · sleep disorders · uterine cramps · vomiting · vulvovaginal disorders · weight decreased
- **Rare or very rare** Aggression · anxiety · arterial thromboembolism · asthma · chest pain · cholecystitis chronic · concentration impaired · constipation · contact lens intolerance · dry eye · dry mouth · dyspnoea · eye swelling · fever · galactorrhoea · gastroesophageal reflux disease · genital discharge · hair changes · hypertriglyceridaemia · hypotension · lymphadenopathy · malaise · myocardial infarction · pain · palpitations · paraesthesia · seborrhoea · sensation of pressure · urinary tract pain · vascular disorders · vertigo

● DIRECTIONS FOR ADMINISTRATION

Changing to *Qlaira*® Start the first active *Qlaira*® tablet on the day after taking the last active tablet of the previous brand.

● PATIENT AND CARER ADVICE

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Qlaira*®, refer to product literature.

Missed doses A missed pill for a patient taking *Qlaira*® is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*®, refer to product literature.

498

Ethinylestradiol with etonogestrel

● INDICATIONS AND DOSE

Contraception | Menstrual symptoms

▶ BY VAGINA

- ▶ Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

● DIRECTIONS FOR ADMINISTRATION

Changing method of contraception to vaginal ring

Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer vaginal ring. Counselling The presence of the ring should be checked regularly.

Missed doses Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle *or* allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

• INDICATIONS AND DOSE

Contraception | Menstrual symptoms

► BY TRANSDERMAL APPLICATION

- Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

- **UNLICENSED USE** Consult product literature for the licensing status of individual preparations.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

● SIDE-EFFECTS

- **Common or very common** Anxiety · breast abnormalities · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · increased risk of infection · malaise · mood altered · muscle spasms · skin reactions · uterine cramps · vaginal haemorrhage · vomiting · vulvovaginal disorders
- **Uncommon** Appetite increased · dyslipidaemia · insomnia · lactation disorders · oedema · photosensitivity reaction · sexual dysfunction
- **Rare or very rare** Embolism and thrombosis · gallbladder disorders · genital discharge · neoplasms · stroke · swelling
- **Frequency not known** Anger · angioedema · cervical dysplasia · colitis · contact lens intolerance · erythema nodosum · hepatic disorders · hyperglycaemia · hypertensive crisis · intracranial haemorrhage · myocardial infarction · pulmonary artery thrombosis · taste altered

- **DIRECTIONS FOR ADMINISTRATION** Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.

Changing to a transdermal combined hormonal contraceptive

Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last *active* tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

Changing from progestogen-only method

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

After abortion or miscarriage Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier

methods) should be used for first 7 days after applying the patch.

- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer patches.

Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Missed doses Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra*® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

Levonorgestrel, p. 508

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper)

INDICATIONS AND DOSE

Contraception

- ▶ BY INTRA-UTERINE ADMINISTRATION
- ▶ Females of childbearing potential: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

- **CONTRA-INDICATIONS** Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · distorted uterine cavity · established or marked immunosuppression · genital malignancy · medical diathermy · pelvic inflammatory disease · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding · Wilson's disease

- **CAUTIONS** Anaemia · anticoagulant therapy (avoid if possible) · diabetes · disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age

CAUTIONS, FURTHER INFORMATION

- ▶ **Risk of infection** The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
 - they are under 25 years old *or*
 - they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If

results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- **SIDE-EFFECTS** Device complications · epilepsy (on insertion) · haemorrhage (on insertion) · hypersensitivity · menstrual cycle irregularities · pain (on insertion—alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection exacerbated · presyncope (on insertion) · uterine injuries

SIDE-EFFECTS, FURTHER INFORMATION Advise the patient to seek medical attention promptly in case of significant symptoms—very small risk of uterine perforation, ectopic pregnancy and pelvic inflammatory disease.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a copper allergy.
- **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.
- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.
- **PRESCRIBING AND DISPENSING INFORMATION**

TT380® SLIMLINE For uterine length 6.5–9 cm; replacement every 10 years.

LOAD® 375 For uterine length over 7 cm; replacement every 5 years.

3.3 Contraception, emergency

Other drugs used for Contraception, emergency
Levonorgestrel, p. 508

PROGESTERONE RECEPTOR MODULATORS

Ulipristal acetate

12-Apr-2018

- **DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

• INDICATIONS AND DOSE

Emergency contraception

► BY MOUTH

- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

- **CAUTIONS** Uncontrolled severe asthma

- **INTERACTIONS** → Appendix 1: ulipristal

• SIDE-EFFECTS

- **Common or very common** Back pain • breast tenderness • dizziness • fatigue • gastrointestinal discomfort • headaches • menstrual cycle irregularities • mood altered • myalgia • nausea • pelvic pain • vomiting
- **Uncommon** Anxiety • appetite disorder • chills • concentration impaired • diarrhoea • drowsiness • dry mouth • fever • flatulence • hot flush • increased risk of infection • insomnia • libido disorder • malaise • skin reactions • vision disorders • vulvovaginal disorders
- **Rare or very rare** Abnormal sensation in eye • disorientation • dry throat • eye erythema • genital pruritus • ovarian cyst ruptured • painful sexual intercourse • syncope • taste altered • thirst • tremor • vertigo

- **CONCEPTION AND CONTRACEPTION** When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for *Qlaira*®) and 9 days for oral progestogen-only contraceptives.

- **PREGNANCY** Limited information available when used as an emergency contraceptive.

- **BREAST FEEDING** In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk.

• HEPATIC IMPAIRMENT

- When used for Emergency contraception Manufacturer advises avoid in severe impairment—no information available.

• PATIENT AND CARER ADVICE

- When used for Emergency contraception If vomiting occurs within 3 hours of taking a dose, a replacement dose should be given. When prescribing or supplying hormonal emergency contraception, women should be advised:
 - that their next period may be early or late;
 - that a barrier method of contraception needs to be used until the next period;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
 - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Ellaone** (HRA Pharma UK Ltd)
Ulipristal acetate 30 mg EllaOne 30mg tablets | 1 tablet [P] £14.05
DT = £14.05

► **Esmya** (Gedeon Richter (UK) Ltd)
Ulipristal acetate 5 mg Esmya 5mg tablets | 28 tablet [PoM]
£114.13 DT = £114.13

3.4 Contraception, oral progestogen-only

Other drugs used for Contraception, oral progestogen-only Norethisterone, p. 479

PROGESTOGENS

Desogestrel

• INDICATIONS AND DOSE

Contraception

► BY MOUTH

- Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a 'missed pill'

- **UNLICENSED USE** Consult product literature for the licensing status of individual preparations.
- **CONTRA-INDICATIONS** Acute porphyrias p. 603 • history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable • severe arterial disease • undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • arterial disease • functional ovarian cysts • history of jaundice in pregnancy • malabsorption syndromes • past ectopic pregnancy • sex-steroid dependent cancer • systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- CAUTIONS, FURTHER INFORMATION**
 - Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- **INTERACTIONS** → Appendix 1: desogestrel

● SIDE-EFFECTS

- ▶ **Common or very common** Breast abnormalities · depressed mood · headache · libido decreased · menstrual cycle irregularities · mood altered · nausea · skin reactions · weight increased
- ▶ **Uncommon** Alopecia · contact lens intolerance · fatigue · ovarian cyst · vomiting · vulvovaginal infection
- ▶ **Rare or very rare** Erythema nodosum
- ▶ **Frequency not known** Angioedema · embolism and thrombosis · neoplasms

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progestogen-only contraceptives (POCs), such as desogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

Available evidence does not support an association between the use of a progestogen-only contraceptive pill and breast cancer. Any increased risk is likely to be small and reduces gradually during the 10 years after stopping; there is no excess risk 10 years after stopping. The older age at which the contraceptive is stopped appears to have a greater influence on increased risk rather than the duration of use.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

● PATIENT AND CARER ADVICE

Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Missed doses The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2003) that *Cerazette*® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

● MEDICINAL FORMS

Levonorgestrel

16-Apr-2018

● INDICATIONS AND DOSE

Emergency contraception

▶ BY MOUTH

- ▶ Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time), alternatively 3 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time). Higher dose should be considered for patients with body-weight over 70 kg or BMI over 26 kg/m²

Contraception

▶ BY MOUTH

- ▶ Females of childbearing potential: 30 micrograms daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

JAYDESS® 13.5MG INTRA-UTERINE DEVICE**Contraception**

► BY VAGINA

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

KYLEENA® 19.5MG INTRA-UTERINE DEVICE**Contraception**

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery and not before uterus is fully involuted; effective for 5 years

LEVOSERT® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE**Contraception | Menorrhagia**

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester abortion; postpartum insertions should be delayed until at least 6 weeks after delivery and not before uterus is fully involuted; effective for 4 years

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE**Contraception | Menorrhagia**

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs.
- There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.
- With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

- **UNLICENSED USE** ^(EvGr) Dose for emergency contraception in patients with body-weight over 70 kg or BMI over 26 kg/m² differs from product licence. Use for emergency contraception between 72–96 hours after coitus differs from product licence. ^(A)
- With oral use Consult product literature for licensing status of individual preparations.
- With vaginal use Not licensed for use in women under 18 years.

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS**

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

• CONTRA-INDICATIONS

- With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration · acute cervicitis · acute malignancies affecting the blood (use with caution in remission) · acute vaginitis · distorted uterine cavity · history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception · increased risk factors for pelvic infections · infected abortion during the previous three months · not suitable for emergency contraception · pelvic inflammatory disease · postpartum endometritis · unexplained uterine bleeding · unresolved cervical intraepithelial neoplasia · uterine or cervical malignancy
- With oral use Acute porphyrias p. 603
- With oral use for contraception History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

• CAUTIONS

GENERAL CAUTIONS Risk factors for ectopic pregnancy (including previous ectopic pregnancy, tubal surgery or pelvic infection)

SPECIFIC CAUTIONS

- With intra-uterine use Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · acute venous thromboembolism (consider removal) · anaemia · anticoagulant therapy (avoid if possible) · diabetes · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · jaundice (consider removal) · marked increase of blood pressure (consider removal) · menorrhagia (progestogen intra-uterine system

- might be preferable) • migraine (consider removal) • nulliparity • severe arterial disease (consider removal) • severe cervical stenosis • severe headache (consider removal) • severe primary dysmenorrhoea • severely scarred uterus (including after endometrial resection) • young age
- ▶ With oral use for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • arterial disease • functional ovarian cysts • history of jaundice in pregnancy • malabsorption syndromes • past ectopic pregnancy • sex-steroid dependent cancer • systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- ▶ With oral use for emergency contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • past ectopic pregnancy • severe malabsorption syndromes

CAUTIONS, FURTHER INFORMATION

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- ▶ Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
 - they are under 25 years old *or*
 - they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

- ▶ Use as a contraceptive in co-morbidities
- ▶ With oral use The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE Advanced uterine atrophy

- **INTERACTIONS** → Appendix 1: levonorgestrel
- **SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With intra-uterine use Back pain • breast abnormalities • depression • device expulsion • gastrointestinal discomfort • headaches • hirsutism • increased risk of infection • libido decreased • menstrual cycle irregularities • nausea • nervousness • ovarian cyst • pelvic disorders • skin reactions • uterine haemorrhage (on insertion) • vaginal haemorrhage (on insertion) • vulvovaginal disorders • weight increased
 - ▶ With oral use Breast tenderness • diarrhoea • dizziness • fatigue • gastrointestinal discomfort • haemorrhage • headaches • menstrual cycle irregularities • nausea • vomiting
- ▶ **Uncommon**
 - ▶ With intra-uterine use Alopecia • endometritis • oedema • uterine rupture
- ▶ **Rare or very rare**
 - ▶ With oral use Face oedema • pelvic pain • skin reactions
- ▶ **Frequency not known**
 - ▶ With oral use Cerebrovascular insufficiency • depressed mood • diabetes mellitus • embolism and thrombosis • neoplasms • sexual dysfunction • weight changes

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

With intra-uterine use There is no evidence of an association between the levonorgestrel intra-uterine system and breast cancer. The levonorgestrel intra-uterine system should be avoided in patients with a history of breast cancer; any consideration of its use should be by a specialist in contraception and in consultation with the patients cancer specialist.

Patients should be informed about the device that has been inserted and when it should be removed or replaced (including referring them to a patient information leaflet and other sources of information).

Patients may experience irregular, prolonged or infrequent menstrual bleeding in the 3–6 months following insertion; bleeding pattern improves with time but persists in some patients.

Progestogenic side-effects resolve with time (after the first few months).

● PREGNANCY

- ▶ With oral use Not known to be harmful.
- ▶ With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

● **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

● HEPATIC IMPAIRMENT

- ▶ With oral use Manufacturer advises avoid in severe impairment.
- ▶ With intra-uterine use Manufacturer advises avoid in severe impairment—no information available; avoid in acute hepatic disease.

● MONITORING REQUIREMENTS

- ▶ With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intra-uterine use *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

JAYDESS® 13.5MG INTRA-UTERINE DEVICE When system is removed (and not immediately replaced) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

KYLEENA® 19.5MG INTRA-UTERINE DEVICE When system is removed (and not immediately replaced) and pregnancy is

not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle, or in case of irregular menses, and if there is intercourse within 7 days.

● PATIENT AND CARER ADVICE

Diarrhoea and vomiting with use as an oral contraceptive
Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progesterone-only contraceptives. If vomiting occurs within 2 hours of taking an oral progesterone-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progesterone-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine

- With oral use for Contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progesterone-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

- With oral use for Emergency contraception Manufacturer advises if vomiting occurs within 3 hours of taking levonorgestrel, a replacement dose should be taken immediately.
 - When prescribing or supplying hormonal emergency contraception, women should be advised:
 - that their next period may be early or late;
 - that a barrier method of contraception needs to be used until the next period;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
 - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

- With intra-uterine use Counsel women on the signs, symptoms and risks of perforation and ectopic pregnancy.
Missed doses When used as an oral contraceptive, the following advice is recommended 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progesterone-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

● NATIONAL FUNDING/ACCESS DECISIONS

KYLEENA® 19.5MG INTRA-UTERINE DEVICE

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2018) that levonorgestrel (Kyleena®) is accepted for use

within NHS Scotland as a contraceptive device for up to 5 years.

- **EXCEPTIONS TO LEGAL CATEGORY** *Levonelle® One Step* can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Intra-uterine device

- ▶ **Jaydess** (Bayer Plc) ▼
Levonorgestrel 13.5 mg Jaydess 13.5mg intra-uterine device | 1 device [PoM] £69.22

3.5 Contraception, parenteral progesterone-only

Other drugs used for Contraception, parenteral progesterone-only Norethisterone, p. 479

PROGESTOGENS

Etonogestrel

27-Sep-2016

● INDICATIONS AND DOSE

Contraception (no hormonal contraceptive use in previous month)

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery (delay continued →

until 28 days postpartum if breast-feeding), implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester

► BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the first trimester

► BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: 1 implant to be inserted within 5 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception (changing from other hormonal contraceptive)

► BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

- **UNLICENSED USE** *Nexplanon*® not licensed for use in females outside of the age range 18–40 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2016): *NEXPLANON*® (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: REPORTS OF DEVICE IN VASCULATURE AND LUNG

There have been rare reports of *Nexplanon*® implants reaching the lung via the pulmonary artery. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Correct subdermal insertion reduces the risk of these events.

- **CONTRA-INDICATIONS** Acute porphyrias p. 603 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · history of jaundice in pregnancy · malabsorption syndromes · possible risk of breast cancer · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- **INTERACTIONS** → Appendix 1: etonogestrel
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · alopecia · anxiety · appetite increased · breast abnormalities · depressed mood · dizziness · emotional lability · fatigue · flatulence · headaches · hot flush · increased risk of infection · influenza like illness · libido decreased · menstrual cycle irregularities · nausea · ovarian cyst · pain · skin reactions · weight changes
 - **Uncommon** Arthralgia · constipation · diarrhoea · drowsiness · dysuria · fever · galactorrhoea · genital abnormalities · hypertrichosis · insomnia · myalgia · oedema · vomiting · vulvovaginal discomfort
 - **Frequency not known** Abscess · angioedema · embolism and thrombosis · haemorrhage · insulin resistance · neoplasms · paraesthesia · seborrhoea
- SIDE-EFFECTS, FURTHER INFORMATION** The benefits of using progestogen-only contraceptives (POCs), such as etonogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

- **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Implant

► Etonogestrel (Non-proprietary)

Etonogestrel 68 mg Etonogestrel 68mg implant | 1 device [PoM] 
DT = £83.43

► Nexplanon (Merck Sharp & Dohme Ltd)

Etonogestrel 68 mg Nexplanon 68mg implant | 1 device [PoM]
£83.43 DT = £83.43

Medroxyprogesterone acetate

24-May-2017

● INDICATIONS AND DOSE

Contraception

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Long-term contraception

► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: 104 mg every 13 weeks, first dose to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraceptive)

► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: (consult product literature)

- **UNLICENSED USE**  Not licensed for the treatment of hot flushes caused by long-term androgen suppression in men. 

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 603 · severe arterial disease · undiagnosed vaginal bleeding

SPECIFIC CONTRA-INDICATIONS History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

● CAUTIONS

GENERAL CAUTIONS Possible risk of breast cancer

SPECIFIC CAUTIONS History during pregnancy in disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus

● **INTERACTIONS** → Appendix 1: medroxyprogesterone

● SIDE-EFFECTS

► **Common or very common** Anxiety · asthenia · breast abnormalities · depression · dizziness · gastrointestinal discomfort · headaches · insomnia · menstrual cycle irregularities · mood altered · nausea · pain · sexual dysfunction · skin reactions · vulvovaginal infection · weight changes

► **Uncommon** Alopecia · appetite abnormal · arthralgia · drowsiness · fever · fluid retention · galactorrhoea · hirsutism · hot flush · hypertension · muscle spasms · ovarian cyst · painful sexual intercourse · tachycardia · uterine haemorrhage · varicose veins · vertigo · vulvovaginal disorders

► **Rare or very rare** Breast cancer · lipodystrophy

► **Frequency not known** Embolism and thrombosis · hepatic disorders · osteoporosis · osteoporotic fractures · seizure

SIDE-EFFECTS, FURTHER INFORMATION Reduction in bone mineral density is greater with increasing duration of use. The loss is mostly recovered on discontinuation.

● CONCEPTION AND CONTRACEPTION

► **With intramuscular use** If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.

► **With subcutaneous use** If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation. The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

● **HEPATIC IMPAIRMENT** Avoid in liver tumour. Caution in severe liver disease and recurrent cholestatic jaundice.

● **PATIENT AND CARER ADVICE** Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

► **Depo-Provera** (Pfizer Ltd)

Medroxyprogesterone acetate 150 mg per 1 ml Depo-Provera 150mg/1ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £6.01 DT = £6.01

► **Sayana Press** (Pfizer Ltd)

Medroxyprogesterone acetate 160 mg per 1 ml Sayana Press 104mg/0.65 ml suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £6.90

3.6 Contraception, spermicidal

SPERMICIDALS

Nonoxinol

● INDICATIONS AND DOSE

Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps

► **BY VAGINA**

► **Females of childbearing potential:** (consult product literature)

● **SIDE-EFFECTS** Genital erosion · increased risk of HIV infection · pain · paraesthesia · skin reactions · vaginal redness

SIDE-EFFECTS, FURTHER INFORMATION High frequency use of the spermicide nonoxinol-9 has been associated with genital lesions, which may increase the risk of acquiring sexually transmitted infections.

● **CONCEPTION AND CONTRACEPTION** No evidence of harm to latex condoms and diaphragms.

● **PREGNANCY** Toxicity in *animal* studies.

● **BREAST FEEDING** Present in milk in *animal* studies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol, sorbic acid

► **Gygel** (Marlborough Pharmaceuticals Ltd)

Nonoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly | 30 gram [GSL] £4.25 | 81 gram [GSL] £11.00

4 Vaginal and vulval conditions

Vaginal and vulval conditions

Management

Pre-pubertal girls may be particularly susceptible to vulvovaginitis. Barrier preparations applied after cleansing can be useful when the symptoms are due to non-specific irritation, but systemic drugs are required in the treatment of bacterial infection or threadworm infestation. Intravaginal preparations, particularly those that require the use of an applicator, are not generally suitable for young girls; topical preparations may be useful in some adolescent girls.

In older girls symptoms are often restricted to the vulva, but infections almost invariably involve the vagina, which should also be treated; treatment should be as for adults.

Vaginal and vulval changes

Topical oestrogen creams containing **estriol** 0.01% (*Gynest*®) are used in the treatment of labial adhesions; treatment is usually restricted to symptomatic cases. Estriol cream should be applied to the adhesions once or twice daily for 2–6 weeks; adhesions may recur following treatment.

Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Vaginal fungal infections are not normally a problem in younger girls but can occur in adolescents. *Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis*, rare in girls before puberty, can be treated with antifungal pessaries or cream inserted high into the vagina (including during menstruation), however, these are not recommended for pre-pubertal girls and treatment with an external cream may be more appropriate. Single-dose intravaginal preparations offer an advantage when compliance is a problem. Local irritation can occur on application of vaginal antifungal products.

Imidazole drugs (clotrimazole p. 515, econazole nitrate p. 515, fenticonazole nitrate p. 516, and miconazole p. 516) are effective against candida in short courses of 1 to 3 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 374 may be considered for girls post-puberty.

Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited absorption of imidazoles from the skin and vagina. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrent vulvovaginal candidiasis is very rare in children, but can occur if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection can also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus, as well as the gastro-intestinal tract and the bladder. The sexual partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 333 or tinidazole p. 335.

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin below cream and metronidazole gel are indicated for bacterial vaginosis.

The antiviral drugs aciclovir p. 404 and valaciclovir p. 406 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

4.1 Vaginal and vulval infections**4.1a Vaginal and vulval bacterial infections****ANTIBACTERIALS > LINCOSAMIDES****Clindamycin****• INDICATIONS AND DOSE**

DALACIN® 2% CREAM

Bacterial vaginosis

► BY VAGINA

► Child: 1 applicatorful daily for 3–7 nights, dose to be administered at night

DOSE EQUIVALENCE AND CONVERSION

► 1 applicatorful delivers a 5 g dose of clindamycin 2%.

● **UNLICENSED USE** Not licensed for use in children.

● **CAUTIONS** Avoid intravaginal preparations (particularly those that require the use of an applicator) in young girls who are not sexually active, unless there is no alternative

● **INTERACTIONS** → Appendix 1: clindamycin

• SIDE-EFFECTS

► **Common or very common** Skin reactions

► **Frequency not known** Constipation · diarrhoea

(discontinue) · dizziness · gastrointestinal discomfort · headache · increased risk of infection · nausea · vertigo · vomiting · vulvovaginal irritation

SIDE-EFFECTS, FURTHER INFORMATION Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

● **CONCEPTION AND CONTRACEPTION** Damages latex condoms and diaphragms.

► Metronidazole (Non-proprietary)

Metronidazole 7.5 mg per 1 gram Metronidazole 0.75% vaginal gel | 40 gram [PoM] Σ DT = £4.31

► Zidoval (Meda Pharmaceuticals Ltd)

Metronidazole 7.5 mg per 1 gram Zidoval 0.75% vaginal gel | 40 gram [PoM] £4.31 DT = £4.31

CARBOXYLIC ACIDS

Lactic acid

● INDICATIONS AND DOSE

BALANCE ACTIV RX[®] GEL

Prevention of bacterial vaginosis

- **BY VAGINA**
- Child: 5 mL 1–2 times a week, insert the content of 1 tube (5 mL)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in shellfish allergy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Products without form

EXCIPIENTS: May contain Propylene glycol

- **Balance Activ** (BBI Healthcare Ltd)
Balance Activ BV vaginal pH correction gel | 7 device £5.25

4.1b Vaginal and vulval fungal infections

Other drugs used for Vaginal and vulval fungal infections
Fluconazole, p. 374

ANTIFUNGALS > IMIDAZOLE

Clotrimazole

● INDICATIONS AND DOSE

Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)

- **BY VAGINA USING CREAM**
- Child: Apply 2–3 times a day, to be applied to anogenital area

Vaginal candidiasis (dose for 10% intravaginal cream)

- **BY VAGINA USING VAGINAL CREAM**
- Child: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary

Vaginal candidiasis

- **BY VAGINA USING PESSARIES**
- Child: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary

Recurrent vulvovaginal candidiasis

► BY VAGINA USING PESSARIES

- Child: 500 mg every week for 6 months, dose to be administered following topical imidazole for 10–14 days

- **UNLICENSED USE** Consult product literature for individual preparations.

- **CAUTIONS** Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative

- **INTERACTIONS** → Appendix 1: antifungals, azoles

- **SIDE-EFFECTS** Abdominal pain · discomfort · dyspnoea · genital peeling · hypotension · oedema · paraesthesia · pelvic pain · skin reactions · syncope · vaginal haemorrhage

- **CONCEPTION AND CONTRACEPTION** Cream and pessaries may damage latex condoms and diaphragms.

- **PREGNANCY**

Dose adjustments Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

- **EXCEPTIONS TO LEGAL CATEGORY** Brands for sale to the public include *Canesten*[®] Internal Cream.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pessary

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

► Clotrimazole (Non-proprietary)

Clotrimazole 500 mg Clotrimazole 500mg pessaries | 1 pessary [P] £3.57 DT = £3.57

Immune system

1 Immune system disorders and transplantation

Immune response

Inflammatory bowel disease

Azathioprine p. 518, mercaptopurine p. 543, or once weekly methotrexate p. 543 are used to induce remission in unresponsive or chronically active Crohn's disease. Azathioprine or mercaptopurine may also be helpful for retaining remission in frequently relapsing inflammatory bowel disease; once weekly methotrexate is used in Crohn's disease when azathioprine or mercaptopurine are ineffective or not tolerated. Response to azathioprine or mercaptopurine may not become apparent for several months. Folic acid p. 574 should be given to reduce the possibility of methotrexate toxicity. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Ciclosporin p. 519 (cyclosporin) is a potent immunosuppressant and is markedly nephrotoxic. In children with severe ulcerative colitis unresponsive to other treatment, ciclosporin may reduce the need for urgent colorectal surgery.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 527), calcineurin inhibitors (ciclosporin or tacrolimus p. 522), corticosteroids, or sirolimus p. 521. Choice is dependent on the type of organ, time after transplant, and clinical condition of the patient. Special management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Infections in the immunocompromised child can be severe and show atypical features. Specific local protocols should be followed for the management of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised. Children should be up-to-

date with their childhood vaccinations before initiation of immunosuppressant therapy (e.g. before transplantation); vaccination with varicella-zoster vaccine is also necessary during this period— **important**: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella-zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced (to one quarter of the original dose in children) when allopurinol p. 556 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil may reduce the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Children may suffer a high incidence of side-effects, particularly gastrointestinal effects, calling for temporary reduction in dose or interruption of treatment.

Cyclophosphamide p. 535 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

The corticosteroids prednisolone p. 442 and dexamethasone p. 439 are widely used in paediatric oncology; they have a marked antitumour effect. Dexamethasone is preferred for acute lymphoblastic leukaemia whilst prednisolone may be used for Hodgkin's disease, non-Hodgkin's lymphoma, and B-cell lymphoma and leukaemia.

Dexamethasone is the corticosteroid of choice in paediatric supportive and palliative care. For children who are not receiving a corticosteroid as a component of their chemotherapy, dexamethasone may be used to reduce raised intracranial pressure, or to help control emesis when combined with an appropriate anti-emetic.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin (cyclosporin), a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-

myelotoxic but markedly nephrotoxic. It may be used in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease. Ciclosporin also has a role in steroid-sensitive and steroid-resistant nephrotic syndrome; in corticosteroid-sensitive nephrotic syndrome it may be given with prednisolone.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects.

Other drugs used for immune system disorders and transplantation Hydroxychloroquine sulfate, p. 639 · Rituximab, p. 530

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Antithymocyte immunoglobulin (rabbit)

28-Nov-2017

● INDICATIONS AND DOSE

Prophylaxis of organ rejection in heart allograft recipients

► BY INTRAVENOUS INFUSION

- Child: 1–2.5 mg/kg daily for 3–5 days, start treatment on day of transplantation, to be given over at least 6 hours

Prophylaxis of organ rejection in renal allograft recipients

► BY INTRAVENOUS INFUSION

- Child 1–17 years: 1–1.5 mg/kg daily for 3–9 days, start treatment on day of transplantation, to be given over at least 6 hours

Treatment of corticosteroid-resistant allograft rejection in renal transplantation

► BY INTRAVENOUS INFUSION

- Child 1–17 years: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

● CONTRA-INDICATIONS Infection

● SIDE-EFFECTS

- **Common or very common** Chills · diarrhoea · dysphagia · dyspnoea · fever · hypotension · infection · lymphopenia · myalgia · nausea · neoplasm malignant · neoplasms · neutropenia · reactivation of infection · secondary malignancy · sepsis · skin reactions · thrombocytopenia · vomiting

- **Uncommon** Cytokine release syndrome · hepatic disorders · hypersensitivity · infusion related reaction

SIDE-EFFECTS, FURTHER INFORMATION Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor blood count.

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with Glucose 5% or Sodium Chloride 0.9% to an approx. concentration of 0.5 mg/mL; begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); incompatible with unfractionated heparin and

hydrocortisone in glucose infusion—precipitation reported.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Immunosuppressive therapy for kidney transplant in children and young people (October 2017)** NICE TA482

Antithymocyte immunoglobulin (rabbit) is not recommended as an initial treatment to prevent organ rejection in patients having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA482

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

- **Thymoglobulin** (Sanofi)

Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobuline 25mg powder and solvent for solution for infusion vials | 1 vial [PoM] £158.77 (Hospital only)

IMMUNOSUPPRESSANTS > ANTIMETABOLITES

Azathioprine

21-Mar-2018

- **DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

● INDICATIONS AND DOSE

Severe ulcerative colitis | Severe Crohn's disease

► BY MOUTH

- Child 2–17 years: Initially 2 mg/kg once daily, then increased if necessary up to 2.5 mg/kg once daily

Systemic lupus erythematosus | Vasculitis | Autoimmune conditions usually when corticosteroid therapy alone has proved inadequate

► BY MOUTH

- Child: Initially 1 mg/kg daily, then adjusted according to response to 3 mg/kg daily, consider withdrawal if no improvement within 3 months; maximum 3 mg/kg per day

Suppression of transplant rejection

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: Maintenance 1–3 mg/kg daily, adjusted according to response, consult local treatment protocol for details, oral route preferred, but if oral route is not possible then can be given by intravenous infusion, the total daily dose may alternatively be given in 2 divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

- **CAUTIONS** Reduced thiopurine methyltransferase activity

- **INTERACTIONS** → Appendix 1: azathioprine

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Bone marrow depression (dose-related) · increased risk of infection · leucopenia · thrombocytopenia
- **Uncommon** Anaemia · hepatic disorders · hypersensitivity · pancreatitis
- **Rare or very rare** Agranulocytosis · alopecia · bone marrow disorders · diarrhoea · gastrointestinal disorders · neoplasms · photosensitivity reaction · pneumonitis · severe cutaneous adverse reactions (SCARs)
- **Frequency not known** Nodular regenerative hyperplasia · sinusoidal obstruction syndrome

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Nausea

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may require drug withdrawal.

Hypersensitivity reactions Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and renal dysfunction) call for immediate withdrawal.

Neutropenia and thrombocytopenia Neutropenia is dose-dependent. Management of neutropenia and thrombocytopenia requires careful monitoring and dose adjustment.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.
- **PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

- **BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

HEPATIC IMPAIRMENT

Dose adjustments Reduce dose.

Monitoring Monitor liver function.

RENAL IMPAIRMENT

Dose adjustments Reduce dose.

PRE-TREATMENT SCREENING

Thiopurine methyltransferase (TPMT) The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

MONITORING REQUIREMENTS

- ▶ Monitor for toxicity throughout treatment.
- ▶ Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
- ▶ Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Consult local treatment protocol for details. For *intravenous injection*, reconstitute 50 mg with 5–15 mL Water for Injections; give over at least 1 minute. For *intravenous infusion*, reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a concentration of 0.25–2.5 mg/mL in Glucose 5% or Sodium Chloride 0.9%. Intravenous injection is alkaline and very irritant. Intravenous route should therefore be used **only** if oral route not feasible and discontinued as soon as oral route can be tolerated. To reduce irritation flush line with infusion fluid.

- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of

azathioprine is required, the following strength is used: 50 mg/5 mL.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Azathioprine for inflammatory bowel disease www.medicinesforchildren.org.uk/azathioprine-inflammatory-bowel-disease-0

Medicines for Children leaflet: Azathioprine for renal (kidney) transplant www.medicinesforchildren.org.uk/azathioprine-renal-kidney-transplant-0

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin

(Cyclosporin)

01-Sep-2016

- **DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

INDICATIONS AND DOSE**Refractory ulcerative colitis****▶ BY MOUTH**

- ▶ Child 2-17 years: Initially 2 mg/kg twice daily (max. per dose 5 mg/kg twice daily), dose adjusted according to blood-ciclosporin concentration and response

▶ BY INTRAVENOUS INFUSION

- ▶ Child 3-17 years: Initially 0.5–1 mg/kg twice daily, dose adjusted according to blood-ciclosporin concentration and response

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

▶ BY MOUTH

- ▶ Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum

continued →

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- **BY MOUTH**
- Child: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

- **BY MOUTH**
- Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Prevention of graft rejection following bone-marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation | Prevention and treatment of graft-versus-host disease

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
- Child: (consult local protocol)

Nephrotic syndrome

- **BY MOUTH**
- Child: 3 mg/kg twice daily, dose can be increased if necessary in corticosteroid-resistant disease; for maintenance reduce to lowest effective dose according to whole blood-ciclosporin concentrations, proteinuria, and renal function

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- With oral use Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide.

- **UNLICENSED USE** Not licensed for use in children under 3 months. Not licensed for use in children under 16 years for atopic eczema (dermatitis) or psoriasis. Not licensed for use in ulcerative colitis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CICLOSPORIN MUST BE PRESCRIBED AND DISPENSED BY BRAND NAME (DECEMBER 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- **CONTRA-INDICATIONS** Abnormal baseline renal function (in non-transplant indications) · malignancy (in non-transplant indications) · uncontrolled hypertension (in non-transplant indications) · uncontrolled infections (in non-transplant indications)
- **CAUTIONS** Hyperuricaemia · in atopic dermatitis, active herpes simplex infections—allow infection to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis, *Staphylococcus aureus* skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in psoriasis treat, patients with malignant pre-malignant conditions of skin only after appropriate treatment (and if no other option) · in uveitis, Behcet's syndrome (monitor neurological status) · lymphoproliferative disorders (discontinue treatment) · malignancy
- **CAUTIONS, FURTHER INFORMATION**
- Malignancy In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after

appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.

- **INTERACTIONS** → Appendix 1: ciclosporin
- **SIDE-EFFECTS**
- **Common or very common** Appetite decreased · diarrhoea · electrolyte imbalance · fatigue · fever · flushing · gastrointestinal discomfort · gingival hyperplasia · hair changes · headaches · hepatic disorders · hyperglycaemia · hyperlipidaemia · hypertension · hyperuricaemia · leucopenia · muscle complaints · nausea · paraesthesia · peptic ulcer · renal impairment (renal structural changes on long-term administration) · seizure · skin reactions · tremor · vomiting
- **Uncommon** Anaemia · encephalopathy · oedema · thrombocytopenia · weight increased
- **Rare or very rare** Eye inflammation · gynaecomastia · haemolytic anaemia · idiopathic intracranial hypertension · menstrual disorder · multifocal motor neuropathy · muscle weakness · myopathy · pancreatitis
- **Frequency not known** Pain in extremity · thrombotic microangiopathy
- **PREGNANCY** Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT** **Dose adjustments** Extensively metabolised by the liver—manufacturer advises consider dose adjustment based on bilirubin and liver enzyme levels.
- **RENAL IMPAIRMENT** **Dose adjustments** In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid. In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. *During treatment* for non-transplant indications, manufacturer recommends if the estimated glomerular filtration rate decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the estimated glomerular filtration rate decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.
- **MONITORING REQUIREMENTS**
- Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).
- In long-term management of nephrotic syndrome, perform renal biopsies every 1–2 years.
- **DIRECTIONS FOR ADMINISTRATION**
- With oral use Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.
- With intravenous use For intermittent *intravenous infusion*, dilute to a concentration of 0.5–2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.
- **PRESCRIBING AND DISPENSING INFORMATION**
- Brand name prescribing Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications).

Sandimmun® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of different formulations of ciclosporin.

Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

Sirolimus

16-Nov-2017

- **DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

● INDICATIONS AND DOSE

As a component of immunosuppressive therapy for renal transplantation in children and adolescents only if intolerance necessitates the withdrawal of a calcineurin inhibitor

- **BY MOUTH**
- **Child:** (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

- The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should **not** be used as a substitute for other tablet strengths.

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Hyperlipidaemia · increased susceptibility to infection (especially urinary-tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)
- **INTERACTIONS** → Appendix 1: sirolimus
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anaemia · arthralgia · ascites · constipation · diabetes mellitus · diarrhoea · dyslipidaemia · electrolyte imbalance · embolism and thrombosis · fever · haemolytic uraemic syndrome · haemorrhage · headache · healing impaired · hyperglycaemia · hypertension · increased risk of infection · leucopenia · lymphatic vessel disorders · menstrual cycle irregularities · nausea · neoplasms · neutropenia · oedema · osteonecrosis · ovarian cyst · pain · pancreatitis · pericardial effusion · proteinuria · respiratory disorders · sepsis · skin reactions · stomatitis · tachycardia · thrombocytopenia
 - **Uncommon** Antibiotic associated colitis · focal segmental glomerulosclerosis · hepatic failure · nephrotic syndrome · pancytopenia · post transplant lymphoproliferative disorder
 - **Frequency not known** Posterior reversible encephalopathy syndrome (PRES)
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.
- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
Dose adjustments Dose reduction may be necessary, consult local treatment protocols for details.
Monitoring Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

● MONITORING REQUIREMENTS

- ▶ Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
- ▶ Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.

● **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.

● **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus.
Patients should be advised to avoid excessive exposure to UV light.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482
Sirolimus is not recommended as an initial treatment to prevent organ rejection in patients having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/TA482

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Ethanol

▶ Rapamune (Pfizer Ltd)

Sirolimus 1 mg per 1 mL Rapamune 1mg/mL oral solution sugar-free
| 60 mL [PoM] £162.41

Tablet

▶ Rapamune (Pfizer Ltd)

Sirolimus 1 mg Rapamune 1mg tablets | 30 tablet [PoM] £86.49 DT = £86.49

Sirolimus 2 mg Rapamune 2mg tablets | 30 tablet [PoM] £172.98 DT = £172.98

Tacrolimus

19-Mar-2018

- **DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

● INDICATIONS AND DOSE

ADOPT [®]

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

- ▶ Neonate: Initially 150 micrograms/kg twice daily.

- ▶ Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

- ▶ Neonate: Initially 150 micrograms/kg twice daily.

- ▶ Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

▶ BY MOUTH

- ▶ Neonate: Initially 50–150 micrograms/kg twice daily.

- ▶ Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

▶ BY MOUTH

- ▶ Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

- ▶ Child: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion)

Allograft rejection resistant to conventional immunosuppressive therapy

▶ BY MOUTH

- ▶ Child: Seek specialist advice

CAPEXION [®]

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

- ▶ Neonate: Initially 150 micrograms/kg twice daily.

- ▶ Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

- ▶ Neonate: Initially 150 micrograms/kg twice daily.

- ▶ Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

▶ BY MOUTH

- ▶ Neonate: Initially 50–150 micrograms/kg twice daily.

- ▶ Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

▶ BY MOUTH

- ▶ Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

- ▶ Child: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion)

Allograft rejection resistant to conventional immunosuppressive therapy

▶ BY MOUTH

- ▶ Child: Seek specialist advice

MODIGRAF [®]

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

- ▶ Neonate: Initially 150 micrograms/kg twice daily.

- ▶ Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

► BY MOUTH

- Neonate: Initially 150 micrograms/kg twice daily.
- Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

► BY MOUTH

- Neonate: Initially 50–150 micrograms/kg twice daily.

- Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

► BY MOUTH

- Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

● **UNLICENSED USE**

ADVAGRAF® Advagraf® not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- **Adoport®, Prograf®, Capexion®, Tacni®, and Vivadex®** are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- **Modigraf®** granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- **Advagraf®** is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: **Envarsus®** is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** Increased risk of infections · lymphoproliferative disorders · malignancies · neurotoxicity · QT-interval prolongation · UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS** → Appendix 1: tacrolimus

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · ascites · asthenic conditions · bile duct disorders · confusion · consciousness impaired · constipation · coronary artery disease · cough · depression · diabetes mellitus · diarrhoea · dizziness · dysgraphia · dyslipidaemia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorder · febrile disorders · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal inflammatory disorders · haemorrhage · hallucination · headache · hearing impairment · hepatic disorders · hyperglycaemia · hyperhidrosis · hypertension · hyperuricaemia · hypotension · increased risk of infection · ischaemia · joint disorders · leucocytosis · leucopenia · metabolic acidosis · mood altered · muscle spasms · nasal complaints · nausea · nephropathy · nervous system disorder · oedema · oral disorders · pain · peripheral neuropathy · peripheral vascular disease · primary transplant dysfunction · psychiatric disorder · renal impairment · renal tubular necrosis · respiratory disorders · seizure · sensation abnormal · skin reactions · sleep disorders · temperature sensation altered · thrombocytopenia · tremor · urinary tract disorder · urine abnormal · vision disorders · vomiting · weight changes
 - **Uncommon** Asthma · cardiac arrest · cardiomyopathy · cataract · central nervous system haemorrhage · chest discomfort · coagulation disorders · coma · dysmenorrhoea · encephalopathy · feeling abnormal · haemolytic anaemia · heart failure · hypoglycaemia · hypoproteinaemia · influenza like illness · memory loss · multi organ failure · neutropenia · palpitations · pancreatitis · pancytopenia · paralysis · paresis · photosensitivity reaction · psychotic disorder · shock · speech disorder · stroke · ventricular hypertrophy
 - **Rare or very rare** Fall · hirsutism · mobility decreased · muscle tone increased · muscle weakness · pancreatic pseudocyst · pericardial effusion · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · sinusoidal obstruction syndrome · thirst · ulcer
 - **Frequency not known** Agranulocytosis · malignancy · neoplasms · polyomavirus-associated nephropathy · progressive multifocal leukoencephalopathy · pure red cell aplasia
- SPECIFIC SIDE-EFFECTS**
- With intravenous use Anaphylactoid reaction (due to excipient) · hypersensitivity
- SIDE-EFFECTS, FURTHER INFORMATION** Cardiomyopathy has been reported to occur primarily in children with

tacrolimus blood trough concentrations much higher than the recommended maximum levels. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).
- **HEPATIC IMPAIRMENT**
Dose adjustments Dose reduction may be necessary in severe impairment.
- **MONITORING REQUIREMENTS**
 - After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
 - Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.
- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* over 24 hours, dilute to a concentration of 4–100 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%, to a total volume between 20–500mL. Tacrolimus is incompatible with PVC.
- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of tacrolimus is required, the following strength is used: 5 mg/5 mL.
PROGRAF® INFUSION Intravenous route should only be used if oral route is inappropriate.
- **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight.
 Medicines for Children leaflet: Tacrolimus for prevention of transplant rejection www.medicinesforchildren.org.uk/tacrolimus-for-prevention-of-transplant-rejection
Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
 - Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482
 Immediate-release tacrolimus, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in patients having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. Tacrolimus granules for oral suspension (*Modigraf®*) should be used only if the manufacturer provides it at the same price or lower than that agreed with the Commercial Medicines Unit. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/TA482
 - Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482

started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA482

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2010) that tacrolimus granules for suspension (*Modigraf®*) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Canakinumab

- **DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

● INDICATIONS AND DOSE

Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome)

- BY SUBCUTANEOUS INJECTION
- Child: (consult product literature)

Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone) in children who have had an inadequate response to NSAIDs and systemic corticosteroids

- BY SUBCUTANEOUS INJECTION
- Child 2–17 years (body-weight 7.5 kg and above): 4 mg/kg every 4 weeks (max. per dose 300 mg)

- **CONTRA-INDICATIONS** Active infection · leucopenia · neutropenia
- **CAUTIONS** History of recurrent infection · latent and active tuberculosis · predisposition to infection

CAUTIONS, FURTHER INFORMATION

- **Vaccinations** Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain upper · arthralgia · asthenia · dizziness · increased risk of infection · leucopenia · neutropenia · pain · proteinuria · vertigo
 - **Uncommon** Gastroesophageal reflux disease
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.
- **HEPATIC IMPAIRMENT** No information available.
- **RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.
- **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS**
 - Monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.
 - Monitor for signs and symptoms of tuberculosis during and after treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Ilaris** (Novartis Pharmaceuticals UK Ltd)

Canakinumab 150 mg per 1 ml Ilaris 150mg/1ml solution for injection vials | 1 vial (POM) £9,927.80

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

Basiliximab

16-Nov-2017

- **DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

● INDICATIONS AND DOSE

Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child 1–17 years (body-weight up to 35 kg): Initially 10 mg, dose to be administered within 2 hours before transplant surgery, followed by 10 mg after 4 days, dose administered after transplant surgery, withhold second dose if severe hypersensitivity or graft loss occurs
- Child 1–17 years (body-weight 35 kg and above): Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs

- **CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS** Capillary leak syndrome · constipation · cytokine release syndrome · dyspnoea · fever · heart failure · hypersensitivity · hypertension · hypertrichosis · hypotension · increased risk of infection · myocardial infarction · pulmonary oedema · respiratory disorders · sepsis · skin reactions · sneezing · tachycardia
- **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute reconstituted solution to a concentration not exceeding 400 micrograms/mL, with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Immunosuppressive therapy for kidney transplant in children and young people (October 2017)** NICE TA482 Basiliximab, when used as part of an immunosuppressive regimen that includes a calcineurin inhibitor, is recommended as an initial option to prevent organ rejection in patients having a kidney transplant. The use of basiliximab with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA482

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

▶ **Simulect** (Novartis Pharmaceuticals UK Ltd)

Basiliximab 10 mg Simulect 10mg powder and solvent for solution for injection vials | 1 vial [PoM] £758.69 (Hospital only)

Basiliximab 20 mg Simulect 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £842.38 (Hospital only)

IMMUNOSUPPRESSANTS > PURINE SYNTHESIS INHIBITORS

Mycophenolate mofetil

09-Mar-2018

● INDICATIONS AND DOSE

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)

▶ BY MOUTH

Child: 600 mg/m² twice daily, consult local protocol for details; maximum 2 g per day

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and tacrolimus) (under expert supervision)

▶ BY MOUTH

Child: 300 mg/m² twice daily, consult local protocol for details; maximum 2 g per day

Prophylaxis of acute rejection in hepatic transplantation (in combination with a corticosteroid and ciclosporin or tacrolimus) (under expert supervision)

▶ BY MOUTH

Child: 10 mg/kg twice daily, increased to 20 mg/kg twice daily, consult local protocol for details; maximum 2 g per day

- **UNLICENSED USE** Not licensed for use in children under 2 years for the prophylaxis of acute rejection in renal transplantation. Not licensed for use in children for the prophylaxis of acute rejection in hepatic transplantation.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MYCOPHENOLATE MOFETIL, MYCOPHENOLIC ACID: UPDATED CONTRACEPTION ADVICE FOR MALE PATIENTS (FEBRUARY 2018)

Available clinical evidence does not indicate an increased risk of malformations or miscarriage in pregnancies where the father was taking mycophenolate medicines, however mycophenolate mofetil and mycophenolic acid are genotoxic and a risk cannot be fully excluded; for further information, see Conception and contraception and Patient and carer advice.

- **CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · children (higher incidence of side-effects may call for temporary reduction of dose or interruption) · delayed graft function · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

CAUTIONS, FURTHER INFORMATION

- ▶ Hypogammaglobulinaemia or bronchiectasis Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.
- **INTERACTIONS** → Appendix 1: mycophenolate
- **SIDE-EFFECTS**
- ▶ **Common or very common** Acidosis · alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · burping · chills · confusion ·

constipation · cough · depression · diarrhoea · dizziness · drowsiness · dyslipidaemia · dyspnoea · electrolyte imbalance · fever · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal haemorrhage · gout · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hyperuricaemia · hypotension · increased risk of infection · insomnia · leucocytosis · leucopenia · malaise · nausea · neoplasms · neuromuscular dysfunction · oedema · oral disorders · pain · pancreatitis · paraesthesia · renal impairment · respiratory disorders · seizure · sepsis · skin reactions · tachycardia · taste altered · thinking abnormal · thrombocytopenia · tremor · vasodilation · vomiting · weight decreased

▶ **Uncommon** Agranulocytosis

▶ **Frequency not known** Endocarditis ·

hypogammaglobulinaemia · malignancy · meningitis · neutropenia · polyomavirus-associated nephropathy · progressive multifocal leukoencephalopathy · pure red cell aplasia

SIDE-EFFECTS, FURTHER INFORMATION Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

● **CONCEPTION AND CONTRACEPTION**

Pregnancy prevention The MHRA advises to exclude pregnancy in females of child-bearing potential before treatment—2 pregnancy tests 8–10 days apart are recommended. Women should use at least 1 method of effective contraception before and during treatment, and for 6 weeks after discontinuation—2 methods of effective contraception are preferred. Male patients or their female partner should use effective contraception during treatment and for 90 days after discontinuation.

- **PREGNANCY** Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises consider dose reduction if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).
- **PRESCRIBING AND DISPENSING INFORMATION** Tablets and capsules not appropriate for dose titration in children with body surface are less than 1.25 m².

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Mycophenolate mofetil for nephrotic syndrome www.medicinesforchildren.org.uk/mycophenolate-mofetil-for-nephrotic-syndrome

Pregnancy prevention advice The MHRA advises that prescribers should ensure that female patients understand the need to comply with the pregnancy prevention advice, and they should be informed to seek immediate medical attention if there is a possibility of pregnancy; male patients planning to conceive children should be informed of the implications of both immunosuppression and the effect of the prescribed medications on the pregnancy. **Bone marrow suppression** Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Immunosuppressive therapy for kidney transplant in children and young people (October 2017)** NICE TA482
Mycophenolate mofetil, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in patients having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. The use of mycophenolate mofetil with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA482

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

- ▶ **Mycophenolate mofetil (Non-proprietary)**
Mycophenolate mofetil 500 mg Mycophenolate mofetil 500mg tablets | 50 tablet [PoM] £42.50 DT = £5.66
- ▶ **CellCept** (Roche Products Ltd)
Mycophenolate mofetil 500 mg CellCept 500mg tablets | 50 tablet [PoM] £82.26 DT = £5.66
- ▶ **Myfenax** (Teva UK Ltd)
Mycophenolate mofetil 500 mg Myfenax 500mg tablets | 50 tablet [PoM] £78.15 DT = £5.66

Oral suspension

EXCIPIENTS: May contain Aspartame

- ▶ **CellCept** (Roche Products Ltd)
Mycophenolate mofetil 200 mg per 1 ml CellCept 1g/5ml oral suspension sugar-free | 175 ml [PoM] £115.16 DT = £115.16

Capsule

- ▶ **Mycophenolate mofetil (Non-proprietary)**
Mycophenolate mofetil 250 mg Mycophenolate mofetil 250mg capsules | 100 capsule [PoM] £82.26 DT = £82.26
- ▶ **CellCept** (Roche Products Ltd)
Mycophenolate mofetil 250 mg CellCept 250mg capsules | 100 capsule [PoM] £82.26 DT = £82.26
- ▶ **Myfenax** (Teva UK Ltd)
Mycophenolate mofetil 250 mg Myfenax 250mg capsules | 100 capsule [PoM] £78.15 DT = £82.26

Malignant disease

1 Antibody responsive malignancy

ANTINEOPLASTIC DRUGS > MONOCLONAL ANTIBODIES

Gemtuzumab ozogamicin

21-May-2018

- **DRUG ACTION** Gemtuzumab ozogamicin is a monoclonal antibody that binds to CD33-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

● INDICATIONS AND DOSE

CD33-positive acute myeloid leukaemia (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 15-17 years: (consult product literature)

- **CAUTIONS** Adverse-risk cytogenetics (consider benefits and risks of treatment, consult product literature) • haematopoietic stem cell transplantation (increased risk of hepatotoxicity) • pre-medication recommended to minimise adverse reactions

CAUTIONS, FURTHER INFORMATION

- ▶ **Pre-medication** Serious infusion-related reactions can occur and gemtuzumab ozogamicin should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with a corticosteroid, paracetamol and antihistamine 1 hour prior to dosing, and to take appropriate measures to help prevent the development of tumour lysis-related hyperuricaemia—consult product literature.

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia • appetite decreased • ascites • chills • constipation • decreased leucocytes • diarrhoea • dyspnoea • fatigue • fever • gastrointestinal discomfort • gastrointestinal disorders • haemorrhage • headache • hepatic disorders • hyperbilirubinaemia • hyperglycaemia • hypertension • hypotension • infection • infusion related reaction (including fatal cases) • multi organ failure • nausea • neutropenia • oedema • pancytopenia • sinusoidal obstruction syndrome • skin reactions • stomatitis • tachycardia • thrombocytopenia • tumour lysis syndrome (including fatal cases) • vomiting
- ▶ **Frequency not known** Interstitial pneumonia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions (including fatal cases) can occur during the first 24 hours after administration. Manufacturer advises interrupt treatment immediately and treat as clinically indicated (consult product literature); permanent discontinuation should be strongly considered in patients who develop signs and symptoms of anaphylaxis.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use 2 methods of effective contraception during treatment and for at least 7 months after the last dose; male patients should use 2 methods of effective contraception during treatment and for at least 4 months after the last dose if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 531.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 531.

● **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least one month after the last dose—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate-to-severe impairment—increased risk of developing hepatotoxicity; postpone treatment if serum transaminases (ALT or AST) greater than 2.5 times the upper limit of normal or total bilirubin greater than 2 times the upper limit of normal.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection, bleeding and other effects of myelosuppression during treatment; dose interruption or discontinuation of treatment may be required—consult product literature.
- ▶ Manufacturer advises monitor for signs and symptoms of infusion-related reactions—close clinical monitoring, including pulse, blood pressure and temperature, should be performed during infusion; monitor for signs and symptoms of tumour lysis syndrome.
- ▶ Manufacturer advises monitor for signs and symptoms of hepatotoxicity (including hepatic veno-occlusive disease); liver tests should be monitored prior to each dose—consult product literature.

● PRESCRIBING AND DISPENSING INFORMATION

Gemtuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and headache.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Mylotarg** (Pfizer Ltd) ▼

Gemtuzumab ozogamicin 5 mg Mylotarg 5mg powder for concentrate for solution for infusion vials | 1 vial **[PoM]** £6,300.00 (Hospital only)

Ipilimumab

24-May-2018

● **DRUG ACTION** Ipilimumab is a monoclonal antibody which causes T-cell activation resulting in tumour cell death.

● INDICATIONS AND DOSE

Advanced melanoma (specialist use only)

▶ **BY INTRAVENOUS INFUSION**

▶ Child 12–17 years: 3 mg/kg every 3 weeks for 4 doses, for dose interruption or discontinuation of treatment due to immune-related side-effects—consult product literature

● CAUTIONS

CAUTIONS, FURTHER INFORMATION For full details consult product literature.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cancer pain · chills · confusion · constipation · cough · dehydration · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · eye discomfort · fever · gastrointestinal discomfort ·

gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hypophysitis · hypopituitarism · hypotension · hypothyroidism · influenza like illness · lethargy · lymphopenia · mucositis · muscle complaints · nausea · nerve disorders · night sweats · oedema · pain · skin reactions · vasodilation · vision disorders · vomiting · weight decreased

- ▶ **Uncommon** Adrenal hypofunction · alkalosis · allergic rhinitis · amenorrhoea · arrhythmias · arthritis · brain oedema · depression · dysarthria · eosinophilia · eye inflammation · glomerulonephritis · haemolytic anaemia · hair colour changes · hyperthyroidism · hypogonadism · increased risk of infection · infusion related reaction · libido decreased · meningitis · movement disorders · multi organ failure · muscle weakness · myopathy · nephritis · autoimmune · neutropenia · pancreatitis · paraneoplastic syndrome · peripheral ischaemia · polymyalgia rheumatica · psychiatric disorder · pulmonary oedema · renal failure · renal tubular acidosis · respiratory disorders · sepsis · severe cutaneous adverse reactions (SCARs) · syncope · systemic inflammatory response syndrome · thrombocytopenia · tremor · tumour lysis syndrome · vascular disorders · vasculitis
- ▶ **Rare or very rare** Myasthenia gravis · proteinuria · thyroiditis

SIDE-EFFECTS, FURTHER INFORMATION A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

● **CONCEPTION AND CONTRACEPTION** Use effective contraception.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Use with caution if plasma-bilirubin concentration greater than 3 times upper limit of normal range or if plasma-transaminase concentration 5 times or greater than the upper limit of normal range.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor liver function tests and thyroid function prior to initiation of treatment and before each dose.
- ▶ Manufacturer advises monitor for signs or symptoms of immune-related side-effects and gastrointestinal perforation—consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion*, give undiluted or dilute to a concentration of 1–4 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 90 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION** Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C) and protect from light—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

● NATIONAL FUNDING/ACCESS DECISIONS

- ▶ **Ipilimumab** for previously treated advanced (unresectable or metastatic) melanoma (December 2012) NICE TA268 Ipilimumab is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in patients who have received prior therapy, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

www.nice.org.uk/TA268

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- **Yervoy** (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼
Ipilimumab 5 mg per 1 ml Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £3,750.00 (Hospital only)
Yervoy 200mg/40ml concentrate for solution for infusion vials | 1 vial [PoM] £15,000.00 (Hospital only)

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE**Anti-lymphocyte monoclonal antibodies**

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

IMPORTANT SAFETY INFORMATION

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

● SIDE-EFFECTS

- **Common or very common** Alopecia · anaemia · arthralgia · asthenia · back pain · chills · constipation · cough · cytokine release syndrome · depression · diarrhoea · dyspnoea · fever · flushing · headache · hypersensitivity (discontinue permanently) · hypertension · hypotension · increased risk of infection · infusion related reaction · leucopenia · nausea · neutropenia · pruritus · sweat changes · tachycardia · thrombocytopenia · tumour lysis syndrome · vomiting
- **Uncommon** Progressive multifocal leukoencephalopathy
- **Rare or very rare** Hepatitis B reactivation
- **Frequency not known** Anaphylactic reaction

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side-effects In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.
Cytokine release syndrome Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

- **PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.

Rituximab

above

21-Feb-2018

● INDICATIONS AND DOSE

Post-transplantation lymphoproliferative disease (under expert supervision) | Non-Hodgkin's lymphoma (under expert supervision) | Hodgkin's lymphoma (under expert supervision) | Severe cases of resistant immune modulated disease including idiopathic thrombocytopenia purpura, haemolytic anaemia, and systemic lupus erythematosus (under expert supervision)

- **BY INTRAVENOUS INFUSION**
- **Child:** Patients should receive premedication before each dose (consult product literature for details) (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported · transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

CAUTIONS, FURTHER INFORMATION

- **Hepatitis B infection and reactivation** Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **rituximab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details on cautions, consult product literature or local treatment protocol.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- **Common or very common** Angioedema · anxiety · appetite decreased · arrhythmias · bone marrow disorders · bursitis · cancer pain · cardiac disorder · chest pain · conjunctivitis · cough aggravated · dizziness · dysphagia · ear pain · gastrointestinal discomfort · gastrointestinal disorders · hearing impairment · hepatitis B · hypercholesterolaemia · hyperglycaemia · hypocalcaemia · increased risk of infection · insomnia · lacrimation disorder · malaise · migraine · multi organ failure · muscle tone increased · myalgia · myocardial infarction · nerve disorders · neutropenia · oedema · oral disorders · oropharyngeal pain · osteoarthritis · pain · postural hypotension · respiratory disorders · sensation abnormal · sepsis · skin reactions · throat irritation · vasodilation · weight decreased
- **Uncommon** Asthma · coagulation disorder · haemolytic anaemia · heart failure · hypoxia · ischaemic heart disease · lymphadenopathy · taste altered
- **Rare or very rare** Facial paralysis · hypersensitivity · renal failure · Stevens-Johnson syndrome (discontinue) · toxic epidermal necrolysis (discontinue) · vasculitis · vision disorders
- **Frequency not known** Hypogammaglobulinaemia · posterior reversible encephalopathy syndrome (PRES) · psychiatric disorder · seizure

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

Progressive multifocal leukoencephalopathy has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal

leucoencephalopathy is suspected, suspend treatment until it has been excluded.

- **CONCEPTION AND CONTRACEPTION** Effective contraception (in both sexes) required during and for 12 months after treatment.
- **PREGNANCY** Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.
- **BREAST FEEDING** Avoid breast-feeding during and for 12 months after treatment.
- **MONITORING REQUIREMENTS** For full details on monitoring requirements consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Rituximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● MEDICINAL FORMS

2 Cytotoxic responsive malignancy

Cytotoxic drugs

Overview

The management of childhood cancer is complex and is generally confined to specialist regional centres and some associated shared-care units.

Cytotoxic drugs have both anti-cancer activity and the potential for damage to normal tissue. In children, chemotherapy is almost always started with curative intent, but may be continued as palliation if the disease is refractory.

Chemotherapy with a combination of two or more cytotoxic drugs aims to reduce the development of resistance and to improve cytotoxic effect. Treatment protocols generally incorporate a series of treatment courses at defined intervals with clear criteria for starting each course, such as adequate bone-marrow recovery and renal or cardiac function. The principal component of treatment for leukaemias in children is cytotoxic therapy, whereas solid tumours may be managed with surgery or radiotherapy in addition to chemotherapy.

Only medical or nursing staff who have received appropriate training should administer parenteral cytotoxics. In most instances central venous access will be required for the intravenous administration of cytotoxics to children; care is required to avoid the risk of extravasation (see Side-effects of Cytotoxic Drugs and their Management).

Cytotoxic drug handling guidelines

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from:

Department of Health
PO Box 777
London
SE1 6XH
Fax: 01623 724524

It is also available from the Department of Health website (www.dh.gov.uk).

Safe systems for cytotoxic medicines

Safe system requirements for cytotoxic medicines:

- Cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care that is co-ordinated by a multi-disciplinary team
- Cytotoxic drugs should be prescribed, dispensed and administered only in the context of a written protocol or treatment plan
- Injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- Oral cytotoxic medicines should be dispensed with clear directions for use

Cytotoxic drugs: important safety information

Risks of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Cytotoxic drug doses

Doses of cytotoxic drugs are determined using a variety of different methods including age, body-surface area, or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of

previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from many of the drug entries in this chapter.

Cytotoxic drugs: effect on pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended).

Alkylating drugs can have an adverse effect on gametogenesis, which may be reversible particularly in females. Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy. Amenorrhoea may occur, which also may be reversible.

Management of cytotoxic drug side-effects

Gastro-intestinal effects

Management of gastrointestinal effects of cytotoxic drugs includes the use of antacids, H_2 -receptor antagonists, and proton pump inhibitors to protect the gastric mucosa, laxatives to treat constipation, and enteral and parenteral nutritional support.

Oral mucositis

Good oral hygiene keeps the mouth clean and moist and helps to prevent mucositis; prevention is more effective than treatment of the complication. Good oral hygiene measures for children over 6 months include brushing teeth with a soft small brush with fluoride toothpaste 2–3 times daily, and rinsing the mouth frequently. Daily fluoride supplements can be used on the advice of the child's dental team. For children under 6 months or when it is not possible to brush teeth, carers should be instructed how to clean the mouth using an oral sponge moistened with water or with an antimicrobial solution such as diluted chlorhexidine.

Mucositis related to chemotherapy can be extremely painful and may, in some circumstances, require opioid analgesia. Secondary infection with candida is frequent; treatment with a systemically absorbed antifungal, such as fluconazole p. 374, is effective.

Nausea and vomiting

Nausea and vomiting cause considerable distress to many children who receive chemotherapy, and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Susceptibility to nausea and vomiting may increase with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered, and to the individual's susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide p. 549, low doses of methotrexate p. 543, the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—carboplatin p. 548, doxorubicin hydrochloride p. 539, intermediate and low doses of cyclophosphamide p. 535, mitoxantrone p. 540, and high doses of methotrexate.

Highly emetogenic treatment—cisplatin p. 548, dacarbazine p. 536, and high doses of alkylating drugs.

Anti-emetic drugs, when given regularly, help prevent or ameliorate emesis associated with chemotherapy in children.

Prevention of acute symptoms: For patients at low risk of emesis, pretreatment with a $5HT_3$ -receptor antagonist may be of benefit.

For patients at high risk of emesis or when other treatment is inadequate, a $5HT_3$ -receptor antagonist is often highly effective. The addition of dexamethasone p. 439 and other anti-emetics may also be required.

Prevention of delayed symptoms: dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide hydrochloride p. 262. Due to the risks of neurological side-effects, metoclopramide hydrochloride should only be used in children as a second-line option. The $5HT_3$ -receptor antagonists may have a role in preventing uncontrolled symptoms. Aprepitant p. 263 given in combination with a $5HT_3$ -receptor antagonist (with or without dexamethasone) is licensed for prevention of nausea and vomiting associated with highly and moderately emetogenic cancer chemotherapy.

Prevention of anticipatory symptoms: Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam p. 222 can be helpful for its amnesiac, sedative, and anxiolytic effects.

Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 550 and bleomycin p. 547 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as melphalan p. 537. Peripheral blood counts must be checked before each treatment. The duration and severity of neutropenia can be reduced by the use of granulocyte-colony stimulating factors; their use should be reserved for children who have previously experienced severe neutropenia.

Cytotoxic drugs may be contra-indicated in children with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Infection in a child with neutropenia requires immediate broad-spectrum antibacterial treatment that covers all likely pathogens. Appropriate bacteriological investigations should be conducted as soon as possible. Children taking cytotoxic drugs who have signs or symptoms of infection (or their carers) should be advised to seek prompt medical attention. All children should be investigated and treated under the supervision of an appropriate oncology or haematology specialist. Antifungal treatment may be required in a child with prolonged neutropenia or fever lasting longer than 4–5 days. Chickenpox and measles can be particularly hazardous in immunocompromised children. Varicella-zoster immunoglobulin p. 775 is indicated if the child does not have immunity against varicella and has had close contact with infectious chickenpox or herpes zoster. Antiviral prophylaxis can be considered in addition to varicella-zoster immunoglobulin or as an alternative if varicella-zoster immunoglobulin is inappropriate. If an immunocompromised child has come into close contact with

an infectious individual with measles, normal immunoglobulin p. 773 should be given.

For advice on the use of live vaccines in individuals with impaired immune response, see Vaccines.

Alopecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients.

Long-term and delayed toxicity

Cytotoxic drugs may produce specific organ-related toxicity in children (e.g. cardiotoxicity with doxorubicin hydrochloride or nephrotoxicity with cisplatin and ifosfamide p. 536). Manifestations of such toxicity may not appear for several months or even years after cancer treatment. Careful follow-up of survivors of childhood cancer is therefore vital; national and local guidelines have been developed to facilitate this.

Thromboembolism

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration and renal impairment are also predisposing factors. Features, include hyperkalaemia, hyperuricaemia, and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early recognition of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Treatment of cytotoxic drug side-effects

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure.

Allopurinol p. 556 is used routinely in children at low to moderate risk of hyperuricaemia. It should be started 24 hours before treatment; patients should be adequately hydrated (consideration should be given to omitting phosphate and potassium from hydration fluids). The dose of mercaptopurine p. 543 or azathioprine p. 518 should be reduced if allopurinol is given concomitantly.

Rasburicase p. 556 is a recombinant urate oxidase used in children who are at high-risk of developing hyperuricaemia. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Methotrexate-induced mucositis and myelosuppression

Folinic acid p. 555 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

The calcium salt of levofolinic acid p. 556, a single isomer of folinic acid, is also used following methotrexate administration. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate administration.

The efficacy of high dose methotrexate is enhanced by delaying initiation of folinic acid for at least 24 hours, local protocols define the correct time. Folinic acid is normally continued until the plasma-methotrexate concentration falls to 45–90 nanograms/mL (100–200 nanomol/litre).

In the treatment of methotrexate p. 543 overdose, folinate should be administered immediately; other measures to enhance the elimination of methotrexate are also necessary.

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 535 and ifosfamide p. 536; it is caused by the metabolite acrolein. Adequate hydration is essential to reduce the risk of urothelial toxicity. Mesna p. 555 reacts specifically with acrolein in the urinary tract, preventing toxicity. Mesna is given for the same duration as cyclophosphamide or ifosfamide. It is generally given intravenously; the dose of mesna is equal to or greater than that of the oxazaphosphorine.

Cytotoxic antibiotics

Cytotoxic antibiotics are widely used. Many act as radiomimetics and simultaneous use of radiotherapy should be **avoided** because it may markedly increase toxicity.

Doxorubicin p. 538, doxorubicin hydrochloride p. 539, and epirubicin hydrochloride p. 540 are anthracycline antibiotics. Mitoxantrone p. 540 (mitozantrone) is an anthracycline derivative.

Epirubicin hydrochloride and mitoxantrone are considered less toxic than the other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.

Vinca alkaloids

The vinca alkaloids, vinblastine sulfate p. 549 and vincristine sulfate p. 550 are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours.

Antimetabolites

Antimetabolites are incorporated into new nuclear material or they combine irreversibly with cellular enzymes and prevent normal cellular division. Cytarabine p. 541, fludarabine phosphate p. 542, mercaptopurine p. 543, methotrexate, and tioguanine p. 546 are commonly used in paediatric chemotherapy.

Other antineoplastic drugs

Asparaginase

Asparaginase is used almost exclusively in the treatment of acute lymphoblastic leukaemia. Hypersensitivity reactions may occur and facilities for the management of anaphylaxis should be available. A number of different preparations of asparaginase exist and only the product specified in the treatment protocol should be used.

ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS

Busulfan

(Busulphan)

● INDICATIONS AND DOSE

Conditioning treatment before haematopoietic progenitor cell transplantation

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

DOSES AT EXTREMES OF BODY-WEIGHT

- Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

- **CAUTIONS** Avoid in Acute porphyrias p. 603 • high dose (antiepileptic prophylaxis required) • history of seizures (antiepileptic prophylaxis required) • ineffective once in blast crisis phase • previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) • previous radiation therapy (increased risk of hepatic veno-occlusive disease) • risk of second malignancy • three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)

- **INTERACTIONS** → Appendix 1: alkylating agents

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Alopecia • diarrhoea • hepatic disorders • nausea • respiratory disorders • sinusoidal obstruction syndrome • skin reactions • thrombocytopenia • vomiting
- ▶ **Uncommon** Seizure
- ▶ **Rare or very rare** Cataract • eye disorders
- **SPECIFIC SIDE-EFFECTS**
- ▶ **Common or very common**
 - With intravenous use Anaemia • anxiety • appetite decreased • arrhythmias • arthralgia • ascites • asthenia • asthma • cardiomegaly • chest pain • chills • confusion • constipation • cough • depression • dizziness • dyspnoea • dysuria • electrolyte imbalance • embolism and thrombosis • fever • gastrointestinal discomfort • gastrointestinal disorders • haemorrhage • headache • hiccups • hyperglycaemia • hypersensitivity • hypertension • hypoalbuminaemia • hypotension • increased risk of infection • insomnia • mucositis • myalgia • nervous system disorder • neutropenia • oedema • pain • pancytopenia • pericardial effusion • pericarditis • reactivation of infections • renal disorder • renal impairment • stomatitis • vasodilation • weight increased
- ▶ **With oral use** Amenorrhoea (may be reversible) • azoospermia • bone marrow disorders • cardiac tamponade • delayed puberty • hyperbilirubinaemia • infertility male • leucopenia • leukaemia • menopausal symptoms • oral disorders • ovarian and fallopian tube disorders • testicular atrophy

▶ **Uncommon**

- ▶ **With intravenous use** Capillary leak syndrome • delirium • encephalopathy • hallucination • hypoxia • intracranial haemorrhage

▶ **Rare or very rare**

- ▶ **With oral use** Dry mouth • erythema nodosum • gynaecomastia • myasthenia gravis • radiation injury • Sjögren's syndrome

▶ **Frequency not known**

- ▶ **With intravenous use** Hypogonadism • ovarian failure • premature menopause • sepsis

SIDE-EFFECTS, FURTHER INFORMATION

Lung toxicity Discontinue if lung toxicity develops.

Secondary malignancy Use of busulfan is associated with an increased incidence of secondary malignancy.

Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Avoid (teratogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Monitoring In patients with hepatic impairment, manufacturer advises regular liver function tests—consult product literature.

• MONITORING REQUIREMENTS

- ▶ Monitor cardiac and liver function.
- ▶ Monitor full blood count regularly throughout treatment.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

▶ **Busulfan (Non-proprietary)**

Busulfan 2 mg Busulfan 2mg tablets | 25 tablet [PoM] £69.02 DT = £69.02

Solution for infusion

▶ **Busilvex** (Pierre Fabre Ltd)

Busulfan 6 mg per 1 ml Busilvex 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule [PoM] £1,610.00 (Hospital only)

Chlorambucil

• INDICATIONS AND DOSE

Hodgkin's disease | Non-Hodgkin's lymphoma

▶ **BY MOUTH**

- ▶ **Child:** (consult local protocol)

Relapsing steroid-sensitive nephrotic syndrome (initiated in specialist centres)

▶ **BY MOUTH**

- ▶ **Child** 3 months–17 years: 200 micrograms/kg daily for 8 weeks

- **UNLICENSED USE** Not licensed for use in nephrotic syndrome.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

- **CAUTIONS** Children with nephrotic syndrome (increased seizure risk) • history of epilepsy (increased seizure risk)

- **INTERACTIONS** → Appendix 1: alkylating agents

• SIDE-EFFECTS

- ▶ **Common or very common** Anaemia • bone marrow disorders • diarrhoea • gastrointestinal disorder • leucopenia • nausea • neoplasms • neutropenia • oral ulceration • seizures • thrombocytopenia • vomiting

▶ **Uncommon** Skin reactions

- ▶ **Rare or very rare** Cystitis • fever • hepatic disorders • movement disorders • muscle twitching • peripheral neuropathy • respiratory disorders • severe cutaneous adverse reactions (SCARs) • tremor

▶ **Frequency not known** Amenorrhoea • azoospermia

SIDE-EFFECTS, FURTHER INFORMATION

Secondary malignancy Use of chlorambucil is associated with an increased incidence of acute leukaemia, particularly with prolonged use.

Skin reactions Manufacturer advises assessing continued use if rash occurs—has been reported to progress to Stevens–Johnson syndrome and toxic epidermal necrolysis.

Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
Dose adjustments Manufacturer advises consider dose reduction in severe impairment—limited information available.
- **MONITORING REQUIREMENTS** Monitor full blood count regularly throughout treatment.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Chlorambucil for nephrotic syndrome www.medicinesforchildren.org.uk/chlorambucil-nephrotic-syndrome-0

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Chlorambucil (Non-proprietary)

Chlorambucil 2 mg Chlorambucil 2mg tablets | 25 tablet **[PoM]**
£42.87 DT = £42.87

Cyclophosphamide

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, retinoblastoma, neuroblastoma, rhabdomyosarcoma, soft-tissue sarcomas, Ewing tumour, neuroectodermal tumours (including medulloblastoma), infant brain tumours, ependymoma, high-dose conditioning for bone marrow transplantation, lupus nephritis

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Child: (consult local protocol)

Steroid-sensitive nephrotic syndrome

► BY MOUTH

► Child 3 months–17 years: 2–3 mg/kg daily for 8 weeks

► BY INTRAVENOUS INFUSION

► Child 3 months–17 years: 500 mg/m² once a month for 6 months

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

- **CONTRA-INDICATIONS** Haemorrhagic cystitis
- **CAUTIONS** Avoid in Acute porphyrias p. 603 · diabetes mellitus · previous or concurrent mediastinal irradiation—risk of cardiotoxicity
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
► **Common or very common** Agranulocytosis · alopecia · anaemia · asthenia · bone marrow disorders · cystitis · decreased leucocytes · fever · haemolytic uraemic syndrome · haemorrhage · hepatic disorders · immunosuppression · increased risk of infection · mucosal abnormalities · neutropenia · progressive multifocal leukoencephalopathy · reactivation of infections · sperm abnormalities · thrombocytopenia
- **Uncommon** Appetite decreased · embolism and thrombosis · flushing · hypersensitivity · ovarian and fallopian tube disorders · sepsis
- **Rare or very rare** Bladder disorders · chest pain · confusion · constipation · diarrhoea · disseminated intravascular coagulation · dizziness · eye inflammation · fluid imbalance · headache · hyponatraemia · menstrual cycle irregularities · nail discolouration · nausea · neoplasms · oral disorders · pancreatitis acute · renal failure · secondary neoplasm · seizure · severe cutaneous adverse reactions (SCARs) · SIADH · skin reactions · visual impairment · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Haemorrhagic cystitis A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication that may be prevented by increasing fluid intake for 24–48 hours after intravenous injection, mesna can also help prevent cystitis.

Secondary malignancy As with all cytotoxic therapy, treatment with cyclophosphamide is associated with an increased incidence of secondary malignancies.
Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Discontinue breast-feeding during and for 36 hours after stopping treatment.
- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose—consult local treatment protocol for details.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose—consult local treatment protocol for details.
- **DIRECTIONS FOR ADMINISTRATION** Consult local treatment protocol for details.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Cyclophosphamide for nephrotic syndrome www.medicinesforchildren.org.uk/cyclophosphamide-nephrotic-syndrome-0

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion

Tablet

CAUTIONARY AND ADVISORY LABELS 25, 27

► Cyclophosphamide (Non-proprietary)

Cyclophosphamide (as Cyclophosphamide monohydrate)

50 mg Cyclophosphamide 50mg tablets | 100 tablet **[PoM]** £139.00
DT = £139.00

► Cytoxan (Imported (United States))

Cyclophosphamide 25 mg Cytoxan 25mg tablets | 100 tablet **[PoM]** £9

Powder for solution for injection

► Cyclophosphamide (Non-proprietary)

Cyclophosphamide (as Cyclophosphamide monohydrate)

500 mg Cyclophosphamide 500mg powder for solution for injection vials | 1 vial **[PoM]** £9.66 (Hospital only) | 1 vial **[PoM]** £9.66

Cyclophosphamide (as Cyclophosphamide monohydrate)

1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial [PoM] £17.06 (Hospital only) | 1 vial [PoM] £17.91

Cyclophosphamide (as Cyclophosphamide monohydrate)

2 gram Cyclophosphamide 2g powder for solution for injection vials | 1 vial [PoM] £34.12 (Hospital only)

Dacarbazine**● INDICATIONS AND DOSE****Hodgkin's disease | Paediatric solid tumours**

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

- **Common or very common** Anaemia · appetite decreased · leucopenia · nausea · thrombocytopenia · vomiting
- **Uncommon** Alopecia · infection · influenza like illness · photosensitivity reaction · skin reactions
- **Rare or very rare** Agranulocytosis · confusion · diarrhoea · flushing · headache · hepatic disorders · lethargy · pancytopenia · paraesthesia · renal impairment · seizure · visual impairment

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Avoid (carcinogenic and teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Dose reduction may be required in combined renal and hepatic impairment.

- **RENAL IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Dose reduction may be required in combined renal and hepatic impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Dacarbazine is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously *Adriamycin*®], bleomycin, vinblastine, and dacarbazine).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Dacarbazine (Non-proprietary)**

Dacarbazine (as Dacarbazine citrate) 500 mg Dacarbazine 500mg powder for solution for infusion vials | 1 vial [PoM] £37.50

Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial [PoM] £70.00

Powder for solution for injection

- **Dacarbazine (Non-proprietary)**

Dacarbazine (as Dacarbazine citrate) 100 mg Dacarbazine 100mg powder for solution for injection vials | 10 vial [PoM] £90.00

Dacarbazine (as Dacarbazine citrate) 200 mg Dacarbazine 200mg powder for solution for injection vials | 10 vial [PoM] £160.00

Ifosfamide**● INDICATIONS AND DOSE****Rhabdomyosarcoma | Soft-tissue sarcomas | Ewing tumour | Germ cell tumour | Osteogenic sarcoma**

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **CONTRA-INDICATIONS** Acute infection · urinary-tract infection · urinary-tract obstruction · urothelial damage

- **CAUTIONS** Avoid in Acute porphyrrias p. 603

- **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

- **Common or very common** Alopecia · appetite decreased · bone marrow disorders · haemorrhage · hepatic disorders · infection · leucopenia · nausea · reactivation of infection · renal impairment · thrombocytopenia · vascular disorders · vomiting
- **Uncommon** Cardiotoxicity · diarrhoea · hypotension · oral disorders
- **Rare or very rare** Skin reactions

SIDE-EFFECTS, FURTHER INFORMATION

Urothelial toxicity Mesna is routinely given with ifosfamide to reduce urothelial toxicity.

Secondary malignancy Use of ifosfamide is associated with an increased incidence of acute leukaemia.

Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Avoid (teratogenic and carcinogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid.

- **RENAL IMPAIRMENT** Avoid.

- **MONITORING REQUIREMENTS** Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- **Ifosfamide (Non-proprietary)**

Ifosfamide 1 gram Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial [PoM] £115.79

Ifosfamide 2 gram Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial [PoM] £228.09

Melphalan

● INDICATIONS AND DOSE

High intravenous dose with haematopoietic stem cell transplantation in the treatment of childhood neuroblastoma and some other advanced embryonal tumours

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in embryonal tumours.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

- **CAUTIONS** Consider use of prophylactic anti-infective agents · for high-dose intravenous administration establish adequate hydration · haematopoietic stem cell transplantation essential for high dose treatment (consult local treatment protocol for details)

- **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

- **Common or very common** Alopecia · anaemia · bone marrow depression (delayed) · diarrhoea · feeling hot · myalgia · myopathy · nausea · paraesthesia · stomatitis · thrombocytopenia · vomiting
- **Rare or very rare** Haemolytic anaemia · hepatic disorders · peripheral vascular disease · respiratory disorders · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION

Secondary malignancy Use of melphalan is associated with an increased incidence of acute leukaemias.

Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose initially (consult product literature).

- **MONITORING REQUIREMENTS** Monitor full blood count before and throughout treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► Melphalan (Non-proprietary)

Melphalan (as Melphalan hydrochloride) 50 mg Melphalan 50mg powder and solvent for solution for injection vials | 1 vial [PoM] £137.37

Temozolomide

- **DRUG ACTION** Temozolomide is structurally related to dacarbazine.

● INDICATIONS AND DOSE

Treatment of recurrent or progressive malignant glioma

- BY MOUTH
- Child 3-17 years: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

- **CAUTIONS** *Pneumocystis jirovecii* pneumonia—consult product literature for monitoring and prophylaxis requirements

- **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

- **Common or very common** Alopecia · anxiety · appetite decreased · arthralgia · asthenia · chills · concentration impaired · confusion · constipation · cough · decreased leucocytes · diarrhoea · dizziness · drowsiness · dysphagia · dyspnoea · emotional lability · fever · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hemiparesis · hyperglycaemia · hypersensitivity · increased risk of infection · insomnia · level of consciousness decreased · malaise · memory loss · movement disorders · muscle weakness · nausea · neutropenia · oedema · oral disorders · pain · peripheral neuropathy · radiation injury · seizures · sensation abnormal · skin reactions · speech impairment · taste altered · thrombocytopenia · tremor · urinary disorders · vision disorders · vomiting · weight changes
- **Uncommon** Altered smell sensation · anaemia · behaviour disorder · bone marrow disorders · cognitive impairment · condition aggravated · Cushing's syndrome · depression · diabetes insipidus · ear pain · erectile dysfunction · eye pain · gait abnormal · hallucination · hepatic disorders · hyperacusia · hyperbilirubinaemia · hypertension · hypokalaemia · intracranial haemorrhage · myalgia · myopathy · nasal congestion · nervous system disorder · palpitations · photosensitivity reaction · reactivation of infections · thirst · vasodilation
- **Rare or very rare** Neoplasms · respiratory disorders · secondary malignancy · severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

● MONITORING REQUIREMENTS

- Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
- Monitor for myelodysplastic syndrome.
- Monitor for secondary malignancies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule

CAUTIONARY AND ADVISORY LABELS 23, 25

► Temozolomide (Non-proprietary)

Temozolomide 5 mg Temozolomide 5mg capsules | 5 capsule [PoM]
£10.06–£16.00

Temozolomide 20 mg Temozolomide 20mg capsules |
5 capsule [PoM] £40.23–£65.00

Temozolomide 100 mg Temozolomide 100mg capsules |
5 capsule [PoM] £201.18–£325.00

Temozolomide 140 mg Temozolomide 140mg capsules |
5 capsule [PoM] £296.47–£465.00

Temozolomide 180 mg Temozolomide 180mg capsules |
5 capsule [PoM] £381.18–£586.00

Temozolomide 250 mg Temozolomide 250mg capsules |
5 capsule [PoM] £529.42–£814.00

► Temodal (Merck Sharp & Dohme Ltd)

Temozolomide 5 mg Temodal 5mg capsules | 5 capsule [PoM]
£10.59 (Hospital only)

Temozolomide 20 mg Temodal 20mg capsules | 5 capsule [PoM]
£42.35 (Hospital only)

Temozolomide 100 mg Temodal 100mg capsules | 5 capsule [PoM]
£211.77 (Hospital only)

Temozolomide 140 mg Temodal 140mg capsules | 5 capsule [PoM]
£296.48 (Hospital only)

Temozolomide 180 mg Temodal 180mg capsules | 5 capsule [PoM]
£381.19 (Hospital only)

Temozolomide 250 mg Temodal 250mg capsules | 5 capsule [PoM]
£529.43 (Hospital only)

► Temomedac (medac UK)

Temozolomide 5 mg Temomedac 5mg capsules | 5 capsule [PoM]
£16.12

Temozolomide 20 mg Temomedac 20mg capsules | 5 capsule [PoM]
£64.49

Temozolomide 100 mg Temomedac 100mg capsules |
5 capsule [PoM] £322.43

Temozolomide 140 mg Temomedac 140mg capsules |
5 capsule [PoM] £451.40

Temozolomide 180 mg Temomedac 180mg capsules |
5 capsule [PoM] £580.37

Temozolomide 250 mg Temomedac 250mg capsules |
5 capsule [PoM] £806.08

► **Frequency not known** Pulmonary arterial hypertension · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

● **PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

● **BREAST FEEDING** Discontinue breast-feeding.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2012) that thiotepa (*Tepadina*®) is **not** recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Tepadina (Adienne Pharma & Biotech)

Thiotepa 15 mg Tepadina 15mg powder for concentrate for solution for infusion vials | 1 vial [PoM] [Σ]

Thiotepa 100 mg Tepadina 100mg powder for concentrate for solution for infusion vials | 1 vial [Σ]

ANTINEOPLASTIC DRUGS > ANTHRACYCLINES AND RELATED DRUGS

Daunorubicin

● INDICATIONS AND DOSE

Acute myelogenous leukaemia | **Acute lymphocytic leukaemia**

► BY INTRAVENOUS INFUSION

► Child: (consult local protocol)

● **UNLICENSED USE** *DaunoXome*® is not licensed for use in children.

● **CONTRA-INDICATIONS** Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracycline · recent myocardial infarction · severe arrhythmia

CONTRA-INDICATIONS, FURTHER INFORMATION

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

● **CAUTIONS** Caution in handling—irritant to tissues

● **INTERACTIONS** → Appendix 1: anthracyclines

● **SIDE-EFFECTS** Abdominal pain · alopecia · amenorrhoea · anaemia · arrhythmias · ascites · atrioventricular block · azoospermia · bone marrow disorders · cardiac inflammation · cardiomyopathy · chills · congestive heart failure · cyanosis · death · dehydration · diarrhoea · dyspnoea · extravasation · fever · flushing · gastrointestinal disorders · haemorrhage · hepatomegaly · hyperpyrexia · hyperuricaemia · hypoxia · increased risk of infection · ischaemic heart disease · leucopenia · mucositis · myocardial infarction · nail discoloration · nausea · nephropathy · neutropenia · oedema · pain · paraesthesia · pleural effusion · radiation injuries · shock · skin reactions · soft tissue necrosis · stomatitis · thrombocytopenia · thrombophlebitis · urine red · vascular disorders · vomiting

Thiotepa

● INDICATIONS AND DOSE

Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy

► BY INTRAVENOUS INFUSION

► Child: (consult local protocol)

● **CAUTIONS** Avoid in Acute porphyrias p. 603

● **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · anaemia · appetite decreased · ataxia · bladder disorder · cardiac arrest · cardiovascular insufficiency · diarrhoea · encephalopathy · fever · gastrointestinal disorders · graft versus host disease · growth retardation · haemorrhage · headache · hearing impairment · heart failure · hepatic failure · hyperglycaemia · hypertension · hypogonadism · hypopituitarism · hypothyroidism · hypoxia · increased risk of infection · intracranial haemorrhage · memory loss · mucositis · multi organ failure · nausea · neutropenia · pain · pancytopenia · paresis · psychiatric disorder · pulmonary oedema · renal failure · respiratory disorders · secondary malignancy · seizure · sepsis · sinusoidal obstruction syndrome · skin reactions · stomatitis · thrombocytopenia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Cardiotoxicity is cumulative and may be irreversible, however responds to treatment if detected early.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Reduce dose according to serum bilirubin concentration—consult local protocol for details.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Reduce dose—consult local treatment protocol for details.
- **MONITORING REQUIREMENTS**
 - ▶ Cardiac monitoring essential.
 - ▶ Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **DaunoXome** (Galen Ltd)
Daunorubicin (as Daunorubicin hydrochloride citrate) 2 mg per 1 ml DaunoXome 50mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £250.00

Powder for solution for infusion

- ▶ **Daunorubicin (Non-proprietary)**
Daunorubicin (as Daunorubicin hydrochloride)
20 mg Daunorubicin 20mg powder for solution for infusion vials | 10 vial [PoM] £650.00 (Hospital only)

Doxorubicin hydrochloride

04-Oct-2017

● INDICATIONS AND DOSE

Some paediatric malignancies | Ewing's sarcoma | Osteogenic sarcoma | Wilms' tumour | Neuroblastoma | Retinoblastoma | Some liver tumours | Acute lymphoblastic leukaemia | Hodgkin's lymphoma | Non-Hodgkin's lymphoma

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **CONTRA-INDICATIONS** Acute inflammatory heart disease · consult product literature · increased haemorrhagic tendency · marked persisting myelosuppression induced by previous treatment · marked persisting stomatitis induced by previous treatment · previous myocardial infarction · previous treatment with maximum cumulative doses of doxorubicin · previous treatment with maximum cumulative doses of other anthracycline · severe arrhythmia · severe myocardial insufficiency

CONTRA-INDICATIONS, FURTHER INFORMATION

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- **CAUTIONS** Caution in handling—irritant to tissues · consult product literature
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
 - ▶ Common or very common Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · bone marrow depression · breast pain · cachexia · cardiovascular disorder · chest discomfort · chills · constipation · cough · decreased leucocytes · dehydration · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysphagia · dyspnoea · dysuria · electrolyte imbalance · epistaxis · eye inflammation · fever · gastrointestinal

discomfort · gastrointestinal disorders · headache · hyperhidrosis · hypersensitivity · hypertension · hyperthermia · hypotension · increased risk of infection · influenza like illness · infusion related reaction · insomnia · malaise · mucosal abnormalities · muscle complaints · muscle tone increased · muscle weakness · nail disorder · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · scrotal erythema · sensation abnormal · sepsis · skin reactions · skin ulcer · syncope · taste altered · thrombocytopenia · vasodilation · vision blurred · vomiting · weight decreased

- ▶ **Uncommon** Confusion · embolism and thrombosis
- ▶ **Rare or very rare** Secondary oral neoplasms · severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Asthma · congestive heart failure · secondary malignancy · throat tightness

SIDE-EFFECTS, FURTHER INFORMATION Extravasation can cause tissue necrosis.

Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details.
- **RENAL IMPAIRMENT** Consult product literature in severe impairment.
- **MONITORING REQUIREMENTS** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

- ▶ **Doxorubicin hydrochloride (Non-proprietary)**
Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 10mg/5ml solution for injection vials | 1 vial [PoM] £18.54 (Hospital only)
Doxorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial [PoM] £103.00 (Hospital only)
Doxorubicin 50mg/25ml solution for infusion vials | 1 vial [PoM] £103.00 (Hospital only)
Doxorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial [PoM] £20.60 (Hospital only)
Doxorubicin 10mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £19.57
Doxorubicin 10mg/5ml solution for infusion vials | 1 vial [PoM] £20.60 (Hospital only)
Doxorubicin 50mg/25ml solution for injection vials | 1 vial [PoM] £92.70 (Hospital only)
Doxorubicin 50mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £97.85

Solution for infusion

- ▶ **Doxorubicin hydrochloride (Non-proprietary)**
Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 200mg/100ml solution for injection Cytosafe vials | 1 vial [PoM] £412.00 (Hospital only)
Doxorubicin 200mg/100ml solution for infusion vials | 1 vial [PoM] £412.00 (Hospital only)
Doxorubicin 200mg/100ml concentrate for solution for infusion vials | 1 vial [PoM] £391.40
- ▶ **Caelyx** (Janssen-Cilag Ltd)
Doxorubicin hydrochloride (as Doxorubicin hydrochloride liposomal pegylated) 2 mg per 1 ml Caelyx 50mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £712.49

Caelyx 20mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £360.23

Powder for solution for injection

- ▶ **Doxorubicin** (medac UK)
Doxorubicin hydrochloride 50 mg. Doxorubicin 50mg powder for solution for injection vials | 10 vial [PoM] £914.00

Powder and solvent for suspension for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Myocet** (Teva UK Ltd)
Doxorubicin hydrochloride 50 mg. Myocet 50mg powder and solvent for suspension for infusion vials | 2 vial [PoM] £912.26 (Hospital only)

Epirubicin hydrochloride

• INDICATIONS AND DOSE

Recurrent acute lymphoblastic leukaemia | Rhabdomyosarcoma | Other soft-tissue tumours of childhood

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Myocardiopathy · previous treatment with maximum cumulative doses of epirubicin or other anthracycline · recent myocardial infarction · severe arrhythmia · severe myocardial insufficiency · unstable angina

CONTRA-INDICATIONS, FURTHER INFORMATION

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · appetite decreased · bone marrow depression · dehydration · diarrhoea · increased risk of infection · leucopenia · mucositis · nausea · neutropenia · oesophagitis · paraesthesia · stomatitis · urinary frequency increased · urine red · vasodilation · vomiting
 - ▶ **Uncommon** Embolism and thrombosis · thrombocytopenia
 - ▶ **Rare or very rare** Amenorrhoea · arrhythmias · ascites · asthenia · azoospermia · cardiac conduction disorders · cardiomyopathy · cardiotoxicity · chills · congestive heart failure · dizziness · dyspnoea · fever · hepatomegaly · hyperuricaemia · malaise · neoplasms · oedema · pleural effusion · pulmonary oedema · skin reactions
 - ▶ **Frequency not known** Eye inflammation · haemorrhage · hypoxia · nail discolouration · photosensitivity reaction · radiation injuries · sepsis · shock

SIDE-EFFECTS, FURTHER INFORMATION

Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

Cumulative doses of other anthracycline Epirubicin is considered less toxic than other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **PREGNANCY** Avoid (carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Reduce dose according to bilirubin concentration—consult local treatment protocol for details.

• RENAL IMPAIRMENT

Dose adjustments Dose reduction may be necessary in severe impairment.

• MONITORING REQUIREMENTS

- ▶ **Cardiac toxicity** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

• MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

- ▶ **Epirubicin hydrochloride (Non-proprietary)**
Epirubicin hydrochloride 2 mg per 1 ml Epirubicin 50mg/25ml solution for injection vials | 1 vial [PoM] £86.89–£100.88
Epirubicin 10mg/5ml solution for injection vials | 1 vial [PoM] £17.38–£20.18
- ▶ **Pharmorubicin** (Pfizer Ltd)
Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial [PoM] £106.19 (Hospital only)
Pharmorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial [PoM] £21.24 (Hospital only)

Solution for infusion

- ▶ **Epirubicin hydrochloride (Non-proprietary)**
Epirubicin hydrochloride 2 mg per 1 ml Epirubicin 200mg/100ml solution for infusion vials | 1 vial [PoM] £306.20–£366.85
Epirubicin 100mg/50ml solution for infusion vials | 1 vial [PoM] £201.76
- ▶ **Pharmorubicin** (Pfizer Ltd)
Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 200mg/100ml solution for infusion Cytosafe vials | 1 vial [PoM] £386.16 (Hospital only)

Mitoxantrone (Mitozantrone)

• INDICATIONS AND DOSE

Acute myeloid leukaemia | Recurrent acute lymphoblastic leukaemia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS**
CONTRA-INDICATIONS, FURTHER INFORMATION
Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS** Abdominal pain · acute leukaemia · alopecia · amenorrhoea · anxiety · appetite decreased · arrhythmia · asthenia · bone marrow depression · confusion · constipation · diarrhoea · drowsiness · dyspnoea · fever · gastrointestinal haemorrhage · heart failure · mucositis · nail discolouration · nail dystrophy · nausea · neurological effects · paraesthesia · scleral discolouration · skin discolouration · stomatitis · thrombocytopenia · urine blue · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Use with caution—consult local treatment protocol.
- **MONITORING REQUIREMENTS**
 - ▶ Cardiac toxicity Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Mitoxantrone (Non-proprietary)

Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £121.85 (Hospital only) | 1 vial [PoM] £51.43

▶ Onkotrone (Baxter Healthcare Ltd)

Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial [PoM] £103.57
Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial [PoM] £129.48

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

Clofarabine

● INDICATIONS AND DOSE

Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1–17 years: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children under 1 year.

- **CAUTIONS** Cardiac disease

- **INTERACTIONS** → Appendix 1: clofarabine

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anxiety · appetite decreased · arthralgia · capillary leak syndrome · chills · cough · dehydration · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · feeling abnormal · feeling hot · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hepatic disorders · hyperbilirubinaemia · hyperhidrosis · hypersensitivity · hypotension · increased risk of infection · irritability · mucositis · multi organ failure · myalgia · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · pericardial effusion · peripheral neuropathy · psychiatric disorder · renal impairment · respiratory disorders · sepsis · sinusoidal obstruction syndrome · skin reactions · systemic inflammatory response syndrome · tachycardia · tremor · tumour lysis syndrome · vomiting · weight decreased
- ▶ **Frequency not known** Antibiotic associated colitis · gastrointestinal disorders · hyponatraemia · pancreatitis · severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ Clofarabine (Non-proprietary)

Clofarabine 1 mg per 1 ml Clofarabine 20mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,259.87 (Hospital only)

▶ Evoltra (Sanofi) ▼

Clofarabine 1 mg per 1 ml Evoltra 20mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,326.18 (Hospital only)

Cytarabine

- **DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia | Acute myeloid leukaemia | Non-Hodgkin's lymphoma

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: (consult local protocol)

Meningeal leukaemia | Meningeal neoplasms

- ▶ BY INTRATHECAL INJECTION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Depocyte® intrathecal injection not licensed for use in children.

IMPORTANT SAFETY INFORMATION

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

- **INTERACTIONS** → Appendix 1: cytarabine

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · consciousness impaired · diarrhoea · dysarthria · dysphagia · eye disorders · eye inflammation · eye stinging · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhagic conjunctivitis (consider prophylactic corticosteroid eye drops) · hyperuricaemia · leucopenia · nausea · oral disorders · renal impairment · skin reactions · thrombocytopenia · urinary retention · vasculitis · vision disorders · vomiting
- ▶ **Uncommon** Arthralgia · dyspnoea · headache · increased risk of infection · myalgia · nerve disorders · pain · paralysis · pericarditis · sepsis · skin ulcer · throat pain
- ▶ **Rare or very rare** Arrhythmias
- ▶ **Frequency not known** Acute respiratory distress syndrome (ARDS) · amenorrhoea · ataxia · azoospermia · bone marrow disorders · cardiomyopathy · cerebellar dysfunction · chest pain · coma · confusion · cytarabine syndrome · dizziness · drowsiness · haemorrhage · hepatic disorders · hyperbilirubinaemia · neurotoxicity · neurotoxicity rash · neutropenia · pancreatitis · personality change · pulmonary oedema · reticulocytopenia · rhabdomyolysis · seizure · tremor
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
- **Dose adjustments** Reduce dose—consult product literature.
- **RENAL IMPAIRMENT** Consult local treatment protocols.

● MONITORING REQUIREMENTS

- Haematological monitoring Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.

- **PRESCRIBING AND DISPENSING INFORMATION** Dose is based on weight or body-surface area, children may tolerate higher doses of cytarabine than adults.

● NATIONAL FUNDING/ACCESS DECISIONS

DEPOCYTE®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2007) that liposomal cytarabine suspension (*DepoCyt*®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

► Cytarabine (Non-proprietary)

Cytarabine 20 mg per 1 ml Cytarabine 500mg/25ml solution for injection vials | 1 vial [PoM] £19.50 (Hospital only) | 1 vial [PoM] £19.50

Cytarabine 100mg/5ml solution for injection vials | 5 vial [PoM] £20.48–£30.00 (Hospital only) | 5 vial [PoM] £20.98

Cytarabine 100 mg per 1 ml Cytarabine 500mg/5ml solution for injection vials | 5 vial [PoM] £100.00 (Hospital only) | 5 vial [PoM] £89.78

Cytarabine 100mg/1ml solution for injection vials | 5 vial [PoM] £26.93

Cytarabine 2g/20ml solution for injection vials | 1 vial [PoM] £77.50–£79.00 (Hospital only) | 1 vial [PoM] £73.63–£77.50
Cytarabine 1g/10ml solution for injection vials | 1 vial [PoM] £39.00–£40.00 (Hospital only) | 1 vial [PoM] £37.05–£39.00

Suspension for injection

► DepoCyt (Napp Pharmaceuticals Ltd)

Cytarabine 10 mg per 1 ml DepoCyt 50mg/5ml suspension for injection vials | 1 vial [PoM] £1,223.75 (Hospital only)

Fludarabine phosphate

● INDICATIONS AND DOSE

Poor prognosis or relapsed acute myeloid leukaemia | Relapsed acute lymphoblastic leukaemia | Conditioning before bone marrow transplantation

- BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

● UNLICENSED USE Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

● CONTRA-INDICATIONS Haemolytic anaemia

● CAUTIONS Increased susceptibility to skin cancer · worsening of existing skin cancer

CAUTIONS, FURTHER INFORMATION

- Immunosuppression Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

● INTERACTIONS → Appendix 1: fludarabine

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Anaemia · appetite decreased · asthenia · bone marrow depression (may be cumulative) · chills · cough · diarrhoea · fever · increased risk of infection · malaise · mucositis · nausea · neoplasms · nerve disorders · neutropenia · oedema · stomatitis · thrombocytopenia · vision disorders · vomiting
- **Uncommon** Autoimmune disorder · confusion · haemorrhage · respiratory disorders · tumour lysis syndrome
- **Rare or very rare** Agitation · arrhythmia · coma · heart failure · seizure · severe cutaneous adverse reactions (SCARs)

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With oral use Progressive multifocal leukoencephalopathy · skin reactions · viral infection reactivation
- With parenteral use Rash
- **Uncommon**
- With oral use Acquired haemophilia · crystalluria · dyspnoea · electrolyte imbalance · haemolytic anaemia · hyperuricaemia · metabolic acidosis · renal failure
- **Frequency not known**
- With parenteral use Encephalopathy · intracranial haemorrhage
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (embryotoxic and teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

● BREAST FEEDING Discontinue breast-feeding.

● RENAL IMPAIRMENT Avoid if creatinine clearance less than 30 mL/minute/1.73 m².

Dose adjustments Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- Monitor for signs of haemolysis.
- Monitor for neurological toxicity.

● DIRECTIONS FOR ADMINISTRATION Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Fludarabine phosphate (Non-proprietary)

Fludarabine phosphate 25 mg per 1 ml Fludarabine phosphate 50mg/2ml concentrate for solution for injection vials | 1 vial [PoM] £156.00 (Hospital only) | 1 vial [PoM] £155.00

Tablet

► Fludara (Sanofi)

Fludarabine phosphate 10 mg Fludara 10mg tablets | 15 tablet [PoM] £302.48 (Hospital only) | 20 tablet [PoM] £403.31 (Hospital only)

Powder for solution for injection

► Fludarabine phosphate (Non-proprietary)

Fludarabine phosphate 50 mg Fludarabine phosphate 50mg powder for solution for injection vials | 1 vial [PoM] £155.00 (Hospital only)

► Fludara (Sanofi)

Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial [PoM] £735.34 (Hospital only)

Mercaptopurine

(6-Mercaptopurine)

● INDICATIONS AND DOSE

Severe ulcerative colitis | Severe Crohn's disease

► BY MOUTH

- Child 2–17 years: Initially 1–1.5 mg/kg once daily (max. per dose 50 mg), then increased if necessary up to 75 mg once daily

Acute lymphoblastic leukaemia | Lymphoblastic lymphomas

► BY MOUTH

- Child: (consult local protocol)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

DOSE EQUIVALENCE AND CONVERSION

- Mercaptopurine tablets and *Xaluprine*® oral suspension are **not** bioequivalent, haematological monitoring is advised when switching formulations.

- **UNLICENSED USE** Not licensed for use in severe ulcerative colitis and Crohn's disease.

Not licensed for use in children for acute lymphoblastic lymphoma or T-cell non-Hodgkins lymphoma.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Mercaptopurine has been confused with mercaptamine; care must be taken to ensure the correct drug is prescribed and dispensed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Reduced thiopurine methyltransferase activity
- CAUTIONS, FURTHER INFORMATION**
 - Thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- **INTERACTIONS** → Appendix 1: mercaptopurine
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia • appetite decreased • bone marrow depression • diarrhoea • hepatic disorders • hepatotoxicity (more common at high doses) • leucopenia • nausea • oral disorders • thrombocytopenia • vomiting
 - **Uncommon** Arthralgia • fever • increased risk of infection • neutropenia • pancreatitis • rash
 - **Rare or very rare** Alopecia • face oedema • intestinal ulcer • neoplasms • oligozoospermia
 - **Frequency not known** Hypoglycaemia • photosensitivity reaction
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **PREGNANCY** Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Discontinue breast-feeding.

● HEPATIC IMPAIRMENT

Dose adjustments May need dose reduction.

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises consider reducing dose.

- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.

● MONITORING REQUIREMENTS

- Monitor liver function—discontinue if jaundice develops.
- When used for Severe ulcerative colitis or Severe Crohn's disease Monitor for toxicity throughout treatment. Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

- **Mercaptopurine (Non-proprietary)**

Mercaptopurine 50 mg Mercaptopurine 50mg tablets | 25 tablet (PoM) £49.15 DT = £49.15

Methotrexate

17-May-2017

- **DRUG ACTION** Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

● INDICATIONS AND DOSE

Severe Crohn's disease

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**

- Child 7–17 years: 15 mg/m² once weekly (max. per dose 25 mg)

Maintenance of remission of severe Crohn's disease

- **BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**

- Child 7–17 years: 15 mg/m² once weekly (max. per dose 25 mg), dose reduced according to response to lowest effective dose

Juvenile idiopathic arthritis | Juvenile dermatomyositis | Vasculitis | Uveitis | Systemic lupus erythematosus | Localised scleroderma | Sarcoidosis

- **BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**

- Child: Initially 10–15 mg/m² once weekly, then increased if necessary up to 25 mg/m² once weekly

Maintenance and remission of acute lymphoblastic leukaemia, lymphoblastic lymphoma

- **BY MOUTH**
- Child: (consult local protocol)

Treatment of early stage Burkitt's lymphoma, non-Hodgkin's lymphoma, osteogenic sarcoma, some CNS tumours including infant brain tumours, acute lymphoblastic leukaemia

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- Child: (consult local protocol)

Meningeal leukaemia, treatment and prevention of CNS involvement of leukaemia

- **BY INTRATHECAL INJECTION**
- Child: (consult local protocol)

continued →

Severe psoriasis unresponsive to conventional therapy (specialist use only)**► BY MOUTH**

- Child 2–17 years: Initially 200 micrograms/kg once weekly (max. per dose 10 mg), then increased if necessary to 400 micrograms/kg once weekly (max. per dose 25 mg), adjusted according to response, stop treatment if inadequate response after 3 months at the optimum dose

- **UNLICENSED USE** *Metotect*® is licensed for use in children over 3 years for polyarticular forms of juvenile idiopathic arthritis; other preparations not licensed for use in children for non-malignant conditions.

IMPORTANT SAFETY INFORMATION

Note that the dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the child or their carer is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medication (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

- **CONTRA-INDICATIONS** Active infection (in non-malignant conditions) · ascites · immunodeficiency syndromes (in non-malignant conditions) · significant pleural effusion
- **CAUTIONS** Photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported) · diarrhoea · extreme caution in blood disorders (avoid if severe) · peptic ulceration · risk of accumulation in pleural effusion or ascites—drain before treatment · ulcerative colitis · ulcerative stomatitis

CAUTIONS, FURTHER INFORMATION

- Blood count Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
- Gastro-intestinal toxicity Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.
- Liver toxicity Persistent 2–fold rise in liver transaminases may necessitate dose reduction or rarely discontinuation; abrupt withdrawal should be avoided as this can lead to disease flare.
- Pulmonary toxicity Acute pulmonary toxicity is rare in children treated for juvenile idiopathic arthritis, but children and carers should seek medical attention if dyspnoea, cough or fever develops; discontinue if pneumonitis suspected.
- **INTERACTIONS** → Appendix 1: methotrexate
- **SIDE-EFFECTS**
- **Common or very common**
- With intramuscular and subcutaneous use Anaemia · appetite decreased · chest pain · cough · diarrhoea · drowsiness · dyspnoea · fatigue · fever · gastrointestinal discomfort · headache · leucopenia · malaise · nausea · oral disorders · respiratory disorders · skin reactions · throat complaints · thrombocytopenia · vomiting
- With intrathecal use Arachnoiditis · fever · headache · nausea · necrotising demyelinating leukoencephalopathy · neurotoxicity · vomiting
- With intravenous use Abdominal distress · fever · headache · leucopenia · nausea · oral disorders · vomiting
- With oral use Anaemia · appetite decreased · diarrhoea · drowsiness · fatigue · fever · gastrointestinal discomfort · headache · increased risk of infection · leucopenia · nausea · oral disorders · respiratory disorders · skin reactions · throat ulcer · thrombocytopenia · vomiting
- **Uncommon**
- With intramuscular use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · confusion · cystitis · depression · diabetes mellitus · drug toxicity · dysuria · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · increased risk of infection · lipodystrophy · local reaction · myalgia · neoplasms · osteoporosis · pain · paraesthesia · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · sterile abscess · vasculitis · vertigo · vulvovaginal disorders
- With oral use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · chills · confusion · cystitis · depression · diabetes mellitus · dysuria · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · myalgia · neoplasms · nephropathy · osteoporosis · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · vasculitis · vertigo · vulvovaginal disorders
- With subcutaneous use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · confusion · cystitis · depression · diabetes mellitus · drug toxicity · dysuria · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · increased risk of infection · myalgia · neoplasms · osteoporosis · pain · paraesthesia · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · vasculitis · vertigo · vulvovaginal disorders
- **Rare or very rare**
- With intramuscular and subcutaneous use Apnoea · asthma-like conditions · azotaemia · conjunctivitis · eosinophilia · gynaecomastia · hypotension · immune deficiency · infertility · influenza like illness · insomnia · lymphadenopathy · meningism · meningitis aseptic · menstrual disorder · mood swings · muscle weakness · nail discoloration · neutropenia · oligozoospermia · paralysis · pericardial disorders · pericarditis · proteinuria · reactivation of infection · renal impairment · retinopathy · sepsis · sexual dysfunction · stress fracture · taste altered · telangiectasia · thromboembolism · visual impairment
- With intravenous use Anaemia · bone marrow depression · gastrointestinal disorders · hepatic disorders · hypogammaglobulinaemia · necrosis · respiratory disorders · skin reactions · thrombocytopenia
- With oral use Azotaemia · brain oedema · cognitive impairment · conjunctivitis · cough · dyspnoea · eosinophilia · gynaecomastia · hypotension · immune deficiency · infertility · insomnia · lymphadenopathy · meningitis aseptic · menstrual disorder · mood altered · muscle weakness · nail discoloration · neutropenia · oligozoospermia · pain · pancreatitis · paresis · pericardial disorders · pericarditis · proteinuria · psychosis · radiation injuries · renal impairment · retinopathy · sensation abnormal · sepsis · sexual dysfunction · speech impairment · stress fracture · taste metallic · telangiectasia · tinnitus · visual impairment
- **Frequency not known**
- With intramuscular and subcutaneous use Leukoencephalopathy
- With intravenous use Alopecia · aphasia · appetite decreased · arthralgia · azotaemia · chills · cognitive disorder · conjunctivitis · cystitis · defective oogenesis · diabetes mellitus · diarrhoea · dizziness · drowsiness · embolism and

thrombosis · fatigue · haemorrhage · hemiparesis · hypotension · increased risk of infection · infertility · leukoencephalopathy · malaise · menstrual disorder · metabolic change · mood altered · mucositis · myalgia · neoplasms · nephropathy · osteoporosis · pancreatitis · pericardial effusion · pericarditis · photosensitivity reaction · pulmonary oedema · renal failure · seizure · sepsis · severe cutaneous adverse reactions (SCARs) · skin ulcer · sperm abnormalities · sudden death · telangiectasia · tinnitus · vaginal ulceration · vasculitis · vision blurred

• **With oral use** Encephalopathy

SIDE-EFFECTS, FURTHER INFORMATION Give folic acid to reduce side-effects. Folic acid decreases mucosal and gastrointestinal side-effects of methotrexate and may prevent hepatotoxicity; there is no evidence of a reduction in haematological side-effects.

Withdraw treatment if ulcerative stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 3 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).
- **BREAST FEEDING** Discontinue breast-feeding—present in milk.
- **HEPATIC IMPAIRMENT** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.
- **RENAL IMPAIRMENT** Risk of nephrotoxicity at high doses. Avoid in severe impairment.
Dose adjustments Reduce dose.
- **PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.
Patients should have full blood count and renal and liver function tests before starting treatment.
Check immunity to varicella-zoster and consider vaccination before initiating therapy.
- **MONITORING REQUIREMENTS** Full blood count and liver function tests repeated fortnightly for at least the first 4 weeks of treatment and at this frequency after any change in dose until therapy stabilised, thereafter monthly; renal function tests should be performed regularly during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Folic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.

- **PATIENT AND CARER ADVICE** Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Children and carers should be advised to avoid self-medication with over-the-counter ibuprofen

Children and their carers should be counselled on the dose and use of NSAIDs.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

• Methotrexate (Non-proprietary)

Methotrexate 2.5 mg Methotrexate 2.5mg tablets | 24 tablet [PoM] £1.23-£3.75 | 28 tablet [PoM] £3.82 DT = £1.44 | 100 tablet [PoM] £5.14-£14.01

Methotrexate 10 mg Methotrexate 10mg tablets | 100 tablet [PoM] £57.21 DT = £49.33

• Maxtrex (Pfizer Ltd)

Methotrexate 2.5 mg Maxtrex 2.5mg tablets | 24 tablet [PoM] £2.39 | 100 tablet [PoM] £9.96

Methotrexate 10 mg Maxtrex 10mg tablets | 100 tablet [PoM] £45.16 DT = £49.33

Solution for injection

• Methotrexate (Non-proprietary)

Methotrexate (as Methotrexate sodium) 2.5 mg per

1 ml Methotrexate 5mg/2ml solution for injection vials | 5 vial [PoM] £36.00 (Hospital only)

Methotrexate (as Methotrexate sodium) 25 mg per

1 ml Methotrexate 1g/40ml solution for injection vials | 1 vial [PoM] £1,452.55 (Hospital only) | 1 vial [PoM] £44.57

Methotrexate 500mg/20ml solution for injection vials | 1 vial [PoM] £48.00-£726.28 (Hospital only) | 1 vial [PoM] £25.07

Methotrexate 50mg/2ml solution for injection vials | 1 vial [PoM] £2.62-£72.63 | 5 vial [PoM] £35.00 (Hospital only)

Methotrexate 200mg/8ml solution for injection vials | 1 vial [PoM] £10.02

Methotrexate (as Methotrexate sodium) 100 mg per

1 ml Methotrexate 1g/10ml solution for injection vials | 1 vial [PoM] £85.00 (Hospital only)

• Methofill (Accord Healthcare Ltd)

Methotrexate 50 mg per 1 ml Methofill 12.5mg/0.25ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £14.85 DT = £16.50

Methofill 22.5mg/0.45ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £16.61 DT = £18.45

Methofill 30mg/0.6ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £17.06 DT = £18.95

Methofill 27.5mg/0.55ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £17.00 DT = £18.89

Methofill 7.5mg/0.15ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £13.37 DT = £14.85

Methofill 20mg/0.4ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £16.06 DT = £17.84

Methofill 10mg/0.2ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £13.76 DT = £15.29

Methofill 15mg/0.3ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £14.91 DT = £16.57

Methofill 17.5mg/0.35ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £15.75 DT = £17.50

Methofill 25mg/0.5ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £16.63 DT = £18.48

• Metojet PEN (medac UK)

Methotrexate 50 mg per 1 ml Metojet PEN 30mg/0.6ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £16.56 DT = £18.95

Metojet PEN 22.5mg/0.45ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £16.11 DT = £18.45

Metojet PEN 12.5mg/0.25ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £14.35 DT = £16.50

Metojet PEN 20mg/0.4ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £15.56 DT = £17.84

Metojet PEN 17.5mg/0.35ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £15.25 DT = £17.50

Metojet PEN 7.5mg/0.15ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £12.87 DT = £14.85

Metojet PEN 10mg/0.2ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £13.26 DT = £15.29

Metojet PEN 27.5mg/0.55ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £16.50 DT = £18.89

Metojet PEN 25mg/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £16.13 DT = £18.48

Metojet PEN 15mg/0.3ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £14.41 DT = £16.57

► **Nordimet** (Nordic Pharma Ltd)

- Methotrexate 25 mg per 1 ml** Nordimet 15mg/0.6ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £14.92 DT = £14.92
- Nordimet 20mg/0.8ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.06 DT = £16.06

Solution for infusion

► **Methotrexate (Non-proprietary)**

- Methotrexate (as Methotrexate sodium) 25 mg per 1 ml** Methotrexate 5g/200ml solution for infusion vials | 1 vial [PoM] £200.57

Methotrexate (as Methotrexate sodium) 100 mg per 1 ml

- Methotrexate 5g/50ml solution for infusion vials | 1 vial [PoM] £400.00 (Hospital only)

Oral solution

► **Methotrexate (Non-proprietary)**

- Methotrexate (as Methotrexate sodium) 2 mg per 1 ml** Methotrexate 2mg/ml oral solution sugar free sugar-free | 35 ml [PoM] £95.00 DT = £95.00 sugar-free | 65 ml [PoM] £125.00 DT = £125.00

► **Jylamvo** (Intrapharm Laboratories Ltd)

- Methotrexate (as Methotrexate sodium) 2 mg per 1 ml** Jylamvo 2mg/ml oral solution sugar-free | 60 ml [PoM] £112.50

Nelarabine

● **INDICATIONS AND DOSE**

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in children who have relapsed or who are refractory after receiving at least two previous regimens

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **CAUTIONS** Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) · previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

- **INTERACTIONS** → Appendix 1: nelarabine

● **SIDE-EFFECTS**

- **Common or very common** Anaemia · arthralgia · asthenia · ataxia · confusion · constipation · diarrhoea · drowsiness · electrolyte imbalance · fever · headache · hyperbilirubinaemia · hypoglycaemia · increased risk of infection · leucopenia · nausea · neutropenia · pain in extremity · peripheral neuropathy · seizures · sensation abnormal · stomatitis · thrombocytopenia · tremor · vomiting

SIDE-EFFECTS, FURTHER INFORMATION If neurotoxicity occurs, treatment should be discontinued.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.
- **PREGNANCY** Avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Discontinue breast-feeding.
- **MONITORING REQUIREMENTS**
 - Neurotoxicity Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- **Atriance** (Novartis Pharmaceuticals UK Ltd) ▼

Nelarabine 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials | 6 vial [PoM] £1,332.00

Tioguanine

(Thioguanine)

● **INDICATIONS AND DOSE**

Infant acute lymphoblastic leukaemia

- BY MOUTH

- Child: Can be given at various stages of treatment in short-term cycles (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Thiopurine methyltransferase status
- **CAUTIONS, FURTHER INFORMATION**
 - Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
 - Long-term therapy Long-term therapy is no longer recommended because of the high risk of liver toxicity.
- **INTERACTIONS** → Appendix 1: tioguanine
- **SIDE-EFFECTS**
 - **Common or very common** Bone marrow failure · gastrointestinal disorders · hepatic disorders · hyperbilirubinaemia · hyperuricaemia · hyperuricosuria · nodular regenerative hyperplasia · oral disorders · sinusoidal obstruction syndrome · splenomegaly · thrombocytopenia · uric acid nephropathy · weight increased
 - **Frequency not known** Photosensitivity reaction
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men or women.
- **PREGNANCY** Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also

Pregnancy and reproductive function in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose.
- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.
- **MONITORING REQUIREMENTS** Monitor liver function weekly—discontinue if liver toxicity develops.

• MEDICINAL FORMS

Tioguanine 40 mg Tioguanine 40mg tablets | 25 tablet [PoM](#)
£109.57

ANTINEOPLASTIC DRUGS > CYTOTOXIC ANTIBIOTICS AND RELATED SUBSTANCES

Bleomycin

• INDICATIONS AND DOSE

Some germ cell tumours | Hodgkin's lymphoma

▶ BY INTRAVENOUS INFUSION

▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Acute pulmonary infection • significantly reduced lung function
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: bleomycin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia • angular stomatitis • appetite decreased • chills • fever (after administration) • haemorrhage • headache • interstitial pneumonia • leucopenia • malaise • nail discoloration • nail disorder • nausea • pain • pulmonary fibrosis (dose-related) • scleroderma • skin reactions • stomatitis • vomiting • weight decreased
 - ▶ **Uncommon** Diarrhoea • dizziness • hepatocellular injury • oliguria • shock • urinary disorders • vein wall hypertrophy • venous stenosis
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531
- **BREAST FEEDING** Discontinue breast feeding.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose—consult local treatment protocol for details.
- **MONITORING REQUIREMENTS** Ensure monitoring of pulmonary function—investigate any shortness of breath before initiation.
- **PRESCRIBING AND DISPENSING INFORMATION** To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Bleo-Kyowa (Kyowa Kirin Ltd)

Bleomycin (as Bleomycin sulfate) 15000 unit Bleo-Kyowa
15,000unit powder for solution for injection vials | 10 vial [PoM](#)
£190.60

Dactinomycin

(Actinomycin D)

• INDICATIONS AND DOSE

Wilms' tumour | Childhood rhabdomyosarcoma and other soft-tissue sarcomas | Ewing's sarcoma

▶ BY INTRAVENOUS INJECTION

▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: dactinomycin
- **SIDE-EFFECTS** Agranulocytosis • alopecia • anaemia • appetite decreased • ascites • bone marrow disorders • diarrhoea • dysphagia • fatigue • fever • gastrointestinal discomfort • gastrointestinal disorders • growth retardation • healing impaired • hepatic disorders • hypocalcaemia • increased risk of infection • lethargy • leucopenia • leukaemia secondary • malaise • myalgia • nausea • neutropenia • oedema • oral disorders • pneumonitis • renal impairment • reticulocytopenia • secondary neoplasm • sepsis • severe cutaneous adverse reactions (SCARs) • sinusoidal obstruction syndrome • skin reactions • soft tissue damage • thrombocytopenia • tumour lysis syndrome • venous thrombosis • vomiting
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.
- **PREGNANCY** Avoid (teratogenic in animal studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
Dose adjustments Consider dose reduction if raised serum bilirubin or biliary obstruction; consult local treatment protocols.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Cosmegen (Orphan Europe (UK) Ltd)

Dactinomycin 500 microgram Cosmegen Lyovac 500microgram powder for solution for injection vials | 1 vial [PoM](#) £52.58

ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS

Carboplatin

10-Jun-2016

● INDICATIONS AND DOSE

Stage 4 neuroblastoma | Germ cell tumours | Low-grade gliomas (including astrocytomas) | Neuroectodermal tumours (including medulloblastoma) | Rhabdomyosarcoma (metastatic and non-metastatic disease) | Soft-tissue sarcomas | Retinoblastoma | High risk Wilms' tumour | Some liver tumours

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **INTERACTIONS** → Appendix 1: platinum compounds
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · alopecia · anaemia · asthenia · cardiovascular disorder · constipation · diarrhoea · haemorrhage · hypersensitivity · increased risk of infection · leucopenia · mucosal abnormalities · musculoskeletal disorder · nausea · neutropenia · ototoxicity · peripheral neuropathy · reflexes decreased · respiratory disorders · sensation abnormal · skin reactions · taste altered · thrombocytopenia · urogenital disorder · vision disorders · vomiting
 - ▶ **Rare or very rare** Cardiac discomfort · dyspnoea
 - ▶ **Frequency not known** Abdominal cramps · appetite decreased · bone marrow failure · chills · dehydration · embolism · encephalopathy · fever · haemolytic uraemic syndrome · heart failure · hypertension · hyponatraemia · hypotension · malaise · pancreatitis · stomatitis · stroke · treatment related secondary malignancy
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 20 mL/minute/1.73 m².
Dose adjustments Reduce dose.
Monitoring Monitor haematological parameters in renal impairment. Monitor renal function in renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Consider therapeutic drug monitoring.
- **PRESCRIBING AND DISPENSING INFORMATION** Carboplatin can be given in an outpatient setting.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Carboplatin (Non-proprietary)

Carboplatin 10 mg per 1 mL Carboplatin 50mg/5mL concentrate for solution for infusion vials | 1 vial [PoM] £22.04 (Hospital only) | 1 vial [PoM] £20.00–£20.20

Carboplatin 150mg/15mL concentrate for solution for infusion vials | 1 vial [PoM] £56.92 (Hospital only) | 1 vial [PoM] £50.00–£60.59

Carboplatin 600mg/60mL concentrate for solution for infusion vials | 1 vial [PoM] £232.64–£260.00

Carboplatin 600mg/60mL solution for infusion vials | 1 vial [PoM] £260.00 (Hospital only)

Carboplatin 450mg/45mL concentrate for solution for infusion vials | 1 vial [PoM] £168.85 (Hospital only) | 1 vial [PoM] £160.00–£181.77

Carboplatin 450mg/45mL solution for infusion vials | 1 vial [PoM] £197.48 (Hospital only)

Carboplatin 150mg/15mL solution for infusion vials | 1 vial [PoM] £65.83 (Hospital only)

Carboplatin 50mg/5mL solution for infusion vials | 1 vial [PoM] £22.86 (Hospital only)

Cisplatin

● INDICATIONS AND DOSE

Osteogenic sarcoma | Stage 4 neuroblastoma | Some liver tumours | Infant brain tumours | Intra-cranial germ-cell tumours

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- ▶ **Hydration** Cisplatin requires intensive intravenous hydration; routine use of intravenous fluids containing potassium or magnesium may also be required to help control hypokalaemia and hypomagnesaemia. Treatment may be complicated by severe nausea and vomiting; delayed vomiting may occur and is difficult to control.
- **INTERACTIONS** → Appendix 1: platinum compounds

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · arrhythmias · bone marrow failure · electrolyte imbalance · fever · leucopenia · nephrotoxicity (dose-related and potentially cumulative) · sepsis · thrombocytopenia
- ▶ **Uncommon** Anaphylactoid reaction · ototoxicity (dose-related and potentially cumulative) · spermatogenesis abnormal
- ▶ **Rare or very rare** Acute leukaemia · cardiac arrest · encephalopathy · myocardial infarction · nerve disorders · seizure · stomatitis
- ▶ **Frequency not known** Alopecia · appetite decreased · asthenia · autonomic dysfunction · cardiac disorder · cerebrovascular insufficiency · dehydration · diarrhoea · haemolytic anaemia · hearing impairment · hiccups · hyperuricaemia · infection · Lhermitte's sign · malaise · muscle spasms · myelopathy · nausea · papilloedema · pulmonary embolism · rash · Raynaud's phenomenon · renal impairment · renal tubular disorder · retinal discoloration · SIADH · taste loss · tetany · thrombotic microangiopathy · vision disorders · vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAL IMPAIRMENT** Avoid if possible—nephrotoxic.

Monitoring Baseline testing of renal function is required; for children with pre-existing renal impairment, consideration should be given to withholding treatment or using another drug.

● MONITORING REQUIREMENTS

- ▶ Monitor full blood count.
- ▶ Monitor audiology.
- ▶ Monitor plasma electrolytes.
- ▶ Baseline testing of hearing is required; for children with pre-existing hearing impairment, consideration should be given to withholding treatment or using another drug.
- ▶ For children with pre-existing marked bone-marrow suppression, consideration should be given to withholding treatment or using another drug.
- ▶ Monitor renal function.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Cisplatin (Non-proprietary)

Cisplatin 1 mg per 1 ml Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £26.70 DT = £26.51 | 1 vial [PoM] £25.11–£28.11 DT = £26.51 (Hospital only)
Cisplatin 100mg/100ml solution for infusion vials | 1 vial [PoM] £50.22 (Hospital only) | 1 vial [PoM] £50.22
Cisplatin 10mg/10ml solution for infusion vials | 1 vial [PoM] £5.90 (Hospital only) | 1 vial [PoM] £5.90
Cisplatin 50mg/50ml solution for infusion vials | 1 vial [PoM] £25.37–£28.11 DT = £26.51 | 1 vial [PoM] £25.37 DT = £26.51 (Hospital only)
Cisplatin 10mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £5.36
Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial [PoM] £50.22–£55.64 (Hospital only) | 1 vial [PoM] £52.86

ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES

Etoposide

● INDICATIONS AND DOSE

Stage 4 neuroblastoma | Germ-cell tumours | Intracranial germ-cell tumours | Rhabdomyosarcoma | Soft-tissue sarcomas | Neuroectodermal tumours (including medulloblastoma) | Relapsed Hodgkin's disease | Non-Hodgkin's lymphoma | Ewing tumour | Acute lymphoblastic leukaemia | Acute myeloid leukaemia
 ► BY MOUTH, OR BY INTRAVENOUS INFUSION
 ► Child: (consult local protocol)

● UNLICENSED USE Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
 See Cytotoxic drugs p. 531.

● INTERACTIONS → Appendix 1: etoposide

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Abdominal pain · acute leukaemia · alopecia · anaemia · appetite decreased · arrhythmia · asthenia · bone marrow depression · constipation · diarrhoea · dizziness · extravasation · hepatotoxicity · hypertension · leucopenia · malaise · mucositis · myocardial infarction · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting
- **Uncommon** Nerve disorders
- **Rare or very rare** Dysphagia · neurotoxicity · radiation recall reaction · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · taste altered · vision loss

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With intravenous use Anaphylactic reaction · hypotension · infection
- With oral use Oesophagitis · stomatitis · transient systolic hypotension
- **Uncommon**
- With intravenous use Haemorrhage
- **Rare or very rare**
- With intravenous use Fever
- With oral use Drowsiness
- **Frequency not known**
- With intravenous use Angioedema · infertility · tumour lysis syndrome

● CONCEPTION AND CONTRACEPTION Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

● PREGNANCY Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

● BREAST FEEDING Discontinue breast-feeding.

● HEPATIC IMPAIRMENT Avoid in severe impairment.

● RENAL IMPAIRMENT

Dose adjustments Consider dose reduction—consult local treatment protocol for details.

● DIRECTIONS FOR ADMINISTRATION Etoposide is usually given by slow intravenous infusion. It may also be given by mouth, but it is unpredictably absorbed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Etoposide (Non-proprietary)

Etoposide 20 mg per 1 ml Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £11.50 (Hospital only) | 1 vial [PoM] £11.50 | 10 vial [PoM] £115.00
Etoposide 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £73.85 (Hospital only)

Powder for solution for injection

► Etopophos (Bristol-Myers Squibb Pharmaceuticals Ltd)

Etoposide (as Etoposide phosphate) 100 mg Etopophos 100mg powder for solution for injection vials | 10 vial [PoM] £261.68 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 23

► Vepesid (Bristol-Myers Squibb Pharmaceuticals Ltd)

Etoposide 50 mg Vepesid 50mg capsules | 20 capsule [PoM] £99.82 (Hospital only)

Etoposide 100 mg Vepesid 100mg capsules | 10 capsule [PoM] £87.23 (Hospital only)

ANTINEOPLASTIC DRUGS > VINCA ALKALOIDS

Vinblastine sulfate

● INDICATIONS AND DOSE

Hodgkin's disease and other lymphomas

- BY INTRAVENOUS INJECTION
- Child: (consult local protocol)

● UNLICENSED USE Licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

Vinblastine is for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION
 Intrathecal injection **contra-indicated**.

● CAUTIONS Caution in handling—irritant to tissues

● INTERACTIONS → Appendix 1: vinca alkaloids

● SIDE-EFFECTS

- **Rare or very rare** Hearing impairment · nerve disorders
- **Frequency not known** Abdominal pain · acute respiratory distress syndrome (ARDS) · alopecia (reversible) · anaemia · appetite decreased · asthenia · balance impaired · cancer pain · constipation · depression · diarrhoea · dizziness · dyspnoea · haemorrhage · headache · hypertension · ileus · increased risk of infection · leucopenia (dose-limiting) · malaise · mediastinal disorder · myalgia · myocardial infarction · nausea · nystagmus · oral blistering · pain ·

Raynaud's phenomenon · reflexes absent · seizure · sensation abnormal · SIADH · skin reactions · stroke · thrombocytopenia · vertigo · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Constipation Prophylactic use of laxatives may be considered.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**

Dose adjustments Dose reduction may be necessary—consult local treatment protocol for details.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Vinblastine sulfate (Non-proprietary)**

Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial [PoM] £85.00 (Hospital only)

Vincristine sulfate

● INDICATIONS AND DOSE

Acute leukaemias | Lymphomas | Paediatric solid tumours

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

Vincristine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- **CONTRA-INDICATIONS**

CONTRA-INDICATIONS, FURTHER INFORMATION Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues · ileus · neuromuscular disease

- **INTERACTIONS** → Appendix 1: vinca alkaloids

- **SIDE-EFFECTS**

- ▶ **Rare or very rare** Hypersensitivity · rash · SIADH
- ▶ **Frequency not known** Abdominal cramps · adrenal disorder · alopecia · anaemia · appetite decreased · azotaemia · bladder atony · bronchospasm · connective tissue disorders · constipation · coronary artery disease · dehydration · diarrhoea · dizziness · dyspnoea · eighth cranial nerve damage · eye disorders · fever · gait abnormalities · gastrointestinal disorders · haemolytic anaemia · headache · hearing impairment · hypertension · hyponatraemia · hypotension · infection · leucopenia · movement disorders · muscle atrophy · myalgia · myocardial infarction · nausea · neuromuscular effects (dose-limiting) · neutropenia · oedema · oral disorders · pain · paralysis · paresis · reflexes absent · renal disorder · secondary malignancy · seizure · sensation abnormal · sepsis · throat pain ·

thrombocytopenia · urinary disorders · vertigo · vision loss · vomiting · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION

Bronchospasm Severe bronchospasm following administration is more common when used in combination with mitomycin-C.

Neurotoxicity Sensory and motor neuropathies are common and are cumulative. Manufacturer advises monitoring patients for symptoms of neuropathy, such as hypoesthesia, hyperesthesia, paresthesia, hyporeflexia, areflexia, neuralgia, jaw pain, decreased vibratory sense, cranial neuropathy, ileus, burning sensation, arthralgia, myalgia, muscle spasm, or weakness, both before and during treatment—requires dose reduction, treatment interruption or treatment discontinuation, depending on severity.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

Constipation Prophylactic use of laxatives may be considered.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**

Dose adjustments Dose reduction may be necessary—consult local treatment protocol for details.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Vincristine sulfate (Non-proprietary)**

Vincristine sulfate 1 mg per 1 ml Vincristine 2mg/2ml solution for injection vials | 1 vial [PoM] £26.66 (Hospital only) | 5 vial [PoM] £133.30 (Hospital only)

Vincristine 1mg/1ml solution for injection vials | 1 vial [PoM] £13.47 (Hospital only) | 5 vial [PoM] £67.35 (Hospital only)

Vincristine 5mg/5ml solution for injection vials | 5 vial [PoM] £329.50 (Hospital only)

ANTINEOPLASTIC DRUGS > OTHER

Asparaginase

18-May-2018

- **DRUG ACTION** Asparaginase is an enzyme which acts by breaking down L-asparagine to aspartic acid and ammonia, this disrupts protein synthesis of tumour cells.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Neonate:** (consult product literature or local protocols).

- ▶ Child 1-11 months: (consult product literature or local protocols)
- ▶ Child 1-17 years: 5000 units/m² every 3 days

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy · history of serious haemorrhage related to asparaginase therapy · history of serious thrombosis related to asparaginase therapy · pancreatitis · pre-existing known coagulopathy

- **CAUTIONS** Diabetes (may raise blood glucose) · hypersensitivity reactions · hypertriglyceridaemia (severe)—increased risk of acute pancreatitis

CAUTIONS, FURTHER INFORMATION

- **Hypersensitivity reactions** Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—asparaginase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated. Manufacturer advises an intracutaneous or small intravenous test dose can be used but is of limited value for predicting which patients will experience an allergic reaction.

- **INTERACTIONS** → Appendix 1: asparaginase

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · agitation · anaemia · angioedema · appetite decreased · arthralgia · back pain · bronchospasm · confusion · depression · diarrhoea · disseminated intravascular coagulation · dizziness · drowsiness · dyspnoea · embolism and thrombosis · fatigue · flushing · haemorrhage · hallucination · hyperglycaemia · hypersensitivity · hypoaalbuminaemia · hypoglycaemia · hypotension · increased risk of infection · leucopenia · nausea · neurological effects · oedema · pancreatitis · skin reactions · thrombocytopenia · vomiting · weight decreased
- **Uncommon** Headache · hyperammonaemia · hyperuricaemia

- **Rare or very rare** Coma · consciousness impaired · diabetic ketoacidosis · hepatic disorders · hyperparathyroidism · hypoparathyroidism · ischaemic stroke · necrotising pancreatitis · pancreatic pseudocyst · posterior reversible encephalopathy syndrome (PRES) · seizure · tremor

SIDE-EFFECTS, FURTHER INFORMATION There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 3 months after last dose; asparaginase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor trough serum asparaginase levels 3 days after administration; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
- Manufacturer advises monitor bilirubin, hepatic transaminases, and coagulation parameters before and during treatment; in addition, monitor plasma and urinary glucose, amylase, lipase, triglycerides, cholesterol and serum protein levels during treatment.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage conditions after reconstitution and dilution.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises asparaginase has moderate influence on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

● NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) Decisions**

SMC No. 1319/18

The *Scottish Medicines Consortium* has advised (April 2018) that asparaginase (*Spectrila*®) is accepted for use within NHS Scotland when used as a component of antineoplastic combination therapy for the treatment of acute lymphoblastic leukaemia in paediatric patients from birth to 18 years and adults.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Spectrila** (medac UK) ▼

Asparaginase 10000 unit Spectrila 10,000unit powder for concentrate for solution for infusion vials | 1 vial [PoM] £450.00 (Hospital only)

Crisantaspase

16-Mar-2017

- **DRUG ACTION** Crisantaspase is the enzyme asparaginase produced by *Erwinia chrysanthemi*.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia | Acute myeloid leukaemia | Non-Hodgkin's lymphoma

- BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Child: (consult local protocol)

- **UNLICENSED USE** Preparations of asparaginase derived from *Escherichia coli* are available but they are not licensed, they include: *Medac*® asparaginase and *Elspar*® asparaginase.

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy

- **CAUTIONS** Diabetes (may raise blood glucose)

- **INTERACTIONS** → Appendix 1: crisantaspase

● SIDE-EFFECTS

- **Common or very common** Chills · coagulation disorders · confusion · diarrhoea · dizziness · drowsiness · dyspnoea · face oedema · fever · headache · hepatic disorders · hypersensitivity · limb swelling · lip swelling · neurotoxicity · pain · pallor · pancreatitis · seizures · skin reactions · thrombosis
- **Uncommon** Hyperglycaemia · hyperlipidaemia · hypoxia · increased risk of infection · respiratory disorders
- **Rare or very rare** Arthritis reactive · coma · diabetic ketoacidosis · dysphagia · dysphasia · encephalopathy · haemorrhage · level of consciousness decreased · myalgia · myocardial infarction · necrotising pancreatitis · neutropenia · paresis · sepsis · thrombocytopenia
- **Frequency not known** Abdominal pain · flushing · hyperammonaemia · hypertension · hypotension · nausea · pseudocyst · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Children who are hypersensitive to asparaginase derived from one organism may tolerate asparaginase derived from another organism but cross-sensitivity occurs in about 20–30% of individuals.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **PREGNANCY** Avoid. See also, *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Discontinue breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** Facilities for the management of anaphylaxis should be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► **Erwinase** (Jazz Pharmaceuticals UK)

Crisantaspace 10000 unit Erwinase 10,000unit powder for solution for injection vials | 5 vial [PoM](#) £3,065.00

Hydroxycarbamide

22-Mar-2018

(Hydroxyurea)**INDICATIONS AND DOSE****SIKLOS®**

Sickle-cell disease [prevention of recurrent vaso-occlusive crises] (initiated by a specialist)

► BY MOUTH

► Child 2–17 years: Initially 10–15 mg/kg once daily, increased in steps of 2.5–5 mg/kg daily, dose to be increased every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

● **CAUTIONS** Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)

● **INTERACTIONS** → Appendix 1: hydroxycarbamide

SIDE-EFFECTS

► **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · bone marrow failure · chills · constipation · cutaneous vasculitis · dermatomyositis · diarrhoea · disorientation · dizziness · drowsiness · dyspnoea · dysuria · fever · gastrointestinal discomfort · hallucination · headache · hepatic disorders · leucopenia · malaise · melaena · mucositis · nail disorder · nausea · pancreatitis · peripheral neuropathy · pulmonary oedema · respiratory disorders · seizure · skin cancer · skin reactions · skin ulcer · sperm abnormalities · stomatitis · thrombocytopenia · vomiting

► **Rare or very rare** Gangrene

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception before and during treatment.

● **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment, unless used for malignant conditions.

● **RENAL IMPAIRMENT** In sickle-cell disease, avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
Dose adjustments In sickle-cell disease, reduce initial dose by 50% if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

MONITORING REQUIREMENTS

► Monitor renal and hepatic function before and during treatment.
► Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).
► Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.

● **PATIENT AND CARER ADVICE** Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.

Medicines for Children leaflet: Hydroxycarbamide for sickle cell disease www.medicinesforchildren.org.uk/hydroxycarbamide-for-sickle-cell-disease

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Siklos** (Nordic Pharma Ltd)

Hydroxycarbamide 100 mg Siklos 100mg tablets | 60 tablet [PoM](#)
£100.00 DT = £100.00

Hydroxycarbamide 1 gram Siklos 1000mg tablets | 30 tablet [PoM](#)
£500.00 DT = £500.00

Mitotane

● **DRUG ACTION** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

INDICATIONS AND DOSE

Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

► BY MOUTH

► Child: (consult local protocol)

● **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

● **CAUTIONS** Avoid in Acute porphyrias p. 603 · risk of accumulation in overweight patients

● **INTERACTIONS** → Appendix 1: mitotane

SIDE-EFFECTS

► **Common or very common** Adrenal insufficiency · anaemia · appetite decreased · asthenia · cognitive impairment · confusion · diarrhoea · dizziness · drowsiness · dyslipidaemia · gastrointestinal discomfort · gynaecomastia · headache · hepatic disorders · leucopenia · movement disorders · mucositis · muscle weakness · nausea · paraesthesia · polyneuropathy · rash · thrombocytopenia · vertigo · vomiting
► **Frequency not known** Encephalopathy · eye disorders · flushing · fungal infection · generalised pain · growth retardation · haemorrhage · hyperpyrexia · hypersalivation · hypertension · hypothyroidism · hypouricaemia · lens opacity · neuro-psychological retardation · ovarian cyst · postural hypotension · proteinuria · taste altered · thyroid disorder · vision disorders

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

● **PREGNANCY** Manufacturer advises avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

Monitoring In mild to moderate hepatic impairment, monitoring of plasma-mitotane concentration is recommended.

● **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
Monitoring In mild to moderate renal impairment, monitoring of plasma-mitotane concentration is recommended.

● MONITORING REQUIREMENTS

- ▶ Monitor plasma-mitotane concentration—consult product literature.

● PRESCRIBING AND DISPENSING INFORMATION

Corticosteroid replacement therapy Corticosteroid replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.

- **PATIENT AND CARER ADVICE** Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency).
Driving and skilled tasks Central nervous system toxicity may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 10, 21

- ▶ **Lysodren** (HRA Pharma UK Ltd)

Mitotane 500 mg Lysodren 500mg tablets | 100 tablet **[PoM]**
£590.97

Pegaspargase

16-Mar-2017

- **DRUG ACTION** Pegaspargase breaks down the amino acid L-asparagine, thereby interfering with the growth of malignant cells, which are unable to synthesise L-asparagine.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate: 82.5 units/kg every 14 days.

- ▶ Child (body surface area up to 0.6 m²): 82.5 units/kg every 14 days
- ▶ Child (body surface area 0.6 m² and above): 2500 units/m² every 14 days

IMPORTANT SAFETY INFORMATION

Be aware that doses are calculated either using units/kg or units/m², depending on the size of the child.

- **CONTRA-INDICATIONS** History of pancreatitis · history of serious haemorrhagic event with previous L-asparaginase therapy · history of serious thrombosis with previous L-asparaginase therapy
- **CAUTIONS** Concomitant use of other hepatotoxic drugs (particularly in pre-existing hepatic impairment)—monitor hepatic function · diabetes (may raise blood glucose) · hypersensitivity reactions · marked decrease of leukocyte count at start of treatment is possible—may be associated with significant rise in serum uric acid and development of uric acid nephropathy
- CAUTIONS, FURTHER INFORMATION**
 - ▶ Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—pegaspargase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises patients should be closely monitored for signs of hypersensitivity during treatment and for an hour after administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.
- **INTERACTIONS** → Appendix 1: pegaspargase
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · bone marrow depression · diarrhoea · hyperglycaemia · hypersensitivity ·

- hypoxia · pain in extremity · pancreatitis (discontinue if suspected and do not restart if confirmed) · peripheral neuropathy · rash · seizure · stomatitis · syncope · thrombosis (discontinue) · vomiting
- ▶ **Rare or very rare** Acute kidney injury · posterior reversible encephalopathy syndrome (PRES) · tremor
- ▶ **Frequency not known** Confusion · diabetic ketoacidosis · drowsiness · hepatobiliary disorder · hyperammonaemia (monitor if symptoms present) · toxic epidermal necrolysis
- SIDE-EFFECTS, FURTHER INFORMATION** There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome in patients receiving pegaspargase.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 6 months after discontinuing treatment; pegaspargase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **PREGNANCY** Manufacturer advises avoid unless essential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises trough serum asparaginase activity levels may be measured before the next administration of pegaspargase; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
 - ▶ Manufacturer advises monitor plasma and urine glucose levels during treatment; monitor coagulation profile at baseline and periodically during and after treatment (particularly with concomitant use of other drugs that inhibit coagulation); monitor serum amylase.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intramuscular injection, volumes over 2 mL must be divided between more than one site.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator between 2–8°C.
- **PATIENT AND CARER ADVICE**
 - Pancreatitis** Manufacturer advises patients and carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.
 - Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of confusion and somnolence.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - NICE decisions**
 - ▶ **Pegaspargase for treating acute lymphoblastic leukaemia (September 2016)** NICE TA408
Pegaspargase, as part of antineoplastic combination therapy, is recommended as an option for treating acute lymphoblastic leukaemia only in patients with untreated newly diagnosed disease.
Patients whose treatment was started within the NHS before this guidance was published may continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta408

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2016) that pegaspargase (*Oncaspar*[®]) is accepted for use within NHS Scotland as a component of antineoplastic combination therapy in acute lymphoblastic leukaemia.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Oncaspar (Imported (United States)) ▼**

Pegaspargase 750 unit per 1 ml Oncaspar 3,750units/5ml solution for injection vials | 1 vial [PoM] 

Procarbazine

- **DRUG ACTION** Procarbazine is a mild monoamine-oxidase inhibitor.

INDICATIONS AND DOSE**Hodgkin's lymphoma**▶ **BY MOUTH**

- ▶ Child: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 531.

- **CONTRA-INDICATIONS** Pre-existing severe leucopenia · pre-existing severe thrombocytopenia
- **CAUTIONS** Cardiovascular disease · cerebrovascular disease · epilepsy · phaeochromocytoma · procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)
- **INTERACTIONS** → Appendix 1: procarbazine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased
 - ▶ **Frequency not known** Azoospermia · hepatic disorders · infection · lethargy · leucopenia · nausea · neutropenia · ovarian failure · pneumonitis · skin reactions · thrombocytopenia · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **PREGNANCY** Avoid (teratogenic in animal studies and isolated reports in humans). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 4

▶ **Procarbazine (Non-proprietary)****Procarbazine (as Procarbazine hydrochloride)**

50 mg Procarbazine 50mg capsules | 50 capsule [PoM] £411.34-£411.35 DT = £411.35

RETINOID AND RELATED DRUGS**Tretinoin****INDICATIONS AND DOSE**

Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

▶ **BY MOUTH**

- ▶ Child: (consult local protocol)

- **CAUTIONS** Increased risk of thromboembolism during first month of treatment
- **INTERACTIONS** → Appendix 1: retinoids
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · alopecia · anxiety · appetite decreased · arrhythmia · asthma · bone pain · cheilitis · chest pain · chills · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · flushing · headache · hearing impairment · hyperhidrosis · idiopathic intracranial hypertension (children particularly susceptible—consider dose reduction if intractable headache) · insomnia · intracranial pressure increased · malaise · nasal dryness · nausea · pancreatitis · paraesthesia · respiratory disorders · skin reactions · visual impairment · vomiting
 - ▶ **Frequency not known** Embolism and thrombosis · erythema nodosum · genital ulceration · hepatotoxicity · hypercalcaemia · increased leucocytes · myocardial infarction · myositis · necrotising fasciitis · QT interval prolongation · stroke · thrombocytosis · vasculitis
- **SIDE-EFFECTS, FURTHER INFORMATION** Children are particularly susceptible to nervous system effects.
- **Retinoic acid syndrome** Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).
- **PREGNANCY** Teratogenic. See *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.
- **BREAST FEEDING** Avoid (discontinue breast-feeding).
- **HEPATIC IMPAIRMENT**
 - Dose adjustments** Reduce dose—consult local treatment protocol for details.
- **RENAL IMPAIRMENT**
 - Dose adjustments** Reduce dose—consult local treatment protocol for details.
- **MONITORING REQUIREMENTS** Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Tretinoin is the acid form of vitamin A.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

 - ▶ **Tretinoin (Non-proprietary)**

Tretinoin 10 mg Tretinoin 10mg capsules | 100 capsule [PoM] £240.00-£256.80 DT = £240.00

2.1 Cytotoxic drug-induced side effects

DETOXIFYING DRUGS > UROPROTECTIVE DRUGS

Mesna

● INDICATIONS AND DOSE

Urothelial toxicity following oxazaphosphorine therapy

- ▶ BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

Mucolytic in cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child: 3–6 mL twice daily, use a 20% solution

- **UNLICENSED USE** Not licensed for use in children.

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · arthralgia · asthenia · chest pain · chills · concentration impaired · conjunctivitis · constipation · cough · dehydration · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · dysuria · fever · flatulence · flushing · gastrointestinal discomfort · haemorrhage · headache · hyperhidrosis · influenza like illness · laryngeal discomfort · lymphadenopathy · malaise · myalgia · nasal congestion · nausea · oral irritation · pain · palpitations · respiratory disorders · sensation abnormal · skin reactions · sleep disorders · syncope · vision disorders · vomiting
- ▶ **Frequency not known** Acute kidney injury · angioedema · drug reaction with eosinophilia and systemic symptoms (DRESS) · hypotension · hypoxia · oedema · tachycardia · ulcer · vulvovaginal rash
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to thiol-containing compounds.
- **PREGNANCY** Not known to be harmful. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Mesna (Non-proprietary)

Mesna 100 mg per 1 mL Mesna 1g/10mL solution for injection ampoules | 15 ampoule [PoM] £441.15
Mesna 400mg/4mL solution for injection ampoules | 5 ampoule [PoM] £18.90 | 15 ampoule [PoM] £201.15

VITAMINS AND TRACE ELEMENTS > FOLATES

Folinic acid

● INDICATIONS AND DOSE

Reduction of methotrexate-induced toxicity

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: (consult local protocol)

Methotrexate overdose

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: (consult local protocol)

Megaloblastic anaemia due to folate deficiency

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 250 micrograms/kg once daily
- ▶ Child 12–17 years: 15 mg once daily

Metabolic disorders leading to folate deficiency

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child: 15 mg once daily, larger doses may be required in older children

Prevention of megaloblastic anaemia associated with pyrimethamine and sulfadiazine treatment of congenital toxoplasmosis

▶ BY MOUTH

- ▶ Neonate: 5 mg 3 times a week; increased if necessary up to 20 mg 3 times a week, if the patient is neutropenic.

- ▶ Child 1–11 months: 10 mg 3 times a week

SODIOFOLIN®

As an antidote to methotrexate

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: (consult product literature)

- **UNLICENSED USE** Consult product literature for licensing status of individual preparations.

- **CONTRA-INDICATIONS** Intrathecal injection

- **CAUTIONS** Avoid simultaneous administration of methotrexate · **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency

- **INTERACTIONS** → Appendix 1: folates

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

▶ Uncommon Fever

- ▶ **Rare or very rare** Agitation (with high doses) · depression (with high doses) · epilepsy exacerbated · gastrointestinal disorder (with high doses) · insomnia (with high doses) · urticaria

SPECIFIC SIDE-EFFECTS

▶ Common or very common

- ▶ With intravenous use Bone marrow failure · dehydration · diarrhoea (with high doses) · mucositis · nausea · oral disorders · skin reactions · vomiting

▶ Rare or very rare

- ▶ With intravenous use Sensitisation
- ▶ **Frequency not known**
- ▶ With intravenous use Hyperammonaemia

- **PREGNANCY** Not known to be harmful; benefit outweighs risk.

- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ Folinic acid (Non-proprietary)

Folinic acid (as Calcium folinate) 15 mg Calcium folinate 15mg tablets | 10 tablet [PoM] £49.00 DT = £46.92

▶ Refolinon (Pfizer Ltd)

Folinic acid (as Calcium folinate) 15 mg Refolinon 15mg tablets | 30 tablet [PoM] £85.74

Solution for injection

▶ Folinic acid (Non-proprietary)

Folinic acid (as Calcium folinate) 7.5 mg per 1 mL Calcium folinate 15mg/2mL solution for injection ampoules | 5 ampoule [PoM] £39.00 DT = £39.00 | 5 ampoule [PoM] £39.00 DT = £39.00 (Hospital only)

Folinic acid (as Calcium folinate) 10 mg per 1 mL Calcium folinate 300mg/30mL solution for injection vials | 1 vial [PoM] £100.00 (Hospital only)

Calcium folinate 50mg/5mL solution for injection vials | 1 vial [PoM] £20.00 (Hospital only)

Calcium folinate 100mg/10mL solution for injection vials | 1 vial [PoM] £37.50 (Hospital only)

Folinic acid (as Disodium folinate) 50 mg per 1 mL Disodium folinate 50mg/1mL solution for injection vials | 1 vial [PoM] £24.70 Disodium folinate 200mg/4mL solution for injection vials | 1 vial [PoM] £80.40

▶ Refolinon (Pfizer Ltd)

Folinic acid (as Calcium folinate) 3 mg per 1 mL Refolinon 30mg/10mL solution for injection ampoules | 5 ampoule [PoM] £23.12 (Hospital only)

- ▶ **Sodiofolin** (medac UK)
Folinic acid (as Disodium folinate) 50 mg per 1 ml Sodiofolin 400mg/8ml solution for injection vials | 1 vial [PoM] £126.25 (Hospital only)
Sodiofolin 100mg/2ml solution for injection vials | 1 vial [PoM] £35.09 (Hospital only)

Levofolinic acid

- **DRUG ACTION** Levofolinic acid is an isomer of folinic acid.

● INDICATIONS AND DOSE

Reduction of methotrexate-induced toxicity

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

Methotrexate overdose

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **CONTRA-INDICATIONS** Intrathecal injection
- **CAUTIONS** Avoid simultaneous administration of methotrexate - **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency
- **INTERACTIONS** → Appendix 1: folates
- **SIDE-EFFECTS**
 - ▶ Common or very common Dehydration · diarrhoea · mucosal toxicity · nausea · vomiting
 - ▶ Uncommon Fever
 - ▶ Rare or very rare Agitation (with high doses) · depression (with high doses) · epilepsy exacerbated · gastrointestinal disorder · insomnia (with high doses) · urticaria
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.
- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Isovorin** (Pfizer Ltd)
Levofolinic acid (as Calcium levofolinate) 10 mg per 1 ml Isovorin 175mg/17.5ml solution for injection vials | 1 vial [PoM] £81.33 (Hospital only)
Isovorin 25mg/2.5ml solution for injection vials | 1 vial [PoM] £11.62 (Hospital only)

- ▶ **Uncommon** Bronchospasm · haemolysis · haemolytic anaemia · hypersensitivity · hypotension · methaemoglobinemia · seizure
- ▶ **Rare or very rare** Rhinitis
- ▶ **Frequency not known** Muscle contractions involuntary
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor closely for hypersensitivity.
- **EFFECT ON LABORATORY TESTS** May interfere with test for uric acid—consult product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

- ▶ **Fasturtec** (Sanofi)
Rasburicase 1.5 mg Fasturtec 1.5mg powder and solvent for solution for infusion vials | 3 vial [PoM] £208.39 (Hospital only)
Rasburicase 7.5 mg Fasturtec 7.5mg powder and solvent for solution for infusion vials | 1 vial [PoM] £347.32 (Hospital only)

XANTHINE OXIDASE INHIBITORS

Allopurinol

● INDICATIONS AND DOSE

Prophylaxis of hyperuricaemia associated with cancer chemotherapy | Prophylaxis of hyperuricaemic nephropathy, enzyme disorders causing increased serum urate e.g Lesch-Nyhan syndrome

- ▶ BY MOUTH
- ▶ Child 1 month-14 years: 10–20 mg/kg daily, dose to be taken preferably after food; maximum 400 mg per day
- ▶ Child 15-17 years: Initially 100 mg daily, taken preferably after food; dose to be increased according to response, up to 900 mg daily in divided doses (max. per dose 300 mg)

- **CAUTIONS** Ensure adequate fluid intake · for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy
- **INTERACTIONS** → Appendix 1: allopurinol
- **SIDE-EFFECTS**
 - ▶ Common or very common Rash (discontinue therapy; if rash mild re-introduce cautiously but discontinue immediately if recurrence)
 - ▶ Uncommon Hypersensitivity · nausea · vomiting
 - ▶ Rare or very rare Agranulocytosis · alopecia · angina pectoris · angioedema · angioimmunoblastic T-cell lymphoma · aplastic anaemia · asthenia · ataxia · boil · bradycardia · cataract · coma · depression · diabetes mellitus · drowsiness · erectile dysfunction · fever · gastrointestinal disorders · gynaecomastia · haemorrhage · hair colour changes · headache · hepatic disorders · hyperlipidaemia · hypertension · infertility male · maculopathy · malaise · oedema · paraesthesia · paralysis · peripheral neuropathy · severe cutaneous adverse reactions (SCARs) · skin reactions · stomatitis · taste altered · thrombocytopenia · vertigo · visual impairment
- **PREGNANCY** Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.
- **BREAST FEEDING** Present in milk—not known to be harmful.

2.1a Hyperuricaemia associated with cytotoxic drugs

DETOXIFYING DRUGS > URATE OXIDASES

Rasburicase

● INDICATIONS AND DOSE

Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** G6PD deficiency
- **CAUTIONS** Atopic allergies
- **SIDE-EFFECTS**
 - ▶ Common or very common Diarrhoea · fever · headache · nausea · skin reactions · vomiting

● HEPATIC IMPAIRMENT**Dose adjustments** Reduce dose.**Monitoring** Monitor hepatic function.**● RENAL IMPAIRMENT****Dose adjustments** Manufacturer advises reduce dose or increase dose interval in severe impairment; adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.**● PATIENT AND CARER ADVICE****Medicines for Children leaflet:** Allopurinol for hyperuricaemia www.medicinesforchildren.org.uk/allopurinol-for-hyperuricaemia**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, mouthwash

3 Immunotherapy responsive malignancy

IMMUNOSTIMULANTS > INTERFERONS

Interferon alfa

- DRUG ACTION**
- Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

● INDICATIONS AND DOSE**Induction of early regression of life-threatening corticosteroid resistant haemangiomas of infancy****▶ BY SUBCUTANEOUS INJECTION****▶ Child:** (consult local protocol)**INTRONA® PEN****Chronic active hepatitis B****▶ BY SUBCUTANEOUS INJECTION****▶ Child 2–17 years:** 5 000 000–10 000 000 units/m² 3 times a week**Chronic active hepatitis C (in combination with oral ribavirin)****▶ BY SUBCUTANEOUS INJECTION****▶ Child 3–17 years:** 3 000 000 units/m² 3 times a week**INTRONA® VIALS****Chronic active hepatitis B****▶ BY SUBCUTANEOUS INJECTION****▶ Child 2–17 years:** 5 000 000–10 000 000 units/m² 3 times a week**Chronic active hepatitis C (in combination with ribavirin)****▶ BY SUBCUTANEOUS INJECTION****▶ Child 3–17 years:** 3 000 000 units/m² 3 times a week**ROFERON-A®****Chronic active hepatitis B****▶ BY SUBCUTANEOUS INJECTION****▶ Child 2–17 years:** 2 500 000–5 000 000 units/m² 3 times a week, up to 10 000 000 units/m² has been used 3 times a week

- UNLICENSED USE**
- Not licensed for use in children for chronic active hepatitis B.

ROFERON-A® Roferon-A® not licensed for use in children.

- CONTRA-INDICATIONS**
- Avoid injections containing benzyl alcohol in neonates · history of severe psychiatric illness

CONTRA-INDICATIONS, FURTHER INFORMATION

For contra-indications consult product literature and local treatment protocol.

● CAUTIONS**CAUTIONS, FURTHER INFORMATION** For cautions consult product literature and local treatment protocol.

Interferon alfa should always be used under the close supervision of a specialist; the decision to treat should be made only after careful assessment of the expected benefits versus the potential risks, in particular the risk of growth inhibition caused by combination therapy.

- INTERACTIONS**
- Appendix 1: interferons

● SIDE-EFFECTS

- ▶ Common or very common**
- Alopecia · anaemia · anxiety · appetite abnormal · arthralgia · asthenia · behaviour abnormal · chest pain · chills · concentration impaired · confusion · conjunctivitis · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dysphonia · dyspnoea · epistaxis · eye pain · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · growth retardation · headache · hepatic function abnormal · hyperhidrosis · hyperkinesia · hyperthyroidism · hypertriglyceridaemia (sometimes severe) · hyperuricaemia · hypothyroidism · increased risk of infection · influenza like illness · lacrimation disorder · lymphadenopathy · malaise · menstrual cycle irregularities · mood altered · musculoskeletal pain · myalgia · nail disorder · nasal complaints · nausea · neoplasms · neutropenia · oedema · oral disorders · pallor · photosensitivity reaction · sensation abnormal · skin reactions · sleep disorders · suicidal ideation · tachypnoea · testicular pain · thrombocytopenia · tremor · urinary disorders · vaginal disorder · virilism · visual impairment · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of interferon alfa should be considered.

- CONCEPTION AND CONTRACEPTION**
- Effective contraception required during treatment—consult product literature.

- PREGNANCY**
- Avoid unless potential benefit outweighs risk (toxicity in animal studies).

- BREAST FEEDING**
- Unlikely to be harmful.

- HEPATIC IMPAIRMENT**
- Avoid in severe hepatic impairment.
- Monitoring**
- Close monitoring required in mild to moderate hepatic impairment.

- RENAL IMPAIRMENT**
- Avoid in severe renal impairment.
- Monitoring**
- Close monitoring required in mild to moderate renal impairment.

● MONITORING REQUIREMENTS

- ▶ Monitoring of lipid concentration**
- is recommended.
-
- ▶ Monitoring of hepatic function**
- is recommended.

● DIRECTIONS FOR ADMINISTRATION**INTRONA® VIALS** IntronA® injection vials for subcutaneous injection or intravenous infusion.

ROFERON-A® *Roferon-A®* injection for subcutaneous injection.

systemic lupus erythematosus (SLE) · tachycardia · thrombocytopenia · transient ischaemic attack

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.
- **MONITORING REQUIREMENTS** Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Immukin** (Horizon Pharma Ireland Ltd)

Interferon gamma-1b (recombinant human) 200 microgram per 1 ml Immukin 100micrograms/0.5ml solution for injection vials | 6 vial [PoM] £450.00

IMMUNOSTIMULANTS > OTHER

Mifamurtide

INDICATIONS AND DOSE

Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)

- BY INTRAVENOUS INFUSION
- Child 2-17 years: Infusion to be given over 1 hour (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in patients under 2 years of age at initial diagnosis.
- **CAUTIONS** Asthma—consider prophylactic bronchodilator therapy · chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy · history of autoimmune disease · history of collagen disease · history of inflammatory disease
- **INTERACTIONS** → Appendix 1: mifamurtide
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · cancer pain · chest discomfort · chills · confusion · constipation · cough · cyanosis · dehydration · depression · diarrhoea · dizziness · drowsiness · dysmenorrhoea · dyspnoea · feeling cold · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hepatic pain · hyperhidrosis · hypertension · hypokalaemia · hypotension · hypothermia · increased risk of infection · insomnia · laryngeal pain · leucopenia · malaise · mucositis · muscle complaints · musculoskeletal stiffness · nasal congestion · nausea · neutropenia · oedema · pain · palpitations · respiratory disorders · sensation abnormal · sepsis · skin reactions · tachycardia · thrombocytopenia · tremor · urinary disorders · vascular disorders · vertigo · vision blurred · vomiting · weight decreased
- **CONCEPTION AND CONTRACEPTION** Effective contraception required.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—no information available.

Interferon gamma-1b

(Immune interferon)

INDICATIONS AND DOSE

To reduce the frequency of serious infection in chronic granulomatous disease

- BY SUBCUTANEOUS INJECTION
- Child 6 months-17 years (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
- Child 6 months-17 years (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week

To reduce the frequency of serious infection in severe malignant osteopetrosis

- BY SUBCUTANEOUS INJECTION
- Child (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
- Child (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week

- **CONTRA-INDICATIONS** Simultaneous administration of foreign proteins including immunological products (such as vaccines)—risk of exaggerated immune response
- **CAUTIONS** Arrhythmias · cardiac disease · congestive heart failure · ischaemia · seizure disorders (including seizures associated with fever)
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · arthralgia · back pain · chills · depression · diarrhoea · fatigue · fever · headache · nausea · rash · vomiting
 - **Frequency not known** Atrioventricular block · chest discomfort · confusion · connective tissue disorders · embolism and thrombosis · gait abnormal · gastrointestinal haemorrhage · hallucination · heart failure · hepatic failure · hypertriglyceridaemia · hypoglycaemia · hyponatraemia · hypotension · influenza like illness · myocardial infarction · neutropenia · pancreatitis · parkinsonism · proteinuria · renal failure · respiratory disorders · seizure · syncope ·

- **HEPATIC IMPAIRMENT** Use with caution—no information available.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor renal function, hepatic function and clotting parameters.
 - ▶ Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235

Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.

- **DRUG ACTION** Everolimus is a protein kinase inhibitor.

● INDICATIONS AND DOSE

VOTUBIA® DISPERSIBLE TABLETS

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

- ▶ BY MOUTH USING DISPERSIBLE TABLETS
- ▶ Child 1–17 years: (consult product literature)

Adjunctive treatment of refractory partial-onset seizures, with or without secondary generalisation, associated with tuberous sclerosis complex

- ▶ BY MOUTH USING DISPERSIBLE TABLETS
- ▶ Child 2–17 years: (consult product literature)

VOTUBIA® TABLETS

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

- ▶ BY MOUTH USING TABLETS
- ▶ Child 1–17 years: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 531.

- **CAUTIONS** History of bleeding disorders
- **INTERACTIONS** → Appendix 1: everolimus

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cough · decreased leucocytes · dehydration · diabetes mellitus · diarrhoea · dry mouth · dyslipidaemia · dysphagia · dyspnoea · electrolyte imbalance · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · headache · hyperglycaemia · hypertension · increased risk of infection · insomnia · menstrual cycle irregularities · mucositis · nail disorders · nausea · neutropenia · oral disorders · peripheral oedema · proteinuria · renal impairment · respiratory disorders · skin reactions · taste altered · thrombocytopenia · vomiting · weight decreased
- ▶ **Uncommon** Congestive heart failure · embolism and thrombosis · flushing · healing impaired · hepatitis B · musculoskeletal chest pain · pancytopenia · sepsis · urinary frequency increased
- ▶ **Rare or very rare** Pure red cell aplasia
- ▶ **Frequency not known** Hepatitis B reactivation

SIDE-EFFECTS, FURTHER INFORMATION Reduce dose or discontinue if severe side-effects occur—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for up to 8 weeks after treatment.

- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Consult product literature.

● MONITORING REQUIREMENTS

- ▶ For **Votubia®** preparations: manufacturer advises everolimus blood concentration monitoring is required—consult product literature.
- ▶ Monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.
- ▶ Monitor renal function before treatment and periodically thereafter.

● DIRECTIONS FOR ADMINISTRATION

VOTUBIA® DISPERSIBLE TABLETS Manufacturer advises tablets must be dispersed in water before administration—consult product literature for details.

VOTUBIA® TABLETS Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

- **PRESCRIBING AND DISPENSING INFORMATION** **Votubia®** is available as both *tablets* and *dispersible tablets*. These formulations vary in their licensed indications and are not interchangeable—consult product literature for information on switching between formulations.

● PATIENT AND CARER ADVICE

Pneumonitis Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS
An EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

● **CAUTIONS** Cardiac disease · hepatitis B infection · history of renal failure · risk factors for heart failure

CAUTIONS, FURTHER INFORMATION

► **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

● **INTERACTIONS** → Appendix 1: imatinib

● **SIDE-EFFECTS**

► **Common or very common** Alopecia · anaemia · appetite abnormal · asthenia · bone marrow disorders · chills · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · excessive tearing · eye inflammation · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · insomnia · joint disorders · muscle complaints · nausea · neutropenia · oedema · pain · photosensitivity reaction · sensation abnormal · skin reactions · sweat changes · taste altered · thrombocytopenia · vision blurred · vomiting · weight changes

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH TYROSINE KINASE INHIBITORS

An EU wide review has concluded that nilotinib can cause hepatitis B virus reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Clinically significant bradycardia · congestive heart failure · hepatitis B infection · history of pancreatitis · recent myocardial infarction · susceptibility to QT-interval prolongation (including electrolyte disturbances) · unstable angina

CAUTIONS, FURTHER INFORMATION

- **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: nilotinib

● SIDE-EFFECTS

- **Common or very common** Alopecia · anaemia · angina pectoris · anxiety · appetite abnormal · arrhythmias · arthralgia · asthenia · bone marrow disorders · cardiac conduction disorders · chest discomfort · constipation · cough · decreased leucocytes · depression · diabetes mellitus · diarrhoea · dizziness · dry eye · dyslipidaemia · dyspnoea · electrolyte imbalance · eosinophilia · eye discomfort · eye disorders · eye inflammation · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · headaches · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · increased risk of infection · insomnia · muscle complaints · muscle weakness · myocardial infarction · nausea · neoplasms · neutropenia · oedema · pain · palpitations · peripheral neuropathy · QT interval prolongation · respiratory disorders · sensation abnormal · skin reactions · sweat changes · taste altered · thrombocytopenia · vertigo · vomiting · weight changes
- **Uncommon** Atherosclerosis · cerebrovascular insufficiency · chills · cyanosis · erectile dysfunction · gout · haemorrhage · heart failure · hyperaemia · malaise · oral disorders · pancreatitis · peripheral vascular disease · temperature sensation altered · vision disorders
- **Frequency not known** Breast abnormalities · chorioretinopathy · diastolic dysfunction · dry mouth · facial swelling · gynaecomastia · hepatitis B reactivation · hyperparathyroidism · hyperuricaemia · hypoglycaemia · lethargy · memory loss · menorrhagia · oropharyngeal pain · pericardial effusion · pericarditis · restless legs · sebaceous hyperplasia · syncope · tremor · urinary disorders · urine discolouration
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for up to two weeks after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 531.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor lipid profiles before initiating treatment, at 3 and 6 months, and then yearly thereafter; monitor blood glucose before initiating treatment and then periodically during treatment, as clinically indicated.
- Manufacturer advises monitor full blood count every 2 weeks for the first 2 months of treatment, then monthly thereafter, or as clinically indicated.
- Manufacturer advises perform baseline ECG before treatment and as clinically indicated thereafter; correct any electrolyte disturbances before treatment and monitor periodically during treatment.
- Manufacturer advises monitor and actively manage cardiovascular risk factors during treatment.
- Manufacturer advises monitor liver function (including bilirubin and hepatic transaminases) monthly or as clinically indicated.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules should either be swallowed whole or the contents of each capsule may be dispersed in one teaspoon of apple sauce and taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** All prescribers should be familiar with the *Summary of Key Safety Recommendations for Tasigna® (nilotinib)* provided by the manufacturer.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should seek immediate medical attention if signs or symptoms of cardiovascular events occur.

All patients should be provided with the *Important Information About How to Take Your Medication* leaflet provided by the manufacturer.

Blood and blood-forming organs

1 Anaemias

Anaemias

Anaemia treatment considerations

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza

vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 552 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

Drugs with definite risk of haemolysis in most G6PD-deficient individuals

- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Methylthioninium chloride
- Niridazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

Drugs with possible risk of haemolysis in some G6PD-deficient individuals

- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfonyleureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

Hypoplastic, haemolytic, and renal anaemias

Anabolic steroids, pyridoxine hydrochloride p. 627, antilymphocyte immunoglobulin, rituximab p. 530 [unlicensed], and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin p. 519 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special order' manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological

effects. However, certain forms of *sideroblastic anaemia* respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur with high doses. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but pyridoxine hydrochloride is indicated in pregnancy, haemolytic anaemias, or during isoniazid p. 367 treatment.

Corticosteroids have an important place in the management of haematological disorders including *autoimmune haemolytic anaemia*, *idiopathic thrombocytopenias* and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaiemias*, including *multiple myeloma*.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure.

Epoetin beta p. 566 is also used for the prevention of anaemia in preterm neonates of low birth-weight; a therapeutic response may take several weeks.

There is insufficient information to support the use of erythropoietins in children with leukaemia or in those receiving cancer chemotherapy.

Darbepoetin is a glycosylated derivative of epoetin; it persists longer in the body and can be administered less frequently than epoetin.

EPOETINS

Epoetins

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOIETINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (UPDATED JANUARY 2018)

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal.

More severe cases were recorded with long-acting agents

(darbopoetin alfa and methoxy polyethylene glycol-epoetin beta). Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

In chronic kidney disease, the use of erythropoietins can be considered in a child with anaemia. The aim of treatment is to relieve symptoms of anaemia and to avoid the need for blood transfusion. The optimum haemoglobin concentration is dependent on the child's age and factors such as symptoms, comorbidities, and patient preferences. The haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia. In *adults*, overcorrection of haemoglobin concentration with erythropoietins in those with chronic kidney disease may increase the risk of serious cardiovascular events and death; haemoglobin concentrations higher than 12 g/100 mL should be avoided in children.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension

- **CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) · concurrent infection (can impair the response to erythropoietin) · correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment · during dialysis (increase in unfractionated or low molecular weight heparin dose may be needed) · epilepsy · inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled · ischaemic vascular disease · malignant disease · other inflammatory disease (can impair the response to erythropoietin) · sickle-cell disease (lower target haemoglobin concentration may be appropriate) · sudden stabbing migraine-like pain (warning of a hypertensive crisis) · thrombocytosis (monitor platelet count for first 8 weeks)

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · embolism and thrombosis · headache · hypertension (dose-dependent) · influenza like illness · skin reactions · stroke
- ▶ **Uncommon** Hypertensive crisis (in isolated patients with normal or low blood pressure) · respiratory tract congestion · seizure
- ▶ **Rare or very rare** Thrombocytosis
- ▶ **Frequency not known** Pure red cell aplasia (more common following subcutaneous administration in patients with chronic renal failure)

SIDE-EFFECTS, FURTHER INFORMATION

Hypertensive crisis In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.

Pure red cell aplasia There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

● MONITORING REQUIREMENTS

- ▶ Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.

- ▶ Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients and in preterm neonates.

F 563

Darbopoetin alfa

● INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure in patients on dialysis

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 11–17 years: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 11–17 years: Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 11–17 years: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

- **INTERACTIONS** → Appendix 1: darbopoetin alfa

● SIDE-EFFECTS

- **Common or very common** Hypersensitivity · oedema
- **PREGNANCY** No evidence of harm in *animal studies*—manufacturer advises caution.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Aranesp (Amgen Ltd)

F 563

Epoetin alfa

● INDICATIONS AND DOSE

BINOCRIT® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

► BY INTRAVENOUS INJECTION

- **Child (body-weight up to 10 kg):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at

intervals of at least 4 weeks; maintenance 75–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

- **Child (body-weight 10–30 kg):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 60–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
- **Child (body-weight 31 kg and above):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 30–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

EPREX® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

► BY INTRAVENOUS INJECTION

- **Child (body-weight up to 10 kg):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
- **Child (body-weight 10–30 kg):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 60–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
- **Child (body-weight 31–60 kg):** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 30–100 units/kg 3 times a week, intravenous continued →

injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

- ▶ **Child** (body-weight 61 kg and above): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, maintenance dose can be given as a single dose or in divided doses, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

● **INTERACTIONS** → Appendix 1: epoetin alfa

● **SIDE-EFFECTS**

- **Common or very common** Chills · cough · diarrhoea · fever · myalgia · nausea · pain · peripheral oedema · vomiting
- ▶ **Uncommon** Hyperkalaemia

● **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

● **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.

● **HEPATIC IMPAIRMENT** Manufacturers advise caution in chronic hepatic failure.

● **PRESCRIBING AND DISPENSING INFORMATION** Epoetin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Epoetin beta

● INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure

- ▶ **BY SUBCUTANEOUS INJECTION**

▶ **Neonate:** Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

▶ **Child:** Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

- ▶ **BY INTRAVENOUS INJECTION**

▶ **Neonate:** Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

▶ **Child:** Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL

over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

Prevention of anaemias of prematurity in neonates

► BY SUBCUTANEOUS INJECTION

- Neonate up to 33 weeks corrected gestational age (body-weight 0.75–1.5 kg): 250 units/kg 3 times a week preferably started within 3 days of birth and continued for 6 weeks, using single-dose unpreserved injection.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MAY 2015) EPOETIN BETA (NEORECORMON): INCREASED RISK OF RETINOPATHY IN PRETERM INFANTS CANNOT BE EXCLUDED

There is a possible increased risk of retinopathy in premature infants, when epoetin beta is used for preventing anaemia of prematurity. When using epoetin beta in preterm infants:

- consider the benefits and risks of treatment, including the possible risk of retinopathy,
- monitor the infant for features of retinopathy, and
- advise parents or carers that their baby's eyes will be carefully monitored for any ill effects.

- **INTERACTIONS** → Appendix 1: epoetin beta

- **SIDE-EFFECTS** Severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.

- **HEPATIC IMPAIRMENT** Manufacturers advise caution in chronic hepatic failure.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Eculizumab

04-Dec-2017

- **DRUG ACTION** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

● INDICATIONS AND DOSE

Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)

- BY INTRAVENOUS INFUSION
- Child: Refer for specialist advice, experience very limited

Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)

- BY INTRAVENOUS INFUSION
- Child 2 months–17 years (body-weight 5–9 kg): Initially 300 mg once weekly for 2 weeks, followed by 300 mg every 3 weeks
- Child 2 months–17 years (body-weight 10–19 kg): Initially 600 mg once weekly for 1 week, then reduced to 300 mg once weekly for 1 week, followed by 300 mg every 2 weeks
- Child 2 months–17 years (body-weight 20–29 kg): Initially 600 mg once weekly for 3 weeks, followed by 600 mg every 2 weeks
- Child 2 months–17 years (body-weight 30–39 kg): Initially 600 mg once weekly for 2 weeks, then increased to 900 mg once weekly for 1 week, followed by 900 mg every 2 weeks
- Child 2 months–17 years (body-weight 40 kg and above): Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week, followed by 1.2 g every 2 weeks

- **UNLICENSED USE** Not licensed for use in children for paroxysmal nocturnal haemoglobinuria.
- **CONTRA-INDICATIONS** Patients unvaccinated against *Neisseria meningitidis* · unresolved *Neisseria meningitidis* infection
- **CAUTIONS** Active systemic infection
- CAUTIONS, FURTHER INFORMATION**
 - Meningococcal infection Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetraavalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after

vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · asthenia · chills · cough · decreased leucocytes · diarrhoea · dizziness · fever · gastrointestinal discomfort · headache · hypertension · increased risk of infection · influenza like illness · joint disorders · muscle complaints · nausea · oropharyngeal pain · pain · skin reactions · sleep disorders · taste altered · tremor · vomiting
 - **Uncommon** Abscess · anxiety · appetite decreased · chest discomfort · constipation · cystitis · depression · dysuria · haemorrhage · hot flush · hyperhidrosis · hypersensitivity · hypotension · meningitis meningococcal · mood swings · nasal complaints · oedema · palpitations · paraesthesia · sepsis · spontaneous penile erection · throat irritation · tinnitus · vascular disorders · vertigo · vision blurred
 - **Rare or very rare** Abnormal clotting factor · conjunctival irritation · feeling hot · gastrooesophageal reflux disease · gingival discomfort · Grave's disease · infusion related reaction · jaundice · malignant melanoma · menstrual disorder · syncope · urogenital tract gonococcal infection
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 5 months after treatment.
- **PREGNANCY** No information available—use only if potential benefit outweighs risk. Human IgG antibodies known to cross placenta.
- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.
- **MONITORING REQUIREMENTS**
 - Monitor for 1 hour after infusion.
 - For *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
 - For *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.
- **DIRECTIONS FOR ADMINISTRATION** Dilute requisite dose to a concentration of 5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and mix gently; give over 25–45 minutes. If infusion-related reactions occur, infusion time may be increased to 4 hours in child under 12 years or 2 hours in child over 12 years.
- **PRESCRIBING AND DISPENSING INFORMATION** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.
- **PATIENT AND CARER ADVICE** Patient or carers should be advised to report promptly any signs of meningococcal infection.
 - A patient information card should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - Eculizumab for treating atypical haemolytic uraemic syndrome (January 2015) NICE HST1 Eculizumab, within its marketing authorisation, is recommended for funding for treating atypical haemolytic uraemic syndrome, only if all the following arrangements are in place:
 - coordination of eculizumab use through an expert centre, and
 - monitoring systems to record the number of people with a diagnosis of atypical haemolytic uraemic syndrome

and the number who have eculizumab, and the dose and duration of treatment, **and**

- a national protocol for starting and stopping eculizumab for clinical reasons, **and**
- a research programme with robust methods to evaluate when stopping treatment or dose adjustment might occur.

The long-term budget impact of eculizumab for treating atypical haemolytic uraemic syndrome is uncertain but will be considerable. NHS England and the manufacturer should consider what opportunities might exist to reduce the cost of eculizumab to the NHS.

1.2 Iron deficiency anaemia

Anaemia, iron deficiency

Iron deficiency, treatment and prophylaxis

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastro-intestinal bleeding). The possibility of thalassaemia should be considered in children of Mediterranean or Indian subcontinent descent.

Prophylaxis with an iron preparation may be appropriate in those with a poor diet, malabsorption, menorrhagia, pregnancy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by formulation, palatability, incidence of side-effects, and cost.

Treatment of iron-deficiency anaemia

The oral dose of elemental iron to treat deficiency is 3–6 mg/kg (max. 200 mg) daily given in 2–3 divided doses. Iron supplementation may also be required to produce an optimum response to erythropoietins in iron-deficient children with chronic renal failure or in preterm neonates.

When prescribing, express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered.

Iron content of different iron salts

Iron salt/amount	Content of ferrous iron
ferrous fumarate 200 mg	65 mg
ferrous gluconate 300 mg	35 mg
ferrous sulfate 300 mg	60 mg
ferrous sulfate, dried 200 mg	65 mg
sodium ferredetate 190 mg	27.5 mg

Prophylaxis of iron deficiency

In neonates, haemoglobin and haematocrit concentrations change rapidly. These changes are not due to iron deficiency and cannot be corrected by iron supplementation. Similarly, neonatal anaemia resulting from repeated blood sampling does not respond to iron therapy.

All babies, including preterm neonates, are born with substantial iron stores but these stores can become depleted unless dietary intake is adequate. All babies require an iron intake of 400–700 nanograms daily to maintain body stores. Iron in breast milk is well absorbed but that in artificial feeds or in cow's milk is less so. Most artificial formula feeds are sufficiently fortified with iron to prevent deficiency and their iron content should be taken into account when considering further iron supplementation.

Prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

Infants with a poor diet may become anaemic in the second year of life, particularly if cow's milk, rather than fortified formula feed, is a major part of the diet.

Compound preparations

Some oral preparations contain ascorbic acid p. 629 to aid absorption of the iron, but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins**, except folic acid p. 574 for pregnant women.

Parenteral iron

Iron can be administered parenterally as iron dextran p. 570, iron sucrose p. 571 or ferric carboxymaltose p. 570. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the child cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption.

Many children with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of children with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the child's body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

MINERALS AND TRACE ELEMENTS > IRON, INJECTABLE

Iron (injectable)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · flushing · headache · hypertension · hypophosphataemia · hypotension · nausea · taste altered
- ▶ **Uncommon** Arrhythmias · arthralgia · bronchospasm · chest pain · chills · constipation · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · hyperhidrosis · hypersensitivity · loss of consciousness · muscle complaints · pain · peripheral oedema · sensation abnormal · skin reactions · vascular disorders · vision blurred · vomiting
- ▶ **Rare or very rare** Angioedema · anxiety · circulatory collapse · influenza like illness · malaise · palpitations · psychiatric disorder · seizure · syncope · tremor

SIDE-EFFECTS, FURTHER INFORMATION Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available. If children complain of acute symptoms particularly nausea, back pain, breathlessness, or develop hypotension, the infusion should be stopped.

Overdose For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 832.

Iron (as iron sucrose) 20 mg per 1 mL Venofer 100mg/5mL solution for injection vials | 5 vial [PoM] £43.52
Venofer 50mg/2.5mL solution for injection vials | 5 vial [PoM] £

MINERALS AND TRACE ELEMENTS > IRON, ORAL

Iron (oral)

SIDE-EFFECTS

- Common or very common Constipation · diarrhoea · gastrointestinal discomfort · nausea
- Uncommon Vomiting
- Frequency not known Appetite decreased · faeces discoloured

SIDE-EFFECTS, FURTHER INFORMATION Iron can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel

disease; care is also needed in patients with intestinal strictures and diverticular disease.

Overdose For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 832.

Iron preparations are an important cause of accidental overdose in children and as little as 20mg/kg of elemental iron can lead to symptoms of toxicity.

MONITORING REQUIREMENTS

- Therapeutic response The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

● PRESCRIBING AND DISPENSING INFORMATION Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription.

The iron content of artificial formula feeds should also be considered.

The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

● PATIENT AND CARER ADVICE Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

Anaemia, megaloblastic

Overview

Megaloblastic anaemias are rare in children; they may result from a lack of either vitamin B₁₂ or folate and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

Vitamin B₁₂ is used in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare disorders of *congenital transcobalamin II deficiency* and *homocystinuria*.

Vitamin B₁₂ should be given prophylactically after *total ileal resection*.

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂ in large oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 575 has completely replaced cyanocobalamin p. 575 as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

Folate acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is administered concurrently otherwise neuropathy may be precipitated.

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores; higher doses may be necessary in malabsorption states. In pregnancy, folic acid daily is continued to term.

For prophylaxis in *chronic haemolytic states, malabsorption, or in renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in juvenile idiopathic arthritis, severe Crohn's disease and severe psoriasis.

Folic acid is actively excreted in breast milk and is well absorbed by the infant. It is also present in cow's milk and artificial formula feeds but is heat labile. Serum and red cell

folate concentrations fall after delivery and urinary losses are high, particularly in low birth-weight neonates. Although symptomatic deficiency is rare in the absence of malabsorption or prolonged diarrhoea, it is common for neonatal units to give supplements of folic acid to all preterm neonates from 2 weeks of age until full-term corrected age is reached, particularly if heated breast milk is used without an artificial formula fortifier.

Folinic acid p. 555 is also effective in the treatment of folate deficient megaloblastic anaemia but it is normally only used in association with cytotoxic drugs; it is given as calcium folinate.

There is **no** justification for prescribing multiple ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 637.

VITAMINS AND TRACE ELEMENTS > FOLATES

Folic acid

09-Jun-2016

● INDICATIONS AND DOSE

Folate-deficient megaloblastic anaemia

► BY MOUTH

► Neonate: Initially 500 micrograms/kg once daily for up to 4 months.

- Child 1-11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
- Child 1-17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

Folate supplementation in neonates

► BY MOUTH

► Neonate: 50 micrograms once daily.

Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see Neural tube defects (prevention in pregnancy) p. 637)

► BY MOUTH

► Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant see Neural tube defects (prevention in pregnancy) p. 637)

► BY MOUTH

► Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those with sickle-cell disease)

► BY MOUTH

► Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy

Prevention of methotrexate side-effects in severe Crohn's disease | Prevention of methotrexate side-effects in severe psoriasis

► BY MOUTH

► Child: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prophylaxis of folate deficiency in dialysis

► BY MOUTH

- Child 1 month-11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- Child 12-17 years: 5–10 mg once daily

Haemolytic anaemia | Metabolic disorders

► BY MOUTH

- Child 1 month–11 years: 2.5–5 mg once daily
- Child 12–17 years: 5–10 mg once daily

Prevention of methotrexate side-effects in juvenile idiopathic arthritis

► BY MOUTH

- Child: 1 mg daily, alternatively 5 mg once weekly, dose to be adjusted according to local guidelines, weekly dose to be taken on a different day to methotrexate dose

- **UNLICENSED USE** Unlicensed for limiting methotrexate toxicity.
- **CAUTIONS** Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)
- **INTERACTIONS** → Appendix 1: folates
- **SIDE-EFFECTS** Abdominal distension · appetite decreased · flatulence · nausea · vitamin B₁₂ deficiency exacerbated
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Folic acid for megaloblastic anaemia caused by folate deficiency and haemolytic anaemia

VITAMINS AND TRACE ELEMENTS > VITAMIN B GROUP**Cyanocobalamin**

20-Jul-2017

● **INDICATIONS AND DOSE****Vitamin B₁₂ deficiency of dietary origin**

► BY MOUTH

- Child: 50–105 micrograms daily in 1–3 divided doses

- **PRESCRIBING AND DISPENSING INFORMATION** Currently available brands of the tablet may not be suitable for vegans.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Cyanocobalamin solution is not prescribable in NHS primary care.
- **LESS SUITABLE FOR PRESCRIBING** Cyanocobalamin is less suitable for prescribing.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet► **Cyanocobalamin (Non-proprietary)**

Cyanocobalamin 50 microgram Cyanocobalamin 50microgram tablets | 50 tablet [S] DT = £9.79 | 50 tablet [P] £9.84 DT = £9.79
Cyanocobalamin 1 mg Behepan 1mg tablets | 100 tablet [PoM] [S]

Oral solution► **Cyanocobalamin (Non-proprietary)**

Cyanocobalamin 7 microgram per 1 ml Cyanocobalamin 35micrograms/5ml oral solution | 200 ml [P] £8.75

Hydroxocobalamin

20-Jul-2017

● **INDICATIONS AND DOSE****Macrocytic anaemia without neurological involvement**

► BY INTRAMUSCULAR INJECTION

- Child: Initially 0.25–1 mg 3 times a week for 2 weeks, then 0.25 mg once weekly until blood count normal, then 1 mg every 3 months

Macrocytic anaemia with neurological involvement

► BY INTRAMUSCULAR INJECTION

- Child: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months

Prophylaxis of macrocytic anaemias associated with vitamin B₁₂ deficiency

► BY INTRAMUSCULAR INJECTION

- Child: 1 mg every 2–3 months

Leber's optic atrophy

► BY INTRAMUSCULAR INJECTION

- Child: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

Congenital transcobalamin II deficiency

► BY INTRAMUSCULAR INJECTION

- Neonate: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate.

- Child: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate

Methylmalonic acidemia and homocystinuria

► BY INTRAMUSCULAR INJECTION

- Child: Initially 1 mg daily for 5–7 days, then adjusted according to response to up to 1 mg 1–2 times a week, this is the maintenance dose

Methylmalonic acidemia, maintenance once intramuscular response established

► BY MOUTH

- Child: 5–10 mg 1–2 times a week, some children do not respond to oral route

CYANOKIT®

Poisoning with cyanides

► BY INTRAVENOUS INFUSION

- Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

● **UNLICENSED USE**

- With intramuscular use or oral use Licensed for use in children (age not specified by manufacturers). Not licensed for use in inborn errors of metabolism.

● **CAUTIONS**

- With intramuscular use or oral use Should not be given before diagnosis fully established

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS Dizziness · urine discolouration
SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Arrhythmia · chills · diarrhoea · drug fever · headache · hot flush · hypokalaemia · malaise · nausea · pain · skin reactions · thrombocytosis · tremor · vomiting
- ▶ With intravenous use Angioedema · diarrhoea · dysphagia · extrasystole · gastrointestinal discomfort · hot flush · hypersensitivity · memory loss · mucosal discolouration · red · peripheral oedema · pleural effusion · rash pustular · red discolouration of plasma · restlessness · skin reactions · swelling · throat complaints
- ▶ With oral use Fever · headache · hypersensitivity · nausea · pruritus
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **EFFECT ON LABORATORY TESTS**
 - ▶ With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For intravenous infusion (Cyanokit)[®], given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).
 - ▶ With oral use For administration by mouth, injection solution may be given orally; it will not have prolonged effect via this route.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - ▶ With intramuscular use The BP directs that when vitamin B₁₂ injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied. Poisoning by cyanides
 - ▶ With intravenous use Cyanokit[®] is the only preparation of hydroxocobalamin that is suitable for use in victims of smoke inhalation who show signs of significant cyanide poisoning.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Cobalin-H[®] is not prescribable in NHS primary care.

Neo-Cytamen[®] is not prescribable in NHS primary care.

• MEDICINAL FORMS

Powder for solution for infusion

- ▶ **Cyanokit** (SERB)
 Hydroxocobalamin 5 gram Cyanokit 5g powder for solution for infusion vials | 1 vial [PoM] £772.00

anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, and in thalassaemia, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 578 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by ascorbic acid (vitamin C) p. 629 daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to children with cardiac dysfunction; in children with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

ANTIDOTES AND CHELATORS > IRON CHELATORS

Desferasirox

18-Jul-2017

- **DRUG ACTION** Desferasirox is an oral iron chelator.

• INDICATIONS AND DOSE

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

▶ BY MOUTH

- ▶ Child 2–5 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

▶ BY MOUTH

- ▶ Child 6–17 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only)

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)

▶ BY MOUTH

- ▶ Child 2–17 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every

2 Iron overload

Iron overload

Overview

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory

3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

► BY MOUTH

- Child 10–17 years: Initially 7 mg/kg once daily, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 7 mg/kg per day

- **CAUTIONS** History of liver cirrhosis · not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) · platelet count less than $50 \times 10^9/\text{litre}$ · risk of gastro-intestinal ulceration and haemorrhage · unexplained cytopenia—consider treatment interruption

- **INTERACTIONS** → Appendix 1: iron chelators

● **SIDE-EFFECTS**

- **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · headache · nausea · skin reactions · urine abnormalities · vomiting
- **Uncommon** Anxiety · cataract · cholelithiasis · deafness · dizziness · fatigue · fever · gastrointestinal disorders · gastrointestinal haemorrhage (including fatal cases) · hepatic disorders · laryngeal pain · maculopathy · oedema · renal tubular disorders · sleep disorder

- **Rare or very rare** Optic neuritis

- **Frequency not known** Acute kidney injury · alopecia · anaemia aggravated · angioedema · hypersensitivity vasculitis · metabolic acidosis · nephritis tubulointerstitial · nephrolithiasis · neutropenia · pancreatitis acute · pancytopenia · renal tubular necrosis · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment. **Dose adjustments** Use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated creatinine clearance less than 60 mL/minute. **Dose adjustments** Manufacturer advises reduce dose if serum-creatinine increased above age-appropriate limits or creatinine clearance less than 90 mL/minute on 2 consecutive occasions—consult product literature.

● **MONITORING REQUIREMENTS**

- Manufacturer advises monitoring of the following patient parameters: baseline serum creatinine twice and creatinine clearance once before initiation of treatment, weekly in the first month after treatment initiation or modification, then monthly thereafter; proteinuria before treatment initiation then monthly thereafter, and other markers of renal tubular function as needed; liver function before treatment initiation, every 2 weeks during the first month of treatment, then monthly thereafter; eye and ear examinations before treatment and annually during treatment; serum-ferritin concentration monthly.
- Manufacturer advises monitor liver-iron concentration every three months in children with non-transfusion-dependent thalassaemia syndromes when serum ferritin is ≤ 800 micrograms/litre.
- Manufacturer advises monitor body-weight, height, and sexual development before treatment and then annually thereafter.

- **DIRECTIONS FOR ADMINISTRATION** For film-coated tablets, manufacturer advises tablets may be crushed and

sprinkled on to soft food (yoghurt or apple sauce), then administered immediately.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer deferasirox tablets. Medicines for Children leaflet: Deferasirox for removing excess iron www.medicinesforchildren.org.uk/deferasirox-for-removing-excess-iron

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2017) that deferasirox (*Exjade*®) is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

Patients with myelodysplastic syndromes, the commonest cause of transfusion-dependent anaemia, were poorly represented in the clinical trial population and the economic case was not demonstrated in this group.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Deferiprone

- **DRUG ACTION** Deferiprone is an oral iron chelator.

● **INDICATIONS AND DOSE**

Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate

► BY MOUTH

- Child 6–17 years: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

- **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia

- **INTERACTIONS** → Appendix 1: deferiprone

● **SIDE-EFFECTS**

- **Common or very common** Abdominal pain (reducing dose and increasing gradually may improve tolerance) · agranulocytosis · appetite increased · arthralgia · diarrhoea (reducing dose and increasing gradually may improve tolerance) · fatigue · headache · nausea (reducing dose and increasing gradually may improve tolerance) · neutropenia · urine discolouration · vomiting (reducing dose and increasing gradually may improve tolerance)

- **Frequency not known** Skin reactions · zinc deficiency

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in *animal* studies. Contraception advised in females of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.

- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
- **PATIENT AND CARER ADVICE**
Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Oral solution

Desferrioxamine mesilate

(Deferoxamine Mesilate)

INDICATIONS AND DOSE

Iron poisoning

- BY CONTINUOUS INTRAVENOUS INFUSION

➤ Neonate: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service.

➤ Child: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

Aluminium overload in dialysis patients

- BY INTRAVENOUS INFUSION

➤ Child: 5 mg/kg once weekly

Chronic iron overload (low iron overload)

- BY SUBCUTANEOUS INFUSION

➤ Child: Initially up to 30 mg/kg 3–7 times a week, to be given over 8–12 hours, the dose should reflect the degree of iron overload

Chronic iron overload (established overload)

- BY SUBCUTANEOUS INFUSION

➤ Child: 20–50 mg/kg daily

UNLICENSED USE

- When used for iron poisoning Licensed for use in children (age range not specified by manufacturer).

● **CAUTIONS** Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

● **INTERACTIONS** → Appendix 1: iron chelators

SIDE-EFFECTS

- **Common or very common** Arthralgia · bone disorder · fever · growth retardation · headache · muscle complaints · nausea · skin reactions
- **Uncommon** Abdominal pain · asthma · hearing impairment · vomiting
- **Rare or very rare** Angioedema · blood disorder · cataract · diarrhoea · dizziness · encephalopathy · eye disorders · hypersensitivity · hypotension (more common when given too rapidly by intravenous injection) · increased risk of infection · nerve disorders · nervous system disorder ·

paraesthesia · respiratory disorders · shock · tachycardia · thrombocytopenia · vision disorders

- **Frequency not known** Acute kidney injury · hypocalcaemia · leucopenia · renal tubular disorder · seizure · urine red

● **PREGNANCY** Teratogenic in *animal* studies. Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

● **RENAL IMPAIRMENT** Use with caution.

MONITORING REQUIREMENTS

- Eye and ear examinations before treatment and at 3-month intervals during treatment.
- Monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses.

● **DIRECTIONS FOR ADMINISTRATION** For full details and warnings relating to administration, consult product literature.

- When used for Chronic iron overload or Aluminium overload in dialysis patients For *intravenous or subcutaneous infusion*, reconstitute powder with Water for Injection to a concentration of 100 mg/mL; dilute with Glucose 5% or Sodium Chloride 0.9%. In *haemodialysis or haemo-filtration* administer over the last hour of dialysis (may be given via the dialysis fistula). *Intraperitoneal*: may be added to dialysis fluid. In CAPD give prior to the last exchange of the day.

3 Neutropenia and stem cell mobilisation

3.1 Neutropenia

Neutropenia

Management

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim (unglycosylated rhG-CSF) p. 579 and lenograstim (glycosylated rhG-CSF) p. 580 have similar effects; both have been used in a variety of clinical settings, including cytotoxic-induced neutropenia, and neutropenia following bone marrow transplantation, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy.

Treatment with granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

Neonatal neutropenia

Filgrastim has been used to treat sepsis-induced neutropenia in preterm neonates. There is no clear evidence that granulocyte-colony stimulating factors improve survival or long-term outcomes.

IMMUNOSTIMULANTS > GRANULOCYTE-COLONY STIMULATING FACTORS

Granulocyte-colony stimulating factors

- **DRUG ACTION** Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.
- **CAUTIONS** Malignant myeloid conditions · pre-malignant myeloid conditions · risk of splenomegaly and rupture—spleen size should be monitored · sickle-cell disease
- CAUTIONS, FURTHER INFORMATION**
 - ▶ Acute respiratory distress syndrome There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthralgia · cutaneous vasculitis · dyspnoea · haemoptysis · headache · hypersensitivity · leucocytosis · pain · spleen abnormalities · thrombocytopenia
 - ▶ **Uncommon** Acute febrile neutrophilic dermatosis · capillary leak syndrome · hypoxia · pulmonary oedema · respiratory disorders · sickle cell anaemia with crisis
- SIDE-EFFECTS, FURTHER INFORMATION** Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.
- **PREGNANCY** There have been reports of toxicity in *animal* studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.
- **BREAST FEEDING** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.
- **MONITORING REQUIREMENTS**
 - ▶ Full blood counts including differential white cell and platelet counts should be monitored.
 - ▶ Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

F above

Filgrastim

(Recombinant human granulocyte-colony stimulating factor; G-CSF)

● INDICATIONS AND DOSE

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ **Child:** 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)

- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- ▶ **Child:** 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)

- ▶ BY SUBCUTANEOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ **Child:** 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion

Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Child:** 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature

Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Child 16–17 years:** 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Child:** Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Child:** Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Persistent neutropenia in HIV infection (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Child:** Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

Neonatal neutropenia (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Neonate:** 10 micrograms/kg daily, to be discontinued if white cell count exceeds $50 \times 10^9/\text{litre}$.

Glycogen storage disease type 1b (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Child:** Initially 5 micrograms/kg daily, dose to be adjusted as necessary

- **UNLICENSED USE** Not licensed for treatment of glycogen storage disease or neonatal neutropenia.
- **CONTRA-INDICATIONS** Severe congenital neutropenia (Kostmann's syndrome) with abnormal cytogenetics

- **CAUTIONS** Osteoporotic bone disease (monitor bone density if given for more than 6 months) · secondary acute myeloid leukaemia
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · diarrhoea · dysuria · haemorrhage · hepatomegaly · hyperuricaemia · hypotension · osteoporosis · rash
 - **Uncommon** Fluid imbalance · graft versus host disease · peripheral vascular disease · pseudogout · rheumatoid arthritis aggravated · urine abnormalities
- **MONITORING REQUIREMENTS** Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous or intravenous infusion*, dilute with Glucose 5% to a concentration of not less than 15 micrograms/mL; to dilute to a concentration of 2–15 micrograms/mL, add albumin solution (human albumin solution) to produce a final albumin solution of 2 mg/mL; not compatible with Sodium Chloride solutions.
- **PRESCRIBING AND DISPENSING INFORMATION** Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.
 - 1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

4 Platelet disorders

Platelet disorders

Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. A corticosteroid, such as prednisolone p. 442, is sometimes used if idiopathic thrombocytopenic purpura does not resolve spontaneously or if it is associated with severe cutaneous symptoms or mucous membrane bleeding; corticosteroid treatment should not be continued longer than 14 days regardless of the response.

Immunoglobulin preparations may be used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are often used in preference to a corticosteroid. Anti-D (Rh₀) immunoglobulin p. 771 is licensed for the management of idiopathic thrombocytopenic purpura.

Other therapy that has been tried under specialist supervision in refractory idiopathic thrombocytopenic purpura includes azathioprine p. 518, cyclophosphamide p. 535, vincristine sulfate p. 550, and ciclosporin p. 519. Rituximab p. 530 [unlicensed] is also used in specialist centres but experience of its use in children is limited. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 82 may be given to reduce the severity of haemorrhage.

Splenectomy is considered in chronic thrombocytopenic purpura if a satisfactory platelet count is not achieved with regular immunoglobulin infusions, if there is a relapse on withdrawing or reducing the dose of corticosteroid, and if other therapies are considered inappropriate.

Essential thrombocythaemia

Anagrelide below reduces platelets in essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs.

4.1 Essential thrombocythaemia

ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

Anagrelide

● INDICATIONS AND DOSE

Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)

► BY MOUTH

- Child 7–17 years: Initially 500 micrograms daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

● **UNLICENSED USE** Not licensed for use in children.

● **CAUTIONS** Cardiovascular disease—assess cardiac function before and regularly during treatment · concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment · risk factors for QT-

interval prolongation—assess cardiac function before and regularly during treatment

● **INTERACTIONS** → Appendix 1: anagrelide

● SIDE-EFFECTS

- **Common or very common** Anaemia · arrhythmias · asthenia · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · palpitations · skin reactions · vomiting
- **Uncommon** Alopecia · appetite decreased · arthralgia · chest pain · chills · confusion · congestive heart failure · constipation · depression · dry mouth · dyspnoea · erectile dysfunction · fever · haemorrhage · hypertension · insomnia · malaise · memory loss · myalgia · nervousness · oedema · pain · pancreatitis · pancytopenia · pneumonia · pulmonary hypertension · respiratory disorders · sensation abnormal · syncope · thrombocytopenia · weight changes
- **Rare or very rare** Angina pectoris · cardiomegaly · cardiomyopathy · coordination abnormal · dizziness · dysarthria · influenza like illness · myocardial infarction · nocturia · pericardial effusion · postural hypotension · renal failure · tinnitus · vasodilation · vision disorders
- **Frequency not known** Hepatitis · nephritis · tubulointerstitial

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment. Avoid in moderate to severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²

● MONITORING REQUIREMENTS

- Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
- Monitor liver function.
- Monitor serum creatinine.
- Monitor urea.
- Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.
- Monitor closely for further signs of disease progression such as malignant transformation.

● **PRESCRIBING AND DISPENSING INFORMATION** Initiate only when signs of disease progression or patient suffers from thrombosis.

Consider stopping treatment after 3 months if inadequate response.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

4.2 Idiopathic thrombocytopenic purpura

ANTIHAEMORRHAGICS > THROMBOPOIETIN RECEPTOR AGONISTS

Eltrombopag

09-Jun-2017

● INDICATIONS AND DOSE

Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

► BY MOUTH

- Child 1–5 years: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of $50 \times 10^9/\text{litre}$ or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
- Child 6–17 years: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of $50 \times 10^9/\text{litre}$ or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
- Child 16–17 years (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of $50 \times 10^9/\text{litre}$ or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

● **CAUTIONS** Patients of East Asian origin · risk factors for thromboembolism

● **INTERACTIONS** → Appendix 1: eltrombopag

● SIDE-EFFECTS

- **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · cough · depression · diarrhoea · dry eye · dry mouth · fever · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · hepatic disorders · hyperbilirubinaemia · increased risk of infection · malaise · menorrhagia · muscle complaints · nausea · oral disorders · pain · peripheral oedema · QT interval prolongation · sensation abnormal · skin reactions · sleep disorder · sweat changes · vertigo · vision disorders · vomiting
- **Uncommon** Anisocytosis · arrhythmias · balance impaired · cardiovascular disorder · cataract cortical · chest pain · cyanosis · drowsiness · ear pain · electrolyte imbalance · embolism and thrombosis · eosinophilia · excessive tearing · eye inflammation · eye pain · feeling hot · feeling jittery · food poisoning · gout · haemorrhage · headaches · hemiparesis · increased leucocytes · lens opacity · mood altered · muscle weakness · myocardial infarction · nasal complaints · nephritis lupus · nerve disorders · nocturia · oropharyngeal complaints · rectosigmoid cancer · renal failure · retinal pigment epitheliopathy · sinus disorder · sleep apnoea · speech disorder · sunburn · thrombocytopenia · tremor · urine abnormalities · vasodilation · wound inflammation

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment.

● **PREGNANCY** Avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid.

● HEPATIC IMPAIRMENT

Dose adjustments For *idiopathic thrombocytopenic purpura*, manufacturer advises avoid unless potential benefit outweighs risk—reduce initial dose to 25 mg once daily and wait at least 3 weeks before upwards titration of dose.

● **RENAL IMPAIRMENT** Use with caution.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.
- Manufacturer advises regular ophthalmological examinations for cataract formation.
- Manufacturer advises peripheral blood smear prior to initiation to establish baseline level of cellular morphologic abnormalities; once stabilised, full blood count with white blood cell count differential should be performed monthly.
- For *idiopathic thrombocytopenic purpura*, manufacturer advises monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached ($50 \times 10^9/\text{litre}$ or more for at least 4 weeks), then monthly thereafter; monitor platelet count weekly for 4 weeks following treatment discontinuation.

● **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.

● **PATIENT AND CARER ADVICE** Patient counselling is advised on how to administer eltrombopag tablets.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2017) that eltrombopag (*Revolade*®) is accepted for restricted use within NHS Scotland for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged 1 year to 17 years who have severe symptomatic ITP or a high risk of bleeding, and are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland, or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2016) that eltrombopag (*Revolade*®) is recommended as an option for use within NHS Wales for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged 1 year to 17 years who are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This recommendation applies only if the approved Wales Patient Access Scheme is used or where the list/contract price is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Nutrition and metabolic disorders

1 Acid-base imbalance

1.1 Metabolic acidosis

ALKALISING DRUGS

Trometamol

(Tris(hydroxymethyl)aminomethane, THAM)

● INDICATIONS AND DOSE

Metabolic acidosis

► BY INTRAVENOUS INFUSION

- Child: To be administered at an amount appropriate to the body base deficit

- **UNLICENSED USE** Unlicensed preparation.

- **CONTRA-INDICATIONS** Anuria · chronic respiratory acidosis

- **CAUTIONS** Extravasation can cause severe tissue damage

- **SIDE-EFFECTS** Hepatic necrosis (following administration via umbilical vein, in neonates) · hyperkalaemia (in renal impairment) · hypoglycaemia · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Respiratory support may be required because trometamol induces respiratory depression.

- **PREGNANCY** Limited information available, hypoglycaemia may harm fetus.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Use with caution, may cause hyperkalaemia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion

Trometamol 363.4 mg per 1 ml Tris 36.34% solution for infusion
20ml ampoules | 10 ampoule 

2 Fluid and electrolyte imbalances

Fluids and electrolytes

Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

Oral potassium

Compensation for potassium loss is especially necessary:

- in children in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, renal tubule disorder, the nephrotic syndrome, and severe heart failure;
- in children with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse;
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias.

Measures to compensate for potassium loss may be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the *prevention of hypokalaemia*, then doses of potassium chloride p. 601 daily by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency to reduce the risk of **hyperkalaemia**.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness (small divided doses may minimise gastric irritation); when appropriate, potassium-sparing diuretics are preferable. When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia

Acute severe hyperkalaemia calls for urgent treatment with intravenous infusion of **soluble insulin** (0.3–0.6 units/kg/hour in neonates and 0.05–0.2 units/kg/hour in children over 1 month) with glucose 0.5–1 g/kg/hour (5–10 mL/kg of glucose 10%; 2.5–5 mL/kg of glucose 20% via a central venous catheter may also be considered). If insulin cannot be used, salbutamol p. 156 can be given by intravenous injection, but it has a slower onset of action and may be less effective for reducing plasma-potassium concentration.

Calcium gluconate p. 594 is given by slow intravenous injection to manage cardiac excitability caused by hyperkalaemia.

The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 586 should be considered (**important**: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Intravenous furosemide can also be given but is less effective in children with renal impairment. Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; dialysis may occasionally be required.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes. Calcium polystyrene sulfonate is preferred unless plasma-calcium concentrations are high.

Oral sodium and water

Sodium chloride p. 589 is indicated in states of sodium depletion. In preterm neonates in the first few weeks of life and in chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride may be sufficient. Sodium chloride solutions suitable for use by mouth in neonates are available from 'special-order' manufacturers or specialist importing companies, they should be used with care because they are hypertonic. Supplementation with sodium chloride may be required to

replace losses in children with cystic fibrosis particularly in warm weather.

Oral rehydration therapy (ORT)

Diarrhoea in children is usually self-limiting, however, in children under 6 months of age, and more particularly in those under 3 months, symptoms of dehydration may be less obvious and there is a risk of rapid and severe deterioration. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na^+ 75 mmol, K^+ 20 mmol, Cl^- 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children's fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breastfeeding or formula feeds should be offered between oral rehydration drinks.

Oral bicarbonate

Sodium bicarbonate p. 586 is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish

substantial deficits or continuing losses when it is not possible or desirable to use the oral route. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 589 or glucose 5% p. 590) can also be given subcutaneously by hypodermoclysis.

In an individual patient the nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical examination. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, for example 15% glucose, are best given through an indwelling catheter positioned in a large vein.

Maintenance fluid requirements in children are usually derived from the relationship that exists between body-weight and metabolic rate; the figures in the table below may be used as a guide outside the neonatal period. The glucose requirement is that needed to minimise gluconeogenesis from amino acids obtained as substrate from muscle breakdown. Maintenance fluids are intended only to provide hydration for a short period until enteral or parenteral nutrition can be established.

It is usual to meet these requirements by using a standard solution of sodium chloride with glucose p. 590. Solutions containing 20 mmol/litre of potassium chloride p. 601 meet usual potassium requirements when given in the suggested volumes; adjustments may be needed if there is an inability to excrete fluids or electrolytes, excessive renal loss or continuing extra-renal losses. The exact requirements depend upon the nature of the clinical situation and types of losses incurred.

Fluid requirements for children over 1 month:

Body-weight	24-hour fluid requirement
Under 10 kg	100 mL/kg
10–20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight over 10 kg
Over 20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight between 10–20 kg + 20 mL/kg for each 1 kg body-weight over 20 kg (max. 2 litres in females, 2.5 litres in males)

Important The baseline fluid requirements shown in the table should be adjusted to take account of factors that reduce water loss (e.g. increased antidiuretic hormone, renal failure, hypothermia, and high ambient humidity) or increase water loss (e.g. pyrexia or burns).

Replacement therapy: initial intravenous replacement fluid is generally required if the child is over 10% dehydrated, or if 5–10% dehydrated and oral or enteral rehydration is not tolerated or possible. Oral rehydration is adequate, if tolerated, in the majority of those less than 10% dehydrated. Subsequent fluid and electrolyte requirements are determined by clinical assessment of fluid balance.

Intravenous sodium

Intravenous sodium chloride in isotonic (0.9%) solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*. It may be given for initial treatment of acute fluid loss and to replace ongoing gastro-intestinal losses from the upper gastro-intestinal tract. Intravenous sodium chloride is commonly given as a component of maintenance and replacement therapy, usually in combination with other electrolytes and glucose.

Chronic hyponatraemia should ideally be corrected by fluid restriction. However, if sodium chloride is required, the

Electrolyte concentrations—intravenous fluids

Intravenous infusion	Millimoles per litre				
	Na ⁺	K ⁺	HCO ₃ ⁻	Cl ⁻	Ca ²⁺
Normal plasma values	142	4.5	26	103	2.5
Sodium Chloride 0.9%	150	–	–	150	–
Compound Sodium Lactate (Hartmann's)	131	5	29	111	2
Sodium Chloride 0.18% and Glucose 4% (Adults only)	30	–	–	30	–

Small bowel	–	120–140	5–15	20–40	90–130

deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome; the rise in plasma sodium concentration should be no more than 10 mmol/litre in 24 hours.

Sodium chloride with glucose solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

Compound sodium lactate (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded.

Intravenous glucose

Glucose solutions are used mainly to replace water deficit. Water depletion (dehydration) tends to occur when losses are not matched by a comparable intake, as may occur in coma or dysphagia.

Water loss rarely exceeds electrolyte losses but this can occur in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder; the rate of infusion should be adjusted to return the plasma-sodium concentration to normal over 48 hours.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given with insulin for the emergency management of *hyperkalaemia*. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuous insulin infusion.

Intravenous potassium

Potassium chloride with sodium chloride intravenous infusion p. 588 is the initial treatment for the correction of *severe hypokalaemia* and when sufficient potassium cannot be taken by mouth.

Repeated measurements of plasma-potassium concentration are necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

Bicarbonate and trometamol

Sodium bicarbonate is used to correct severe *metabolic acidosis* (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anaemia or hypovolaemia,

sodium bicarbonate below (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium depletion; in these circumstances sodium bicarbonate is best given intravenously as a small volume of hypertonic solution, such as 8.4%; plasma pH and electrolytes should be monitored. For *chronic acidotic states*, sodium bicarbonate can be given by mouth.

Trometamol (tris(hydroxymethyl)aminomethane, THAM) p. 583, an organic buffer, corrects metabolic acidosis by causing an increase in urinary pH and an osmotic diuresis. It is indicated when sodium bicarbonate is unsuitable as in carbon dioxide retention, hypernatraemia, or renal impairment. It is also used during cardiac bypass surgery and, very rarely, in cardiac arrest.

Plasma and plasma substitutes

Albumin solution p. 595, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in nephrotic syndrome).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma substitutes

Gelatin p. 595 is a macromolecular substance that is metabolised slowly. Gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicæmia; it may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Gelatin is rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also the management of shock.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Neonates lose water through the skin and nose, particularly if preterm or if the skin is damaged. The basic fluid requirement for a term baby in average ambient humidity is 40–60 mL/kg/day plus urinary losses. Preterm babies have very high transepidermal losses particularly in the first few days of life; they may need more fluid replacement than full term babies and up to 180 mL/kg/day may be required. Local guidelines for fluid management in the neonatal period should be consulted.

Intravenous sodium

The sodium requirement for most healthy neonates is 3 mmol/kg daily. Preterm neonates, particularly below 30 weeks gestation, may require up to 6 mmol/kg daily. *Hyponatraemia* may be caused by excessive renal loss of sodium; it may also be dilutional and restriction of fluid intake may be appropriate. Sodium supplementation is likely to be required if the serum sodium concentration is significantly reduced.

Hypernatraemia may also occur, most often due to dehydration (e.g. breast milk insufficiency). Severe hypernatraemia and hyponatraemia can cause fits and rarely brain damage. Sodium in drug preparations, delivered via continuous infusions, or in infusions to maintain the patency of intravascular or umbilical lines, can result in significant amounts of sodium being delivered, (e.g. 1 mL/hour of 0.9% sodium chloride infused over 24 hours is equivalent to 3.6 mmol/day of sodium).

BICARBONATE

Sodium bicarbonate

● INDICATIONS AND DOSE

Chronic acidotic states such as uraemic acidosis or renal tubular acidosis

► BY MOUTH

► Neonate: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response.

► Child: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response

Severe metabolic acidosis

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)

Renal hyperkalaemia

► BY SLOW INTRAVENOUS INJECTION

► Neonate: 1 mmol/kg daily.

► Child: 1 mmol/kg daily

Persistent cyanotic spell in a child with congenital heart disease despite optimal use of 100% oxygen and propranolol

► BY INTRAVENOUS INFUSION

► Child: 1 mmol/kg, dose given to correct acidosis (or dose calculated according to arterial blood gas results), sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year

● CONTRA-INDICATIONS

► With oral use Salt restricted diet

● **CAUTIONS** Respiratory acidosis

● **INTERACTIONS** → Appendix 1: sodium bicarbonate

● SIDE-EFFECTS

► With intravenous use Skin exfoliation · soft tissue necrosis · ulcer

► With oral use Abdominal cramps · burping · flatulence · hypokalaemia · metabolic alkalosis

● MONITORING REQUIREMENTS

► With intravenous use Plasma-pH and electrolytes should be monitored.

● DIRECTIONS FOR ADMINISTRATION

► With intravenous use For *peripheral infusion* dilute 8.4% solution at least 1 in 10. For *central line infusion* dilute 1 in 5 with Glucose 5% or 10% or Sodium Chloride 0.9%. Extravasation can cause severe tissue damage.

► With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

● PRESCRIBING AND DISPENSING INFORMATION

- With oral use *Sodium bicarbonate* 500mg capsules contain approximately 6 mmol each of Na^+ and HCO_3^- ; *Sodium bicarbonate* 600mg capsules contain approximately 7 mmol each of Na^+ and HCO_3^- . Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.
- With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na^+ and HCO_3^- /litre), various other strengths available.

● PATIENT AND CARER ADVICE Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

ELECTROLYTES AND MINERALS > SODIUM CHLORIDE

Sodium chloride

● INDICATIONS AND DOSE

Chronic renal salt wasting

► BY MOUTH

- Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements

Sodium supplementation in neonates

► INITIALLY BY MOUTH

- Neonate up to 36 weeks corrected gestational age: 2 mmol, dose to be administered in 100 ml of formula feed (consult dietician), alternatively (by mouth using modified-release tablets) 3–4 mmol, dose to be administered in 100 ml of breast milk (consult dietician).

Sodium replacement

► BY MOUTH USING MODIFIED-RELEASE TABLETS

- Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements, higher doses may be needed in severe depletion

Management of diabetic ketoacidosis (to restore circulating volume if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)

► BY INTRAVENOUS INFUSION

- Child: (consult local protocol)

Diluent for instillation of drugs to the bladder

► BY INTRAVESICAL INSTILLATION

- Child: (consult product literature)

● CAUTIONS

- With intravenous use Avoid excessive administration · cardiac failure · cardio-respiratory diseases · children receiving glucocorticoids · dilutional hyponatraemia · hepatic cirrhosis · hypertension · peripheral oedema · pulmonary oedema · reduced fluid loss · renal insufficiency · restrict intake in impaired renal function · toxæmia of pregnancy

CAUTIONS, FURTHER INFORMATION

- Reduced fluid loss
- With intravenous use The volume of fluid infused should take into account the possibility of reduced fluid loss owing to increased antidiuretic hormone and factors such as renal failure, hypothermia, and high humidity.
- Dilutional hyponatraemia
- With intravenous use Dilutional hyponatraemia is a rare but potentially fatal risk of parenteral hydration. It may be caused by inappropriate use of hypotonic fluids such as sodium chloride 0.18% and glucose 4% intravenous infusion, especially in the postoperative period when antidiuretic hormone secretion is increased. Dilutional hyponatraemia is characterized by a rapid fall in plasma-sodium concentration leading to cerebral oedema and seizures; any child with severe hyponatraemia or rapidly

changing plasma-sodium concentration should be referred urgently to a paediatric high dependency facility.

● SIDE-EFFECTS

- With intravenous use Chills · fever · hypervolaemia · hypotension · local reaction · localised pain · paraesthesia · skin reactions · tremor · vascular disorders · venous thrombosis
- With oral use Abdominal cramps · acidosis hyperchloraemic · diarrhoea · generalised oedema · hypertension · hypotension · irritability · muscle complaints · nausea · vomiting

- **MONITORING REQUIREMENTS** During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

● PRESCRIBING AND DISPENSING INFORMATION

- With intravenous use Sodium chloride 0.9% intravenous infusion contains Na⁺ and Cl⁻ each 150 mmol/litre. The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).
- With oral use Each *Slow Sodium*[®] tablet contains approximately 10 mmol each of Na⁺ and Cl⁻; *Evgr* tablets can be crushed before administration .

The RCPCH and NPPG recommend that, when a liquid special of sodium chloride is required, the following strength is used: 5 mmol/mL.

Combinations available: *Potassium chloride with calcium chloride and sodium chloride and sodium lactate*, p. 587 · *Potassium chloride with calcium chloride dihydrate and sodium chloride*, p. 587 · *Potassium chloride with glucose and sodium chloride*, p. 588 · *Potassium chloride with sodium chloride*, p. 588

Sodium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 589, glucose below.

● INDICATIONS AND DOSE**Combined water and sodium depletion**

- BY INTRAVENOUS INFUSION
- Child: (consult product literature)

● CAUTIONS

CAUTIONS, FURTHER INFORMATION Sodium chloride 0.18% and glucose 4% intravenous infusion fluid should not be used for fluid replacement in children aged 16 years or less because of the risk of hyponatraemia; availability of this infusion should be restricted to high dependency and intensive care units, and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.

● INTERACTIONS → Appendix 1: glucose**● MONITORING REQUIREMENTS**

- Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.
- During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Infusion► **Sodium chloride with glucose (Non-proprietary)**

NUTRIENTS > SUGARS**Glucose****(Dextrose Monohydrate)****● INDICATIONS AND DOSE****Establish presence of gestational diabetes**

► BY MOUTH

- Child: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Oral glucose tolerance test

► BY MOUTH

- Child: Test dose 1.75 g/kg (max. per dose 75 g), anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals. To be given with 200–300 mL fluid

Neonatal hypoglycaemia

► BY INTRAVENOUS INFUSION

- Neonate: 500 mg/kg/hour, to be administered as Glucose 10% intravenous infusion, an initial dose of 250 mg/kg over 5 minutes may be required if hypoglycaemia is severe enough to cause loss of consciousness or seizures.

Hypoglycaemia

► BY INTRAVENOUS INFUSION

- Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

Energy source

► BY INTRAVENOUS INFUSION

- Child: (consult product literature)

Water replacement

► BY INTRAVENOUS INFUSION

- Child: The volume of glucose solution needed to replace deficits may vary (consult product literature)

Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)

► BY INTRAVENOUS INFUSION

- Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

Management of diabetic ketoacidosis

► BY INTRAVENOUS INFUSION

- Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre

DOSE EQUIVALENCE AND CONVERSION

- 75 g anhydrous glucose is equivalent to Glucose BP 82.5g.

- **CAUTIONS** Do not give alone except when there is no significant loss of electrolytes · prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances
- **INTERACTIONS** → Appendix 1: glucose
- **SIDE-EFFECTS** Chills · electrolyte imbalance · fever · fluid imbalance · hypersensitivity · local reaction · localised pain · polyuria · rash · venous thrombosis
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.
- **PRESCRIBING AND DISPENSING INFORMATION** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.
- **EXCEPTIONS TO LEGAL CATEGORY**
 - With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

ORAL REHYDRATION SALTS**Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride**

(Formulated as oral rehydration salts)

INDICATIONS AND DOSE**Fluid and electrolyte loss in diarrhoea**

► BY MOUTH

- Child 1-11 months: 1–1½ times usual feed volume to be given
- Child 1-11 years: 200 mL, to be given after every loose motion
- Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include black currant, citrus, or natural.

- **PATIENT AND CARER ADVICE** After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

Dioralyte Relief oral powder sachets blackcurrant sugar-free | 20 sachet [P] £7.13

The **bisphosphonates** are useful and pamidronate disodium p. 469 is probably the most effective.

Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 471 can be used by specialists for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful. Parathyroidectomy may be indicated for hyperparathyroidism.

Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

Neonates

Calcium supplements

Hypocalcaemia is common in the first few days of life, particularly following birth asphyxia or respiratory distress. Late onset at 4–10 days after birth may be secondary to vitamin D deficiency, hypoparathyroidism or hypomagnesaemia and may be associated with seizures.

2.1 Calcium imbalance

Calcium

Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand. Hypocalcaemia may be caused by vitamin D deficiency (see Vitamin D under Vitamins p. 623), impaired metabolism, a failure of secretion (hypoparathyroidism), or resistance to parathyroid hormone (pseudohypoparathyroidism).

Mild asymptomatic hypocalcaemia may be managed with oral calcium supplements. *Severe symptomatic hypocalcaemia* requires an intravenous infusion of calcium gluconate 10% p. 594 over 5 to 10 minutes, repeating the dose if symptoms persist; in exceptional cases it may be necessary to maintain a continuous calcium infusion over a day or more. Calcium chloride injection p. 593 is also available, but is more irritant; care should be taken to prevent extravasation.

See the role of calcium gluconate in temporarily reducing the toxic effects of *hyperkalaemia*.

Persistent hypocalcaemia requires oral calcium supplements and either a vitamin D analogue (alfacalcidol p. 630 or calcitriol p. 631) for hypoparathyroidism and pseudohypoparathyroidism or natural vitamin D (calciferol) if due to vitamin D deficiency. It is important to monitor plasma and urinary calcium during long-term maintenance therapy.

Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 589. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required.

2.1a Hypocalcaemia

ELECTROLYTES AND MINERALS > CALCIUM

Calcium salts

- **CONTRA-INDICATIONS** Conditions associated with hypercalcaemia (e.g. some forms of malignant disease) · conditions associated with hypercalciuria (e.g. some forms of malignant disease)
- **CAUTIONS** History of nephrolithiasis · sarcoidosis
- **SIDE-EFFECTS**
 - **Uncommon** Constipation · diarrhoea · hypercalcaemia · nausea
- **RENAL IMPAIRMENT** Use with caution. Risk of hypercalcaemia and renal calculi.

► above

Calcium carbonate

● INDICATIONS AND DOSE

Phosphate binding in renal failure and hyperphosphataemia

► BY MOUTH

- Child 1–11 months: 120 mg 3–4 times a day, dose to be adjusted as necessary, to be taken with feeds
- Child 1–5 years: 300 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
- Child 6–11 years: 600 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
- Child 12–17 years: 1.25 g 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals

Calcium deficiency

► BY MOUTH

- Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
- Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
- Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
- Child 12–17 years: 10 mmol 4 times a day, adjusted according to response

F 592

Calcium gluconate

● INDICATIONS AND DOSE

Calcium deficiency | Mild asymptomatic hypocalcaemia

► BY MOUTH

► Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.

- Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
- Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
- Child 12–17 years: 10 mmol 4 times a day, adjusted according to response

Acute hypocalcaemia, urgent correction | Hyperkalaemia (prevention of arrhythmias)

► BY SLOW INTRAVENOUS INJECTION

► Neonate: 0.11 mmol/kg for 1 dose, to be given over 5–10 minutes, some units use a dose of 0.46 mmol/kg (2 mL/kg calcium gluconate 10%) for hypocalcaemia in line with US practice.

► Child: 0.11 mmol/kg, to be given over 5–10 minutes, maximum 4.5 mmol (20 mL calcium gluconate 10%)

Acute hypocalcaemia, maintenance

► BY CONTINUOUS INTRAVENOUS INFUSION

► Neonate: 0.5 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation.

- Child 1 month–1 year: 1 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation; Usual maximum 8.8 mmol
- Child 2–17 years: 8.8 mmol daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation

DOSE EQUIVALENCE AND CONVERSION

► 0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

IMPORTANT SAFETY INFORMATION

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

● **INTERACTIONS** → Appendix 1: calcium salts

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Arrhythmias

SPECIFIC SIDE-EFFECTS

- With intravenous use Circulatory collapse · feeling hot · hyperhidrosis · hypotension · vasodilation · vomiting
- With oral use Gastrointestinal disorder

● **MONITORING REQUIREMENTS**

- With intravenous use Plasma-calcium and ECG monitoring required for administration by slow intravenous injection (risk of arrhythmias if given too rapidly).

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion dilute to at least 45 micromol/mL with Glucose 5% or Sodium Chloride 0.9%. Maximum administration rate 45 micromol/kg/hour (or in neonates max. 22 micromol/kg/hour). May be given more concentrated via a central venous catheter. May be used undiluted (10%)

calcium gluconate) in emergencies. Avoid extravasation; should not be given by intramuscular injection. Incompatible with sodium bicarbonate and phosphate solutions.

● **PRESCRIBING AND DISPENSING INFORMATION** Calcium gluconate 1 g contains calcium 89 mg or Ca^{2+} 2.23 mmol.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection, solution for infusion

Solution for injection

► **Calcium gluconate (Non-proprietary)**

Calcium gluconate 100 mg per 1 mL Calcium gluconate 10% solution for injection 10ml ampoules | 10 ampoule [PoM] £7.50-£12.50 DT = £12.50 | 20 ampoule [PoM] £30.00

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13

F 592

Calcium phosphate

● INDICATIONS AND DOSE

Indications listed in combination monographs (available in the UK only in combination with other drugs)

► BY MOUTH

► Child: Doses listed in combination monographs

● **INTERACTIONS** → Appendix 1: calcium salts

● **SIDE-EFFECTS** Epigastric pain · gastrointestinal disorder · hypercalcaemia

● **MEDICINAL FORMS**

No licensed medicines listed.

2.2 Low blood volume

BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

Albumin solution

(Human Albumin Solution)

● INDICATIONS AND DOSE

Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)

- BY INTRAVENOUS INFUSION
- Child: (consult product literature)

Adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn (with concentrated solutions 20%)

- BY INTRAVENOUS INFUSION
- Child: (consult product literature)

- **CONTRA-INDICATIONS** Cardiac failure · severe anaemia
- **CAUTIONS** Correct dehydration when administering concentrated solution · history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · increased capillary permeability
- **SIDE-EFFECTS**
- **Rare or very rare** Fever · flushing · nausea · shock · urticaria
- **MONITORING REQUIREMENTS** Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.
- **PRESCRIBING AND DISPENSING INFORMATION** A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

● MEDICINAL FORMS

PLASMA SUBSTITUTES

Gelatin

● INDICATIONS AND DOSE

Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

- BY INTRAVENOUS INFUSION
- Child: Initially 10–20 mL/kilogram, use 3.5–4% solution

- **CAUTIONS** Cardiac disease · severe liver disease
- **CAUTIONS, FURTHER INFORMATION** The use of plasma substitutes in children requires specialist supervision due to the risk of fluid overload; use is best restricted to an intensive care setting.
- **SIDE-EFFECTS**
- **Rare or very rare** Chills · dyspnoea · fever · hyperhidrosis · hypersensitivity · hypertension · hypotension · hypoxia · tachycardia · tremor · urticaria · wheezing
- **PREGNANCY** Manufacturer of *Geloplasma*® advises avoid at the end of pregnancy.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in renal impairment.
- **MONITORING REQUIREMENTS**
- Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.
- **PRESCRIBING AND DISPENSING INFORMATION** The gelatin is partially degraded.
Gelaspan® contains succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na⁺ 151 mmol, K⁺ 4 mmol, Mg²⁺ 1 mmol, Cl⁻ 103 mmol, Ca²⁺ 1 mmol, acetate 24 mmol/litre; *Gelofusine*® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 124 mmol/litre; *Geloplasma*® contains partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na⁺ 150 mmol, K⁺ 5 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 100 mmol, lactate 30 mmol/litre; *Isoplex*® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40g (4%), Na⁺ 145 mmol, K⁺ 4 mmol, Mg²⁺ 0.9 mmol, Cl⁻ 105 mmol,

lactate 25mmol/litre; *Volplex*® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 125 mmol/litre.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

- ▶ **Gelaspan** (B.Braun Medical Ltd)

2.3 Magnesium imbalance

Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate p. 597 as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypermagnesaemia* (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia (with which it may be confused), particularly in neonates, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg. Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth in divided doses, but there is limited evidence of benefit. Magnesium aspartate below powder for oral solution is available as a licensed preparation.

Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes*.

2.3a Hypomagnesaemia

ELECTROLYTES AND MINERALS > MAGNESIUM

Magnesium aspartate

• INDICATIONS AND DOSE

Treatment and prevention of magnesium deficiency

- ▶ BY MOUTH
- ▶ Child 2–3 years: 4.5 mmol daily, given as one level 5 mL spoonful of *Magnaspartate*® powder.
- ▶ Child 4–9 years: 4.5 mmol daily, given as a 5 mL level spoonful of *Magnaspartate*® powder, alternatively 10 mmol daily, given as 1 sachet of *Magnaspartate*® powder.
- ▶ Child 10–17 years: 10 mmol daily, given as 1 sachet of *Magnaspartate*® powder.

• CONTRA-INDICATIONS Disorders of cardiac conduction

• INTERACTIONS → Appendix 1: magnesium

• SIDE-EFFECTS

- ▶ Uncommon Diarrhoea · faeces soft
- ▶ Rare or very rare Fatigue · hypermagnesaemia
- ▶ Frequency not known Gastrointestinal irritation

SIDE-EFFECTS, FURTHER INFORMATION Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

Overdose Symptoms of hypermagnesaemia may include nausea, vomiting, flushing of the skin, thirst, hypotension due to peripheral vasodilatation, drowsiness, confusion, loss of tendon reflexes and respiratory depression due to neuromuscular blockade, slurred speech, double vision, muscle weakness, bradycardia, cardiac arrhythmias, coma, and cardiac arrest.

• RENAL IMPAIRMENT Avoid in severe impairment (estimated glomerular filtration rate less than 30 mL/minute/1.73²).

• DIRECTIONS FOR ADMINISTRATION Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.

• PRESCRIBING AND DISPENSING INFORMATION *Magnaspartate*® contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.

• PATIENT AND CARER ADVICE Patients and carers should be given advice on how to administer magnesium aspartate powder.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

Powder

- EXCIPIENTS: May contain Sucrose
- ▶ **Magnaspartate** (KoRa Healthcare)

Magnesium (as Magnesium aspartate) 243 mg *Magnaspartate* 243mg (magnesium 10mmol) oral powder sachets | 10 sachet [PoM] £8.95 DT = £8.95

Magnesium glycerophosphate

24-Oct-2017

• INDICATIONS AND DOSE

Hypomagnesaemia

▶ BY MOUTH

- ▶ Child 1 month–11 years: Initially 0.2 mmol/kg 3 times a day, dose to be adjusted as necessary, dose expressed as Mg²⁺

- ▶ Child 12–17 years: Initially 4–8 mmol 3 times a day, dose to be adjusted as necessary, dose expressed as Mg^{2+}

DOSE EQUIVALENCE AND CONVERSION

- ▶ Magnesium glycerophosphate 1 g is approximately equivalent to Mg^{2+} 4 mmol or magnesium 97 mg.

NEOMAG® CHEWABLE TABLETS

Hypomagnesaemia

▶ BY MOUTH

- ▶ Child 4–11 years: Initially 1 tablet twice daily, dose to be adjusted according to the serum total magnesium level
- ▶ Child 12–17 years: Initially 1 tablet 3 times a day, dose to be adjusted according to the serum total magnesium level

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each *Neomag*® chewable tablet contains Mg^{2+} 4 mmol or magnesium 97 mg.

- **UNLICENSED USE** Preparations other than *Neomag*® are not licensed for use.

- **INTERACTIONS** → Appendix 1: magnesium

- **SIDE-EFFECTS** Diarrhoea - hypermagnesaemia

- **RENAL IMPAIRMENT** Increased risk of toxicity.

Dose adjustments Avoid or reduce dose.

NEOMAG® CHEWABLE TABLETS Manufacturer advises avoid in severe impairment.

- **MONITORING REQUIREMENTS** Manufacturer advises to monitor serum magnesium levels every 3–6 months.

- **DIRECTIONS FOR ADMINISTRATION**

NEOMAG® CHEWABLE TABLETS Manufacturer advises that tablets may be broken into quarters and chewed or swallowed with water.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NEOMAG® CHEWABLE TABLETS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2017) that magnesium glycerophosphate (*Neomag*®) is accepted for use within NHS Scotland as an oral magnesium supplement for the treatment of patients with chronic magnesium loss or hypomagnesaemia.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, powder

Oral solution

- ▶ **LiquaMag GP** (Fontus Health Ltd)

Magnesium (as Magnesium glycerophosphate)

97.2 mg MagnaPhos 97.2mg (4mmol) capsules | 50 capsule £37.87

Magnesium sulfate

● INDICATIONS AND DOSE

Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child 2–17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes

Persistent pulmonary hypertension of the newborn

- ▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Neonate: Initially 200 mg/kg, to be given over 20–30 minutes, then (by continuous intravenous infusion) 20–75 mg/kg/hour for up to 5 days if response occurs after initial dose (to maintain plasma magnesium concentration between 3.5–5.5 mmol/litre).

Hypomagnesaemia

- ▶ BY INTRAVENOUS INJECTION

- ▶ Neonate: 100 mg/kg every 6–12 hours as required, to be given over at least 10 minutes.

- ▶ Child 1 month–11 years: 50 mg/kg every 12 hours as required, to be given over at least 10 minutes

- ▶ Child 12–17 years: 1 g every 12 hours as required, to be given over at least 10 minutes

Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child: 50–100 mg/kg daily; maximum 5 g per day

Neonatal hypocalcaemia

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate: 100 mg/kg every 12 hours for 2–3 doses.

Torsade de pointes

- ▶ BY INTRAVENOUS INJECTION

- ▶ Child: 25–50 mg/kg (max. per dose 2 g), to be given over 10–15 minutes, dose may be repeated once if necessary (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

- ▶ Magnesium sulfate heptahydrate 1 g equivalent to Mg^{2+} approx. 4 mmol.

- **UNLICENSED USE** Unlicensed indication in severe acute asthma and continuing respiratory deterioration in anaphylaxis.

- **INTERACTIONS** → Appendix 1: magnesium

- **SIDE-EFFECTS** Electrolyte imbalance

- **PREGNANCY** Not known to be harmful for short-term intravenous administration in eclampsia. Sufficient amount may cross the placenta in mothers treated with high doses, causing hypotonia and respiratory depression in newborns.

- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.

- **RENAL IMPAIRMENT** Increased risk of toxicity.

Dose adjustments Avoid or reduce dose.

- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump).

For intravenous infusion, in persistent pulmonary hypertension of the newborn, dilute to a max. concentration of 100 mg/mL (10%) (0.4 mmol/mL Mg^{2+}) magnesium sulfate heptahydrate (200 mg/mL (0.8 mmol/mL Mg^{2+}) if fluid restricted) with Glucose 5% or Sodium Chloride 0.9%.

For neonatal hypocalcaemia, hypomagnesaemia, and torsade de pointes, dilute to 10% (100 mg magnesium sulfate heptahydrate (0.4 mmol Mg^{2+}) in 1 mL) with Glucose 5% or 10%, Sodium Chloride 0.45% or 0.9% or Glucose and Sodium Chloride combinations. Up to 20% solution may be given in fluid restriction. Rate of administration should not exceed 10 mg/kg/minute (0.04 mmol/kg/minute Mg^{2+}) of magnesium sulfate heptahydrate.

- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg^{2+}) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

► Magnesium sulfate (Non-proprietary)

Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £21.70–£21.71 DT = £21.63
Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 20ml vials | 10 vial [PoM] £49.20
Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 5ml ampoules | 10 ampoule [PoM] £37.80–£61.26
Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 2ml ampoules | 10 ampoule [PoM] £17.30–£17.35 DT = £17.35

Solution for infusion

► Magnesium sulfate (Non-proprietary)

Magnesium sulfate heptahydrate 100 mg per 1 ml Magnesium sulfate 10% (magnesium 0.4mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £66.26 DT = £66.26
Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial [PoM] £73.00

2.4 Phosphate imbalance

Phosphorus

Phosphate supplements

Oral phosphate supplements p. 600 may be required in addition to vitamin D in children with hypophosphataemic vitamin D-resistant rickets, see also Vitamin D, under Vitamins p. 623.

Phosphate infusion is occasionally needed in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. It is difficult to provide detailed guidelines for the treatment of severe hypophosphatemia because the extent of total body deficits and response to therapy are difficult to predict. High doses of phosphate may result in a transient serum elevation followed by redistribution into intracellular compartments or bone tissue. It is recommended that severe hypophosphataemia be treated intravenously as large doses

of oral phosphate may cause diarrhoea; intestinal absorption may be unreliable and dose adjustment may be necessary.

Phosphate is not the first choice for the treatment of hypercalcaemia because of the risk of precipitation of calcium phosphate in the kidney and other tissues. If used, the child should be well hydrated and electrolytes monitored.

Neonates

Phosphate deficiency may occur in very low-birthweight infants and may compromise bone growth if not corrected. Parenterally fed infants may be at risk of phosphate deficiency due to the limited solubility of phosphate. Some units routinely supplement expressed breast milk with phosphate, although the effect on the osmolality of the milk should be considered.

Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride is licensed for the treatment of hyperphosphataemia in adults on haemodialysis or peritoneal dialysis. Although experience is limited in children sevelamer hydrochloride may be useful when hypercalcaemia prevents the use of calcium carbonate p. 592.

2.4a Hyperphosphataemia

ELECTROLYTES AND MINERALS > ALUMINIUM

Aluminium hydroxide

● INDICATIONS AND DOSE

Hyperphosphataemia in renal failure

► BY MOUTH USING CAPSULES

- Child 5–11 years: 1–2 capsules 3–4 times a day, dose adjusted as necessary
- Child 12–17 years: 1–5 capsules 3–4 times a day, dose adjusted as necessary

- **CONTRA-INDICATIONS** Hypophosphataemia · infants · neonates

CONTRA-INDICATIONS, FURTHER INFORMATION

- Neonates and infants Aluminium-containing antacids should not be used because accumulation may lead to increased plasma-aluminium concentrations.

- **INTERACTIONS** → Appendix 1: antacids

- **SIDE-EFFECTS** Constipation

- **HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma.

- **RENAL IMPAIRMENT** There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Alu-Cap** (Meda Pharmaceuticals Ltd)
Aluminium hydroxide 475 mg Alu-Cap 475mg capsules | 120 capsule [P] £13.71 DT = £13.71

PHOSPHATE BINDERS

Sevelamer

19-Mar-2018

INDICATIONS AND DOSE

RENAGEL®

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

▶ BY MOUTH

- ▶ **Child 12–17 years:** Initially 0.8–1.6 g 3 times a day, dose to be given with meals and adjusted according to serum-phosphate concentration

RENVELA® 2.4G ORAL POWDER SACHETS

Hyperphosphataemia in chronic kidney disease

▶ BY MOUTH

- ▶ **Child 6–17 years** (body surface area 0.75–1.1 m²): Initially 2.4 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks—consult product literature

- ▶ **Child 6–17 years** (body surface area 1.2 m² and above): Initially 4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks—consult product literature

UNLICENSED USE

- RENAGEL®** Not licensed for use in children under 18 years.

CONTRA-INDICATIONS

- Bowel obstruction**

CAUTIONS

- Gastro-intestinal disorders

SIDE-EFFECTS

- ▶ **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · nausea · vomiting
- ▶ **Frequency not known** Skin reactions

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING

- RENVELA® 2.4G ORAL POWDER SACHETS** Unlikely to be present in milk (however, manufacturer advises avoid).

- RENAGEL®** Manufacturer advises use only if potential benefit outweighs risk.

DIRECTIONS FOR ADMINISTRATION

- RENVELA® 2.4G ORAL POWDER SACHETS** Manufacturer advises each sachet should be dispersed in 60 mL water, or mixed with a small amount of cool food (100 g), prior to administration and discarded if unused after 30 minutes.

PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Sevelamer in dialysis

RENVELA® 2.4G ORAL POWDER SACHETS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2018) that sevelamer carbonate (*Renvela®*) is accepted for restricted use within NHS Scotland as second-line management of hyperphosphataemia in paediatric patients (greater than 6 years of age and a Body Surface Area greater than 0.75m²) with chronic kidney disease receiving haemodialysis.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

CAUTIONARY AND ADVISORY LABELS 13

▶ Renvela (Sanofi)

- Sevelamer carbonate 2.4 gram** Renvela 2.4g oral powder sachets sugar-free | 60 sachet [PoM] £167.04 DT = £167.04

Tablet

CAUTIONARY AND ADVISORY LABELS 25

EXCIPIENTS: May contain Propylene glycol

▶ Renagel (Sanofi)

- Sevelamer 800 mg** Renagel 800mg tablets | 180 tablet [PoM] £167.04 DT = £30.52

2.4b Hypophosphataemia

ELECTROLYTES AND MINERALS > PHOSPHATES

Phosphate

● INDICATIONS AND DOSE

Hypophosphataemia | Hypophosphataemic rickets | Osteomalacia

► BY MOUTH USING EFFERVESCENT TABLETS

► Neonate: 1 mmol/kg daily in 1–2 divided doses, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details.

► Child 1 month–4 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details; maximum 48 mmol per day

► Child 5–17 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary; maximum 97 mmol per day

► BY INTRAVENOUS INFUSION

► Neonate: 1 mmol/kg daily, dose to be adjusted as necessary.

► Child 1 month–1 year: 0.7 mmol/kg daily, dose to be adjusted as necessary

► Child 2–17 years: 0.4 mmol/kg daily, dose to be adjusted as necessary

IMPORTANT SAFETY INFORMATION

Some phosphate injection preparations also contain potassium. For peripheral intravenous administration the concentration of potassium should not usually exceed 40 mmol/litre. The infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium concentrate should be followed. The potassium content of some phosphate preparations may also limit the *rate* at which they may be administered.

● CAUTIONS

GENERAL CAUTIONS Cardiac disease • dehydration • diabetes mellitus • sodium and potassium concentrations of preparations

SPECIFIC CAUTIONS

► With intravenous use Avoid extravasation • severe tissue necrosis

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

► Common or very common Diarrhoea
► Frequency not known Nausea

SPECIFIC SIDE-EFFECTS

► With intravenous use Acute kidney injury • hypocalcaemia • hypotension • metastatic calcification • oedema
► With oral use Abdominal distress

SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea is a common side-effect and should prompt a reduction in dosage.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose.

Monitoring Monitor closely in renal impairment.

● **MONITORING REQUIREMENTS** It is essential to monitor closely plasma concentrations of calcium, phosphate,

potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.

● DIRECTIONS FOR ADMINISTRATION

► With intravenous use Dilute injection with Sodium Chloride 0.9% or 0.45% or Glucose 5% or 10%. Administration rate of phosphate should not exceed 0.05 mmol/kg/hour. In emergencies in intensive care faster rates may be used—seek specialist advice.

● PRESCRIBING AND DISPENSING INFORMATION

Phosphate Sandoz® contains sodium dihydrogen phosphate anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na⁺ 20.4 mmol), potassium 123 mg (K⁺ 3.1 mmol); *Polyfusor NA*® contains Na⁺ 162 mmol/litre, K⁺ 19 mmol/litre, PO₄³⁻ 100 mmol/litre; non-proprietary *potassium dihydrogen phosphate injection* (potassium acid phosphate) 13.6% may contain 1 mmol/mL phosphate, 1 mmol/mL potassium.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Phosphate supplements for low phosphate levels www.medicinesforchildren.org.uk/phosphate-supplements-low-phosphate-levels

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13

► **Phosphate Sandoz** (HK Pharma Ltd)

Sodium dihydrogen phosphate anhydrous 1.936 gram Phosphate Sandoz effervescent tablets | 100 tablet [P] £19.39

Solution for infusion

► **Phosphate (Non-proprietary)**

Potassium dihydrogen phosphate 136 mg per 1 ml Potassium dihydrogen phosphate 13.6% (potassium 10mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule [PcM] £80.25–£92.69 DT = £92.69

Infusion

► **Phosphate (Non-proprietary)**

Potassium dihydrogen phosphate 1.295 gram per 1 litre, Disodium hydrogen phosphate anhydrous 5.75 gram per 1 litre Polyfusor NA phosphates infusion 500ml bottles | 1 bottle [PcM] £5.15

2.5 Potassium imbalance

2.5a Hyperkalaemia

Other drugs used for Hyperkalaemia Calcium gluconate, p. 594 • Salbutamol, p. 156

ANTIDOTES AND CHELATORS > CATION EXCHANGE RESINS

Calcium polystyrene sulfonate

● INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

► BY MOUTH

► Child: 0.5–1 g/kg daily in divided doses; maximum 60 g per day

► BY RECTUM

► Neonate: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours.

► Child: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours; maximum 30 g per day

- **CONTRA-INDICATIONS** Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · reduced gut motility (in neonates) · sarcoidosis
- **CAUTIONS** Impaction of resin with excessive dosage or inadequate dilution
- **INTERACTIONS** → Appendix 1: polystyrene sulfonate
- **SIDE-EFFECTS** Appetite decreased · constipation (discontinue—avoid magnesium-containing laxatives) · diarrhoea · electrolyte imbalance · epigastric discomfort · gastrointestinal disorders · gastrointestinal necrosis (in combination with sorbitol) · hypercalcaemia (in dialysed patients and occasionally in those with renal impairment) · increased risk of infection · nausea · vomiting
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With rectal use Mix each 1 g of resin with 5 mL of water or 10% glucose.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

Powder

CAUTIONARY AND ADVISORY LABELS 13

EXCIPIENTS: May contain Sucrose

▶ **Calcium Resonium** (Sanofi)

Calcium polystyrene sulfonate 999.34 mg per 1 gram Calcium Resonium powder sugar-free | 300 gram [P] £82.16

Sodium polystyrene sulfonate

● INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

▶ BY MOUTH

▶ Child: 0.5–1 g/kg daily in divided doses; maximum 60 g per day

▶ BY RECTUM

▶ Neonate: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours.

▶ Child: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours; maximum 30 g per day

- **CONTRA-INDICATIONS** Obstructive bowel disease · reduced gut motility (in neonates)
- **CAUTIONS** Congestive heart failure · hypertension · impaction of resin with excessive dosage or inadequate dilution · oedema
- **INTERACTIONS** → Appendix 1: polystyrene sulfonate
- **SIDE-EFFECTS** Appetite decreased · bezoar · constipation (discontinue—avoid magnesium-containing laxatives) · diarrhoea · electrolyte imbalance · epigastric discomfort · gastrointestinal disorders · increased risk of infection · nausea · necrosis (in combination with sorbitol) · vomiting
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Use with caution.

- **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With rectal use Mix each 1 g of resin with 5 mL of water or 10% glucose.
 - ▶ With oral use Administer dose (powder) in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Powder

CAUTIONARY AND ADVISORY LABELS 13

▶ **Resonium A** (Sanofi)

Sodium polystyrene sulfonate 999.34 mg per 1 gram Resonium A powder sugar-free | 454 gram [P] £81.11

2.5b Hypokalaemia

ELECTROLYTES AND MINERALS > POTASSIUM

Potassium bicarbonate with potassium acid tartrate

● INDICATIONS AND DOSE

Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastrointestinal disorders)

▶ BY MOUTH

▶ Child: (consult product literature)

- **CONTRA-INDICATIONS** Hypochloraemia · plasma-potassium concentration above 5 mmol/litre
- **CAUTIONS** Cardiac disease
- **SIDE-EFFECTS** Abdominal pain · diarrhoea · flatulence · nausea · vomiting
- **RENAL IMPAIRMENT** Avoid in severe impairment. **Monitoring** Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **DIRECTIONS FOR ADMINISTRATION** To be dissolved in water before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** These tablets do not contain chloride.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

▶ **Potassium bicarbonate with potassium acid tartrate (Non-proprietary)**

Potassium acid tartrate 300 mg, Potassium bicarbonate

500 mg Potassium (potassium 6.5mmol) effervescent tablets BPC 1968 | 56 tablet [GSL] £77.77-£93.33 DT = £88.15

Potassium chloride

● INDICATIONS AND DOSE

Prevention of hypokalaemia (patients with normal diet)

▶ BY MOUTH

▶ Child: 1–2 mmol/kg daily; Usual maximum 50 mmol

Electrolyte imbalance

▶ BY INTRAVENOUS INFUSION

▶ Neonate: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements.

continued →

- ▶ Child: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements

Potassium depletion

▶ BY MOUTH

- ▶ Neonate: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration.
- ▶ Child: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

- **CONTRA-INDICATIONS** Plasma-potassium concentration above 5 mmol/litre
- **CAUTIONS**
 - ▶ With intravenous use seek specialist advice in very severe potassium depletion or difficult cases
 - ▶ With oral use Cardiac disease · hiatus hernia (*with modified-release preparations*) · history of peptic ulcer (*with modified-release preparations*) · intestinal stricture (*with modified-release preparations*)
- **INTERACTIONS** → Appendix 1: potassium chloride
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Hyperkalaemia

SPECIFIC SIDE-EFFECTS

 - ▶ With oral use Abdominal cramps · diarrhoea · gastrointestinal disorders · nausea · vomiting
- **RENAL IMPAIRMENT** Avoid in severe impairment. **Dose adjustments** Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia. **Monitoring** Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **MONITORING REQUIREMENTS**
 - ▶ Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
 - ▶ With intravenous use ECG monitoring should be performed in difficult cases.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use in neonates Potassium chloride solutions suitable for use by mouth in neonates are available from 'special order' manufacturers or specialist importing companies; they should be used with care because they are hypertonic and can damage the gastric mucosa.
 - ▶ With oral use Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic* states).
 - ▶ With intravenous use Potassium chloride concentrate must be diluted with **not less than** 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and **mixed well**. Ready-mixed infusion solutions should be used when possible. For *peripheral intravenous infusion*, the concentration of potassium should not usually exceed 40 mmol/L. Potassium infusions should be given slowly over at least 2–3 hours and at a rate not exceeding 0.2 mmol/kg/hour with specialist advice and ECG monitoring in difficult cases. Higher concentrations of

potassium chloride or faster infusion rates may be given in very severe depletion, but require specialist advice.

- **PRESCRIBING AND DISPENSING INFORMATION** Kay-Cee-L[®] contains 1 mmol/mL each of K⁺ and Cl⁻. Potassium Tablets Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer potassium chloride modified-release tablets. Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt[®]* and *Ruthmol[®]*). These should not be used by patients with renal failure as potassium intoxication may result.
- **LESS SUITABLE FOR PRESCRIBING** Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, solution for injection, infusion, solution for infusion

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25, 27

▶ Potassium chloride (Non-proprietary)

Potassium chloride 600 mg Kaleorid LP 600mg tablets | 30 tablet [PoM] [X]
Duro-K 600mg tablets | 100 tablet [PoM] [X]

Solution for infusion

▶ Potassium chloride (Non-proprietary)

Potassium chloride 150 mg per 1 ml Potassium chloride 15% (potassium 20mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule [PoM] £5.00 | 20 ampoule [PoM] £6.50–£10.70
Potassium chloride 15% (potassium 20mmol/10ml) solution for infusion 10ml Mini-Plasco ampoules | 20 ampoule [PoM] £10.70
Potassium chloride 200 mg per 1 ml Potassium chloride 20% (potassium 13.3mmol/5ml) solution for infusion 5ml ampoules | 10 ampoule [PoM] £3.84–£4.00
Potassium chloride 20% (potassium 27mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule [PoM] £121.25

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

▶ Kay-Cee-L (Geistlich Sons Ltd)

Potassium chloride 75 mg per 1 ml Kay-Cee-L syrup sugar-free | 500 ml [P] £8.43

3 Metabolic disorders

Metabolic disorders

Use of medicines in metabolic disorders

Metabolic disorders should be managed under the guidance of a specialist. As many preparations are unlicensed and may be difficult to obtain, arrangements for continued prescribing and supply should be made in primary care.

General advice on the use of medicines in metabolic disorders can be obtained from:

Alder Hey Children's Hospital, Medicines Information Centre

(0151) 252 5381

and

Great Ormond Street Hospital for Children, pharmacy

(020) 7405 9200

Urea cycle disorders

Sodium benzoate p. 614 and sodium phenylbutyrate p. 615 are used in the management of urea cycle disorders. Both, either singly or in combination, are indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy. Sodium benzoate is also used in non-ketotic hyperglycinaemia.

The long-term management of urea cycle disorders includes oral maintenance treatment with sodium benzoate and sodium phenylbutyrate combined with a low protein diet and other drugs such as arginine p. 613 or citrulline p. 614, depending on the specific disorder.

Emergency management

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at: www.bimdg.org.uk.

3.1 Acute porphyrias

Acute porphyrias

01-Oct-2017

Overview

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 75 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

EvGr Where there is no safe alternative, drug treatment for serious or life-threatening conditions should not be withheld from patients with acute porphyria. Where possible, the clinical situation should be discussed with a porphyria specialist for advice on how to proceed and monitor the patient. In the UK clinical advice can be obtained from the National Acute Porphyria Service or from the UK Porphyria Medicines Information Service (UKPMIS)—see details below. **⚠**

Haem arginate p. 604 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from two centres (University Hospital of Wales and King's College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

EvGr The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available. **⚠**

An up-to-date list of drugs considered safe in acute porphyrias is available from the UKPMIS, see *Useful resources* below.

Further information may be obtained from: porphyria.eu/ and also from:

The UK Porphyria Medicines Information Service (UKPMIS)

University Hospital of Wales

CF14 4XW

Cardiff

(029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Anabolic steroids
- Antidepressants, MAOIs (contact UKPMIS for advice)
- Antidepressants, Tricyclic and related (contact UKPMIS for advice)
- Barbiturates (includes primidone and thiopental)
- Contraceptives, hormonal (for detailed advice contact UKPMIS or a porphyria specialist)
- Hormone replacement therapy (for detailed advice contact UKPMIS or a porphyria specialist)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact UKPMIS for advice)
- Progestogens (for detailed advice contact UKPMIS or a porphyria specialist)
- Protease inhibitors (contact UKPMIS for advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonyleureas (glipizide and glimepiride are thought to be safe)
- Taxanes (contact UKPMIS for advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe Drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Busulfan
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clemastine
- Clindamycin
- Cocaine
- Danazol
- Dapsone
- Diltiazem
- Disopyramide
- Disulfiram
- Ergometrine
- Ergotamine
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate
- Flutamide
- Fosaprepitant
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Ifosfamide
- Indapamide
- Isometheptene mucate
- Isoniazid (safety uncertain, contact UKPMIS for advice)
- Ketamine

- Mefenamic acid (safety uncertain, contact UKPMIS for advice)
- Meprobamate
- Methyl dopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (safety uncertain, contact UKPMIS for advice)
- Mitotane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine
- Pentoxifylline
- Pergolide
- Phenoxymethamine
- Phenytoin
- Pivmecillinam
- Pizotifen
- Porfimer
- Raloxifene
- Rifabutin (safety uncertain, contact UKPMIS for advice)
- Rifampicin
- Riluzole
- Risperidone
- Spironolactone
- Sulfapyrazone
- Tamoxifen
- Temoporfin
- Thiotepa
- Tiagabine
- Tibolone
- Topiramate
- Toremifene
- Trimethoprim
- Valproate
- Verapamil
- Xipamide

BLOOD AND RELATED PRODUCTS > HAEM DERIVATIVES

Haem arginate

(Human hemin)

• INDICATIONS AND DOSE

Acute porphyrias | Acute intermittent porphyria | Porphyria variegata | Hereditary coproporphyria

► BY INTRAVENOUS INFUSION

- Child: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring; maximum 250 mg per day

• SIDE-EFFECTS

- Rare or very rare Fever
- Frequency not known Headache · skin discolouration · venous thrombosis

• **PREGNANCY** Manufacturer advises avoid unless essential.

• **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

• **DIRECTIONS FOR ADMINISTRATION** Administer over at least 30 minutes through a filter via large antebrachial or central vein; dilute requisite dose in 100 mL Sodium

Chloride 0.9% in glass bottle; administer within 1 hour after dilution; max. concentration 2.5 mg/mL.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► **Normosang** (Orphan Europe (UK) Ltd)

Haem arginate 25 mg per 1 mL Normosang 250mg/10ml solution for infusion ampoules | 4 ampoule [PoM] £1,737.00

3.2 Carnitine deficiency

AMINO ACIDS AND DERIVATIVES

Levocarnitine

(Carnitine)

• INDICATIONS AND DOSE

Primary carnitine deficiency due to inborn errors of metabolism

► BY MOUTH

- Neonate: Up to 200 mg/kg daily in 2–4 divided doses.

- Child: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

► INITIALLY BY INTRAVENOUS INFUSION

- Neonate: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

- Child: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour

► BY SLOW INTRAVENOUS INJECTION

- Neonate: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

- Child: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

Secondary carnitine deficiency in haemodialysis patients

► INITIALLY BY SLOW INTRAVENOUS INJECTION

- Child: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

Organic acidaemias

► BY MOUTH

- Neonate: Up to 200 mg/kg daily in 2–4 divided doses.

- Child: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

► INITIALLY BY INTRAVENOUS INFUSION

- Neonate: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

- Child: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour

► BY SLOW INTRAVENOUS INJECTION

- Neonate: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

- Child: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

• **UNLICENSED USE** Not licensed for use by intravenous infusion. Tablets, chewable tablets, and oral liquid (10%) not licensed in children under 12 years. Paediatric oral

solution (30%) not licensed in children over 12 years. Not licensed for use in organic acidemias.

● **CAUTIONS** Diabetes mellitus

● **SIDE-EFFECTS**

- ▶ **Rare or very rare** Abdominal cramps · diarrhoea · nausea · skin odour abnormal · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

- **PREGNANCY** Appropriate to use; no evidence of teratogenicity in *animal* studies.

- **RENAL IMPAIRMENT** Accumulation of metabolites may occur with chronic oral administration in severe impairment.

● **MONITORING REQUIREMENTS**

- ▶ Monitoring of free and acyl carnitine in blood and urine recommended.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute injection with Sodium Chloride 0.9% or Glucose 5% or 10%.

● **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ When used for Organic acidemias Levocarnitine is used in the treatment of some organic acidemias; however, use in fatty acid oxidation is controversial.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Carnitine for metabolic disorders www.medicinesforchildren.org.uk/carnitine-metabolic-disorders-0

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Solution for injection

- ▶ **Carnitor** (Logixx Pharma Solutions Ltd)
L-Carnitine 200 mg per 1 ml Carnitor 1g/5ml solution for injection ampoules | 5 ampoule [PoM] £59.50

Oral solution

- ▶ **Levocarnitine (Non-proprietary)**
L-Carnitine 300 mg per 1 ml Levocarnitine 1.5g/5ml (30%) oral solution paediatric | 20 ml [PoM] £71.40 DT = £71.40 | 40 ml [PoM] £69.80

- ▶ **Carnitor** (Logixx Pharma Solutions Ltd)
L-Carnitine 100 mg per 1 ml Carnitor oral single dose 1g solution sugar-free | 10 unit dose [PoM] £35.00

Chewable tablet

- ▶ **Carnitor** (Logixx Pharma Solutions Ltd)
L-Carnitine 1 gram Carnitor 1g chewable tablets | 10 tablet [PoM] £35.00

3.3 Cystinosis

3.3a Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine

(Cysteamine)

● **INDICATIONS AND DOSE**

Nephropathic cystinosis (specialist use only)

▶ BY MOUTH

- ▶ **Neonate:** Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.

- ▶ **Child 1 month–11 years (body-weight up to 50 kg):** Initially one-sixth to one-quarter of the expected maintenance

dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses

- ▶ **Child 12–17 years (body-weight up to 50 kg):** Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses
- ▶ **Child 12–17 years (body-weight 50 kg and above):** Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

Corneal cystine crystal deposits in patients with cystinosis (specialist use only)

- ▶ **TO THE EYE**
- ▶ **Child 2–17 years:** Apply 1 drop 4 times a day, to be applied to both eyes (minimum 4 hours between doses); dose may be reduced according to response (minimum daily dose 1 drop in each eye)

DOSE EQUIVALENCE AND CONVERSION

- ▶ With oral use
- ▶ 1.3 g/m² is approximately equivalent to 50 mg/kg.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

● **CAUTIONS**

- ▶ When used by eye Contact lens wearers
- ▶ With oral use Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

● **SIDE-EFFECTS**

▶ **Common or very common**

- ▶ When used by eye Dry eye · eye discomfort · eye erythema · excessive tearing · vision blurred
- ▶ With oral use Appetite decreased · asthenia · breath odour · diarrhoea · drowsiness · encephalopathy · fever · gastroenteritis · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting

▶ **Uncommon**

- ▶ With oral use Compression fracture · gastrointestinal ulcer · hair colour changes · hallucination · joint hyperextension · leg pain · leucopenia · musculoskeletal disorders · nephrotic syndrome · nervousness · osteopenia · seizure

▶ **Frequency not known**

- ▶ With oral use Depression · intracranial pressure increased · papilloedema

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to penicillamine.

● **PREGNANCY**

- ▶ With oral use Manufacturer advises avoid—teratogenic and toxic in *animal* studies.

● **BREAST FEEDING**

- ▶ With oral use Manufacturer advises avoid—no information available.

● **MONITORING REQUIREMENTS**

- ▶ With oral use Leucocyte-cystine concentration and haematological monitoring required—consult product literature.
- ▶ All patients receiving mercaptamine should be registered (contact local specialist centre for details).

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With oral use For children under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice).

● **PRESCRIBING AND DISPENSING INFORMATION**

Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

● **HANDLING AND STORAGE**

When used by eye Manufacturer advises store in a refrigerator (2–8°C)—after opening store at room temperature up to 25°C for up to 7 days; protect from light.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Mercaptamine eye drops for ocular symptoms of cystinosis www.medicinesforchildren.org.uk/mercaptamine-eye-drops-ocular-symptoms-cystinosis

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

With oral use The *Scottish Medicines Consortium* has advised (November 2017) that mercaptamine (*Procsylbi*®) is **not** recommended for use within NHS Scotland for the treatment of proven nephropathic cystinosis.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Gastro-resistant capsule

► **Procsylbi** (Chiesi Ltd)

Mercaptamine (as Mercaptamine bitartrate) 25 mg Procsylbi 25mg gastro-resistant capsules | 60 capsule [PoM](#) £335.97

Mercaptamine (as Mercaptamine bitartrate) 75 mg Procsylbi 75mg gastro-resistant capsules | 250 capsule [PoM](#) £4,199.65

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► **Cystadrops** (Orphan Europe (UK) Ltd)

Mercaptamine (as Mercaptamine hydrochloride) 3.8 mg per 1 ml Cystadrops 3.8mg/ml eye drops | 5 ml [PoM](#) £865.00

Capsule

CAUTIONARY AND ADVISORY LABELS 21

► **Cystagon** (Orphan Europe (UK) Ltd)

Mercaptamine (as Mercaptamine bitartrate) 50 mg Cystagon 50mg capsules | 100 capsule [PoM](#) £70.00

Mercaptamine (as Mercaptamine bitartrate) 150 mg Cystagon 150mg capsules | 100 capsule [PoM](#) £190.00

- **Uncommon** Altered smell sensation · angioedema · hypersensitivity · sensation of pressure
- **Frequency not known** Heart failure · hyperhidrosis · hypotension · myocardial ischaemia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions; manage by interrupting the infusion, or minimise by pre-treatment with an antihistamine or corticosteroid—consult product literature.

● **PREGNANCY** Use with caution.

● **BREAST FEEDING** Use with caution—no information available.

● **DIRECTIONS FOR ADMINISTRATION** Administration for *intravenous infusion*, dilute requisite dose with 100 mL Sodium Chloride 0.9% and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► **Replagal** (Shire Pharmaceuticals Ltd)

Agalsidase alfa 1 mg per 1 mL Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial [PoM](#) £1,049.94

Agalsidase beta

● **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

● **INDICATIONS AND DOSE**

Fabry's disease (specialist use only)

► BY INTRAVENOUS INFUSION

► Child 8–17 years: 1 mg/kg every 2 weeks

● **INTERACTIONS** → Appendix 1: agalsidase

● **SIDE-EFFECTS**

- **Common or very common** Angioedema · arrhythmias · arthralgia · asthenia · chest discomfort · chills · cough · diarrhoea · dizziness · drowsiness · dyspnoea · eye disorders · fever · gastrointestinal discomfort · headache · hypertension · hyperthermia · hypotension · increased risk of infection · muscle complaints · musculoskeletal stiffness · nasal complaints · nausea · oedema · oral hypoaesthesia · pain · pallor · palpitations · respiratory disorders · sensation abnormal · skin reactions · syncope · temperature sensation altered · throat complaints · tinnitus · vasodilation · vertigo · vomiting
- **Uncommon** Dysphagia · ear discomfort · eye pruritus · influenza like illness · malaise · peripheral coldness · tremor
- **Frequency not known** Anaphylactoid reaction · hypersensitivity vasculitis · hypoxia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions; manage by slowing the infusion rate, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

● **PREGNANCY** Use with caution.

● **BREAST FEEDING** Use with caution—no information available.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, given intermittently in Sodium chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding

3.4 Fabry's disease

ENZYMES

Agalsidase alfa

● **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

● **INDICATIONS AND DOSE**

Fabry's disease (specialist use only)

► BY INTRAVENOUS INFUSION

► Child 7–17 years: 200 micrograms/kg every 2 weeks

● **INTERACTIONS** → Appendix 1: agalsidase

● **SIDE-EFFECTS**

- **Common or very common** Arrhythmias · asthenia · chest discomfort · chills · cough · diarrhoea · dizziness · dyspnoea · excessive tearing · fever · flushing · gastrointestinal discomfort · headache · hearing impairment · hoarseness · hypersomnia · hypertension · increased risk of infection · influenza like illness · joint disorders · malaise · musculoskeletal discomfort · myalgia · nausea · pain · palpitations · peripheral oedema · peripheral swelling · rhinorrhoea · sensation abnormal · skin reactions · taste altered · temperature sensation altered · throat complaints · tremor · vomiting

0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► **Fabrazyme** (Genzyme Therapeutics Ltd)

Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial [PoM] £315.08

Agalsidase beta 35 mg Fabrazyme 35mg powder for solution for infusion vials | 1 vial [PoM] £2,196.59

ENZYME STABILISERS

Migalastat

24-Nov-2017

- **DRUG ACTION** Migalastat is a pharmacological chaperone that binds to the active sites of certain mutant forms of alpha-galactosidase A, thereby stabilising these mutant forms in the endoplasmic reticulum, and facilitating normal trafficking to lysosomes.

INDICATIONS AND DOSE

Fabry's disease (specialist use only)

► BY MOUTH

- Child 16–17 years: 123 mg once daily on alternate days, take at the same time of day, at least 2 hours before or after food

SIDE-EFFECTS

- **Common or very common** Constipation · defaecation urgency · depression · diarrhoea · dizziness · dry mouth · dyspnoea · epistaxis · fatigue · gastrointestinal discomfort · headache · muscle complaints · nausea · pain in extremity · palpitations · proteinuria · sensation abnormal · skin reactions · torticollis · vertigo

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function, echocardiographic parameters and biochemical markers every 6 months.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is missed entirely for the day, the missed dose should not be taken and the next dose should be taken on the normal day and at the normal time (not to be taken on 2 consecutive days).

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Migalastat for treating Fabry disease (February 2017)**

NICE HST4

Migalastat is recommended, within its marketing authorisation, as an option for treating Fabry disease in people over 16 years of age with an amenable mutation, only if migalastat is provided with the discount agreed in the patient access scheme, and only if enzyme replacement therapy would otherwise be offered.

www.nice.org.uk/guidance/hst4

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* (November 2016) has advised that migalastat (*Galafold*®) is accepted for restricted use within NHS Scotland for long-term treatment of adults and adolescents aged 16 years and older with a confirmed diagnosis of Fabry disease (α-galactosidase A deficiency) and who have an amenable mutation—consult SMC advice for full details of restriction.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

► **Galafold** (Amicus Therapeutics UK Ltd) ▼

Migalastat (as Migalastat hydrochloride) 123 mg Galafold 123mg capsules | 14 capsule [PoM] £16,153.85

3.5 Gaucher's disease

ENZYMES

Imiglucerase

- **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

INDICATIONS AND DOSE

Gaucher's disease type I (specialist use only)

► BY INTRAVENOUS INFUSION

- Neonate: Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate.

- Child: Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate

Gaucher's disease type III (specialist use only)

► BY INTRAVENOUS INFUSION

- Neonate: Initially 60–120 units/kg every 2 weeks, adjusted according to response.

- Child: Initially 60–120 units/kg every 2 weeks, adjusted according to response

SIDE-EFFECTS

- **Common or very common** Angioedema · cough · dyspnoea · hypersensitivity · skin reactions
- **Uncommon** Abdominal cramps · arthralgia · back pain · chest discomfort · chills · cyanosis · diarrhoea · dizziness · fatigue · fever · flushing · headache · hypotension · nausea · paraesthesia · tachycardia · vomiting

- **PREGNANCY** Manufacturer advises use with caution—limited information available.

- **BREAST FEEDING** No information available.

MONITORING REQUIREMENTS

- Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.
- When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Cerezyme*®), give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

► **Cerezyme** (Genzyme Therapeutics Ltd)

Imiglucerase 400 unit Cerezyme 400unit powder for solution for infusion vials | 1 vial [PoM] £1,071.29

Velaglucerase alfa

- **DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

● INDICATIONS AND DOSE

Type I Gaucher's disease (specialist use only)

► BY INTRAVENOUS INFUSION

- Child 4–17 years: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

● SIDE-EFFECTS

- **Common or very common** Arthralgia · asthenia · chest discomfort · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hypersensitivity · hypertension · hypotension · infusion related reaction · nausea · pain · skin reactions · tachycardia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions are very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Manufacturer advises use with caution—limited information available.
- **BREAST FEEDING** Manufacturer advises use with caution—no information available.
- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute each 400-unit vial with 4.3 mL water for injections; dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Velaglucerase alfa 400 unit VPRIV 400units powder for solution for infusion vials | 1 vial **[PoM]** £1,410.20

3.6 Homocystinuria

METHYL DONORS

Betaine

● INDICATIONS AND DOSE

Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)

► BY MOUTH

- Neonate: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response; maximum 150 mg/kg per day.
- Child 1 month–9 years: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response; maximum 150 mg/kg per day
- Child 10–17 years: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

● SIDE-EFFECTS

- **Uncommon** Abdominal discomfort · agitation · alopecia · appetite decreased · brain oedema · diarrhoea · glossitis · irritability · nausea · skin reactions · urinary incontinence · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.
- **DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of *Cystadane*® powder.
- **PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (July 2010) that betaine anhydrous (*Cystadane*®) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution

Powder

► **Cystadane** (Orphan Europe (UK) Ltd)

Betaine 1 gram per 1 gram Cystadane oral powder | 180 gram **[PoM]** £347.00

3.7 Hypophosphatasia

ENZYMES

Asfotase alfa

04-Dec-17

- **DRUG ACTION** Asfotase alfa is a human recombinant tissue-nonspecific alkaline phosphatase that promotes mineralisation of the skeleton.

● INDICATIONS AND DOSE

Paediatric-onset hypophosphatasia (initiated by a specialist)

► BY SUBCUTANEOUS INJECTION

- Neonate: 2 mg/kg 3 times a week, alternatively 1 mg/kg 6 times a week, dosing frequency depends on body-weight—consult product literature for further information.
- Child: 2 mg/kg 3 times a week, alternatively 1 mg/kg 6 times a week, dosing frequency depends on body-weight—consult product literature for further information

- **CAUTIONS** Hypersensitivity reactions

CAUTIONS, FURTHER INFORMATION

- **Hypersensitivity reactions** Reactions, including signs and symptoms consistent with anaphylaxis, have occurred within minutes of administration and can occur in patients on treatment for more than one year; if these reactions

occur, manufacturer advises immediate discontinuation of treatment and initiation of appropriate medical treatment. For information on re-administration, consult product literature.

● SIDE-EFFECTS

- ▶ **Common or very common** Bruising tendency · chills · cutis laxa · fever · headache · hypersensitivity · irritability · lipohypertrophy · myalgia · nausea · oral hypoaesthesia · pain · skin reactions · vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Injection-site reactions including hypertrophy, induration, skin discolouration, and cellulitis may occur, particularly in patients receiving treatment 6 times a week. Manufacturer advises rotation of injection sites to manage these reactions; interrupt treatment if severe reactions occur and administer appropriate medical therapy.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor serum parathyroid hormone and calcium concentrations—supplements of calcium and oral vitamin D may be required.
- ▶ Manufacturer advises periodic ophthalmological examination and renal ultrasounds.
- ▶ Manufacturer advises monitor for increased intracranial pressure (including fundoscopy for signs of papilloedema) periodically in patients below 5 years of age—prompt intervention required if increased intracranial pressure develops.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises max. 1 mL per injection site; administer multiple injections if more than 1 mL is required—consult product literature.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C).

● PATIENT AND CARER ADVICE

Injection guides The manufacturer has produced injection guides for patients and carers to support training given by health care professionals.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Asfotase alfa for treating paediatric-onset hypophosphatasia (August 2017)** NICE HST6

Asfotase alfa is recommended as an option for treating paediatric-onset hypophosphatasia only:

- for people who meet the criteria for treatment within the managed access arrangement (see section 4.18 of the guidance), **and**
- for the duration of this arrangement and in line with the other conditions it specifies, **and**
- when the manufacturer provides asfotase alfa with the confidential commercial terms agreed with NHS England.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/HST6

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

3.9 Mucopolysaccharidosis

ENZYMES

Elosulfase alfa

04-Dec-2017

- **DRUG ACTION** Elosulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylgalactosamine-6-sulfatase (GALNS) deficiency.

● INDICATIONS AND DOSE

Mucopolysaccharidosis IVA (specialist use only)

► BY INTRAVENOUS INFUSION

- Neonate: 2 mg/kg once weekly.
- Child: 2 mg/kg once weekly

- **CAUTIONS** Infusion-related reactions

CAUTIONS, FURTHER INFORMATION

- Infusion-related reactions Infusion-related reactions can occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30–60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during re-administration following a severe reaction.

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · chills · diarrhoea · dizziness · dyspnoea · fever · headache · hypersensitivity · infusion related reaction · myalgia · nausea · oropharyngeal pain · vomiting

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Vimizim[®]), give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 mL infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 mL/hour, then increase to a rate of 6 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 mL/hour to max. 36 mL/hour; body-weight 25 kg or over, dilute requisite dose to final volume of 250 mL and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 mL/hour, then increase to a rate of 12 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 mL/hour to max. 72 mL/hour.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.

● PATIENT AND CARER ADVICE

- **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Elosulfase alfa for treating mucopolysaccharidosis type IVA (December 2015) NICE HST2
Elosulfase alfa, within its marketing authorisation, is recommended for funding for treating mucopolysaccharidosis type IVA (MPS IVA) according to

the conditions in the managed access agreement for elosulfase alfa.

www.nice.org.uk/guidance/HST2

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates, sorbitol
ELECTROLYTES: May contain Sodium

► Vimizim (BioMarin Europe Ltd) ▼

Elosulfase alfa 1 mg per 1 mL Vimizim 5mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £750.00

Galsulfase

- **DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

● INDICATIONS AND DOSE

Mucopolysaccharidosis VI (specialist use only)

► BY INTRAVENOUS INFUSION

- Child 5–17 years: 1 mg/kg once weekly

- **CAUTIONS** Acute febrile illness (consider delaying treatment) · acute respiratory illness (consider delaying treatment) · infusion-related reactions can occur · respiratory disease

- **SIDE-EFFECTS** Abdominal pain · apnoea · chest pain · chills · conjunctivitis · corneal opacity · dyspnoea · ear pain · face oedema · hypertension · increased risk of infection · malaise · nasal congestion · reflexes absent · umbilical hernia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute requisite dose with Sodium Chloride 0.9% to a final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over at least 4 hours.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Naglazyme (BioMarin Europe Ltd) ▼

Galsulfase 1 mg per 1 mL Naglazyme 5mg/5ml solution for infusion vials | 1 vial [PoM] £982.00

Idursulfase

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

● INDICATIONS AND DOSE

Mucopolysaccharidosis II (specialist use only)

► BY INTRAVENOUS INFUSION

- Child 5–17 years: 500 micrograms/kg once weekly

- **CAUTIONS** Acute febrile respiratory illness (consider delaying treatment) • infusion-related reactions can occur • severe respiratory disease

- **SIDE-EFFECTS**

- ▶ **Common or very common** Arrhythmias • arthralgia • chest pain • cough • cyanosis • diarrhoea • dizziness • dyspnoea • fever • flushing • gastrointestinal discomfort • headache • hypertension • hypotension • hypoxia • nausea • oedema • respiratory disorders • skin reactions • tongue swelling • tremor • vomiting

- ▶ **Frequency not known** Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute requisite dose in 100 mL Sodium Chloride 0.9% and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Elaprase** (Shire Pharmaceuticals Ltd) ▼
Idursulfase 2 mg per 1 mL Elaprase 6mg/3mL concentrate for solution for infusion vials | 1 vial **[PoM]** £1,985.00

Laronidase

- **DRUG ACTION** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

- **INDICATIONS AND DOSE**

Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Child:** 100 units/kg once weekly

- **CAUTIONS** Infusion-related reactions can occur

- **INTERACTIONS** → Appendix 1: laronidase

- **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain • alopecia • anaphylactic reaction • angioedema • chills • cough • diarrhoea • dizziness • dyspnoea • fatigue • fever • flushing • headache • hypotension • influenza like illness • joint disorders • nausea • pain • pallor • paraesthesia • peripheral coldness • respiratory disorders • restlessness • skin reactions • sweat changes • tachycardia • temperature sensation altered • vomiting

- ▶ **Frequency not known** Cyanosis • hypoxia • oedema

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute with Sodium Chloride 0.9%; body-weight under 20 kg, dilute to 100 mL, body-weight over 20 kg dilute to 250 mL; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Aldurazyme** (Genzyme Therapeutics Ltd)

Laronidase 100 unit per 1 mL Aldurazyme 500units/5mL solution for infusion vials | 1 vial **[PoM]** £444.70

3.10 Niemann-Pick type C disease

ENZYME INHIBITORS > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

Miglustat

- **DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

- **INDICATIONS AND DOSE**

Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)

- ▶ **BY MOUTH**
- ▶ **Child 4–11 years** (body surface area up to 0.48 m²): 100 mg once daily
- ▶ **Child 4–11 years** (body surface area 0.48–0.73 m²): 100 mg twice daily
- ▶ **Child 4–11 years** (body surface area 0.74–0.88 m²): 100 mg 3 times a day
- ▶ **Child 4–11 years** (body surface area 0.89–1.25 m²): 200 mg twice daily
- ▶ **Child 4–11 years** (body surface area 1.26 m² and above): 200 mg 3 times a day
- ▶ **Child 12–17 years:** 200 mg 3 times a day

- **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased • asthenia • chills • constipation • depression • diarrhoea • dizziness • flatulence • gastrointestinal discomfort • headache • insomnia • libido decreased • malaise • muscle spasms • muscle weakness • nausea • peripheral neuropathy • sensation abnormal • thrombocytopenia • tremor • vomiting • weight decreased

- ▶ **Frequency not known** Growth retardation

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution.

- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration less than 30 mL/minute/1.73 m². Child under 12 years—consult product literature.

Dose adjustments Child 12–17 years, initially 200 mg twice daily if estimated glomerular filtration rate 50–70 mL/minute/1.73 m².

Child 12–17 years, initially 100 mg twice daily if estimated glomerular filtration rate 30–50 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ Monitor cognitive and neurological function.
- ▶ Monitor growth and platelet count in Niemann-Pick type C disease.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Zavesca** (Actelion Pharmaceuticals UK Ltd)

Miglustat 100 mg Zavesca 100mg capsules | 84 capsule [\[PoM\]](#) £3,934.17 (Hospital only)

3.11 Pompe disease

ENZYMES

Alglucosidase alfa

- **DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

● INDICATIONS AND DOSE

Pompe disease (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

▶ Neonate: 20 mg/kg every 2 weeks.

▶ Child: 20 mg/kg every 2 weeks

- **CAUTIONS** Cardiac dysfunction · infusion-related reactions—consult product literature · respiratory dysfunction

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · arrhythmias · chest discomfort · chills · cough · cyanosis · diarrhoea · dizziness · fatigue · feeling hot · fever · flushing · hyperhidrosis · hypersensitivity · hypertension · irritability · local swelling · muscle complaints · nausea · oedema · pallor · paraesthesia · respiratory disorders · skin reactions · throat complaints · tremor · vomiting
- ▶ **Frequency not known** Abdominal pain · angioedema · apnoea · arthralgia · cardiac arrest · dyspnoea · excessive tearing · eye inflammation · headache · hypotension · nephrotic syndrome · peripheral coldness · proteinuria · vasoconstriction

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions are very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

- **PREGNANCY** Toxicity in *animal* studies, but treatment should not be withheld.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● MONITORING REQUIREMENTS

- ▶ Monitor closely if cardiac dysfunction.
- ▶ Monitor closely if respiratory dysfunction.
- ▶ Monitor immunoglobulin G (IgG) antibody concentration.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with Sodium Chloride 0.9% to give a final concentration of

0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7mg/kg/hour.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Myozyme** (Genzyme Therapeutics Ltd)

Alglucosidase alfa 50 mg Myozyme 50mg powder for concentrate for solution for infusion vials | 1 vial [\[PoM\]](#) £356.06 (Hospital only)

3.12 Tyrosinaemia type I

ENZYME INHIBITORS >

4-HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

Nitisinone

(NTBC)

● INDICATIONS AND DOSE

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

- ▶ BY MOUTH

▶ Neonate: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day.

▶ Child: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

- **INTERACTIONS** → Appendix 1: nitisinone

● SIDE-EFFECTS

- ▶ **Common or very common** Corneal opacity · eye inflammation · eye pain · granulocytopenia · leucopenia · photophobia · thrombocytopenia
- ▶ **Uncommon** Leucocytosis · skin reactions

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—adverse effects in *animal* studies.

- **PRE-TREATMENT SCREENING** Slit-lamp examination of eyes recommended before treatment.

● MONITORING REQUIREMENTS

- ▶ Monitor liver function regularly.
- ▶ Monitor platelet and white blood cell count every 6 months.

- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Orfadin** (Swedish Orphan Biovitrum Ltd)

Nitisinone 4 mg per 1 mL Orfadin 4mg/1mL oral suspension sugar-free | 90 mL [\[PoM\]](#) £1,692.00 DT = £1,692.00

Capsule

- ▶ **Nitisinone (Non-proprietary)**

Nitisinone 20 mg Orfadin 20mg capsules | 60 capsule [PoM]
£4,512.00

3.13 Urea cycle disorders

AMINO ACIDS AND DERIVATIVES

Arginine

● INDICATIONS AND DOSE

Acute hyperammonaemia in carbamylphosphate synthetase deficiency (specialist use only) | Acute hyperammonaemia in ornithine transcarbamylase deficiency (specialist use only)

► BY INTRAVENOUS INFUSION

► Neonate: 6 mg/kg/hour.

► Child (body-weight up to 40 kg): 6 mg/kg/hour
► Child (body-weight 40 kg and above): 4 mg/kg/hour

Maintenance treatment of hyperammonaemia in carbamylphosphate synthetase deficiency (specialist use only) | Maintenance treatment of hyperammonaemia in ornithine transcarbamylase deficiency (specialist use only)

► BY MOUTH

► Neonate: 100–200 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.

► Child (body-weight up to 20 kg): 100–200 mg/kg daily in 3–4 divided doses, dose to be given with feeds or meals
► Child (body-weight 20 kg and above): 2.5–6 g/m² daily in 3–4 divided doses, dose to be taken with meals; maximum 6 g per day

Acute hyperammonaemia in citrullinaemia (specialist use only) | Acute hyperammonaemia in arginosuccinic aciduria (specialist use only)

► BY INTRAVENOUS INFUSION

► Neonate: Initially 300 mg/kg, to be administered over 90 minutes, followed by 12.5 mg/kg/hour, to be administered over 24 hours (maximum 25 mg/kg/hour thereafter).

► Child (body-weight up to 40 kg): Initially 300 mg/kg, to be administered over 90 minutes, followed by 12.5 mg/kg/hour, to be administered over 24 hours (maximum 25 mg/kg/hour thereafter)
► Child (body-weight 40 kg and above): 21 mg/kg/hour

Maintenance treatment of hyperammonaemia in citrullinaemia (specialist use only) | Maintenance treatment of hyperammonaemia in arginosuccinic aciduria (specialist use only)

► BY MOUTH

► Neonate: 100–300 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.

► Child (body-weight up to 20 kg): 100–300 mg/kg daily in 3–4 divided doses, dose to be taken with feed or meals
► Child (body-weight 20 kg and above): 2.5–6 g/m² daily in 3–4 divided doses, doses to be taken with meals; maximum 6 g per day

● **UNLICENSED USE** Injection not licensed in children. Tablets not licensed in children. Powder licensed for urea cycle disorders in children.

● **CONTRA-INDICATIONS** Not to be used in the treatment of arginase deficiency

● **SIDE-EFFECTS** Acidosis hyperchloraemic · flushing · headache · hypotension · nausea · numbness · vomiting

● **PREGNANCY** No information available.

● **BREAST FEEDING** No information available.

● **MONITORING REQUIREMENTS** Monitor plasma pH and chloride.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute to a max. concentration of 50 mg/mL with glucose 10%.

● **PRESCRIBING AND DISPENSING INFORMATION** Powder to be prescribed as a borderline substance (ACBS). For use as a supplement in urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullinaemia, arginosuccinic aciduria, and deficiency of N-acetyl glutamate synthetase.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Arginine for urea cycle disorders
www.medicinesforchildren.org.uk/arginine-urea-cycle-disorders-0

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral solution, solution for infusion

Tablet

► **Arginine (Non-proprietary)**

L-Arginine 500 mg L-Arginine 500mg tablets | 60 tablet £5.86

L-Arginine 1 gram Arginine 1g tablets | 90 tablet £11.14

Solution for infusion

L-Arginine 1 gram per 1 gram L-Arginine powder | 100 gram £44.31

Carglumic acid

● INDICATIONS AND DOSE

Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)

► BY MOUTH

► Neonate: Initially 50–125 mg/kg twice daily, to be taken immediately before feeds, dose adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses.

► Child: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses

Hyperammonaemia due to organic acidemia (under expert supervision)

► BY MOUTH

► Neonate: Initially 50–125 mg/kg twice daily, to be taken immediately before feeds, dose adjusted according to plasma-ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses.

► Child: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted continued →

according to plasma-ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

IMPORTANT SAFETY INFORMATION

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

• SIDE-EFFECTS

- ▶ **Common or very common** Hyperhidrosis
- ▶ **Uncommon** Bradycardia · diarrhoea · fever · vomiting
- ▶ **Frequency not known** Rash
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13

Carglumatic acid 200 mg Carbaglu 200mg dispersible tablets sugar-free | 5 tablet (PoM) £299.00 sugar-free | 15 tablet (PoM) £897.00 sugar-free | 60 tablet (PoM) £3,499.00

▶ **Ucedane** (Lucane Pharma Ltd)

Carglumatic acid 200 mg Ucedane 200mg dispersible tablets sugar-free | 60 tablet (PoM) £3,300.00

Citrulline

• INDICATIONS AND DOSE

Carbamyl phosphate synthase deficiency | Ornithine carbamyl transferase deficiency

▶ BY MOUTH

- ▶ **Neonate:** 150 mg/kg daily in 3–4 divided doses, adjusted according to response.
- ▶ **Child:** 150 mg/kg daily in 3–4 divided doses, adjusted according to response

- **PREGNANCY** No information available.

- **BREAST FEEDING** No information available.

- **DIRECTIONS FOR ADMINISTRATION** Powder may be mixed with drinks or taken as a paste.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution, powder

Powder

▶ **Citrulline (Non-proprietary)**

L-citrulline 1 mg per 1 mg L-Citrulline powder | 100 gram £234.27

BENZOATES

Sodium benzoate

• INDICATIONS AND DOSE

Acute hyperammonaemia due to urea cycle disorder (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ **Neonate:** Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response.

- ▶ **Child:** Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response

Maintenance treatment of hyperammonaemia due to urea cycle disorders (specialist use only) | Non-ketotic hypoglycaemia (specialist use only)

▶ BY MOUTH

- ▶ **Neonate:** Up to 250 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.
- ▶ **Child:** Up to 250 mg/kg daily in 3–4 divided doses, dose to be taken with feeds or meals; maximum 12 g per day

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Conditions involving sodium retention with oedema (preparations contain significant amounts of sodium) · congestive heart failure (preparations contain significant amounts of sodium) · neonates (risk of kernicterus and increased side-effects)

- **SIDE-EFFECTS** Appetite decreased · coma · irritability · lethargy · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Gastro-intestinal side-effects may be reduced by giving smaller doses more frequently.

- **PREGNANCY** No information available.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Caution in renal insufficiency—preparations contain significant amounts of sodium.

• DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use For administration *by mouth*, oral solution or powder may be administered in fruit drinks; less soluble in acidic drinks.

- ▶ With intravenous use For *intravenous infusion*, dilute to a max. concentration of 50 mg/mL with Glucose 10%.

• PATIENT AND CARER ADVICE

Medicines for Children leaflet: Sodium benzoate for urea cycle disorders www.medicinesforchildren.org.uk/sodium-benzoate-for-urea-cycle-disorders

DRUGS FOR METABOLIC DISORDERS > ACETIC ACIDS

Sodium dichloroacetate

• INDICATIONS AND DOSE

Pyruvate dehydrogenase defects

▶ BY MOUTH

- ▶ **Neonate:** Initially 12.5 mg/kg 4 times a day, adjusted according to response, increased if necessary up to 200 mg/kg daily.

- ▶ **Child:** Initially 12.5 mg/kg 4 times a day, adjusted according to response, increased if necessary up to 200 mg/kg daily

- **SIDE-EFFECTS** Metabolic acidosis · oxalate metabolism abnormal · polyneuropathy (long term use)

- **PREGNANCY** No information available.

- **BREAST FEEDING** No information available.

• MEDICINAL FORMS

No licensed medicines listed.

DRUGS FOR METABOLIC DISORDERS >

AMMONIA LOWERING DRUGS

Glycerol phenylbutyrate

14-May-2018

- **DRUG ACTION** Glycerol phenylbutyrate is a nitrogen-binding agent that provides an alternative vehicle for waste nitrogen excretion.

● INDICATIONS AND DOSE

Urea cycle disorders (specialist use only)

- ▶ BY MOUTH, OR BY GASTROSTOMY TUBE, OR BY NASOGASTRIC TUBE
- ▶ Child 2 months–17 years (body surface area up to 1.3 m²): Initially 9.4 g/m² daily in divided doses, usual maintenance 5.3–12.4 g/m² daily in divided doses, with meals, each dose should be rounded up to the nearest 0.5 mL. For dose adjustments based on individual requirements—consult product literature
- ▶ Child 2 months–17 years (body surface area 1.3 m² and above): Initially 8 g/m² daily in divided doses, usual maintenance 5.3–12.4 g/m² daily in divided doses, with meals, each dose should be rounded up to the nearest 0.5 mL. For dose adjustments based on individual requirements—consult product literature

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 mL of liquid contains 1.1 g of glycerol phenylbutyrate.
- ▶ For patients switching from sodium phenylbutyrate—consult product literature.

IMPORTANT SAFETY INFORMATION

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- **CONTRA-INDICATIONS** Treatment of acute hyperammonaemia
- **CAUTIONS** Intestinal malabsorption • pancreatic insufficiency
- **INTERACTIONS** → Appendix 1: glycerol phenylbutyrate
- **SIDE-EFFECTS**
- ▶ **Common or very common** Constipation • diarrhoea • dizziness • fatigue • gastrointestinal discomfort • gastrointestinal disorders • headache • menstrual disorder • nausea • oral disorders • peripheral oedema • skin reactions • tremor • vomiting
- ▶ **Uncommon** Akathisia • alopecia • biliary colic • bladder pain • confusion • depressed mood • drowsiness • epistaxis • hot flush • hyperhidrosis • hypoalbuminaemia • hypokalaemia • hypothyroidism • joint swelling • muscle spasms • pain • paraesthesia • plantar fasciitis • speech disorder • taste altered • ventricular arrhythmia • weight change
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution—use lowest possible dose.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises may be added to a small amount of apple sauce, ketchup, or squash and used within 2 hours. For administration advice via nasogastric or gastrostomy tube—consult product literature.
- **HANDLING AND STORAGE** Manufacturer advises discard contents of bottle 14 days after opening.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

- ▶ **Ravicti** (Swedish Orphan Biovitrum Ltd) ▼

Glycerol phenylbutyrate 1.1 gram per 1 mL Ravicti 1.1g/ml oral liquid | 25 mL [PoM] £161.00

Sodium phenylbutyrate

● INDICATIONS AND DOSE

Acute hyperammonaemia due to urea cycle disorders (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Neonate:** Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response.

- ▶ **Child:** Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response

Maintenance treatment of hyperammonaemia due to urea cycle disorders (specialist use only)

- ▶ BY MOUTH

- ▶ **Neonate:** Up to 250 mg/kg daily in 3–4 divided doses, with feeds.

- ▶ **Child (body-weight up to 20 kg):** Up to 250 mg/kg daily in 3–4 divided doses, with feeds or meals
- ▶ **Child (body-weight 20 kg and above):** 5 g/m² daily in 3–4 divided doses, with meals; maximum 12 g per day

- **UNLICENSED USE** Injection not licensed for use in children.

IMPORTANT SAFETY INFORMATION

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- **CAUTIONS** Conditions involving sodium retention with oedema (preparations contain significant amounts of sodium) • congestive heart failure (preparations contain significant amounts of sodium)
- **INTERACTIONS** → Appendix 1: sodium phenylbutyrate
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain • anaemia • appetite decreased • constipation • depression • headache • irritability • leucocytosis • leucopenia • menstrual cycle irregularities • metabolic acidosis • metabolic alkalosis • nausea • oedema • renal tubular acidosis • skin reactions • syncope • taste altered • thrombocytopenia • thrombocytosis • vomiting • weight increased
- ▶ **Uncommon** Anorectal haemorrhage • aplastic anaemia • arrhythmia • gastrointestinal disorders • pancreatitis
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during administration in women of child-bearing potential.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution (preparations contain significant amounts of sodium).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use Oral dose may be mixed with fruit drinks, milk, or feeds. Granules should be mixed with food before taking. *Pheburane*® granules must not be administered by nasogastric or gastrostomy tubes.
 - ▶ With intravenous use For *intravenous infusion*, dilute to a maximum concentration of 50 mg/mL with Glucose 10%.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Sodium phenylbutyrate for urea cycle disorders www.medicinesforchildren.org.uk/sodium-phenylbutyrate-for-urea-cycle-disorders
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion

Granules

3.14 Wilson's disease

ANTIDOTES AND CHELATORS > COPPER ABSORPTION INHIBITORS

Zinc acetate

- **DRUG ACTION** Zinc prevents the absorption of copper in Wilson's disease.

● INDICATIONS AND DOSE

Wilson's disease (initiated under specialist supervision)

- ▶ **BY MOUTH**
- ▶ Child 1–5 years: 25 mg twice daily
- ▶ Child 6–15 years (body-weight up to 57 kg): 25 mg 3 times a day
- ▶ Child 6–15 years (body-weight 57 kg and above): 50 mg 3 times a day
- ▶ Child 16–17 years: 50 mg 3 times a day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses expressed as elemental zinc.

PHARMACOKINETICS

- ▶ Symptomatic Wilson's disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS** Portal hypertension (risk of hepatic decompensation when switching from chelating agent)

- **INTERACTIONS** → Appendix 1: zinc

● SIDE-EFFECTS

- ▶ **Common or very common** Epigastric discomfort (usually transient)
- ▶ **Uncommon** Leucopenia · sideroblastic anaemia

SIDE-EFFECTS, FURTHER INFORMATION Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.

● PREGNANCY

Dose adjustments Usual dose 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.

- **BREAST FEEDING** Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.

- **MONITORING REQUIREMENTS** Monitor full blood count and serum cholesterol.

- **DIRECTIONS FOR ADMINISTRATION** Capsules may be opened and the contents mixed with water.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

- ▶ **Wilzin** (Orphan Europe (UK) Ltd)

Zinc (as Zinc acetate) 25 mg Wilzin 25mg capsules | 250 capsule [PoM] £132.00

Zinc (as Zinc acetate) 50 mg Wilzin 50mg capsules | 250 capsule [PoM] £242.00

ANTIDOTES AND CHELATORS > COPPER CHELATORS

Penicillamine

- **DRUG ACTION** Penicillamine aids the elimination of copper ions in Wilson's disease (hepatolenticular degeneration).

● INDICATIONS AND DOSE

Wilson's disease

- ▶ **BY MOUTH**

- ▶ Child 1 month–11 years: 20 mg/kg daily in 2–3 divided doses, to be taken 1 hour before food; maximum 2 g per day
- ▶ Child 12–17 years: Initially 20 mg/kg daily in 2–3 divided doses, maintenance 0.75–1 g daily, to be taken 1 hour before food; maximum 2 g per day

Cystinuria

- ▶ **BY MOUTH**

- ▶ Child: 20–30 mg/kg daily in 2–3 divided doses, lower doses may be used initially and increased gradually, doses to be adjusted to maintain 24-hour urinary cystine below 1 mmol/litre, maintain adequate fluid intake, to be taken 1 hour before food; maximum 3 g per day

- **CONTRA-INDICATIONS** Lupus erythematosus

- **CAUTIONS** Neurological involvement in Wilson's disease

- **INTERACTIONS** → Appendix 1: penicillamine

● SIDE-EFFECTS

- ▶ **Common or very common** Proteinuria · thrombocytopenia
- ▶ **Rare or very rare** Alopecia · breast enlargement (males and females) · connective tissue disorders · haematuria (discontinue immediately if cause unknown) · hypersensitivity · oral disorders · skin reactions
- ▶ **Frequency not known** Agranulocytosis · aplastic anaemia · appetite decreased · fever · glomerulonephritis · Goodpasture's syndrome · haemolytic anaemia · increased risk of infection · jaundice · cholestatic · leucopenia · lupus-like syndrome · myasthenia gravis · nausea · nephrotic syndrome · neurological deterioration in Wilson's Disease · neutropenia · pancreatitis · polymyositis · pulmonary haemorrhage · rash (consider dose reduction) · respiratory disorders · Stevens-Johnson syndrome · taste loss (mineral supplements not recommended) · vomiting · yellow nail syndrome

- **ALLERGY AND CROSS-SENSITIVITY** Patients who are hypersensitive to penicillin may react rarely to penicillamine.

- **PREGNANCY** Fetal abnormalities reported rarely; avoid if possible.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose and monitor renal function or avoid (consult product literature).
- **MONITORING REQUIREMENTS**
 - ▶ Consider withdrawal if platelet count falls below $120\,000/\text{mm}^3$ or white blood cells below $2500/\text{mm}^3$ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).
 - ▶ Monitor urine for proteinuria.
 - ▶ Monitor blood and platelet count regularly.
- **PATIENT AND CARER ADVICE** Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 6, 22

▶ Penicillamine (Non-proprietary)

Penicillamine 125 mg Penicillamine 125mg tablets | 56 tablet [PoM]
 £45.00 DT = £45.00

Penicillamine 250 mg Penicillamine 250mg tablets |
 56 tablet [PoM] £88.77 DT = £88.77

Trientine dihydrochloride

● INDICATIONS AND DOSE

Wilson's disease in patients intolerant of penicillamine

▶ BY MOUTH

- ▶ Child 2–11 years: Initially 0.6–1.5 g daily in 2–4 divided doses, adjusted according to response, to be taken before food
- ▶ Child 12–17 years: 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

● INTERACTIONS → Appendix 1: trientine

● SIDE-EFFECTS

- ▶ **Rare or very rare** Anaemia
- ▶ **Frequency not known** Gastrointestinal disorders · nausea · neurological deterioration in Wilson's Disease · rash

● PREGNANCY

Teratogenic in *animal* studies—use only if benefit outweighs risk.

Monitoring Monitor maternal and neonatal serum-copper concentrations.

● PRESCRIBING AND DISPENSING INFORMATION

Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 6, 22

Trientine dihydrochloride 300 mg Trientine dihydrochloride 300mg capsules | 100 capsule [PoM] £3,090.00 DT = £3,090.00

4 Mineral and trace elements deficiencies

4.1 Zinc deficiency

Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease, or in zinc-losing states.

Zinc is used in the treatment of Wilson's disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc, see also Intravenous nutrition p. 618. If necessary, further zinc can be added to intravenous feeding regimens.

ELECTROLYTES AND MINERALS > ZINC

Zinc sulfate

● INDICATIONS AND DOSE

Zinc deficiency or supplementation in zinc-losing conditions

▶ BY MOUTH USING EFFERVESCENT TABLETS

- ▶ Neonate: 1 mg/kg daily, dose expressed as elemental zinc, to be dissolved in water and taken after food.

- ▶ Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Child (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

Acrodermatitis enteropathica

▶ BY MOUTH USING EFFERVESCENT TABLETS

- ▶ Neonate: 0.5–1 mg/kg twice daily, dose to be adjusted as necessary, total daily dose may alternatively be given in 3 divided doses, dose expressed as elemental zinc.
- ▶ Child: 0.5–1 mg/kg twice daily, dose to be adjusted as necessary, total daily dose may alternatively be given in 3 divided doses, dose expressed as elemental zinc

● UNLICENSED USE

Solvazinc® is not licensed for use in acrodermatitis enteropathica.

● INTERACTIONS → Appendix 1: zinc

● SIDE-EFFECTS

Diarrhoea · gastritis · gastrointestinal discomfort · nausea · vomiting

● PREGNANCY

Crosses placenta; risk theoretically minimal, but no information available.

● BREAST FEEDING

Present in milk; risk theoretically minimal, but no information available.

● RENAL IMPAIRMENT

Accumulation may occur in acute renal failure.

- **PRESCRIBING AND DISPENSING INFORMATION** Each *Solvazinc*® tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

- ▶ *Solvazinc* (Galen Ltd)

Zinc sulfate monohydrate 125 mg *Solvazinc* 125mg effervescent tablets sugar-free | 90 tablet **P** £17.20 DT = £17.20

5 Nutrition (intravenous)

Intravenous nutrition

Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to oral or enteral tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition (TPN)**. Complete enteral starvation is undesirable and total parenteral nutrition is a last resort.

Indications for parenteral nutrition include prematurity; severe or prolonged disorders of the gastro-intestinal tract; preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; major surgery, trauma, or burns; prolonged coma or inability to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations used in children is given under Proprietary Infusion Fluids for Parenteral Feeding p. 619.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, lipids, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of an amino-acid, glucose, electrolyte bag, and a separate lipid infusion or, in older children a single 'all-in-one' bag. If the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of nutritional solutions of low osmolality and neutral pH. Nutritional fluids should be given by a dedicated intravenous line; if not possible, compatibility with any drugs or fluids should be checked as precipitation of components may occur. Extravasation of parenteral nutrition solution can cause severe tissue damage and injury; the infusion site should be regularly monitored.

Before starting intravenous nutrition the patient should be clinically stable and renal function and acid-base status should be assessed. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment. The nutritional components of parenteral nutrition regimens are usually increased gradually over a number of days to prevent metabolic complications and to allow metabolic adaptation to the infused nutrients. The solutions are usually infused over 24 hours but this may be gradually reduced if long-term nutrition is required. Home parenteral nutrition is usually infused over 12 hours overnight.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and

management of parenteral nutrition complications, specialist literature should be consulted.

Protein (nitrogen) is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes. Solutions for use in neonates and children under 1 year of age are based on the amino acid profile of umbilical cord blood (*Primene*®) or breast milk (*Vaminolact*®) and contain amino acids that are essential in this age group; these amino acids may not be present in sufficient quantities in preparations designed for older children and adults.

Energy requirements must be met if amino acids are to be utilised for tissue maintenance. An appropriate energy to protein ratio is essential and requirements will vary depending on the child's age and condition. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose p. 590 is the preferred source of carbohydrate, but frequent monitoring of blood glucose is required particularly during initiation and build-up of the regimen; insulin may be necessary. Glucose above a concentration of 12.5% must be infused through a central venous catheter to avoid thrombosis; the maximum concentration of glucose that should normally be infused in fluid restricted children is 20–25%.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphataemia. Neonates, particularly preterm neonates, and young children also require phosphorus and calcium to ensure adequate bone mineralisation. The compatibility and solubility of calcium and phosphorus salts is complex and unpredictable; precipitation is a risk and specialist pharmacy advice should be sought.

Fat (lipid) emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolality with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Regular monitoring of plasma cholesterol and triglyceride is necessary to ensure clearance from the plasma, particularly in conditions where fat metabolism may be disturbed e.g. infection. Emulsions containing 20% or 30% fat should be used in neonates as they are cleared more efficiently. **Additives should not be mixed with fat emulsions unless compatibility is known.**

Electrolytes are usually provided as the chloride salts of potassium and sodium. Acetate salts can be used to reduce the amount of chloride infused; hyperchloraemic acidosis or hypochloraemic alkalosis can occur in preterm neonates or children with renal impairment.

Administration

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature and other specialist literature should be consulted*.

NUTRIENTS > PARENTERAL NUTRITION

Parenteral nutrition supplements

● INDICATIONS AND DOSE

Supplement in intravenous nutrition

- ▶ BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Child: (consult product literature)

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES

Amino acid supplement for hypercatabolic or hypermetabolic states

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

● CAUTIONS

PEDITRACE SOLUTION FOR INFUSION 10ML VIALS Reduced biliary excretion · reduced biliary excretion in cholestatic

liver disease · reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required) · total parenteral nutrition exceeding one month

CAUTIONS, FURTHER INFORMATION

- ▶ Total parenteral nutrition exceeding one month Measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment—discontinue if manganese concentration raised or if cholestasis develops.
- **DIRECTIONS FOR ADMINISTRATION** Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature, and other specialist literature should be consulted*. Compatibility with the infusion solution must be ascertained before adding supplementary preparations. **Additives should not be mixed with fat emulsions unless compatibility is known.**

CERNEVIT SOLUTION FOR INJECTION VIALS AND DILUENT

Dissolve in 5 mL water for injections.

PEDITRACE SOLUTION FOR INFUSION 10ML VIALS For addition to *Vaminolact*[®], *Vamin*[®] 14 Electrolyte-Free solutions, and glucose intravenous infusions.

ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES For addition to *Vamin*[®] solutions and glucose intravenous infusions.

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES For addition to infusion solutions containing amino acids.

ADDPHOS[®] VIALS For addition to *Vamin*[®] solutions and glucose intravenous infusions.

DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES For addition to infusion solutions.

GLYCOPHOS[®] VIALS For addition to *Vamin*[®] and *Vaminolact*[®] solutions, and glucose intravenous infusions.

SOLIVITO N POWDER FOR SOLUTION FOR INFUSION

VIALS Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or *Intralipid*[®]; dissolve in *Vitlipid N*[®] or *Intralipid*[®] for adding to *Intralipid*[®] only.

VITLIPID N ADULT EMULSION FOR INJECTION 10ML AMPOULES For addition to *Intralipid*[®].

VITLIPID N INFANT EMULSION FOR INJECTION 10ML AMPOULES For addition to *Intralipid*[®].

● **PRESCRIBING AND DISPENSING INFORMATION**

CERNEVIT SOLUTION FOR INJECTION VIALS AND

DILUENT *Cernevit*[®] solution contains *dl*-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, coenzyme Q10 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dexpantenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg.

PEDITRACE SOLUTION FOR INFUSION 10ML VIALS For use in neonates (when kidney function established, usually second day of life), infants, and children.

Peditrace[®] solution contains traces of Zn²⁺, Cu²⁺, Mn²⁺, Se⁴⁺, F⁻, I⁻.

ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES For patients over 40 kg.

Additrac[®] solution contains traces of Fe³⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, F⁻, I⁻.

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES *Dipeptiven*[®] solution contains N(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg).

ADDPHOS[®] VIALS *Addiphos*[®] sterile solution contains phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL.

DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES For patients over 40 kg.

Decan[®] solution contains trace elements Fe²⁺, Zn²⁺, Cu²⁺, Mn²⁺, F⁻, Co²⁺, I⁻, Se⁴⁺, Mo⁶⁺, Cr³⁺.

GLYCOPHOS[®] VIALS *Glycophos*[®] Sterile Concentrate solution contains phosphate 20 mmol, Na⁺ 40 mmol/20 mL.

SOLIVITO N POWDER FOR SOLUTION FOR INFUSION

VIALS *Solivito N*[®] powder for reconstitution contains biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg.

VITLIPID N ADULT EMULSION FOR INJECTION 10ML

AMPOULES *Vitlipid N*[®] adult emulsion contains vitamin A 330 units, ergocalciferol 20 units, *dl*-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL.

For adults and children over 11 years.

VITLIPID N INFANT EMULSION FOR INJECTION 10ML

AMPOULES *Vitlipid N*[®] infant emulsion contains vitamin A 230 units, ergocalciferol 40 units, *dl*-alpha tocopherol 0.7 unit, phytomenadione 20 micrograms/mL.

6 Nutrition (oral)

Enteral nutrition

Overview

Children have higher nutrient requirements per kg bodyweight, different metabolic rates, and physiological responses compared to adults. They have low nutritional stores and are particularly vulnerable to growth and nutritional problems during critical periods of development. Major illness, operations, or trauma impose increased metabolic demands and can rapidly exhaust nutritional reserves.

Every effort should be made to optimise oral food intake before beginning enteral tube feeding; this may include change of posture, special seating, feeding equipment, oral desensitisation, food texture changes, thickening of liquids, increasing energy density of food, treatment of reflux or oesophagitis, as well as using age-specific nutritional supplements.

Enteral tube feeding has a role in both short-term rehabilitation and long-term nutritional management in paediatrics. It can be used as supportive therapy, in which the enteral feed supplies a proportion of the required nutrients, or as primary therapy, in which the enteral feed delivers all the necessary nutrients. Most children receiving tube feeds should also be encouraged to take oral food and drink. Tube feeding should be considered in the following situations:

- unsafe swallowing and risk of aspiration
- inability to consume at least 60% of energy needs by mouth
- total feeding time of more than 4 hours per day
- weight loss or no weight gain for a period of 3 months (less for younger children and infants)
- weight for height (or length) less than 2nd percentile for age and sex

Most feeds for enteral use contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for children who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in the clinically unstable child. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

Choosing the best formula for children depends on several factors including: nutritional requirements, gastro-intestinal function, underlying disease, nutrient restrictions, age, and feed characteristics (nutritional composition, viscosity, osmolality, availability and cost). Children have specific dietary requirements and in many situations liquid feeds prepared for adults are totally unsuitable and should not be given. Expert advice from a dietician should be sought before prescribing enteral feeds for a child.

Infant formula feeds

Child 0–12 months. Term infants with normal gastro-intestinal function are given either breast milk or normal infant formula during the first year of life. The average intake is between 150 mL and 200 mL/kg/day. Infant milk formulas are based on whey- or casein-dominant protein, lactose with or without maltodextrin, amylose, vegetable oil and milk fat. The composition of all normal and soya infant formulas have to meet The Infant Formula and Follow-on Formula Regulations (England and Wales) 2007, which enact

the European Community Regulations 2006/141/EC; the composition of other enteral and specialist feeds has to meet the Commission Directive (1999/21/EC) on Dietary Foods for Special Medical Purposes.

A high-energy feed, which contains 9–11% of energy derived from protein can be used for infants who fail to grow adequately. Alternatively, energy supplements may be added to normal infant formula to achieve a higher energy content (but this will reduce the protein to energy ratio) or the normal infant formula concentration may be increased slightly. Care should be taken not to present an osmotic load of more than 500 milliosmols/kg water to the normal functioning gut, otherwise osmotic diarrhoea will result. Concentrating or supplementing feeds should not be attempted without the advice of a paediatric dietician.

Enteral feeds

Child 1–6 years (body-weight 8–20 kg). Ready-to-use feeds based on caseinates, maltodextrin and vegetable oils (with or without added medium chain triglyceride (MCT) oil or fibre) are well tolerated and effective in improving nutritional status in this age group. Although originally designed for children 1–6 years (body-weight 8–20 kg), some products have ACBS approval for use in children weighing up to 30 kg (approx. 10 years of age). Enteral feeds formulated for children 1–6 years are low in sodium and potassium; electrolyte intake and biochemical status should be monitored. Older children in this age range taking small feed volumes may need to be given additional micronutrients. Fibre-enriched feeds may be helpful for children with chronic constipation or diarrhoea.

Child 7–12 years (body-weight 21–45 kg). Depending on age, weight, clinical condition and nutritional requirements, ready-to-use feeds formulated for 7–12 year olds may be given at appropriate rates.

Child over 12 years (body-weight over 45 kg). As there are no standard enteral feeds formulated for this age group, adult formulations are used. The intake of protein, electrolytes, vitamins, and trace minerals should be carefully assessed and monitored. Note: Adult feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be used with caution and expert advice.

Specialised formula

It is essential that any infant who is intolerant of breast milk or normal infant formula, or whose condition requires nutrient-specific adaptation, is prescribed an adequate volume of a nutritionally complete replacement formula. In the first 4 months of life, a volume of 150–200 mL/kg/day is recommended. After 6 months, should the formula still be required, a volume of 600 mL/day should be maintained, in addition to solid food.

Products for cow's milk protein intolerance or lactose intolerance. There are a number of infant formulas formulated for cow's milk protein intolerance or lactose intolerance; these feeds may contain a residual amount of lactose (less than 1 g/100 mL formula)—sometimes described as clinically lactose-free or 'lactose-free' by manufacturers. If the total daily intake of these formulas is low, it may be necessary to supplement with calcium, and a vitamin and mineral supplement.

Soya-based infant formulas have a high phytoestrogen content and this may be a long-term reproductive health risk. The Chief Medical Officer has advised that soya-based infant formulas should not be used as the first choice for the management of infants with proven cow's milk sensitivity, lactose intolerance, galactokinase deficiency and galactosaemia. Most UK paediatricians with expertise in inherited metabolic disease still advocate soya-based formulations for infants with galactosaemia as there are concerns about the residual lactose content of low lactose formulas and protein hydrolysates based on cow's milk protein.

Low lactose infant formulations, based on whole cow's milk protein, are unsuitable for children with cow's milk protein intolerance. Liquid soya milks purchased from supermarkets and health food stores are not nutritionally complete and should never be used for infants under 1 year of age.

Protein hydrolysate formulas. Non-milk, peptide-based feeds containing hydrolysates of casein, whey, meat and soya protein, are suitable for infants with disaccharide or whole protein intolerance. The total daily intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet the child's nutritional requirements; these feeds have a high osmolality when given at recommended dilution and need gradual and careful introduction.

Elemental (amino acid based formula). Specially formulated elemental feeds containing essential and nonessential amino acids are available for use in infants and children under 6 years with proven whole protein intolerance. Adult elemental formula may be used for children over 6 years; the intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet nutritional requirements. These feeds have a high osmolality when given at the recommended concentration and therefore need gradual and careful introduction.

Modular feeds. Modular feeds (see Specialised Formulas for Specific Clinical Conditions) are based on individual protein, fat, carbohydrate, vitamin and mineral components or modules which can be combined to meet the specific needs of a child. Modular feeds are used when nutritionally complete specialised formula are not tolerated, or if the fluid and nutrient requirements change e.g. in gastro-intestinal, renal or liver disease. The main advantage of modular feeds is their flexibility; disadvantages include their complexity and preparation difficulties. Modular feeds should not be used without the supervision of a paediatric dietician.

Specialised formula. Highly specialised formulas are designed to meet the specific requirements in various clinical conditions such as renal and liver diseases. When using these formulas, both the biochemical status of the child and their growth parameters need to be monitored.

Feed thickeners

Carob based thickeners may be used to thicken feeds for infants under 1 year with significant gastro-oesophageal reflux. Breast-fed infants can be given the thickener mixed to a paste with water or breast-milk prior to feeds.

Pre-thickened formula Milk-protein- or casein-dominant infant formula, which contains small quantities of pre-gelatinized starch, is recommended primarily for infants with mild gastro-oesophageal reflux. Pre-thickened formula is prepared in the same way as normal infant formula and flows through a standard teat. The feeds do not thicken on standing but thicken in the stomach when exposed to acid pH.

Starched based thickeners can be used to thicken liquids and feeds for children over 1 year of age with dysphagia.

Dietary supplements for oral use

Three types of prescribable fortified dietary supplements are available: fortified milk and non-milk tasting (juice-style) drinks, and fortified milk-based semi-solid preparations. The recommended daily quantity is age-dependent. The following is a useful guide: 1–2 years, 200 kcal (840 kJ); 3–5 years, 400 kcal (1680 kJ); 6–11 years, 600 kcal (2520 kJ); and over 12 years, 800 kcal (3360 kJ). Supplements containing 1.5 kcal/mL are high in protein and should not be used for children under 3 years of age. Many supplements are high in sugar or maltodextrin; care should be taken to prevent prolonged contact with teeth. Ideally supplements should be administered after meals or at bedtime so as not to affect appetite.

Products for metabolic diseases

There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

Enteral feeding tubes

Care is required in choosing an appropriate formulation of a drug for administration through a nasogastric narrow-bore feeding tube or through a percutaneous endoscopic gastrostomy (PEG) or jejunostomy tube. Liquid preparations (or soluble tablets) are preferred; injection solutions may also be suitable for administration through an enteral tube.

If a solid formulation of a medicine needs to be given, it should be given as a suspension of particles fine enough to pass through the tube. It is possible to crush many immediate-release tablets but enteric-coated or modified-release preparations should **not** be crushed.

Enteral feeds may affect the absorption of drugs and it is therefore important to consider the timing of drug administration in relation to feeds. If more than one drug needs to be given, they should be given separately and the tube should be flushed with water after each drug has been given.

Clearing blockages

Carbonated (sugar-free) drinks may be marginally more effective than water in unblocking feeding tubes, but mildly acidic liquids (such as pineapple juice or cola-based drinks) can coagulate protein in feeds, causing further blockage. If these measures fail to clear the enteral feeding tube, an alkaline solution containing pancreatic enzymes may be introduced into the tube (followed after at least 5 minutes by water). Specific products designed to break up blockages caused by formula feeds are also available.

6.1 Special diets

Nutrition in special diets

Overview

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for children who either cannot tolerate or cannot metabolise certain common constituents of food.

Celiac disease

Celiac disease is caused by an abnormal immune response to gluten. For management and further information, see Celiac disease p. 25.

Phenylketonuria

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise **phenylalanine**, is managed by restricting dietary intake of **phenylalanine** to a small amount sufficient for tissue building and repair.

Aspartame (used as a sweetener in some foods and medicines) contributes to the **phenylalanine** intake and may affect control of **phenylketonuria**. If alternatives are unavailable, children with phenylketonuria should not be denied access to appropriate medication; the amount of **aspartame** consumed can be taken in to account in the management of the condition. Where the presence of **aspartame** in a preparation is specified in the product literature, **aspartame** is listed as an excipient in the relevant

product entry in *BNF for Children*; the child or carer should be informed of this.

Some rare forms of *phenylketonuria* are caused by a deficiency of **tetrahydrobiopterin**. Treatment involves oral supplementation of tetrahydrobiopterin below; in some severe cases, the addition of the neurotransmitter precursors, levodopa and 5-hydroxytryptophan, is also necessary.

Sapropterin dihydrochloride below, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of **phenylalanine** in the management of patients with *phenylketonuria* and *tetrahydrobiopterin deficiency*.

Products for metabolic diseases

There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

6.1a Phenylketonuria

DRUGS FOR METABOLIC DISORDERS > TETRAHYDROBIOPTERIN AND DERIVATIVES

Sapropterin dihydrochloride

● INDICATIONS AND DOSE

Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)

► BY MOUTH

- Child 4–17 years: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning

Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)

► BY MOUTH

- Neonate: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day.
- Child: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

● **CAUTIONS** History of convulsions

● **INTERACTIONS** → Appendix 1: sapropterin

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · cough · diarrhoea · headache · laryngeal pain · nasal congestion · vomiting

► **Frequency not known** Hypersensitivity

● **PREGNANCY** Manufacturer advises caution—consider only if strict dietary management inadequate.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

● MONITORING REQUIREMENTS

- Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response

increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.

- Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.

● **DIRECTIONS FOR ADMINISTRATION** Tablets should be dissolved in water and taken within 20 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION** Sapropterin is a synthetic form of tetrahydrobiopterin.

● **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

► **Kuvan** (BioMarin Europe Ltd)

Sapropterin dihydrochloride 100 mg Kuvan 100mg soluble tablets sugar-free | 30 tablet **[PoM]** £597.22

Tetrahydrobiopterin

● INDICATIONS AND DOSE

Monotherapy in tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)

► BY MOUTH

- Child: 10 mg/kg twice daily, adjusted according to response, total daily dose may alternatively be given in 3 divided doses

In combination with neurotransmitter precursors for tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)

► BY MOUTH

- Child 1 month–1 year: Initially 250–750 micrograms/kg 4 times a day, adjusted according to response, total daily dose may alternatively be given in 3 divided doses; maximum 7 mg/kg per day
- Child 2–17 years: Initially 250–750 micrograms/kg 4 times a day, adjusted according to response, total daily dose may alternatively be given in 3 divided doses; maximum 10 mg/kg per day

● **UNLICENSED USE** Not licensed.

● **SIDE-EFFECTS** Diarrhoea · sleep disorder · urinary frequency increased

● **PREGNANCY** Crosses the placenta; use only if benefit outweighs risk.

● **BREAST FEEDING** Present in milk, effects unknown.

● **RENAL IMPAIRMENT** Use with caution—accumulation of metabolites.

● MEDICINAL FORMS

No licensed medicines listed.

7 Vitamin deficiency

Vitamins

Overview

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements. Except for iron-deficiency anaemia, a primary vitamin or mineral deficiency due to simple dietary inadequacy is rare in the developed world. Some children may be at risk of developing

deficiencies because of an inadequate intake, impaired vitamin synthesis or malabsorption in disease states such as cystic fibrosis and Crohn's disease.

The use of vitamins as general 'pick-me-ups' is of unproven value and, the 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 629 and pyridoxine hydrochloride p. 627, is unscientific and can be harmful. Many vitamin supplements are described as 'multivitamin' but few contain the whole range of essential vitamins and many contain relatively high amounts of vitamins A and D. Care should be taken to ensure the correct dose is not exceeded.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. *Report on Health and Social Subjects* 41. London: HMSO, 1991.

Dental patients

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

Vitamin A

Deficiency of vitamin A (retinol) p. 626 is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin A supplementation may be required in children with liver disease, particularly cholestatic liver disease, due to the malabsorption of fat soluble vitamins. In those with complete biliary obstruction an intramuscular dose once a month may be appropriate.

Preterm neonates have low plasma concentrations of vitamin A and are usually given vitamin A supplements, often as part of an oral multivitamin preparation once enteral feeding has been established.

Vitamin B group

Deficiency of the B vitamins, other than vitamin B₁₂, is rare in the UK and is usually treated by preparations containing thiamine (B₁) p. 628, and riboflavin (B₂). Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate, and pantothenic acid or pantothenol may be included in vitamin B preparations, but there is no evidence of their value as supplements; however, they can be used in the management of certain metabolic disorders. Anaphylaxis has been reported with parenteral B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride (B₆) deficiency is rare, but it may occur during isoniazid p. 367 therapy or penicillamine p. 616 treatment in Wilson's disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, cystathioninuria and homocystinuria; folic acid p. 574 supplementation may also be beneficial in these disorders. Pyridoxine hydrochloride is also used in sideroblastic anaemia. Rarely, seizures in the neonatal period or during infancy respond to pyridoxine hydrochloride treatment; pyridoxine hydrochloride should be tried in all cases of early-onset intractable seizures and status epilepticus. Pyridoxine hydrochloride has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

A number of mitochondrial disorders may respond to treatment with certain B vitamins but these disorders require specialist management. Thiamine is used in the treatment of maple syrup urine disease, mitochondrial respiratory chain defects and, together with riboflavin, in the treatment of congenital lactic acidosis; riboflavin is also used in glutaric acidemias and cytochrome oxidase deficiencies; biotin is used in carboxylase defects.

Folic acid and vitamin B₁₂ are used in the treatment of megaloblastic anaemia. Folinic acid p. 555 (available as calcium folinate) is used in association with cytotoxic therapy.

Vitamin C

Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency have been reported. Vitamin C is used to enhance the excretion of iron one month after starting desferrioxamine mesilate p. 578 therapy; it is given separately from food as it also enhances iron absorption. Vitamin C is also used in the treatment of some inherited metabolic disorders, particularly mitochondrial disorders; specialist management of these conditions is required.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a child with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

Vitamin D

The term Vitamin D is used for a range of compounds including ergocalciferol (calciferol, vitamin D₂) p. 634, colecalciferol (vitamin D₃) p. 631, dihydrotachysterol, alfalcaldol (1 α -hydroxycholecalciferol) p. 630, and calcitriol (1,25-dihydroxycholecalciferol) p. 631.

Asymptomatic vitamin D deficiency is common in the United Kingdom; symptomatic deficiency may occur in certain ethnic groups, particularly as rickets or hypocalcaemia, and rarely in association with malabsorption. The amount of vitamin D required in infancy is related to the stores built up *in-utero* and subsequent exposure to sunlight. The amount of vitamin D in breast milk varies and some breast-fed babies, particularly if preterm or born to vitamin D deficient mothers, may become deficient. Most formula milk and supplement feeds contain adequate vitamin D to prevent deficiency.

Simple, nutritional vitamin D deficiency can be prevented by oral supplementation of ergocalciferol (calciferol, vitamin D₂) or colecalciferol (vitamin D₃) daily, using multi-vitamin drops, preparations of vitamins A and D, manufactured 'special' solutions, or as calcium and ergocalciferol tablets (although the calcium and other vitamins in supplements are unnecessary); excessive supplementation may cause hypercalcaemia.

Inadequate bone mineralisation can be caused by a deficiency, or a lack of action of vitamin D or its active metabolite. In childhood this causes bowing and distortion of bones (rickets). In nutritional vitamin D deficiency rickets, initial high doses of ergocalciferol or colecalciferol should be reduced to supplemental doses after 8–12 weeks, as there is a significant risk of hypercalcaemia. However, calcium supplements are recommended if there is hypocalcaemia or evidence of a poor dietary calcium intake. A single large dose of ergocalciferol p. 634 or colecalciferol p. 631 can also be effective for the treatment of nutritional vitamin D deficiency rickets.

Poor bone mineralisation in neonates and young children may also be due to inadequate intake of phosphate or calcium particularly during long-term parenteral nutrition—

supplementation with phosphate or calcium may be required.

Hypophosphataemic rickets occurs due to abnormal phosphate excretion; treatment with high doses of oral phosphate, and hydroxylated (activated) forms of vitamin D allow bone mineralisation and optimise growth.

Nutritional deficiency of vitamin D is best treated with colecalciferol or ergocalciferol. Preparations containing calcium and colecalciferol are also occasionally used in children where there is evidence of combined calcium and vitamin D deficiency. Vitamin D deficiency caused by *intestinal malabsorption* or *chronic liver disease* usually requires vitamin D in pharmacological doses; the hypocalcaemia of *hypoparathyroidism* often requires higher doses in order to achieve normocalcaemia and alfacalcidol p. 630 is generally preferred.

Vitamin D supplementation is often given in combination with calcium supplements for persistent hypocalcaemia in neonates, and in chronic renal disease.

Vitamin D requires hydroxylation, by the kidney and liver, to its active form therefore the hydroxylated derivatives alfacalcidol or calcitriol p. 631 should be prescribed if patients with *severe liver* or *renal impairment* require vitamin D therapy. Alfacalcidol is generally preferred in children as there is more experience of its use and appropriate formulations are available. Calcitriol is unlicensed for use in children and is generally reserved for those with severe liver disease.

Vitamin E

The daily requirement of vitamin E (tocopherol) has not been well defined. Vitamin E supplements are given to children with fat malabsorption such as in cystic fibrosis and cholestatic liver disease. In children with abetalipoproteinaemia abnormally low vitamin E concentrations may occur in association with neuromuscular problems; this usually responds to high doses of vitamin E. Some neonatal units still administer a single intramuscular dose of vitamin E at birth to preterm neonates to reduce the risk of complications; no trials of long-term outcome have been carried out. The intramuscular route should also be considered in children with severe liver disease when response to oral therapy is inadequate.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, children with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. For oral administration to prevent vitamin K deficiency in malabsorption syndromes, a water-soluble synthetic vitamin K derivative, menadiol sodium phosphate p. 636 can be used if supplementation with phytomenadione p. 636 by mouth has been insufficient.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K; see advice on the use of vitamin K in haemorrhage.

Multivitamins

Multivitamin supplements are used in children with vitamin deficiencies and also in malabsorption conditions such as cystic fibrosis or liver disease. Supplementation is not required if nutrient enriched feeds are used; consult a dietician for further advice.

Vitamin K

Vitamin K deficiency bleeding

Neonates are relatively deficient in vitamin K and those who do not receive supplements of vitamin K are at risk of serious bleeding including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). An appropriate regimen should be selected after discussion with parents in the antenatal period.

Vitamin K (as phytomenadione) may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies.

Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione by mouth at birth (using the contents of a phytomenadione capsule) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

► **Arovit (Imported (Italy))**

Vitamin A 150000 unit per 1 ml Arovit 150,000units/ml drops | 7.5 ml [PoM](#) [S](#)

Combinations available: **Vitamins A, C and D**, p. 626

VITAMINS AND TRACE ELEMENTS > VITAMIN B GROUP

Biotin

(Vitamin H)

● INDICATIONS AND DOSE

Isolated carboxylase defects

► BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION

- **Neonate:** 5 mg once daily, adjusted according to response, maintenance 10–50 mg daily, higher doses may be required.

- **Child:** 10 mg once daily, adjusted according to response; maintenance 10–50 mg daily, increased if necessary up to 100 mg daily

Defects of biotin metabolism

► BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION

- **Neonate:** Initially 10 mg once daily, adjusted according to response; maintenance 5–20 mg daily, higher doses may be required.
- **Child:** Initially 10 mg once daily, adjusted according to response; maintenance 5–20 mg daily, higher doses may be required

- **PREGNANCY** No information available.

- **BREAST FEEDING** No information available.

- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be crushed and mixed with food or drink.

Biotin 5 mg OroB7 5mg tablets | 30 tablet £33.99

Pyridoxine hydrochloride

(Vitamin B₆)

● INDICATIONS AND DOSE

Isoniazid-induced neuropathy (prophylaxis)

► BY MOUTH

- **Neonate:** 5 mg daily.

- **Child 1 month–11 years:** 5–10 mg daily

- **Child 12–17 years:** 10 mg daily

Isoniazid-induced neuropathy (treatment)

► BY MOUTH

- **Neonate:** 5–10 mg daily.

- **Child 1 month–11 years:** 10–20 mg 2–3 times a day

- **Child 12–17 years:** 30–50 mg 2–3 times a day

Prevention of penicillamine-induced neuropathy in Wilson's disease

► BY MOUTH

- **Child 1–11 years:** 5–10 mg daily

- **Child 12–17 years:** 10 mg daily

Metabolic diseases | Cystathioninuria | Homocystinuria

► BY MOUTH

- **Neonate:** 50–100 mg 1–2 times a day.

- **Child:** 50–250 mg 1–2 times a day

Pyridoxine-dependent seizures

► INITIALLY BY INTRAVENOUS INJECTION

- **Neonate:** Test dose 50–100 mg, repeated if necessary, if responsive, followed by an oral maintenance dose; (by mouth) maintenance 50–100 mg once daily, dose to be adjusted as necessary.

- **Child 1 month–11 years:** Test dose 50–100 mg daily, if responsive, followed by an oral maintenance dose, (by mouth) maintenance 20–50 mg 1–2 times a day, dose to be adjusted as necessary, (by mouth) increased if necessary up to 30 mg/kg daily, alternatively (by mouth) increased if necessary up to 1 g daily

- **UNLICENSED USE** Not licensed for prophylaxis of penicillamine-induced neuropathy in Wilson's disease. Not licensed for use in children.

● CAUTIONS

- With intravenous use risk of cardiovascular collapse (with intravenous injection—resuscitation facilities must be available and monitor closely)

- **SIDE-EFFECTS** Peripheral neuritis

Riboflavin 100 mg E-B2 100mg capsules | 30 capsule £89.20

Thiamine

(Vitamin B₁)

• INDICATIONS AND DOSE

Maple syrup urine disease

► BY MOUTH

► Neonate: 5 mg/kg daily, dose to be adjusted as necessary.

► Child: 5 mg/kg daily, dose to be adjusted as necessary

Metabolic disorders | Congenital lactic acidosis

► INITIALLY BY MOUTH, OR BY INTRAVENOUS INFUSION

► Neonate: 50–200 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes.

► Child: 100–300 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes, (by mouth) increased if necessary up to 2 g daily

• UNLICENSED USE Not licensed in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (SEPTEMBER 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

• CAUTIONS Anaphylaxis may occasionally follow injection

• SIDE-EFFECTS Abdominal pain · diarrhoea · gastrointestinal disorder · nausea · palpitations · respiratory distress · shock · skin reactions · tachycardia · vomiting

• BREAST FEEDING Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.

• PRESCRIBING AND DISPENSING INFORMATION

► With intravenous use Some preparations may contain phenol as a preservative.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Vitamin B complex

20-Jul-2017

● INDICATIONS AND DOSE

Treatment of deficiency

- BY MOUTH USING SYRUP
- Child 1–11 months: 5 mL 3 times a day, this dose is for *Vigranon B*[®] syrup.
- Child 1–11 years: 10 mL 3 times a day, this dose is for *Vigranon B*[®] syrup.
- Child 12–17 years: 10–15 mL 3 times a day, this dose is for *Vigranon B*[®] syrup.

Prophylaxis of deficiency

- BY MOUTH USING SYRUP
- Child 1–11 months: 5 mL once daily, this dose is for *Vigranon B*[®] syrup.
- Child 1–11 years: 5 mL twice daily, this dose is for *Vigranon B*[®] syrup.
- Child 12–17 years: 5 mL 3 times a day, this dose is for *Vigranon B*[®] syrup.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions *Vigranon B*[®] syrup is not prescribable in NHS primary care.

- **LESS SUITABLE FOR PRESCRIBING** Vitamin B compound tablets, vitamin B compound strong tablets, and *Vigranon B*[®] syrup are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- **Vigranon-B** (Wallace Manufacturing Chemists Ltd)
Pyridoxine hydrochloride 400 microgram per 1 mL, Riboflavin sodium phosphate 548 microgram per 1 mL, Dexpantenol 600 microgram per 1 mL, Thiamine hydrochloride 1 mg per 1 mL, Nicotinamide 4 mg per 1 mL *Vigranon-B* syrup sugar-free | 150 mL \mathcal{P} £26.00

Vitamins with minerals and trace elements

● INDICATIONS AND DOSE

FORCEVAL[®] CAPSULES

Vitamin and mineral deficiency and as adjunct in synthetic diets

- BY MOUTH
- Child 12–17 years: 1 capsule daily, one hour after a meal

KETOVITE[®] LIQUID

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets

- BY MOUTH
- Child: 5 mL daily, dose adjusted according to condition, diet, or age, use with *Ketovite*[®] Tablets for complete vitamin supplementation.

KETOVITE[®] TABLETS

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets

- BY MOUTH
- Child: 1 tablet 3 times a day, dose adjusted according to condition, diet, or age, use with *Ketovite*[®] Liquid for complete vitamin supplementation.

- **PRESCRIBING AND DISPENSING INFORMATION** To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Multivitamin preparations for vitamin deficiency www.medicinesforchildren.org.uk/multivitamin-preparations-vitamin-deficiency

KETOVITE[®] LIQUID *Ketovite*[®] liquid may be mixed with milk, cereal, or fruit juice.

KETOVITE[®] TABLETS Tablets may be crushed immediately before use.

● MEDICINAL FORMS

VITAMINS AND TRACE ELEMENTS > VITAMIN C

Ascorbic acid

(Vitamin C)

● INDICATIONS AND DOSE

Treatment of scurvy

- BY MOUTH
- Child 1 month–3 years: 125–250 mg daily in 1–2 divided doses
- Child 4–11 years: 250–500 mg daily in 1–2 divided doses
- Child 12–17 years: 0.5–1 g daily in 1–2 divided doses

Adjunct to desferrioxamine (to enhance the excretion of iron 1 month after treatment)

- BY MOUTH
- Child: 100–200 mg daily, to be taken 1 hour before food

Metabolic disorders | Tyrosinaemia type III | Transient tyrosinaemia of the newborn | Glutathione synthase deficiency | Hawkinsinuria

- BY MOUTH

- Neonate: 50–200 mg daily, dose to be adjusted as necessary.

- Child: 200–400 mg daily in 1–2 divided doses, dose to be adjusted as necessary, increased if necessary up to 1 g daily

- **UNLICENSED USE** Not licensed for metabolic disorders.

- **CONTRA-INDICATIONS** Hyperoxaluria

- **CAUTIONS**

CAUTIONS, FURTHER INFORMATION

- **Iron overload** Ascorbic acid should not be given to patients with cardiac dysfunction.

In patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

- **INTERACTIONS** → Appendix 1: ascorbic acid
- **SIDE-EFFECTS** Diarrhoea · drug tolerance · gastrointestinal disorder · hyperoxaluria · oxalate nephrolithiasis · polyuria
- **PRESCRIBING AND DISPENSING INFORMATION** It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

MEDICINAL FORMS

Combinations available: **Vitamins A, C and D**, p. 626

VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

Vitamin D and analogues (systemic)

- **CONTRA-INDICATIONS** Hypercalcaemia · metastatic calcification
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · headache · hypercalcaemia · hypercalciuria · nausea · skin reactions
 - ▶ **Uncommon** Appetite decreased · constipation · thirst · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Overdose Symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.

- **PREGNANCY** High doses teratogenic in *animals* but therapeutic doses unlikely to be harmful.
- **BREAST FEEDING** Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.
- **MONITORING REQUIREMENTS** **Important:** all patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

Alfacalcidol

(1 α -Hydroxycholecalciferol)

• INDICATIONS AND DOSE

Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION

▶ Child 1 month–11 years: 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum

1 microgram per day

▶ Child 12–17 years: 1 microgram once daily, dose to be adjusted as necessary

Persistent neonatal hypocalcaemia

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION

▶ Neonate: 50–100 nanograms/kg once daily, dose to be adjusted as necessary, in resistant cases higher doses may be needed; increased if necessary up to 2 micrograms/kg daily.

Prevention of vitamin D deficiency in renal or cholestatic liver disease

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION

▶ Neonate: 20 nanograms/kg once daily, dose to be adjusted as necessary.

▶ Child 1 month–11 years (body-weight up to 20 kg): 15–30 nanograms/kg once daily (max. per dose 500 nanograms)

▶ Child 1 month–11 years (body-weight 20 kg and above): 250–500 nanograms once daily, dose to be adjusted as necessary

▶ Child 12–17 years: 250–500 nanograms once daily, dose to be adjusted as necessary

DOSE EQUIVALENCE AND CONVERSION

▶ One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

• **CAUTIONS** Nephrolithiasis · take care to ensure correct dose in infants

• **INTERACTIONS** → Appendix 1: vitamin D substances

• SIDE-EFFECTS

▶ **Common or very common** Abdominal discomfort · hyperphosphataemia

▶ **Uncommon** Asthenia · diarrhoea · malaise · myalgia · urolithiasis

▶ **Rare or very rare** Dizziness

▶ **Frequency not known** Confusion · renal impairment

• RENAL IMPAIRMENT

Monitoring Monitor plasma-calcium concentration in renal impairment.

• **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

• **DIRECTIONS FOR ADMINISTRATION** For injection, shake ampoule for at least 5 seconds before use, and give over 30 seconds.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Ergocalciferol

(Calciferol; Vitamin D₂)

● INDICATIONS AND DOSE

Nutritional vitamin-D deficiency rickets

- BY MOUTH
- Child 1–5 months: 3000 units daily, dose to be adjusted as necessary
- Child 6 months–11 years: 6000 units daily, dose to be adjusted as necessary
- Child 12–17 years: 10 000 units daily, dose to be adjusted as necessary

Nutritional or physiological supplement | Prevention of rickets

- BY MOUTH
- Neonate: 400 units daily.

- Child: 400–600 units daily

Vitamin D deficiency in intestinal malabsorption or in chronic liver disease

- BY MOUTH, OR BY INTRAMUSCULAR INJECTION
- Child 1–11 years: 10 000–25 000 units daily, dose to be adjusted as necessary
- Child 12–17 years: 10 000–40 000 units daily, dose to be adjusted as necessary

- **CAUTIONS** Take care to ensure correct dose in infants

- **INTERACTIONS** → Appendix 1: vitamin D substances

● RENAL IMPAIRMENT

Monitoring Monitor plasma-calcium concentration in renal impairment.

- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied.

When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

Alpha tocopheryl acetate

(Tocopherol)

● INDICATIONS AND DOSE

Vitamin E deficiency

▶ BY MOUTH

- ▶ Neonate: 10 mg/kg once daily.

- ▶ Child: 2–10 mg/kg daily, increased if necessary up to 20 mg/kg daily

Malabsorption in cystic fibrosis

▶ BY MOUTH

- ▶ Child 1-11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- ▶ Child 1-11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- ▶ Child 12-17 years: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

Vitamin E deficiency in cholestasis and severe liver disease

▶ BY MOUTH

- ▶ Neonate: 10 mg/kg daily.

- ▶ Child 1 month-11 years: Initially 100 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily
- ▶ Child 12-17 years: Initially 200 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily

▶ BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 10 mg/kg once a month.

- ▶ Child: 10 mg/kg once a month (max. per dose 100 mg)

Malabsorption in abetalipoproteinaemia

▶ BY MOUTH

- ▶ Neonate: 100 mg/kg once daily.

- ▶ Child: 50–100 mg/kg once daily

- **CAUTIONS** Increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg or in a preterm neonate · predisposition to thrombosis

- **INTERACTIONS** → Appendix 1: vitamin E substances

- **SIDE-EFFECTS** Abdominal pain (more common at high doses) · bleeding tendency · diarrhoea (more common at high doses) · increased risk of thrombosis

- **PREGNANCY** No evidence of safety of high doses.

- **BREAST FEEDING** Excreted in milk; minimal risk, although caution with large doses.

- **MONITORING REQUIREMENTS** Increased bleeding tendency in vitamin-K deficient patients or those taking anticoagulants (prothrombin time and INR should be monitored).

- **DIRECTIONS FOR ADMINISTRATION** Consider dilution of oral suspension for use in neonates due to high osmolality.

VITAMINS AND TRACE ELEMENTS > VITAMIN K

Menadiol sodium phosphate

● **INDICATIONS AND DOSE**

Supplementation in vitamin K malabsorption

► **BY MOUTH**

- Child 1–11 years: 5–10 mg daily, dose to be adjusted as necessary
- Child 12–17 years: 10–20 mg daily, dose to be adjusted as necessary

● **CONTRA-INDICATIONS** Infants · neonates

● **CAUTIONS** G6PD deficiency (risk of haemolysis) · vitamin E deficiency (risk of haemolysis)

● **PREGNANCY** Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.

● **MEDICINAL FORMS**

Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Phytomenadione

(Vitamin K₁)

● **INDICATIONS AND DOSE**

Neonatal prophylaxis of vitamin-K deficiency bleeding

► **BY INTRAMUSCULAR INJECTION**

- Preterm neonate: 400 micrograms/kg (max. per dose 1 mg) for 1 dose, to be given at birth, the intravenous route may be used in preterm neonates with very low birth-weight if intramuscular injection is not possible, however, it may not provide the prolonged protection of the intramuscular injection, any neonate receiving intravenous vitamin K should be given subsequent oral doses.

- Neonate: 1 mg for 1 dose, to be given at birth.

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at particular risk of bleeding disorders

► **BY MOUTH USING CAPSULES**

- Neonate: 1 mg for 1 dose at birth (to protect from the risk of vitamin K deficiency bleeding in the first week).

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at particular risk of bleeding disorders (exclusively breast-fed babies)

► **BY MOUTH USING CAPSULES**

- Neonate: Initially 1 mg for 1 dose at birth, then 1 mg every week for 12 weeks.

Neonatal hypoprothrombinaemia | Vitamin-K deficiency bleeding

► **BY INTRAVENOUS INJECTION**

- Neonate: 1 mg every 8 hours if required.

Neonatal biliary atresia and liver disease

► **BY MOUTH**

- Neonate: 1 mg daily.

Reversal of coumarin anticoagulation when continued anticoagulation required or if no significant bleeding—seek specialist advice

► **BY INTRAVENOUS INJECTION**

- Child: 15–30 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may be repeated as necessary

Reversal of coumarin anticoagulation when anticoagulation not required or if significant bleeding—seek specialist advice | Treatment of haemorrhage associated with vitamin-K deficiency—seek specialist advice

► **BY INTRAVENOUS INJECTION**

- Child: 250–300 micrograms/kg (max. per dose 10 mg) for 1 dose

KONAKION[®] MM PAEDIATRIC

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at risk of bleeding disorders

► **BY MOUTH**

- Neonate: Initially 2 mg for 1 dose at birth, then 2 mg after 4–7 days.

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at risk of bleeding disorders (exclusively breast fed babies)

► **BY MOUTH**

- Neonate: Initially 2 mg for 1 dose at birth, then 2 mg after 4–7 days for a further 1 dose, then 2 mg for a further 1 dose 1 month after birth.

● **CAUTIONS** Intravenous injections should be given very slowly—risk of vascular collapse

KONAKION[®] MM PAEDIATRIC Parenteral administration in premature infant or neonate of less than 2.5 kg (increased risk of kernicterus)

● **PREGNANCY** Use if potential benefit outweighs risk.

● **BREAST FEEDING** Present in milk.

● **HEPATIC IMPAIRMENT**

KONAKION[®] MM Caution—glycocholic acid may displace bilirubin.

● **DIRECTIONS FOR ADMINISTRATION**

- With oral use in neonates The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given.

KONAKION[®] MM PAEDIATRIC Konakion[®] MM Paediatric may be administered by mouth or by intramuscular injection or by intravenous injection. For intravenous injection, may be diluted with Glucose 5% if necessary.

KONAKION[®] MM Konakion[®] MM may be administered by slow intravenous injection or by intravenous infusion in glucose 5%; **not** for intramuscular injection.

7.1 Neural tube defects (prevention in pregnancy)

Neural tube defects (prevention in pregnancy)

01-Aug-2017

Description of condition

Neural tube defects represent a group of congenital defects, caused by incomplete closure of the neural tube within 28 days of conception. The most common forms are anencephaly, spina bifida and encephalocele.

The main risk factors are maternal folate deficiency, maternal vitamin B₁₂ deficiency, previous history of having an infant with a neural tube defect, smoking, diabetes, obesity, and use of antiepileptic drugs.

Prevention in pregnancy

 Pregnant women or women who wish to become pregnant should be advised to take supplementation with folic acid p. 574 before conception and until week 12 of pregnancy.

A higher daily dose (see folic acid) is recommended for women at a high risk of conceiving a child with a neural tube defect, including women who have previously had an infant with a neural tube defect, who are receiving antiepileptic medication (see Epilepsy p. 191), or who have diabetes or sickle-cell disease.

1 Arthritis

Juvenile idiopathic arthritis

Management

Rheumatic diseases require symptomatic treatment to relieve pain, swelling, and stiffness, together with treatment to control and suppress disease activity. Treatment of juvenile idiopathic arthritis may involve Non-steroidal anti-inflammatory drugs (NSAIDs) p. 650, a disease modifying anti-rheumatic drug (DMARD) such as methotrexate p. 543 or a cytokine modulator, and intra-articular, intravenous, or oral corticosteroids.

Rheumatic disease, suppressing drugs

Overview

Certain drugs, such as methotrexate p. 543, cytokine modulators, and sulfasalazine p. 31, are used to suppress the disease process in *juvenile idiopathic arthritis* (juvenile chronic arthritis); these drugs are known as disease-modifying antirheumatic drugs (DMARDs). In children, disease modifying antirheumatic drugs should be used under specialist supervision.

Some children with juvenile idiopathic arthritis do not require disease-modifying antirheumatic drugs.

Methotrexate is effective in juvenile idiopathic arthritis; sulfasalazine is an alternative but should be avoided in *systemic-onset juvenile idiopathic arthritis*. Gold and penicillamine are no longer used. Cytokine modulators have a role in *polyarticular juvenile idiopathic arthritis*.

Unlike NSAIDs, disease-modifying antirheumatic drugs can affect the progression of disease but they may require 3–6 months of treatment for a full therapeutic response. Response to a disease-modifying antirheumatic drug may allow the dose of the NSAID to be reduced.

Disease-modifying antirheumatic drugs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations. They reduce the erythrocyte sedimentation rate and C-reactive protein.

Antimalarials

The antimalarial hydroxychloroquine sulfate p. 639 is rarely used to treat juvenile idiopathic arthritis. Hydroxychloroquine sulfate can also be useful for systemic

or discoid lupus erythematosus, particularly involving the skin and joints, and in sarcoidosis.

Retinopathy rarely occurs provided that the recommended doses are not exceeded.

Mepacrine hydrochloride is used on rare occasions to treat discoid lupus erythematosus [unlicensed].

Drugs affecting the immune response

Methotrexate, given as a once weekly dose, is the disease-modifying antirheumatic drug of choice in the treatment of juvenile idiopathic arthritis and also has a role in juvenile dermatomyositis, vasculitis, uveitis, systemic lupus erythematosus, localised scleroderma, and sarcoidosis; for these indications it is given by the subcutaneous, oral, or rarely, the intramuscular route. Absorption from intramuscular or subcutaneous routes may be more predictable than from the oral route; if the oral route is ineffective subcutaneous administration is generally preferred. Folic acid may reduce mucosal or gastro-intestinal side-effects of methotrexate. The dosage regimen for folic acid p. 574 has not been established—in children over 2 years a weekly dose [unlicensed indication], may be given on a different day from the methotrexate.

Azathioprine p. 518 may be used in children for vasculitis which has failed to respond to other treatments, for the management of severe cases of *systemic lupus erythematosus* and other connective tissue disorders, in conjunction with corticosteroids for patients with severe or progressive renal disease, and in cases of *polymyositis* which are resistant to corticosteroids. Azathioprine has a corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive.

Ciclosporin is rarely used in juvenile idiopathic arthritis, connective tissue diseases, vasculitis, and uveitis; it may be considered if the condition has failed to respond to other treatments.

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab p. 642, etanercept p. 643, and infliximab p. 33 inhibit the activity of tumour necrosis factor alpha (TNF- α). Adalimumab can be used for the management of active polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis. Etanercept is licensed for the treatment of the following subtypes of juvenile idiopathic arthritis: polyarticular juvenile idiopathic arthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, oligoarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, psoriatic arthritis in children over 12 years who have had an inadequate response to methotrexate or cannot tolerate

it, and enthesitis-related arthritis in children over 12 years who have had an inadequate response to conventional therapy or cannot tolerate it. Infliximab has been used in refractory polyarticular juvenile idiopathic arthritis [unlicensed indication] when other treatments, such as etanercept, have failed.

Abatacept p. 641 prevents the full activation of T-lymphocytes; it can be used for the management of active polyarticular juvenile idiopathic arthritis. Abatacept is not recommended for use in combination with TNF inhibitors.

Canakinumab p. 526 inhibits the activity of interleukin-1 beta (IL-1 β) and is licensed for the treatment of active systemic juvenile idiopathic arthritis in children over 2 years, when there has been an inadequate response to NSAIDs and systemic corticosteroids.

Tocilizumab p. 640 antagonises the actions of interleukin-6; it can be used for the management of active systemic juvenile idiopathic arthritis when there has been an inadequate response to NSAIDs and systemic corticosteroids and polyarticular juvenile idiopathic arthritis when there has been an inadequate response to methotrexate. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated. Tocilizumab is not recommended for use with other cytokine modulators.

Sulfasalazine

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity associated with some forms of juvenile idiopathic arthritis; it is generally not used in systemic-onset disease.

Other drugs used for Arthritis Diclofenac potassium, p. 651 · Diclofenac sodium, p. 652 · Etoricoxib, p. 653 · Flurbiprofen, p. 654 · Ibuprofen, p. 655 · Indometacin, p. 657 · Meloxicam, p. 658 · Naproxen, p. 659 · Piroxicam, p. 660

DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS

Hydroxychloroquine sulfate

● INDICATIONS AND DOSE

Active rheumatoid arthritis (including juvenile idiopathic arthritis) (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice) | Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

► BY MOUTH

Child: 5–6.5 mg/kg once daily (max. per dose 400 mg), dose given based on ideal body-weight

- **UNLICENSED USE** *Plaquenil*® not licensed for use in children for dermatological conditions caused or aggravated by sunlight.
- **CAUTIONS** Acute porphyrias p. 603 · diabetes (may lower blood glucose) · G6PD deficiency · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders (especially in those with a history of epilepsy) · severe gastro-intestinal disorders

CAUTIONS, FURTHER INFORMATION

- Screening for ocular toxicity Hydroxychloroquine is rarely associated with ocular toxicity. The British Society for Paediatric and Adolescent Rheumatology recommends that children should have their vision tested before long-term treatment with hydroxychloroquine and have an annual review of visual acuity. Children should be referred to an ophthalmologist if there is visual impairment, changes in visual acuity, or blurred vision. The Royal College of Ophthalmologists has recommended that a locally agreed protocol between the prescribing doctor and ophthalmologist be established to monitor the vision of

these children. A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening* 2009); this includes the recommendation that a child treated for juvenile idiopathic arthritis should receive slit-lamp examination routinely to check for uveitis.

- **INTERACTIONS** → Appendix 1: hydroxychloroquine

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · appetite decreased · diarrhoea · emotional lability · headache · nausea · skin reactions · vision disorders · vomiting
- **Uncommon** Alopecia · corneal oedema · dizziness · eye disorders · hair colour changes · hearing impairment · nervousness · neuromuscular dysfunction · retinopathy · seizure · vertigo
- **Frequency not known** Acute hepatic failure · agranulocytosis · anaemia · angioedema · bone marrow disorders · bronchospasm · cardiac conduction disorders · cardiomyopathy · hypoglycaemia · leucopenia · movement disorders · muscle weakness · myopathy · photosensitivity reaction · psychosis · reflexes absent · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tremor · ventricular hypertrophy

Overdose Hydroxychloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.
- **BREAST FEEDING** Avoid—risk of toxicity in infant.
- **HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. **Monitoring** Monitor plasma-hydroxychloroquine concentration in severe renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tocilizumab

24-May-2018

● INDICATIONS AND DOSE

Active systemic juvenile idiopathic arthritis [in combination with methotrexate or alone if methotrexate inappropriate, in children who have had an inadequate response to NSAIDs and systemic corticosteroids]

► BY INTRAVENOUS INFUSION

- Child 2–17 years (body-weight up to 30 kg): 12 mg/kg every 2 weeks, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 6 weeks
- Child 2–17 years (body-weight 30 kg and above): 8 mg/kg every 2 weeks, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 6 weeks

Polyarticular juvenile idiopathic arthritis [in combination with methotrexate or alone if methotrexate inappropriate, in children who have had an inadequate response to methotrexate]

► BY INTRAVENOUS INFUSION

- Child 2–17 years (body-weight up to 30 kg): 10 mg/kg every 4 weeks, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 12 weeks
- Child 2–17 years (body-weight 30 kg and above): 8 mg/kg every 4 weeks, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 12 weeks

ROACTEMRA® PRE-FILLED SYRINGE

Polyarticular juvenile idiopathic arthritis [in combination with methotrexate or alone if methotrexate inappropriate, in children who have had an inadequate response to methotrexate]

► BY SUBCUTANEOUS INJECTION

- Child 2–17 years (body-weight up to 30 kg): 162 mg every 3 weeks, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 12 weeks
- Child 2–17 years (body-weight 30 kg and above): 162 mg every 2 weeks, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, review treatment if no improvement within 12 weeks

- **CONTRA-INDICATIONS** Do not initiate if absolute neutrophil count less than $2 \times 10^9/\text{litre}$ · severe active infection
- **CAUTIONS** History of diverticulitis · history of intestinal ulceration · history of recurrent or chronic infection (interrupt treatment if serious infection occurs) · low absolute neutrophil count · low platelet count · predisposition to infection (interrupt treatment if serious infection occurs)
- **CAUTIONS, FURTHER INFORMATION**
 - Tuberculosis Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- **Common or very common** Diarrhoea · headache · increased risk of infection · infusion related reaction · nausea
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if absolute neutrophil count less than $0.5 \times 10^9/\text{litre}$ or platelet count less than $50 \times 10^9/\text{microlitre}$.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—consult product literature.

● RENAL IMPAIRMENT

- With intravenous use Manufacturer advises monitor renal function closely in moderate-to-severe impairment—no information available.
- With subcutaneous use Manufacturer advises monitor renal function closely in severe impairment—no information available.

● PRE-TREATMENT SCREENING

- Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor lipid profile 4–8 weeks after starting treatment and then as indicated.
- Manufacturer advises monitor for demyelinating disorders.
- Manufacturer advises monitor hepatic transaminases, and neutrophil and platelet count at the time of the second administration, and then as indicated.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *intravenous infusion*, manufacturer advises for body-weight less than 30 kg, give intermittently in Sodium chloride 0.9%, dilute requisite dose to a volume of 50 mL with infusion fluid and give over 1 hour; body-weight 30 kg or greater, give intermittently in Sodium chloride 0.9%, dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour.
- With subcutaneous use For *subcutaneous injection*, manufacturer advises rotate injection site and avoid skin that is tender, damaged or scarred. Patients may self-administer RoActemra®, after appropriate training in subcutaneous injection technique.

● PRESCRIBING AND DISPENSING INFORMATION

- Manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises protect from light and store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

An alert card should be provided.

- Driving and skilled tasks** Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Tocilizumab for the treatment of systemic juvenile idiopathic arthritis (December 2011) NICE TA238
Tocilizumab is recommended for the treatment of systemic juvenile idiopathic arthritis in children aged

2 years and older who have not responded adequately to NSAIDs, systemic corticosteroids and methotrexate, if the manufacturer makes tocilizumab available with the discount agreed as part of the patient access scheme.

Tocilizumab is **not** recommended for the treatment of systemic juvenile idiopathic arthritis in children whose disease continues to respond to methotrexate or who have not been treated with methotrexate.

Patients currently receiving tocilizumab for systemic juvenile idiopathic arthritis who do not meet these criteria should have the option to continue treatment until it is considered appropriate to stop.

www.nice.org.uk/guidance/ta238

- ▶ **Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015)**
NICE TA373

Tocilizumab is recommended as an option for treatment of polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in children 2 years and older whose disease has responded inadequately to previous therapy with methotrexate and if the manufacturer provides tocilizumab with the discounts agreed in the patient access schemes.

www.nice.org.uk/guidance/ta373

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **RoActemra** (Roche Products Ltd)

Tocilizumab 180 mg per 1 mL RoActemra 162mg/0.9mL solution for injection pre-filled syringes | 4 pre-filled disposable injection [PoM] £913.12 (Hospital only)

RoActemra 162mg/0.9mL solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £913.12

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **RoActemra** (Roche Products Ltd)

Tocilizumab 20 mg per 1 mL RoActemra 400mg/20mL concentrate for solution for infusion vials | 1 vial [PoM] £512.00 (Hospital only)
RoActemra 200mg/10mL concentrate for solution for infusion vials | 1 vial [PoM] £256.00 (Hospital only)

RoActemra 80mg/4mL concentrate for solution for infusion vials | 1 vial [PoM] £102.40 (Hospital only)

IMMUNOSUPPRESSANTS > T-CELL ACTIVATION INHIBITORS

Abatacept

01-Dec-2017

● INDICATIONS AND DOSE

Moderate-to-severe active polyarticular juvenile idiopathic arthritis (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child 6–17 years (body-weight up to 75 kg): 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months
- ▶ Child 6–17 years (body-weight 75–100 kg): 750 mg every 2 weeks for 3 doses, then 750 mg every 4 weeks, review treatment if no response within 6 months
- ▶ Child 6–17 years (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses, then 1 g every 4 weeks, review treatment if no response within 6 months

- **CONTRA-INDICATIONS** Severe infection

- **CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy · do not initiate until active infections are controlled · predisposition to infection (screen for latent tuberculosis and viral hepatitis) · progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)

- **INTERACTIONS** → Appendix 1: abatacept

● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · cough · diarrhoea · dizziness · gastrointestinal discomfort · headaches · hypertension · increased risk of infection · nausea · oral ulceration · skin reactions · vomiting
- ▶ **Uncommon** Alopecia · anxiety · arrhythmias · arthralgia · bruising tendency · conjunctivitis · depression · dry eye · dyspnoea · gastritis · hyperhidrosis · hypotension · influenza like illness · leucopenia · menstrual cycle irregularities · pain in extremity · palpitations · paraesthesia · respiratory disorders · sepsis · sleep disorders · throat tightness · thrombocytopenia · vasculitis · vasodilation · vertigo · visual acuity decreased · weight increased
- ▶ **Rare or very rare** Pelvic inflammatory disease · respiratory malignancy
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 14 weeks after last dose.
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
▶ **Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015)**
NICE TA373
Abatacept is recommended as options for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 6 years and older whose disease has responded inadequately to other disease-modifying anti-rheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor, **only** if the manufacturer provides abatacept with the discounts agreed in the patient access schemes.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Orencia** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Abatacept 125 mg per 1 mL Orencia 125mg/1mL solution for injection pre-filled syringes | 4 pre-filled disposable injection [PoM] £1,209.60 (Hospital only)

- ▶ **Orencia ClickJect** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Abatacept 125 mg per 1 mL Orencia ClickJect 125mg/1mL solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £1,209.60

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Orencia** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Abatacept 250 mg Orencia 250mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £302.40 (Hospital only)

IMMUNOSUPPRESSANTS > TUMOR NECROSIS FACTOR ALPHA (TNF- α) INHIBITORS

Adalimumab

21-Feb-2018

• INDICATIONS AND DOSE

Plaque psoriasis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 4–17 years (body-weight 15–29 kg): Initially 20 mg once weekly for 2 doses, then 20 mg every 2 weeks, review treatment if no response within 16 weeks
- ▶ Child 4–17 years (body-weight 30 kg and above): Initially 40 mg once weekly for 2 doses, then 40 mg every 2 weeks, review treatment if no response within 16 weeks

Polyarticular juvenile idiopathic arthritis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years (body-weight 10–29 kg): 20 mg every 2 weeks, review treatment if no response within 12 weeks
- ▶ Child 2–17 years (body-weight 30 kg and above): 40 mg every 2 weeks, review treatment if no response within 12 weeks

Enthesitis-related arthritis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 6–17 years (body-weight 15–29 kg): 20 mg every 2 weeks
- ▶ Child 6–17 years (body-weight 30 kg and above): 40 mg every 2 weeks

Crohn's disease (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 6–17 years (body-weight up to 40 kg): Initially 40 mg, then 20 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once weekly, review treatment if no response within 12 weeks of initial dose
- ▶ Child 6–17 years (body-weight 40 kg and above): Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Crohn's disease (accelerated regimen) (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 6–17 years (body-weight up to 40 kg): Initially 80 mg, then 40 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose
- ▶ Child 6–17 years (body-weight 40 kg and above): Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Hidradenitis suppurativa (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 12–17 years (body-weight 30 kg and above): Initially 80 mg, given as two 40 mg injections in one day, followed by 40 mg after 1 week, then maintenance 40 mg every 2 weeks; increased if necessary to 40 mg once weekly, review treatment if no response within 12 weeks; if treatment interrupted—consult product literature

Uveitis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years (body-weight up to 30 kg): Initially 40 mg, then 20 mg after 1 week; maintenance 20 mg every 2 weeks, alternatively 20 mg every 2 weeks
- ▶ Child 2–17 years (body-weight 30 kg and above): Initially 80 mg, given as two 40 mg injections in one day, then 40 mg after 1 week; maintenance 40 mg every 2 weeks, alternatively 40 mg every 2 weeks

- **CONTRA-INDICATIONS** Moderate or severe heart failure • severe infection

- **CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy • demyelinating disorders (risk of exacerbation) • development of malignancy • do not initiate until active infections are controlled (discontinue if new serious infection develops) • hepatitis B virus—monitor for active infection • history of malignancy • mild heart failure (discontinue if symptoms develop or worsen) • predisposition to infection

CAUTIONS, FURTHER INFORMATION

- ▶ **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Agranulocytosis • alopecia • anaemia • anxiety • arrhythmias • arterial occlusion • asthma • broken nails • chest pain • coagulation disorder • connective tissue disorders • cough • dehydration • depression • dyspnoea • electrolyte imbalance • embolism and thrombosis • eye inflammation • fever • flushing • gastrointestinal discomfort • gastrointestinal disorders • haemorrhage • headaches • healing impaired • hyperglycaemia • hypersensitivity • hypertension • increased risk of infection • insomnia • leucocytosis • leucopenia • mood altered • muscle spasms • musculoskeletal pain • nausea • neoplasms • nerve disorders • neutropenia • oedema • renal impairment • seasonal allergy • sensation abnormal • sepsis • skin reactions • sweat changes • thrombocytopenia • vasculitis • vertigo • vision disorders • vomiting
- ▶ **Uncommon** Aortic aneurysm • congestive heart failure • demyelinating disorders • dysphagia • erectile dysfunction • gallbladder disorders • hearing impairment • hepatic disorders • inflammation • lupus erythematosus • meningitis viral • myocardial infarction • nocturia • pancreatitis • respiratory disorders • rhabdomyolysis • sarcoidosis • solid organ neoplasm • stroke • tremor
- ▶ **Rare or very rare** Cardiac arrest • pancytopenia • Stevens-Johnson syndrome

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicæmia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid; manufacturer advises avoid for at least 5 months after last dose.

● PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor for infection before, during, and for 4 months after treatment.
- ▶ Manufacturer advises monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.
- ▶ For uveitis, manufacturer advises patients should be assessed for pre-existing or developing central demyelinating disorders before and at regular intervals during treatment.

● PRESCRIBING AND DISPENSING INFORMATION

Adalimumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.

- **PATIENT AND CARER ADVICE** An alert card should be provided.

When used to treat *hidradenitis suppurativa*, patients and their carers should be advised to use a daily topical antiseptic wash on lesions during treatment with adalimumab.

Tuberculosis patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, or, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015)** NICE TA373

Adalimumab is recommended as an option for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 2 years and older whose disease has responded inadequately to 1 or more disease-modifying antirheumatic drugs (DMARDs) and for treating enthesitis-related JIA in patients 6 years and older whose disease has responded inadequately to, or who are intolerant of, conventional therapy.

www.nice.org.uk/guidance/ta373

- ▶ **Adalimumab, etanercept and ustekinumab for treating plaque psoriasis in children and young people (July 2017)** NICE TA455
- Adalimumab is recommended as an option for treating plaque psoriasis in children and young people aged 4 years or older, only if the disease:

- is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and
- has not responded to standard systemic therapy, such as ciclosporin, methotrexate or phototherapy, or these options are contra-indicated or not tolerated.

Stop treatment at 16 weeks if the psoriasis has not responded adequately. An adequate response is defined as a 75% reduction in the PASI score from the start of treatment.

Patients currently receiving adalimumab who do not meet the above criteria and whose treatment was started within the NHS before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta455

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2015) that adalimumab (*Humira*®) is accepted for restricted use

within NHS Scotland for the treatment of active enthesitis-related arthritis in children 6 years of age and over who have had an inadequate response to, or who are intolerant of, conventional therapy, and is used within specialist rheumatology services (including those working within the network for paediatric rheumatology).

The *Scottish Medicines Consortium* has advised (June 2017) that adalimumab (*Humira*®) is accepted for use within NHS Scotland for the treatment of active moderate-to-severe hidradenitis suppurativa (HS) (acne inversa) in adolescents from 12 years of age with an inadequate response to conventional systemic HS therapy.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (January 2017) that adalimumab (*Humira*®) is recommended as an option for use within NHS Wales for the treatment of moderately to severely active Crohn's disease in children 6 years and over, who have had an inadequate response to conventional therapy including primary nutrition therapy and a corticosteroid and/or an immunomodulator, or who are intolerant to or have contra-indications for such therapies.

The *All Wales Medicines Strategy Group* has advised (August 2017) that adalimumab (*Humira*®) is recommended as an option for use within NHS Wales for the treatment of active moderate to severe hidradenitis suppurativa (acne inversa) in adolescents from 12 years of age with an inadequate response to conventional systemic hidradenitis suppurativa therapy. This advice is contingent upon the continuing availability of the Wales Patient Access Scheme or a list price that is equivalent or lower.

The *All Wales Medicines Strategy Group* has advised (December 2017) that adalimumab (*Humira*®) is recommended as an option for use within NHS Wales for the treatment of paediatric chronic non-infectious anterior uveitis in patients from two years of age who have had an inadequate response to or are intolerant to conventional therapy, or in whom conventional therapy is inappropriate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

► BY SUBCUTANEOUS INJECTION

- Child 12–17 years: 400 micrograms/kg twice weekly (max. per dose 25 mg), to be given at an interval of 3–4 days between doses, alternatively 800 micrograms/kg once weekly (max. per dose 50 mg), consider discontinuation if no response after 4 months

Chronic, severe plaque psoriasis in children who have had an inadequate response to other systemic therapies or phototherapies or who cannot tolerate them

► BY SUBCUTANEOUS INJECTION

- Child 6–17 years: 800 micrograms/kg once weekly (max. per dose 50 mg) for up to 24 weeks, discontinue if no response after 12 weeks

- **CONTRA-INDICATIONS** Active infection · avoid injections containing benzyl alcohol in neonates

- **CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy · development of malignancy · diabetes mellitus · heart failure (risk of exacerbation) · hepatitis B virus—monitor for active infection · hepatitis C infection (monitor for worsening infection) · history of blood disorders · history of malignancy · history or increased risk of demyelinating disorders · predisposition to infection (avoid if predisposition to septicaemia) · significant exposure to herpes zoster virus—interrupt treatment and consider varicella-zoster immunoglobulin

CAUTIONS, FURTHER INFORMATION

- **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept.

- **INTERACTIONS** → Appendix 1: etanercept

● **SIDE-EFFECTS**

- **Common or very common** Cystitis · fever · hypersensitivity · increased risk of infection · pain · skin reactions · swelling
- **Uncommon** Abscess · bursitis · cholecystitis · diarrhoea · endocarditis · eye inflammation · gastritis · hepatic disorders · myositis · neoplasms · respiratory disorders · sepsis · skin ulcers · thrombocytopenia · vasculitis
- **Rare or very rare** Anaemia · bone marrow disorders · congestive heart failure · cutaneous lupus erythematosus · demyelination · leucopenia · lupus-like syndrome · nerve disorders · neutropenia · sarcoidosis · seizure · severe cutaneous adverse reactions (SCARs) · transverse myelitis
- **Frequency not known** Abdominal pain · depression · dermatomyositis exacerbated · headache · hepatitis B reactivation · inflammatory bowel disease · macrophage activation syndrome · nausea · personality disorder · post procedural infection · type 1 diabetes mellitus · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for 3 weeks after last dose.
- **PREGNANCY** Avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe alcoholic hepatitis.
- **PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS** Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).

- **PRESCRIBING AND DISPENSING INFORMATION** Etanercept is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

BENEPALI® SOLUTION FOR INJECTION Manufacturer advises patients requiring less than the full 50 mg dose should **not** receive *Benepali*®—if an alternate dose is required, other etanercept formulations providing this option should be used.

- **PATIENT AND CARER ADVICE** An alert card should be provided.
Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.
Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015)**
NICE TA373

Etanercept is recommended as an option for treating:

- polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA, in patients 2 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate;
- enthesitis-related JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, conventional therapy;
- psoriatic JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate.

www.nice.org.uk/TA373

- **Adalimumab, etanercept and ustekinumab for treating plaque psoriasis in children and young people (July 2017)**

Etanercept is recommended as an option for treating plaque psoriasis in children and young people aged 6 years and older, only if the disease:

- is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more, and
- has not responded to standard systemic therapy, such as ciclosporin, methotrexate or phototherapy, or these options are contra-indicated or not tolerated.

If the psoriasis has not responded adequately, stop treatment at 12 weeks. An adequate response is defined as a 75% reduction in PASI score from the start of treatment.

Patients currently receiving etanercept who do not meet the above criteria and whose treatment was started within the NHS before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA455

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2013) that etanercept (*Enbrel*®) is accepted for restricted use within NHS Scotland for the treatment of polyarthritis (rheumatoid factor positive or negative) and extended oligoarthritis in children and adolescents from the age of 2 years who have had an inadequate response to or are intolerant of methotrexate, psoriatic arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of methotrexate, and enthesitis-related arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of conventional therapy. It is further restricted to use within specialist rheumatology services (including

those working within the network for paediatric rheumatology).

Golimumab

01-Mar-2018

● INDICATIONS AND DOSE

Polyarticular juvenile idiopathic arthritis (initiated by a specialist)

- BY SUBCUTANEOUS INJECTION

- Child (body-weight 40 kg and above): 50 mg once a month, on the same date each month, review treatment if no response after 3–4 doses

- **CONTRA-INDICATIONS** Moderate or severe heart failure · severe active infection

- **CAUTIONS** Active infection (do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled) · children should be brought up to date with current immunisation schedule before initiating therapy · demyelinating disorders (risk of exacerbation) · hepatitis B virus—monitor for active infection · history or development of malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection · risk factors for dysplasia or carcinoma of the colon—screen for dysplasia regularly

CAUTIONS, FURTHER INFORMATION

- **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start golimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with golimumab. Patients who have tested negative for latent tuberculosis, and those who are receiving or who have completed treatment for latent tuberculosis, should be monitored closely for symptoms of active infection.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

► **Common or very common** Abscess · alopecia · anaemia · asthenia · asthma · bone fracture · chest discomfort · depression · dizziness · fever · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal inflammatory disorders · headache · hypersensitivity · hypertension · increased risk of infection · insomnia · nausea · paraesthesia · respiratory disorders · skin reactions · stomatitis

► **Uncommon** Arrhythmia · balance impaired · bone marrow disorders · breast disorder · cholelithiasis · constipation · eye inflammation · eye irritation · flushing · goitre · hyperthyroidism · hypothyroidism · leucopenia · liver disorder · menstrual disorder · myocardial ischaemia · neoplasms · sepsis · thrombocytopenia · thrombosis · thyroid disorder · vision disorders

► **Rare or very rare** Bladder disorder · congestive heart failure · demyelination · healing impaired · hepatitis B reactivation · lupus-like syndrome · Raynaud's phenomenon · renal disorder · sarcoidosis · taste altered · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 6 months after last dose.

● **PREGNANCY** Use only if essential.

● **BREAST FEEDING** Manufacturer advises avoid during and for at least 6 months after treatment—present in milk in animal studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

● **PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● **MONITORING REQUIREMENTS** Monitor for infection before, during, and for 5 months after treatment.

● DIRECTIONS FOR ADMINISTRATION

Missed dose If dose administered more than 2 weeks late, subsequent doses should be administered on the new monthly due date.

● **PATIENT AND CARER ADVICE** An alert card should be provided.

Tuberculosis All patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2 Neuromuscular disorders

Neuromuscular disorders

Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 518 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in *myasthenia gravis*. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 810.

Neostigmine p. 648 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 63 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. In infants, neostigmine by either subcutaneous or intramuscular injection is preferred for the short-term management of *myasthenia*.

Pyridostigmine bromide p. 649 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required. It is inadvisable to use excessive doses because acetylcholine receptor down regulation may occur. Immunosuppressant therapy may be considered if high doses of pyridostigmine bromide are needed.

Neostigmine and pyridostigmine bromide should be given to neonates 30 minutes before feeds to improve suckling.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

Immunosuppressant therapy

A course of **corticosteroids** is an established treatment in severe cases of *myasthenia gravis* and may be particularly useful when antibodies to the acetylcholine receptor are present in high titre. Short courses of high-dose ('pulsed') methylprednisolone p. 441 followed by maintenance therapy with oral corticosteroids may also be useful.

Corticosteroid treatment is usually initiated under specialist supervision. Transient but very serious worsening of symptoms can occur in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Once remission has occurred (usually after 2–6 months), the dose of prednisolone p. 442 should be reduced slowly to the minimum effective dose.

Skeletal muscle relaxants

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with neurological damage; they are not indicated for spasm associated with minor injuries. They act principally on the central nervous system with the exception of dantrolene, which has a peripheral site of action. They differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Dantrolene sodium p. 821 acts directly on skeletal muscle and produces fewer central adverse effects. It is generally used in resistant cases. The dose should be increased slowly.

Baclofen p. 649 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

Diazepam p. 220 has undoubted efficacy in some children. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties.

2.1 Muscular dystrophy

DRUGS FOR NEUROMUSCULAR DISORDERS

Ataluren

24-May-2017

- **DRUG ACTION** Ataluren restores the synthesis of dystrophin by allowing ribosomes to read through premature stop codons that cause incomplete dystrophin synthesis in nonsense mutation Duchenne muscular dystrophy.

● INDICATIONS AND DOSE

Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients (initiated by a specialist)

► BY MOUTH

► Child 5–17 years: (consult product literature)

- **INTERACTIONS** → Appendix 1: ataluren

● SIDE-EFFECTS

- **Common or very common** Appetite decreased · constipation · cough · enuresis · fever · flatulence · gastrointestinal discomfort · haemorrhage · headache · hypertension · hypertriglyceridaemia · nausea · pain · rash erythematous · vomiting · weight decreased

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.

- **RENAL IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function at least every 6–12 months, and cholesterol and triglyceride concentrations at least annually.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises the contents of each sachet should be mixed with at least

30 mL of liquid (water, milk, fruit juice), or 3 tablespoons of semi-solid food (yoghurt or apple sauce).

- **PATIENT AND CARER ADVICE** Manufacturer advises patients should maintain adequate hydration during treatment.

Missed doses Manufacturer advises if a morning or midday dose is more than 3 hours late, or an evening dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Ataluren for treating Duchenne muscular dystrophy with a nonsense mutation in the dystrophin gene (July 2016)** NICE HST3

Ataluren, within its marketing authorisation, is recommended for treating Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene in people aged 5 years and older who can walk, only when:

- the manufacturer provides ataluren with the discount agreed in the patient access scheme, **and**
- the conditions under which ataluren is made available are set out in the managed access agreement between the manufacturer and NHS England, which should include the conditions set out in sections 5.12–5.15 and 5.23 of the guidance.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/HST3

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2016) that ataluren (*Translarna*®) is **not** recommended for use within NHS Scotland for the treatment of Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients aged 5 years and older as the economic case was not demonstrated.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (August 2016) that the NICE HST advice for ataluren (*Translarna*®) should be implemented within NHS Wales.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Granules

- **Translarna** (PTC Therapeutics Ltd) ▼

Ataluren 125 mg Translarna 125mg granules for oral suspension sachets | 30 sachet [PoM] £2,532.00

Ataluren 250 mg Translarna 250mg granules for oral suspension sachets | 30 sachet [PoM] £5,064.00

Ataluren 1 gram Translarna 1,000mg granules for oral suspension sachets | 30 sachet [PoM] £20,256.00

Nusinersen

18-May-2018

- **DRUG ACTION** Nusinersen is an antisense oligonucleotide that increases the production of survival motor neurone (SMN) protein, thereby helping to compensate for the defect in the SMN1 gene found in 5q spinal muscular atrophy.

● INDICATIONS AND DOSE

5q spinal muscular atrophy (initiated by a specialist)

► BY INTRATECAL INJECTION

- **Neonate:** Initially 12 mg for 4 doses on days 0, 14, 28 and 63, then 12 mg every 4 months, for advice on missed doses—consult product literature.

continued →

- ▶ Child: Initially 12 mg for 4 doses on days 0, 14, 28 and 63, then 12 mg every 4 months, for advice on missed doses—consult product literature

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Risk factors for renal toxicity—monitor urine protein (preferably using a first morning urine specimen) · risk factors for thrombocytopenia and coagulation disorders—monitor platelet and coagulation profile before treatment
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C); may be stored (in the original carton, protected from light) at or below 30 °C, for up to 14 days.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1318/18

The *Scottish Medicines Consortium* has advised (May 2018) that nusinersen (*Spinraza*®) is accepted for restricted use within NHS Scotland for the treatment of 5q spinal muscular atrophy (SMA) in patients with symptomatic type 1 SMA (infantile onset). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Spinraza** (Biogen Idec Ltd) ▼

Nusinersen (as Nusinersen sodium) 2.4 mg per 1 ml Spinraza 12mg/5ml solution for injection vials | 1 vial [PoM] £75,000.00

excessive dreaming, and weakness eventually leading to fasciculation and paralysis.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.

▶ above

Neostigmine

(Neostigmine methylsulfate)

● INDICATIONS AND DOSE

Treatment of myasthenia gravis

▶ BY MOUTH

- ▶ Neonate: Initially 1–2 mg, then 1–5 mg every 4 hours, given 30 minutes before feeds.

- ▶ Child 1 month–5 years: Initially 7.5 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg
- ▶ Child 6–11 years: Initially 15 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg
- ▶ Child 12–17 years: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 150 micrograms/kg every 6–8 hours, to be given 30 minutes before feeds, then increased if necessary up to 300 micrograms/kg every 4 hours.

- ▶ Child 1 month–11 years: 200–500 micrograms, dose repeated at suitable intervals throughout the day
- ▶ Child 12–17 years: 1–2.5 mg, dose repeated at suitable intervals throughout the day

Reversal of non-depolarising (competitive) neuromuscular blockade

▶ BY INTRAVENOUS INJECTION

- ▶ Neonate: 50 micrograms/kg, to be given over 1 minute after or with glycopyrronium or atropine, followed by 25 micrograms/kg if required.

- ▶ Child 1 month–11 years: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg if required

- ▶ Child 12–17 years: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg (max. per dose 2.5 mg) if required

● UNLICENSED USE

- ▶ In neonates Dose for treatment of myasthenia gravis by subcutaneous or intramuscular injection is unlicensed.

● CAUTIONS

- ▶ With intravenous use Glycopyrronium or atropine should also be given when reversing neuromuscular blockade

● INTERACTIONS → Appendix 1: neostigmine

● RENAL IMPAIRMENT

Dose adjustments May need dose reduction.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

2.2 Myasthenia gravis and Lambert-Eaton myasthenic syndrome

ANTICHOLINESTERASES

Anticholinesterases

- **DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.

- **CONTRA-INDICATIONS** Intestinal obstruction · urinary obstruction

- **CAUTIONS** Arrhythmias · asthma (extreme caution) · atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection) but not given routinely because it may mask signs of overdosage · bradycardia · epilepsy · hyperthyroidism · hypotension · parkinsonism · peptic ulceration · recent myocardial infarction · vagotonia

- **SIDE-EFFECTS** Abdominal cramps · diarrhoea · excessive tearing · gastrointestinal disorders · hypersalivation · muscle complaints · nausea · rash · vomiting

Overdose Signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation,

● MEDICINAL FORMS

F 648

Pyridostigmine bromide

- **DRUG ACTION** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

● INDICATIONS AND DOSE

Myasthenia gravis

► INITIALLY BY MOUTH

- Neonate: Initially 1–1.5 mg/kg, dose repeated throughout the day, then (by mouth using immediate-release medicines) increased if necessary up to 10 mg, to be increased gradually and given 30–60 minutes before feeds.
- Child 1 month–11 years: Initially 1–1.5 mg/kg daily, then (by mouth using immediate-release medicines) increased to 7 mg/kg daily in 6 divided doses, to be increased gradually; (by mouth using immediate-release medicines) usual dose 30–360 mg daily in divided doses
- Child 12–17 years: 30–120 mg, dose repeated throughout the day; (by mouth using immediate-release medicines) usual dose 300–600 mg daily in divided doses, consider immunosuppressant therapy if total daily dose exceeds 360 mg, down-regulation of acetylcholine receptors possible if total daily dose exceeds 450 mg

- **INTERACTIONS** → Appendix 1: pyridostigmine

● RENAL IMPAIRMENT

Dose adjustments Reduce dose; excreted by kidney.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Pyridostigmine bromide (Non-proprietary)

Pyridostigmine bromide 60 mg Pyridostigmine bromide 60mg tablets | 200 tablet [PoM] £45.48 DT = £44.02

► Mestinon (Meda Pharmaceuticals Ltd)

Pyridostigmine bromide 60 mg Mestinon 60mg tablets | 200 tablet [PoM] £45.57 DT = £44.02

2.3 Spasticity

Other drugs used for Spasticity Dantrolene sodium, p. 821 · Diazepam, p. 220

MUSCLE RELAXANTS > CENTRALLY ACTING

Baclofen

21-Nov-2016

● INDICATIONS AND DOSE

Chronic severe spasticity of voluntary muscle

► BY MOUTH

- Child 1 month–7 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly

intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 40 mg per day

- Child 8–17 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 60 mg per day

Severe chronic spasticity of cerebral or spinal origin unresponsive to oral antispastic drugs (or oral therapy not tolerated) (specialist use only)

► BY INTRATHECAL INJECTION

- Child 4–17 years: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not more often than every 24 hours to determine initial maintenance dose; maintenance 25–200 micrograms daily, adjusted according to response, dose-titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose retaining some spasticity to avoid sensation of paralysis

IMPORTANT SAFETY INFORMATION

Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

● CONTRA-INDICATIONS

- With intrathecal use Local infection · systemic infection
- With oral use Avoid oral route in active peptic ulceration

● CAUTIONS

GENERAL CAUTIONS Diabetes · epilepsy · history of peptic ulcer · hypertonic bladder sphincter · psychiatric illness · respiratory impairment

SPECIFIC CAUTIONS

- With intrathecal use Coagulation disorders · malnutrition (increased risk of post-surgical complications) · previous spinal fusion procedure
- **INTERACTIONS** → Appendix 1: baclofen
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- **Common or very common** Asthenia · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · euphoric mood · hallucination · headache · hyperhidrosis · hypotension · nausea · paraesthesia · respiratory disorders · sexual dysfunction · skin reactions · sleep disorders · urinary disorders · vision disorders · vomiting
- **Uncommon** Bradycardia · hypothermia · taste altered
- **Rare or very rare** Withdrawal syndrome

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With intrathecal use Anxiety · appetite decreased · chills · dyspnoea · fever · hypersalivation · neuromuscular dysfunction · oedema · pain · pneumonia · seizure
- With oral use Gastrointestinal disorder · muscle weakness · myalgia

- **Uncommon**
 - With intrathecal use Alopecia · deep vein thrombosis · dehydration · flushing · hypertension · ileus · memory loss · pallor · paranoia · suicidal tendencies
- **Rare or very rare**
 - With oral use Abdominal pain · hepatic function abnormal
- **Frequency not known**
 - With intrathecal use Scoliosis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal studies*).
- **BREAST FEEDING** Present in milk—amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT**
 - With oral use Manufacturer advises use with caution.
- **RENAL IMPAIRMENT** Excreted by the kidney.
 - Dose adjustments** ► With oral use Risk of toxicity—use smaller oral doses and if necessary increase dosage interval; if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² use by mouth only if potential benefit outweighs risk.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.
- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Baclofen for muscle spasm www.medicinesforchildren.org.uk/baclofen-muscle-spasm

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

3 Pain and inflammation in musculoskeletal disorders

Non-steroidal anti-inflammatory drugs

Therapeutic effects

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 271 but paracetamol is preferred.

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation.

Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance of these drugs. A large proportion of children will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. However, in juvenile idiopathic arthritis NSAIDs may take 4–12 weeks to be effective. If appropriate responses are not obtained within these times, another NSAID should be tried. The availability of appropriate formulations needs to be considered when prescribing NSAIDs for children.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. However, in children gastro-intestinal symptoms are rare in those taking NSAIDs for short periods. The role of selective inhibitors of cyclo-oxygenase-2 is undetermined in children.

Ibuprofen p. 655 and naproxen p. 659 are propionic acid derivatives used in children.

Ibuprofen combines anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other NSAIDs but its anti-inflammatory properties are weaker.

Naproxen combines good efficacy with a low incidence of side-effects.

Diclofenac sodium p. 652, diclofenac potassium p. 651, indometacin p. 657, mefenamic acid p. 658, and piroxicam p. 660 have properties similar to those of propionic acid derivatives:

Diclofenac sodium and diclofenac potassium are similar in efficacy to naproxen.

Indometacin has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances. It is rarely used in children and should be reserved for when other NSAIDs have been unsuccessful.

Mefenamic acid has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administration.

However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Meloxicam p. 658 is a selective inhibitor of cyclo-oxygenase-2. Its use may be considered in adolescents intolerant to other NSAIDs.

Ketorolac trometamol p. 817 can be used for the short-term management of postoperative pain.

Etoricoxib p. 653, a selective inhibitor of cyclo-oxygenase-2, is licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, and acute gout in children aged 16 years and over.

Dental and orofacial pain

Most mild to moderate dental pain and inflammation is effectively relieved by ibuprofen, diclofenac potassium or diclofenac sodium.

NSAIDs and cardiovascular events

The risk of cardiovascular events secondary to NSAID use is undetermined in children. In adults, all NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those patients receiving high doses long term. A small increased thrombotic risk cannot be excluded in children.

In adults, cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of etoricoxib. Naproxen (in adults, 1 g daily) is associated with a lower thrombotic risk, and lower doses of ibuprofen (in adults, 1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms, and the need for long-term treatment should be reviewed periodically.

NSAIDs and gastro-intestinal events

All NSAIDs are associated with gastro-intestinal toxicity. In adults, evidence on the relative safety of NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam and ketorolac trometamol are associated with the highest risk; indometacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Children appear to tolerate NSAIDs better than adults and gastro-intestinal side-effects are less common although they do still occur and can be significant; use of gastro-protective drugs may be necessary.

Asthma

All NSAIDs have the potential to worsen asthma, either acutely or as a gradual worsening of symptoms; consider both prescribed NSAIDs and those that are purchased over the counter.

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Diclofenac potassium

• INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders

► BY MOUTH

► Child 14–17 years: 75–100 mg daily in 2–3 divided doses

Postoperative pain

► BY MOUTH

► Child 9–13 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

► Child 14–17 years: 75–100 mg daily in 2–3 divided doses

Fever in ear, nose, or throat infection

► BY MOUTH

► Child 9–17 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

• **UNLICENSED USE** Voltarol® Rapid not licensed for use in children under 14 years or in fever.

• **CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • cerebrovascular disease • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • ischaemic heart disease • mild to severe heart failure • peripheral arterial disease

• **CAUTIONS** Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • coagulation defects • connective-tissue disorders • Crohn's disease (may be exacerbated) • history of cardiac failure • hypertension • left ventricular dysfunction • oedema • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated)

• **INTERACTIONS** → Appendix 1: NSAIDs

• SIDE-EFFECTS

- **Common or very common** Appetite decreased • diarrhoea • dizziness • gastrointestinal discomfort • gastrointestinal disorders • headache • nausea • skin reactions • vertigo • vomiting
- **Uncommon** Chest pain • heart failure • myocardial infarction • palpitations
- **Rare or very rare** Acute kidney injury • agranulocytosis • alopecia • anaemia • angioedema • anxiety • aplastic anaemia • asthma • confusion • constipation • depression • drowsiness • dyspnoea • erectile dysfunction • fatigue • haemolytic anaemia • haemorrhage • hearing impairment • hepatic disorders • hypersensitivity • hypertension • hypotension • inflammatory bowel disease • irritability • leucopenia • memory loss • meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • nephritis tubulointerstitial • nephrotic syndrome • oedema • oral disorders • pancreatitis • photosensitivity reaction • pneumonitis • proteinuria • psychotic disorder • renal papillary necrosis • seizure • sensation abnormal • severe cutaneous adverse reactions (SCARs) • shock • sleep disorders • stroke • taste altered • thrombocytopenia • tremor • vasculitis • vision disorders
- **Frequency not known** Hallucination • malaise • optic neuritis
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any

other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount in milk too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.
- **Dose adjustments** The lowest effective dose should be used for the shortest possible duration.
- **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **PATIENT AND CARER ADVICE**

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ Diclofenac potassium (Non-proprietary)

Diclofenac potassium 25 mg Diclofenac potassium 25mg tablets | 28 tablet [PoM] £3.87 DT = £3.87

Diclofenac potassium 50 mg Diclofenac potassium 50mg tablets | 28 tablet [PoM] £6.18–£7.41

▶ Voltarol Rapid (Novartis Pharmaceuticals UK Ltd)

Diclofenac potassium 50 mg Voltarol Rapid 50mg tablets | 30 tablet [PoM] £7.94 DT = £7.94

Diclofenac sodium

● INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 6 months–17 years: 1.5–2.5 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses; maximum 150 mg per day

Postoperative pain

▶ BY RECTUM

- ▶ Child 6 months–17 years (body-weight 8–11 kg): 12.5 mg twice daily for maximum 4 days
- ▶ Child 6 months–17 years (body-weight 12 kg and above): 1 mg/kg 3 times a day (max. per dose 50 mg) for maximum 4 days

Inflammation | Mild to moderate pain

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY RECTUM

- ▶ Child 6 months–17 years: 0.3–1 mg/kg 3 times a day (max. per dose 50 mg)

DICLOMAX RETARD®

Pain and inflammation

▶ BY MOUTH

- ▶ Child 12–17 years: 1 capsule once daily

DICLOMAX SR®

Pain and inflammation

▶ BY MOUTH

- ▶ Child 12–17 years: 1 capsule 1–2 times a day

MOTIFENE®

Pain and inflammation

▶ BY MOUTH

- ▶ Child 12–17 years: 1 capsule 1–2 times a day

VOLTAROL® 75MG SR TABLETS

Pain and inflammation

▶ BY MOUTH

- ▶ Child 12–17 years: 1 tablet 1–2 times a day

VOLTAROL® RETARD

Pain and inflammation

▶ BY MOUTH

- ▶ Child 12–17 years: 1 tablet once daily

VOLTAROL® SOLUTION FOR INJECTION

Postoperative pain

▶ BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child 2–17 years: 0.3–1 mg/kg 1–2 times a day for maximum 2 days, for intramuscular injection, to be injected into the gluteal muscle; maximum 150 mg per day

- **UNLICENSED USE** Not licensed for use in children under 1 year. *Suppositories* not licensed for use in children under 6 years except for use in children over 1 year for juvenile idiopathic arthritis. Solid dose forms containing more than 25 mg not licensed for use in children. *Injection* not licensed for use in children.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · avoid injections containing benzyl alcohol in neonates · avoid suppositories in proctitis · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease
- ▶ With intravenous use Dehydration · history of asthma · history of confirmed or suspected cerebrovascular bleeding · history of haemorrhagic diathesis · hypovolaemia · operations with high risk of haemorrhage

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · oedema · skin reactions · rash (discontinue) · vertigo · vomiting
- ▶ **Uncommon** Chest pain · heart failure · myocardial infarction · palpitations
- ▶ **Rare or very rare** Acute kidney injury · agranulocytosis · alopecia · anaemia · angioedema · anxiety · aplastic anaemia · asthma · confusion · constipation · Crohn's disease · depression · disorientation · drowsiness · dyspnoea · erectile dysfunction · haemolytic anaemia · haemorrhage · hearing impairment · hepatic disorders · hypersensitivity · hypertension · hypotension · irritability · leucopenia · memory loss · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nephritis tubulointerstitial · nephrotic syndrome · oral disorders · pancreatitis · paraesthesia · photosensitivity reaction · pneumonitis · proteinuria · psychotic disorder · renal

papillary necrosis • seizure • sensation abnormal • severe cutaneous adverse reactions (SCARs) • shock • sleep disorders • stroke • taste altered • thrombocytopenia • tremor • vasculitis • vision disorders

- **Frequency not known** Fertility decreased female • fluid retention • hallucination • malaise • optic neuritis • platelet aggregation inhibition

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 650.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount in milk too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.
- With intravenous use Contra-indicated in moderate or severe renal impairment.
- Dose adjustments** The lowest effective dose should be used for the shortest possible duration.
- Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute 75 mg with 100–500 mL Glucose 5% or Sodium Chloride 0.9% (previously buffered with 0.5 mL Sodium Bicarbonate 8.4% solution or with 1 mL Sodium Bicarbonate 4.2% solution); give over 30–120 minutes.

Etoricoxib

23-Nov-2016

● INDICATIONS AND DOSE

Pain and inflammation in osteoarthritis

► BY MOUTH

- Child 16–17 years: 30 mg once daily, increased if necessary to 60 mg once daily

Pain and inflammation in rheumatoid arthritis |

Ankylosing spondylitis

► BY MOUTH

- Child 16–17 years: 60 mg once daily, increased if necessary to 90 mg once daily

Acute gout

► BY MOUTH

- Child 16–17 years: 120 mg once daily for maximum 8 days

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • cerebrovascular disease • inflammatory bowel disease • ischaemic heart disease • mild to severe heart failure • peripheral arterial disease • uncontrolled hypertension (persistently above 140/90 mmHg)

- **CAUTIONS** Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • coagulation defects • connective-tissue disorders • Crohn's disease (may be exacerbated) • dehydration • history of cardiac failure • hypertension • left ventricular dysfunction • oedema • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- **Common or very common** Arrhythmias • asthenia • bronchospasm • constipation • diarrhoea • dizziness • fluid retention • gastrointestinal discomfort • gastrointestinal disorders • headache • hypertension • increased risk of infection • influenza like illness • nausea • oedema • oral ulceration • palpitations • skin reactions • vomiting
- **Uncommon** Alertness decreased • anaemia • angina pectoris • anxiety • appetite abnormal • cerebrovascular insufficiency • chest pain • congestive heart failure • conjunctivitis • cough • depression • drowsiness • dry mouth

• dyspnoea • flushing • haemorrhage • hallucination • hyperkalaemia • hypersensitivity • insomnia • irritable bowel syndrome • leucopenia • myocardial infarction • pancreatitis • proteinuria • renal failure (more common in patients with pre-existing renal impairment) • sensation abnormal • taste altered • thrombocytopenia • tinnitus • vasculitis • vertigo • vision blurred • weight increased

► **Rare or very rare** Angioedema • confusion • hepatic disorders • muscle complaints • severe cutaneous adverse reactions (SCARs) • shock

► **Frequency not known** Nephritis tubulointerstitial • nephropathy

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 650.

• **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

• **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

• **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

• **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in animal studies.

• **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

Dose adjustments Max. 60 mg daily in mild impairment.

Max. 60 mg on alternate days or 30 mg once daily in moderate impairment.

• **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Dose adjustments The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

• **MONITORING REQUIREMENTS** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

£64.34 DT = £64.34

Ibuprofen

● INDICATIONS AND DOSE

Closure of ductus arteriosus

► BY SLOW INTRAVENOUS INJECTION

- Neonate: Initially 10 mg/kg for 1 dose, followed by 5 mg/kg every 24 hours for 2 doses, the course may be repeated after 48 hours if necessary.

Mild to moderate pain | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1-2 months: 5 mg/kg 3–4 times a day
- Child 3-5 months: 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 6-11 months: 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 1-3 years: 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 4-6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 7-9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 10-11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 12-17 years: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

Pain and inflammation

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Child 12-17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 3 months-17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

Pain and inflammation in systemic juvenile idiopathic arthritis

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 3 months-17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

Post-immunisation pyrexia in infants (on doctor's advice only)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 2-3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

● UNLICENSED USE

- With intravenous use Orphan licence for the injection for closure of ductus arteriosus in premature neonates less than 34 weeks corrected gestational age.
- With oral use Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.
- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- With intravenous use Active bleeding (especially intracranial or gastro-intestinal) · coagulation defects · known or suspected necrotising enterocolitis · life-threatening infection · marked unconjugated hyperbilirubinaemia · pulmonary hypertension · thrombocytopenia

- **CAUTIONS** Cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- With intravenous use May mask symptoms of infection

CAUTIONS, FURTHER INFORMATION

- High-dose ibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose ibuprofen (≥ 2.4 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II-III), and uncontrolled hypertension.

● INTERACTIONS → Appendix 1: NSAIDs

● SIDE-EFFECTS

► Common or very common

- With intravenous use Fluid retention · gastrointestinal disorders · haemorrhage · intrauterine haemorrhage · neutropenia · periventricular leukomalacia · renal impairment · thrombocytopenia

► Uncommon

- With oral use Gastrointestinal discomfort · headache · hypersensitivity · nausea · rash (discontinue) · skin reactions

► Rare or very rare

- With oral use Acute kidney injury · agranulocytosis · anaemia · angioedema · constipation · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal disorders · haemorrhage · hypotension · influenza like illness · leucopenia · liver disorder · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · oedema · oral disorders · pancytopenia · renal papillary necrosis · respiratory disorders · severe cutaneous adverse reactions (SCARs) · shock · tachycardia · throat pain · thrombocytopenia · vomiting
- Frequency not known
- With oral use Asthma · Crohn's disease · fertility decreased · female · fluid retention · heart failure · hypertension · increased risk of arterial thromboembolism · renal failure

(more common in patients with pre-existing renal impairment) · respiratory tract reaction

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 650.

Overdose Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated followed by symptomatic measures are indicated if more than 100mg/kg has been ingested within the preceding hour.

For details on the management of poisoning, see Emergency treatment of poisoning p. 832.

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

● **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.

● HEPATIC IMPAIRMENT

▶ With intravenous use Increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
▶ With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

● RENAL IMPAIRMENT

▶ With intravenous use Avoid if possible in severe impairment.
▶ With oral use Avoid if possible or use with caution. Avoid in severe impairment.

Dose adjustments ▶ With intravenous use Use lowest effective dose.

▶ With oral use The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● MONITORING REQUIREMENTS

▶ With intravenous use Monitor for bleeding. Monitor gastrointestinal function.

● **DIRECTIONS FOR ADMINISTRATION** For *slow intravenous injection*, give over 15 minutes, preferably undiluted. May be diluted with Glucose 5% or Sodium Chloride 0.9%.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include orange.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: ibuprofen for pain and inflammation www.medicinesforchildren.org.uk/ibuprofen-for-pain-and-inflammation

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Ibuprofen Oral Suspension Sugar-free may be prescribed. Ibuprofen Tablets may be prescribed.

● **EXCEPTIONS TO LEGAL CATEGORY** Oral preparations can be sold to the public in certain circumstances.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Effervescent granules

CAUTIONARY AND ADVISORY LABELS 13, 21

Ibuprofen 200 mg Ibuprofen 200mg orodispersible tablets sugar free sugar-free | 12 tablet [GSL] [N] DT = £2.19

► Brands may include Nurofen Meltlets

Indometacin

(Indomethacin)

• **INDICATIONS AND DOSE**

Symptomatic ductus arteriosus

► BY INTRAVENOUS INFUSION

- Neonate: Initially 100–200 micrograms/kg for 1 dose, followed by 100 micrograms/kg after 24 hours for 2 doses, at 24-hour intervals, doses to be given over 20–30 minutes, if residual patency present, 100 micrograms/kg to be given for a further 3 doses at 24-hour intervals.

Relief of pain and inflammation in rheumatic diseases including juvenile idiopathic arthritis

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child: 0.5–1 mg/kg twice daily, higher doses may be used under specialist supervision

• **UNLICENSED USE**

- With oral use Not licensed for use in children.

• **CONTRA-INDICATIONS**

- With intravenous use Bleeding (especially with active intracranial haemorrhage or gastro-intestinal bleeding) · coagulation defects · necrotising enterocolitis · thrombocytopenia · untreated infection
- With oral use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

• **CAUTIONS**

GENERAL CAUTIONS Heart failure

SPECIFIC CAUTIONS

- With intravenous use Inhibition of platelet aggregation (monitor for bleeding) · may induce hyponatraemia · may mask symptoms of infection · may reduce urine output by 50% or more and precipitate renal impairment especially if extracellular volume depleted · sepsis
- With oral use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · epilepsy · ischaemic heart disease · peripheral arterial disease · psychiatric disturbances · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

• **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Agranulocytosis · alopecia · anaphylactic reaction · angioedema · anxiety · appetite decreased · arrhythmias · asthma · blood disorder · bone marrow disorders · breast abnormalities · chest pain · coma · confusion · congestive heart failure · constipation · corneal deposits · depression · diarrhoea · disseminated intravascular coagulation · dizziness · drowsiness · dysarthria · erythema nodosum · eye disorder · eye pain · fatigue · fluid retention · flushing · gastrointestinal discomfort · gastrointestinal disorders · gynaecomastia ·

haemolytic anaemia · haemorrhage · hallucination · headache · hearing impairment · hepatic disorders · hyperglycaemia · hyperhidrosis · hyperkalaemia · hypotension · inflammatory bowel disease · insomnia · leucopenia · movement disorders · muscle weakness · nausea · nephritis tubulointerstitial · nephrotic syndrome · oedema · oral disorders · palpitations · pancreatitis · paraesthesia · peripheral neuropathy · photosensitivity reaction · platelet aggregation inhibition · psychiatric disorders · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · seizures · severe cutaneous adverse reactions (SCARs) · skin reactions · syncope · thrombocytopenia · urine abnormalities · vasculitis · vertigo · vision disorders · vomiting

SPECIFIC SIDE-EFFECTS

- With oral use Anaemia · dyspnoea · eosinophilia · malaise · pulmonary oedema · sigmoid lesion perforation

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 650.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

• **PREGNANCY**

- With oral use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

• **BREAST FEEDING**

- With oral use Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.

• **HEPATIC IMPAIRMENT**

- With intravenous use Increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe impairment.
- With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

• **RENAL IMPAIRMENT**

- With intravenous use Avoid if possible in severe impairment. Anuria or oliguria
- With intravenous use If anuria or marked oliguria (urinary output less than 0.6 mL/kg/hour), delay further doses until renal function returns to normal.
- With oral use Avoid if possible or use with caution. Avoid in severe impairment.

Dose adjustments ► With intravenous use Use lowest effective dose.

- With oral use The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

• **MONITORING REQUIREMENTS**

- With oral use During prolonged therapy ophthalmic and blood examinations particularly advisable.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute each vial with 1–2 mL Sodium Chloride 0.9% or Water for Injections.

• **PATIENT AND CARER ADVICE**

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

Capsule

CAUTIONARY AND ADVISORY LABELS 21

► **Indometacin (Non-proprietary)**

Indometacin 25 mg Indometacin 25mg capsules | 28 capsule [PoM]
£5.00 DT = £0.83

Indometacin 50 mg Indometacin 50mg capsules | 28 capsule [PoM]
£7.50 DT = £1.24

Mefenamic acid

05-Oct-2016

● INDICATIONS AND DOSE

Acute pain including dysmenorrhoea | Menorrhagia

► BY MOUTH

► Child 12–17 years: 500 mg 3 times a day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · inflammatory bowel disease · severe heart failure
- **CAUTIONS** Acute porphyrias p. 603 · allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · epilepsy · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Agranulocytosis · anaemia · angioedema · appetite decreased · asthma · bone marrow disorders · confusion · constipation · Crohn's disease · depression · diarrhoea (discontinue) · disseminated intravascular coagulation · dizziness · drowsiness · dyspnoea · dysuria · ear pain · eosinophilia · eye irritation · fatigue · fertility decreased female · gastrointestinal discomfort · gastrointestinal disorders · glomerulonephritis · glucose tolerance impaired · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hyperhidrosis · hypersensitivity · hypertension · hyponatraemia · hypotension · insomnia · leucopenia · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · multi organ failure · nausea · nephritis acute interstitial · nephrotic syndrome · nervousness · neutropenia · oedema · optic neuritis · oral ulceration · palpitations · pancreatitis · paraesthesia · photosensitivity reaction · proteinuria · rash (discontinue) · renal failure (more common in patients with pre-existing renal impairment) · renal failure non-oliguric · renal papillary necrosis · respiratory disorders · seizure · sepsis · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · vertigo · vision disorders · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 650.
- Overdose** Mefenamic acid has important consequences in overdose because it can cause convulsions, which if prolonged or recurrent, require treatment.

For details on the management of poisoning, see Emergency treatment of poisoning, in particular, Convulsions p. 832.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.
Dose adjustments The lowest effective dose should be used for the shortest possible duration.
Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Meloxicam

● INDICATIONS AND DOSE

Exacerbation of osteoarthritis (short-term)

► BY MOUTH

► Child 16–17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

Pain and inflammation in rheumatic disease | Ankylosing spondylitis

► BY MOUTH

► Child 16–17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required

Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs

► BY MOUTH

- Child 12–17 years (body-weight up to 50 kg): 7.5 mg once daily
- Child 12–17 years (body-weight 50 kg and above): 15 mg once daily

- **UNLICENSED USE** Not licensed for use in children under 16 years.
 - **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
 - **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
 - **INTERACTIONS** → Appendix 1: NSAIDs
 - **SIDE-EFFECTS**
 - **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · vomiting
 - **Uncommon** Anaemia · angioedema · burping · dizziness · drowsiness · electrolyte imbalance · fluid retention · flushing · haemorrhage · hepatic disorders · hypersensitivity · oedema · skin reactions · stomatitis · vertigo
 - **Rare or very rare** Acute kidney injury · asthma · conjunctivitis · leucopenia · mood altered · nightmare · palpitations · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tinnitus · vision disorders
 - **Frequency not known** Agranulocytosis · confusion · fertility decreased female · heart failure · increased risk of arterial thromboembolism · nephritis tubulointerstitial · nephrotic syndrome · photosensitivity reaction · renal necrosis
- SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 650.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
 - **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
 - **BREAST FEEDING** Use with caution during breast-feeding. Present in milk in *animal* studies—manufacturer advises avoid.
 - **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
 - **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².
- Dose adjustments** The lowest effective dose should be used for the shortest possible duration.
- Monitoring** In renal impairment monitor renal function;

sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● INDICATIONS AND DOSE

Relief of pain and inflammation in juvenile idiopathic arthritis

► BY MOUTH

- Child 6–17 years (body-weight up to 15 kg): 5 mg daily
- Child 6–17 years (body-weight 15–25 kg): 10 mg daily
- Child 6–17 years (body-weight 26–45 kg): 15 mg daily
- Child 6–17 years (body-weight 46 kg and above): 20 mg daily

● UNLICENSED USE Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

CHMP ADVICE—PIROXICAM (JUNE 2007)

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
 - piroxicam should not be used as first-line treatment
 - in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
 - piroxicam dose should not exceed 20 mg daily
 - piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
 - treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
 - concomitant administration of a gastro-protective agent should be considered.
- Topical preparations containing piroxicam are not affected by these restrictions.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · inflammatory bowel disease · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

- **Common or very common** Anaemia · appetite decreased · constipation · diarrhoea · dizziness · drowsiness · eosinophilia · gastrointestinal discomfort · gastrointestinal disorders · headache · hearing impairment · hyperglycaemia · leucopenia · nausea · oedema · rash (discontinue) · skin reactions · thrombocytopenia · vertigo · vomiting · weight changes

- **Uncommon** Hypoglycaemia • palpitations • stomatitis • vision blurred
- **Rare or very rare** Nephritis tubulointerstitial • nephrotic syndrome • renal failure • renal papillary necrosis • severe cutaneous adverse reactions (SCARs)
- **Frequency not known** Alopecia • angioedema • aplastic anaemia • bronchospasm • confusion • depression • dyspnoea • embolism and thrombosis • eye irritation • eye swelling • fertility decreased female • fluid retention • haemolytic anaemia • haemorrhage • hallucination • heart failure • hepatic disorders • hypersensitivity • hypertension • malaise • mood altered • nervousness • onycholysis • pancreatitis • paraesthesia • photosensitivity reaction • sleep disorders • vasculitis

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 650.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration. **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **DIRECTIONS FOR ADMINISTRATION** Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing. Piroxicam orodispersible tablets may be halved to give 10 mg dose.
- **LESS SUITABLE FOR PRESCRIBING** Piroxicam is less suitable for prescribing.

4 Soft tissue and joint disorders

4.1 Local inflammation of joints and soft tissue

CORTICOSTEROIDS

Corticosteroids, inflammatory disorders

Systemic corticosteroids

In children with rheumatic diseases corticosteroids should be reserved for specific indications (e.g. when other therapies are unsuccessful or while waiting for DMARDs to take effect) and should be used only under the supervision of a specialist.

Systemic corticosteroids may be considered for the management of juvenile idiopathic arthritis in systemic disease or when several joints are affected. Systemic corticosteroids may also be considered in severe, possibly life-threatening conditions such as systemic lupus erythematosus, systemic vasculitis, juvenile dermatomyositis, Behçet's disease, and polyarticular joint disease.

In severe conditions, short courses ('pulses') of high dose intravenous methylprednisolone p. 441 or a pulsed oral corticosteroid may be particularly effective for providing rapid relief, and has fewer long-term adverse effects than continuous treatment.

Corticosteroid doses should be reduced with care because of the possibility of relapse if the reduction is too rapid. If complete discontinuation of corticosteroids is not possible, consideration should be given to alternate-day (or alternate high-dose, low-dose) administration; on days when no corticosteroid is given, or a lower dose is given, an additional dose of a NSAID may be helpful. In some conditions, alternative treatment using an antimalarial or concomitant use of an immunosuppressant drug, such as azathioprine p. 518, methotrexate p. 543 or cyclophosphamide p. 535 may prove useful; in less severe conditions treatment with a NSAID alone may be adequate.

Administration of corticosteroids may result in suppression of growth and may affect the development of puberty. The risk of corticosteroid-induced osteoporosis should be considered for those on long-term corticosteroid treatment; corticosteroids may also increase the risk of osteopenia in those unable to exercise. See the disadvantages of corticosteroid treatment.

Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, including juvenile idiopathic arthritis, they are given by *intra-articular injection* as monotherapy, or as an adjunct to long-term therapy to reduce swelling and deformity in one or a few joints. Aseptic precautions (e.g. a no-touch technique) are essential, as is a clinician skilled in the technique; infected areas should be avoided and general anaesthesia, or local anaesthesia, or conscious sedation should be used.

Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Triamcinolone hexacetonide p. 562 [unlicensed] is preferred for intra-articular injection because it is almost insoluble and has a long-acting (depot) effect.

Triamcinolone acetonide below and methylprednisolone may also be considered for intra-articular injection into larger joints, whilst hydrocortisone acetate below should be reserved for smaller joints or for soft-tissue injections. Intra-articular corticosteroid injections can cause flushing and, in adults, may affect the hyaline cartilage. Each joint should usually be treated no more than 3–4 times in one year.

A smaller amount of corticosteroid may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis or golfer's elbow* or *compression neuropathies*, which occur rarely in children. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

Hydrocortisone

21-Dec-2017

● INDICATIONS AND DOSE

HYDROCORTISTAB®

Local inflammation of joints and soft-tissues

- ▶ BY INTRA-ARTICULAR INJECTION
- ▶ Child 1 month–11 years: 5–30 mg, select dose according to size of child and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature
- ▶ Child 12–17 years: 5–50 mg, select dose according to size of patient and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Bruising · increased risk of infection · malaise · myocardial rupture (following recent myocardial infarction)

● MEDICINAL FORMS

- **NATIONAL FUNDING/ACCESS DECISIONS**

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (August 2017) that triamcinolone hexacetonide 20 mg/mL suspension for injection is recommended as an option for use within NHS Wales for the treatment of juvenile idiopathic arthritis.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Benzyl alcohol

► **Triamcinolone hexacetonide (Non-proprietary)**

Triamcinolone hexacetonide 20 mg per 1 ml Triamcinolone hexacetonide 20mg/1ml suspension for injection ampoules | 10 ampoule (PoM) £120.00

4.2 Soft tissue disorders

Soft-tissue disorders

Soft-tissue and musculoskeletal disorders

The management of children with soft-tissue injuries and strains, and musculoskeletal disorders, may include temporary rest together with the local application of heat or cold, local massage and physiotherapy. For pain relief, paracetamol p. 271 is often adequate and should be used first. Alternatively, the lowest effective dose of a **NSAID** (e.g. ibuprofen p. 655) can be used. If pain relief with either drug is inadequate, both paracetamol (in a full dose appropriate for the child) and a low dose of a NSAID may be required.

Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolality greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. Very young children are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

Extravasation prevention

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and children receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trinitrate patch p. 135 or using glyceryl trinitrate ointment distal to the cannula may improve the patency of the vessel in children with small veins or in those whose veins are prone to collapse. Children or their carers should be asked to report any pain or burning at the site of injection immediately.

Extravasation management

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 440 or dexamethasone p. 439 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. Antihistamines and analgesics may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase below. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should **not** be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique).

Enzymes used in soft-tissue disorders

Hyaluronidase is used for the management of extravasation.

ENZYMES

Hyaluronidase

● **INDICATIONS AND DOSE****Extravasation**

► BY LOCAL INFILTRATION

- Child: (consult product literature)

- **UNLICENSED USE** Licensed for use in children, but age range not specified by the manufacturer.
- **CONTRA-INDICATIONS** Avoid sites where infection is present • avoid sites where malignancy is present • do not apply direct to cornea • not for anaesthesia in unexplained premature labour • not for intravenous administration • not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists • not to be used to reduce swelling of bites • not to be used to reduce swelling of stings

- **CAUTIONS** Infants (control speed and total volume and avoid overhydration especially in renal impairment)

- **SIDE-EFFECTS** Oedema · periorbital oedema

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye

Eye treatment: drug administration

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—contact individual manufacturers for further information. They are particularly useful for children in whom normal application is difficult, for the visually impaired, or otherwise physically limited patients.

Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; in neonates and infants it may be more appropriate to administer the drop in the inner angle of the open eye. One drop is all that is needed; instillation of more than one drop at a time should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow can occur when one immediately follows the other. The carer or child should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops. Both drops and ointment can cause transient blurred vision; children should be warned, where appropriate, not to perform skilled tasks (e.g. cycling or driving) until vision is clear.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

Also see warnings relating to eye drops and contact lenses.

Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution p. 673 is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Ophthalmic Specials

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product will not be suitable for a child's needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Eye preparations: control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *domiciliary use* should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in *hospital wards* are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye

only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In *out-patient departments* single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In *eye surgery* single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann's solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 123 and hyalalazine hydrochloride p. 116). Other drugs that may affect contact lens wear are

isotretinoin p. 757 (can cause conjunctival inflammation), aspirin p. 91 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 364 and sulfasalazine p. 31 (can discolour lenses).

1 Allergic and inflammatory eye conditions

Eye, allergy and inflammation

Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

Topical corticosteroids should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' can follow prolonged use.

Products combining a corticosteroid with an antimicrobial are used after ocular surgery to reduce inflammation and prevent infection: use of combination products is otherwise rarely justified.

Systemic corticosteroids may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

Eye care, other anti-inflammatory preparations

Eye drops containing **antihistamines**, such as antazoline with xylometazoline below as *Otrivine-Antistin*®, azelastine hydrochloride p. 667, epinastine hydrochloride p. 667, ketotifen p. 667, and olopatadine p. 667, can be used for allergic conjunctivitis.

Sodium cromoglicate and nedocromil sodium eye drops p. 668 may be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops p. 667 are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

1.1 Allergic conjunctivitis

ANTIHISTAMINES

Antazoline with xylometazoline

● INDICATIONS AND DOSE

Allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12–17 years: Apply 2–3 times a day for maximum 7 days

- **CAUTIONS** Angle-closure glaucoma • cardiovascular disease • diabetes mellitus • hypertension • hyperthyroidism • phaeochromocytoma • urinary retention
- **INTERACTIONS** → Appendix 1: antihistamines, sedating • sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS** Drowsiness · eye irritation · headache · hyperhidrosis · hypertension · mydriasis · nausea · palpitations · vascular disorders · vision blurred

SIDE-EFFECTS, FURTHER INFORMATION Absorption of antazoline and xylometazoline may result in systemic side-effects.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Otrivine Antistin** (Thea Pharmaceuticals Ltd)

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Opatanol** (Novartis Pharmaceuticals UK Ltd)

Olopatadine (as Olopatadine hydrochloride) 1 mg per 1 ml Opatanol 1mg/ml eye drops | 5 ml [PoM] £4.68 DT = £4.68

MAST-CELL STABILISERS

Lodoxamide

● INDICATIONS AND DOSE

Allergic conjunctivitis

- ▶ TO THE EYE

- ▶ Child 4-17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

● SIDE-EFFECTS

- ▶ Common or very common Dry eye · eye discomfort · eye disorders · vision disorders
- ▶ Uncommon Corneal deposits · dizziness · eye inflammation · headache · nausea

- **Rare or very rare** Nasal complaints · rash · taste altered
- **EXCEPTIONS TO LEGAL CATEGORY** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Alomide** (Novartis Pharmaceuticals UK Ltd)

Lodoxamide (as Lodoxamide trometamol) 1 mg per 1 ml Alomide 0.1% eye drops | 10 ml [PoM] £5.21 DT = £5.21

Nedocromil sodium

● INDICATIONS AND DOSE

Seasonal and perennial conjunctivitis

- TO THE EYE
- Child 6–17 years: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis

Seasonal keratoconjunctivitis

- TO THE EYE
- Child 6–17 years: Apply 4 times a day

● SIDE-EFFECTS

- **Common or very common** Eye discomfort · eye strain · taste altered

● MEDICINAL FORMS

No licensed medicines listed.

Sodium cromoglicate

(Sodium cromoglycate)

● INDICATIONS AND DOSE

Allergic conjunctivitis | Seasonal keratoconjunctivitis

- TO THE EYE
- Child: Apply 4 times a day

● SIDE-EFFECTS

- **Frequency not known** Eye stinging
- **EXCEPTIONS TO LEGAL CATEGORY** Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

- **Sodium cromoglicate (Non-proprietary)**

Sodium cromoglicate 20 mg per 1 ml Sodium cromoglicate 2% eye drops | 13.5 ml [PoM] £11.25 DT = £9.87

- **Opticrom** (Sanofi)

Sodium cromoglicate 20 mg per 1 ml Opticrom Aqueous 2% eye drops | 13.5 ml [PoM] £8.03 DT = £9.87

- **Vividrin** (Bausch & Lomb UK Ltd)

Sodium cromoglicate 20 mg per 1 ml Vividrin 2% eye drops | 13.5 ml [PoM] £10.95 DT = £9.87

1.2 Inflammatory eye conditions

Other drugs used for Inflammatory eye conditions

Adalimumab, p. 642

CORTICOSTEROIDS

Betamethasone

21-Dec-2017

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- TO THE EYE USING EYE DROP
- Child: Apply every 1–2 hours until controlled then reduce frequency
- TO THE EYE USING EYE OINTMENT
- Child: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Vision disorders

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Betnesol** (RPH Pharmaceuticals AB)

Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [PoM] £2.32 DT = £2.32

- **Vistamethasone** (Martindale Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] £1.02 | 10 ml [PoM] £1.16 DT = £2.32

Eye ointment

- **Betamethasone (Non-proprietary)**

Betamethasone sodium phosphate 1 mg per 1 gram Betamethasone 0.1% eye ointment | 3 gram [PoM] £3.48 DT = £1.41

- **Betnesol** (Focus Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 gram Betnesol 0.1% eye ointment | 3 gram [PoM] £1.41 DT = £1.41

Combinations available: **Betamethasone with neomycin**, p. 669

Dexamethasone

21-Dec-2017

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- TO THE EYE USING EYE DROP
- Child: Apply 4–6 times a day

Short term local treatment of inflammation (severe conditions)

- TO THE EYE USING EYE DROP
- Child: Apply every 30–60 minutes until controlled, reduce frequency when control achieved

- **UNLICENSED USE** *Maxidex*® not licensed for use in children under 2 years. *Dropodex*® and *Dexafree*® not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 434.

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS**
 - **Common or very common** Eye discomfort
 - **Uncommon** Photophobia · taste altered
- **PREGNANCY** Dexamethasone readily crosses the placenta.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose Dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

► Dexamethasone (Non-proprietary)

Dexamethasone sodium phosphate 1 mg per 1 ml Minim's dexamethasone 0.1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.46 DT = £11.46

► Dexafree (Thea Pharmaceuticals Ltd)

Dexamethasone sodium phosphate 1 mg per 1 ml Dexafree 1mg/1ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £9.70
